Here might be the starting-point for fresh investigations. Our consciousness communicates to us feelings from within not only of pleasure and unpleasure but also of a peculiar tension which in its turn can be either pleasurable or unpleasurable. Should the difference between these feelings enable us to distinguish between bound and unbound processes of energy? or is the feeling of tension to be related to the absolute magnitude, or perhaps to the level, of the cathexis, while the pleasure and unpleasure series indicates a change in magnitude of the cathexis within a given unit of time? Another striking fact is that the life instincts have so much more contact with our internal perception - emerging as breakers of the peace and constantly producing tensions whose release is felt as pleasure - while the death instincts seem to do their work unobtrusively. The pleasure principle seems actually to serve the death instincts. It is true that it keeps watch upon stimuli from without, which are regarded as dangers by both kinds of instincts; but it is more especially on guard against increases of stimulation from within, which would make the task of living more difficult. This in turn raises a host of other questions to which we can at present find no answer. We must be patient and await fresh methods and occasions of research. We must be ready, too, to abandon a path that we have followed for a time, if it seems to be leading to no good end. Only believers, who demand that science shall be a substitute for the catechism they have given up, will blame an investigator for developing or even transforming his views. We may take comfort, too, for the slow advances of our scientific knowledge in the words of the poet:

Recognition of Two Classes of Instincts in Mental Life. - Though psycho-analysis endeavours as a rule to develop its theories as independently as possible from those of other sciences, it is nevertheless obliged to seek a basis for the theory of the instincts in biology. On the ground of a far-reaching consideration of the processes which go to make up life and which lead to death, it becomes probable that we should recognize the existence of two classes of instincts, corresponding to the contrary processes of construction and dissolution in the organism. On this view, the one set of instincts, which work essentially in silence, would be those which follow the aim of leading the living creature to death and therefore deserve to be called the ‘death instincts’; these would be directed outwards as the result of the combination of numbers of unicellular elementary organisms, and would manifest themselves as destructiveness or aggressive impulses. The other set of instincts would be those which are better known to us in analysis - the libidinal, sexual or life instincts, which are best comprised under the name of Eros; their purpose would be to form living substance into ever greater unities, so that life may be prolonged and brought to higher development. The erotic instincts and the death instincts would be present in living beings in regular mixtures or fusions; but 'defusions' would also be liable to occur. Life would consist in the manifestations of the conflict or interaction between the two classes of instincts; death would mean for the individual the victory of the destructive instincts, but reproduction would mean for him the victory of Eros.

Over and over again we find, when we are able to trace instinctual impulses back, that they reveal themselves as derivatives of Eros. If it were not for the considerations put forward in Beyond the Pleasure Principle, and ultimately for the sadistic constituents which have attached themselves to Eros, we should have difficulty in holding to our fundamental dualistic point of view. But since we cannot escape that view, we are driven to conclude that the death instincts are by their nature mute and that the clamour of life proceeds for the most part from Eros.¹

[1920g, 3762]

[1923a, 3934]

[1923b, 3980]
The id, to which we finally come back, has no means of showing the ego either love or hate. It
cannot say what it wants; it has achieved no unified will. Eros and the death instinct struggle
within it; we have seen with what weapons the one group of instincts defends itself against the
other. It would be possible to picture the id as under the domination of the mute but powerful
death instincts, which desire to be at peace and (prompted by the pleasure principle) to put
Eros, the mischief maker, to rest; but perhaps that might be to undervalue the part played by
Eros.
[1923b, 3992]

In the works of my later years (Beyond the Pleasure Principle, Group Psychology and the
Analysis of the Ego, and The Ego and the Id), I have given free rein to the inclination, which I
kept down for so long, to speculation, and I have also contemplated a new solution of the
problem of the instincts. I have combined the instincts for self-preservation and for the
preservation of the species under the concept of Eros and have contrasted with it an instinct of
death or destruction which works in silence. Instinct in general is regarded as a kind of elasticity
of living things, an impulsion towards the restoration of a situation which once existed but was
brought to an end by some external disturbance. This essentially conservative character of
instincts is exemplified by the phenomena of the compulsion to repeat. The picture which life
presents to us is the result of the concurrent and mutually opposing action of Eros and the
dead instinct.
[1925d, 4232]
Every analyst will admit that even to-day this view has not the sound of a long-discarded error. Nevertheless, alterations in it became essential, as our enquiries advanced from the repressed to the repressing forces, from the object-instincts to the ego. The decisive step forward was the introduction of the concept of narcissism - that is to say, the discovery that the ego itself is cathexed with libido, that the ego, indeed, is the libido's original home, and remains to some extent its headquarters. This narcissistic libido turns towards objects, and thus becomes object-libido; and it can change back into narcissistic libido once more. The concept of narcissism made it possible to obtain an analytic understanding of the traumatic neuroses and of many of the affections bordering on the psychoses, as well as of the latter themselves. It was not necessary to give up our interpretation of the transference neuroses as attempts made by the ego to defend itself against sexuality; but the concept of libido was endangered. Since the ego-instincts, too, were libidinal, it seemed for a time inevitable that we should make libido coincide with instinctual energy in general, as C. G. Jung had already advocated earlier. Nevertheless, there still remained in me a kind of conviction, for which I was not as yet able to find reasons, that the instincts could not all be of the same kind. My next step was taken in Beyond the Pleasure Principle (1920), when the compulsion to repeat and the conservative character of instinctual life first attracted my attention. Starting from speculations on the beginning of life and from biological parallels, I drew the conclusion that, besides the instinct to preserve living substance and to join it into ever larger units,¹ there must exist another, contrary instinct seeking to dissolve those units and to bring them back to their præmaeval, inorganic state. That is to say, as well as Eros there was an instinct of death. The phenomena of life could be explained from the concurrent or mutually opposing action of these two instincts. It was not easy, however, to demonstrate the activities of this supposed death instinct. The manifestations of Eros were conspicuous and noisy enough. It might be assumed that the death instinct operated silently within the organism towards its dissolution, but that, of course, was no proof. A more fruitful idea was that a portion of the instinct is diverted towards the external world and comes to light as an instinct of aggressiveness and destructiveness. In this way the instinct itself could be pressed into the service of Eros, in that the organism was destroying some other thing, whether animate or inanimate, instead of destroying its own self. Conversely, any restriction of this aggressiveness directed outwards would be bound to increase the self-destruction, which is in any case proceeding. At the same time one can suspect from this example that the two kinds of instinct seldom - perhaps never - appear in isolation from each other, but are alloyed with each other in varying and very different proportions and so become unrecognizable to our judgement. In sadism, long since known to us as a component instinct of sexuality, we should have before us a particularly strong alloy of this kind between trends of love and the destructive instinct; while its counterpart, masochism, would be a union between destructiveness directed inwards and sexuality - a union which makes what is otherwise an imperceptible trend into a conspicuous and tangible one.

[1930a, 4509]
The assumption of the existence of an instinct of death or destruction has met with resistance even in analytic circles; I am aware that there is a frequent inclination rather to ascribe whatever is dangerous and hostile in love to an original bipolarity in its own nature. To begin with it was only tentatively that I put forward the views I have developed here, but in the course of time they have gained such a hold upon me that I can no longer think in any other way. To my mind, they are far more serviceable from a theoretical standpoint than any other possible ones; they provide that simplification, without either ignoring or doing violence to the facts, for which we strive in scientific work. I know that in sadism and masochism we have always seen before us manifestations of the destructive instinct (directed outwards and inwards), strongly alloyed with erotism; but I can no longer understand how we can have overlooked the ubiquity of non-erotic aggressivity and destructiveness and can have failed to give it its due place in our interpretation of life. (The desire for destruction when it is directed inwards mostly eludes our perception, of course, unless it is tinged with erotism.) I remember my own defensive attitude when the idea of an instinct of destruction first emerged in psycho-analytic literature, and how long it took before I became receptive to it. That others should have shown, and still show, the same attitude of rejection surprises me less. For 'little children do not like it' when there is talk of the inborn human inclination to 'badness', to aggressiveness and destructiveness, and so to cruelty as well. God has made them in the image of His own perfection; nobody wants to be reminded how hard it is to reconcile the undeniable existence of evil - despite the protestations of Christian Science - with His all-powerfulness or His all-goodness. The Devil would be the best way out as an excuse for God; in that way he would be playing the same part as an agent of economic discharge as the Jew does in the world of the Aryan ideal. But even so, one can hold God responsible for the existence of the Devil just as well as for the existence of the wickedness which the Devil embodies. In view of these difficulties, each of us will be well advised, on some suitable occasion, to make a low bow to the deeply moral nature of mankind; it will help us to be generally popular and much will be forgiven us for it.¹

[1930a, 4510]

The name 'libido' can once more be used to denote the manifestations of the power of Eros in order to distinguish them from the energy of the death instinct.¹ It must be confessed that we have much greater difficulty in grasping that instinct; we can only suspect it, as it were, as something in the background behind Eros, and it escapes detection unless its presence is betrayed by its being alloyed with Eros. It is in sadism, where the death instinct twists the erotic aim in its own sense and yet at the same time fully satisfies the erotic urge, that we succeed in obtaining the clearest insight into its nature and its relation to Eros. But even where it emerges without any sexual purpose, in the blindest fury of destructiveness, we cannot fail to recognize that the satisfaction of the instinct is accompanied by an extraordinarily high degree of narcissistic enjoyment, owing to its presenting the ego with a fulfilment of the latter's old wishes for omnipotence. The instinct of destruction, moderated and tamed, and, as it were, inhibited in its aim, must, when it is directed towards objects, provide the ego with the satisfaction of its vital needs and with control over nature. Since the assumption of the existence of the instinct is mainly based on theoretical grounds, we must also admit that it is not entirely proof against theoretical objections. But this is how things appear to us now, in the present state of our knowledge; future research and reflection will no doubt bring further light which will decide the matter.

[1930a, 4511]
There is, as we think, no doubt about the origin of this unconscious need for punishment. It behaves like a piece of conscience, like a prolongation of our conscience into the unconscious; and it must have the same origin as conscience and correspond, therefore, to a piece of aggressiveness that has been internalized and taken over by the super-ego. If only the words went together better, we should be justified for all practical purposes in calling it an 'unconscious sense of guilt'. Theoretically we are in fact in doubt whether we should suppose that all the aggressiveness that has returned from the external world is bound by the super-ego and accordingly turned against the ego, or that a part of it is carrying on its mute and uncanny activity as a free destructive instinct in the ego and the id. A distribution of the latter kind is the more probable; but we know nothing more about it. There is no doubt that, when the super-ego was first instituted, in equipping that agency use was made of the piece of the child's aggressiveness towards his parents for which he was unable to effect a discharge outwards on account of his erotic fixation as well as of external difficulties; and for that reason the severity of the super-ego need not simply correspond to the strictness of the upbringing. It is very possible that, when there are later occasions for suppressing aggressiveness, the instinct may take the same path that was opened to it at that decisive point of time.

[1933a, 4713]

So long as that instinct operates internally, as a death instinct, it remains silent; it only comes to our notice when it is diverted outwards as an instinct of destruction. It seems to be essential for the preservation of the individual that this diversion should occur; the muscular apparatus serves this purpose. When the super-ego is established, considerable amounts of the aggressive instinct are fixated in the interior of the ego and operate there self-destructively. This is one of the dangers to health by which human beings are faced on their path to cultural development. Holding back aggressiveness is in general unhealthy and leads to illness (to mortification). A person in a fit of rage will often demonstrate how the transition from aggressiveness that has been prevented to self-destructiveness is brought about by diverting the aggressiveness against himself: he tears his hair or beats his face with his fists, though he would evidently have preferred to apply this treatment to someone else. Some portion of self-destructiveness remains within, whatever the circumstances; till at last it succeeds in killing the individual, not, perhaps, until his libido has been used up or fixated in a disadvantageous way. Thus it may in general be suspected that the individual dies of his internal conflicts but that the species dies of its unsuccessful struggle against the external world if the latter changes in a fashion which cannot be adequately dealt with by the adaptations which the species has acquired.

[1940a [1938], 4961]
Recognition of Two Classes of Instincts in Mental Life. - Though psycho-analysis endeavours as a rule to develop its theories as independently as possible from those of other sciences, it is nevertheless obliged to seek a basis for the theory of the instincts in biology. On the ground of a far-reaching consideration of the processes which go to make up life and which lead to death, it becomes probable that we should recognize the existence of two classes of instincts, corresponding to the contrary processes of construction and dissolution in the organism. On this view, the one set of instincts, which work essentially in silence, would be those which follow the aim of leading the living creature to death and therefore deserve to be called the ‘death instincts'; these would be directed outwards as the result of the combination of numbers of unicellular elementary organisms, and would manifest themselves as destructiveness or aggressive impulses. The other set of instincts would be those which are better known to us in analysis - the libidinal, sexual or life instincts, which are best comprised under the name of Eros; their purpose would be to form living substance into ever greater unities, so that life may be prolonged and brought to higher development. The erotic instincts and the death instincts would be present in living beings in regular mixtures or fusions; but 'defusions' would also be liable to occur. Life would consist in the manifestations of the conflict or interaction between the two classes of instincts; death would mean for the individual the victory of the destructive instincts, but reproduction would mean for him the victory of Eros.
[1923a, 3934]

This hypothesis throws no light whatever upon the manner in which the two classes of instincts are fused, blended, and alloyed with each other; but that this takes place regularly and very extensively is an assumption indispensable to our conception. It appears that, as a result of the combination of unicellular organisms into multicellular forms of life, the death instinct of the single cell can successfully be neutralized and the destructive impulses be diverted on to the external world through the instrumentality of a special organ. This special organ would seem to be the muscular apparatus; and the death instinct would thus seem to express itself - though probably only in part - as an instinct of destruction directed against the external world and other organisms.
[1923b, 3975]

¹ In fact, on our view it is through the agency of Eros that the destructive instincts that are directed towards the external world have been diverted from the self.
[1923b, 3980]

The dangerous death instincts are dealt with in the individual in various ways: in part they are rendered harmless by being fused with erotic components, in part they are diverted towards the external world in the form of aggression, while to a large extent they undoubtedly continue their internal work unhindered. How is it then that in melancholia the super-ego can become a kind of gathering-place for the death instincts?
[1923b, 3988]
The inadequacy of this explanation is seen, however, in the fact that it throws no light on the regular and close connections of masochism with its counterpart in instinctual life, sadism. If we go back a little further, to our hypothesis of the two classes of instincts which we regard as operative in the living organism, we arrive at another derivation of masochism, which, however, is not in contradiction with the former one. In (multicellular) organisms the libido meets the instinct of death, or destruction, which is dominant in them and which seeks to disintegrate the cellular organism and to conduct each separate unicellular organism into a state of inorganic stability (relative though this may be). The libido has the task of making the destroying instinct innocuous, and it fulfils the task by diverting that instinct to a great extent outwards - soon with the help of a special organic system, the muscular apparatus - towards objects in the external world. The instinct is then called the destructive instinct, the instinct for mastery, or the will to power. A portion of the instinct is placed directly in the service of the sexual function, where it has an important part to play. This is sadism proper. Another portion does not share in this transposition outwards; it remains inside the organism and, with the help of the accompanying sexual excitation described above, becomes libidinally bound there. It is in this portion that we have to recognize the original, erotogenic masochism.

[1924c, 4075]

If one is prepared to overlook a little inexactitude, it may be said that the death instinct which is operative in the organism - primal sadism - is identical with masochism. After the main portion of it has been transposed outwards on to objects, there remains inside, as a residuum of it, the erotogenic masochism proper, which on the one hand has become a component of the libido and, on the other, still has the self as its object. This masochism would thus be evidence of, and a remainder from, the phase of development in which the coalescence, which is so important for life, between the death instinct and Eros took place. We shall not be surprised to hear that in certain circumstances the sadism, or instinct of destruction, which has been directed outwards, projected, can be once more introjected, turned inwards, and in this way regress to its earlier situation. If this happens, a secondary masochism is produced, which is added to the original masochism.

[1924c, 4076]

Thus moral masochism becomes a classical piece of evidence for the existence of fusion of instinct. Its danger lies in the fact that it originates from the death instinct and corresponds to the part of that instinct which has escaped being turned outwards as an instinct of destruction. But since, on the other hand, it has the significance of an erotic component, even the subject's destruction of himself cannot take place without libidinal satisfaction.

[1924c, 4082]
Every analyst will admit that even to-day this view has not the sound of a long-discarded error. Nevertheless, alterations in it became essential, as our enquiries advanced from the repressed to the repressing forces, from the object-instincts to the ego. The decisive step forward was the introduction of the concept of narcissism - that is to say, the discovery that the ego itself is cathected with libido, that the ego, indeed, is the libido's original home, and remains to some extent its headquarters. This narcissistic libido turns towards objects, and thus becomes object-libido; and it can change back into narcissistic libido once more. The concept of narcissism made it possible to obtain an analytic understanding of the traumatic neuroses and of many of the affections bordering on the psychoses, as well as of the latter themselves. It was not necessary to give up our interpretation of the transference neuroses as attempts made by the ego to defend itself against sexuality; but the concept of libido was endangered. Since the ego-instincts, too, were libidinal, it seemed for a time inevitable that we should make libido coincide with instinctual energy in general, as C. G. Jung had already advocated earlier. Nevertheless, there still remained in me a kind of conviction, for which I was not as yet able to find reasons, that the instincts could not all be of the same kind. My next step was taken in Beyond the Pleasure Principle (1920g), when the compulsion to repeat and the conservative character of instinctual life first attracted my attention. Starting from speculations on the beginning of life and from biological parallels, I drew the conclusion that, besides the instinct to preserve living substance and to join it into ever larger units,¹ there must exist another, contrary instinct seeking to dissolve those units and to bring them back to their primaeval, inorganic state. That is to say, as well as Eros there was an instinct of death. The phenomena of life could be explained from the concurrent or mutually opposing action of these two instincts. It was not easy, however, to demonstrate the activities of this supposed death instinct. The manifestations of Eros were conspicuous and noisy enough. It might be assumed that the death instinct operated silently within the organism towards its dissolution, but that, of course, was no proof. A more fruitful idea was that a portion of the instinct is diverted towards the external world and comes to light as an instinct of aggressiveness and destructiveness. In this way the instinct itself could be pressed into the service of Eros, in that the organism was destroying some other thing, whether animate or inanimate, instead of destroying its own self. Conversely, any restriction of this aggressiveness directed outwards would be bound to increase the self-destruction, which is in any case proceeding. At the same time one can suspect from this example that the two kinds of instinct seldom - perhaps never - appear in isolation from each other, but are alloyed with each other in varying and very different proportions and so become unrecognizable to our judgement. In sadism, long since known to us as a component instinct of sexuality, we should have before us a particularly strong alloy of this kind between trends of love and the destructive instinct; while its counterpart, masochism, would be a union between destructiveness directed inwards and sexuality - a union which makes what is otherwise an imperceptible trend into a conspicuous and tangible one.

[1930a, 4509]
Let us go back to the special problem presented to us by masochism. If for a moment we leave its erotic components on one side, it affords us a guarantee of the existence of a trend that has self-destruction as its aim. If it is true of the destructive instinct as well that the ego - but what we have in mind here is rather the id, the whole person - originally includes all the instinctual impulses, we are led to the view that masochism is older than sadism, and that sadism is the destructive instinct directed outwards, thus acquiring the characteristic of aggressiveness. A certain amount of the original destructive instinct may still remain in the interior. It seems that we can only perceive it under two conditions: if it is combined with erotic instincts into masochism or if - with a greater or lesser erotic addition - it is directed against the external world as aggressiveness. And now we are struck by the significance of the possibility that the aggressiveness may not be able to find satisfaction in the external world because it comes up against real obstacles. If this happens, it will perhaps retreat and increase the amount of self-destructiveness holding sway in the interior. We shall hear how this is in fact what occurs and how important a process this is. Impeded aggressiveness seems to involve a grave injury. It really seems as though it is necessary for us to destroy some other thing or person in order not to destroy ourselves, in order to guard against the impulsion to self-destruction. A sad disclosure indeed for the moralist!

I fear I may be abusing your interest, which is after all concerned with the prevention of war and not with our theories. Nevertheless I should like to linger for a moment over our destructive instinct, whose popularity is by no means equal to its importance. As a result of a little speculation, we have come to suppose that this instinct is at work in every living creature and is striving to bring it to ruin and to reduce life to its original condition of inanimate matter. Thus it quite seriously deserves to be called a death instinct, while the erotic instincts represent the effort to live. The death instinct turns into the destructive instinct when, with the help of special organs, it is directed outwards, on to objects. The organism preserves its own life, so to say, by destroying an extraneous one. Some portion of the death instinct, however, remains operative within the organism, and we have sought to trace quite a number of normal and pathological phenomena to this internalization of the destructive instinct. We have even been guilty of the heresy of attributing the origin of conscience to this diversion inwards of aggressiveness. You will notice that it is by no means a trivial matter if this process is carried too far: it is positively unhealthy. On the other hand if these forces are turned to destruction in the external world, the organism will be relieved and the effect must be beneficial. This would serve as a biological justification for all the ugly and dangerous impulses against which we are struggling. It must be admitted that they stand nearer to Nature than does our resistance to them for which an explanation also needs to be found. It may perhaps seem to you as though our theories are a kind of mythology and, in the present case, not even an agreeable one. But does not every science come in the end to a kind of mythology like this? Cannot the same be said to-day of your own Physics?

[1933a, 4709]

[1933b, 4800]
Recognition of Two Classes of Instincts in Mental Life. - Though psycho-analysis endeavours as a rule to develop its theories as independently as possible from those of other sciences, it is nevertheless obliged to seek a basis for the theory of the instincts in biology. On the ground of a far-reaching consideration of the processes which go to make up life and which lead to death, it becomes probable that we should recognize the existence of two classes of instincts, corresponding to the contrary processes of construction and dissolution in the organism. On this view, the one set of instincts, which work essentially in silence, would be those which follow the aim of leading the living creature to death and therefore deserve to be called the 'death instincts'; these would be directed outwards as the result of the combination of numbers of unicellular elementary organisms, and would manifest themselves as destructive or aggressive impulses. The other set of instincts would be those which are better known to us in analysis - the libidinal, sexual or life instincts, which are best comprised under the name of Eros; their purpose would be to form living substance into ever greater unities, so that life may be prolonged and brought to higher development. The erotic instincts and the death instincts would be present in living beings in regular mixtures or fusions; but 'defusions' would also be liable to occur. Life would consist in the manifestations of the conflict or interaction between the two classes of instincts; death would mean for the individual the victory of the destructive instincts, but reproduction would mean for him the victory of Eros.

[1923a, 3934]

This hypothesis throws no light whatever upon the manner in which the two classes of instincts are fused, blended, and alloyed with each other; but that this takes place regularly and very extensively is an assumption indispensable to our conception. It appears that, as a result of the combination of unicellular organisms into multicellular forms of life, the death instinct of the single cell can successfully be neutralized and the destructive impulses be diverted on to the external world through the instrumentality of a special organ. This special organ would seem to be the muscular apparatus; and the death instinct would thus seem to express itself - though probably only in part - as an instinct of destruction directed against the external world and other organisms.

[1923b, 3975]

One such fact there appears to be. For the opposition between the two classes of instincts we may put the polarity of love and hate. There is no difficulty in finding a representative of Eros; but we must be grateful that we can find a representative of the elusive death instinct in the instinct of destruction, to which hate points the way. Now, clinical observation shows not only that love is with unexpected regularity accompanied by hate (ambivalence), and not only that in human relationships hate is frequently a forerunner of love, but also that in a number of circumstances hate changes into love and love into hate. If this change is more than a mere succession in time - if, that is, one of them actually turns into the other - then clearly the ground is cut away from under a distinction so fundamental as that between erotic instincts and death instincts, one which presupposes physiological processes running in opposite directions.

[1923b, 3976]

Over and over again we find, when we are able to trace instinctual impulses back, that they reveal themselves as derivatives of Eros. If it were not for the considerations put forward in Beyond the Pleasure Principle, and ultimately for the sadistic constituents which have attached themselves to Eros, we should have difficulty in holding to our fundamental dualistic point of view. But since we cannot escape that view, we are driven to conclude that the death instincts are by their nature mute and that the clamour of life proceeds for the most part from Eros.¹

[1923b, 3980]
Every analyst will admit that even to-day this view has not the sound of a long-discarded error. Nevertheless, alterations in it became essential, as our enquiries advanced from the repressed to the repressing forces, from the object-instincts to the ego. The decisive step forward was the introduction of the concept of narcissism - that is to say, the discovery that the ego itself is cathexed with libido, that the ego, indeed, is the libido's original home, and remains to some extent its headquarters. This narcissistic libido turns towards objects, and thus becomes object-libido; and it can change back into narcissistic libido once more. The concept of narcissism made it possible to obtain an analytic understanding of the traumatic neuroses and of many of the affections bordering on the psychoses, as well as of the latter themselves. It was not necessary to give up our interpretation of the transference neuroses as attempts made by the ego to defend itself against sexuality; but the concept of libido was endangered. Since the ego-instincts, too, were libidinal, it seemed for a time inevitable that we should make libido coincide with instinctual energy in general, as C. G. Jung had already advocated earlier. Nevertheless, there still remained in me a kind of conviction, for which I was not as yet able to find reasons, that the instincts could not all be of the same kind. My next step was taken in Beyond the Pleasure Principle (1920), when the compulsion to repeat and the conservative character of instinctual life first attracted my attention. Starting from speculations on the beginning of life and from biological parallels, I drew the conclusion that, besides the instinct to preserve living substance and to join it into ever larger units,¹ there must exist another, contrary instinct seeking to dissolve those units and to bring them back to their primaeval, inorganic state. That is to say, as well as Eros there was an instinct of death. The phenomena of life could be explained from the concurrent or mutually opposing action of these two instincts. It was not easy, however, to demonstrate the activities of this supposed death instinct. The manifestations of Eros were conspicuous and noisy enough. It might be assumed that the death instinct operated silently within the organism towards its dissolution, but that, of course, was no proof. A more fruitful idea was that a portion of the instinct is diverted towards the external world and comes to light as an instinct of aggressiveness and destructiveness. In this way the instinct itself could be pressed into the service of Eros, in that the organism was destroying some other thing, whether animate or inanimate, instead of destroying its own self. Conversely, any restriction of this aggressiveness directed outwards would be bound to increase the self-destruction, which is in any case proceeding. At the same time one can suspect from this example that the two kinds of instinct seldom - perhaps never - appear in isolation from each other, but are alloyed with each other in varying and very different proportions and so become unrecognizable to our judgement. In sadism, long since known to us as a component instinct of sexuality, we should have before us a particularly strong alloy of this kind between trends of love and the destructive instinct; while its counterpart, masochism, would be a union between destructiveness directed inwards and sexuality - a union which makes what is otherwise an imperceptible trend into a conspicuous and tangible one.  

[1930a, 4509]
Let us go back to the special problem presented to us by masochism. If for a moment we leave its erotic components on one side, it affords us a guarantee of the existence of a trend that has self-destruction as its aim. If it is true of the destructive instinct as well that the ego - but what we have in mind here is rather the id, the whole person - originally includes all the instinctual impulses, we are led to the view that masochism is older than sadism, and that sadism is the destructive instinct directed outwards, thus acquiring the characteristic of aggressiveness. A certain amount of the original destructive instinct may still remain in the interior. It seems that we can only perceive it under two conditions: if it is combined with erotic instincts into masochism or if - with a greater or lesser erotic addition - it is directed against the external world as aggressiveness. And now we are struck by the significance of the possibility that the aggressiveness may not be able to find satisfaction in the external world because it comes up against real obstacles. If this happens, it will perhaps retreat and increase the amount of self-destructiveness holding sway in the interior. We shall hear how this is in fact what occurs and how important a process this is. Impeded aggressiveness seems to involve a grave injury. It really seems as though it is necessary for us to destroy some other thing or person in order not to destroy ourselves, in order to guard against the impulse to self-destruction. A sad disclosure indeed for the moralist!

[1933a, 4709]

You may perhaps shrug your shoulders and say: 'That isn't natural science, it's Schopenhauer's philosophy!' But, Ladies and Gentlemen, why should not a bold thinker have guessed something that is afterwards confirmed by sober and painstaking detailed research? Moreover, there is nothing that has not been said already, and similar things had been said by many people before Schopenhauer. Furthermore, what we are saying is not even genuine Schopenhauer. We are not asserting that death is the only aim of life; we are not overlooking the fact that there is life as well as death. We recognize two basic instincts and give each of them its own aim. How the two of them are mingled in the process of living, how the death instinct is made to serve the purposes of Eros, especially by being turned outwards as aggressiveness - these are tasks which are left to future investigation. We have not gone beyond the point at which this prospect lies open before us. The question, too, of whether the conservative character may not belong to all instincts without exception, whether the erotic instincts as well may not be seeking to bring back an earlier state of things when they strive to bring about a synthesis of living things into greater unities - this question, too, we must leave unanswered.

[1933a, 4711]

So long as that instinct operates internally, as a death instinct, it remains silent; it only comes to our notice when it is diverted outwards as an instinct of destruction. It seems to be essential for the preservation of the individual that this diversion should occur; the muscular apparatus serves this purpose. When the super-ego is established, considerable amounts of the aggressive instinct are fixated in the interior of the ego and operate there self-destructively. This is one of the dangers to health by which human beings are faced on their path to cultural development. Holding back aggressiveness is in general unhealthy and leads to illness (to mortification). A person in a fit of rage will often demonstrate how the transition from aggressiveness that has been prevented to self-destructiveness is brought about by diverting the aggressiveness against himself: he tears his hair or beats his face with his fists, though he would evidently have preferred to apply this treatment to someone else. Some portion of self-destructiveness remains within, whatever the circumstances; till at last it succeeds in killing the individual, not, perhaps, until his libido has been used up or fixated in a disadvantageous way. Thus it may in general be suspected that the individual dies of his internal conflicts but that the species dies of its unsuccessful struggle against the external world if the latter changes in a fashion which cannot be adequately dealt with by the adaptations which the species has acquired.

[1940a [1938], 4961]
This hypothesis throws no light whatever upon the manner in which the two classes of instincts are fused, blended, and alloyed with each other; but that this takes place regularly and very extensively is an assumption indispensable to our conception. It appears that, as a result of the combination of unicellular organisms into multicellular forms of life, the death instinct of the single cell can successfully be neutralized and the destructive impulses be diverted on to the external world through the instrumentality of a special organ. This special organ would seem to be the muscular apparatus; and the death instinct would thus seem to express itself - though probably only in part - as an instinct of destruction directed against the external world and other organisms.

[1923b, 3975]

The dangerous death instincts are dealt with in the individual in various ways: in part they are rendered harmless by being fused with erotic components, in part they are diverted towards the external world in the form of aggression, while to a large extent they undoubtedly continue their internal work unhindered. How is it then that in melancholia the super-ego can become a kind of gathering-place for the death instincts?

[1923b, 3988]

Thus moral masochism becomes a classical piece of evidence for the existence of fusion of instinct. Its danger lies in the fact that it originates from the death instinct and corresponds to the part of that instinct which has escaped being turned outwards as an instinct of destruction. But since, on the other hand, it has the significance of an erotic component, even the subject’s destruction of himself cannot take place without libidinal satisfaction.

[1924c, 4082]
Every analyst will admit that even to-day this view has not the sound of a long-discarded error. Nevertheless, alterations in it became essential, as our enquiries advanced from the repressed to the repressing forces, from the object-instincts to the ego. The decisive step forward was the introduction of the concept of narcissism - that is to say, the discovery that the ego itself is cathexed with libido, that the ego, indeed, is the libido's original home, and remains to some extent its headquarters. This narcissistic libido turns towards objects, and thus becomes object-libido; and it can change back into narcissistic libido once more. The concept of narcissism made it possible to obtain an analytic understanding of the traumatic neuroses and of many of the affections bordering on the psychoses, as well as of the latter themselves. It was not necessary to give up our interpretation of the transference neuroses as attempts made by the ego to defend itself against sexuality; but the concept of libido was endangered. Since the ego-instincts, too, were libidinal, it seemed for a time inevitable that we should make libido coincide with instinctual energy in general, as C. G. Jung had already advocated earlier. Nevertheless, there still remained in me a kind of conviction, for which I was not as yet able to find reasons, that the instincts could not all be of the same kind. My next step was taken in Beyond the Pleasure Principle (1920g), when the compulsion to repeat and the conservative character of instinctual life first attracted my attention. Starting from speculations on the beginning of life and from biological parallels, I drew the conclusion that, besides the instinct to preserve living substance and to join it into ever larger units,¹ there must exist another, contrary instinct seeking to dissolve those units and to bring them back to their primaeval, inorganic state. That is to say, as well as Eros there was an instinct of death. The phenomena of life could be explained from the concurrent or mutually opposing action of these two instincts. It was not easy, however, to demonstrate the activities of this supposed death instinct. The manifestations of Eros were conspicuous and noisy enough. It might be assumed that the death instinct operated silently within the organism towards its dissolution, but that, of course, was no proof. A more fruitful idea was that a portion of the instinct is diverted towards the external world and comes to light as an instinct of aggressiveness and destructiveness. In this way the instinct itself could be pressed into the service of Eros, in that the organism was destroying some other thing, whether animate or inanimate, instead of destroying its own self. Conversely, any restriction of this aggressiveness directed outwards would be bound to increase the self-destruction, which is in any case proceeding. At the same time one can suspect from this example that the two kinds of instinct seldom - perhaps never - appear in isolation from each other, but are alloyed with each other in varying and very different proportions and so become unrecognizable to our judgement. In sadism, long since known to us as a component instinct of sexuality, we should have before us a particularly strong alloy of this kind between trends of love and the destructive instinct; while its counterpart, masochism, would be a union between destructiveness directed inwards and sexuality - a union which makes what is otherwise an imperceptible trend into a conspicuous and tangible one.

[1930a, 4509]
Let us go back to the special problem presented to us by masochism. If for a moment we leave its erotic components on one side, it affords us a guarantee of the existence of a trend that has self-destruction as its aim. If it is true of the destructive instinct as well that the ego - but what we have in mind here is rather the id, the whole person - originally includes all the instinctual impulses, we are led to the view that masochism is older than sadism, and that sadism is the destructive instinct directed outwards, thus acquiring the characteristic of aggressiveness. A certain amount of the original destructive instinct may still remain in the interior. It seems that we can only perceive it under two conditions: if it is combined with erotic instincts into masochism or if - with a greater or lesser erotic addition - it is directed against the external world as aggressiveness. And now we are struck by the significance of the possibility that the aggressiveness may not be able to find satisfaction in the external world because it comes up against real obstacles. If this happens, it will perhaps retreat and increase the amount of self-destructiveness holding sway in the interior. We shall hear how this is in fact what occurs and how important a process this is. Impeded aggressiveness seems to involve a grave injury. It really seems as though it is necessary for us to destroy some other thing or person in order not to destroy ourselves, in order to guard against the impulsion to self-destruction. A sad disclosure indeed for the moralist!

I fear I may be abusing your interest, which is after all concerned with the prevention of war and not with our theories. Nevertheless I should like to linger for a moment over our destructive instinct, whose popularity is by no means equal to its importance. As a result of a little speculation, we have come to suppose that this instinct is at work in every living creature and is striving to bring it to ruin and to reduce life to its original condition of inanimate matter. Thus it quite seriously deserves to be called a death instinct, while the erotic instincts represent the effort to live. The death instinct turns into the destructive instinct when, with the help of special organs, it is directed outwards, on to objects. The organism preserves its own life, so to say, by destroying an extraneous one. Some portion of the death instinct, however, remains operative within the organism, and we have sought to trace quite a number of normal and pathological phenomena to this internalization of the destructive instinct. We have even been guilty of the heresy of attributing the origin of conscience to this diversion inwards of aggressiveness. You will notice that it is by no means a trivial matter if this process is carried too far: it is positively unhealthy. On the other hand if these forces are turned to destruction in the external world, the organism will be relieved and the effect must be beneficial. This would serve as a biological justification for all the ugly and dangerous impulses against which we are struggling. It must be admitted that they stand nearer to Nature than does our resistance to them for which an explanation also needs to be found. It may perhaps seem to you as though our theories are a kind of mythology and, in the present case, not even an agreeable one. But does not every science come in the end to a kind of mythology like this? Cannot the same be said to-day of your own Physics?

[1933a, 4709]

[1933b, 4800]
So long as that instinct operates internally, as a death instinct, it remains silent; it only comes to our notice when it is diverted outwards as an instinct of destruction. It seems to be essential for the preservation of the individual that this diversion should occur; the muscular apparatus serves this purpose. When the super-ego is established, considerable amounts of the aggressive instinct are fixated in the interior of the ego and operate there self-destructively. This is one of the dangers to health by which human beings are faced on their path to cultural development. Holding back aggressiveness is in general unhealthy and leads to illness (to mortification). A person in a fit of rage will often demonstrate how the transition from aggressiveness that has been prevented to self-destructiveness is brought about by diverting the aggressiveness against himself: he tears his hair or beats his face with his fists, though he would evidently have preferred to apply this treatment to someone else. Some portion of self-destructiveness remains within, whatever the circumstances; till at last it succeeds in killing the individual, not, perhaps, until his libido has been used up or fixated in a disadvantageous way. Thus it may in general be suspected that the individual dies of his internal conflicts but that the species dies of its unsuccessful struggle against the external world if the latter changes in a fashion which cannot be adequately dealt with by the adaptations which the species has acquired.

[1940a [1938], 4961]
This hypothesis throws no light whatever upon the manner in which the two classes of instincts are fused, blended, and alloyed with each other; but that this takes place regularly and very extensively is an assumption indispensable to our conception. It appears that, as a result of the combination of unicellular organisms into multicellular forms of life, the death instinct of the single cell can successfully be neutralized and the destructive impulses be diverted on to the external world through the instrumentality of a special organ. This special organ would seem to be the muscular apparatus; and the death instinct would thus seem to express itself - though probably only in part - as an instinct of destruction directed against the external world and other organisms.

[1923b, 3975]

The inadequacy of this explanation is seen, however, in the fact that it throws no light on the regular and close connections of masochism with its counterpart in instinctual life, sadism. If we go back a little further, to our hypothesis of the two classes of instincts which we regard as operative in the living organism, we arrive at another derivation of masochism, which, however, is not in contradiction with the former one. In (multicellular) organisms the libido meets the instinct of death, or destruction, which is dominant in them and which seeks to disintegrate the cellular organism and to conduct each separate unicellular organism into a state of inorganic stability (relative though this may be). The libido has the task of making the destroying instinct innocuous, and it fulfils the task by diverting that instinct to a great extent outwards - soon with the help of a special organic system, the muscular apparatus - towards objects in the external world. The instinct is then called the destructive instinct, the instinct for mastery, or the will to power. A portion of the instinct is placed directly in the service of the sexual function, where it has an important part to play. This is sadism proper. Another portion does not share in this transposition outwards; it remains inside the organism and, with the help of the accompanying sexual excitation described above, becomes libidinally bound there. It is in this portion that we have to recognize the original, erotogenic masochism.

[1924c, 4075]

So long as that instinct operates internally, as a death instinct, it remains silent; it only comes to our notice when it is diverted outwards as an instinct of destruction. It seems to be essential for the preservation of the individual that this diversion should occur; the muscular apparatus serves this purpose. When the super-ego is established, considerable amounts of the aggressive instinct are fixated in the interior of the ego and operate there self-destructively. This is one of the dangers to health by which human beings are faced on their path to cultural development. Holding back aggressiveness is in general unhealthy and leads to illness (to mortification). A person in a fit of rage will often demonstrate how the transition from aggressiveness that has been prevented to self-destructiveness is brought about by diverting the aggressiveness against himself: he tears his hair or beats his face with his fists, though he would evidently have preferred to apply this treatment to someone else. Some portion of self-destructiveness remains within, whatever the circumstances; till at last it succeeds in killing the individual, not, perhaps, until his libido has been used up or fixated in a disadvantageous way. Thus it may in general be suspected that the individual dies of his internal conflicts but that the species dies of its unsuccessful struggle against the external world if the latter changes in a fashion which cannot be adequately dealt with by the adaptations which the species has acquired.

[1940a [1938], 4961]
As regards active algolagnia, sadism, the roots are easy to detect in the normal. The sexuality of most male human beings contains an element of aggressiveness - a desire to subjugate; the biological significance of it seems to lie in the need for overcoming the resistance of the sexual object by means other than the process of wooing. Thus sadism would correspond to an aggressive component of the sexual instinct which has become independent and exaggerated and, by displacement, has usurped the leading position.

(b) If we wish to bring our hypothesis into contact with biological lines of thought, we must not forget that the antithesis between male and female, which is introduced by the reproductive function, cannot be present as yet at the stage of pregenital object-choice. We find in its place the antithesis between trends with an active and with a passive aim, an antithesis which later becomes firmly attached to that between the sexes. Activity is supplied by the common instinct of mastery, which we call sadism when we find it in the service of the sexual function; and even in fully developed normal sexual life it has important subsidiary services to perform. The passive trend is fed by anal erotism, whose erotogenic zone corresponds to the old, undifferentiated cloaca. A stressing of this anal erotism in the pregenital stage of organization leaves behind a significant predisposition to homosexuality in men when the next stage of the sexual function, the primacy of the genitals, is reached. The way in which this last phase is erected upon the preceding one and the accompanying remoulding of the libidinal catheaxes present analytic research with the most interesting problems.

The inadequacy of this explanation is seen, however, in the fact that it throws no light on the regular and close connections of masochism with its counterpart in instinctual life, sadism. If we go back a little further, to our hypothesis of the two classes of instincts which we regard as operative in the living organism, we arrive at another derivation of masochism, which, however, is not in contradiction with the former one. In (multicellular) organisms the libido meets the instinct of death, or destruction, which is dominant in them and which seeks to disintegrate the cellular organism and to conduct each separate unicellular organism into a state of inorganic stability (relative though this may be). The libido has the task of making the destroying instinct innocuous, and it fulfils the task by diverting that instinct to a great extent outwards - soon with the help of a special organic system, the muscular apparatus - towards objects in the external world. The instinct is then called the destructive instinct, the instinct for mastery, or the will to power. A portion of the instinct is placed directly in the service of the sexual function, where it has an important part to play. This is sadism proper. Another portion does not share in this transposition outwards; it remains inside the organism and, with the help of the accompanying sexual excitation described above, becomes libidinally bound there. It is in this portion that we have to recognize the original, erotogenic masochism.
It is not my intention to pursue the further behaviour of femininity through puberty to the period
of maturity. Our knowledge, moreover, would be insufficient for the purpose. But I will bring a
few features together in what follows. Taking its prehistory as a starting-point, I will only
emphasize here that the development of femininity remains exposed to disturbance by the
residual phenomena of the early masculine period. Regressions to the fixations of the pre-
Oedipus phases very frequently occur; in the course of some women's lives there is a repeated
alternation between periods in which masculinity or femininity gains the upper hand. Some
portion of what we men call 'the enigma of women' may perhaps be derived from this
expression of bisexuality in women's lives. But another question seems to have become ripe for
judgement in the course of these researches. We have called the motive force of sexual life 'the
libido'. Sexual life is dominated by the polarity of masculine-feminine; thus the notion suggests
itself of considering the relation of the libido to this antithesis. It would not be surprising if it were
to turn out that each sexuality had its own special libido appropriated to it, so that one sort of
libido would pursue the aims of a masculine sexual life and another sort those of a feminine
one. But nothing of the kind is true. There is only one libido, which serves both the masculine
and the feminine sexual functions. To it itself we cannot assign any sex; if, following the
conventional equation of activity and masculinity, we are inclined to describe it as masculine, we
must not forget that it also covers trends with a passive aim. Nevertheless the juxtaposition
'feminine libido' is without any justification. Furthermore, it is our impression that more constraint
has been applied to the libido when it is pressed into the service of the feminine function, and
that - to speak teleologically - Nature takes less careful account of its demands than in the case
of masculinity. And the reason for this may lie - thinking once again teleologically - in the fact
that the accomplishment of the aim of biology has been entrusted to the aggressiveness of men
and has been made to some extent independent of women's consent.
[1933a, 4733]

According to our hypothesis human instincts are of only two kinds: those which seek to
preserve and unite - which we call 'erotic', exactly in the sense in which Plato uses the word
'Eros' in his Symposium, or 'sexual', with a deliberate extension of the popular conception of
'sexuality' - and those which seek to destroy and kill and which we group together as the
aggressive or destructive instinct. As you see, this is in fact no more than a theoretical
clarification of the universally familiar opposition between Love and Hate which may perhaps
have some fundamental relation to the polarity of attraction and repulsion that plays a part in
your own field of knowledge. But we must not be too hasty in introducing ethical judgements of
good and evil. Neither of these instincts is any less essential than the other; the phenomena of
life arise from the concurrent or mutually opposing action of both. Now it seems as though an
instinct of the one sort can scarcely ever operate in isolation; it is always accompanied - or, as
we say, alloyed - with a certain quota from the other side, which modifies its aim or is, in some
cases, what enables it to achieve that aim. Thus, for instance, the instinct of self-preservation is
certainly of an erotic kind, but it must nevertheless have aggressiveness at its disposal if it is to
fulfil its purpose. So, too, the instinct of love, when it is directed towards an object, stands in
need of some contribution from the instinct for mastery if it is in any way to obtain possession of
that object. The difficulty of isolating the two classes of instinct in their actual manifestations is
indeed what has so long prevented us from recognizing them.
[1933b, 4798]

Modifications in the proportions of the fusion between the instincts have the most tangible
results. A surplus of sexual aggressiveness will turn a lover into a sex-murderer, while a sharp
diminution in the aggressive factor will make him bashful or impotent.
[1940a [1938], 4960]
This hypothesis throws no light whatever upon the manner in which the two classes of
instincts are fused, blended, and alloyed with each other; but that this takes place regularly and
very extensively is an assumption indispensable to our conception. It appears that, as a result of
the combination of unicellular organisms into multicellular forms of life, the death instinct of the
single cell can successfully be neutralized and the destructive impulses be diverted on to the
external world through the instrumentality of a special organ. This special organ would seem to
be the muscular apparatus; and the death instinct would thus seem to express itself - though
probably only in part - as an instinct of destruction directed against the external world and other
organisms.
[1923b, 3975]

Every analyst will admit that even to-day this view has not the sound of a long-discarded error.
Nevertheless, alterations in it became essential, as our enquiries advanced from the repressed
to the repressing forces, from the object-instincts to the ego. The decisive step forward was the
introduction of the concept of narcissism - that is to say, the discovery that the ego itself is
cathedected with libido, that the ego, indeed, is the libido's original home, and remains to some
extent its headquarters. This narcissistic libido turns towards objects, and thus becomes object-
libido; and it can change back into narcissistic libido once more. The concept of narcissism
made it possible to obtain an analytic understanding of the traumatic neuroses and of many of
the affections bordering on the psychoses, as well as of the latter themselves. It was not
necessary to give up our interpretation of the transference neuroses as attempts made by the
ego to defend itself against sexuality; but the concept of libido was endangered. Since the ego-
instincts, too, were libidinal, it seemed for a time inevitable that we should make libido coincide
with instinctual energy in general, as C. G. Jung had already advocated earlier. Nevertheless,
there still remained in me a kind of conviction, for which I was not as yet able to find reasons,
that the instincts could not all be of the same kind. My next step was taken in Beyond the
Pleasure Principle (1920g), when the compulsion to repeat and the conservative character of
instinctual life first attracted my attention. Starting from speculations on the beginning of life and
from biological parallels, I drew the conclusion that, besides the instinct to preserve living
substance and to join it into ever larger units,¹ there must exist another, contrary instinct seeking
to dissolve those units and to bring them back to their primaeval, inorganic state. That is to say,
as well as Eros there was an instinct of death. The phenomena of life could be explained from
the concurrent or mutually opposing action of these two instincts. It was not easy, however, to
demonstrate the activities of this supposed death instinct. The manifestations of Eros were
conspicuous and noisy enough. It might be assumed that the death instinct operated silently
within the organism towards its dissolution, but that, of course, was no proof. A more fruitful idea
was that a portion of the instinct is diverted towards the external world and comes to light as an
instinct of aggressiveness and destructiveness. In this way the instinct itself could be pressed
into the service of Eros, in that the organism was destroying some other thing, whether animate
or inanimate, instead of destroying its own self. Conversely, any restriction of this
aggressiveness directed outwards would be bound to increase the self-destruction, which is in
any case proceeding. At the same time one can suspect from this example that the two kinds of
instinct seldom - perhaps never - appear in isolation from each other, but are alloyed with each
other in varying and very different proportions and so become unrecognizable to our judgement.
In sadism, long since known to us as a component instinct of sexuality, we should have before
us a particularly strong alloy of this kind between trends of love and the destructive instinct;
while its counterpart, masochism, would be a union between destructiveness directed inwards
and sexuality - a union which makes what is otherwise an imperceptible trend into a
conspicuous and tangible one.
[1930a, 4509]
The name 'libido' can once more be used to denote the manifestations of the power of Eros in order to distinguish them from the energy of the death instinct.¹ It must be confessed that we have much greater difficulty in grasping that instinct; we can only suspect it, as it were, as something in the background behind Eros, and it escapes detection unless its presence is betrayed by its being alloyed with Eros. It is in sadism, where the death instinct twists the erotic aim in its own sense and yet at the same time fully satisfies the erotic urge, that we succeed in obtaining the clearest insight into its nature and its relation to Eros. But even where it emerges without any sexual purpose, in the blindest fury of destructiveness, we cannot fail to recognize that the satisfaction of the instinct is accompanied by an extraordinarily high degree of narcissistic enjoyment, owing to its presenting the ego with a fulfilment of the latter's old wishes for omnipotence. The instinct of destruction, moderated and tamed, and, as it were, inhibited in its aim, must, when it is directed towards objects, provide the ego with the satisfaction of its vital needs and with control over nature. Since the assumption of the existence of the instinct is mainly based on theoretical grounds, we must also admit that it is not entirely proof against theoretical objections. But this is how things appear to us now, in the present state of our knowledge; future research and reflection will no doubt bring further light which will decide the matter.

[1930a, 4511]

Let us go back to the special problem presented to us by masochism. If for a moment we leave its erotic components on one side, it affords us a guarantee of the existence of a trend that has self-destruction as its aim. If it is true of the destructive instinct as well that the ego - but what we have in mind here is rather the id, the whole person - originally includes all the instinctual impulses, we are led to the view that masochism is older than sadism, and that sadism is the destructive instinct directed outwards, thus acquiring the characteristic of aggressiveness. A certain amount of the original destructive instinct may still remain in the interior. It seems that we can only perceive it under two conditions: if it is combined with erotic instincts into masochism or if - with a greater or lesser erotic addition - it is directed against the external world as aggressiveness. And now we are struck by the significance of the possibility that the aggressiveness may not be able to find satisfaction in the external world because it comes up against real obstacles. If this happens, it will perhaps retreat and increase the amount of self-destructiveness holding sway in the interior. We shall hear how this is in fact what occurs and how important a process this is. Impeded aggressiveness seems to involve a grave injury. It really seems as though it is necessary for us to destroy some other thing or person in order not to destroy ourselves, in order to guard against the impulsion to self-destruction. A sad disclosure indeed for the moralist!

[1933a, 4709]
It was not our intention at all events to produce such a result. Our argument had as its point of departure a sharp distinction between ego-instincts, which we equated with death instincts, and sexual instincts, which we equated with life instincts. (We were prepared at one stage to include the so-called self-preservation instincts of the ego among the death instincts; but we subsequently corrected ourselves on this point and withdrew it.) Our views have from the very first been dualistic, and to-day they are even more definitely dualistic than before - now that we describe the opposition as being, not between ego-instincts and sexual instincts but between life instincts and death instincts. Jung's libido theory is on the contrary monistic; the fact that he has called his one instinctual force 'libido' is bound to cause confusion, but need not affect us otherwise. We suspect that instincts other than those of self-preservation operate in the ego, and it ought to be possible for us to point to them. Unfortunately, however, the analysis of the ego has made so little headway that it is very difficult for us to do so. It is possible, indeed, that the libidinal instincts in the ego may be linked in a peculiar manner with these other ego-instincts which are still strange to us. Even before we had any clear understanding of narcissism, psycho-analysts had a suspicion that the 'ego-instincts' had libidinal components attached to them. But these are very uncertain possibilities, to which our opponents will pay very little attention. The difficulty remains that psycho-analysis has not enabled us hitherto to point to any instincts other than the libidinal ones. That, however, is no reason for our falling in with the conclusion that no others in fact exist.

I have lately developed a view of the instincts¹ which I shall here hold to and take as the basis of my further discussions. According to this view we have to distinguish two classes of instincts, one of which, the sexual instincts or Eros, is by far the more conspicuous and accessible to study. It comprises not merely the uninhibited sexual instinct proper and the instinctual impulses of an aim-inhibited or sublimated nature derived from it, but also the self-preservative instinct, which must be assigned to the ego and which at the beginning of our analytic work we had good reason for contrasting with the sexual object-instincts. The second class of instincts was not so easy to point to; in the end we came to recognize sadism as its representative. On the basis of theoretical considerations, supported by biology, we put forward the hypothesis of a death instinct, the task of which is to lead organic life back into the inanimate state; on the other hand, we supposed that Eros, by bringing about a more and more far-reaching combination of the particles into which living substance is dispersed, aims at complicating life and at the same time, of course, at preserving it. Acting in this way, both the instincts would be conservative in the strictest sense of the word, since both would be endeavouring to re-establish a state of things that was disturbed by the emergence of life. The emergence of life would thus be the cause of the continuance of life and also at the same time of the striving towards death; and life itself would be a conflict and compromise between these two trends. The problem of the origin of life would remain a cosmological one; and the problem of the goal and purpose of life would be answered dualistically.

One such fact there appears to be. For the opposition between the two classes of instincts we may put the polarity of love and hate. There is no difficulty in finding a representative of Eros; but we must be grateful that we can find a representative of the elusive death instinct in the instinct of destruction, to which hate points the way. Now, clinical observation shows not only that love is with unexpected regularity accompanied by hate (ambivalence), and not only that in human relationships hate is frequently a forerunner of love, but also that in a number of circumstances hate changes into love and love into hate. If this change is more than a mere succession in time - if, that is, one of them actually turns into the other - then clearly the ground is cut away from under a distinction so fundamental as that between erotic instincts and death instincts, one which presupposes physiological processes running in opposite directions.
Over and over again we find, when we are able to trace instinctual impulses back, that they reveal themselves as derivatives of Eros. If it were not for the considerations put forward in Beyond the Pleasure Principle, and ultimately for the sadistic constituents which have attached themselves to Eros, we should have difficulty in holding to our fundamental dualistic point of view. But since we cannot escape that view, we are driven to conclude that the death instincts are by their nature mute and that the clamour of life proceeds for the most part from Eros.¹

Every analyst will admit that even to-day this view has not the sound of a long-discarded error. Nevertheless, alterations in it became essential, as our enquiries advanced from the repressed to the repressing forces, from the object-instincts to the ego. The decisive step forward was the introduction of the concept of narcissism - that is to say, the discovery that the ego itself is cathected with libido, that the ego, indeed, is the libido's original home, and remains to some extent its headquarters. This narcissistic libido turns towards objects, and thus becomes object-libido; and it can change back into narcissistic libido once more. The concept of narcissism made it possible to obtain an analytic understanding of the traumatic neuroses and of many of the affections bordering on the psychoses, as well as of the latter themselves. It was not necessary to give up our interpretation of the transference neuroses as attempts made by the ego to defend itself against sexuality; but the concept of libido was endangered. Since the ego-instincts, too, were libidinal, it seemed for a time inevitable that we should make libido coincide with instinctual energy in general, as C. G. Jung had already advocated earlier. Nevertheless, there still remained in me a kind of conviction, for which I was not as yet able to find reasons, that the instincts could not all be of the same kind. My next step was taken in Beyond the Pleasure Principle (1920g), when the compulsion to repeat and the conservative character of instinctual life first attracted my attention. Starting from speculations on the beginning of life and from biological parallels, I drew the conclusion that, besides the instinct to preserve living substance and to join it into ever larger units,¹ there must exist another, contrary instinct seeking to dissolve those units and to bring them back to their primaeval, inorganic state. That is to say, as well as Eros there was an instinct of death. The phenomena of life could be explained from the concurrent or mutually opposing action of these two instincts. It was not easy, however, to demonstrate the activities of this supposed death instinct. The manifestations of Eros were conspicuous and noisy enough. It might be assumed that the death instinct operated silently within the organism towards its dissolution, but that, of course, was no proof. A more fruitful idea was that a portion of the instinct is diverted towards the external world and comes to light as an instinct of aggressiveness and destructiveness. In this way the instinct itself could be pressed into the service of Eros, in that the organism was destroying some other thing, whether animate or inanimate, instead of destroying its own self. Conversely, any restriction of this aggressiveness directed outwards would be bound to increase the self-destruction, which is in any case proceeding. At the same time one can suspect from this example that the two kinds of instinct seldom - perhaps never - appear in isolation from each other, but are alloyed with each other in varying and very different proportions and so become unrecognizable to our judgement. In sadism, long since known to us as a component instinct of sexuality, we should have before us a particularly strong alloy of this kind between trends of love and the destructive instinct; while its counterpart, masochism, would be a union between destructiveness directed inwards and sexuality - a union which makes what is otherwise an imperceptible trend into a conspicuous and tangible one.

[1930a, 4509]
The name 'libido' can once more be used to denote the manifestations of the power of Eros in order to distinguish them from the energy of the death instinct.¹ It must be confessed that we have much greater difficulty in grasping that instinct; we can only suspect it, as it were, as something in the background behind Eros, and it escapes detection unless its presence is betrayed by its being alloyed with Eros. It is in sadism, where the death instinct twists the erotic aim in its own sense and yet at the same time fully satisfies the erotic urge, that we succeed in obtaining the clearest insight into its nature and its relation to Eros. But even where it emerges without any sexual purpose, in the blindest fury of destructiveness, we cannot fail to recognize that the satisfaction of the instinct is accompanied by an extraordinarily high degree of narcissistic enjoyment, owing to its presenting the ego with a fulfilment of the latter's old wishes for omnipotence. The instinct of destruction, moderated and tamed, and, as it were, inhibited in its aim, must, when it is directed towards objects, provide the ego with the satisfaction of its vital needs and with control over nature. Since the assumption of the existence of the instinct is mainly based on theoretical grounds, we must also admit that it is not entirely proof against theoretical objections. But this is how things appear to us now, in the present state of our knowledge; future research and reflection will no doubt bring further light which will decide the matter.

[1930a, 4511]

There can be no question of restricting one or the other of the basic instincts to one of the provinces of the mind. They must necessarily be met with everywhere. We may picture an initial state as one in which the total available energy of Eros, which henceforward we shall speak of as 'libido', is present in the still undifferentiated ego-id and serves to neutralize the destructive tendencies which are simultaneously present. (We are without a term analogous to 'libido' for describing the energy of the destructive instinct.) At a later stage it becomes relatively easy for us to follow the vicissitudes of the libido, but this is more difficult with the destructive instinct.

[1940a [1938], 4960]
It may quite often happen that although a danger-situation is correctly estimated in itself, a certain amount of instinctual anxiety is added to the realistic anxiety. In that case the instinctual demand before whose satisfaction the ego recoils is a masochistic one: the instinct of destruction directed against the subject himself. Perhaps an addition of this kind explains cases in which reactions of anxiety are exaggerated, inexpedient or paralysing. Phobias of heights (windows, towers, precipices and so on) may have some such origin. Their hidden feminine significance is closely connected with masochism.

[1926d, 4320]

I fear I may be abusing your interest, which is after all concerned with the prevention of war and not with our theories. Nevertheless I should like to linger for a moment over our destructive instinct, whose popularity is by no means equal to its importance. As a result of a little speculation, we have come to suppose that this instinct is at work in every living creature and is striving to bring it to ruin and to reduce life to its original condition of inanimate matter. Thus it quite seriously deserves to be called a death instinct, while the erotic instincts represent the effort to live. The death instinct turns into the destructive instinct when, with the help of special organs, it is directed outwards, on to objects. The organism preserves its own life, so to say, by destroying an extraneous one. Some portion of the death instinct, however, remains operative within the organism, and we have sought to trace quite a number of normal and pathological phenomena to this internalization of the destructive instinct. We have even been guilty of the heresy of attributing the origin of conscience to this diversion inwards of aggressiveness. You will notice that it is by no means a trivial matter if this process is carried too far: it is positively unhealthy. On the other hand if these forces are turned to destruction in the external world, the organism will be relieved and the effect must be beneficial. This would serve as a biological justification for all the ugly and dangerous impulses against which we are struggling. It must be admitted that they stand nearer to Nature than does our resistance to them for which an explanation also needs to be found. It may perhaps seem to you as though our theories are a kind of mythology and, in the present case, not even an agreeable one. But does not every science come in the end to a kind of mythology like this? Cannot the same be said to-day of your own Physics?

[1933b, 4800]

It is less easy to demonstrate the existence of another resistance, our means of combating which are specially inadequate. There are some neurotics in whom, to judge by all their reactions, the instinct of self-preservation has actually been reversed. They seem to aim at nothing other than self-injury and self-destruction. It is possible too that the people who in fact do in the end commit suicide belong to this group. It is to be assumed that in such people far-reaching defusions of instinct have taken place, as a result of which there has been a liberation of excessive quantities of the destructive instinct directed inwards. Patients of this kind are not able to tolerate recovery through our treatment and fight against it with all their strength. But we must confess that this is a case which we have not yet succeeded in completely explaining.

[1940a [1938], 4989]
In yet another group of cases the distinguishing characteristics of the ego, which are to be held responsible as sources of resistance against analytic treatment and as impediments to therapeutic success, may spring from different and deeper roots. Here we are dealing with the ultimate things which psychological research can learn about: the behaviour of the two primal instincts, their distribution, mingling and defusion - things which we cannot think of as being confined to a single province of the mental apparatus, the id, the ego or the super-ego. No stronger impression arises from the resistances during the work of analysis than of there being a force which is defending itself by every possible means against recovery and which is absolutely resolved to hold on to illness and suffering. One portion of this force has been recognized by us, undoubtedly with justice, as the sense of guilt and need for punishment, and has been localized by us in the ego's relation to the super-ego. But this is only the portion of it which is, as it were, psychically bound by the super-ego and thus becomes recognizable; other quotas of the same force, whether bound or free, may be at work in other, unspecified places. If we take into consideration the total picture made up of the phenomena of masochism immanent in so many people, the negative therapeutic reaction and the sense of guilt found in so many neurotics, we shall no longer be able to adhere to the belief that mental events are exclusively governed by the desire for pleasure. These phenomena are unmistakable indications of the presence of a power in mental life which we call the instinct of aggression or of destruction according to its aims, and which we trace back to the original death instinct of living matter. It is not a question of an antithesis between an optimistic and a pessimistic theory of life. Only by the concurrent or mutually opposing action of the two primal instincts - Eros and the death instinct -, never by one or the other alone, can we explain the rich multiplicity of the phenomena of life. [1937c, 5037]
The question which we put off answering runs as follows: How is it that the super-ego manifests itself essentially as a sense of guilt (or rather, as criticism - for the sense of guilt is the perception in the ego answering to this criticism) and moreover develops such extraordinary harshness and severity towards the ego? If we turn to melancholia first, we find that the excessively strong super-ego which has obtained a hold upon consciousness rages against the ego with merciless violence, as if it had taken possession of the whole of the sadism available in the person concerned. Following our view of sadism, we should say that the destructive component had entrenched itself in the super-ego and turned against the ego. What is now holding sway in the super-ego is, as it were, a pure culture of the death instinct, and in fact it often enough succeeds in driving the ego into death, if the latter does not fend off its tyrant in time by the change round into mania.

[1923b, 3987]

From the point of view of instinctual control, of morality, it may be said of the id that it is totally non-moral, of the ego that it strives to be moral, and of the super-ego that it can be super-moral and then become as cruel as only the id can be. It is remarkable that the more a man checks his aggressiveness towards the exterior the more severe - that is aggressive - he becomes in his ego ideal. The ordinary view sees the situation the other way round: the standard set up by the ego ideal seems to be the motive for the suppression of aggressiveness. The fact remains, however, as we have stated it: the more a man controls his aggressiveness, the more intense becomes his ideal's inclination to aggressiveness against his ego. It is like a displacement, a turning round upon his own ego. But even ordinary normal morality has a harshly restraining, cruelly prohibiting quality. It is from this, indeed, that the conception arises of a higher being who deals out punishment inexorably.

[1923b, 3988]

I cannot go further in my consideration of these questions without introducing a fresh hypothesis. The super-ego arises, as we know, from an identification with the father taken as a model. Every such identification is in the nature of a desexualization or even of a sublimation. It now seems as though when a transformation of this kind takes place, an instinctual defusion occurs at the same time. After sublimation the erotic component no longer has the power to bind the whole of the destructiveness that was combined with it, and this is released in the form of an inclination to aggression and destruction. This defusion would be the source of the general character of harshness and cruelty exhibited by the ideal - its dictatorial 'Thou shalt'.

[1923b, 3988]

But since the ego's work of sublimation results in a defusion of the instincts and a liberation of the aggressive instincts in the super-ego, its struggle against the libido exposes it to the danger of maltreatment and death. In suffering under the attacks of the super-ego or perhaps even succumbing to them, the ego is meeting with a fate like that of the protista which are destroyed by the products of decomposition that they themselves have created. From the economic point of view the morality that functions in the super-ego seems to be a similar product of decomposition.

[1923b, 3990]
To return to masochism. Masochism comes under our observation in three forms: as a condition imposed on sexual excitation, as an expression of the feminine nature, and as a norm of behaviour. We may, accordingly, distinguish an erotogenic, a feminine and a moral masochism. The first, the erotogenic, masochism - pleasure in pain - lies at the bottom of the other two forms as well. Its basis must be sought along biological and constitutional lines and it remains incomprehensible unless one decides to make certain assumptions about matters that are extremely obscure. The third, and in some respects the most important, form assumed by masochism has only recently been recognized by psycho-analysis as a sense of guilt which is mostly unconscious; but it can already be completely explained and fitted into the rest of our knowledge. Feminine masochism, on the other hand, is the one that is most accessible to our observation and least problematical, and it can be surveyed in all its relations. We will begin our discussion with it.

Another question concerns us more nearly. What means does civilization employ in order to inhibit the aggressiveness which opposes it, to make it harmless, to get rid of it, perhaps? We have already become acquainted with a few of these methods, but not yet with the one that appears to be the most important. This we can study in the history of the development of the individual. What happens in him to render his desire for aggression innocuous? Something very remarkable, which we should never have guessed and which is nevertheless quite obvious. His aggressiveness is introjected, internalized; it is, in point of fact, sent back to where it came from - that is, it is directed towards his own ego. There it is taken over by a portion of the ego, which sets itself over against the rest of the ego as super-ego, and which now, in the form of 'conscience', is ready to put into action against the ego the same harsh aggressiveness that the ego would have liked to satisfy upon other, extraneous individuals. The tension between the harsh super-ego and the ego that is subjected to it, is called by us the sense of guilt; it expresses itself as a need for punishment. Civilization, therefore, obtains mastery over the individual's dangerous desire for aggression by weakening and disarming it and by setting up an agency within him to watch over it, like a garrison in a conquered city.
At this second stage of development, the conscience exhibits a peculiarity which was absent from the first stage and which is no longer easy to account for. For the more virtuous a man is, the more severe and distrustful is its behaviour, so that ultimately it is precisely those people who have carried saintliness furthest who reproach themselves with the worst sinfulness. This means that virtue forfeits some part of its promised reward; the docile and continent ego does not enjoy the trust of its mentor, and strives in vain, it would seem, to acquire it. The objection will at once be made that these difficulties are artificial ones, and it will be said that a stricter and more vigilant conscience is precisely the hallmark of a moral man. Moreover, when saints call themselves sinners, they are not so wrong, considering the temptations to instinctual satisfaction to which they are exposed in a specially high degree - since, as is well known, temptations are merely increased by constant frustration, whereas an occasional satisfaction of them causes them to diminish, at least for the time being. The field of ethics, which is so full of problems, presents us with another fact: namely that ill-luck - that is, external frustration - so greatly enhances the power of the conscience in the super-ego. As long as things to well with a man, his conscience is lenient and lets the ego do all sorts of things; but when misfortune befalls him, he searches his soul, acknowledges his sinfulness, heightens the demands of his conscience, imposes abstinences on himself and punishes himself with penances.¹ Whole peoples have behaved in this way, and still do. This, however, is easily explained by the original infantile stage of conscience, which, as we see, is not given up after the introjection into the super-ego, but persists alongside of it and behind it. Fate is regarded as a substitute for the parental agency. If a man is unfortunate it means that he is no longer loved by this highest power; and, threatened by such a loss of love, he once more bows to the parental representative in his super-ego - a representative whom, in his days of good fortune, he was ready to neglect. This becomes especially clear where Fate is looked upon in the strictly religious sense of being nothing else than an expression of the Divine Will. The people of Israel had believed themselves to be the favourite child of God, and when the great Father caused misfortune after misfortune to rain down upon this people of his, they were never shaken in their belief in his relationship to them or questioned his power or righteousness. Instead, they produced the prophets, who held up their sinfulness before them; and out of their sense of guilt they created the over-strict commandments of their priestly religion. It is remarkable how differently a primitive man behaves. If he has met with a misfortune, he does not throw the blame on himself but on his fetish, which has obviously not done its duty, and he gives it a thrashing instead of punishing himself.

¹ [1930a, 4516]
But if the human sense of guilt goes back to the killing of the primal father, that was after all a case of 'remorse'. Are we to assume that a conscience and a sense of guilt were not, as we have presupposed, in existence before the deed? If not, where, in this case, did the remorse come from? There is no doubt that this case should explain the secret of the sense of guilt to us and put an end to our difficulties. And I believe it does. This remorse was the result of the primordial ambivalence of feeling towards the father. His sons hated him, but they loved him, too. After their hatred had been satisfied by their act of aggression, their love came to the fore in their remorse for the deed. It set up the super-ego by identification with the father; it gave that agency the father's power, as though as a punishment for the deed of aggression they had carried out against him, and it created the restrictions which were intended to prevent a repetition of the deed. And since the inclination to aggressiveness against the father was repeated in the following generations, the sense of guilt, too, persisted, and it was reinforced once more by every piece of aggressiveness that was suppressed and carried over to the super-ego. Now, I think, we can at last grasp two things perfectly clearly: the part played by love in the origin of conscience and the fatal inevitability of the sense of guilt. Whether one has killed one's father or has abstained from doing so is not really the decisive thing. One is bound to feel guilty in either case, for the sense of guilt is an expression of the conflict due to ambivalence, of the eternal struggle between Eros and the instinct of destruction or death. This conflict is set going as soon as men are faced with the task of living together. So long as the community assumes no other form than that of the family, the conflict is bound to express itself in the Oedipus complex, to establish the conscience and to create the first sense of guilt. When an attempt is made to widen the community, the same conflict is continued in forms which are dependent on the past; and it is strengthened and results in a further intensification of the sense of guilt. Since civilization obeys an internal erotic impulsion which causes human beings to unite in a closely-knit group, it can only achieve this aim through an ever-increasing reinforcement of the sense of guilt. What began in relation to the father is completed in relation to the group. If civilization is a necessary course of development from the family to humanity as a whole, then - as a result of the inborn conflict arising from ambivalence, of the eternal struggle between the trends of love and death - there is inextricably bound up with it an increase of the sense of guilt, which will perhaps reach heights that the individual finds hard to tolerate. One is reminded of the great poet's moving arraignment of the 'Heavenly Powers':-

[1930a, 4522]
Though it cannot be of great importance, it may not be superfluous to elucidate the meaning of a few words such as 'super-ego', 'conscience', 'sense of guilt', 'need for punishment' and 'remorse', which we have often, perhaps, used too loosely and interchangeably. They all relate to the same state of affairs, but denote different aspects of it. The super-ego is an agency which has been inferred by us, and conscience is a function which we ascribe, among other functions, to that agency. This function consists in keeping a watch over the actions and intentions of the ego and judging them, in exercising a censorship. The sense of guilt, the harshness of the super-ego, is thus the same thing as the severity of the conscience. It is the perception which the ego has of being watched over in this way, the assessment of the tension between its own strivings and the demands of the super-ego. The fear of this critical agency (a fear which is at the bottom of the whole relationship), the need for punishment, is an instinctual manifestation on the part of the ego, which has become masochistic under the influence of a sadistic super-ego; it is a portion, that is to say, of the instinct towards internal destruction present in the ego, employed for forming an erotic attachment to the super-ego. We ought not to speak of a conscience until a super-ego is demonstrably present. As to a sense of guilt, we must admit that it is in existence before the super-ego, and therefore before conscience, too. At that time it is the immediate expression of fear of the external authority, a recognition of the tension between the ego and that authority. It is the direct derivative of the conflict between the need for the authority's love and the urge towards instinctual satisfaction, whose inhibition produces the inclination to aggression. The superimposition of these two strata of the sense of guilt - one coming from fear of the external authority, the other from fear of the internal authority - has hampered our insight into the position of conscience in a number of ways. Remorse is a general term for the ego's reaction in a case of sense of guilt. It contains, in little altered form, the sensory material of the anxiety which is operating behind the sense of guilt; it is itself a punishment and can include the need for punishment. Thus remorse, too, can be older than conscience.

[1930a, 4524]

Nor will it do any harm if we once more review the contradictions which have for a while perplexed us during our enquiry. Thus, at one point the sense of guilt was the consequence of acts of aggression that had been abstained from; but at another point - and precisely at its historical beginning, the killing of the father - it was the consequence of an act of aggression that had been carried out. But a way out of this difficulty was found. For the institution of the internal authority, the super-ego, altered the situation radically. Before this, the sense of guilt coincided with remorse. (We may remark, incidentally, that the term 'remorse' should be reserved for the reaction after an act of aggression has actually been carried out.) After this, owing to the omniscience of the super-ego, the difference between an aggression intended and an aggression carried out lost its force. Henceforward a sense of guilt could be produced not only by an act of violence that is actually carried out (as all the world knows), but also by one that is merely intended (as psycho-analysis has discovered). Irrespectively of this alteration in the psychological situation, the conflict arising from ambivalence - the conflict between the two primal instincts - leaves the same result behind. We are tempted to look here for the solution of the problem of the varying relation in which the sense of guilt stands to consciousness. It might be thought that a sense of guilt arising from remorse for an evil deed must always be conscious, whereas a sense of guilt arising from the perception of an evil impulse may remain unconscious. But the answer is not so simple as that. Obsessional neurosis speaks energetically against it.

[1930a, 4525]
This is, I think, the place at which to put forward for serious consideration a view which I have earlier recommended for provisional acceptance. In the most recent analytic literature a predilection is shown for the idea that any kind of frustration, any thwarted instinctual satisfaction, results, or may result, in a heightening of the sense of guilt.¹ A great theoretical simplification will, I think, be achieved if we regard this as applying only to the aggressive instincts, and little will be found to contradict this assumption. For how are we to account, on dynamic and economic grounds, for an increase in the sense of guilt appearing in place of an unfulfilled erotic demand? This only seems possible in a round-about way - if we suppose, that is, that the prevention of an erotic satisfaction calls up a piece of aggressiveness against the person who has interfered with the satisfaction, and that this aggressiveness has itself to be suppressed in turn. But if this is so, it is after all only the aggressiveness which is transformed into a sense of guilt, by being suppressed and made over to the super-ego. I am convinced that many processes will admit of a simpler and clearer exposition if the findings of psycho-analysis with regard to the derivation of the sense of guilt are restricted to the aggressive instincts. Examination of the clinical material gives us no unequivocal answer here, because, as our hypothesis tells us, the two classes of instinct hardly ever appear in a pure form, isolated from each other; but an investigation of extreme cases would probably point in the direction I anticipate.
[1930a, 4526]

There is, as we think, no doubt about the origin of this unconscious need for punishment. It behaves like a piece of conscience, like a prolongation of our conscience into the unconscious; and it must have the same origin as conscience and correspond, therefore, to a piece of aggressiveness that has been internalized and taken over by the super-ego. If only the words went together better, we should be justified for all practical purposes in calling it an 'unconscious sense of guilt'. Theoretically we are in fact in doubt whether we should suppose that all the aggressiveness that has returned from the external world is bound by the super-ego and accordingly turned against the ego, or that a part of it is carrying on its mute and uncanny activity as a free destructive instinct in the ego and the id. A distribution of the latter kind is the more probable; but we know nothing more about it. There is no doubt that, when the super-ego was first instituted, in equipping that agency use was made of the piece of the child's aggressiveness towards his parents for which he was unable to effect a discharge outwards on account of his erotic fixation as well as of external difficulties; and for that reason the severity of the super-ego need not simply correspond to the strictness of the upbringing. It is very possible that, when there are later occasions for suppressing aggressiveness, the instinct may take the same path that was opened to it at that decisive point of time.
[1933a, 4713]
And here, at an unexpected point, we have emerged from the psychical underworld into the open market-place. I cannot lead you any further, but before I take leave of you for to-day I must detain you with one more train of thought. It has become our habit to say that our civilization has been built up at the cost of sexual trends which, being inhibited by society, are partly, it is true, repressed but have partly been made usable for other aims. We have admitted, too, that, in spite of all our pride in our cultural attainments, it is not easy for us to fulfil the requirements of this civilization or to feel comfortable in it, because the instinctual restrictions imposed on us constitute a heavy psychical burden. Well, what we have come to see about the sexual instincts, applies equally and perhaps still more to the other ones, the aggressive instincts. It is they above all that make human communal life difficult and threaten its survival. Restriction of the individual’s aggressiveness is the first and perhaps the severest sacrifice which society requires of him. We have learnt the ingenious way in which the taming of this unruly thing has been achieved. The institution of the super-ego which takes over the dangerous aggressive impulses, introduces a garrison, as it were, into regions that are inclined to rebellion. But on the other hand, if we look at it purely psychologically, we must recognize that the ego does not feel happy in being thus sacrificed to the needs of society, in having to submit to the destructive trends of aggressiveness which it would have been glad to employ itself against others. It is like a prolongation in the mental sphere of the dilemma of ‘eat or be eaten’ which dominates the organic animate world. Luckily the aggressive instincts are never alone but always alloyed with the erotic ones. These latter have much to mitigate and much to avert under the conditions of the civilization which mankind has created.

[1933a, 4714]

So long as that instinct operates internally, as a death instinct, it remains silent; it only comes to our notice when it is diverted outwards as an instinct of destruction. It seems to be essential for the preservation of the individual that this diversion should occur; the muscular apparatus serves this purpose. When the super-ego is established, considerable amounts of the aggressive instinct are fixated in the interior of the ego and operate there self-destructively. This is one of the dangers to health by which human beings are faced on their path to cultural development. Holding back aggressiveness is in general unhealthy and leads to illness (to mortification). A person in a fit of rage will often demonstrate how the transition from aggressiveness that has been prevented to self-destructiveness is brought about by diverting the aggressiveness against himself: he tears his hair or beats his face with his fists, though he would evidently have preferred to apply this treatment to someone else. Some portion of self-destructiveness remains within, whatever the circumstances; till at last it succeeds in killing the individual, not, perhaps, until his libido has been used up or fixated in a disadvantageous way. Thus it may in general be suspected that the individual dies of his internal conflicts but that the species dies of its unsuccessful struggle against the external world if the latter changes in a fashion which cannot be adequately dealt with by the adaptations which the species has acquired.

[1940a [1938], 4961]
In yet another group of cases the distinguishing characteristics of the ego, which are to be held responsible as sources of resistance against analytic treatment and as impediments to therapeutic success, may spring from different and deeper roots. Here we are dealing with the ultimate things which psychological research can learn about: the behaviour of the two primal instincts, their distribution, mingling and defusion - things which we cannot think of as being confined to a single province of the mental apparatus, the id, the ego or the super-ego. No stronger impression arises from the resistances during the work of analysis than of there being a force which is defending itself by every possible means against recovery and which is absolutely resolved to hold on to illness and suffering. One portion of this force has been recognized by us, undoubtedly with justice, as the sense of guilt and need for punishment, and has been localized by us in the ego's relation to the super-ego. But this is only the portion of it which is, as it were, psychically bound by the super-ego and thus becomes recognizable; other quotas of the same force, whether bound or free, may be at work in other, unspecified places. If we take into consideration the total picture made up of the phenomena of masochism immanent in so many people, the negative therapeutic reaction and the sense of guilt found in so many neurotics, we shall no longer be able to adhere to the belief that mental events are exclusively governed by the desire for pleasure. These phenomena are unmistakable indications of the presence of a power in mental life which we call the instinct of aggression or of destruction according to its aims, and which we trace back to the original death instinct of living matter. It is not a question of an antithesis between an optimistic and a pessimistic theory of life. Only by the concurrent or mutually opposing action of the two primal instincts - Eros and the death instinct -, never by one or the other alone, can we explain the rich multiplicity of the phenomena of life. [1937c, 5037]
From the point of view of instinctual control, of morality, it may be said of the id that it is totally non-moral, of the ego that it strives to be moral, and of the super-ego that it can be super-moral and then become as cruel as only the id can be. It is remarkable that the more a man checks his aggressiveness towards the exterior the more severe - that is aggressive - he becomes in his ego ideal. The ordinary view sees the situation the other way round: the standard set up by the ego ideal seems to be the motive for the suppression of aggressiveness. The fact remains, however, as we have stated it: the more a man controls his aggressiveness, the more intense becomes his ideal's inclination to aggressiveness against his ego. It is like a displacement, a turning round upon his own ego. But even ordinary normal morality has a harshly restraining, cruelly prohibiting quality. It is from this, indeed, that the conception arises of a higher being who deals out punishment inexorably.

[1923b, 3988]

Every analyst will admit that even to-day this view has not the sound of a long-discarded error. Nevertheless, alterations in it became essential, as our enquiries advanced from the repressed to the repressing forces, from the object-instincts to the ego. The decisive step forward was the introduction of the concept of narcissism - that is to say, the discovery that the ego itself is cathexed with libido, that the ego, indeed, is the libido's original home, and remains to some extent its headquarters. This narcissistic libido turns towards objects, and thus becomes object-libido; and it can change back into narcissistic libido once more. The concept of narcissism made it possible to obtain an analytic understanding of the traumatic neuroses and of many of the affections bordering on the psychoses, as well as of the latter themselves. It was not necessary to give up our interpretation of the transference neuroses as attempts made by the ego to defend itself against sexuality; but the concept of libido was endangered. Since the ego-instincts, too, were libidinal, it seemed for a time inevitable that we should make libido coincide with instinctual energy in general, as C. G. Jung had already advocated earlier. Nevertheless, there still remained in me a kind of conviction, for which I was not as yet able to find reasons, that the instincts could not all be of the same kind. My next step was taken in *Beyond the Pleasure Principle* (1920), when the compulsion to repeat and the conservative character of instinctual life first attracted my attention. Starting from speculations on the beginning of life and from biological parallels, I drew the conclusion that, besides the instinct to preserve living substance and to join it into ever larger units,¹ there must exist another, contrary instinct seeking to dissolve those units and to bring them back to their præmaeval, inorganic state. That is to say, as well as Eros there was an instinct of death. The phenomena of life could be explained from the concurrent or mutually opposing action of these two instincts. It was not easy, however, to demonstrate the activities of this supposed death instinct. The manifestations of Eros were conspicuous and noisy enough. It might be assumed that the death instinct operated silently within the organism towards its dissolution, but that, of course, was no proof. A more fruitful idea was that a portion of the instinct is diverted towards the external world and comes to light as an instinct of aggressiveness and destructiveness. In this way the instinct itself could be pressed into the service of Eros, in that the organism was destroying some other thing, whether animate or inanimate, instead of destroying its own self. Conversely, any restriction of this aggressiveness directed outwards would be bound to increase the self-destruction, which is in any case proceeding. At the same time one can suspect from this example that the two kinds of instinct seldom - perhaps never - appear in isolation from each other, but are alloyed with each other in varying and very different proportions and so become recognizable to our judgement. In sadism, long since known to us as a component instinct of sexuality, we should have before us a particularly strong alloy of this kind between trends of love and the destructive instinct; while its counterpart, masochism, would be a union between destructiveness directed inwards and sexuality - a union which makes what is otherwise an imperceptible trend into a conspicuous and tangible one.

[1930a, 4509]
I fear I may be abusing your interest, which is after all concerned with the prevention of war and not with our theories. Nevertheless I should like to linger for a moment over our destructive instinct, whose popularity is by no means equal to its importance. As a result of a little speculation, we have come to suppose that this instinct is at work in every living creature and is striving to bring it to ruin and to reduce life to its original condition of inanimate matter. Thus it quite seriously deserves to be called a death instinct, while the erotic instincts represent the effort to live. The death instinct turns into the destructive instinct when, with the help of special organs, it is directed outwards, on to objects. The organism preserves its own life, so to say, by destroying an extraneous one. Some portion of the death instinct, however, remains operative within the organism, and we have sought to trace quite a number of normal and pathological phenomena to this internalization of the destructive instinct. We have even been guilty of the heresy of attributing the origin of conscience to this diversion inwards of aggressiveness. You will notice that it is by no means a trivial matter if this process is carried too far: it is positively unhealthy. On the other hand if these forces are turned to destruction in the external world, the organism will be relieved and the effect must be beneficial. This would serve as a biological justification for all the ugly and dangerous impulses against which we are struggling. It must be admitted that they stand nearer to Nature than does our resistance to them for which an explanation also needs to be found. It may perhaps seem to you as though our theories are a kind of mythology and, in the present case, not even an agreeable one. But does not every science come in the end to a kind of mythology like this? Cannot the same be said to-day of your own Physics?

[1933b, 4800]

So long as that instinct operates internally, as a death instinct, it remains silent; it only comes to our notice when it is diverted outwards as an instinct of destruction. It seems to be essential for the preservation of the individual that this diversion should occur; the muscular apparatus serves this purpose. When the super-ego is established, considerable amounts of the aggressive instinct are fixated in the interior of the ego and operate there self-destructively. This is one of the dangers to health by which human beings are faced on their path to cultural development. Holding back aggressiveness is in general unhealthy and leads to illness (to mortification). A person in a fit of rage will often demonstrate how the transition from aggressiveness that has been prevented to self-destructiveness is brought about by diverting the aggressiveness against himself: he tears his hair or beats his face with his fists, though he would evidently have preferred to apply this treatment to someone else. Some portion of self-destructiveness remains within, whatever the circumstances; till at last it succeeds in killing the individual, not, perhaps, until his libido has been used up or fixated in a disadvantageous way. Thus it may in general be suspected that the individual dies of his internal conflicts but that the species dies of its unsuccessful struggle against the external world if the latter changes in a fashion which cannot be adequately dealt with by the adaptations which the species has acquired.

[1940a [1938], 4961]
The dangerous death instincts are dealt with in the individual in various ways: in part they are rendered harmless by being fused with erotic components, in part they are diverted towards the external world in the form of aggression, while to a large extent they undoubtedly continue their internal work unhindered. How is it then that in melancholia the super-ego can become a kind of gathering-place for the death instincts?

[1923b, 3988]

The inadequacy of this explanation is seen, however, in the fact that it throws no light on the regular and close connections of masochism with its counterpart in instinctual life, sadism. If we go back a little further, to our hypothesis of the two classes of instincts which we regard as operative in the living organism, we arrive at another derivation of masochism, which, however, is not in contradiction with the former one. In (multicellular) organisms the libido meets the instinct of death, or destruction, which is dominant in them and which seeks to disintegrate the cellular organism and to conduct each separate unicellular organism into a state of inorganic stability (relative though this may be). The libido has the task of making the destroying instinct innocuous, and it fulfils the task by diverting that instinct to a great extent outwards - soon with the help of a special organic system, the muscular apparatus - towards objects in the external world. The instinct is then called the destructive instinct, the instinct for mastery, or the will to power. A portion of the instinct is placed directly in the service of the sexual function, where it has an important part to play. This is sadism proper. Another portion does not share in this transposition outwards; it remains inside the organism and, with the help of the accompanying sexual excitation described above, becomes libidinally bound there. It is in this portion that we have to recognize the original, erotogenic masochism.

[1924c, 4075]

If one is prepared to overlook a little inexactitude, it may be said that the death instinct which is operative in the organism - primal sadism - is identical with masochism. After the main portion of it has been transposed outwards on to objects, there remains inside, as a residuum of it, the erotogenic masochism proper, which on the one hand has become a component of the libido and, on the other, still has the self as its object. This masochism would thus be evidence of, and a remainder from, the phase of development in which the coalescence, which is so important for life, between the death instinct and Eros took place. We shall not be surprised to hear that in certain circumstances the sadism, or instinct of destruction, which has been directed outwards, projected, can be once more introjected, turned inwards, and in this way regress to its earlier situation. If this happens, a secondary masochism is produced, which is added to the original masochism.

[1924c, 4076]
Every analyst will admit that even to-day this view has not the sound of a long-discarded error. Nevertheless, alterations in it became essential, as our enquiries advanced from the repressed to the repressing forces, from the object-instincts to the ego. The decisive step forward was the introduction of the concept of narcissism - that is to say, the discovery that the ego itself is cathected with libido, that the ego, indeed, is the libido's original home, and remains to some extent its headquarters. This narcissistic libido turns towards objects, and thus becomes object-libido; and it can change back into narcissistic libido once more. The concept of narcissism made it possible to obtain an analytic understanding of the traumatic neuroses and of many of the affections bordering on the psychoses, as well as of the latter themselves. It was not necessary to give up our interpretation of the transference neuroses as attempts made by the ego to defend itself against sexuality; but the concept of libido was endangered. Since the ego-instincts, too, were libidinal, it seemed for a time inevitable that we should make libido coincide with instinctual energy in general, as C. G. Jung had already advocated earlier. Nevertheless, there still remained in me a kind of conviction, for which I was not as yet able to find reasons, that the instincts could not all be of the same kind. My next step was taken in Beyond the Pleasure Principle (1920g), when the compulsion to repeat and the conservative character of instinctual life first attracted my attention. Starting from speculations on the beginning of life and from biological parallels, I drew the conclusion that, besides the instinct to preserve living substance and to join it into ever larger units,¹ there must exist another, contrary instinct seeking to dissolve those units and to bring them back to their præmaeval, inorganic state. That is to say, as well as Eros there was an instinct of death. The phenomena of life could be explained from the concurrent or mutually opposing action of these two instincts. It was not easy, however, to demonstrate the activities of this supposed death instinct. The manifestations of Eros were conspicuous and noisy enough. It might be assumed that the death instinct operated silently within the organism towards its dissolution, but that, of course, was no proof. A more fruitful idea was that a portion of the instinct is diverted towards the external world and comes to light as an instinct of aggressiveness and destructiveness. In this way the instinct itself could be pressed into the service of Eros, in that the organism was destroying some other thing, whether animate or inanimate, instead of destroying its own self. Conversely, any restriction of this aggressiveness directed outwards would be bound to increase the self-destruction, which is in any case proceeding. At the same time one can suspect from this example that the two kinds of instinct seldom - perhaps never - appear in isolation from each other, but are alloyed with each other in varying and very different proportions and so become unrecognizable to our judgement. In sadism, long since known to us as a component instinct of sexuality, we should have before us a particularly strong alloy of this kind between trends of love and the destructive instinct; while its counterpart, masochism, would be a union between destructiveness directed inwards and sexuality - a union which makes what is otherwise an imperceptible trend into a conspicuous and tangible one.

[1930a, 4509]
Let us go back to the special problem presented to us by masochism. If for a moment we leave its erotic components on one side, it affords us a guarantee of the existence of a trend that has self-destruction as its aim. If it is true of the destructive instinct as well that the ego - but what we have in mind here is rather the id, the whole person - originally includes all the instinctual impulses, we are led to the view that masochism is older than sadism, and that sadism is the destructive instinct directed outwards, thus acquiring the characteristic of aggressiveness. A certain amount of the original destructive instinct may still remain in the interior. It seems that we can only perceive it under two conditions: if it is combined with erotic instincts into masochism or if - with a greater or lesser erotic addition - it is directed against the external world as aggressiveness. And now we are struck by the significance of the possibility that the aggressiveness may not be able to find satisfaction in the external world because it comes up against real obstacles. If this happens, it will perhaps retreat and increase the amount of self-destructiveness holding sway in the interior. We shall hear how this is in fact what occurs and how important a process this is. Impeded aggressiveness seems to involve a grave injury. It really seems as though it is necessary for us to destroy some other thing or person in order not to destroy ourselves, in order to guard against the impulsion to self-destruction. A sad disclosure indeed for the moralist!

[1933a, 4709]

I fear I may be abusing your interest, which is after all concerned with the prevention of war and not with our theories. Nevertheless I should like to linger for a moment over our destructive instinct, whose popularity is by no means equal to its importance. As a result of a little speculation, we have come to suppose that this instinct is at work in every living creature and is striving to bring it to ruin and to reduce life to its original condition of inanimate matter. Thus it quite seriously deserves to be called a death instinct, while the erotic instincts represent the effort to live. The death instinct turns into the destructive instinct when, with the help of special organs, it is directed outwards, on to objects. The organism preserves its own life, so to say, by destroying an extraneous one. Some portion of the death instinct, however, remains operative within the organism, and we have sought to trace quite a number of normal and pathological phenomena to this internalization of the destructive instinct. We have even been guilty of the heresy of attributing the origin of conscience to this diversion inwards of aggressiveness. You will notice that it is by no means a trivial matter if this process is carried too far: it is positively unhealthy. On the other hand if these forces are turned to destruction in the external world, the organism will be relieved and the effect must be beneficial. This would serve as a biological justification for all the ugly and dangerous impulses against which we are struggling. It must be admitted that they stand nearer to Nature than does our resistance to them for which an explanation also needs to be found. It may perhaps seem to you as though our theories are a kind of mythology and, in the present case, not even an agreeable one. But does not every science come in the end to a kind of mythology like this? Cannot the same be said to-day of your own Physics?

[1933b, 4800]
So long as that instinct operates internally, as a death instinct, it remains silent; it only comes to our notice when it is diverted outwards as an instinct of destruction. It seems to be essential for the preservation of the individual that this diversion should occur; the muscular apparatus serves this purpose. When the super-ego is established, considerable amounts of the aggressive instinct are fixated in the interior of the ego and operate there self-destructively. This is one of the dangers to health by which human beings are faced on their path to cultural development. Holding back aggressiveness is in general unhealthy and leads to illness (to mortification). A person in a fit of rage will often demonstrate how the transition from aggressiveness that has been prevented to self-destructiveness is brought about by diverting the aggressiveness against himself: he tears his hair or beats his face with his fists, though he would evidently have preferred to apply this treatment to someone else. Some portion of self-destructiveness remains within, whatever the circumstances; till at last it succeeds in killing the individual, not, perhaps, until his libido has been used up or fixated in a disadvantageous way. Thus it may in general be suspected that the individual dies of his internal conflicts but that the species dies of its unsuccessful struggle against the external world if the latter changes in a fashion which cannot be adequately dealt with by the adaptations which the species has acquired.

[1940a [1938], 4961]
If such an assumption as this is permissible, then we have met the demand that we should produce an example of a death instinct - though, it is true, a displaced one. But this way of looking at things is very far from being easy to grasp and creates a positively mystical impression. It looks suspiciously as though we were trying to find a way out of a highly embarrassing situation at any price. We may recall, however, that there is nothing new in an assumption of this kind. We put one forward on an earlier occasion, before there was any question of an embarrassing situation. Clinical observations led us at that time to the view that masochism, the component instinct which is complementary to sadism, must be regarded as sadism that has been turned round upon the subject's own ego. But there is no difference in principle between an instinct turning from an object to the ego and its turning from the ego to an object - which is the new point now under discussion. Masochism, the turning round of the instinct upon the subject's own ego, would in that case be a return to an earlier phase of the instinct's history, a regression. The account that was formerly given of masochism requires emendation as being too sweeping in one respect: there might be such a thing as primary masochism - a possibility which I had contested at that time.

One such fact there appears to be. For the opposition between the two classes of instincts we may put the polarity of love and hate. There is no difficulty in finding a representative of Eros; but we must be grateful that we can find a representative of the elusive death instinct in the instinct of destruction, to which hate points the way. Now, clinical observation shows not only that love is with unexpected regularity accompanied by hate (ambivalence), and not only that in human relationships hate is frequently a forerunner of love, but also that in a number of circumstances hate changes into love and love into hate. If this change is more than a mere succession in time - if, that is, one of them actually turns into the other - then clearly the ground is cut away from under a distinction so fundamental as that between erotic instincts and death instincts, one which presupposes physiological processes running in opposite directions.

Over and over again we find, when we are able to trace instinctual impulses back, that they reveal themselves as derivatives of Eros. If it were not for the considerations put forward in Beyond the Pleasure Principle, and ultimately for the sadistic constituents which have attached themselves to Eros, we should have difficulty in holding to our fundamental dualistic point of view. But since we cannot escape that view, we are driven to conclude that the death instincts are by their nature mute and that the clamour of life proceeds for the most part from Eros.
Every analyst will admit that even to-day this view has not the sound of a long-discarded error. Nevertheless, alterations in it became essential, as our enquiries advanced from the repressed to the repressing forces, from the object-instincts to the ego. The decisive step forward was the introduction of the concept of narcissism - that is to say, the discovery that the ego itself is cathexed with libido, that the ego, indeed, is the libido's original home, and remains to some extent its headquarters. This narcissistic libido turns towards objects, and thus becomes object-libido; and it can change back into narcissistic libido once more. The concept of narcissism made it possible to obtain an analytic understanding of the traumatic neuroses and of many of the affections bordering on the psychoses, as well as of the latter themselves. It was not necessary to give up our interpretation of the transference neuroses as attempts made by the ego to defend itself against sexuality; but the concept of libido was endangered. Since the ego-instincts, too, were libidinal, it seemed for a time inevitable that we should make libido coincide with instinctual energy in general, as C. G. Jung had already advocated earlier. Nevertheless, there still remained in me a kind of conviction, for which I was not as yet able to find reasons, that the instincts could not all be of the same kind. My next step was taken in Beyond the Pleasure Principle (1920), when the compulsion to repeat and the conservative character of instinctual life first attracted my attention. Starting from speculations on the beginning of life and from biological parallels, I drew the conclusion that, besides the instinct to preserve living substance and to join it into ever larger units,¹ there must exist another, contrary instinct seeking to dissolve those units and to bring them back to their primateval, inorganic state. That is to say, as well as Eros there was an instinct of death. The phenomena of life could be explained from the concurrent or mutually opposing action of these two instincts. It was not easy, however, to demonstrate the activities of this supposed death instinct. The manifestations of Eros were conspicuous and noisy enough. It might be assumed that the death instinct operated silently within the organism towards its dissolution, but that, of course, was no proof. A more fruitful idea was that a portion of the instinct is diverted towards the external world and comes to light as an instinct of aggressiveness and destructiveness. In this way the instinct itself could be pressed into the service of Eros, in that the organism was destroying some other thing, whether animate or inanimate, instead of destroying its own self. Conversely, any restriction of this aggressiveness directed outwards would be bound to increase the self-destruction, which is in any case proceeding. At the same time one can suspect from this example that the two kinds of instinct seldom - perhaps never - appear in isolation from each other, but are alloyed with each other in varying and very different proportions and so become unrecognizable to our judgement. In sadism, long since known to us as a component instinct of sexuality, we should have before us a particularly strong alloy of this kind between trends of love and the destructive instinct; while its counterpart, masochism, would be a union between destructiveness directed inwards and sexuality - a union which makes what is otherwise an imperceptible trend into a conspicuous and tangible one.

[1930a, 4509]
The assumption of the existence of an instinct of death or destruction has met with resistance even in analytic circles; I am aware that there is a frequent inclination rather to ascribe whatever is dangerous and hostile in love to an original bipolarity in its own nature. To begin with it was only tentatively that I put forward the views I have developed here, but in the course of time they have gained such a hold upon me that I can no longer think in any other way. To my mind, they are far more serviceable from a theoretical standpoint than any other possible ones; they provide that simplification, without either ignoring or doing violence to the facts, for which we strive in scientific work. I know that in sadism and masochism we have always seen before us manifestations of the destructive instinct (directed outwards and inwards), strongly alloyed with erotism; but I can no longer understand how we can have overlooked the ubiquity of non-erotic aggressivity and destructiveness and can have failed to give it its due place in our interpretation of life. (The desire for destruction when it is directed inwards mostly eludes our perception, of course, unless it is tinged with erotism.) I remember my own defensive attitude when the idea of an instinct of destruction first emerged in psycho-analytic literature, and how long it took before I became receptive to it. That others should have shown, and still show, the same attitude of rejection surprises me less. For 'little children do not like it' when there is talk of the inborn human inclination to 'badness', to aggressiveness and destructiveness, and so to cruelty as well. God has made them in the image of His own perfection; nobody wants to be reminded how hard it is to reconcile the undeniable existence of evil - despite the protestations of Christian Science - with His all-powerfulness or His all-goodness. The Devil would be the best way out as an excuse for God; in that way he would be playing the same part as an agent of economic discharge as the Jew does in the world of the Aryan ideal. But even so, one can hold God responsible for the existence of the Devil just as well as for the existence of the wickedness which the Devil embodies. In view of these difficulties, each of us will be well advised, on some suitable occasion, to make a low bow to the deeply moral nature of mankind; it will help us to be generally popular and much will be forgiven us for it.¹

[1930a, 4510]

The name 'libido' can once more be used to denote the manifestations of the power of Eros in order to distinguish them from the energy of the death instinct.¹ It must be confessed that we have much greater difficulty in grasping that instinct; we can only suspect it, as it were, as something in the background behind Eros, and it escapes detection unless its presence is betrayed by its being alloyed with Eros. It is in sadism, where the death instinct twists the erotic aim in its own sense and yet at the same time fully satisfies the erotic urge, that we succeed in obtaining the clearest insight into its nature and its relation to Eros. But even where it emerges without any sexual purpose, in the blindest fury of destructiveness, we cannot fail to recognize that the satisfaction of the instinct is accompanied by an extraordinarily high degree of narcissistic enjoyment, owing to its presenting the ego with a fulfilment of the latter's old wishes for omnipotence. The instinct of destruction, moderated and tamed, and, as it were, inhibited in its aim, must, when it is directed towards objects, provide the ego with the satisfaction of its vital needs and with control over nature. Since the assumption of the existence of the instinct is mainly based on theoretical grounds, we must also admit that it is not entirely proof against theoretical objections. But this is how things appear to us now, in the present state of our knowledge; future research and reflection will no doubt bring further light which will decide the matter.

[1930a, 4511]
Let us go back to the special problem presented to us by masochism. If for a moment we leave its erotic components on one side, it affords us a guarantee of the existence of a trend that has self-destruction as its aim. If it is true of the destructive instinct as well that the ego - but what we have in mind here is rather the id, the whole person - originally includes all the instinctual impulses, we are led to the view that masochism is older than sadism, and that sadism is the destructive instinct directed outwards, thus acquiring the characteristic of aggressiveness. A certain amount of the original destructive instinct may still remain in the interior. It seems that we can only perceive it under two conditions: if it is combined with erotic instincts into masochism or if - with a greater or lesser erotic addition - it is directed against the external world as aggressiveness. And now we are struck by the significance of the possibility that the aggressiveness may not be able to find satisfaction in the external world because it comes up against real obstacles. If this happens, it will perhaps retreat and increase the amount of self-destructiveness holding sway in the interior. We shall hear how this is in fact what occurs and how important a process this is. Impeded aggressiveness seems to involve a grave injury. It really seems as though it is necessary for us to destroy some other thing or person in order not to destroy ourselves, in order to guard against the impulsion to self-destruction. A sad disclosure indeed for the moralist!

[1933a, 4709]

But the moralist will console himself for a long time to come with the improbability of our speculations. A queer instinct indeed, directed to the destruction of its own organic home! Poets, it is true, talk of such things; but poets are irresponsible people and enjoy the privilege of poetic licence. Incidentally, such ideas are not foreign even to physiology: consider the notion, for instance, of the mucous membrane of the stomach digesting itself. It must be admitted, however, that our self-destructive instinct calls for support on a wider basis. One cannot, after all, venture on a hypothesis of such a wide range merely because a few poor fools have linked their sexual satisfaction to a peculiar condition. A more profound study of the instincts will, I believe, give us what we need. The instincts rule not only mental but also vegetative life, and these organic instincts exhibit a characteristic which deserves our deepest interest. (We shall not be able to judge until later whether it is a general characteristic of instincts.) For they reveal an effort to restore an earlier state of things. We may suppose that from the moment at which a state of things that has once been attained is upset, an instinct arises to create it afresh and brings about phenomena which we can describe as a 'compulsion to repeat'. Thus the whole of embryology is an example of the compulsion to repeat. A power of regenerating lost organs extends far up into the animal kingdom, and the instinct for recovery to which, alongside of therapeutic assistance, our cures are due must be the residue of this capacity which is so enormously developed in the lower animals. The spawning migrations of fishes, the migratory flights of birds, and possibly all that we describe as manifestations of instinct in animals, take place under the orders of the compulsion to repeat, which expresses the conservative nature of the instincts. Nor have we far to look in the mental field for its manifestations. We have been struck by the fact that the forgotten and repressed experiences of childhood are reproduced during the work of analysis in dreams and reactions, particularly in those occurring in the transference, although their revival runs counter to the interest of the pleasure principle; and we have explained this by supposing that in these cases a compulsion to repeat is overcoming even the pleasure principle. Outside analysis, too, something similar can be observed. There are people in whose lives the same reactions are perpetually being repeated uncorrected, to their own detriment, or others who seem to be pursued by a relentless fate, though closer investigation teaches us that they are unwittingly bringing this fate on themselves. In such cases we attribute a 'daemonic' character to the compulsion to repeat.

[1933a, 4710]
But how can this conservative characteristic of instincts help us to understand our self-destructiveness? What earlier state of things does an instinct such as this want to restore? Well, the answer is not far to seek and opens wide perspectives. If it is true that - at some immeasurably remote time and in a manner we cannot conceive - life once proceeded out of inorganic matter, then, according to our presumption, an instinct must have arisen which sought to do away with life once more and to re-establish the inorganic state. If we recognize in this instinct the self-destructiveness of our hypothesis, we may regard the self-destructiveness as an expression of a 'death instinct' which cannot fail to be present in every vital process. And now the instincts that we believe in divide themselves into two groups - the erotic instincts, which seek to combine more and more living substance into ever greater unities, and the death instincts, which oppose this effort and lead what is living back into an inorganic state. From the concurrent and opposing action of these two proceed the phenomena of life which are brought to an end by death.

[1933a, 4711]

For, whether a man is a homosexual or a necrophilic, a hysterical suffering from anxiety, an obsessional neurotic cut off from society, or a raving lunatic, the 'Individual Psychologist' of the Adlerian school will declare that the impelling motive of his condition is that he wishes to assert himself, to overcompensate for his inferiority, to remain 'on top', to pass from the feminine to the masculine line. In my young student days we used to hear something very much the same in the out-patients' department when a case of hysteria was introduced: hysterical patients, we were told, produce their symptoms to make themselves interesting, to draw attention to themselves. It is a remarkable thing how these ancient pieces of wisdom keep on cropping up. But even at that time this fragment of psychology did not seem to cover the riddle of hysteria. It left unexplained, for instance, why the patients used no other methods for attaining their purpose. There must, of course, be something correct in this theory of the 'Individual Psychologists': a small particle is taken for the whole. The self-preservative instinct will try to profit by every situation; the ego will seek to turn even illness to its advantage. In psycho-analysis this is known as the 'secondary gain from illness'. Though, indeed, when we think of the facts of masochism, of the unconscious need for punishment and of neurotic self-injury, which make plausible the hypothesis of there being instinctual impulses that run contrary to self-preservation, we even feel shaken in our belief in the general validity of the commonplace truth on which the theoretical structure of Individual Psychology is erected. But a theory such as this is bound to be very welcome to the great mass of the people, a theory which recognizes no complications, which introduces no new concepts that are hard to grasp, which knows nothing of the unconscious, which gets rid at a single blow of the universally oppressive problem of sexuality and which restricts itself to the discovery of the artifices by which people seek to make life easy. For the mass of the people themselves take things easily: they call for no more than a single reason by way of explanation, they do not thank science for its diffuseness, they want to have simple solutions and to know that problems are solved. When we consider how very far Individual Psychology goes in meeting these demands, we cannot suppress the recollection of a sentence in Wallenstein:

[1937c, 5038]

In studying the phenomena which testify to the activity of the destructive instinct, we are not confined to observations on pathological material. Numerous facts of normal mental life call for an explanation of this kind, and the sharper our eye grows, the more copiously they strike us. The subject is too new and too important for me to treat it as a side-issue in this discussion. I shall therefore content myself with selecting a few sample cases.
Here is one instance. It is well known that at all periods there have been, as there still are, people who can take as their sexual objects members of their own sex as well as of the opposite one, without the one trend interfering with the other. We call such people bisexuals, and we accept their existence without feeling much surprise about it. We have come to learn, however, that every human being is bisexual in this sense and that his libido is distributed, either in a manifest or a latent fashion, over objects of both sexes. But we are struck by the following point. Whereas in the first class of people the two trends have got on together without clashing, in the second and more numerous class they are in a state of irreconcilable conflict. A man's heterosexuality will not put up with any homosexuality, and vice versa. If the former is the stronger it succeeds in keeping the latter latent and forcing it away from satisfaction in reality. On the other hand, there is no greater danger for a man's heterosexual function than its being disturbed by his latent homosexuality. We might attempt to explain this by saying that each individual only has a certain quota of libido at his disposal, for which the two rival trends have to struggle. But it is not clear why the rivals do not always divide up the available quota of libido between them according to their relative strength, since they are able to do so in a number of cases. We are forced to the conclusion that the tendency to a conflict is something special, something which is newly added to the situation, irrespective of the quantity of libido. An independently-emerging tendency to conflict of this sort can scarcely be attributed to anything but the intervention of an element of free aggressiveness.

[1937c, 5038]
Here, from the outset, we come upon the same situation. Since our individual childhood, and, similarly, since the childhood of human civilization, hostile impulses against our fellow men have been subject to the same restrictions, the same progressive repression, as our sexual urges. We have not yet got so far as to be able to love our enemies or to offer our left cheek after being struck on the right. Furthermore, all moral rules for the restriction of active hatred give the clearest evidence to this day that they were originally framed for a small society of fellow clansmen. In so far as we are all able to feel that we are members of one people, we allow ourselves to disregard most of these restrictions in relation to a foreign people. Nevertheless, within our own circle we have made some advances in the control of hostile impulses. As Lichtenberg puts it in drastic terms: 'Where we now say "Excuse me!" we used to give a box on the ears.' Brutal hostility, forbidden by law, has been replaced by verbal invective; and a better knowledge of the interlinking of human impulses is more and more robbing us - by its consistent 'tout comprendre c'est tout pardonner' - of the capacity for feeling angry with a fellow man who gets in our way. Though as children we are still endowed with a powerful inherited disposition to hostility, we are later taught by a higher personal civilization that it is an unworthy thing to use abusive language; and even where fighting has in itself remained permissible, the number of things which may not be employed as methods of fighting has extraordinarily increased. Since we have been obliged to renounce the expression of hostility by deeds - held back by the passionless third person, in whose interest it is that personal security shall be preserved - we have, just as in the case of sexual aggressiveness, developed a new technique of invective, which aims at enlisting this third person against our enemy. By making our enemy small, inferior, despicable or comic, we achieve in a roundabout way the enjoyment of overcoming him - to which the third person, who has made no efforts, bears witness by his laughter.

But Hans was not by any means a bad character; he was not even one of those children who at his age still give free play to the propensity towards cruelty and violence which is a constituent of human nature. On the contrary, he had an unusually kind-hearted and affectionate disposition; his father reported that the transformation of aggressive tendencies into feelings of pity took place in him at a very early age. Long before the phobia he had become uneasy when he saw the horses in a merry-go-round being beaten; and he was never unmoved if any one wept in his presence. At one stage in the analysis a piece of suppressed sadism made its appearance in a particular context:¹ but it was suppressed sadism, and we shall presently have to discover from the content what it stood for and what it was meant to replace. And Hans deeply loved the father against whom he cherished these death-wishes; and while his intellect demurred to such a contradiction,² he could not help demonstrating the fact of its existence, by hitting his father and immediately afterwards kissing the place he had hit. We ourselves, too, must guard against making a difficulty of such a contradiction. The emotional life of man is in general made up of pairs of contraries such as these.³ Indeed, if it were not so, repressions and neuroses would perhaps never come about. In the adult these pairs of contrary emotions do not as a rule become simultaneously conscious except at the climaxes of passionate love; at other times they usually go on suppressing each other until one of them succeeds in keeping the other altogether out of sight. But in children they can exist peaceably side by side for quite a considerable time.

¹ [1905c, 1697]
² [1909b, 2097]
There are various factors which can be adduced to explain this taboo of virginity and which I will enumerate and consider briefly. When a virgin is deflowered, her blood is as a rule shed; the first attempt at explanation, then, is based on the horror of blood among primitive races who consider blood as the seat of life. This blood taboo is seen in numerous kinds of observances which have nothing to do with sexuality; it is obviously connected with the prohibition against murder and forms a protective measure against the primal thirst for blood, primaeval man's pleasure in killing. According to this view the taboo of virginity is connected with the taboo of menstruation which is almost universally maintained. Primitive people cannot dissociate the puzzling phenomenon of this monthly flow of blood from sadistic ideas. Menstruation, especially its first appearance, is interpreted as the bite of some spirit-animal, perhaps as a sign of sexual intercourse with this spirit. Occasionally some report gives grounds for recognizing the spirit as that of an ancestor and then, supported by other findings, we understand that the menstruating girl is taboo because she is the property of this ancestral spirit.

There is something to be said, however, in criticism of his disappointment. Strictly speaking it is not justified, for it consists in the destruction of an illusion. We welcome illusions because they spare us unpleasurable feelings, and enable us to enjoy satisfactions instead. We must not complain, then, if now and again they come into collision with some portion of reality, and are shattered against it.

Hence the primaeval history of mankind is filled with murder. Even to-day, the history of the world which our children learn at school is essentially a series of murders of peoples. The obscure sense of guilt to which mankind has been subject since prehistoric times, and which in some religions has been condensed into the doctrine of primal guilt, of original sin, is probably the outcome of a blood-guilt incurred by prehistoric man. In my book *Totem and Taboo* (1912-13) I have, following clues given by Robertson Smith, Atkinson and Charles Darwin, tried to guess the nature of this primal guilt, and I believe, too, that the Christian doctrine of to-day enables us to deduce it. If the Son of God was obliged to sacrifice his life to redeem mankind from original sin, then by the law of talion, the requital of like by like, that sin must have been a killing, a murder. Nothing else could call for the sacrifice of a life for its expiation. And the original sin was an offence against God the Father, the primal crime of mankind must have been a parricide, the killing of the primal father of the primitive human horde, whose mnemonic image was later transfigured into a deity.

And so, if we are to be judged by our unconscious wishful impulses, we ourselves are, like primaeval man, a gang of murderers. It is fortunate that all these wishes do not possess the potency that was attributed to them in primaeval times; in the cross-fire of mutual curses mankind would long since have perished, the best and wisest of men and the loveliest and fairest of women with the rest.
This sounds so simple and seductive that it has a claim on our attention. It is true that it would involve a displacement of the riddle of the neurotic state. The continued existence of the sense of inferiority - and thus, of what determine anxiety and the formation of symptoms - seems so well assured that what calls for an explanation is rather how, as an exception, what we know as health can come about. But what is revealed by a careful examination of apprehensiveness in children? At the very beginning, what children are afraid of is strange people; situations only become important because they include people, and impersonal things do not come into account at all until later. But a child is not afraid of these strangers because he attributes evil intentions to them and compares his weakness with their strength, and accordingly assesses them as dangers to his existence, safety and freedom from pain. A child who is mistrustful in this way and terrified of the aggressive instinct which dominates the world is a theoretical construction that has quite miscarried. A child is frightened of a strange face because he is adjusted to the sight of a familiar and beloved figure - ultimately of his mother. It is his disappointment and longing that are transformed into anxiety - his libido, in fact, which has become unemployable, which cannot at that time be held in suspense and is discharged as anxiety. And it can scarcely be a matter of chance, either, that in this situation which is the prototype of the anxiety of children there is a repetition of the determinant of the first state of anxiety during the act of birth - namely, separation from the mother.

[1916-1917, 3453]

When this hostility is directed against people who are otherwise loved we describe it as ambivalence of feeling; and we explain the fact, in what is probably far too rational a manner, by means of the numerous occasions for conflicts of interest which arise precisely in such intimate relations. In the undisguised antipathies and aversions which people feel towards strangers with whom they have to do we may recognize the expression of self-love - of narcissism. This self-love works for the preservation of the individual, and behaves as though the occurrence of any divergence from his own particular lines of development involved a criticism of them and a demand for their alteration. We do not know why such sensitiveness should have been directed to just these details of differentiation; but it is unmistakable that in this whole connection men give evidence of a readiness for hatred, an aggressiveness, the source of which is unknown, and to which one is tempted to ascribe an elementary character.¹

[1921c, 3795]

One thus gets an impression that civilization is something which was imposed on a resisting majority by a minority which understood how to obtain possession of the means to power and coercion. It is, of course, natural to assume that these difficulties are not inherent in the nature of civilization itself but are determined by the imperfections of the cultural forms which have so far been developed. And in fact it is not difficult to indicate those defects. While mankind has made continual advances in its control over nature and may expect to make still greater ones, it is not possible to establish with certainty that a similar advance has been made in the management of human affairs; and probably at all periods, just as now once again, many people have asked themselves whether what little civilization has thus acquired is indeed worth defending at all. One would think that a re-ordering of human relations should be possible, which would remove the sources of dissatisfaction with civilization by renouncing coercion and the suppression of the instincts, so that, undisturbed by internal discord, men might devote themselves to the acquisition of wealth and its enjoyment. That would be the golden age, but it is questionable if such a state of affairs can be realized. It seems rather that every civilization must be built up on coercion and renunciation of instinct; it does not even seem certain that if coercion were to cease the majority of human beings would be prepared to undertake to perform the work necessary for acquiring new wealth. One has, I think, to reckon with the fact that there are present in all men destructive, and therefore anti-social and anti-cultural, trends and that in a great number of people these are strong enough to determine their behaviour in human society.

[1927c, 4419]
The view expressed above is supported by the following considerations. Man is an animal organism with (like others) an unmistakably bisexual disposition. The individual corresponds to a fusion of two symmetrical halves, of which, according to some investigators, one is purely male and the other female. It is equally possible that each half was originally hermaphrodite. Sex is a biological fact which, although it is of extraordinary importance in mental life, is hard to grasp psychologically. We are accustomed to say that every human being displays both male and female instinctual impulses, needs and attributes; but though anatomy, it is true, can point out the characteristic of maleness and femaleness, psychology cannot. For psychology the contrast between the sexes fades away into one between activity and passivity, in which we far too readily identify activity with maleness and passivity with femaleness, a view which is by no means universally confirmed in the animal kingdom. The theory of bisexuality is still surrounded by many obscurities and we cannot but feel it as a serious impediment in psycho-analysis that it has not yet found any link with the theory of the instincts. However this may be, if we assume it as a fact that each individual seeks to satisfy both male and female wishes in his sexual life, we are prepared for the possibility that those demands are not fulfilled by the same object, and that they interfere with each other unless they can be kept apart and each impulse guided into a particular channel that is suited to it. Another difficulty arises from the circumstance that there is so often associated with the erotic relationship, over and above its own sadistic components, a quota of plain inclination to aggression. The love-object will not always view these complications with the degree of understanding and tolerance shown by the peasant woman who complained that her husband did not love her any more, since he had not beaten her for a week.

The element of truth behind all this, which people are so ready to disavow, is that men are not gentle creatures who want to be loved, and who at the most can defend themselves if they are attacked; they are, on the contrary, creatures among whose instinctual endowments is to be reckoned a powerful share of aggressiveness. As a result, their neighbour is for them not only a potential helper or sexual object, but also someone who tempts them to satisfy their aggressiveness on him, to exploit his capacity for work without compensation, to use him sexually without his consent, to seize his possessions, to humiliate him, to cause him pain, to torture and to kill him. *Homo homini lupus.* Who, in the face of all his experience of life and of history, will have the courage to dispute this assertion? As a rule this cruel aggressiveness waits for some provocation or puts itself at the service of some other purpose, whose goal might also have been reached by milder measures. In circumstances that are favourable to it, when the mental counter-forces which ordinarily inhibit it are out of action, it also manifests itself spontaneously and reveals man as a savage beast to whom consideration towards his own kind is something alien. Anyone who calls to mind the atrocities committed during the racial migrations or the invasions of the Huns, or by the people known as Mongols under Jenghiz Khan and Tamerlane, or at the capture of Jerusalem by the pious Crusaders, or even, indeed, the horrors of the recent World War - anyone who calls these things to mind will have to bow humbly before the truth of this view.

[1930a, 4499]

[1930a, 4503]
The existence of this inclination to aggression, which we can detect in ourselves and justly assume to be present in others, is the factor which disturbs our relations with our neighbour and which forces civilization into such a high expenditure. In consequence of this primary mutual hostility of human beings, civilized society is perpetually threatened with disintegration. The interest of work in common would not hold it together; instinctual passions are stronger than reasonable interests. Civilization has to use its utmost efforts in order to set limits to man's aggressive instincts and to hold the manifestations of them in check by psychical reaction-formations. Hence, therefore, the use of methods intended to incite people into identifications and aim-inhibited relationships of love, hence the restriction upon sexual life, and hence too the ideal's commandment to love one's neighbour as oneself - a commandment which is really justified by the fact that nothing else runs so strongly counter to the original nature of man. In spite of every effort, these endeavours of civilization have not so far achieved very much. It hopes to prevent the crudest excesses of brutal violence by itself assuming the right to use violence against criminals, but the law is not able to lay hold of the more cautious and refined manifestations of human aggressiveness. The time comes when each one of us has to give up as illusions the expectations which, in his youth, he pinned upon his fellow men, and when he may learn how much difficulty and pain has been added to his life by their ill-will. At the same time, it would be unfair to reproach civilization with trying to eliminate strife and competition from human activity. These things are undoubtedly indispensable. But opposition is not necessarily enmity; it is merely misused and made an occasion for enmity.

The communists believe that they have found the path to deliverance from our evils. According to them, man is wholly good and is well-disposed to his neighbour; but the institution of private property has corrupted his nature. The ownership of private wealth gives the individual power, and with it the temptation to ill-treat his neighbour; while the man who is excluded from possession is bound to rebel in hostility against his oppressor. If private property were abolished, all wealth held in common, and everyone allowed to share in the enjoyment of it, ill-will and hostility would disappear among men. Since everyone's needs would be satisfied, no one would have any reason to regard another as his enemy; all would willingly undertake the work that was necessary. I have no concern with any economic criticisms of the communist system; I cannot enquire into whether the abolition of private property is expedient or advantageous.¹ But I am able to recognize that the psychological premisses on which the system is based are an untenable illusion. In abolishing private property we deprive the human love of aggression of one of its instruments, certainly a strong one, though certainly not the strongest; but we have in no way altered the differences in power and influence which are misused by aggressiveness, nor have we altered anything in its nature. Aggressiveness was not created by property. It reigned almost without limit in primitive times, when property was still very scanty, and it already shows itself in the nursery almost before property has given up its primal, anal form; it forms the basis of every relation of affection and love among people (with the single exception, perhaps, of the mother's relation to her male child). If we do away with personal rights over material wealth, there still remains prerogative in the field of sexual relationships, which is bound to become the source of the strongest dislike and the most violent hostility among men who in other respects are on an equal footing. If we were to remove this factor, too, by allowing complete freedom of sexual life and thus abolishing the family, the germ-cell of civilization, we cannot, it is true, easily foresee what new paths the development of civilization could take; but one thing we can expect, and that is that this indestructible feature of human nature will follow it there.

¹[1930a, 4505]
It is clearly not easy for men to give up the satisfaction of this inclination to aggression. They do not feel comfortable without it. The advantage which a comparatively small cultural group offers of allowing this instinct an outlet in the form of hostility against intruders is not to be despised. It is always possible to bind together a considerable number of people in love, so long as there are other people left over to receive the manifestations of their aggressiveness. I once discussed the phenomenon that it is precisely communities with adjoining territories, and related to each other in other ways as well, who are engaged in constant feuds and in ridiculing each other - like the Spaniards and Portuguese, for instance, the North Germans and South Germans, the English and Scotch, and so on. I gave this phenomenon the name of 'the narcissism of minor differences', a name which does not do much to explain it. We can now see that it is a convenient and relatively harmless satisfaction of the inclination to aggression, by means of which cohesion between the members of the community is made easier. In this respect the Jewish people, scattered everywhere, have rendered most useful services to the civilizations of the countries that have been their hosts; but unfortunately all the massacres of the Jews in the Middle Ages did not suffice to make that period more peaceful and secure for their Christian fellows. When once the Apostle Paul had posited universal love between men as the foundation of his Christian community, extreme intolerance on the part of Christendom towards those who remained outside it became the inevitable consequence. To the Romans, who had not founded their communal life as a State upon love, religious intolerance was something foreign, although with them religion was a concern of the State and the State was permeated by religion. Neither was it an unaccountable chance that the dream of a Germanic world-dominion called for anti-Semitism as its complement; and it is intelligible that the attempt to establish a new, communist civilization in Russia should find its psychological support in the persecution of the bourgeois. One only wonders, with concern, what the Soviets will do after they have wiped out their bourgeois.

[1930a, 4506]

In none of my previous writings have I had so strong a feeling as now that what I am describing is common knowledge and that I am using up paper and ink and, in due course, the compositor's and printer's work and material in order to expound things which are, in fact, self-evident. For that reason I should be glad to seize the point if it were to appear that the recognition of a special, independent aggressive instinct means an alteration of the psychoanalytic theory of the instincts.

[1930a, 4508]
The assumption of the existence of an instinct of death or destruction has met with resistance even in analytic circles; I am aware that there is a frequent inclination rather to ascribe whatever is dangerous and hostile in love to an original bipolarity in its own nature. To begin with it was only tentatively that I put forward the views I have developed here, but in the course of time they have gained such a hold upon me that I can no longer think in any other way. To my mind, they are far more serviceable from a theoretical standpoint than any other possible ones; they provide that simplification, without either ignoring or doing violence to the facts, for which we strive in scientific work. I know that in sadism and masochism we have always seen before us manifestations of the destructive instinct (directed outwards and inwards), strongly alloyed with erotism; but I can no longer understand how we can have overlooked the ubiquity of non-erotic aggressivity and destructiveness and can have failed to give it its due place in our interpretation of life. (The desire for destruction when it is directed inwards mostly eludes our perception, of course, unless it is tinged with erotism.) I remember my own defensive attitude when the idea of an instinct of destruction first emerged in psycho-analytic literature, and how long it took before I became receptive to it. That others should have shown, and still show, the same attitude of rejection surprises me less. For 'little children do not like it' when there is talk of the inborn human inclination to 'badness', to aggressiveness and destructiveness, and so to cruelty as well. God has made them in the image of His own perfection; nobody wants to be reminded how hard it is to reconcile the undeniable existence of evil - despite the protestations of Christian Science - with His all-powerfulness or His all-goodness. The Devil would be the best way out as an excuse for God; in that way he would be playing the same part as an agent of economic discharge as the Jew does in the world of the Aryan ideal. But even so, one can hold God responsible for the existence of the Devil just as well as for the existence of the wickedness which the Devil embodies. In view of these difficulties, each of us will be well advised, on some suitable occasion, to make a low bow to the deeply moral nature of mankind; it will help us to be generally popular and much will be forgiven us for it.¹

[1930a, 4510]

In all that follows I adopt the standpoint, therefore, that the inclination to aggression is an original, self-subsisting instinctual disposition in man, and I return to my view that it constitutes the greatest impediment to civilization. At one point in the course of this enquiry I was led to the idea that civilization was a special process which mankind undergoes, and I am still under the influence of that idea. I may now add that civilization is a process in the service of Eros, whose purpose is to combine single human individuals, and after that families, then races, peoples and nations, into one great unity, the unity of mankind. Why this has to happen, we do not know; the work of Eros is precisely this.¹ These collections of men are to be libidinally bound to one another. Necessity alone, the advantages of work in common, will not hold them together. But man's natural aggressive instinct, the hostility of each against all and of all against each, opposes this programme of civilization. This aggressive instinct is the derivative and the main representative of the death instinct which we have found alongside of Eros and which shares world-dominion with it. And now, I think, the meaning of the evolution of civilization is no longer obscure to us. It must present the struggle between Eros and Death, between the instinct of life and the instinct of destruction, as it works itself out in the human species. This struggle is what all life essentially consists of, and the evolution of civilization may therefore be simply described as the struggle for life of the human species.¹ And it is this battle of the giants that our nursemaid try to appease with their lullaby about Heaven.

[1930a, 4512]
The cultural super-ego has developed its ideals and set up its demands. Among the latter, those which deal with the relations of human beings to one another are comprised under the heading of ethics. People have at all times set the greatest value on ethics, as though they expected that it in particular would produce especially important results. And it does in fact deal with a subject which can easily be recognized as the sorest spot in every civilization. Ethics is thus to be regarded as a therapeutic attempt - as an endeavour to achieve, by means of a command of the super-ego, something which has so far not been achieved by means of any other cultural activities. As we already know, the problem before us is how to get rid of the greatest hindrance to civilization - namely, the constitutional inclination of human beings to be aggressive towards one another; and for that very reason we are especially interested in what is probably the most recent of the cultural commands of the super-ego, the commandment to love one's neighbour as oneself. In our research into, and therapy of, a neurosis, we are led to make two reproaches against the super-ego of the individual. In the severity of its commands and prohibitions it troubles itself too little about the happiness of the ego, in that it takes insufficient account of the resistances against obeying them - of the instinctual strength of the id, and of the difficulties presented by the real external environment. Consequently we are very often obliged, for therapeutic purposes, to oppose the super-ego, and we endeavour to lower its demands. Exactly the same objections can be made against the ethical demands of the cultural super-ego. It, too, does not trouble itself enough about the facts of the mental constitution of human beings. It issues a command and does not ask whether it is possible for people to obey it. On the contrary, it assumes that a man's ego is psychologically capable of anything that is required of it, that his ego has unlimited mastery over his id. This is a mistake; and even in what are known as normal people the id cannot be controlled beyond certain limits. If more is demanded of a man, a revolt will be produced in him or a neurosis, or he will be made unhappy. The commandment, 'Love thy neighbour as thyself', is the strongest defence against human aggressiveness and an excellent example of the unpsychological proceedings of the cultural super-ego. The commandment is impossible to fulfil; such an enormous inflation of love can only lower its value, not get rid of the difficulty. Civilization pays no attention to all this; it merely admonishes us that the harder it is to obey the precept the more meritorious it is to do so. But anyone who follows such a precept in present-day civilization only puts himself at a disadvantage vis-à-vis the person who disregards it. What a potent obstacle to civilization aggressiveness must be, if the defence against it can cause as much unhappiness as aggressiveness itself! 'Natural' ethics, as it is called, has nothing to offer here except the narcissistic satisfaction of being able to think oneself better than others. At this point the ethics based on religion introduces its promises of a better after-life. But so long as virtue is not rewarded here on earth, ethics will, I fancy, preach in vain. I too think it quite certain that a real change in the relations of human beings to possessions would be of more help in this direction than any ethical commands; but the recognition of this fact among socialists has been obscured and made useless for practical purposes by a fresh idealistic misconception of human nature.

The fateful question for the human species seems to me to be whether and to what extent their cultural development will succeed in mastering the disturbance of their communal life by the human instinct of aggression and self-destruction. It may be that in this respect precisely the present time deserves a special interest. Men have gained control over the forces of nature to such an extent that with their help they would have no difficulty in exterminating one another to the last man. They know this, and hence comes a large part of their current unrest, their unhappiness and their mood of anxiety. And now it is to be expected that the other of the two 'Heavenly Powers', eternal Eros, will make an effort to assert himself in the struggle with his equally immortal adversary. But who can foresee with what success and with what result?
We did not maintain this position for long. Our feeling of their being a contrariety in instinctual life soon found another and sharper expression. It is not my wish, however, to put before you the origin of this novelty in the theory of the instincts; it too is based essentially on biological considerations. I shall offer it to you as a ready-made product. Our hypothesis is that there are two essentially different classes of instincts: the sexual instincts, understood in the widest sense - Eros, if you prefer that name - and the aggressive instincts, whose aim is destruction. When it is put to you like this, you will scarcely regard it as a novelty. It looks like an attempt at a theoretical transfiguration of the commonplace opposition between loving and hating, which coincides, perhaps, with the other polarity, of attraction and repulsion, which physics assumes in the inorganic world. But it is a remarkable thing that this hypothesis is nevertheless felt by many people as an innovation and, indeed, as a most undesirable one which should be got rid of as quickly as possible. I presume that a strong affective factor is coming into effect in this rejection. Why have we ourselves needed such a long time before we decided to recognize an aggressive instinct? Why did we hesitate to make use, on behalf of our theory, of facts which were obvious and familiar to everyone? We should probably have met with little resistance if we had wanted to ascribe an instinct with such an aim to animals. But to include it in the human constitution appears sacrilegious; it contradicts too many religious presumptions and social conventions. No, man must be naturally good or at least good-natured. If he occasionally shows himself brutal, violent or cruel, these are only passing disturbances of his emotional life, for the most part provoked, or perhaps only consequences of the inexpedient social regulations which he has hitherto imposed on himself.

Unfortunately what history tells us and what we ourselves have experienced does not speak in this sense but rather justifies a judgement that belief in the 'goodness' of human nature is one of those evil illusions by which mankind expect their lives to be beautified and made easier while in reality they only cause damage. We need not continue this controversy, since we have argued in favour of a special aggressive and destructive instinct in men not on account of the teachings of history or of our experience in life but on the basis of general considerations to which we were led by examining the phenomena of sadism and masochism. As you know, we call it sadism when sexual satisfaction is linked to the condition of the sexual object's suffering pain, ill-treatment and humiliation, and masochism when the need is felt of being the ill-treated object oneself. As you know too, a certain admixture of these two trends is included in normal sexual relations, and we speak of perversions when they push the other sexual aims into the background and replace them by their own aims. And you will scarcely have failed to notice that sadism has a more intimate relation with masculinity and masochism with femininity, as though there were a secret kinship present; though I must add that we have made no progress along that path. Both phenomena, sadism and masochism alike, but masochism quite especially, present a truly puzzling problem to the libido theory; and it is only proper if what was a stumbling-block for the one theory should become the cornerstone of the theory replacing it.
I am almost ashamed to comment to you on a subject of such importance and complexity with
these few inadequate remarks, and I know too that I have told you nothing that is new to you. I
merely want to draw your attention to the fact that the relation of mankind to their control over
Nature, from which they derive their weapons for fighting their fellow-men, must necessarily also
affect their economic arrangements. We seem to have come a long way from the problem of a
Weltanschauung, but we shall very soon be back to it. The strength of Marxism clearly lies, not
in its view of history or the prophecies of the future that are based on it, but in its sagacious
indication of the decisive influence which the economic circumstances of men have upon their
intellectual, ethical and artistic attitudes. A number of connections and implications were thus
uncovered, which had previously been almost totally overlooked. But it cannot be assumed that
economic motives are the only ones that determine the behaviour of human beings in society.
The undoubted fact that different individuals, races and nations behave differently under the
same economic conditions is alone enough to show that economic motives are not the sole
dominating factors. It is altogether incomprehensible how psychological factors can be
overlooked where what is in question are the reactions of living human beings; for not only were
these reactions concerned in establishing the economic conditions, but even under the
domination of those conditions men can only bring their original instinctual impulses into play -
their self-preservative instinct, their aggressiveness, their need to be loved, their drive towards
obtaining pleasure and avoiding unpleasure. In an earlier enquiry I also pointed out the
important claims made by the super-ego, which represents tradition and the ideals of the past
and will for a time resist the incentives of a new economic situation. And finally we must not
forget that the mass of human beings who are subjected to economic necessities also undergo
the process of cultural development - of civilization as other people may say - which, though no
doubt influenced by all the other factors, is certainly independent of them in its origin, being
comparable to an organic process and very well able on its part to exercise an influence on the
other factors. It displaces instinctual aims and brings it about that people become antagonistic
to what they had previously tolerated. Moreover, the progressive strengthening of the scientific
spirit seems to form an essential part of it. If anyone were in a position to show in detail the way
in which these different factors - the general inherited human disposition, its racial variations
and its cultural transformations - inhibit and promote one another under the conditions of social
rank, profession and earning capacity - if anyone were able to do this, he would have
supplemented Marxism so that it was made into a genuine social science. For sociology too,
dealing as it does with the behaviour of people in society, cannot be anything but applied
psychology. Strictly speaking there are only two sciences: psychology, pure and applied, and
natural science.
[1933a, 4775]

I can now proceed to add a gloss to another of your remarks. You express astonishment at
the fact that it is so easy to make men enthusiastic about a war and add your suspicions that
there is something at work in them - an instinct for hatred and destruction - which goes halfway
to meet the efforts of the warmongers. Once again, I can only express my entire agreement. We
believe in the existence of an instinct of that kind and have in fact been occupied during the last
few years in studying its manifestations. Will you allow me to take this opportunity of putting
before you a portion of the theory of the instincts which, after much tentative groping and many
fluctuations of opinion, has been reached by workers in the field of psycho-analysis?
[1933b, 4798]
It is clearly not easy for men to give up the satisfaction of this inclination to aggression. They do not feel comfortable without it. The advantage which a comparatively small cultural group offers of allowing this instinct an outlet in the form of hostility against intruders is not to be despised. It is always possible to bind together a considerable number of people in love, so long as there are other people left over to receive the manifestations of their aggressiveness. I once discussed the phenomenon that it is precisely communities with adjoining territories, and related to each other in other ways as well, who are engaged in constant feuds and in ridiculing each other - like the Spaniards and Portuguese, for instance, the North Germans and South Germans, the English and Scotch, and so on. I gave this phenomenon the name of ‘the narcissism of minor differences’, a name which does not do much to explain it. We can now see that it is a convenient and relatively harmless satisfaction of the inclination to aggression, by means of which cohesion between the members of the community is made easier. In this respect the Jewish people, scattered everywhere, have rendered most useful services to the civilizations of the countries that have been their hosts; but unfortunately all the massacres of the Jews in the Middle Ages did not suffice to make that period more peaceful and secure for their Christian fellows. When once the Apostle Paul had posited universal love between men as the foundation of his Christian community, extreme intolerance on the part of Christendom towards those who remained outside it became the inevitable consequence. To the Romans, who had not founded their communal life as a State upon love, religious intolerance was something foreign, although with them religion was a concern of the State and the State was permeated by religion. Neither was it an unaccountable chance that the dream of a Germanic world-dominion called for anti-Semitism as its complement; and it is intelligible that the attempt to establish a new, communist civilization in Russia should find its psychological support in the persecution of the bourgeois. One only wonders, with concern, what the Soviets will do after they have wiped out their bourgeois.

[1930a, 4506]
In this series of dreams dreamt by an author who had been a journeyman tailor in his youth, it is hard to recognize the dominance of wish-fulfilment. All the dreamer's enjoyment lay in his day-time existence, whereas in his dreams he was still haunted by the shadow of an unhappy life from which he had at last escaped. Some dreams of my own of a similar kind have enabled me to throw a little light on the subject. As a young doctor I worked for a long time at the Chemical Institute without ever becoming proficient in the skills which that science demands; and for that reason in my waking life I have never liked thinking of this barren and indeed humiliating episode in my apprenticeship. On the other hand I have a regularly recurring dream of working in the laboratory, of carrying out analyses and of having various experiences there. These dreams are disagreeable in the same way as examination dreams and they are never very distinct. While I was interpreting one of them, my attention was eventually attracted by the word 'analysis', which gave me a key to their understanding. Since those days I have become an 'analyst', and I now carry out analyses which are very highly spoken of, though it is true that they are 'psycho-analyses'. It was now clear to me: if I have grown proud of carrying out analyses of that kind in my daytime life and feel inclined to boast to myself of how successful I have become, my dreams remind me during the night of those other, unsuccessful analyses of which I have no reason to feel proud. They are the punishment dreams of a parvenu, like the dreams of the journeyman tailor who had grown into a famous author. But how does it become possible for a dream, in the conflict between a parvenu’s pride and his self-criticism, to side with the latter, and choose as its content a sensible warning instead of an unlawful wish-fulfilment? As I have already said, the answer to this question raises difficulties. We may conclude that the foundation of the dream was formed in the first instance by an exaggeratedly ambitious phantasy, but that humiliating thoughts that poured cold water on the phantasy found their way into the dream instead. It may be remembered that there are masochistic impulses in the mind, which may be responsible for a reversal such as this. I should have no objection to this class of dreams being distinguished from 'wish-fulfilment dreams' under the name of 'punishment dreams'. I should not regard this as implying any qualification of the theory of dreams which I have hitherto put forward; it would be no more than a linguistic expedient for meeting the difficulties of those who find it strange that opposites should converge. But a closer examination of some of these dreams brings something more to light. In an indistinct part of the background of one of my laboratory dreams I was of an age which placed me precisely in the gloomiest and most unsuccessful year of my medical career. I was still without a post and had no idea how I could earn my living; but at the same time I suddenly discovered that I had a choice open to me between several women whom I might marry! So I was once more young, and, more than everything, she was once more young - the woman who had shared all these difficult years with me. The unconscious instigator of the dream was thus revealed as one of the constantly gnawing wishes of a man who is growing older. The conflict raging in other levels of the mind between vanity and self-criticism had, it is true, determined the content of the dream; but it was only the more deeply-rooted wish for youth that had made it possible for that conflict to appear as a dream. Even when we are awake we sometimes say to ourselves: "Things are going very well to-day and times were hard in the old days; all the same, it was lovely then - I was still young." [1900a, 918]
Several other forms of creative writing, however, are equally subject to these same preconditions for enjoyment. Lyric poetry serves the purpose, more than anything, of giving vent to intense feelings of many sorts - just as was at one time the case with dancing. Epic poetry aims chiefly at making it possible to feel the enjoyment of a great heroic character in his hour of triumph. But drama seeks to explore emotional possibilities more deeply and to give an enjoyable shape even to forebodings of misfortune; for this reason it depicts the hero in his struggles, or rather (with masochistic satisfaction) in defeat. This relation to suffering and misfortune might be taken as characteristic of drama, whether, as happens in serious plays, it is only concern that is aroused, and afterwards allayed, or whether, as happens in tragedies, the suffering is actually realized. The fact that drama originated out of sacrificial rites (cf. the goat and the scapegoat) in the cult of the gods cannot be unrelated to this meaning of drama. It appeases, as it were, a rising rebellion against the divine regulation of the universe, which is responsible for the existence of suffering. Heroes are first and foremost rebels against God or against something divine; and pleasure is derived, as it seems, from the affliction of a weaker being in the face of divine might - a pleasure due to masochistic satisfaction as well as to direct enjoyment of a character whose greatness is insisted upon in spite of everything. Here we have a mood like that of Prometheus, but alloyed with a paltry readiness to let oneself be soothed for the moment by a temporary satisfaction.

Suffering of every kind is thus the subject-matter of drama, and from this suffering it promises to give the audience pleasure. Thus we arrive at a first precondition of this form of art: that it should not cause suffering to the audience, that it should know how to compensate, by means of the possible satisfactions involved, for the sympathetic suffering which is aroused. (Modern writers have particularly often failed to obey this rule.) But the suffering represented is soon restricted to mental suffering; for no one wants physical suffering who knows how quickly all mental enjoyment is brought to an end by the changes in somatic feeling that physical suffering brings about. If we are sick we have one wish only: to be well again and to be quit of our present state. We call for the doctor and medicine, and for the removal of the inhibition on the play of phantasy which has pampered us into deriving enjoyment even from our own sufferings. If a spectator puts himself in the place of someone who is physically ill he finds himself without any capacity for enjoyment or psychical activity. Consequently a person who is physically ill can only figure on the stage as a piece of stage property and not as a hero, unless, indeed, some peculiar physical aspects of his illness make psychical activity possible - such, for instance, as the sick man's forlorn state in the Philoctetes or the hopelessness of the sufferers in the class of plays that centre round consumptives.
People are acquainted with mental suffering principally in connection with the circumstances in which it is acquired; accordingly, dramas dealing with it require some event out of which the illness shall arise and they open with an exposition of this event. It is only an apparent exception that some plays, such as the Ajax and the Philoctetes, introduce the mental illness as already fully established; for in Greek tragedies, owing to the familiarity of the material, the curtain rises, as one might say, in the middle of the play. It is easy to give an exhaustive account of the preconditions governing an event of the kind that is here in question. It must be an event involving conflict and it must include an effort of will together with resistance. This precondition found its first and grandest fulfilment in a struggle against divinity. I have already said that a tragedy of this kind is one of rebellion, in which the dramatist and the audience take the side of the rebel. The less belief there comes to be in divinity, the more important becomes the human regulation of affairs; and it is this which, with increasing insight, comes to be held responsible for suffering. Thus the hero’s next struggle is against human society, and here we have the class of social tragedies. Yet another fulfilment of the necessary precondition is to be found in a struggle between individual men. Such are tragedies of character, which exhibit all the excitement of an ‘agon’, and which are best played out between outstanding characters who have freed themselves from the bond of human institutions - which, in fact, must have two heroes. Fusions between these two last classes, with a hero struggling against institutions embodied in powerful characters, are of course admissible without question. Pure tragedies of character lack the rebellious source of enjoyment, but this emerges once again no less forcibly in social dramas (in Ibsen for instance) than it did in the historical plays of the Greek classical tragedians.

[1942a [1905], 1609]

If, in the third place, you will recall our idea that the dreamer fighting against his own wishes is to be compared with a summation of two separate, though in some way intimately connected, people, you will understand another possibility. For there is a possibility that the fulfilment of a wish may bring about something very far from pleasant - namely, a punishment. Here we can once more use the fairy tale of the three wishes as an illustration. The fried sausages on a plate were the direct fulfilment of the wish of the first person, the woman. The sausages on her nose were the fulfilment of the wish of the second person, the man, but were at the same time a punishment for the woman's foolish wish. (We shall discover in neuroses the motive for the third wish, the last remaining one in the fairy tale.) There are many such punitive trends in the mental life of human beings; they are very powerful, and we may hold them responsible for some of the distressing dreams. Perhaps you will now say that this leaves very little over of the famous wish-fulfilment. But if you look more closely you will admit that you are wrong. Compared with the multiplicity (which I shall mention later) of the things that dreams might be and according to many authorities actually are, our solution - wish-fulfilment, anxiety-fulfilment, punishment-fulfilment - is a very restricted one. We may add that the anxiety is the direct opposite of the wish, that opposites are especially close to one another in associations and that in the unconscious they coalesce; and further, that the punishment is also the fulfilment of a wish - of the wish of the other, censoring person.

[1916-1917, 3307]

It will have been easy to guess from my account that the patient was a Russian. I parted from him, regarding him as cured, a few weeks before the unexpected outbreak of the Great War; and I did not see him again until the shifting chances of the war had given the Central European Powers access to South Russia. He then came to Vienna and reported that immediately after the end of the treatment he had been seized with a longing to tear himself free from my influence. After a few months’ work, a piece of the transference which had not hitherto been overcome was successfully dealt with. Since then the patient has felt normal and has behaved unexceptionably, in spite of the war having robbed him of his home, his possessions, and all his family relationships. It may be that his very misery, by gratifying his sense of guilt, contributed to the consolidation of his recovery.

[1918b, 3596]
Little light is thrown upon the genesis of masochism by our discussion of the beating-phantasy. To begin with, there seems to be a confirmation of the view that masochism is not the manifestation of a primary instinct, but originates from sadism which has been turned round upon the self - that is to say, by means of regression from an object to the ego.¹ Instincts with a passive aim must be taken for granted as existing, especially among women. But passivity is not the whole of masochism. The characteristic of unpleasure belongs to it as well, - a bewilderding accompaniment to the satisfaction of an instinct. The transformation of sadism into masochism appears to be due to the influence of the sense of guilt which takes part in the act of repression. Thus repression is operative here in three ways: it renders the consequences of the genital organization unconscious, it compels that organization itself to regress to the earlier sadistic-anal stage, and it transforms the sadism of this stage into masochism, which is passive and again in a certain sense narcissistic. The second of these three effects is made possible by the weakness of the genital organization, which must be presupposed in these cases. The third becomes necessary because the sense of guilt takes as much objection to sadism as to incestuous object-choice genitally conceived. Again, the analyses do not tell us the origin of the sense of guilt itself. It seems to be brought along by the new phase upon which the child is entering, and, if it afterwards persists, it seems to correspond to a scar-like formation which is similar to the sense of inferiority. According to our present orientation in the structure of the ego, which is as yet uncertain, we should assign it to the agency in the mind which sets itself up as a critical conscience over against the rest of the ego, which produces Silberer's functional phenomenon in dreams, and which cuts itself loose from the ego in delusions of being watched.

I am not aware, however, that patients suffering from traumatic neurosis are much occupied in their waking lives with memories of their accident. Perhaps they are more concerned with not thinking of it. Anyone who accepts it as something self-evident that their dreams should put them back at night into the situation that caused them to fall ill has misunderstood the nature of dreams. It would be more in harmony with their nature if they showed the patient pictures from his healthy past or of the cure for which he hopes. If we are not to be shaken in our belief in the wish-fulfilling tenor of dreams by the dreams of traumatic neurotics, we still have one resource open to us: we may argue that the function of dreaming, like so much else, is upset in this condition and diverted from its purposes, or we may be driven to reflect on the mysterious masochistic trends of the ego.

The existence of a masochistic trend in the instinctual life of human beings may justly be described as mysterious from the economic point of view. For if mental processes are governed by the pleasure principle in such a way that their first aim is the avoidance of unpleasure and the obtaining of pleasure, masochism is incomprehensible. If pain and unpleasure can be not simply warnings but actually aims, the pleasure principle is paralysed - it is as though the watchman over our mental life were put out of action by a drug.

Thus masochism appears to us in the light of a great danger, which is in no way true of its counterpart, sadism. We are tempted to call the pleasure principle the watchman over our life rather than merely over our mental life. But in that case we are faced with the task of investigating the relationship of the pleasure principle to the two classes of instincts which we have distinguished - the death instincts and the erotic (libidinal) life instincts; and we cannot proceed further in our consideration of the problem of masochism till we have accomplished that task.
The inadequacy of this explanation is seen, however, in the fact that it throws no light on the regular and close connections of masochism with its counterpart in instinctual life, sadism. If we go back a little further, to our hypothesis of the two classes of instincts which we regard as operative in the living organism, we arrive at another derivation of masochism, which, however, is not in contradiction with the former one. In (multicellular) organisms the libido meets the instinct of death, or destruction, which is dominant in them and which seeks to disintegrate the cellular organism and to conduct each separate unicellular organism into a state of inorganic stability (relative though this may be). The libido has the task of making the destroying instinct innocuous, and it fulfils the task by diverting that instinct to a great extent outwards - soon with the help of a special organic system, the muscular apparatus - towards objects in the external world. The instinct is then called the destructive instinct, the instinct for mastery, or the will to power. A portion of the instinct is placed directly in the service of the sexual function, where it has an important part to play. This is sadism proper. Another portion does not share in this transposition outwards; it remains inside the organism and, with the help of the accompanying sexual excitation described above, becomes libidinally bound there. It is in this portion that we have to recognize the original, erotogenic masochism.

If one is prepared to overlook a little inexactitude, it may be said that the death instinct which is operative in the organism - primal sadism - is identical with masochism. After the main portion of it has been transposed outwards on to objects, there remains inside, as a residuum of it, the erotogenic masochism proper, which on the one hand has become a component of the libido and, on the other, still has the self as its object. This masochism would thus be evidence of, and a remainder from, the phase of development in which the coalescence, which is so important for life, between the death instinct and Eros took place. We shall not be surprised to hear that in certain circumstances the sadism, or instinct of destruction, which has been directed outwards, projected, can be once more introjected, turned inwards, and in this way regress to its earlier situation. If this happens, a secondary masochism is produced, which is added to the original masochism.

The third form of masochism, moral masochism, is chiefly remarkable for having loosened its connection with what we recognize as sexuality. All other masochistic sufferings carry with them the condition that they shall emanate from the loved person and shall be endured at his command. This restriction has been dropped in moral masochism. The suffering itself is what matters; whether it is decreed by someone who is loved or by someone who is indifferent is of no importance. It may even be caused by impersonal powers or by circumstances; the true masochist always turns his cheek whenever he has a chance of receiving a blow. It is very tempting, in explaining this attitude, to leave the libido out of account and to confine oneself to assuming that in this case the destructive instinct has been turned inwards again and is now raging against the self; yet there must be some meaning in the fact that linguistic usage has not given up the connection between this norm of behaviour and erotism and calls these self-injurers masochists too.
Let us keep to a habit of our technique and consider first the extreme and unmistakably pathological form of this masochism. I have described elsewhere² how in analytic treatment we come across patients to whom, owing to their behaviour towards its therapeutic influence, we are obliged to ascribe an 'unconscious' sense of guilt. I pointed out the sign by which such people can be recognized (a 'negative therapeutic reaction') and I did not conceal the fact that the strength of such an impulse constitutes one of the most serious resistances and the greatest danger to the success of our medical or educative aims. The satisfaction of this unconscious sense of guilt is perhaps the most powerful bastion in the subject's (usually composite) gain from illness - in the sum of forces which struggle against his recovery and refuse to surrender his state of illness. The suffering entailed by neuroses is precisely the factor that makes them valuable to the masochistic trend. It is instructive, too, to find, contrary to all theory and expectation, that a neurosis which has defied every therapeutic effort may vanish if the subject becomes involved in the misery of an unhappy marriage, or loses all his money, or develops a dangerous organic disease. In such instances one form of suffering has been replaced by another; and we see that all that mattered was that it should be possible to maintain a certain amount of suffering.

[1924c, 4078]

Patients do not easily believe us when we tell them about the unconscious sense of guilt. They know only too well by what torments - the pangs of conscience - a conscious sense of guilt, a consciousness of guilt, expresses itself, and they therefore cannot admit that they could harbour exactly analogous impulses in themselves without being in the least aware of them. We may, I think, to some extent meet their objection if we give up the term 'unconscious sense of guilt', which is in any case psychologically incorrect, and speak instead of a 'need for punishment', which covers the observed state of affairs just as aptly. We cannot, however, restrain ourselves from judging and localizing this unconscious sense of guilt in the same way as we do the conscious kind.

[1924c, 4078]

After these preliminaries we can return to our consideration of moral masochism. We have said that, by their behaviour during treatment and in life, the individuals in question give an impression of being morally inhibited to an excessive degree, of being under the domination of an especially sensitive conscience, although they are not conscious of any of this ultra-morality. On closer inspection, we can see the difference there is between an unconscious extension of morality of this kind and moral masochism. In the former, the accent falls on the heightened sadism of the super-ego to which the ego submits; in the latter, it falls on the ego's own masochism which seeks punishment, whether from the super-ego or from the parental powers outside. We may be forgiven for having confused the two to begin with; for in both cases it is a question of a relationship between the ego and the super-ego (or powers that are equivalent to it), and in both cases what is involved is a need which is satisfied by punishment and suffering. It can hardly be an insignificant detail, then, that the sadism of the super-ego becomes for the most part glaringly conscious, whereas the masochistic trend of the ego remains as a rule concealed from the subject and has to be inferred from his behaviour.

[1924c, 4081]
The fact that moral masochism is unconscious leads us to an obvious clue. We were able to translate the expression 'unconscious sense of guilt' as meaning a need for punishment at the hands of a parental power. We now know that the wish, which so frequently appears in phantasies, to be beaten by the father stands very close to the other wish, to have a passive (feminine) sexual relation to him and is only a regressive distortion of it. If we insert this explanation into the content of moral masochism, its hidden meaning becomes clear to us. Conscience and morality have arisen through the overcoming, the desexualization, of the Oedipus complex; but through moral masochism morality becomes sexualized once more, the Oedipus complex is revived and the way is opened for a regression from morality to the Oedipus complex. This is to the advantage neither of morality nor of the person concerned. An individual may, it is true, have preserved the whole or some measure of ethical sense alongside of his masochism; but, alternatively, a large part of his conscience may have vanished into his masochism. Again, masochism creates a temptation to perform 'sinful' actions, which must then be expiated by the reproaches of the sadistic conscience (as is exemplified in so many Russian character-types) or by chastisement from the great parental power of Destiny. In order to provoke punishment from this last representative of the parents, the masochist must do what is inexpedient, must act against his own interests, must ruin the prospects which open out to him in the real world and must, perhaps, destroy his own real existence.

The turning back of sadism against the self regularly occurs where a cultural suppression of the instincts holds back a large part of the subject's destructive instinctual components from being exercised in life. We may suppose that this portion of the destructive instinct which has retreated appears in the ego as an intensification of masochism. The phenomena of conscience, however, lead us to infer that the destructiveness which returns from the external world is also taken up by the super-ego, without any such transformation, and increases its sadism against the ego. The sadism of the super-ego and the masochism of the ego supplement each other and unite to produce the same effects. It is only in this way, I think, that we can understand how the suppression of an instinct can - frequently or quite generally - result in a sense of guilt and how a person's conscience becomes more severe and more sensitive the more he refrains from aggression against others. One might expect that if a man knows that he is in the habit of avoiding the commission of acts of aggression that are undesirable from a cultural standpoint he will for that reason have a good conscience and will watch over his ego less suspiciously. The situation is usually presented as though ethical requirements were the primary thing and the renunciation of instinct followed from them. This leaves the origin of the ethical sense unexplained. Actually, it seems to be the other way about. The first instinctual renunciation is enforced by external powers, and it is only this which creates the ethical sense, which expresses itself in conscience and demands a further renunciation of instinct.

Thus moral masochism becomes a classical piece of evidence for the existence of fusion of instinct. Its danger lies in the fact that it originates from the death instinct and corresponds to the part of that instinct which has escaped being turned outwards as an instinct of destruction. But since, on the other hand, it has the significance of an erotic component, even the subject's destruction of himself cannot take place without libidinal satisfaction.

¹ It may quite often happen that although a danger-situation is correctly estimated in itself, a certain amount of instinctual anxiety is added to the realistic anxiety. In that case the instinctual demand before whose satisfaction the ego recoils is a masochistic one: the instinct of destruction directed against the subject himself. Perhaps an addition of this kind explains cases in which reactions of anxiety are exaggerated, inexpedient or paralysing. Phobias of heights (windows, towers, precipices and so on) may have some such origin. Their hidden feminine significance is closely connected with masochism.
The view expressed above is supported by the following considerations. Man is an animal organism with (like others) an unmistakably bisexual disposition. The individual corresponds to a fusion of two symmetrical halves, of which, according to some investigators, one is purely male and the other female. It is equally possible that each half was originally hermaphrodite. Sex is a biological fact which, although it is of extraordinary importance in mental life, is hard to grasp psychologically. We are accustomed to say that every human being displays both male and female instinctual impulses, needs and attributes; but though anatomy, it is true, can point out the characteristic of maleness and femaleness, psychology cannot. For psychology the contrast between the sexes fades away into one between activity and passivity, in which we far too readily identify activity with maleness and passivity with femaleness, a view which is by no means universally confirmed in the animal kingdom. The theory of bisexuality is still surrounded by many obscurities and we cannot but feel it as a serious impediment in psycho-analysis that it has not yet found any link with the theory of the instincts. However this may be, if we assume it as a fact that each individual seeks to satisfy both male and female wishes in his sexual life, we are prepared for the possibility that those demands are not fulfilled by the same object, and that they interfere with each other unless they can be kept apart and each impulse guided into a particular channel that is suited to it. Another difficulty arises from the circumstance that there is so often associated with the erotic relationship, over and above its own sadistic components, a quota of plain inclination to aggression. The love-object will not always view these complications with the degree of understanding and tolerance shown by the peasant woman who complained that her husband did not love her any more, since he had not beaten her for a week.

[1930a, 4499]

Though it cannot be of great importance, it may not be superfluous to elucidate the meaning of a few words such as 'super-ego', 'conscience', 'sense of guilt', 'need for punishment' and 'remorse', which we have often, perhaps, used too loosely and interchangeably. They all relate to the same state of affairs, but denote different aspects of it. The super-ego is an agency which has been inferred by us, and conscience is a function which we ascribe, among other functions, to that agency. This function consists in keeping a watch over the actions and intentions of the ego and judging them, in exercising a censorship. The sense of guilt, the harshness of the super-ego, is thus the same thing as the severity of the conscience. It is the perception which the ego has of being watched over in this way, the assessment of the tension between its own strivings and the demands of the super-ego. The fear of this critical agency (a fear which is at the bottom of the whole relationship), the need for punishment, is an instinctual manifestation on the part of the ego, which has become masochistic under the influence of a sadistic super-ego; it is a portion, that is to say, of the instinct towards internal destruction present in the ego, employed for forming an erotic attachment to the super-ego. We ought not to speak of a conscience until a super-ego is demonstrably present. As to a sense of guilt, we must admit that it is in existence before the super-ego, and therefore before conscience, too. At that time it is the immediate expression of fear of the external authority, a recognition of the tension between the ego and that authority. It is the direct derivative of the conflict between the need for the authority’s love and the urge towards instinctual satisfaction, whose inhibition produces the inclination to aggression. The superimposition of these two strata of the sense of guilt - one coming from fear of the external authority, the other from fear of the internal authority - has hampered our insight into the position of conscience in a number of ways. Remorse is a general term for the ego's reaction in a case of sense of guilt. It contains, in little altered form, the sensory material of the anxiety which is operating behind the sense of guilt; it is itself a punishment and can include the need for punishment. Thus remorse, too, can be older than conscience.

[1930a, 4524]
But what has been said so far does not exhaust the consequences of the repression of the hatred of the father in the Oedipus complex. There is something fresh to be added: namely that in spite of everything the identification with the father finally makes a permanent place for itself in the ego. It is received into the ego, but establishes itself there as a separate agency in contrast to the rest of the content of the ego. We then give it the name of super-ego and ascribe to it, the inheritor of the parental influence, the most important functions. If the father was hard, violent and cruel, the super-ego takes over those attributes from him and, in the relations between the ego and it, the passivity which was supposed to have been repressed is re-established. The super-ego has become sadistic, and the ego becomes masochistic - that is to say, at bottom passive in a feminine way. A great need for punishment develops in the ego, which in part offers itself as a victim to Fate, and in part finds satisfaction in ill-treatment by the super-ego (that is, in the sense of guilt). For every punishment is ultimately castration and, as such, a fulfilment of the old passive attitude towards the father. Even Fate is, in the last resort, only a later projection of the father.

Unfortunately what history tells us and what we ourselves have experienced does not speak in this sense but rather justifies a judgement that belief in the 'goodness' of human nature is one of those evil illusions by which mankind expect their lives to be beautified and made easier while in reality they only cause damage. We need not continue this controversy, since we have argued in favour of a special aggressive and destructive instinct in men not on account of the teachings of history or of our experience in life but on the basis of general considerations to which we were led by examining the phenomena of sadism and masochism. As you know, we call it sadism when sexual satisfaction is linked to the condition of the sexual object's suffering pain, ill-treatment and humiliation, and masochism when the need is felt of being the ill-treated object oneself. As you know too, a certain admixture of these two trends is included in normal sexual relations, and we speak of perversions when they push the other sexual aims into the background and replace them by their own aims. And you will scarcely have failed to notice that sadism has a more intimate relation with masculinity and masochism with femininity, as though there were a secret kinship present; though I must add that we have made no progress along that path. Both phenomena, sadism and masochism alike, but masochism quite especially, present a truly puzzling problem to the libido theory; and it is only proper if what was a stumbling-block for the one theory should become the cornerstone of the theory replacing it.

Let us go back to the special problem presented to us by masochism. If for a moment we leave its erotic components on one side, it affords us a guarantee of the existence of a trend that has self-destruction as its aim. If it is true of the destructive instinct as well that the ego - but what we have in mind here is rather the id, the whole person - originally includes all the instinctual impulses, we are led to the view that masochism is older than sadism, and that sadism is the destructive instinct directed outwards, thus acquiring the characteristic of aggressiveness. A certain amount of the original destructive instinct may still remain in the interior. It seems that we can only perceive it under two conditions: if it is combined with erotic instincts into masochism or if - with a greater or lesser erotic addition - it is directed against the external world as aggressiveness. And now we are struck by the significance of the possibility that the aggressiveness may not be able to find satisfaction in the external world because it comes up against real obstacles. If this happens, it will perhaps retreat and increase the amount of self-destructiveness holding sway in the interior. We shall hear how this is in fact what occurs and how important a process this is. Impeded aggressiveness seems to involve a grave injury. It really seems as though it is necessary for us to destroy some other thing or person in order not to destroy ourselves, in order to guard against the impulsion to self-destruction. A sad disclosure indeed for the moralist!
For, whether a man is a homosexual or a necrophilic, a hysterical suffering from anxiety, an obsessional neurotic cut off from society, or a raving lunatic, the 'Individual Psychologist' of the Adlerian school will declare that the impelling motive of his condition is that he wishes to assert himself, to overcompensate for his inferiority, to remain 'on top', to pass from the feminine to the masculine line. In my young student days we used to hear something very much the same in the out-patients' department when a case of hysteria was introduced: hysterical patients, we were told, produce their symptoms to make themselves interesting, to draw attention to themselves. It is a remarkable thing how these ancient pieces of wisdom keep on cropping up. But even at that time this fragment of psychology did not seem to cover the riddle of hysteria. It left unexplained, for instance, why the patients used no other methods for attaining their purpose. There must, of course, be something correct in this theory of the 'Individual Psychologists': a small particle is taken for the whole. The self-preservative instinct will try to profit by every situation; the ego will seek to turn even illness to its advantage. In psycho-analysis this is known as the 'secondary gain from illness'. Though, indeed, when we think of the facts of masochism, of the unconscious need for punishment and of neurotic self-injury, which make plausible the hypothesis of there being instinctual impulses that run contrary to self-preservation, we even feel shaken in our belief in the general validity of the commonplace truth on which the theoretical structure of Individual Psychology is erected. But a theory such as this is bound to be very welcome to the great mass of the people, a theory which recognizes no complications, which introduces no new concepts that are hard to grasp, which knows nothing of the unconscious, which gets rid at a single blow of the universally oppressive problem of sexuality and which restricts itself to the discovery of the artifices by which people seek to make life easy. For the mass of the people themselves take things easily: they call for no more than a single reason by way of explanation, they do not thank science for its diffuseness, they want to have simple solutions and to know that problems are solved. When we consider how very far Individual Psychology goes in meeting these demands, we cannot suppress the recollection of a sentence in Wallenstein:

When we have established the existence of a phenomenon, the next question is of course as to its cause. Incredulity of this kind is obviously an attempt to repudiate a piece of reality; but there is something strange about it. We should not be in the least astonished if an attempt of this kind were aimed at a piece of reality that threatened to bring unpleasure: the mechanism of our mind is, so to speak, planned to work along just such lines. But why should such incredulity arise in something which, on the contrary, promises to bring a high degree of pleasure? Truly paradoxical behaviour! But I recollect that on a previous occasion I dealt with the similar case of the people who, as I put it, are ‘wrecked by success’. As a rule people fall ill as a result of frustration, of the non-fulfilment of some vital necessity or desire. But with these people the opposite is the case; they fall ill, or even go entirely to pieces, because an overwhelmingly powerful wish of theirs has been fulfilled. But the contrast between the two situations is not so great as it seems at first. What happens in the paradoxical case is merely that the place of the external frustration is taken by an internal one. The sufferer does not permit himself happiness: the internal frustration commands him to cling to the external one. But why? Because - so runs the answer in a number of cases - one cannot expect Fate to grant one anything so good. In fact, another instance of 'too good to be true', the expression of a pessimism of which a large portion seems to find a home in many of us. In another set of cases, just as in those who are wrecked by success, we find a sense of guilt or inferiority, which can be translated: 'I'm not worthy of such happiness, I don't deserve it.' But these two motives are essentially the same, for one is only a projection of the other. For, as has long been known, the Fate which we expect to treat us so badly is a materialization of our conscience, of the severe super-ego within us, itself a residue of the punitive agency of our childhood.

[1936a, 4826]
In yet another group of cases the distinguishing characteristics of the ego, which are to be held responsible as sources of resistance against analytic treatment and as impediments to therapeutic success, may spring from different and deeper roots. Here we are dealing with the ultimate things which psychological research can learn about: the behaviour of the two primal instincts, their distribution, mingling and defusion - things which we cannot think of as being confined to a single province of the mental apparatus, the id, the ego or the super-ego. No stronger impression arises from the resistances during the work of analysis than of there being a force which is defending itself by every possible means against recovery and which is absolutely resolved to hold on to illness and suffering. One portion of this force has been recognized by us, undoubtedly with justice, as the sense of guilt and need for punishment, and has been localized by us in the ego's relation to the super-ego. But this is only the portion of it which is, as it were, psychically bound by the super-ego and thus becomes recognizable; other quotas of the same force, whether bound or free, may be at work in other, unspecified places. If we take into consideration the total picture made up of the phenomena of masochism immanent in so many people, the negative therapeutic reaction and the sense of guilt found in so many neurotics, we shall no longer be able to adhere to the belief that mental events are exclusively governed by the desire for pleasure. These phenomena are unmistakable indications of the presence of a power in mental life which we call the instinct of aggression or of destruction according to its aims, and which we trace back to the original death instinct of living matter. It is not a question of an antithesis between an optimistic and a pessimistic theory of life. Only by the concurrent or mutually opposing action of the two primal instincts - Eros and the death instinct -, never by one or the other alone, can we explain the rich multiplicity of the phenomena of life.

[1937c, 5037]
At this point we may attempt some discussion of the self-regarding attitude in normal people and in neurotics. [1914c, 2951]

In the first place self-regard appears to us to be an expression of the size of the ego; what the various elements are which go to determine that size is irrelevant. Everything a person possesses or achieves, every remnant of the primitive feeling of omnipotence which his experience has confirmed, helps to increase his self-regard. [1914c, 2951]

Applying our distinction between sexual and ego-instincts, we must recognize that self-regard has a specially intimate dependence on narcissistic libido. Here we are supported by two fundamental facts: that in paraphrenics self-regard is increased, while in the transference neuroses it is diminished; and that in love-relations not being loved lowers the self-regarding feelings, while being loved raises them. As we have indicated, the aim and the satisfaction in a narcissistic object-choice is to be loved. [1914c, 2951]

Further, it is easy to observe that libidinal object-cathexis does not raise self-regard. The effect of dependence upon the loved object is to lower that feeling: a person in love is humble. A person who loves has, so to speak, forfeited a part of his narcissism, and it can only be replaced by his being loved. In all these respects self-regard seems to remain related to the narcissistic element in love. [1914c, 2951]

The realization of impotence, of one's own inability to love, in consequence of mental or physical disorder, has an exceedingly lowering effect upon self-regard. Here, in my judgement, we must look for one of the sources of the feelings of inferiority which are experienced by patients suffering from the transference neuroses and which they are so ready to report. The main source of these feelings is, however, the impoverishment of the ego, due to the extraordinarily large libidinal cathexes which have been withdrawn from it - due, that is to say, to the injury sustained by the ego through sexual trends which are no longer subject to control. [1914c, 2951]

The relations of self-regard to erotism - that is, to libidinal object-cathexes - may be expressed concisely in the following way. Two cases must be distinguished, according to whether the erotic cathexes are ego-syntonic, or, on the contrary, have suffered repression. In the former case (where the use made of the libido is ego-syntonic), love is assessed like any other activity of the ego. Loving in itself, in so far as it involves longing and deprivation, lowers self-regard; whereas being loved, having one's love returned, and possessing the loved object, raises it once more. When libido is repressed, the erotic cathexis is felt as a severe depletion of the ego, the satisfaction of love is impossible, and the re-enrichment of the ego can be effected only by a withdrawal of libido from its objects. The return of the object-libido to the ego and its transformation into narcissism represents, as it were, a happy love once more; and, on the other hand, it is also true that a real happy love corresponds to the primal condition in which object-libido and ego-libido cannot be distinguished. [1914c, 2952]

One part of self-regard is primary - the residue of infantile narcissism; another part arises out of the omnipotence which is corroborated by experience (the fulfilment of the ego ideal), whilst a third part proceeds from the satisfaction of object-libido. [1914c, 2953]
I have, however, already remarked elsewhere that if a man has been his mother's undisputed darling he retains throughout life the triumphant feeling, the confidence in success, which not seldom brings actual success along with it. And Goethe might well have given some such heading to his autobiography as: 'My strength has its roots in my relation to my mother.'

[1917b, 3625]

The early efflorescence of infantile sexual life is doomed to extinction because its wishes are incompatible with reality and with the inadequate stage of development which the child has reached. That efflorescence comes to an end in the most distressing circumstances and to the accompaniment of the most painful feelings. Loss of love and failure leave behind them a permanent injury to self-regard in the form of a narcissistic scar, which in my opinion, as well as in Marcinowski's (1918), contributes more than anything to the 'sense of inferiority' which is so common in neurotics. The child's sexual researches, on which limits are imposed by his physical development, lead to no satisfactory conclusion; hence such later complaints as 'I can't accomplish anything; I can't succeed in anything'. The tie of affection, which binds the child as a rule to the parent of the opposite sex, succumbs to disappointment, to a vain expectation of satisfaction or to jealousy over the birth of a new baby - unmistakable proof of the infidelity of the object of the child's affections. His own attempt to make a baby himself, carried out with tragic seriousness, fails shamefully. The lessening amount of affection he receives, the increasing demands of education, hard words and an occasional punishment - these show him at last the full extent to which he has been scorned. These are a few typical and constantly recurring instances of the ways in which the love characteristic of the age of childhood is brought to a conclusion.

[1920g, 3725]
I can now proceed to add a gloss to another of your remarks. You express astonishment at the fact that it is so easy to make men enthusiastic about a war and add your suspicions that there is something at work in them - an instinct for hatred and destruction - which goes halfway to meet the efforts of the warmongers. Once again, I can only express my entire agreement. We believe in the existence of an instinct of that kind and have in fact been occupied during the last few years in studying its manifestations. Will you allow me to take this opportunity of putting before you a portion of the theory of the instincts which, after much tentative groping and many fluctuations of opinion, has been reached by workers in the field of psycho-analysis? [1933b, 4798]
The instincts which watch over the destinies of these elementary organisms that survive the whole individual, which provide them with a safe shelter while they are defenceless against the stimuli of the external world, which bring about their meeting with other germ-cells, and so on - these constitute the group of the sexual instincts. They are conservative in the same sense as the other instincts in that they bring back earlier states of living substance; but they are conservative to a higher degree in that they are peculiarly resistant to external influences; and they are conservative too in another sense in that they preserve life itself for a comparatively long period.¹ They are the true life instincts. They operate against the purpose of the other instincts, which leads, by reason of their function, to death; and this fact indicates that there is an opposition between them and the other instincts, an opposition whose importance was long ago recognized by the theory of the neuroses. It is as though the life of the organism moved with a vacillating rhythm. One group of instincts rushes forward so as to reach the final aim of life as swiftly as possible; but when a particular stage in the advance has been reached, the other group jerks back to a certain point to make a fresh start and so prolong the journey. And even though it is certain that sexuality and the distinction between the sexes did not exist when life began, the possibility remains that the instincts which were later to be described as sexual may have been in operation from the very first, and it may not be true that it was only at a later time that they started upon their work of opposing the activities of the 'ego-instincts'.²

¹ [1920g, 3742]

² [1920g, 3745]
In the obscurity that reigns at present in the theory of the instincts, it would be unwise to reject any idea that promises to throw light on it. We started out from the great opposition between the life and death instincts. Now object-love itself presents us with a second example of a similar polarity - that between love (or other affection) and hate (or aggressiveness). If only we could succeed in relating these two polarities to each other and in deriving one from the other! From the very first we recognized the presence of a sadistic component in the sexual instinct.¹ As we know, it can make itself independent and can, in the form of a perversion, dominate an individual's entire sexual activity. It also emerges as a predominant component instinct in one of the 'pregenital organizations', as I have named them. But how can the sadistic instinct, whose aim it is to injure the object, be derived from Eros, the preserver of life? Is it not plausible to suppose that this sadism is in fact a death instinct which, under the influence of the narcissistic libido, has been forced away from the ego and has consequently only emerged in relation to the object? It now enters the service of the sexual function. During the oral stage of organization of the libido, the act of obtaining erotic mastery over an object coincides with that object's destruction; later, the sadistic instinct separates off, and finally, at the stage of genital primacy, it takes on, for the purposes of reproduction, the function of overpowering the sexual object to the extent necessary for carrying out the sexual act. It might indeed be said that the sadism which has been forced out of the ego has pointed the way for the libidinal components of the sexual instinct, and that these follow after it to the object. Wherever the original sadism has undergone no mitigation or intermixture, we find the familiar ambivalence of love and hate in erotic life.

¹[1920g, 3755]

We need not feel greatly disturbed in judging our speculation upon the life and death instincts by the fact that so many bewildering and obscure processes occur in it - such as one instinct being driven out by another or an instinct turning from the ego to an object, and so on. This is merely due to our being obliged to operate with the scientific terms, that is to say with the figurative language, peculiar to psychology (or, more precisely, to depth psychology). We could not otherwise describe the processes in question at all, and indeed we could not have become aware of them. The deficiencies in our description would probably vanish if we were already in a position to replace the psychological terms by physiological or chemical ones. It is true that they too are only part of a figurative language; but it is one with which we have long been familiar and which is perhaps a simpler one as well.

¹[1920g, 3760]
I will add a few words to clarify our terminology, which has undergone some development in the course of the present work. We came to know what the 'sexual instincts' were from their relation to the sexes and to the reproductive function. We retained this name after we had been obliged by the findings of psycho-analysis to connect them less closely with reproduction. With the hypothesis of narcissistic libido and the extension of the concept of libido to the individual cells, the sexual instinct was transformed for us into Eros, which seeks to force together and hold together the portions of living substance. What are commonly called the sexual instincts are looked upon by us as the part of Eros which is directed towards objects. Our speculations have suggested that Eros operates from the beginning of life and appears as a 'life instinct' in opposition to the 'death instinct' which was brought into being by the coming to life of inorganic substance. These speculations seek to solve the riddle of life by supposing that these two instincts were struggling with each other from the very first. It is not so easy, perhaps, to follow the transformations though which the concept of the 'ego-instincts' has passed. To begin with we applied that name to all the instinctual trends (of which we had no closer knowledge) which could be distinguished from the sexual instincts directed towards an object; and we opposed the ego-instincts to the sexual instincts of which the libido is the manifestation. Subsequently we came to closer grips with the analysis of the ego and recognized that a portion of the 'ego-instincts' is also of a libidinal character and has taken the subject's own ego as its object. These narcissistic self-preservative instincts had thenceforward to be counted among the libidinal sexual instincts. The opposition between the ego-instincts and the sexual instincts was transformed into one between the ego-instincts and the object-instincts, both of a libidinal nature. But in its place a fresh opposition appeared between the libidinal (ego- and object-) instincts and others, which must be presumed to be present in the ego and which may perhaps actually be observed in the destructive instincts. Our speculations have transformed this opposition into one between the life instincts (Eros) and the death instincts.

Sublimation. - An attentive examination of the sexual trends, which alone were accessible to psycho-analysis, had meanwhile led to some remarkable detailed findings. What is described as the sexual instinct turns out to be of a highly composite nature and is liable to disintegrate once more into its component instincts. Each component instinct is unalterably characterized by its source, that is, by the region or zone of the body from which its excitation is derived. Each has furthermore as distinguishable features an object and an aim. The aim is always discharge accompanied by satisfaction, but it is capable of being changed from activity to passivity. The object is less closely attached to the instinct than was at first supposed; it is easily exchanged for another one, and, moreover, an instinct which had an external object can be turned round upon the subject's own self. The separate instincts can either remain independent of one another or - in what is still an inexplicable manner - can be combined and merged into one another to perform work in common. They are also able to replace one another and to transfer their libidinal cathexis to one another, so that the satisfaction of one instinct can take the place of the satisfaction of others. The most important vicissitude which an instinct can undergo seems to be sublimation; here both object and aim are changed, so that what was originally a sexual instinct finds satisfaction in some achievement which is no longer sexual but has a higher social or ethical valuation. These different features do not as yet combine to form an integral picture.
Recognition of Two Classes of Instincts in Mental Life. - Though psycho-analysis endeavours as a rule to develop its theories as independently as possible from those of other sciences, it is nevertheless obliged to seek a basis for the theory of the instincts in biology. On the ground of a far-reaching consideration of the processes which go to make up life and which lead to death, it becomes probable that we should recognize the existence of two classes of instincts, corresponding to the contrary processes of construction and dissolution in the organism. On this view, the one set of instincts, which work essentially in silence, would be those which follow the aim of leading the living creature to death and therefore deserve to be called the 'death instincts'; these would be directed outwards as the result of the combination of numbers of unicellular elementary organisms, and would manifest themselves as destructiveness or aggressive impulses. The other set of instincts would be those which are better known to us in analysis - the libidinal, sexual or life instincts, which are best comprised under the name of Eros; their purpose would be to form living substance into ever greater unities, so that life may be prolonged and brought to higher development. The erotic instincts and the death instincts would be present in living beings in regular mixtures or fusions; but 'defusions' would also be liable to occur. Life would consist in the manifestations of the conflict or interaction between the two classes of instincts; death would mean for the individual the victory of the destructive instincts, but reproduction would mean for him the victory of Eros.

The Nature of the Instincts. - This view would enable us to characterize instincts as tendencies inherent in living substance towards restoring an earlier state of things: that is to say, they would be historically determined and of a conservative nature and, as it were, the expression of an inertia or elasticity present in what is organic. Both classes of instincts, Eros as well as the death instinct, would, on this view, have been in operation and working against each other from the first origin of life.

I have lately developed a view of the instincts¹ which I shall here hold to and take as the basis of my further discussions. According to this view we have to distinguish two classes of instincts, one of which, the sexual instincts or Eros, is by far the more conspicuous and accessible to study. It comprises not merely the uninhibited sexual instinct proper and the instinctual impulses of an aim-inhibited or sublimated nature derived from it, but also the self-preservative instinct, which must be assigned to the ego and which at the beginning of our analytic work we had good reason for contrasting with the sexual object-instincts. The second class of instincts was not so easy to point to; in the end we came to recognize sadism as its representative. On the basis of theoretical considerations, supported by biology, we put forward the hypothesis of a death instinct, the task of which is to lead organic life back into the inanimate state; on the other hand, we supposed that Eros, by bringing about a more and more far-reaching combination of the particles into which living substance is dispersed, aims at complicating life and at the same time, of course, at preserving it. Acting in this way, both the instincts would be conservative in the strictest sense of the word, since both would be endeavouring to re-establish a state of things that was disturbed by the emergence of life. The emergence of life would thus be the cause of the continuance of life and also at the same time of the striving towards death; and life itself would be a conflict and compromise between these two trends. The problem of the origin of life would remain a cosmological one; and the problem of the goal and purpose of life would be answered dualistically.

On this view, a special physiological process (of anabolism of catabolism) would be associated with each of the two classes of instincts; both kinds of instinct would be active in every particle of living substance, though in unequal proportions, so that some one substance might be the principal representative of Eros.
This hypothesis throws no light whatever upon the manner in which the two classes of instincts are fused, blended, and alloyed with each other; but that this takes place regularly and very extensively is an assumption indispensable to our conception. It appears that, as a result of the combination of unicellular organisms into multicellular forms of life, the death instinct of the single cell can successfully be neutralized and the destructive impulses be diverted on to the external world through the instrumentality of a special organ. This special organ would seem to be the muscular apparatus; and the death instinct would thus seem to express itself - though probably only in part - as an instinct of destruction directed against the external world and other organisms.

[1923b, 3975]

One such fact there appears to be. For the opposition between the two classes of instincts we may put the polarity of love and hate. There is no difficulty in finding a representative of Eros; but we must be grateful that we can find a representative of the elusive death instinct in the instinct of destruction, to which hate points the way. Now, clinical observation shows not only that love is with unexpected regularity accompanied by hate (ambivalence), and not only that in human relationships hate is frequently a forerunner of love, but also that in a number of circumstances hate changes into love and love into hate. If this change is more than a mere succession in time - if, that is, one of them actually turns into the other - then clearly the ground is cut away from under a distinction so fundamental as that between erotic instincts and death instincts, one which presupposes physiological processes running in opposite directions.

[1923b, 3976]

In the present discussion, moreover, I am only putting forward a hypothesis; I have no proof to offer. It seems a plausible view that this displaceable and neutral energy, which is no doubt active in both in the ego and in the id, proceeds from the narcissistic store of libido - that it is desexualized Eros. (The erotic instincts appear to be altogether more plastic, more readily diverted and displaced than the destructive instincts.) From this we can easily go on to assume that this displaceable libido is employed in the service of the pleasure principle to obviate blockages and to facilitate discharge. In this connection it is easy to observe a certain indifference as to the path along which the discharge takes place, so long as it takes place somehow. We know this trait; it is characteristic of the cathetic processes in the id. It is found in erotic cathexes, where a peculiar indifference in regard to the object displays itself; and it is especially evident in the transferences arising in analysis, which develop inevitably, irrespective of the persons who are their object. Not long ago Rank published some good examples of the way in which neurotic acts of revenge can be directed against the wrong people. Such behaviour on the part of the unconscious reminds one of the comic story of the three village tailors, one of whom had to be hanged because the only village blacksmith had committed a capital offence. Punishment must be exacted even if it does not fall upon the guilty. It was in studying the dream-work that we first came upon this kind of looseness in the displacements brought about by the primary process. In that case it was the objects that were thus relegated to a position of no more than secondary importance, just as in the case we are now discussing it is the paths of discharge. It would be characteristic of the ego to be more particular about the choice both of an object and of a path of discharge.

[1923b, 3979]

Towards the two classes of instincts the ego's attitude is not impartial. Through its work of identification and sublimation it gives the death instincts in the id assistance in gaining control over the libido, but in so doing it runs the risk of becoming the object of the death instincts and of itself perishing. In order to be able to help in this way it has had itself to become filled with libido; it thus itself becomes the representative of Eros and henceforward desires to live and to be loved.

[1923b, 3990]
It will be remembered that we have taken the view that the principle which governs all mental processes is a special case of Fechner's 'tendency towards stability', and have accordingly attributed to the mental apparatus the purpose of reducing to nothing, or at least of keeping as low as possible, the sums of excitation which flow in upon it. Barbara Low has suggested the name of 'Nirvana principle' for this supposed tendency, and we have accepted the term. But we have unhesitatingly identified the pleasure-unpleasure principle with this Nirvana principle. Every unpleasure ought thus to coincide with a heightening, and every pleasure with a lowering, of mental tension due to stimulus; the Nirvana principle (and the pleasure principle which is supposedly identical with it) would be entirely in the service of the death instincts, whose aim is to conduct the restlessness of life into the stability of the inorganic state, and it would have the function of giving warnings against the demands of the life instincts - the libido - which try to disturb the intended course of life. But such a view cannot be correct. It seems that in the series of feelings of tension we have a direct sense of the increase and decrease of amounts of stimulus, and it cannot be doubted that there are pleasurable tensions and unpleasurable relaxations of tension. The state of sexual excitation is the most striking example of a pleasurable increase of stimulus of this sort, but it is certainly not the only one.

[1924c, 4071]

The inadequacy of this explanation is seen, however, in the fact that it throws no light on the regular and close connections of masochism with its counterpart in instinctual life, sadism. If we go back a little further, to our hypothesis of the two classes of instincts which we regard as operative in the living organism, we arrive at another derivation of masochism, which, however, is not in contradiction with the former one. In (multicellular) organisms the libido meets the instinct of death, or destruction, which is dominant in them and which seeks to disintegrate the cellular organism and to conduct each separate unicellular organism into a state of inorganic stability (relative though this may be). The libido has the task of making the destroying instinct innocuous, and it fulfills the task by diverting that instinct to a great extent outwards - soon with the help of a special organic system, the muscular apparatus - towards objects in the external world. The instinct is then called the destructive instinct, the instinct for mastery, or the will to power. A portion of the instinct is placed directly in the service of the sexual function, where it has an important part to play. This is sadism proper. Another portion does not share in this transposition outwards; it remains inside the organism and, with the help of the accompanying sexual excitation described above, becomes libidinally bound there. It is in this portion that we have to recognize the original, erotogenic masochism.

[1924c, 4075]

The study of judgement affords us, perhaps for the first time, an insight into the origin of an intellectual function from the interplay of the primary instinctual impulses. Judging is a continuation, along lines of expediency, of the original process by which the ego took things into itself or expelled them from itself, according to the pleasure principle. The polarity of judgement appears to correspond to the opposition of the two groups of instincts which we have supposed to exist. Affirmation - as a substitute for uniting - belongs to Eros; negation - the successor to expulsion - belongs to the instinct of destruction. The general wish to negate, the negativism which is displayed by some psychotics, is probably to be regarded as a sign of a defusion of instincts that has taken place through a withdrawal of the libidinal components. But the performance of the function of judgement is not made possible until the creation of the symbol of negation has endowed thinking with a first measure of freedom from the consequences of repression and, with it, from the compulsion of the pleasure principle.

[1925h, 4143]
It is almost humiliating that, after working so long, we should still be having difficulty in understanding the most fundamental facts. But we have made up our minds to simplify nothing and to hide nothing. If we cannot see things clearly we will at least see clearly what the obscurities are. What is hampering us here is evidently some hitch in the development of our theory of the instincts. We began by tracing the organization of the libido through its successive stages - from the oral through the sadistic-anal to the genital - and in doing so placed all the components of the sexual instinct on the same footing. Later it appeared that sadism was the representative of another instinct, which was opposed to Eros. This new view, that the instincts fall into two groups, seems to explode the earlier construction of the successive stages of libidinal organization. But we do not have to break fresh ground in order to find a way out of the difficulty. The solution has been at hand for a long time and lies in the fact that what we are concerned with are scarcely ever pure instinctual impulses but mixtures in various proportions of the two groups of instincts. If this is so, there is no need to revise our view of the organizations of the libido. A sadistic cathexis of an object may also legitimately claim to be treated as a libidinal one; and an aggressive impulse against the father can just as well be subjected to repression as a tender impulse towards the mother. Nevertheless we shall bear in mind for future consideration the possibility that repression is a process which has a special relation to the genital organization of the libido and that the ego resorts to other methods of defence when it has to secure itself against the libido on other levels of organization. To continue: a case like 'Little Hans's' does not enable us to come to any clear conclusion. It is true that in him an aggressive impulse was disposed of by repression, but this happened after the genital organization had been reached.

¹ Our present point of view can be roughly expressed in the statement that libido has a share in every instinctual manifestation, but that not everything in that manifestation is libido.

In all that follows I adopt the standpoint, therefore, that the inclination to aggression is an original, self-subsisting instinctual disposition in man, and I return to my view that it constitutes the greatest impediment to civilization. At one point in the course of this enquiry I was led to the idea that civilization was a special process which mankind undergoes, and I am still under the influence of that idea. I may now add that civilization is a process in the service of Eros, whose purpose is to combine single human individuals, and after that families, then races, peoples and nations, into one great unity, the unity of mankind. Why this has to happen, we do not know; the work of Eros is precisely this.¹ These collections of men are to be libidinally bound to one another. Necessity alone, the advantages of work in common, will not hold them together. But man's natural aggressive instinct, the hostility of each against all and of all against each, opposes this programme of civilization. This aggressive instinct is the derivative and the main representative of the death instinct which we have found alongside of Eros and which shares world-dominion with it. And now, I think, the meaning of the evolution of civilization is no longer obscure to us. It must present the struggle between Eros and Death, between the instinct of life and the instinct of destruction, as it works itself out in the human species. This struggle is what all life essentially consists of, and the evolution of civilization may therefore be simply described as the struggle for life of the human species.¹ And it is this battle of the giants that our nursemaids try to appease with their lullaby about Heaven.

¹ Our present point of view can be roughly expressed in the statement that libido has a share in every instinctual manifestation, but that not everything in that manifestation is libido.

[1930a, 4511]

[1930a, 4512]
But if the human sense of guilt goes back to the killing of the primal father, that was after all a case of 'remorse'. Are we to assume that a conscience and a sense of guilt were not, as we have presupposed, in existence before the deed? If not, where, in this case, did the remorse come from? There is no doubt that this case should explain the secret of the sense of guilt to us and put an end to our difficulties. And I believe it does. This remorse was the result of the primordial ambivalence of feeling towards the father. His sons hated him, but they loved him, too. After their hatred had been satisfied by their act of aggression, their love came to the fore in their remorse for the deed. It set up the super-ego by identification with the father; it gave that agency the father's power, as though as a punishment for the deed of aggression they had carried out against him, and it created the restrictions which were intended to prevent a repetition of the deed. And since the inclination to aggressiveness against the father was repeated in the following generations, the sense of guilt, too, persisted, and it was reinforced once more by every piece of aggressiveness that was suppressed and carried over to the super-ego. Now, I think, we can at last grasp two things perfectly clearly: the part played by love in the origin of conscience and the fatal inevitability of the sense of guilt. Whether one has killed one's father or has abstained from doing so is not really the decisive thing. One is bound to feel guilty in either case, for the sense of guilt is an expression of the conflict due to ambivalence, of the eternal struggle between Eros and the instinct of destruction or death. This conflict is set going as soon as men are faced with the task of living together. So long as the community assumes no other form than that of the family, the conflict is bound to express itself in the Oedipus complex, to establish the conscience and to create the first sense of guilt. When an attempt is made to widen the community, the same conflict is continued in forms which are dependent on the past; and it is strengthened and results in a further intensification of the sense of guilt. Since civilization obeys an internal erotic impulsion which causes human beings to unite in a closely-knit group, it can only achieve this aim through an ever-increasing reinforcement of the sense of guilt. What began in relation to the father is completed in relation to the group. If civilization is a necessary course of development from the family to humanity as a whole, then - as a result of the inborn conflict arising from ambivalence, of the eternal struggle between the trends of love and death - there is inextricably bound up with it an increase of the sense of guilt, which will perhaps reach heights that the individual finds hard to tolerate. One is reminded of the great poet's moving arraignment of the 'Heavenly Powers':-

[1930a, 4522]
The instincts which watch over the destinies of these elementary organisms that survive the whole individual, which provide them with a safe shelter while they are defenceless against the stimuli of the external world, which bring about their meeting with other germ-cells, and so on - these constitute the group of the sexual instincts. They are conservative in the same sense as the other instincts in that they bring back earlier states of living substance; but they are conservative to a higher degree in that they are peculiarly resistant to external influences; and they are conservative too in another sense in that they preserve life itself for a comparatively long period.¹ They are the true life instincts. They operate against the purpose of the other instincts, which leads, by reason of their function, to death; and this fact indicates that there is an opposition between them and the other instincts, an opposition whose importance was long ago recognized by the theory of the neuroses. It is as though the life of the organism moved with a vacillating rhythm. One group of instincts rushes forward so as to reach the final aim of life as swiftly as possible; but when a particular stage in the advance has been reached, the other group jerks back to a certain point to make a fresh start and so prolong the journey. And even though it is certain that sexuality and the distinction between the sexes did not exist when life began, the possibility remains that the instincts which were later to be described as sexual may have been in operation from the very first, and it may not be true that it was only at a later time that they started upon their work of opposing the activities of the 'ego-instincts'.²

The upshot of our enquiry so far has been the drawing of a sharp distinction between the 'ego-instincts' and the sexual instincts, and the view that the former exercise pressure towards death and the latter towards a prolongation of life. But this conclusion is bound to be unsatisfactory in many respects even to ourselves. Moreover, it is actually only of the former group of instincts that we can predicate a conservative, or rather retrograde, character corresponding to a compulsion to repeat. For on our hypothesis the ego-instincts arise from the coming to life of inanimate matter and seek to restore the inanimate state; whereas as regards the sexual instincts, though it is true that they reproduce primitive states of the organism, what they are clearly aiming at by every possible means is the coalescence of two germ-cells which are differentiated in a particular way. If this union is not effected, the germ-cell dies along with all the other elements of the multicellular organism. It is only on this condition that the sexual function can prolong the cell's life and lend it the appearance of immortality. But what is the important event in the development of living substance which is being repeated in sexual reproduction, or in its fore-runner, the conjugation of two protista? We cannot say; and we should consequently feel relieved if the whole structure of our argument turned out to be mistaken. The opposition between the ego or death instincts and the sexual or life instincts would then cease to hold and the compulsion to repeat would no longer possess the importance we have ascribed to it.

The Nature of the Instincts. - This view would enable us to characterize instincts as tendencies inherent in living substance towards restoring an earlier state of things: that is to say, they would be historically determined and of a conservative nature and, as it were, the expression of an inertia or elasticity present in what is organic. Both classes of instincts, Eros as well as the death instinct, would, on this view, have been in operation and working against each other from the first origin of life.

¹ [1920g, 3742]
² [1920g, 3745]
I have lately developed a view of the instincts¹ which I shall here hold to and take as the basis of my further discussions. According to this view we have to distinguish two classes of instincts, one of which, the sexual instincts or Eros, is by far the more conspicuous and accessible to study. It comprises not merely the uninhibited sexual instinct proper and the instinctual impulses of an aim-inhibited or sublimated nature derived from it, but also the self-preservative instinct, which must be assigned to the ego and which at the beginning of our analytic work we had good reason for contrasting with the sexual object-instincts. The second class of instincts was not so easy to point to; in the end we came to recognize sadism as its representative. On the basis of theoretical considerations, supported by biology, we put forward the hypothesis of a death instinct, the task of which is to lead organic life back into the inanimate state; on the other hand, we supposed that Eros, by bringing about a more and more far-reaching combination of the particles into which living substance is dispersed, aims at complicating life and at the same time, of course, at preserving it. Acting in this way, both the instincts would be conservative in the strictest sense of the word, since both would be endeavouring to re-establish a state of things that was disturbed by the emergence of life. The emergence of life would thus be the cause of the continuance of life and also at the same time of the striving towards death; and life itself would be a conflict and compromise between these two trends. The problem of the origin of life would remain a cosmological one; and the problem of the goal and purpose of life would be answered dualistically.

[1923b, 3974]

It will be remembered that we have taken the view that the principle which governs all mental processes is a special case of Fechner's 'tendency towards stability',¹ and have accordingly attributed to the mental apparatus the purpose of reducing to nothing, or at least of keeping as low as possible, the sums of excitation which flow in upon it. Barbara Low has suggested the name of 'Nirvana principle' for this supposed tendency, and we have accepted the term. But we have unhesitatingly identified the pleasure-unpleasure principle with this Nirvana principle. Every unpleasure ought thus to coincide with a heightening, and every pleasure with a lowering, of mental tension due to stimulus; the Nirvana principle (and the pleasure principle which is supposedly identical with it) would be entirely in the service of the death instincts, whose aim is to conduct the restlessness of life into the stability of the inorganic state, and it would have the function of giving warnings against the demands of the life instincts - the libido - which try to disturb the intended course of life. But such a view cannot be correct. It seems that in the series of feelings of tension we have a direct sense of the increase and decrease of amounts of stimulus, and it cannot be doubted that there are pleasurable tensions and unpleasurable relaxations of tension. The state of sexual excitation is the most striking example of a pleasurable increase of stimulus of this sort, but it is certainly not the only one.

[1924c, 4071]

However this may be, we must perceive that the Nirvana principle, belonging as it does to the death instinct, has undergone a modification in living organisms through which it has become the pleasure principle; and we shall henceforward avoid regarding the two principles as one. It is not difficult, if we care to follow up this line of thought, to guess what power was the source of the modification. It can only be the life instinct, the libido, which has thus, alongside of the death instinct, seized upon a share in the regulation of the processes of life. In this way we obtain a small but interesting set of connections. The Nirvana principle expresses the trend of the death instinct; the pleasure principle represents the demands of the libido; and the modification of the latter principle, the reality principle, represents the influence of the external world.

[1924c, 4072]
The inadequacy of this explanation is seen, however, in the fact that it throws no light on the regular and close connections of masochism with its counterpart in instinctual life, sadism. If we go back a little further, to our hypothesis of the two classes of instincts which we regard as operative in the living organism, we arrive at another derivation of masochism, which, however, is not in contradiction with the former one. In (multicellular) organisms the libido meets the instinct of death, or destruction, which is dominant in them and which seeks to disintegrate the cellular organism and to conduct each separate unicellular organism into a state of inorganic stability (relative though this may be). The libido has the task of making the destroying instinct innocuous, and it fulfils the task by diverting that instinct to a great extent outwards - soon with the help of a special organic system, the muscular apparatus - towards objects in the external world. The instinct is then called the destructive instinct, the instinct for mastery, or the will to power. A portion of the instinct is placed directly in the service of the sexual function, where it has an important part to play. This is sadism proper. Another portion does not share in this transposition outwards; it remains inside the organism and, with the help of the accompanying sexual excitation described above, becomes libidinally bound there. It is in this portion that we have to recognize the original, erotogenic masochism.
[1924c, 4075]

The study of judgement affords us, perhaps for the first time, an insight into the origin of an intellectual function from the interplay of the primary instinctual impulses. Judging is a continuation, along lines of expediency, of the original process by which the ego took things into itself or expelled them from itself, according to the pleasure principle. The polarity of judgement appears to correspond to the opposition of the two groups of instincts which we have supposed to exist. Affirmation - as a substitute for uniting - belongs to Eros; negation - the successor to expulsion - belongs to the instinct of destruction. The general wish to negate, the negativism which is displayed by some psychotics, is probably to be regarded as a sign of a defusion of instincts that has taken place through a withdrawal of the libidinal components. But the performance of the function of judgement is not made possible until the creation of the symbol of negation has endowed thinking with a first measure of freedom from the consequences of repression and, with it, from the compulsion of the pleasure principle.
[1925h, 4143]
Every analyst will admit that even to-day this view has not the sound of a long-discarded error. Nevertheless, alterations in it became essential, as our enquiries advanced from the repressed to the repressing forces, from the object-instincts to the ego. The decisive step forward was the introduction of the concept of narcissism - that is to say, the discovery that the ego itself is cathexed with libido, that the ego, indeed, is the libido’s original home, and remains to some extent its headquarters. This narcissistic libido turns towards objects, and thus becomes object-libido; and it can change back into narcissistic libido once more. The concept of narcissism made it possible to obtain an analytic understanding of the traumatic neuroses and of many of the affections bordering on the psychoses, as well as of the latter themselves. It was not necessary to give up our interpretation of the transference neuroses as attempts made by the ego to defend itself against sexuality; but the concept of libido was endangered. Since the ego-instincts, too, were libidinal, it seemed for a time inevitable that we should make libido coincide with instinctual energy in general, as C. G. Jung had already advocated earlier. Nevertheless, there still remained in me a kind of conviction, for which I was not as yet able to find reasons, that the instincts could not all be of the same kind. My next step was taken in *Beyond the Pleasure Principle* (1920), when the compulsion to repeat and the conservative character of instinctual life first attracted my attention. Starting from speculations on the beginning of life and from biological parallels, I drew the conclusion that, besides the instinct to preserve living substance and to join it into ever larger units,¹ there must exist another, contrary instinct seeking to dissolve those units and to bring them back to their primaeval, inorganic state. That is to say, as well as Eros there was an instinct of death. The phenomena of life could be explained from the concurrent or mutually opposing action of these two instincts. It was not easy, however, to demonstrate the activities of this supposed death instinct. The manifestations of Eros were conspicuous and noisy enough. It might be assumed that the death instinct operated silently within the organism towards its dissolution, but that, of course, was no proof. A more fruitful idea was that a portion of the instinct is diverted towards the external world and comes to light as an instinct of aggressiveness and destructiveness. In this way the instinct itself could be pressed into the service of Eros, in that the organism was destroying some other thing, whether animate or inanimate, instead of destroying its own self. Conversely, any restriction of this aggressiveness directed outwards would be bound to increase the self-destruction, which is in any case proceeding. At the same time one can suspect from this example that the two kinds of instinct seldom - perhaps never - appear in isolation from each other, but are alloyed with each other in varying and very different proportions and so become unrecognizable to our judgement. In sadism, long since known to us as a component instinct of sexuality, we should have before us a particularly strong alloy of this kind between trends of love and the destructive instinct; while its counterpart, masochism, would be a union between destructiveness directed inwards and sexuality - a union which makes what is otherwise an imperceptible trend into a conspicuous and tangible one.

[1930a, 4509]
In all that follows I adopt the standpoint, therefore, that the inclination to aggression is an original, self-subsisting instinctual disposition in man, and I return to my view that it constitutes the greatest impediment to civilization. At one point in the course of this enquiry I was led to the idea that civilization was a special process which mankind undergoes, and I am still under the influence of that idea. I may now add that civilization is a process in the service of Eros, whose purpose is to combine single human individuals, and after that families, then races, peoples and nations, into one great unity, the unity of mankind. Why this has to happen, we do not know; the work of Eros is precisely this.¹ These collections of men are to be libidinally bound to one another. Necessity alone, the advantages of work in common, will not hold them together. But man's natural aggressive instinct, the hostility of each against all and of all against each, opposes this programme of civilization. This aggressive instinct is the derivative and the main representative of the death instinct which we have found alongside of Eros and which shares world-dominion with it. And now, I think, the meaning of the evolution of civilization is no longer obscure to us. It must present the struggle between Eros and Death, between the instinct of life and the instinct of destruction, as it works itself out in the human species. This struggle is what all life essentially consists of, and the evolution of civilization may therefore be simply described as the struggle for life of the human species.¹ And it is this battle of the giants that our nursemaids try to appease with their lullaby about Heaven.

[1930a, 4512]

We did not maintain this position for long. Our feeling of their being a contrariety in instinctual life soon found another and sharper expression. It is not my wish, however, to put before you the origin of this novelty in the theory of the instincts; it too is based essentially on biological considerations. I shall offer it to you as a ready-made product. Our hypothesis is that there are two essentially different classes of instincts: the sexual instincts, understood in the widest sense - Eros, if you prefer that name - and the aggressive instincts, whose aim is destruction. When it is put to you like this, you will scarcely regard it as a novelty. It looks like an attempt at a theoretical transfiguration of the commonplace opposition between loving and hating, which coincides, perhaps, with the other polarity, of attraction and repulsion, which physics assumes in the inorganic world. But it is a remarkable thing that this hypothesis is nevertheless felt by many people as an innovation and, indeed, as a most undesirable one which should be got rid of as quickly as possible. I presume that a strong affective factor is coming into effect in this rejection. Why have we ourselves needed such a long time before we decided to recognize an aggressive instinct? Why did we hesitate to make use, on behalf of our theory, of facts which were obvious and familiar to everyone? We should probably have met with little resistance if we had wanted to ascribe an instinct with such an aim to animals. But to include it in the human constitution appears sacrilegious; it contradicts too many religious presumptions and social conventions. No, man must be naturally good or at least good-natured. If he occasionally shows himself brutal, violent or cruel, these are only passing disturbances of his emotional life, for the most part provoked, or perhaps only consequences of the inexpedient social regulations which he has hitherto imposed on himself.

[1933a, 4707]
According to our hypothesis human instincts are of only two kinds: those which seek to preserve and unite - which we call 'erotic', exactly in the sense in which Plato uses the word 'Eros' in his *Symposium*, or 'sexual', with a deliberate extension of the popular conception of 'sexuality' - and those which seek to destroy and kill and which we group together as the aggressive or destructive instinct. As you see, this is in fact no more than a theoretical clarification of the universally familiar opposition between Love and Hate which may perhaps have some fundamental relation to the polarity of attraction and repulsion that plays a part in your own field of knowledge. But we must not be too hasty in introducing ethical judgements of good and evil. Neither of these instincts is any less essential than the other; the phenomena of life arise from the concurrent or mutually opposing action of both. Now it seems as though an instinct of the one sort can scarcely ever operate in isolation; it is always accompanied - or, as we say, alloyed - with a certain quota from the other side, which modifies its aim or is, in some cases, what enables it to achieve that aim. Thus, for instance, the instinct of self-preservation is certainly of an erotic kind, but it must nevertheless have aggressiveness at its disposal if it is to fulfil its purpose. So, too, the instinct of love, when it is directed towards an object, stands in need of some contribution from the instinct for mastery if it is in any way to obtain possession of that object. The difficulty of isolating the two classes of instinct in their actual manifestations is indeed what has so long prevented us from recognizing them.

[1933b, 4798]

I fear I may be abusing your interest, which is after all concerned with the prevention of war and not with our theories. Nevertheless I should like to linger for a moment over our destructive instinct, whose popularity is by no means equal to its importance. As a result of a little speculation, we have come to suppose that this instinct is at work in every living creature and is striving to bring it to ruin and to reduce life to its original condition of inanimate matter. Thus it quite seriously deserves to be called a death instinct, while the erotic instincts represent the effort to live. The death instinct turns into the destructive instinct when, with the help of special organs, it is directed outwards, on to objects. The organism preserves its own life, so to say, by destroying an extraneous one. Some portion of the death instinct, however, remains operative within the organism, and we have sought to trace quite a number of normal and pathological phenomena to this internalization of the destructive instinct. We have even been guilty of the heresy of attributing the origin of conscience to this diversion inwards of aggressiveness. You will notice that it is by no means a trivial matter if this process is carried too far: it is positively unhealthy. On the other hand if these forces are turned to destruction in the external world, the organism will be relieved and the effect must be beneficial. This would serve as a biological justification for all the ugly and dangerous impulses against which we are struggling. It must be admitted that they stand nearer to Nature than does our resistance to them for which an explanation also needs to be found. It may perhaps seem to you as though our theories are a kind of mythology and, in the present case, not even an agreeable one. But does not every science come in the end to a kind of mythology like this? Cannot the same be said to-day of your own Physics?

[1933b, 4800]
The forces which we assume to exist behind the tensions caused by the needs of the id are called *instincts*. They represent the somatic demands upon the mind. Though they are the ultimate cause of all activity, they are of a conservative nature; the state, whatever it may be, which an organism has reached gives rise to a tendency to re-establish that state so soon as it has been abandoned. It is thus possible to distinguish an indeterminate number of instincts, and in common practice this is in fact done. For us, however, the important question arises whether it may not be possible to trace all these numerous instincts back to a few basic ones. We have found that instincts can change their aim (by displacement) and also that they can replace one another - the energy of one instinct passing over to another. This latter process is still insufficiently understood. After long hesitations and vacillations we have decided to assume the existence of only two basic instincts, *Eros* and the *destructive instinct*. (The contrast between the instincts of self-preservation and the preservation of the species, as well as the contrast between ego-love and object-love, fall within Eros.) The aim of the first of these basic instincts is to establish ever greater unities and to preserve them thus - in short, to bind together; the aim of the second is, on the contrary, to undo connections and so to destroy things. In the case of the destructive instinct we may suppose that its final aim is to lead what is living into an inorganic state. For this reason we also call it the *death instinct*. If we assume that living things came later than inanimate ones and arose from them, then the death instinct fits in with the formula we have proposed to the effect that instincts tend towards a return to an earlier state. In the case of Eros (or the love instinct) we cannot apply this formula. To do so would presuppose that living substance was once a unity which had later been torn apart and was now striving towards reunion.¹

[1940a [1938], 4959]
Sublimation. - An attentive examination of the sexual trends, which alone were accessible to psycho-analysis, had meanwhile led to some remarkable detailed findings. What is described as the sexual instinct turns out to be of a highly composite nature and is liable to disintegrate once more into its component instincts. Each component instinct is unalterably characterized by its source, that is, by the region or zone of the body from which its excitation is derived. Each has furthermore as distinguishable features an object and an aim. The aim is always discharge accompanied by satisfaction, but it is capable of being changed from activity to passivity. The object is less closely attached to the instinct than was at first supposed; it is easily exchanged for another one, and, moreover, an instinct which had an external object can be turned round upon the subject's own self. The separate instincts can either remain independent of one another or - in what is still an inexplicable manner - can be combined and merged into one another to perform work in common. They are also able to replace one another and to transfer their libidinal cathexis to one another, so that the satisfaction of one instinct can take the place of the satisfaction of others. The most important vicissitude which an instinct can undergo seems to be sublimation; here both object and aim are changed, so that what was originally a sexual instinct finds satisfaction in some achievement which is no longer sexual but has a higher social or ethical valuation. These different features do not as yet combine to form an integral picture.

[1923a, 3932]

In the present discussion, moreover, I am only putting forward a hypothesis; I have no proof to offer. It seems a plausible view that this displaceable and neutral energy, which is no doubt active in both in the ego and in the id, proceeds from the narcissistic store of libido - that it is desexualized Eros. (The erotic instincts appear to be altogether more plastic, more readily diverted and displaced than the destructive instincts.) From this we can easily go on to assume that this displaceable libido is employed in the service of the pleasure principle to obviate blockages and to facilitate discharge. In this connection it is easy to observe a certain indifference as to the path along which the discharge takes place, so long as it takes place somehow. We know this trait; it is characteristic of the cathectic processes in the id. It is found in erotic cathexes, where a peculiar indifference in regard to the object displays itself; and it is especially evident in the transferences arising in analysis, which develop inevitably, irrespective of the persons who are their object. Not long ago Rank published some good examples of the way in which neurotic acts of revenge can be directed against the wrong people. Such behaviour on the part of the unconscious reminds one of the comic story of the three village tailors, one of whom had to be hanged because the only village blacksmith had committed a capital offence. Punishment must be exacted even if it does not fall upon the guilty. It was in studying the dream-work that we first came upon this kind of looseness in the displacements brought about by the primary process. In that case it was the objects that were thus relegated to a position of no more than secondary importance, just as in the case we are now discussing it is the paths of discharge. It would be characteristic of the ego to be more particular about the choice both of an object and of a path of discharge.

[1923b, 3979]
On this view, a special physiological process (of anabolism of catabolism) would be associated with each of the two classes of instincts; both kinds of instinct would be active in every particle of living substance, though in unequal proportions, so that some one substance might be the principal representative of Eros.

[1923b, 3975]

One such fact there appears to be. For the opposition between the two classes of instincts we may put the polarity of love and hate. There is no difficulty in finding a representative of Eros; but we must be grateful that we can find a representative of the elusive death instinct in the instinct of destruction, to which hate points the way. Now, clinical observation shows not only that love is with unexpected regularity accompanied by hate (ambivalence), and not only that in human relationships hate is frequently a forerunner of love, but also that in a number of circumstances hate changes into love and love into hate. If this change is more than a mere succession in time - if, that is, one of them actually turns into the other - then clearly the ground is cut away from under a distinction so fundamental as that between erotic instincts and death instincts, one which presupposes physiological processes running in opposite directions.

[1923b, 3976]
If we put together what we have learned from our investigation of positive and negative perversions, it seems plausible to trace them back to a number of 'component instincts', which, however, are not of a primary nature, but are susceptible to further analysis. By an 'instinct' is provisionally to be understood the psychical representative of an endosomatic, continuously flowing source of stimulation, as contrasted with a 'stimulus', which is set up by single excitations coming from without. The concept of instinct is thus one of those lying on the frontier between the mental and the physical. The simplest and likeliest assumption as to the nature of instincts would seem to be that in itself an instinct is without quality, and, so far as mental life is concerned, is only to be regarded as a measure of the demand made upon the mind for work. What distinguishes the instincts from one another and endows them with specific qualities is their relation to their somatic sources and to their aims. The source of an instinct is a process of excitation occurring in an organ and the immediate aim of the instinct lies in the removal of this organic stimulus.¹

There is a further provisional assumption that we cannot escape in the theory of the instincts. It is to the effect that excitations of two kinds arise from the somatic organs, based upon differences of a chemical nature. One of these kinds of excitation we describe as being specifically sexual, and we speak of the organ concerned as the 'erotogenic zone' of the sexual component instinct arising from it.²

Secondly, we know that the sexual instinct is originally divided into a great number of components - or rather, it develops out of them - some of which cannot be taken up into the instinct in its later form, but have at an earlier stage to be suppressed or put to other uses. These are above all the coprophilic instinctual components, which have proved incompatible with our aesthetic standards of culture, probably since, as a result of our adopting an erect gait, we raised our organ of smell from the ground. The same is true of a large portion of the sadistic urges which are a part of erotic life. But all such developmental processes affect only the upper layers of the complex structure. The fundamental processes which produce erotic excitation remain unaltered. The excremental is all too intimately and inseparably bound up with the sexual; the position of the genitals - inter unrinas et faeces - remains the decisive and unchangeable factor. One might say here, varying a well-known saying of the great Napoleon: 'Anatomy is destiny.' The genitals themselves have not taken part in the development of the human body in the direction of beauty: they have remained animal, and thus love, too, has remained in essence just as animal as it ever was. The instincts of love are hard to educate; education of them achieves now too much, now too little. What civilization aims at making out of them seems unattainable except at the price of a sensible loss of pleasure; the persistence of the impulses that could not be made use of can be detected in sexual activity in the form of non-satisfaction.

In spite of all our efforts to prevent biological terminology and considerations from dominating psycho-analytic work, we cannot avoid using them even in our descriptions of the phenomena that we study. We cannot help regarding the term 'instinct' as a concept on the frontier between the spheres of psychology and biology. We speak, too, of 'masculine' and 'feminine' mental attributes and impulses, although, strictly speaking, the differences between the sexes can lay claim to no special psychical characterization. What we speak of in ordinary life as 'masculine' or 'feminine' reduces itself from the point of view of psychology to the qualities of 'activity' and 'passivity' - that is, to qualities determined not by the instincts themselves but by their aims. The regular association of these 'active' and 'passive' instincts in mental life reflects the bisexuality of individuals, which is among the clinical postulates of psycho-analysis.
By the source [Quelle] of an instinct is meant the somatic process which occurs in an organ or part of the body and whose stimulus is represented in mental life by an instinct. We do not know whether this process is invariably of a chemical nature or whether it may also correspond to the release of other, e.g. mechanical, forces. The study of the sources of instincts lies outside the scope of psychology. Although instincts are wholly determined by their origin in a somatic source, in mental life we know them only by their aims. An exact knowledge of the sources of an instinct is not invariably necessary for purposes of psychological investigation; sometimes its source may be inferred from its aim.

[1915c, 2961]

Are we to suppose that the different instincts which originate in the body and operate on the mind are also distinguished by different qualities, and that that is why they behave in qualitatively different ways in mental life? This supposition does not seem to be justified; we are much more likely to find the simpler assumption sufficient - that the instincts are all qualitatively alike and owe the effect they make only to the amount of excitation they carry, or perhaps, in addition, to certain functions of that quantity. What distinguishes from one another the mental effects produced by the various instincts may be traced to the difference in their sources. In any event, it is only in a later connection that we shall be able to make plain what the problem of the quality of instincts signifies.

[1915c, 2961]

From that moment we had to face the problem of the later history of the anal-erotic instinctual impulses. What becomes of them when, owing to the establishment of a definitive genital organization, they have lost their importance in sexual life? Do they preserve their original nature, but in a state of repression? Are they sublimated or assimilated by transformation into character-traits? Or do they find a place within the new organization of sexuality characterized by genital primacy? Or, since none of these vicissitudes of anal eroticism is likely to be the only one, to what extent and in what way does each of them share in deciding its fate? For the organic sources of anal eroticism cannot of course be buried as a result of the emergence of the genital organization.

[1917c, 3599]
For a time psycho-analysis seemed fated to merge into psychology without being able to show why the psychology of the sick differed from that of the normal. In the course of its advance, however, it came up against the problem of dreams, which are abnormal products of the mind created by normal men under regularly recurrent physiological conditions. When psycho-analysis had solved the problem of dreams, it had discovered in unconscious psychical processes the common ground in which the highest and the lowest of mental impulses have their roots and from which spring the most normal as well as the most morbid and erratic of mental productions. The new picture of the workings of the mind began to grow ever clearer and more complete. It was a picture of obscure instinctual forces organic in origin, striving towards inborn aims, and, above them, of an agency comprising more highly organized mental structures - acquisitions of human evolution made under the impact of human history -, an agency which has taken over portions of the instinctual impulses, has developed them further or has even directed them towards higher aims, but which in any case binds them firmly and manipulates their energy to suit its own purposes. This higher organization, however, which is known to us as the ego, has rejected another portion of these same elementary instinctual impulses as being unserviceable because they cannot be fitted into the organic unity of the individual or because they rebel against the individual's cultural aims. The ego is not in a position to exterminate these unsubdued mental powers, but it turns its back on them, lets them remain at the lowest psychological level, defends itself from their demands by the energetic erection of protective and antithetical barriers or seeks to come to terms with them by means of substitutive satisfactions. These instincts which have fallen victim to repression - untamed and indestructible, yet inhibited from any kind of activity - together with their primitive mental representatives, constitute the mental underworld, the nucleus of the true unconscious, and are at every moment ready to assert their demands and, by hook or by crook, to force their way forward to satisfaction. To this is due the instability of the proud superstructure of the mind, the emergence at night of the proscribed and repressed material in the form of dreams, and the tendency to fall ill with neuroses and psychoses as soon as the balance of power between the ego and the repressed shifts to the disadvantage of the ego.

[1919g, 3703]

The fact that the cortical layer which receives stimuli is without any protective shield against excitations from within must have as its result that these latter transmissions of stimulus have a preponderance in economic importance and often occasion economic disturbances comparable with traumatic neuroses. The most abundant sources of this internal excitation are what are described as the organism's 'instincts' - the representatives of all the forces originating in the interior of the body and transmitted to the mental apparatus - at once the most important and the most obscure element of psychological research.

[1920g, 3737]
The Development of the Libido. - The sexual instinct, the dynamic manifestation of which in mental life we shall call 'libido', is made up of component instincts into which it may once more break up and which are only gradually united into well-defined organizations. The sources of these component instincts are the organs of the body and in particular certain specially marked erotogenic zones; but contributions are made to libido from every important functional process in the body. At first the individual component instincts strive for satisfaction independently of one another, but in the course of development they become more and more convergent and concentrated. The first (pregenital) stage of organization to be discerned is the oral one, in which - in conformity with the suckling's predominant interest - the oral zone plays the leading part. This is followed by the sadistic-anal organization, in which the anal zone and the component instinct of sadism are particularly prominent; at this stage the difference between the sexes is represented by the contrast between active and passive. The third and final stage of organization is that in which the majority of the component instincts converge under the primacy of the genital zones. As a rule this development is passed through swiftly and unobtrusively; but some individual portions of the instincts remain behind at theprodromal stages of the process and thus give rise to fixations of libido, which are important as constituting predispositions for subsequent irruptions of repressed impulses and which stand in a definite relation to the later development of neuroses and perversions. (See the article on 'The Libido Theory'.) [1923a, 3921]

Sublimation. - An attentive examination of the sexual trends, which alone were accessible to psycho-analysis, had meanwhile led to some remarkable detailed findings. What is described as the sexual instinct turns out to be of a highly composite nature and is liable to disintegrate once more into its component instincts. Each component instinct is unalterably characterized by its source, that is, by the region or zone of the body from which its excitation is derived. Each has furthermore as distinguishable features an object and an aim. The aim is always discharge accompanied by satisfaction, but it is capable of being changed from activity to passivity. The object is less closely attached to the instinct than was at first supposed; it is easily exchanged for another one, and, moreover, an instinct which had an external object can be turned round upon the subject's own self. The separate instincts can either remain independent of one another or - in what is still an inexplicable manner - can be combined and merged into one another to perform work in common. They are also able to replace one another and to transfer their libidinal cathexis to one another, so that the satisfaction of one instinct can take the place of the satisfaction of others. The most important vicissitude which an instinct can undergo seems to be sublimation; here both object and aim are changed, so that what was originally a sexual instinct finds satisfaction in some achievement which is no longer sexual but has a higher social or ethical valuation. These different features do not as yet combine to form an integral picture. [1923a, 3932]

On this view, a special physiological process (of anabolism of catabolism) would be associated with each of the two classes of instincts; both kinds of instinct would be active in every particle of living substance, though in unequal proportions, so that some one substance might be the principal representative of Eros. [1923b, 3975]
I hope not. You will soon find your way about in it. Well then, we assume that the forces which drive the mental apparatus into activity are produced in the bodily organs as an expression of the major somatic needs. You will recollect the words of our poet-philosopher: 'Hunger and love.' Incidentally, quite a formidable pair of forces! We give these bodily needs, in so far as they represent an instigation to mental activity, the name of 'Triebes', a word for which we are envied by many modern languages. Well, these instincts fill the id: all the energy in the id, as we may put it briefly, originates from them. Nor have the forces in the ego any other origin; they are derived from those in the id. What, then, do these instincts want? Satisfaction - that is, the establishment of situations in which the bodily needs can be extinguished. A lowering of the tension of need is felt by our organ of consciousness as pleasurable; an increase of it is soon felt as unpleasure. From these oscillations arises the series of feelings of pleasure-unpleasure, in accordance with which the whole mental apparatus regulates its activity. In this connection we speak of a 'dominance of the pleasure principle'.

[1926e, 4343]

From the first of these standpoints, the dynamic one, psycho-analysis derives all mental processes (apart from the reception of external stimuli) from the interplay of forces, which assist or inhibit one another, combine with one another, enter into compromises with one another, etc. All of these forces are originally in the nature of instincts; thus they have an organic origin. They are characterized by possessing an immense (somatic) store of power ('the compulsion to repeat'); and they are represented mentally as images or ideas with an affective charge. In psycho-analysis, no less than in other sciences, the theory of the instincts is an obscure subject. An empirical analysis leads to the formulation of two groups of instincts: the so-called 'ego-instincts', which are directed towards self-preservation, and the 'object-instincts', which are concerned with relations to an external object. The social instincts are not regarded as elementary or irreducible. Theoretical speculation leads to the suspicion that there are two fundamental instincts which lie concealed behind the manifest ego-instincts and object-instincts: namely (a) Eros, the instinct which strives for ever closer union, and (b) the instinct of destruction, which leads towards the dissolution of what is living. In psycho-analysis the manifestation of the force of Eros is given the name 'libido'.

[1926f, 4403]
An instinct, then, is distinguished from a stimulus by the fact that it arises from sources of stimulation within the body, that it operates as a constant force and that the subject cannot avoid it by flight, as is possible with an external stimulus. We can distinguish an instinct's source, object and aim. Its source is a state of excitation in the body, its aim is the removal of that excitation; on its path from its source to its aim the instinct becomes operative psychically. We picture it as a certain quota of energy which presses in a particular direction. It is from this pressing that it derives its name of 'Trieb'. People speak of 'active' and 'passive' instincts, but it would be more correct to speak of instincts with active and passive aims: for an expenditure of activity is needed to achieve a passive aim as well. The aim can be achieved in the subject's own body; as a rule an external object is brought in, in regard to which the instinct achieves its external aim; its internal aim invariably remains the bodily change which is felt as satisfaction. It has not become clear to us whether the relation of the instinct to its somatic source gives it a specific quality and if so what. The evidence of analytic experience shows that it is an undoubted fact that instinctual impulses from one source attach themselves to those from other sources and share their further vicissitudes and that in general one instinctual satisfaction can be replaced by another. But it must be admitted that we do not understand this very well. The relations of an instinct to its aim and object are also open to alterations; both can be exchanged for other ones, though its relation to its object is nevertheless the more easily loosened. A certain kind of modification of the aim and change of the object, in which our social valuation is taken into account, is described by us as 'sublimation'. Besides this, we have grounds for distinguishing instincts which are 'inhibited in their aim' - instinctual impulses from sources well known to us with an unambiguous aim, but which come to a stop on their way to satisfaction, so that a lasting object-cathexis comes about and a permanent trend. Such, for instance, is the relation of tenderness, which undoubtedly originates from the sources of sexual need and invariably renounces its satisfaction.

We have arrived at our knowledge of this psychical apparatus by studying the individual development of human beings. To the oldest of these psychical provinces or agencies we give the name of id. It contains everything that is inherited, that is present at birth, that is laid down in the constitution - above all, therefore, the instincts, which originate from the somatic organization and which find a first psychical expression here in forms unknown to us.¹

There can be no question but that the libido has somatic sources, that it streams to the ego from various organs and parts of the body. This is most clearly seen in the case of that portion of the libido which, from its instinctual aim, is described as sexual excitation. The most prominent of the parts of the body from which this libido arises are known by the name of 'erotogenic zones', though in fact the whole body is an erotogenic zone of this kind. The greater part of what we know about Eros - that is to say, about its exponent, the libido - has been gained from a study of the sexual function, which, indeed, on the prevailing view, even if not according to our theory, coincides with Eros. We have been able to form a picture of the way in which the sexual urge, which is destined to exercise a decisive influence on our life, gradually develops out of successive contributions from a number of component instincts, which represent particular erotogenic zones.
The core of our being, then, is formed by the obscure id, which has no direct communication with the external world and is accessible even to our own knowledge only though the medium of another agency. Within this id the organic instincts operate, which are themselves compounded of fusions of two primal forces (Eros and destructiveness) in varying proportions and are differentiated from one another by their relation to organs or systems of organs. The one and only urge of these instincts is towards satisfaction, which is expected to arise from certain changes in the organs with the help of objects in the external world. But immediate and unheeding satisfaction of the instincts, such as the id demands, would often lead to perilous conflicts with the external world and to extinction. The id knows no solicitude about ensuring survival and no anxiety; or it would perhaps be more correct to say that, though it can generate the sensory elements of anxiety, it cannot make use of them. The processes which are possible in and between the assumed psychical elements in the id (the primary process) differ widely from those which are familiar to us through conscious perception in our intellectual and emotional life; nor are they subject to the critical restrictions of logic, which repudiates some of these processes as invalid and seeks to undo them.

[1940a [1938], 5004]
We may pause for a moment over this pre-eminently dualistic view of instinctual life. According to E. Hering's theory, two kinds of processes are constantly at work in living substance, operating in contrary directions, one constructive or assimilatory and the other destructive or dissimilatory. May we venture to recognize in these two directions taken by the vital processes the activity of our two instinctual impulses, the life instincts and the death instincts? There is something else, at any rate, that we cannot remain blind to. We have unwittingly steered our course into the harbour of Schopenhauer's philosophy. For him death is the 'true result and to that extent the purpose of life',¹ while the sexual instinct is the embodiment of the will to live. [1920g, 3750]

Let us make a bold attempt at another step forward. It is generally considered that the union of a number of cells into a vital association - the multicellular character of organisms - has become a means of prolonging their life. One cell helps to preserve the life of another, and the community of cells can survive even if individual cells have to die. We have already heard that conjugation, too, the temporary coalescence of two unicellular organisms, has a life-preserving and rejuvenating effect on both of them. Accordingly, we might attempt to apply the libido theory which has been arrived at in psycho-analysis to the mutual relationship of cells. We might suppose that the life instincts or sexual instincts which are active in each cell take the other cells as their object, that they partly neutralize the death instincts (that is, the processes set up by them) in those cells and thus preserve their life; while the other cells do the same for them, and still others sacrifice themselves in the performance of this libidinal function. The germ-cells themselves would behave in a completely 'narcissistic' fashion - to use the phrase that we are accustomed to use in the theory of the neuroses to describe a whole individual who retains his libido in his ego and pays none of it out in object-cathexes. The germ-cells require their libido, the activity of their life instincts, for themselves, as a reserve against their later momentous constructive activity. (The cells of the malignant neoplasms which destroy the organism should also perhaps be described as narcissistic in this same sense: pathology is prepared to regard their germs as innate and to ascribe embryonic attributes to them.) In this way the libido of our sexual instincts would coincide with the Eros of the poets and philosophers which holds all living things together. [1920g, 3751]

Recognition of Two Classes of Instincts in Mental Life. - Though psycho-analysis endeavours as a rule to develop its theories as independently as possible from those of other sciences, it is nevertheless obliged to seek a basis for the theory of the instincts in biology. On the ground of a far-reaching consideration of the processes which go to make up life and which lead to death, it becomes probable that we should recognize the existence of two classes of instincts, corresponding to the contrary processes of construction and dissolution in the organism. On this view, the one set of instincts, which work essentially in silence, would be those which follow the aim of leading the living creature to death and therefore deserve to be called the 'death instincts'; these would be directed outwards as the result of the combination of numbers of unicellular elementary organisms, and would manifest themselves as destructiveness or aggressive impulses. The other set of instincts would be those which are better known to us in analysis - the libidinal, sexual or life instincts, which are best comprised under the name of Eros; their purpose would be to form living substance into ever greater unities, so that life may be prolonged and brought to higher development. The erotic instincts and the death instincts would be present in living beings in regular mixtures or fusions; but 'defusions' would also be liable to occur. Life would consist in the manifestations of the conflict or interaction between the two classes of instincts; death would mean for the individual the victory of the destructive instincts, but reproduction would mean for him the victory of Eros. [1923a, 3934]
On this view, a special physiological process (of anabolism of catabolism) would be associated with each of the two classes of instincts; both kinds of instinct would be active in every particle of living substance, though in unequal proportions, so that some one substance might be the principal representative of Eros.
[1923b, 3975]
The next step was taken when psycho-analysis felt its way closer towards the psychological ego, which it had first come to know only as a repressive, censoring agency, capable of erecting protective structures and reactive formations. Critical and far-seeing minds had, it is true, long since objected to the concept of libido being restricted to the energy of the sexual instincts directed towards an object. But they failed to explain how they had arrived at their better knowledge or to derive from it anything of which analysis could make use. Advancing more cautiously, psycho-analysis observed the regularity with which libido is withdrawn from the object and directed on to the ego (the process of introversion); and, by studying the libidinal development of children in its earliest phases, came to the conclusion that the ego is the true and original reservoir of libido, and that it is only from that reservoir that libido is extended on to objects. The ego now found its position among sexual objects and was at once given the foremost place among them. Libido which was in this way lodged in the ego was described as 'narcissistic'.¹ This narcissistic libido was of course also a manifestation of the force of the sexual instinct in the analytical sense of those words, and it had necessarily to be identified with the 'self-preservative instincts' whose existence had been recognized from the first. Thus the original opposition between the ego-instincts and the sexual instincts proved to be inadequate. A portion of the ego-instincts was seen to be libidinal; sexual instincts - probably alongside others - operated in the ego. Nevertheless we are justified in saying that the old formula which lays it down that psychoneuroses are based on a conflict between ego-instincts and sexual instincts contains nothing that we need reject to-day. It is merely that the distinction between the two kinds of instinct, which was originally regarded as in some sort of way qualitative, must now be characterized differently - namely as being topographical. And in particular it is still true that the transference neuroses, the essential subject of psycho-analytic study, are the result of a conflict between the ego and the libidinal cathexis of objects.

¹[1920g, 3753]

It was not our intention at all events to produce such a result. Our argument had as its point of departure a sharp distinction between ego-instincts, which we equated with death instincts, and sexual instincts, which we equated with life instincts. (We were prepared at one stage to include the so-called self-preservative instincts of the ego among the death instincts; but we subsequently corrected ourselves on this point and withdrew it.) Our views have from the very first been dualistic, and to-day they are even more definitely dualistic than before - now that we describe the opposition as being, not between ego-instincts and sexual instincts but between life instincts and death instincts. Jung's libido theory is on the contrary monistic; the fact that he has called his one instinctual force 'libido' is bound to cause confusion, but need not affect us otherwise. We suspect that instincts other than those of self-preservation operate in the ego, and it ought to be possible for us to point to them. Unfortunately, however, the analysis of the ego has made so little headway that it is very difficult for us to do so. It is possible, indeed, that the libidinal instincts in the ego may be linked in a peculiar manner with these other ego-instincts which are still strange to us. Even before we had any clear understanding of narcissism, psycho-analysts had a suspicion that the 'ego-instincts' had libidinal components attached to them. But these are very uncertain possibilities, to which our opponents will pay very little attention. The difficulty remains that psycho-analysis has not enabled us hitherto to point to any instincts other than the libidinal ones. That, however, is no reason for our falling in with the conclusion that no others in fact exist.

[1920g, 3754]

Towards the two classes of instincts the ego's attitude is not impartial. Through its work of identification and sublimation it gives the death instincts in the id assistance in gaining control over the libido, but in so doing it runs the risk of becoming the object of the death instincts and of itself perishing. In order to be able to help in this way it has had itself to become filled with libido; it thus itself becomes the representative of Eros and henceforward desires to live and to be loved.

[1923b, 3990]
The id, to which we finally come back, has no means of showing the ego either love or hate. It cannot say what it wants; it has achieved no unified will. Eros and the death instinct struggle within it; we have seen with what weapons the one group of instincts defends itself against the other. It would be possible to picture the id as under the domination of the mute but powerful death instincts, which desire to be at peace and (prompted by the pleasure principle) to put Eros, the mischief maker, to rest; but perhaps that might be to undervalue the part played by Eros.

[1923b, 3992]

Let us go back to the special problem presented to us by masochism. If for a moment we leave its erotic components on one side, it affords us a guarantee of the existence of a trend that has self-destruction as its aim. If it is true of the destructive instinct as well that the ego - but what we have in mind here is rather the id, the whole person - originally includes all the instinctual impulses, we are led to the view that masochism is older than sadism, and that sadism is the destructive instinct directed outwards, thus acquiring the characteristic of aggressiveness. A certain amount of the original destructive instinct may still remain in the interior. It seems that we can only perceive it under two conditions: if it is combined with erotic instincts into masochism or if - with a greater or lesser erotic addition - it is directed against the external world as aggressiveness. And now we are struck by the significance of the possibility that the aggressiveness may not be able to find satisfaction in the external world because it comes up against real obstacles. If this happens, it will perhaps retreat and increase the amount of self-destructiveness holding sway in the interior. We shall hear how this is in fact what occurs and how important a process this is. Impeded aggressiveness seems to involve a grave injury. It really seems as though it is necessary for us to destroy some other thing or person in order not to destroy ourselves, in order to guard against the impulsion to self-destruction. A sad disclosure indeed for the moralist!

[1933a, 4709]

There can be no question of restricting one or the other of the basic instincts to one of the provinces of the mind. They must necessarily be met with everywhere. We may picture an initial state as one in which the total available energy of Eros, which henceforward we shall speak of as 'libido', is present in the still undifferentiated ego-id and serves to neutralize the destructive tendencies which are simultaneously present. (We are without a term analogous to 'libido' for describing the energy of the destructive instinct.) At a later stage it becomes relatively easy for us to follow the vicissitudes of the libido, but this is more difficult with the destructive instinct.

[1940a [1938], 4960]

¹ The question arises whether the satisfaction of purely destructive instinctual impulses can be felt as pleasure, whether pure destructiveness without any libidinal admixture occurs. Satisfaction of the death instinct remaining in the ego seems not to produce feelings of pleasure, though masochism represents a fusion which is entirely analogous to sadism.

[1940a [1938], 4965]
In yet another group of cases the distinguishing characteristics of the ego, which are to be held responsible as sources of resistance against analytic treatment and as impediments to therapeutic success, may spring from different and deeper roots. Here we are dealing with the ultimate things which psychological research can learn about: the behaviour of the two primal instincts, their distribution, mingling and defusion - things which we cannot think of as being confined to a single province of the mental apparatus, the id, the ego or the super-ego. No stronger impression arises from the resistances during the work of analysis than of there being a force which is defending itself by every possible means against recovery and which is absolutely resolved to hold on to illness and suffering. One portion of this force has been recognized by us, undoubtedly with justice, as the sense of guilt and need for punishment, and has been localized by us in the ego's relation to the super-ego. But this is only the portion of it which is, as it were, psychically bound by the super-ego and thus becomes recognizable; other quotas of the same force, whether bound or free, may be at work in other, unspecified places. If we take into consideration the total picture made up of the phenomena of masochism immanent in so many people, the negative therapeutic reaction and the sense of guilt found in so many neurotics, we shall no longer be able to adhere to the belief that mental events are exclusively governed by the desire for pleasure. These phenomena are unmistakable indications of the presence of a power in mental life which we call the instinct of aggression or of destruction according to its aims, and which we trace back to the original death instinct of living matter. It is not a question of an antithesis between an optimistic and a pessimistic theory of life. Only by the concurrent or mutually opposing action of the two primal instincts - Eros and the death instinct -, never by one or the other alone, can we explain the rich multiplicity of the phenomena of life. [1937c, 5037]
The other conflict, that between love and hatred, strikes us more strangely. We know that incipient love is often perceived as hatred, and that love, if it is denied satisfaction, may easily be partly converted into hatred, and poets tell us that in the more tempestuous stages of love the two opposed feelings may subsist side by side for a while as though in rivalry with each other. But the chronic co-existence of love and hatred, both directed towards the same person and both of the highest degree of intensity, cannot fail to astonish us. We should have expected that the passionate love would long ago have conquered the hatred or been devoured by it. And in fact such a protracted survival of two opposites is only possible under quite peculiar psychological conditions and with the co-operation of the state of affairs in the unconscious. The love has not succeeded in extinguishing the hatred but only in driving it down into the unconscious; and in the unconscious the hatred, safe from the danger of being destroyed by the operations of consciousness, is able to persist and even to grow. In such circumstances the conscious love attains as a rule, by way of reaction, an especially high degree of intensity, so as to be strong enough for the perpetual task of keeping its opponent under repression. The necessary condition for the occurrence of such a strange state of affairs in a person's erotic life appears to be that at a very early age, somewhere in the prehistoric period of his infancy, the two opposites should have been split apart and one of them, usually the hatred, have been repressed.¹

Recognition of Two Classes of Instincts in Mental Life. - Though psycho-analysis endeavours as a rule to develop its theories as independently as possible from those of other sciences, it is nevertheless obliged to seek a basis for the theory of the instincts in biology. On the ground of a far-reaching consideration of the processes which go to make up life and which lead to death, it becomes probable that we should recognize the existence of two classes of instincts, corresponding to the contrary processes of construction and dissolution in the organism. On this view, the one set of instincts, which work essentially in silence, would be those which follow the aim of leading the living creature to death and therefore deserve to be called the 'death instincts'; these would be directed outwards as the result of the combination of numbers of unicellular elementary organisms, and would manifest themselves as destructiveness or aggressive impulses. The other set of instincts would be those which are better known to us in analysis - the libidinal, sexual or life instincts, which are best comprised under the name of Eros; their purpose would be to form living substance into ever greater unities, so that life may be prolonged and brought to higher development. The erotic instincts and the death instincts would be present in living beings in regular mixtures or fusions; but 'defusions' would also be liable to occur. Life would consist in the manifestations of the conflict or interaction between the two classes of instincts; death would mean for the individual the victory of the destructive instincts, but reproduction would mean for him the victory of Eros.

The transformation of object-libido into narcissistic libido which thus takes place obviously implies an abandonment of sexual aims, a desexualization - a kind of sublimation, therefore. Indeed, the question arises, and deserves careful consideration, whether this is not the universal road to sublimation, whether all sublimation does not take place though the mediation of the ego, which begins by changing sexual object-libido into narcissistic libido and then, perhaps, goes on to give it another aim.¹ We shall later on have to consider whether other instincutial vicissitudes may not also result from this transformation, whether, for instance, it may not bring about a defusion of the various instincts that are fused together.
This hypothesis throws no light whatever upon the manner in which the two classes of instincts are fused, blended, and alloyed with each other; but that this takes place regularly and very extensively is an assumption indispensable to our conception. It appears that, as a result of the combination of unicellular organisms into multicellular forms of life, the death instinct of the single cell can successfully be neutralized and the destructive impulses be diverted on to the external world through the instrumentality of a special organ. This special organ would seem to be the muscular apparatus; and the death instinct would thus seem to express itself - though probably only in part - as an instinct of destruction directed against the external world and other organisms. [1923b, 3975]

Once we have admitted the idea of a fusion of the two classes of instincts with each other, the possibility of a - more or less complete - 'defusion' of them forces itself upon us. The sadistic component of the sexual instinct would be a classical example of a serviceable instinctual fusion; and the sadism which has made itself independent as a perversion would be typical of a defusion, though not of one carried to extremes. From this point we obtain a view of a great domain of facts which has not before been considered in this light. We perceive that for purposes of discharge the instinct of destruction is habitually brought into the service of Eros; we suspect that the epileptic fit is a product and indication of an instinctual defusion; and we come to understand that instinctual defusion and the marked emergence of the death instinct call for particular consideration among the effects of some severe neuroses - for instance, the obsessional neuroses. Making a swift generalization, we might conjecture that the essence of a regression of libido (e. g. from the genital to the sadistic-anal phase) lies in a defusion of instincts, just as, conversely, the advance from the earlier phase to the definitive genital one would be conditioned by an accession of erotic components. The question also arises whether ordinary ambivalence, which is so often unusually strong in the constitutional disposition to neurosis, should not be regarded as the product of a defusion; ambivalence, however, is such a fundamental phenomenon that it more probably represents an instinctual fusion that has not been completed. [1923b, 3975]

The dangerous death instincts are dealt with in the individual in various ways: in part they are rendered harmless by being fused with erotic components, in part they are diverted towards the external world in the form of aggression, while to a large extent they undoubtedly continue their internal work unhindered. How is it then that in melancholia the super-ego can become a kind of gathering-place for the death instincts? [1923b, 3988]

I cannot go further in my consideration of these questions without introducing a fresh hypothesis. The super-ego arises, as we know, from an identification with the father taken as a model. Every such identification is in the nature of a desexualization or even of a sublimation. It now seems as though when a transformation of this kind takes place, an instinctual defusion occurs at the same time. After sublimation the erotic component no longer has the power to bind the whole of the destructiveness that was combined with it, and this is released in the form of an inclination to aggression and destruction. This defusion would be the source of the general character of harshness and cruelty exhibited by the ideal - its dictatorial 'Thou shalt'. [1923b, 3988]
Let us again consider obsessional neurosis for a moment. The state of affairs is different here. The defusion of love into aggressiveness has not been effected by the work of the ego, but is the result of a regression which has come about in the id. But this process has extended beyond the id to the super-ego, which now increases its severity towards the innocent ego. It would seem, however, that in this case, no less than in that of melancholia, the ego, having gained control over the libido by means of identification, is punished for doing so by the super-ego through the instrumentality of the aggressiveness which was mixed with the libido.

[1923b, 3989]

But since the ego's work of sublimation results in a defusion of the instincts and a liberation of the aggressive instincts in the super-ego, its struggle against the libido exposes it to the danger of maltreatment and death. In suffering under the attacks of the super-ego or perhaps even succumbing to them, the ego is meeting with a fate like that of the protista which are destroyed by the products of decomposition that they themselves have created. From the economic point of view the morality that functions in the super-ego seems to be a similar product of decomposition.

[1923b, 3990]

The inadequacy of this explanation is seen, however, in the fact that it throws no light on the regular and close connections of masochism with its counterpart in instinctual life, sadism. If we go back a little further, to our hypothesis of the two classes of instincts which we regard as operative in the living organism, we arrive at another derivation of masochism, which, however, is not in contradiction with the former one. In (multicellular) organisms the libido meets the instinct of death, or destruction, which is dominant in them and which seeks to disintegrate the cellular organism and to conduct each separate unicellular organism into a state of inorganic stability (relative though this may be). The libido has the task of making the destroying instinct innocuous, and it fulfils the task by diverting that instinct to a great extent outwards - soon with the help of a special organic system, the muscular apparatus - towards objects in the external world. The instinct is then called the destructive instinct, the instinct for mastery, or the will to power. A portion of the instinct is placed directly in the service of the sexual function, where it has an important part to play. This is sadism proper. Another portion does not share in this transposition outwards; it remains inside the organism and, with the help of the accompanying sexual excitation described above, becomes libidinally bound there. It is in this portion that we have to recognize the original, erotogenic masochism.

[1924c, 4075]

We are without any physiological understanding of the ways and means by which this taming of the death instinct by the libido may be effected. So far as the psycho-analytic field of ideas is concerned, we can only assume that a very extensive fusion and amalgamation, in varying proportions, of the two classes of instincts takes place, so that we never have to deal with pure life instincts or pure death instincts but only with mixtures of them in different amounts. Corresponding to a fusion of instincts of this kind, there may, as a result of certain influences, be a defusion of them. How large the portions of the death instincts are which refuse to be tamed in this way by being bound to admixtures of libido we cannot at present guess.

[1924c, 4076]
If one is prepared to overlook a little inexactitude, it may be said that the death instinct which is operative in the organism - primal sadism - is identical with masochism. After the main portion of it has been transposed outwards on to objects, there remains inside, as a residuum of it, the erotogenic masochism proper, which on the one hand has become a component of the libido and, on the other, still has the self as its object. This masochism would thus be evidence of, and a remainder from, the phase of development in which the coalescence, which is so important for life, between the death instinct and Eros took place. We shall not be surprised to hear that in certain circumstances the sadism, or instinct of destruction, which has been directed outwards, projected, can be once more introjected, turned inwards, and in this way regress to its earlier situation. If this happens, a secondary masochism is produced, which is added to the original masochism.

Thus moral masochism becomes a classical piece of evidence for the existence of fusion of instinct. Its danger lies in the fact that it originates from the death instinct and corresponds to the part of that instinct which has escaped being turned outwards as an instinct of destruction. But since, on the other hand, it has the significance of an erotic component, even the subject's destruction of himself cannot take place without libidinal satisfaction.

The study of judgement affords us, perhaps for the first time, an insight into the origin of an intellectual function from the interplay of the primary instinctual impulses. Judging is a continuation, along lines of expediency, of the original process by which the ego took things into itself or expelled them from itself, according to the pleasure principle. The polarity of judgement appears to correspond to the opposition of the two groups of instincts which we have supposed to exist. Affirmation - as a substitute for uniting - belongs to Eros; negation - the successor to expulsion - belongs to the instinct of destruction. The general wish to negate, the negativism which is displayed by some psychotics, is probably to be regarded as a sign of a defusion of instincts that has taken place through a withdrawal of the libidinal components. But the performance of the function of judgement is not made possible until the creation of the symbol of negation has endowed thinking with a first measure of freedom from the consequences of repression and, with it, from the compulsion of the pleasure principle.

As regards the metapsychological explanation of regression, I am inclined to find it in a 'defusion of instinct', in a detachment of the erotic components which, with the onset of the genital stage, had joined the destructive cathexes belonging to the sadistic phase.
From the first of these standpoints, the dynamic one, psycho-analysis derives all mental processes (apart from the reception of external stimuli) from the interplay of forces, which assist or inhibit one another, combine with one another, enter into compromises with one another, etc. All of these forces are originally in the nature of instincts; thus they have an organic origin. They are characterized by possessing an immense (somatic) store of power ("the compulsion to repeat"); and they are represented mentally as images or ideas with an affective charge. In psycho-analysis, no less than in other sciences, the theory of the instincts is an obscure subject. An empirical analysis leads to the formulation of two groups of instincts: the so-called 'ego-instincts', which are directed towards self-preservation, and the 'object-instincts', which are concerned with relations to an external object. The social instincts are not regarded as elementary or reducible. Theoretical speculation leads to the suspicion that there are two fundamental instincts which lie concealed behind the manifest ego-instincts and object-instincts: namely (a) Eros, the instinct which strives for ever closer union, and (b) the instinct of destruction, which leads towards the dissolution of what is living. In psycho-analysis the manifestation of the force of Eros is given the name 'libido'.

It is our opinion, then, that in sadism and in masochism we have before us two excellent examples of a mixture of the two classes of instinct, of Eros and aggressiveness; and we proceed to the hypothesis that this relation is a model one - that every instinctual impulse that we can examine consists of similar fusions or alloys of the two classes of instinct. These fusions, of course, would be in the most varied ratios. Thus the erotic instincts would introduce the multiplicity of their sexual aims into the fusion, while the others would only admit of mitigations or gradations in their monotonous trend. This hypothesis opens a prospect to us of investigations which may some day be of great importance for the understanding of pathological processes. For fusions may also come apart, and we may expect that functioning will be most gravely affected by defusions of such a kind. But these conceptions are still too new; no one has yet tried to apply them in our work.

Modifications in the proportions of the fusion between the instincts have the most tangible results. A surplus of sexual aggressiveness will turn a lover into a sex-murderer, while a sharp diminution in the aggressive factor will make him bashful or impotent.

¹ The question arises whether the satisfaction of purely destructive instinctual impulses can be felt as pleasure, whether pure destructiveness without any libidinal admixture occurs. Satisfaction of the death instinct remaining in the ego seems not to produce feelings of pleasure, though masochism represents a fusion which is entirely analogous to sadism.

It is less easy to demonstrate the existence of another resistance, our means of combating which are specially inadequate. There are some neurotics in whom, to judge by all their reactions, the instinct of self-preservation has actually been reversed. They seem to aim at nothing other than self-injury and self-destruction. It is possible too that the people who in fact do in the end commit suicide belong to this group. It is to be assumed that in such people far-reaching defusions of instinct have taken place, as a result of which there has been a liberation of excessive quantities of the destructive instinct directed inwards. Patients of this kind are not able to tolerate recovery through our treatment and fight against it with all their strength. But we must confess that this is a case which we have not yet succeeded in completely explaining.
The core of our being, then, is formed by the obscure *id*, which has no direct communication with the external world and is accessible even to our own knowledge only though the medium of another agency. Within this id the organic *instincts* operate, which are themselves compounded of fusions of two primal forces (Eros and destructiveness) in varying proportions and are differentiated from one another by their relation to organs or systems of organs. The one and only urge of these instincts is towards satisfaction, which is expected to arise from certain changes in the organs with the help of objects in the external world. But immediate and unheeding satisfaction of the instincts, such as the id demands, would often lead to perilous conflicts with the external world and to extinction. The id knows no solicitude about ensuring survival and no anxiety; or it would perhaps be more correct to say that, though it can generate the sensory elements of anxiety, it cannot make use of them. The processes which are possible in and between the assumed psychical elements in the id (the *primary process*) differ widely from those which are familiar to us through conscious perception in our intellectual and emotional life; nor are they subject to the critical restrictions of logic, which repudiates some of these processes as invalid and seeks to undo them.

In yet another group of cases the distinguishing characteristics of the ego, which are to be held responsible as sources of resistance against analytic treatment and as impediments to therapeutic success, may spring from different and deeper roots. Here we are dealing with the ultimate things which psychological research can learn about: the behaviour of the two primal instincts, their distribution, mingling and defusion - things which we cannot think of as being confined to a single province of the mental apparatus, the id, the ego or the super-ego. No stronger impression arises from the resistances during the work of analysis than of there being a force which is defending itself by every possible means against recovery and which is absolutely resolved to hold on to illness and suffering. One portion of this force has been recognized by us, undoubtedly with justice, as the sense of guilt and need for punishment, and has been localized by us in the ego's relation to the super-ego. But this is only the portion of it which is, as it were, psychically bound by the super-ego and thus becomes recognizable; other quotas of the same force, whether bound or free, may be at work in other, unspecified places. If we take into consideration the total picture made up of the phenomena of masochism immanent in so many people, the negative therapeutic reaction and the sense of guilt found in so many neurotics, we shall no longer be able to adhere to the belief that mental events are exclusively governed by the desire for pleasure. These phenomena are unmistakable indications of the presence of a power in mental life which we call the instinct of aggression or of destruction according to its aims, and which we trace back to the original death instinct of living matter. It is not a question of an antithesis between an optimistic and a pessimistic theory of life. Only by the concurrent or mutually opposing action of the two primal instincts - Eros and the death instinct -, never by one or the other alone, can we explain the rich multiplicity of the phenomena of life.

How parts of these two classes of instincts combine to fulfil the various vital functions, under what conditions such combinations grow looser or break up, to what disturbances these changes correspond and with what feelings the perceptual scale of the pleasure principle replies to them - these are problems whose elucidation would be the most rewarding achievement of psychological research. For the moment we must bow to the superiority of the forces against which we see our efforts come to nothing. Even to exert a psychical influence on simple masochism is a severe tax upon our powers.
The two fundamental principles of Empedocles - φιλία and υείκος - are, both in name and function, the same as our two primal instincts, Eros and destructiveness, the first of which endeavours to combine what exists into ever greater unities, while the second endeavours to dissolve those combinations and to destroy the structures to which they have given rise. We shall not be surprised, however, to find that, on its re-emergence after two and a half millennia, this theory has been altered in some of its features. Apart from the restriction to the biophysical field which is imposed on us, we no longer have as our basic substances the four elements of Empedocles; what is living has been sharply differentiated from what is inanimate, and we no longer think of the mingling and separation of particles of substance, but of the soldering together and defusion of instinctual components. Moreover, we have provided some sort of biological basis for the principle of 'strife' by tracing back our instinct of destruction to the death instinct, to the urge of what is living to return to an inanimate state. This is not to deny that an analogous instinct already existed earlier, nor, of course, to assert that an instinct of this sort only came into existence with the emergence of life. And no one can foresee in what guise the nucleus of truth contained in the theory of Empedocles will present itself to later understanding. [1937c, 5040]
We are without any physiological understanding of the ways and means by which this taming of the death instinct by the libido may be effected. So far as the psycho-analytic field of ideas is concerned, we can only assume that a very extensive fusion and amalgamation, in varying proportions, of the two classes of instincts takes place, so that we never have to deal with pure life instincts or pure death instincts but only with mixtures of them in different amounts. Corresponding to a fusion of instincts of this kind, there may, as a result of certain influences, be a defusion of them. How large the portions of the death instincts are which refuse to be tamed in this way by being bound to admixtures of libido we cannot at present guess.

The third form of masochism, moral masochism, is chiefly remarkable for having loosened its connection with what we recognize as sexuality. All other masochistic sufferings carry with them the condition that they shall emanate from the loved person and shall be endured at his command. This restriction has been dropped in moral masochism. The suffering itself is what matters; whether it is decreed by someone who is loved or by someone who is indifferent is of no importance. It may even be caused by impersonal powers or by circumstances; the true masochist always turns his cheek whenever he has a chance of receiving a blow. It is very tempting, in explaining this attitude, to leave the libido out of account and to confine oneself to assuming that in this case the destructive instinct has been turned inwards again and is now raging against the self; yet there must be some meaning in the fact that linguistic usage has not given up the connection between this norm of behaviour and erotism and calls these self-injurers masochists too.

Thus moral masochism becomes a classical piece of evidence for the existence of fusion of instinct. Its danger lies in the fact that it originates from the death instinct and corresponds to the part of that instinct which has escaped being turned outwards as an instinct of destruction. But since, on the other hand, it has the significance of an erotic component, even the subject’s destruction of himself cannot take place without libidinal satisfaction.

It is almost humiliating that, after working so long, we should still be having difficulty in understanding the most fundamental facts. But we have made up our minds to simplify nothing and to hide nothing. If we cannot see things clearly we will at least see clearly what the obscurities are. What is hampering us here is evidently some hitch in the development of our theory of the instincts. We began by tracing the organization of the libido through its successive stages - from the oral through the sadistic-anal to the genital - and in doing so placed all the components of the sexual instinct on the same footing. Later it appeared that sadism was the representative of another instinct, which was opposed to Eros. This new view, that the instincts fall into two groups, seems to explode the earlier construction of the successive stages of libidinal organization. But we do not have to break fresh ground in order to find a way out of the difficulty. The solution has been at hand for a long time and lies in the fact that what we are concerned with are scarcely ever pure instinctual impulses but mixtures in various proportions of the two groups of instincts. If this is so, there is no need to revise our view of the organizations of the libido. A sadistic cathexis of an object may also legitimately claim to be treated as a libidinal one; and an aggressive impulse against the father can just as well be subjected to repression as a tender impulse towards the mother. Nevertheless we shall bear in mind for future consideration the possibility that repression is a process which has a special relation to the genital organization of the libido and that the ego resorts to other methods of defence when it has to secure itself against the libido on other levels of organization. To continue: a case like 'Little Hans's' does not enable us to come to any clear conclusion. It is true that in him an aggressive impulse was disposed of by repression, but this happened after the genital organization had been reached.
Every analyst will admit that even today this view has not the sound of a long-discarded error. Nevertheless, alterations in it became essential, as our enquiries advanced from the repressed to the repressing forces, from the object-instincts to the ego. The decisive step forward was the introduction of the concept of narcissism - that is to say, the discovery that the ego itself is cathexed with libido, that the ego, indeed, is the libido's original home, and remains to some extent its headquarters. This narcissistic libido turns towards objects, and thus becomes object-libido; and it can change back into narcissistic libido once more. The concept of narcissism made it possible to obtain an analytic understanding of the traumatic neuroses and of many of the affections bordering on the psychoses, as well as of the latter themselves. It was not necessary to give up our interpretation of the transference neuroses as attempts made by the ego to defend itself against sexuality; but the concept of libido was endangered. Since the ego-instincts, too, were libidinal, it seemed for a time inevitable that we should make libido coincide with instinctual energy in general, as C. G. Jung had already advocated earlier. Nevertheless, there still remained in me a kind of conviction, for which I was not as yet able to find reasons, that the instincts could not all be of the same kind. My next step was taken in *Beyond the Pleasure Principle* (1920), when the compulsion to repeat and the conservative character of instinctual life first attracted my attention. Starting from speculations on the beginning of life and from biological parallels, I drew the conclusion that, besides the instinct to preserve living substance and to join it into ever larger units,¹ there must exist another, contrary instinct seeking to dissolve those units and to bring them back to their primaeval, inorganic state. That is to say, as well as Eros there was an instinct of death. The phenomena of life could be explained from the concurrent or mutually opposing action of these two instincts. It was not easy, however, to demonstrate the activities of this supposed death instinct. The manifestations of Eros were conspicuous and noisy enough. It might be assumed that the death instinct operated silently within the organism towards its dissolution, but that, of course, was no proof. A more fruitful idea was that a portion of the instinct is diverted towards the external world and comes to light as an instinct of aggressiveness and destructiveness. In this way the instinct itself could be pressed into the service of Eros, in that the organism was destroying some other thing, whether animate or inanimate, instead of destroying its own self. Conversely, any restriction of this aggressiveness directed outwards would be bound to increase the self-destruction, which is in any case proceeding. At the same time one can suspect from this example that the two kinds of instinct seldom - perhaps never - appear in isolation from each other, but are alloyed with each other in varying and very different proportions and so become unrecognizable to our judgement. In sadism, long since known to us as a component instinct of sexuality, we should have before us a particularly strong alloy of this kind between trends of love and the destructive instinct; while its counterpart, masochism, would be a union between destructiveness directed inwards and sexuality - a union which makes what is otherwise an imperceptible trend into a conspicuous and tangible one.

[1930a, 4509]

¹ Our present point of view can be roughly expressed in the statement that libido has a share in every instinctual manifestation, but that not everything in that manifestation is libido.

[1930a, 4511]
This is, I think, the place at which to put forward for serious consideration a view which I have earlier recommended for provisional acceptance. In the most recent analytic literature a predilection is shown for the idea that any kind of frustration, any thwarted instinctual satisfaction, results, or may result, in a heightening of the sense of guilt.¹ A great theoretical simplification will, I think, be achieved if we regard this as applying only to the aggressive instincts, and little will be found to contradict this assumption. For how are we to account, on dynamic and economic grounds, for an increase in the sense of guilt appearing in place of an unfulfilled erotic demand? This only seems possible in a round-about way - if we suppose, that is, that the prevention of an erotic satisfaction calls up a piece of aggressiveness against the person who has interfered with the satisfaction, and that this aggressiveness has itself to be suppressed in turn. But if this is so, it is after all only the aggressiveness which is transformed into a sense of guilt, by being suppressed and made over to the super-ego. I am convinced that many processes will admit of a simpler and clearer exposition if the findings of psycho-analysis with regard to the derivation of the sense of guilt are restricted to the aggressive instincts. Examination of the clinical material gives us no unequivocal answer here, because, as our hypothesis tells us, the two classes of instinct hardly ever appear in a pure form, isolated from each other; but an investigation of extreme cases would probably point in the direction I anticipate.

[1930a, 4526]

It is our opinion, then, that in sadism and in masochism we have before us two excellent examples of a mixture of the two classes of instinct, of Eros and aggressiveness; and we proceed to the hypothesis that this relation is a model one - that every instinctual impulse that we can examine consists of similar fusions or alloys of the two classes of instinct. These fusions, of course, would be in the most varied ratios. Thus the erotic instincts would introduce the multiplicity of their sexual aims into the fusion, while the others would only admit of mitigations or gradations in their monotonous trend. This hypothesis opens a prospect to us of investigations which may some day be of great importance for the understanding of pathological processes. For fusions may also come apart, and we may expect that functioning will be most gravely affected by defusions of such a kind. But these conceptions are still too new; no one has yet tried to apply them in our work.

[1933a, 4708]
And here, at an unexpected point, we have emerged from the psychical underworld into the
open market-place. I cannot lead you any further, but before I take leave of you for to-day I must
detain you with one more train of thought. It has become our habit to say that our civilization has
been built up at the cost of sexual trends which, being inhibited by society, are partly, it is true,
repressed but have partly been made usable for other aims. We have admitted, too, that, in
spite of all our pride in our cultural attainments, it is not easy for us to fulfil the requirements of
this civilization or to feel comfortable in it, because the instinctual restrictions imposed on us
constitute a heavy psychical burden. Well, what we have come to see about the sexual
instincts, applies equally and perhaps still more to the other ones, the aggressive instincts. It is
they above all that make human communal life difficult and threaten its survival. Restriction of
the individual's aggressiveness is the first and perhaps the severest sacrifice which society
requires of him. We have learnt the ingenious way in which the taming of this unruly thing has
been achieved. The institution of the super-ego which takes over the dangerous aggressive
impulses, introduces a garrison, as it were, into regions that are inclined to rebellion. But on the
other hand, if we look at it purely psychologically, we must recognize that the ego does not feel
happy in being thus sacrificed to the needs of society, in having to submit to the destructive
trends of aggressiveness which it would have been glad to employ itself against others. It is like
a prolongation in the mental sphere of the dilemma of 'eat or be eaten' which dominates the
organic animate world. Luckily the aggressive instincts are never alone but always alloyed with
the erotic ones. These latter have much to mitigate and much to avert under the conditions of
the civilization which mankind has created.

[1933a, 4714]

An abundant source of a child's hostility to its mother is provided by its multifarious sexual
wishes, which alter according to the phase of the libido and which cannot for the most part be
satisfied. The strongest of these frustrations occur at the phallic period, if the mother forbids
pleasurable activity with the genitals - often with severe threats and every sign of displeasure -
activity to which, after all, she herself had introduced the child. One would think these were
reasons enough to account for a girl's turning away from her mother. One would judge, if so,
that the estrangement follows inevitably from the nature of children's sexuality, from the
immoderate character of their demand for love and the impossibility of fulfilling their sexual
wishes. It might be thought indeed that this first love-relation of the child's is doomed to
dissolution for the very reason that it is the first, for these early object-cathexes are regularly
ambivalent to a high degree. A powerful tendency to aggressiveness is always present beside a
powerful love, and the more passionately a child loves its object the more sensitive does it
come to disappointments and frustrations from that object; and in the end the love must
succumb to the accumulated hostility. Or the idea that there is an original ambivalence such as
this in erotic cathexes may be rejected, and it may be pointed out that it is the special nature of
the mother-child relation that leads, with equal inevitability, to the destruction of the child's love;
for even the mildest upbringing cannot avoid using compulsion and introducing restrictions, and
any such intervention in the child's liberty must provoke as a reaction an inclination to
rebelliousness and aggressiveness. A discussion of these possibilities might, I think, be most
interesting; but an objection suddenly emerges which forces our interest in another direction. All
these factors - the slights, the disappointments in love, the jealousy, the seduction followed by
prohibition - are, after all, also in operation in the relation of a boy to his mother and are yet
unable to alienate him from the maternal object. Unless we can find something that is specific
for girls and is not present or not in the same way present in boys, we shall not have explained
the termination of the attachment of girls to their mother.

[1933a, 4726]
According to our hypothesis human instincts are of only two kinds: those which seek to preserve and unite - which we call 'erotic', exactly in the sense in which Plato uses the word 'Eros' in his *Symposium*, or 'sexual', with a deliberate extension of the popular conception of 'sexuality' - and those which seek to destroy and kill and which we group together as the aggressive or destructive instinct. As you see, this is in fact no more than a theoretical clarification of the universally familiar opposition between Love and Hate which may perhaps have some fundamental relation to the polarity of attraction and repulsion that plays a part in your own field of knowledge. But we must not be too hasty in introducing ethical judgements of good and evil. Neither of these instincts is any less essential than the other; the phenomena of life arise from the concurrent or mutually opposing action of both. Now it seems as though an instinct of the one sort can scarcely ever operate in isolation; it is always accompanied - or, as we say, alloyed - with a certain quota from the other side, which modifies its aim or is, in some cases, what enables it to achieve that aim. Thus, for instance, the instinct of self-preservation is certainly of an erotic kind, but it must nevertheless have aggressiveness at its disposal if it is to fulfil its purpose. So, too, the instinct of love, when it is directed towards an object, stands in need of some contribution from the instinct for mastery if it is in any way to obtain possession of that object. The difficulty of isolating the two classes of instinct in their actual manifestations is indeed what has so long prevented us from recognizing them.

If you will follow me a little further, you will see that human actions are subject to another complication of a different kind. It is very rarely that an action is the work of a single instinctual impulse (which must in itself be compounded of Eros and destructiveness). In order to make an action possible there must be as a rule a combination of such compounded motives. This was perceived long ago by a specialist in your own subject, a Professor G. C. Lichtenberg who taught physics at Göttingen during our classical age - though perhaps he was even more remarkable as a psychologist than as a physicist. He invented a Compass of Motives, for he wrote: 'The motives that lead us to do anything might be arranged like the thirty-two winds and might be given names in a similar way: for instance, "bread-bread-fame" or "fame-fame-bread". So that when human beings are incited to war they may have a whole number of motives for assenting - some noble and some base, some which are openly declared and others which are never mentioned. There is no need to enumerate them all. A lust for aggression and destruction is certainly among them: the countless cruelties in history and in our everyday lives vouch for its existence and its strength. The satisfaction of these destructive impulses is of course facilitated by their admixture with others of an erotic and idealistic kind. When we read of the atrocities of the past, it sometimes seems as though the idealistic motives served only as an excuse for the destructive appetites; and sometimes - in the case, for instance, of the cruelties of the Inquisition - it seems as though the idealistic motives had pushed themselves forward in consciousness, while the destructive ones lent them an unconscious reinforcement. Both may be true.

¹ The question arises whether the satisfaction of purely destructive instinctual impulses can be felt as pleasure, whether pure destructiveness without any libidinal admixture occurs. Satisfaction of the death instinct remaining in the ego seems not to produce feelings of pleasure, though masochism represents a fusion which is entirely analogous to sadism.
But Hans was not by any means a bad character; he was not even one of those children who at his age still give free play to the propensity towards cruelty and violence which is a constituent of human nature. On the contrary, he had an unusually kind-hearted and affectionate disposition; his father reported that the transformation of aggressive tendencies into feelings of pity took place in him at a very early age. Long before the phobia he had become uneasy when he saw the horses in a merry-go-round being beaten; and he was never unmoved if any one wept in his presence. At one stage in the analysis a piece of suppressed sadism made its appearance in a particular context:¹ but it was suppressed sadism, and we shall presently have to discover from the content what it stood for and what it was meant to replace. And Hans deeply loved the father against whom he cherished these death-wishes; and while his intellect demurred to such a contradiction,² he could not help demonstrating the fact of its existence, by hitting his father and immediately afterwards kissing the place he had hit. We ourselves, too, must guard against making a difficulty of such a contradiction. The emotional life of man is in general made up of pairs of contraries such as these.³ Indeed, if it were not so, repressions and neuroses would perhaps never come about. In the adult these pairs of contrary emotions do not as a rule become simultaneously conscious except at the climaxes of passionate love; at other times they usually go on suppressing each other until one of them succeeds in keeping the other altogether out of sight. But in children they can exist peaceably side by side for quite a considerable time.

¹ [Footnote added 1923:] The above passage was written at a time when Adler seemed still to be taking his stand upon the ground of psycho-analysis, and before he had put forward the masculine protest and disavowed repression. Since then I have myself been obliged to assert the existence of an 'aggressive instinct', but it is different from Adler's. I prefer to call it the 'destructive' or 'death instinct'. See Beyond the Pleasure Principle (1920g) and The Ego and the Id (1923b). Its opposition to the libidinal instincts finds an expression in the familiar polarity of love and hate. My disagreement with Adler's view, which results in a universal characteristic of instincts in general being reduced to be the property of a single one of them, remains unaltered.

² [Footnote added 1923:] In the obscurity that reigns at present in the theory of the instincts, it would be unwise to reject any idea that promises to throw light on it. We started out from the great opposition between the life and death instincts. Now object-love itself presents us with a second example of a similar polarity - that between love (or other affection) and hate (or aggressiveness). If only we could succeed in relating these two polarities to each other and in deriving one from the other! From the very first we recognized the presence of a sadistic component in the sexual instinct.¹ As we know, it can make itself independent and can, in the form of a perversion, dominate an individual's entire sexual activity. It also emerges as a predominant component instinct in one of the 'pregenital organizations', as I have named them. But how can the sadistic instinct, whose aim it is to injure the object, be derived from Eros, the preserver of life? Is it not plausible to suppose that this sadism is in fact a death instinct which, under the influence of the narcissistic libido, has been forced away from the ego and has consequently only emerged in relation to the object? It now enters the service of the sexual function. During the oral stage of organization of the libido, the act of obtaining erotic mastery over an object coincides with that object's destruction; later, the sadistic instinct separates off, and finally, at the stage of genital primacy, it takes on, for the purposes of reproduction, the function of overpowering the sexual object to the extent necessary for carrying out the sexual act. It might indeed be said that the sadism which has been forced out of the ego has pointed the way for the libidinal components of the sexual instinct, and that these follow after it to the object. Wherever the original sadism has undergone no mitigation or intermixture, we find the familiar ambivalence of love and hate in erotic life.

³ [1920g, 3755]
Sublimation. - An attentive examination of the sexual trends, which alone were accessible to psycho-analysis, had meanwhile led to some remarkable detailed findings. What is described as the sexual instinct turns out to be of a highly composite nature and is liable to disintegrate once more into its component instincts. Each component instinct is unalterably characterized by its source, that is, by the region or zone of the body from which its excitation is derived. Each has furthermore as distinguishable features an object and an aim. The aim is always discharge accompanied by satisfaction, but it is capable of being changed from activity to passivity. The object is less closely attached to the instinct than was at first supposed; it is easily exchanged for another one, and, moreover, an instinct which had an external object can be turned round upon the subject's own self. The separate instincts can either remain independent of one another or - in what is still an inexplicable manner - can be combined and merged into one another to perform work in common. They are also able to replace one another and to transfer their libidinal cathexis to one another, so that the satisfaction of one instinct can take the place of the satisfaction of others. The most important vicissitude which an instinct can undergo seems to be sublimation; here both object and aim are changed, so that what was originally a sexual instinct finds satisfaction in some achievement which is no longer sexual but has a higher social or ethical valuation. These different features do not as yet combine to form an integral picture.
[1923a, 3932]

Recognition of Two Classes of Instincts in Mental Life. - Though psycho-analysis endeavours as a rule to develop its theories as independently as possible from those of other sciences, it is nevertheless obliged to seek a basis for the theory of the instincts in biology. On the ground of a far-reaching consideration of the processes which go to make up life and which lead to death, it becomes probable that we should recognize the existence of two classes of instincts, corresponding to the contrary processes of construction and dissolution in the organism. On this view, the one set of instincts, which work essentially in silence, would be those which follow the aim of leading the living creature to death and therefore deserve to be called the 'death instincts'; these would be directed outwards as the result of the combination of numbers of unicellular elementary organisms, and would manifest themselves as destructiveness or aggressive impulses. The other set of instincts would be those which are better known to us in analysis - the libidinal, sexual or life instincts, which are best comprised under the name of Eros; their purpose would be to form living substance into ever greater unities, so that life may be prolonged and brought to higher development. The erotic instincts and the death instincts would be present in living beings in regular mixtures or fusions; but 'defusions' would also be liable to occur. Life would consist in the manifestations of the conflict or interaction between the two classes of instincts; death would mean for the individual the victory of the destructive instincts, but reproduction would mean for him the victory of Eros.
[1923a, 3934]
I have lately developed a view of the instincts¹ which I shall here hold to and take as the basis of my further discussions. According to this view we have to distinguish two classes of instincts, one of which, the sexual instincts or Eros, is by far the more conspicuous and accessible to study. It comprises not merely the uninhibited sexual instinct proper and the instinctual impulses of an aim-inhibited or sublimated nature derived from it, but also the self-preservative instinct, which must be assigned to the ego and which at the beginning of our analytic work we had good reason for contrasting with the sexual object-instincts. The second class of instincts was not so easy to point to; in the end we came to recognize sadism as its representative. On the basis of theoretical considerations, supported by biology, we put forward the hypothesis of a death instinct, the task of which is to lead organic life back into the inanimate state; on the other hand, we supposed that Eros, by bringing about a more and more far-reaching combination of the particles into which living substance is dispersed, aims at complicating life and at the same time, of course, at preserving it. Acting in this way, both the instincts would be conservative in the strictest sense of the word, since both would be endeavouring to re-establish a state of things that was disturbed by the emergence of life. The emergence of life would thus be the cause of the continuance of life and also at the same time of the striving towards death; and life itself would be a conflict and compromise between these two trends. The problem of the origin of life would remain a cosmological one; and the problem of the goal and purpose of life would be answered dualistically. 

[1923b, 3974]

The inadequacy of this explanation is seen, however, in the fact that it throws no light on the regular and close connections of masochism with its counterpart in instinctual life, sadism. If we go back a little further, to our hypothesis of the two classes of instincts which we regard as operative in the living organism, we arrive at another derivation of masochism, which, however, is not in contradiction with the former one. In (multicellular) organisms the libido meets the instinct of death, or destruction, which is dominant in them and which seeks to disintegrate the cellular organism and to conduct each separate unicellular organism into a state of inorganic stability (relative though this may be). The libido has the task of making the destroying instinct innocuous, and it fulfils the task by diverting that instinct to a great extent outwards - soon with the help of a special organic system, the muscular apparatus - towards objects in the external world. The instinct is then called the destructive instinct, the instinct for mastery, or the will to power. A portion of the instinct is placed directly in the service of the sexual function, where it has an important part to play. This is sadism proper. Another portion does not share in this transposition outwards; it remains inside the organism and, with the help of the accompanying sexual excitation described above, becomes libidinally bound there. It is in this portion that we have to recognize the original, erotogenic masochism. 

[1924c, 4075]

If one is prepared to overlook a little inexactitude, it may be said that the death instinct which is operative in the organism - primal sadism - is identical with masochism. After the main portion of it has been transposed outwards on to objects, there remains inside, as a residuum of it, the erotogenic masochism proper, which on the one hand has become a component of the libido and, on the other, still has the self as its object. This masochism would thus be evidence of, and a remainder from, the phase of development in which the coalescence, which is so important for life, between the death instinct and Eros took place. We shall not be surprised to hear that in certain circumstances the sadism, or instinct of destruction, which has been directed outwards, projected, can be once more introjected, turned inwards, and in this way regress to its earlier situation. If this happens, a secondary masochism is produced, which is added to the original masochism. 

[1924c, 4076]
In the works of my later years (Beyond the Pleasure Principle, Group Psychology and the Analysis of the Ego, and The Ego and the Id), I have given free rein to the inclination, which I kept down for so long, to speculation, and I have also contemplated a new solution of the problem of the instincts. I have combined the instincts for self-preservation and for the preservation of the species under the concept of Eros and have contrasted with it an instinct of death or destruction which works in silence. Instinct in general is regarded as a kind of elasticity of living things, an impulsion towards the restoration of a situation which once existed but was brought to an end by some external disturbance. This essentially conservative character of instincts is exemplified by the phenomena of the compulsion to repeat. The picture which life presents to us is the result of the concurrent and mutually opposing action of Eros and the death instinct.

[1925d, 4232]
The tracing back of the delusion and its resolution were now complete. What the author now adds is no doubt designed to serve as a harmonious end to his story. We cannot but feel reassured about the future when we hear that the young man, who had earlier been obliged to play the pitiable part of a person in urgent need of treatment, advanced still further on the road to recovery and succeeded in arousing in her some of the feelings under which he himself had suffered before. Thus it was that he made her jealous by mentioning the sympathetic young lady who had previously interrupted their tête-à-tête in the House of Meleager, and by confessing that she had been the first woman for whom he had felt a very great liking. Whereupon Zoe prepared to take a chilly leave of him, remarking that everything had now returned to reason - she herself not least; he could look up Gisa Hartleben (or whatever she was now called) again and give her some scientific assistance over the purpose of her visit to Pompeii; she herself, however, must go back to the Albergo del Sole where her father was expecting her for lunch; perhaps they would meet again some time at a party in Germany or in the moon. But once more he was able to make the troublesome fly an excuse for taking possession first of her cheek and then of her lips, and to set in motion the aggressiveness which is a man's inevitable duty in love making. Once only a shadow seemed to fall on their happiness, when Zoe declared that now she really must go back to her father or he will starve at the Sole. 'Your father? . . . what will happen? . . .' (147.) But the clever girl was able swiftly to quiet his concern. 'Probably nothing will happen. I'm not an indispensable part of his zoological collection. If I had been, perhaps I shouldn't have been so foolish as to give my heart to you.' In the exceptional event, however, of her father taking a different view from hers, there was a safe expedient. Hanold need only cross to Capri, catch a *Lacerta faraglionensis* there (he could practise the technique on her little finger), set the creature free over here, catch it again before the zoologist's eyes, and let him choose between a *faraglionensis* on the mainland and his daughter. The scheme, it is easy to see, was one in which the mockery was tinged with bitterness; it was a warning, as it were, to her fiancé not to keep too closely to the model on which she had chosen him. Here again Norbert Hanold reassures us, by showing by all sorts of apparently small signs the great transformation that had taken place in him. He proposed that he and his Zoe should come for their honeymoon to Italy and Pompeii, just as though he had never been indignant with the honeymooning Edwins and Angelinas. He had completely lost from his memory all his feelings against those happy pairs, who had so unnecessarily travelled more than a hundred miles from their German home. The author is certainly right in bringing forward a loss of memory like this as the most trustworthy sign of a change of attitude. Zoe's reply to the plan for the scene of their honeymoon suggested by 'her childhood friend who had also in a sense been dug out of the ruins again' (150.) was that she did not feel quite alive enough yet to make a geographical decision of that sort.

[1907a, 1840]
In the obscurity that reigns at present in the theory of the instincts, it would be unwise to reject any idea that promises to throw light on it. We started out from the great opposition between the life and death instincts. Now object-love itself presents us with a second example of a similar polarity - that between love (or other affection) and hate (or aggressiveness). If only we could succeed in relating these two polarities to each other and in deriving one from the other! From the very first we recognized the presence of a sadistic component in the sexual instinct.¹ As we know, it can make itself independent and can, in the form of a perversion, dominate an individual's entire sexual activity. It also emerges as a predominant component instinct in one of the 'pregenital organizations', as I have named them. But how can the sadistic instinct, whose aim it is to injure the object, be derived from Eros, the preserver of life? Is it not plausible to suppose that this sadism is in fact a death instinct which, under the influence of the narcissistic libido, has been forced away from the ego and has consequently only emerged in relation to the object? It now enters the service of the sexual function. During the oral stage of organization of the libido, the act of obtaining erotic mastery over an object coincides with that object's destruction; later, the sadistic instinct separates off, and finally, at the stage of genital primacy, it takes on, for the purposes of reproduction, the function of overpowering the sexual object to the extent necessary for carrying out the sexual act. It might indeed be said that the sadism which has been forced out of the ego has pointed the way for the libidinal components of the sexual instinct, and that these follow after it to the object. Wherever the original sadism has undergone no mitigation or intermixture, we find the familiar ambivalence of love and hate in erotic life.

We need not feel greatly disturbed in judging our speculation upon the life and death instincts by the fact that so many bewildering and obscure processes occur in it - such as one instinct being driven out by another or an instinct turning from the ego to an object, and so on. This is merely due to our being obliged to operate with the scientific terms, that is to say with the figurative language, peculiar to psychology (or, more precisely, to depth psychology). We could not otherwise describe the processes in question at all, and indeed we could not have become aware of them. The deficiencies in our description would probably vanish if we were already in a position to replace the psychological terms by physiological or chemical ones. It is true that they too are only part of a figurative language; but it is one with which we have long been familiar and which is perhaps a simpler one as well.

Sublimation. - An attentive examination of the sexual trends, which alone were accessible to psycho-analysis, had meanwhile led to some remarkable detailed findings. What is described as the sexual instinct turns out to be of a highly composite nature and is liable to disintegrate once more into its component instincts. Each component instinct is unalterably characterized by its source, that is, by the region or zone of the body from which its excitation is derived. Each has furthermore as distinguishable features an object and an aim. The aim is always discharge accomplished by satisfaction, but it is capable of being changed from activity to passivity. The object is less closely attached to the instinct than was at first supposed; it is easily exchanged for another one, and, moreover, an instinct which had an external object can be turned round upon the subject's own self. The separate instincts can either remain independent of one another or - in what is still an inexplicable manner - can be combined and merged into one another to perform work in common. They are also able to replace one another and to transfer their libidinal cathexis to one another, so that the satisfaction of one instinct can take the place of the satisfaction of others. The most important vicissitude which an instinct can undergo seems to be sublimation; here both object and aim are changed, so that what was originally a sexual instinct finds satisfaction in some achievement which is no longer sexual but has a higher social or ethical valuation. These different features do not as yet combine to form an integral picture.

[1923a, 3932]
Recognition of Two Classes of Instincts in Mental Life. - Though psycho-analysis endeavours as a rule to develop its theories as independently as possible from those of other sciences, it is nevertheless obliged to seek a basis for the theory of the instincts in biology. On the ground of a far-reaching consideration of the processes which go to make up life and which lead to death, it becomes probable that we should recognize the existence of two classes of instincts, corresponding to the contrary processes of construction and dissolution in the organism. On this view, the one set of instincts, which work essentially in silence, would be those which follow the aim of leading the living creature to death and therefore deserve to be called the 'death instincts'; these would be directed outwards as the result of the combination of numbers of unicellular elementary organisms, and would manifest themselves as destructive or aggressive impulses. The other set of instincts would be those which are better known to us in analysis - the libidinal, sexual or life instincts, which are best comprised under the name of Eros; their purpose would be to form living substance into ever greater unities, so that life may be prolonged and brought to higher development. The erotic instincts and the death instincts would be present in living beings in regular mixtures or fusions; but 'defusions' would also be liable to occur. Life would consist in the manifestations of the conflict or interaction between the two classes of instincts; death would mean for the individual the victory of the destructive instincts, but reproduction would mean for him the victory of Eros.

[1923a, 3934]

The inadequacy of this explanation is seen, however, in the fact that it throws no light on the regular and close connections of masochism with its counterpart in instinctual life, sadism. If we go back a little further, to our hypothesis of the two classes of instincts which we regard as operative in the living organism, we arrive at another derivation of masochism, which, however, is not in contradiction with the former one. In (multicellular) organisms the libido meets the instinct of death, or destruction, which is dominant in them and which seeks to disintegrate the cellular organism and to conduct each separate unicellular organism into a state of inorganic stability (relative though this may be). The libido has the task of making the destroying instinct innocuous, and it fulfils the task by diverting that instinct to a great extent outwards - soon with the help of a special organic system, the muscular apparatus - towards objects in the external world. The instinct is then called the destructive instinct, the instinct for mastery, or the will to power. A portion of the instinct is placed directly in the service of the sexual function, where it has an important part to play. This is sadism proper. Another portion does not share in this transposition outwards; it remains inside the organism and, with the help of the accompanying sexual excitation described above, becomes libidinally bound there. It is in this portion that we have to recognize the original, erotogenic masochism.

[1924c, 4075]

From the first of these standpoints, the dynamic one, psycho-analysis derives all mental processes (apart from the reception of external stimuli) from the interplay of forces, which assist or inhibit one another, combine with one another, enter into compromises with one another, etc. All of these forces are originally in the nature of instincts; thus they have an organic origin. They are characterized by possessing an immense (somatic) store of power ('the compulsion to repeat'); and they are represented mentally as images or ideas with an affective charge. In psycho-analysis, no less than in other sciences, the theory of the instincts is an obscure subject. An empirical analysis leads to the formulation of two groups of instincts: the so-called 'ego-instincts', which are directed towards self-preservation, and the 'object-instincts', which are concerned with relations to an external object. The social instincts are not regarded as elementary or irreducible. Theoretical speculation leads to the suspicion that there are two fundamental instincts which lie concealed behind the manifest ego-instincts and object-instincts: namely (a) Eros, the instinct which strives for ever closer union, and (b) the instinct of destruction, which leads towards the dissolution of what is living. In psycho-analysis the manifestation of the force of Eros is given the name 'libido'.

[1926f, 4403]
But how can this conservative characteristic of instincts help us to understand our self-destructiveness? What earlier state of things does an instinct such as this want to restore? Well, the answer is not far to seek and opens wide perspectives. If it is true that - at some immeasurably remote time and in a manner we cannot conceive - life once proceeded out of inorganic matter, then, according to our presumption, an instinct must have arisen which sought to do away with life once more and to re-establish the inorganic state. If we recognize in this instinct the self-destructiveness of our hypothesis, we may regard the self-destructiveness as an expression of a ‘death instinct’ which cannot fail to be present in every vital process. And now the instincts that we believe in divide themselves into two groups - the erotic instincts, which seek to combine more and more living substance into ever greater unities, and the death instincts, which oppose this effort and lead what is living back into an inorganic state. From the concurrent and opposing action of these two proceed the phenomena of life which are brought to an end by death.

[1933a, 4711]

In biological functions the two basic instincts operate against each other or combine with each other. Thus, the act of eating is a destruction of the object with the final aim of incorporating it, and the sexual act is an act of aggression with the purpose of the most intimate union. This concurrent and mutually opposing action of the two basic instincts gives rise to the whole variegation of the phenomena of life. The analogy of our two basic instincts extends from the sphere of living things to the pair of opposing forces - attraction and repulsion - which rule in the inorganic world.¹

[1940a [1938], 4960]
It was not our intention at all events to produce such a result. Our argument had as its point of departure a sharp distinction between ego-instincts, which we equated with death instincts, and sexual instincts, which we equated with life instincts. (We were prepared at one stage to include the so-called self-preservative instincts of the ego among the death instincts; but we subsequently corrected ourselves on this point and withdrew it.) Our views have from the very first been dualistic, and to-day they are even more definitely dualistic than before - now that we describe the opposition as being, not between ego-instincts and sexual instincts but between life instincts and death instincts. Jung's libido theory is on the contrary monistic; the fact that he has called his one instinctual force 'libido' is bound to cause confusion, but need not affect us otherwise. We suspect that instincts other than those of self-preservation operate in the ego, and it ought to be possible for us to point to them. Unfortunately, however, the analysis of the ego has made so little headway that it is very difficult for us to do so. It is possible, indeed, that the libidinal instincts in the ego may be linked in a peculiar manner with these other ego-instincts which are still strange to us. Even before we had any clear understanding of narcissism, psycho-analysts had a suspicion that the 'ego-instincts' had libidinal components attached to them. But these are very uncertain possibilities, to which our opponents will pay very little attention. The difficulty remains that psycho-analysis has not enabled us hitherto to point to any instincts other than the libidinal ones. That, however, is no reason for our falling in with the conclusion that no others in fact exist.

[1920g, 3754]

In the obscurity that reigns at present in the theory of the instincts, it would be unwise to reject any idea that promises to throw light on it. We started out from the great opposition between the life and death instincts. Now object-love itself presents us with a second example of a similar polarity - that between love (or other affection) and hate (or aggressiveness). [1923a, 3932]

Recognition of Two Classes of Instincts in Mental Life. - Though psycho-analysis endeavours as a rule to develop its theories as independently as possible from those of other sciences, it is nevertheless obliged to seek a basis for the theory of the instincts in biology. On the ground of a far-reaching consideration of the processes which go to make up life and which lead to death, it becomes probable that we should recognize the existence of two classes of instincts, corresponding to the contrary processes of construction and dissolution in the organism. On this view, the one set of instincts, which work essentially in silence, would be those which follow the aim of leading the living creature to death and therefore deserve to be called the 'death instincts'; these would be directed outwards as the result of the combination of numbers of unicellular elementary organisms, and would manifest themselves as destructiveness or aggressive impulses. The other set of instincts would be those which are better known to us in analysis - the libidinal, sexual or life instincts, which are best comprised under the name of Eros; their purpose would be to form living substance into ever greater unities, so that life may be prolonged and brought to higher development. The erotic instincts and the death instincts would be present in living beings in regular mixtures or fusions; but 'defusions' would also be liable to occur. Life would consist in the manifestations of the conflict or interaction between the two classes of instincts; death would mean for the individual the victory of the destructive instincts, but reproduction would mean for him the victory of Eros.

[1923a, 3934]
Once we have admitted the idea of a fusion of the two classes of instincts with each other, the possibility of a - more or less complete - 'defusion' of them forces itself upon us. The sadistic component of the sexual instinct would be a classical example of a serviceable instinctual fusion; and the sadism which has made itself independent as a perversion would be typical of a defusion, though not of one carried to extremes. From this point we obtain a view of a great domain of facts which has not before been considered in this light. We perceive that for purposes of discharge the instinct of destruction is habitually brought into the service of Eros; we suspect that the epileptic fit is a product and indication of an instinctual defusion; and we come to understand that instinctual defusion and the marked emergence of the death instinct call for particular consideration among the effects of some severe neuroses - for instance, the obsessional neuroses. Making a swift generalization, we might conjecture that the essence of a regression of libido (e. g. from the genital to the sadistic-anal phase) lies in a defusion of instincts, just as, conversely, the advance from the earlier phase to the definitive genital one would be conditioned by an accession of erotic components. The question also arises whether ordinary ambivalence, which is so often unusually strong in the constitutional disposition to neurosis, should not be regarded as the product of a defusion; ambivalence, however, is such a fundamental phenomenon that it more probably represents an instinctual fusion that has not been completed.

[1923b, 3975]

The inadequacy of this explanation is seen, however, in the fact that it throws no light on the regular and close connections of masochism with its counterpart in instinctual life, sadism. If we go back a little further, to our hypothesis of the two classes of instincts which we regard as operative in the living organism, we arrive at another derivation of masochism, which, however, is not in contradiction with the former one. In (multicellular) organisms the libido meets the instinct of death, or destruction, which is dominant in them and which seeks to disintegrate the cellular organism and to conduct each separate unicellular organism into a state of inorganic stability (relative though this may be). The libido has the task of making the destroying instinct innocuous, and it fulfils the task by diverting that instinct to a great extent outwards - soon with the help of a special organic system, the muscular apparatus - towards objects in the external world. The instinct is then called the destructive instinct, the instinct for mastery, or the will to power. A portion of the instinct is placed directly in the service of the sexual function, where it has an important part to play. This is sadism proper. Another portion does not share in this transposition outwards; it remains inside the organism and, with the help of the accompanying sexual excitation described above, becomes libidinally bound there. It is in this portion that we have to recognize the original, erotogenic masochism.

[1924c, 4075]

From the first of these standpoints, the dynamic one, psycho-analysis derives all mental processes (apart from the reception of external stimuli) from the interplay of forces, which assist or inhibit one another, combine with one another, enter into compromises with one another, etc. All of these forces are originally in the nature of instincts; thus they have an organic origin. They are characterized by possessing an immense (somatic) store of power ('the compulsion to repeat'); and they are represented mentally as images or ideas with an affective charge. In psycho-analysis, no less than in other sciences, the theory of the instincts is an obscure subject. An empirical analysis leads to the formulation of two groups of instincts: the so-called 'ego-instincts', which are directed towards self-preservation, and the 'object-instincts', which are concerned with relations to an external object. The social instincts are not regarded as elementary or irreducible. Theoretical speculation leads to the suspicion that there are two fundamental instincts which lie concealed behind the manifest ego-instincts and object-instincts: namely (a) Eros, the instinct which strives for ever closer union, and (b) the instinct of destruction, which leads towards the dissolution of what is living. In psycho-analysis the manifestation of the force of Eros is given the name 'libido'.

[1926f, 4403]
Every analyst will admit that even to-day this view has not the sound of a long-discarded error. Nevertheless, alterations in it became essential, as our enquiries advanced from the repressed to the repressing forces, from the object-instincts to the ego. The decisive step forward was the introduction of the concept of narcissism - that is to say, the discovery that the ego itself is cathected with libido, that the ego, indeed, is the libido's original home, and remains to some extent its headquarters. This narcissistic libido turns towards objects, and thus becomes object-libido; and it can change back into narcissistic libido once more. The concept of narcissism made it possible to obtain an analytic understanding of the traumatic neuroses and of many of the affections bordering on the psychoses, as well as of the latter themselves. It was not necessary to give up our interpretation of the transference neuroses as attempts made by the ego to defend itself against sexuality; but the concept of libido was endangered. Since the ego-instincts, too, were libidinal, it seemed for a time inevitable that we should make libido coincide with instinctual energy in general, as C. G. Jung had already advocated earlier. Nevertheless, there still remained in me a kind of conviction, for which I was not as yet able to find reasons, that the instincts could not all be of the same kind. My next step was taken in *Beyond the Pleasure Principle* (1920), when the compulsion to repeat and the conservative character of instinctual life first attracted my attention. Starting from speculations on the beginning of life and from biological parallels, I drew the conclusion that, besides the instinct to preserve living substance and to join it into ever larger units,¹ there must exist another, contrary instinct seeking to dissolve those units and to bring them back to their primaeval, inorganic state. That is to say, as well as Eros there was an instinct of death. The phenomena of life could be explained from the concurrent or mutually opposing action of these two instincts. It was not easy, however, to demonstrate the activities of this supposed death instinct. The manifestations of Eros were conspicuous and noisy enough. It might be assumed that the death instinct operated silently within the organism towards its dissolution, but that, of course, was no proof. A more fruitful idea was that a portion of the instinct is diverted towards the external world and comes to light as an instinct of aggressiveness and destructiveness. In this way the instinct itself could be pressed into the service of Eros, in that the organism was destroying some other thing, whether animate or inanimate, instead of destroying its own self. Conversely, any restriction of this aggressiveness directed outwards would be bound to increase the self-destruction, which is in any case proceeding. At the same time one can suspect from this example that the two kinds of instinct seldom - perhaps never - appear in isolation from each other, but are alloyed with each other in varying and very different proportions and so become unrecognizable to our judgement. In sadism, long since known to us as a component instinct of sexuality, we should have before us a particularly strong alloy of this kind between trends of love and the destructive instinct; while its counterpart, masochism, would be a union between destructiveness directed inwards and sexuality - a union which makes what is otherwise an imperceptible trend into a conspicuous and tangible one.

[1930a, 4509]
The assumption of the existence of an instinct of death or destruction has met with resistance even in analytic circles; I am aware that there is a frequent inclination rather to ascribe whatever is dangerous and hostile in love to an original bipolarity in its own nature. To begin with it was only tentatively that I put forward the views I have developed here, but in the course of time they have gained such a hold upon me that I can no longer think in any other way. To my mind, they are far more serviceable from a theoretical standpoint than any other possible ones; they provide that simplification, without either ignoring or doing violence to the facts, for which we strive in scientific work. I know that in sadism and masochism we have always seen before us manifestations of the destructive instinct (directed outwards and inwards), strongly alloyed with erotism; but I can no longer understand how we can have overlooked the ubiquity of non-erotic aggressivity and destructiveness and can have failed to give it its due place in our interpretation of life. (The desire for destruction when it is directed inwards mostly eludes our perception, of course, unless it is tinged with erotism.) I remember my own defensive attitude when the idea of an instinct of destruction first emerged in psycho-analytic literature, and how long it took before I became receptive to it. That others should have shown, and still show, the same attitude of rejection surprises me less. For 'little children do not like it' when there is talk of the inborn human inclination to 'badness', to aggressiveness and destructiveness, and so to cruelty as well. God has made them in the image of His own perfection; nobody wants to be reminded how hard it is to reconcile the undeniable existence of evil - despite the protestations of Christian Science - with His all-powerfulness or His all-goodness. The Devil would be the best way out as an excuse for God; in that way he would be playing the same part as an agent of economic discharge as the Jew does in the world of the Aryans. But even so, one can hold God responsible for the existence of the Devil just as well as for the existence of the wickedness which the Devil embodies. In view of these difficulties, each of us will be well advised, on some suitable occasion, to make a low bow to the deeply moral nature of mankind; it will help us to be generally popular and much will be forgiven us for it.¹

¹[1930a, 4510]

The name 'libido' can once more be used to denote the manifestations of the power of Eros in order to distinguish them from the energy of the death instinct.¹ It must be confessed that we have much greater difficulty in grasping that instinct; we can only suspect it, as it were, as something in the background behind Eros, and it escapes detection unless its presence is betrayed by its being alloyed with Eros. It is in sadism, where the death instinct twists the erotic aim in its own sense and yet at the same time fully satisfies the erotic urge, that we succeed in obtaining the clearest insight into its nature and its relation to Eros. But even where it emerges without any sexual purpose, in the blindest fury of destructiveness, we cannot fail to recognize that the satisfaction of the instinct is accompanied by an extraordinarily high degree of narcissistic enjoyment, owing to its presenting the ego with a fulfilment of the latter's old wishes for omnipotence. The instinct of destruction, moderated and tamed, and, as it were, inhibited in its aim, must, when it is directed towards objects, provide the ego with the satisfaction of its vital needs and with control over nature. Since the assumption of the existence of the instinct is mainly based on theoretical grounds, we must also admit that it is not entirely proof against theoretical objections. But this is how things appear to us now, in the present state of our knowledge; future research and reflection will no doubt bring further light which will decide the matter.

¹[1930a, 4511]
You may perhaps shrug your shoulders and say: 'That isn't natural science, it's
Schopenhauer's philosophy!' But, Ladies and Gentlemen, why should not a bold thinker have
guessed something that is afterwards confirmed by sober and painstaking detailed research?
Moreover, there is nothing that has not been said already, and similar things had been said by
many people before Schopenhauer. Furthermore, what we are saying is not even genuine
Schopenhauer. We are not asserting that death is the only aim of life; we are not overlooking
the fact that there is life as well as death. We recognize two basic instincts and give each of
them its own aim. How the two of them are mingled in the process of living, how the death
instinct is made to serve the purposes of Eros, especially by being turned outwards as
aggressiveness - these are tasks which are left to future investigation. We have not gone
beyond the point at which this prospect lies open before us. The question, too, of whether the
conservative character may not belong to all instincts without exception, whether the erotic
instincts as well may not be seeking to bring back an earlier state of things when they strive to
bring about a synthesis of living things into greater unities - this question, too, we must leave
unanswered.
[1933a, 4711]
But Hans was not by any means a bad character; he was not even one of those children who at his age still give free play to the propensity towards cruelty and violence which is a constituent of human nature. On the contrary, he had an unusually kind-hearted and affectionate disposition; his father reported that the transformation of aggressive tendencies into feelings of pity took place in him at a very early age. Long before the phobia he had become uneasy when he saw the horses in a merry-go-round being beaten; and he was never unmoved if any one wept in his presence. At one stage in the analysis a piece of suppressed sadism made its appearance in a particular context:¹ but it was suppressed sadism, and we shall presently have to discover from the content what it stood for and what it was meant to replace.

And Hans deeply loved the father against whom he cherished these death-wishes; and while his intellect demurred to such a contradiction,² he could not help demonstrating the fact of its existence, by hitting his father and immediately afterwards kissing the place he had hit. We ourselves, too, must guard against making a difficulty of such a contradiction. The emotional life of man is in general made up of pairs of contraries such as these.³ Indeed, if it were not so, repressions and neuroses would perhaps never come about. In the adult these pairs of contrary emotions do not as a rule become simultaneously conscious except at the climaxes of passionate love; at other times they usually go on suppressing each other until one of them succeeds in keeping the other altogether out of sight. But in children they can exist peaceably side by side for quite a considerable time.

² [Footnote added 1923:] The above passage was written at a time when Adler seemed still to be taking his stand upon the ground of psycho-analysis, and before he had put forward the masculine protest and disavowed repression. Since then I have myself been obliged to assert the existence of an 'aggressive instinct', but it is different from Adler's. I prefer to call it the 'destructive' or 'death instinct'. See Beyond the Pleasure Principle (1920g) and The Ego and the Id (1923b). Its opposition to the libidinal instincts finds an expression in the familiar polarity of love and hate. My disagreement with Adler's view, which results in a universal characteristic of instincts in general being reduced to be the property of a single one of them, remains unaltered.

³ It was not our intention at all events to produce such a result. Our argument had as its point of departure a sharp distinction between ego-instincts, which we equated with death instincts, and sexual instincts, which we equated with life instincts. (We were prepared at one stage to include the so-called self-preservation instincts of the ego among the death instincts; but we subsequently corrected ourselves on this point and withdrew it.) Our views have from the very first been dualistic, and to-day they are even more definitely dualistic than before - now that we describe the opposition as being, not between ego-instincts and sexual instincts but between life instincts and death instincts. Jung's libido theory is on the contrary monistic; the fact that he has called his one instinctual force 'libido' is bound to cause confusion, but need not affect us otherwise. We suspect that instincts other than those of self-preservation operate in the ego, and it ought to be possible for us to point to them. Unfortunately, however, the analysis of the ego has made so little headway that it is very difficult for us to do so. It is possible, indeed, that the libidinal instincts in the ego may be linked in a peculiar manner with these other ego-instincts which are still strange to us. Even before we had any clear understanding of narcissism, psycho-analysts had a suspicion that the 'ego-instincts' had libidinal components attached to them. But these are very uncertain possibilities, to which our opponents will pay very little attention. The difficulty remains that psycho-analysis has not enabled us hitherto to point to any instincts other than the libidinal ones. That, however, is no reason for our falling in with the conclusion that no others in fact exist.
We need not feel greatly disturbed in judging our speculation upon the life and death instincts by the fact that so many bewildering and obscure processes occur in it - such as one instinct being driven out by another or an instinct turning from the ego to an object, and so on. This is merely due to our being obliged to operate with the scientific terms, that is to say with the figurative language, peculiar to psychology (or, more precisely, to depth psychology). We could not otherwise describe the processes in question at all, and indeed we could not have become aware of them. The deficiencies in our description would probably vanish if we were already in a position to replace the psychological terms by physiological or chemical ones. It is true that they too are only part of a figurative language; but it is one with which we have long been familiar and which is perhaps a simpler one as well.

¹ I will add a few words to clarify our terminology, which has undergone some development in the course of the present work. We came to know what the 'sexual instincts' were from their relation to the sexes and to the reproductive function. We retained this name after we had been obliged by the findings of psycho-analysis to connect them less closely with reproduction. With the hypothesis of narcissistic libido and the extension of the concept of libido to the individual cells, the sexual instinct was transformed for us into Eros, which seeks to force together and hold together the portions of living substance. What are commonly called the sexual instincts are looked upon by us as the part of Eros which is directed towards objects. Our speculations have suggested that Eros operates from the beginning of life and appears as a 'life instinct' in opposition to the 'death instinct' which was brought into being by the coming to life of inorganic substance. These speculations seek to solve the riddle of life by supposing that these two instincts were struggling with each other from the very first. It is not so easy, perhaps, to follow the transformations though which the concept of the 'ego-instincts' has passed. To begin with we applied that name to all the instinctual trends (of which we had no closer knowledge) which could be distinguished from the sexual instincts directed towards an object; and we opposed the ego-instincts to the sexual instincts of which the libido is the manifestation. Subsequently we came to closer grips with the analysis of the ego and recognized that a portion of the 'ego-instincts' is also of a libidinal character and has taken the subject's own ego as its object. These narcissistic self-preservative instincts had thenceforward to be counted among the libidinal sexual instincts. The opposition between the ego-instincts and the sexual instincts was transformed into one between the ego-instincts and the object-instincts, both of a libidinal nature. But in its place a fresh opposition appeared between the libidinal (ego- and object-) instincts and others, which must be presumed to be present in the ego and which may perhaps actually be observed in the destructive instincts. Our speculations have transformed this opposition into one between the life instincts (Eros) and the death instincts.

¹ In a recently published study, Beyond the Pleasure Principle, I have attempted to connect the polarity of love and hatred with a hypothetical opposition between instincts of life and death, and to establish the sexual instincts as the purest examples of the former, the instincts of life.

[1920g, 3760]

[1921c, 3795]
Recognition of Two Classes of Instincts in Mental Life. - Though psycho-analysis endeavours as a rule to develop its theories as independently as possible from those of other sciences, it is nevertheless obliged to seek a basis for the theory of the instincts in biology. On the ground of a far-reaching consideration of the processes which go to make up life and which lead to death, it becomes probable that we should recognize the existence of two classes of instincts, corresponding to the contrary processes of construction and dissolution in the organism. On this view, the one set of instincts, which work essentially in silence, would be those which follow the aim of leading the living creature to death and therefore deserve to be called the 'death instincts'; these would be directed outwards as the result of the combination of numbers of unicellular elementary organisms, and would manifest themselves as destructiveness or aggressive impulses. The other set of instincts would be those which are better known to us in analysis - the libidinal, sexual or life instincts, which are best comprised under the name of Eros; their purpose would be to form living substance into ever greater unities, so that life may be prolonged and brought to higher development. The erotic instincts and the death instincts would be present in living beings in regular mixtures or fusions; but 'defusions' would also be liable to occur. Life would consist in the manifestations of the conflict or interaction between the two classes of instincts; death would mean for the individual the victory of the destructive instincts, but reproduction would mean for him the victory of Eros.
[1923a, 3934]

The Nature of the Instincts. - This view would enable us to characterize instincts as tendencies inherent in living substance towards restoring an earlier state of things: that is to say, they would be historically determined and of a conservative nature and, as it were, the expression of an inertia or elasticity present in what is organic. Both classes of instincts, Eros as well as the death instinct, would, on this view, have been in operation and working against each other from the first origin of life.
[1923a, 3934]

I have lately developed a view of the instincts¹ which I shall here hold to and take as the basis of my further discussions. According to this view we have to distinguish two classes of instincts, one of which, the sexual instincts or Eros, is by far the more conspicuous and accessible to study. It comprises not merely the uninhibited sexual instinct proper and the instinctual impulses of an aim-inhibited or sublimated nature derived from it, but also the self-preservative instinct, which must be assigned to the ego and which at the beginning of our analytic work we had good reason for contrasting with the sexual object-instincts. The second class of instincts was not so easy to point to; in the end we came to recognize sadism as its representative. On the basis of theoretical considerations, supported by biology, we put forward the hypothesis of a death instinct, the task of which is to lead organic life back into the inanimate state; on the other hand, we supposed that Eros, by bringing about a more and more far-reaching combination of the particles into which living substance is dispersed, aims at complicating life and at the same time, of course, at preserving it. Acting in this way, both the instincts would be conservative in the strictest sense of the word, since both would be endeavouring to re-establish a state of things that was disturbed by the emergence of life. The emergence of life would thus be the cause of the continuance of life and also at the same time of the striving towards death; and life itself would be a conflict and compromise between these two trends. The problem of the origin of life would remain a cosmological one; and the problem of the goal and purpose of life would be answered dualistically.
[1923b, 3974]
One such fact there appears to be. For the opposition between the two classes of instincts we may put the polarity of love and hate. There is no difficulty in finding a representative of Eros; but we must be grateful that we can find a representative of the elusive death instinct in the instinct of destruction, to which hate points the way. Now, clinical observation shows not only that love is with unexpected regularity accompanied by hate (ambivalence), and not only that in human relationships hate is frequently a forerunner of love, but also that in a number of circumstances hate changes into love and love into hate. If this change is more than a mere succession in time - if, that is, one of them actually turns into the other - then clearly the ground is cut away from under a distinction so fundamental as that between erotic instincts and death instincts, one which presupposes physiological processes running in opposite directions.

The id, to which we finally come back, has no means of showing the ego either love or hate. It cannot say what it wants; it has achieved no unified will. Eros and the death instinct struggle within it; we have seen with what weapons the one group of instincts defends itself against the other. It would be possible to picture the id as under the domination of the mute but powerful death instincts, which desire to be at peace and (prompted by the pleasure principle) to put Eros, the mischief maker, to rest; but perhaps that might be to undervalue the part played by Eros.

It is almost humiliating that, after working so long, we should still be having difficulty in understanding the most fundamental facts. But we have made up our minds to simplify nothing and to hide nothing. If we cannot see things clearly we will at least see clearly what the obscurities are. What is hampering us here is evidently some hitch in the development of our theory of the instincts. We began by tracing the organization of the libido through its successive stages - from the oral through the sadistic-anal to the genital - and in doing so placed all the components of the sexual instinct on the same footing. Later it appeared that sadism was the representative of another instinct, which was opposed to Eros. This new view, that the instincts fall into two groups, seems to explode the earlier construction of the successive stages of libidinal organization. But we do not have to break fresh ground in order to find a way out of the difficulty. The solution has been at hand for a long time and lies in the fact that what we are concerned with are scarcely ever pure instinctual impulses but mixtures in various proportions of the two groups of instincts. If this is so, there is no need to revise our view of the organizations of the libido. A sadistic cathexis of an object may also legitimately claim to be treated as a libidinal one; and an aggressive impulse against the father can just as well be subjected to repression as a tender impulse towards the mother. Nevertheless we shall bear in mind for future consideration the possibility that repression is a process which has a special relation to the genital organization of the libido and that the ego resorts to other methods of defence when it has to secure itself against the libido on other levels of organization. To continue: a case like 'Little Hans's' does not enable us to come to any clear conclusion. It is true that in him an aggressive impulse was disposed of by repression, but this happened after the genital organization had been reached.
But if the human sense of guilt goes back to the killing of the primal father, that was after all a case of 'remorse'. Are we to assume that a conscience and a sense of guilt were not, as we have presupposed, in existence before the deed? If not, where, in this case, did the remorse come from? There is no doubt that this case should explain the secret of the sense of guilt to us and put an end to our difficulties. And I believe it does. This remorse was the result of the primordial ambivalence of feeling towards the father. His sons hated him, but they loved him, too. After their hatred had been satisfied by their act of aggression, their love came to the fore in their remorse for the deed. It set up the super-ego by identification with the father; it gave that agency the father's power, as though as a punishment for the deed of aggression they had carried out against him, and it created the restrictions which were intended to prevent a repetition of the deed. And since the inclination to aggressiveness against the father was repeated in the following generations, the sense of guilt, too, persisted, and it was reinforced once more by every piece of aggressiveness that was suppressed and carried over to the super-ego. Now, I think, we can at last grasp two things perfectly clearly: the part played by love in the origin of conscience and the fatal inevitability of the sense of guilt. Whether one has killed one's father or has abstained from doing so is not really the decisive thing. One is bound to feel guilty in either case, for the sense of guilt is an expression of the conflict due to ambivalence, of the eternal struggle between Eros and the instinct of destruction or death. This conflict is set going as soon as men are faced with the task of living together. So long as the community assumes no other form than that of the family, the conflict is bound to express itself in the Oedipus complex, to establish the conscience and to create the first sense of guilt. When an attempt is made to widen the community, the same conflict is continued in forms which are dependent on the past; and it is strengthened and results in a further intensification of the sense of guilt. Since civilization obeys an internal erotic impulsion which causes human beings to unite in a closely-knit group, it can only achieve this aim through an ever-increasing reinforcement of the sense of guilt. What began in relation to the father is completed in relation to the group. If civilization is a necessary course of development from the family to humanity as a whole, then - as a result of the inborn conflict arising from ambivalence, of the eternal struggle between the trends of love and death - there is inextricably bound up with it an increase of the sense of guilt, which will perhaps reach heights that the individual finds hard to tolerate. One is reminded of the great poet's moving arraignment of the 'Heavenly Powers':-

Nor will it do any harm if we once more review the contradictions which have for a while perplexed us during our enquiry. Thus, at one point the sense of guilt was the consequence of acts of aggression that had been abstained from; but at another point - and precisely at its historical beginning, the killing of the father - it was the consequence of an act of aggression that had been carried out. But a way out of this difficulty was found. For the institution of the internal authority, the super-ego, altered the situation radically. Before this, the sense of guilt coincided with remorse. (We may remark, incidentally, that the term 'remorse' should be reserved for the reaction after an act of aggression has actually been carried out.) After this, owing to the omniscience of the super-ego, the difference between an aggression intended and an aggression carried out lost its force. Henceforward a sense of guilt could be produced not only by an act of violence that is actually carried out (as all the world knows), but also by one that is merely intended (as psycho-analysis has discovered). Irrespectively of this alteration in the psychological situation, the conflict arising from ambivalence - the conflict between the two primal instincts - leaves the same result behind. We are tempted to look here for the solution of the problem of the varying relation in which the sense of guilt stands to consciousness. It might be thought that a sense of guilt arising from remorse for an evil deed must always be conscious, whereas a sense of guilt arising from the perception of an evil impulse may remain unconscious. But the answer is not so simple as that. Obsessional neurosis speaks energetically against it.
Some readers of this work may further have an impression that they have heard the formula of the struggle between Eros and the death instinct too often. It was alleged to characterize the process of civilization which mankind undergoes but it was also brought into connection with the development of the individual, and, in addition, it was said to have revealed the secret of organic life in general. We cannot, I think, avoid going into the relations of these three processes to one another. The repetition of the same formula is justified by the consideration that both the process of human civilization and of the development of the individual are also vital processes - which is to say that they must share in the most general characteristic of life. On the other hand, evidence of the presence of this general characteristic fails, for the very reason of its general nature, to help us to arrive at any differentiation, so long as it is not narrowed down by special qualifications. We can only be satisfied, therefore, if we assert that the process of civilization is a modification which the vital process experiences under the influence of a task that is set it by Eros and instigated by Ananke - by the exigencies of reality; and that this task is one of uniting separate individuals into a community bound together by libidinal ties. When, however, we look at the relation between the process of human civilization and the developmental or educative process of individual human beings, we shall conclude without much hesitation that the two are very similar in nature, if not the very same process applied to different kinds of object. The process of the civilization of the human species is, of course, an abstraction of a higher order than is the development of the individual and it is therefore harder to apprehend in concrete terms, nor should we pursue analogies to an obsessional extreme; but in view of the similarity between the aims of the two processes - in the one case the integration of a separate individual into a human group, and in the other case the creation of a unified group out of many individuals - we cannot be surprised at the similarity between the means employed and the resultant phenomena.

[1930a, 4527]

The fateful question for the human species seems to me to be whether and to what extent their cultural development will succeed in mastering the disturbance of their communal life by the human instinct of aggression and self-destruction. It may be that in this respect precisely the present time deserves a special interest. Men have gained control over the forces of nature to such an extent that with their help they would have no difficulty in exterminating one another to the last man. They know this, and hence comes a large part of their current unrest, their unhappiness and their mood of anxiety. And now it is to be expected that the other of the two 'Heavenly Powers', eternal Eros, will make an effort to assert himself in the struggle with his equally immortal adversary. But who can foresee with what success and with what result?

[1930a, 4532]

It is a familiar fact that the aetiological preconditions of neurosis are not yet known with certainty. The precipitating causes of it are frustrations and internal conflicts: conflicts between the three major psychical agencies, conflicts arising within the libidinal economy in consequence of our bisexual disposition and conflicts between the erotic and the aggressive instinctual components. It is the endeavour of the psychology of the neuroses to discover what makes these processes, which belong to the normal course of mental life, become pathogenic.

[1931a, 4587]
Anyone who believes in the occurrence of half-intentional self-injury - if I may use a clumsy expression - will be prepared also to assume that in addition to consciously intentional suicide there is such a thing as half-intentional self-destruction (self-destruction with an unconscious intention), capable of making skilful use of a threat to life and of disguising it as a chance mishap. There is no need to think such self-destruction rare. For the trend to self-destruction is present to a certain degree in very many more human beings than those in whom it is carried out; self-injuries are as a rule a compromise between this instinct and the forces that are still working against it, and even where suicide actually results, the inclination to suicide will have been present for a long time before in lesser strength or in the form of an unconscious and suppressed trend.

[1901b, 1260]

In the obscurity that reigns at present in the theory of the instincts, it would be unwise to reject any idea that promises to throw light on it. We started out from the great opposition between the life and death instincts. Now object-love itself presents us with a second example of a similar polarity - that between love (or other affection) and hate (or aggressiveness). If only we could succeed in relating these two polarities to each other and in deriving one from the other! From the very first we recognized the presence of a sadistic component in the sexual instinct.¹ As we know, it can make itself independent and can, in the form of a perversion, dominate an individual's entire sexual activity. It also emerges as a predominant component instinct in one of the 'pregenital organizations', as I have named them. But how can the sadistic instinct, whose aim it is to injure the object, be derived from Eros, the preserver of life? Is it not plausible to suppose that this sadism is in fact a death instinct which, under the influence of the narcissistic libido, has been forced away from the ego and has consequently only emerged in relation to the object? It now enters the service of the sexual function. During the oral stage of organization of the libido, the act of obtaining erotic mastery over an object coincides with that object's destruction; later, the sadistic instinct separates off, and finally, at the stage of genital primacy, it takes on, for the purposes of reproduction, the function of overpowering the sexual object to the extent necessary for carrying out the sexual act. It might indeed be said that the sadism which has been forced out of the ego has pointed the way for the libidinal components of the sexual instinct, and that these follow after it to the object. Wherever the original sadism has undergone no mitigation or intermixture, we find the familiar ambivalence of love and hate in erotic life.

[1920g, 3755]

We are without any physiological understanding of the ways and means by which this taming of the death instinct by the libido may be effected. So far as the psycho-analytic field of ideas is concerned, we can only assume that a very extensive fusion and amalgamation, in varying proportions, of the two classes of instincts takes place, so that we never have to deal with pure life instincts or pure death instincts but only with mixtures of them in different amounts. Corresponding to a fusion of instincts of this kind, there may, as a result of certain influences, be a defusion of them. How large the portions of the death instincts are which refuse to be tamed in this way by being bound to admixtures of libido we cannot at present guess.

[1924c, 4076]
According to our hypothesis human instincts are of only two kinds: those which seek to preserve and unite - which we call 'erotic', exactly in the sense in which Plato uses the word 'Eros' in his *Symposium*, or 'sexual', with a deliberate extension of the popular conception of 'sexuality' - and those which seek to destroy and kill and which we group together as the aggressive or destructive instinct. As you see, this is in fact no more than a theoretical clarification of the universally familiar opposition between Love and Hate which may perhaps have some fundamental relation to the polarity of attraction and repulsion that plays a part in your own field of knowledge. But we must not be too hasty in introducing ethical judgements of good and evil. Neither of these instincts is any less essential than the other; the phenomena of life arise from the concurrent or mutually opposing action of both. Now it seems as though an instinct of the one sort can scarcely ever operate in isolation; it is always accompanied - or, as we say, alloyed - with a certain quota from the other side, which modifies its aim or is, in some cases, what enables it to achieve that aim. Thus, for instance, the instinct of self-preservation is certainly of an erotic kind, but it must nevertheless have aggressiveness at its disposal if it is to fulfil its purpose. So, too, the instinct of love, when it is directed towards an object, stands in need of some contribution from the instinct for mastery if it is in any way to obtain possession of that object. The difficulty of isolating the two classes of instinct in their actual manifestations is indeed what has so long prevented us from recognizing them.

[1933b, 4798]
Anyone who believes in the occurrence of half-intentional self-injury - if I may use a clumsy expression - will be prepared also to assume that in addition to consciously intentional suicide there is such a thing as half-intentional self-destruction (self-destruction with an unconscious intention), capable of making skilful use of a threat to life and of disguising it as a chance mishap. There is no need to think such self-destruction rare. For the trend to self-destruction is present to a certain degree in very many more human beings than those in whom it is carried out; self-injuries are as a rule a compromise between this instinct and the forces that are still working against it, and even where suicide actually results, the inclination to suicide will have been present for a long time before in lesser strength or in the form of an unconscious and suppressed trend.

The other conflict, that between love and hatred, strikes us more strangely. We know that incipient love is often perceived as hatred, and that love, if it is denied satisfaction, may easily be partly converted into hatred, and poets tell us that in the more tempestuous stages of love the two opposed feelings may subsist side by side for a while as though in rivalry with each other. But the chronic co-existence of love and hatred, both directed towards the same person and both of the highest degree of intensity, cannot fail to astonish us. We should have expected that the passionate love would long ago have conquered the hatred or been devoured by it. And in fact such a protracted survival of two opposites is only possible under quite peculiar psychological conditions and with the co-operation of the state of affairs in the unconscious. The love has not succeeded in extinguishing the hatred but only in driving it down into the unconscious; and in the unconscious the hatred, safe from the danger of being destroyed by the operations of consciousness, is able to persist and even to grow. In such circumstances the conscious love attains as a rule, by way of reaction, an especially high degree of intensity, so as to be strong enough for the perpetual task of keeping its opponent under repression. The necessary condition for the occurrence of such a strange state of affairs in a person’s erotic life appears to be that at a very early age, somewhere in the prehistoric period of his infancy, the two opposites should have been split apart and one of them, usually the hatred, have been repressed.¹

Let us make a bold attempt at another step forward. It is generally considered that the union of a number of cells into a vital association - the multicellular character of organisms - has become a means of prolonging their life. One cell helps to preserve the life of another, and the community of cells can survive even if individual cells have to die. We have already heard that conjugation, too, the temporary coalescence of two unicellular organisms, has a life-preserving and rejuvenating effect on both of them. Accordingly, we might attempt to apply the libido theory which has been arrived at in psycho-analysis to the mutual relationship of cells. We might suppose that the life instincts or sexual instincts which are active in each cell take the other cells as their object, that they partly neutralize the death instincts (that is, the processes set up by them) in those cells and thus preserve their life; while the other cells do the same for them, and still others sacrifice themselves in the performance of this libidinal function. The germ-cells themselves would behave in a completely ‘narcissistic’ fashion - to use the phrase that we are accustomed to use in the theory of the neuroses to describe a whole individual who retains his libido in his ego and pays none of it out in object-cathexes. The germ-cells require their libido, the activity of their life instincts, for themselves, as a reserve against their later momentous constructive activity. (The cells of the malignant neoplasms which destroy the organism should also perhaps be described as narcissistic in this same sense: pathology is prepared to regard their germs as innate and to ascribe embryonic attributes to them.) In this way the libido of our sexual instincts would coincide with the Eros of the poets and philosophers which holds all living things together.

¹ [1909d, 2186]

¹ [1920g, 3751]
Let us, however, return to the self-preservative sexual instincts. The experiments upon protista have already shown us that conjugation - that is, the coalescence of two individuals which separate soon afterwards without any subsequent cell-division occurring - has a strengthening and rejuvenating effect upon both of them.¹ In later generations they show no signs of degenerating and seem able to put up a longer resistance to the injurious effects of their own metabolism. This single observation may, I think, be taken as typical of the effect produced by sexual union as well. But how is it that the coalescence of two only slightly different cells can bring about this renewal of life? The experiment which replaces the conjugation of protozoa by the application of chemical or even of mechanical stimuli (cf. Lipschütz, 1914) enables us to give what is no doubt a conclusive reply to this question. The result is brought about by the influx of fresh amounts of stimulus. This tallies well with the hypothesis that the life process of the individual leads for internal reasons to an abolition of chemical tensions, that is to say, to death, whereas union with the living substance of a different individual increases those tensions, introducing what may be described as fresh ‘vital differences’ which must then be lived off. As regards this dissimilarity there must of course be one or more optima. The dominating tendency of mental life, and perhaps of nervous life in general, is the effort to reduce, to keep constant or to remove internal tension due to stimuli (the 'Nirvana principle', to borrow a term from Barbara Low) - a tendency which finds expression in the pleasure principle; and our recognition of that fact is one of our strongest reasons for believing in the existence of death instincts.

[1920g, 3756]

I cannot go further in my consideration of these questions without introducing a fresh hypothesis. The super-ego arises, as we know, from an identification with the father taken as a model. Every such identification is in the nature of a desexualization or even of a sublimation. It now seems as though when a transformation of this kind takes place, an instinctual defusion occurs at the same time. After sublimation the erotic component no longer has the power to bind the whole of the destructiveness that was combined with it, and this is released in the form of an inclination to aggression and destruction. This defusion would be the source of the general character of harshness and cruelty exhibited by the ideal - its dictatorial 'Thou shalt'.

[1923b, 3988]

The inadequacy of this explanation is seen, however, in the fact that it throws no light on the regular and close connections of masochism with its counterpart in instinctual life, sadism. If we go back a little further, to our hypothesis of the two classes of instincts which we regard as operative in the living organism, we arrive at another derivation of masochism, which, however, is not in contradiction with the former one. In (multicellular) organisms the libido meets the instinct of death, or destruction, which is dominant in them and which seeks to disintegrate the cellular organism and to conduct each separate unicellular organism into a state of inorganic stability (relative though this may be). The libido has the task of making the destroying instinct innocuous, and it fulfills the task by diverting that instinct to a great extent outwards - soon with the help of a special organic system, the muscular apparatus - towards objects in the external world. The instinct is then called the destructive instinct, the instinct for mastery, or the will to power. A portion of the instinct is placed directly in the service of the sexual function, where it has an important part to play. This is sadism proper. Another portion does not share in this transposition outwards; it remains inside the organism and, with the help of the accompanying sexual excitation described above, becomes libidinally bound there. It is in this portion that we have to recognize the original, erotogenic masochism.

[1924c, 4075]
We are without any physiological understanding of the ways and means by which this taming of the death instinct by the libido may be effected. So far as the psycho-analytic field of ideas is concerned, we can only assume that a very extensive fusion and amalgamation, in varying proportions, of the two classes of instincts takes place, so that we never have to deal with pure life instincts or pure death instincts but only with mixtures of them in different amounts. Corresponding to a fusion of instincts of this kind, there may, as a result of certain influences, be a defusion of them. How large the portions of the death instincts are which refuse to be tamed in this way by being bound to admixtures of libido we cannot at present guess.[1924c, 4076]

And here, at an unexpected point, we have emerged from the psychical underworld into the open market-place. I cannot lead you any further, but before I take leave of you for to-day I must detain you with one more train of thought. It has become our habit to say that our civilization has been built up at the cost of sexual trends which, being inhibited by society, are partly, it is true, repressed but have partly been made usable for other aims. We have admitted, too, that, in spite of all our pride in our cultural attainments, it is not easy for us to fulfil the requirements of this civilization or to feel comfortable in it, because the instinctual restrictions imposed on us constitute a heavy psychical burden. Well, what we have come to see about the sexual instincts, applies equally and perhaps still more to the other ones, the aggressive instincts. It is they above all that make human communal life difficult and threaten its survival. Restriction of the individual's aggressiveness is the first and perhaps the severest sacrifice which society requires of him. We have learnt the ingenious way in which the taming of this unruly thing has been achieved. The institution of the super-ego which takes over the dangerous aggressive impulses, introduces a garrison, as it were, into regions that are inclined to rebellion. But on the other hand, if we look at it purely psychologically, we must recognize that the ego does not feel happy in being thus sacrificed to the needs of society, in having to submit to the destructive trends of aggressiveness which it would have been glad to employ itself against others. It is like a prolongation in the mental sphere of the dilemma of 'eat or be eaten' which dominates the organic animate world. Luckily the aggressive instincts are never alone but always alloyed with the erotic ones. These latter have much to mitigate and much to avert under the conditions of the civilization which mankind has created.[1933a, 4714]

There can be no question of restricting one or the other of the basic instincts to one of the provinces of the mind. They must necessarily be met with everywhere. We may picture an initial state as one in which the total available energy of Eros, which henceforward we shall speak of as 'libido', is present in the still undifferentiated ego-id and serves to neutralize the destructive tendencies which are simultaneously present. (We are without a term analogous to 'libido' for describing the energy of the destructive instinct.) At a later stage it becomes relatively easy for us to follow the vicissitudes of the libido, but this is more difficult with the destructive instinct.[1940a [1938], 4960]
I am quite prepared to be told again that I have misunderstood the substance and purpose of the Neo-Zurich theory; but I must protest in advance against any contradictions to my view of it that may be found in the publications of that school being laid at my door instead of theirs. I can find no other way of making the whole range of Jung's innovations intelligible to myself and of grasping all their implications. All the changes that Jung has proposed to make in psycho-analysis flow from his intention to eliminate what is objectionable in the family-complexes, so as not to find it again in religion and ethics. For sexual libido an abstract concept has been substituted, of which one may safely say that it remains mystifying and incomprehensible to wise men and fools alike. The Oedipus complex has a merely 'symbolic' meaning: the mother in it means the unattainable, which must be renounced in the interests of civilization; the father who is killed in the Oedipus myth is the 'inner' father, from whom one must set oneself free in order to become independent. Other parts of the material of sexual ideas will no doubt be subjected to similar re-interpretations in the course of time. In the place of a conflict between ego-dystonic erotic trends and the self-preservative ones a conflict appears between the 'life-task' and 'psychical inertia'; the neurotic's sense of guilt corresponds to his self-reproach for not properly fulfilling his 'life-task'. In this way a new religio-ethical system has been created, which, just like the Adlerian system, was bound to re-interpret, distort or jettison the factual findings of analysis. The truth is that these people have picked out a few cultural overtones from the symphony of life and have once more failed to hear the mighty and primordial melody of the instincts.

[1914d, 2925]

In the obscurity that reigns at present in the theory of the instincts, it would be unwise to reject any idea that promises to throw light on it. We started out from the great opposition between the life and death instincts. Now object-love itself presents us with a second example of a similar polarity - that between love (or other affection) and hate (or aggressiveness). If only we could succeed in relating these two polarities to each other and in deriving one from the other! From the very first we recognized the presence of a sadistic component in the sexual instinct.¹ As we know, it can make itself independent and can, in the form of a perversion, dominate an individual's entire sexual activity. It also emerges as a predominant component instinct in one of the 'pregenital organizations', as I have named them. But how can the sadistic instinct, whose aim it is to injure the object, be derived from Eros, the preserver of life? Is it not plausible to suppose that this sadism is in fact a death instinct which, under the influence of the narcissistic libido, has been forced away from the ego and has consequently only emerged in relation to the object? It now enters the service of the sexual function. During the oral stage of organization of the libido, the act of obtaining erotic mastery over an object coincides with that object's destruction; later, the sadistic instinct separates off, and finally, at the stage of genital primacy, it takes on, for the purposes of reproduction, the function of overpowering the sexual object to the extent necessary for carrying out the sexual act. It might indeed be said that the sadism which has been forced out of the ego has pointed the way for the libidinal components of the sexual instinct, and that these follow after it to the object. Wherever the original sadism has undergone no mitigation or intermixture, we find the familiar ambivalence of love and hate in erotic life.

[1920g, 3755]
**Contrast between Sexual and Ego Instincts.** - Psycho-analysis early became aware that all mental occurrences must be regarded as built on the basis of an interplay of the forces of the elementary instincts. This, however, led to a difficult predicament, since psychology included no theory of the instincts. No one could say what an instinct really was, the question was left entirely to individual caprice, and every psychologist was in the habit of postulating any instincts in any number that he chose. The first sphere of phenomena to be studied by psycho-analysis comprised what are known as the transference neuroses (hysteria and obsessional neurosis). It was found that their symptoms came about by sexual instinctual impulses being repressed (repressed) by the subject's personality (his ego) and then finding expression by circuitous paths through the unconscious. These facts could be met by drawing a contrast between the sexual instincts and ego instincts (instincts of self-preservation), which was in line with the popular saying that hunger and love are what make the world go round: libido was the manifestation of the force of love in the same sense as was hunger of the self-preservative instinct. The nature of the ego instincts remained for the time being undefined and, like all the other characteristics of the ego, inaccessible to analysis. There was no means of deciding whether, and if so what, qualitative differences were to be assumed to exist between the two classes of instincts.

[1923a, 3931]

**Sublimation.** - An attentive examination of the sexual trends, which alone were accessible to psycho-analysis, had meanwhile led to some remarkable detailed findings. What is described as the sexual instinct turns out to be of a highly composite nature and is liable to disintegrate once more into its component instincts. Each component instinct is unalterably characterized by its source, that is, by the region or zone of the body from which its excitation is derived. Each has furthermore as distinguishable features an **object** and an **aim**. The aim is always discharge accompanied by satisfaction, but it is capable of being changed from activity to passivity. The object is less closely attached to the instinct than was at first supposed; it is easily exchanged for another one, and, moreover, an instinct which had an external object can be turned round upon the subject's own self. The separate instincts can either remain independent of one another or - in what is still an inexplicable manner - can be combined and merged into one another to perform work in common. They are also able to replace one another and to transfer their libido cathexis to one another, so that the satisfaction of one instinct can take the place of the satisfaction of others. The most important vicissitude which an instinct can undergo seems to be **sublimation**; here both object and aim are changed, so that what was originally a sexual instinct finds satisfaction in some achievement which is no longer sexual but has a higher social or ethical valuation. These different features do not as yet combine to form an integral picture.

[1923a, 3932]
Recognition of Two Classes of Instincts in Mental Life. - Though psycho-analysis endeavours as a rule to develop its theories as independently as possible from those of other sciences, it is nevertheless obliged to seek a basis for the theory of the instincts in biology. On the ground of a far-reaching consideration of the processes which go to make up life and which lead to death, it becomes probable that we should recognize the existence of two classes of instincts, corresponding to the contrary processes of construction and dissolution in the organism. On this view, the one set of instincts, which work essentially in silence, would be those which follow the aim of leading the living creature to death and therefore deserve to be called the 'death instincts'; these would be directed outwards as the result of the combination of numbers of unicellular elementary organisms, and would manifest themselves as destructive or aggressive impulses. The other set of instincts would be those which are better known to us in analysis - the libidinal, sexual or life instincts, which are best comprised under the name of Eros; their purpose would be to form living substance into ever greater unities, so that life may be prolonged and brought to higher development. The erotic instincts and the death instincts would be present in living beings in regular mixtures or fusions; but 'defusions' would also be liable to occur. Life would consist in the manifestations of the conflict or interaction between the two classes of instincts; death would mean for the individual the victory of the destructive instincts, but reproduction would mean for him the victory of Eros.

I have lately developed a view of the instincts¹ which I shall here hold to and take as the basis of my further discussions. According to this view we have to distinguish two classes of instincts, one of which, the sexual instincts or Eros, is by far the more conspicuous and accessible to study. It comprises not merely the uninhibited sexual instinct proper and the instinctual impulses of an aim-inhibited or sublimated nature derived from it, but also the self-preservative instinct, which must be assigned to the ego and which at the beginning of our analytic work we had good reason for contrasting with the sexual object-instincts. The second class of instincts was not so easy to point to; in the end we came to recognize sadism as its representative. On the basis of theoretical considerations, supported by biology, we put forward the hypothesis of a death instinct, the task of which is to lead organic life back into the inanimate state; on the other hand, we supposed that Eros, by bringing about a more and more far-reaching combination of the particles into which living substance is dispersed, aims at complicating life and at the same time, of course, at preserving it. Acting in this way, both the instincts would be conservative in the strictest sense of the word, since both would be endeavouring to re-establish a state of things that was disturbed by the emergence of life. The emergence of life would thus be the cause of the continuance of life and also at the same time of the striving towards death; and life itself would be a conflict and compromise between these two trends. The problem of the origin of life would remain a cosmological one; and the problem of the goal and purpose of life would be answered dualistically.

In the works of my later years (Beyond the Pleasure Principle, Group Psychology and the Analysis of the Ego, and The Ego and the Id), I have given free rein to the inclination, which I kept down for so long, to speculation, and I have also contemplated a new solution of the problem of the instincts. I have combined the instincts for self-preservation and for the preservation of the species under the concept of Eros and have contrasted with it an instinct of death or destruction which works in silence. Instinct in general is regarded as a kind of elasticity of living things, an impulsion towards the restoration of a situation which once existed but was brought to an end by some external disturbance. This essentially conservative character of instincts is exemplified by the phenomena of the compulsion to repeat. The picture which life presents to us is the result of the concurrent and mutually opposing action of Eros and the death instinct.

¹[1923a, 3934]

²[1923b, 3974]

³[1925d, 4232]
From the first of these standpoints, the dynamic one, psycho-analysis derives all mental processes (apart from the reception of external stimuli) from the interplay of forces, which assist or inhibit one another, combine with one another, enter into compromises with one another, etc. All of these forces are originally in the nature of instincts; thus they have an organic origin. They are characterized by possessing an immense (somatic) store of power ("the compulsion to repeat"); and they are represented mentally as images or ideas with an affective charge. In psycho-analysis, no less than in other sciences, the theory of the instincts is an obscure subject. An empirical analysis leads to the formulation of two groups of instincts: the so-called 'ego-instincts', which are directed towards self-preservation, and the 'object-instincts', which are concerned with relations to an external object. The social instincts are not regarded as elementary or irreducible. Theoretical speculation leads to the suspicion that there are two fundamental instincts which lie concealed behind the manifest ego-instincts and object-instincts: namely (a) Eros, the instinct which strives for ever closer union, and (b) the instinct of destruction, which leads towards the dissolution of what is living. In psycho-analysis the manifestation of the force of Eros is given the name 'libido'.

We shall see, however, that this is not so and that it is merely a matter of bringing into sharper focus a turn of thought arrived at long ago and of following out its consequences. Of all the slowly developed parts of analytic theory, the theory of the instincts is the one that has felt its way the most painfully forward. And yet that theory was so indispensable to the whole structure that something had to be put in its place. In what was at first my utter perplexity, I took as my starting-point a saying of the poet-philosopher, Schiller, that 'hunger and love are what moves the world'. Hunger could be taken to represent the instincts which aim at preserving the individual; while love strives after objects, and its chief function, favoured in every way by nature, is the preservation of the species. Thus, to begin with, ego-instincts and object-instincts confronted each other. It was to denote the energy of the latter and only the latter instinct that I introduced the term 'libido'. Thus the antithesis was between the ego-instincts and the 'libidinal' instincts of love (in its widest sense) which were directed to an object. One of these object-instincts, the sadistic instinct, stood out from the rest, it is true, in that its aim was so very far from being loving. Moreover it was obviously in some respects attached to the ego-instincts: it could not hide its close affinity with instincts of mastery which have no libidinal purpose. But these discrepancies were got over; after all, sadism was clearly a part of sexual life, in the activities of which affection could be replaced by cruelty. Neurosis was regarded as the outcome of a struggle between the interest of self-preservation and the demands of the libido, a struggle in which the ego had been victorious but at the price of severe sufferings and renunciations.

[1926f, 4403]

[1930a, 4508]
Every analyst will admit that even to-day this view has not the sound of a long-discarded error. Nevertheless, alterations in it became essential, as our enquiries advanced from the repressed to the repressing forces, from the object-instincts to the ego. The decisive step forward was the introduction of the concept of narcissism - that is to say, the discovery that the ego itself is cathected with libido, that the ego, indeed, is the libido's original home, and remains to some extent its headquarters. This narcissistic libido turns towards objects, and thus becomes object-libido; and it can change back into narcissistic libido once more. The concept of narcissism made it possible to obtain an analytic understanding of the traumatic neuroses and of many of the affections bordering on the psychoses, as well as of the latter themselves. It was not necessary to give up our interpretation of the transference neuroses as attempts made by the ego to defend itself against sexuality; but the concept of libido was endangered. Since the ego-instincts, too, were libidinal, it seemed for a time inevitable that we should make libido coincide with instinctual energy in general, as C. G. Jung had already advocated earlier. Nevertheless, there still remained in me a kind of conviction, for which I was not as yet able to find reasons, that the instincts could not all be of the same kind. My next step was taken in Beyond the Pleasure Principle (1920g), when the compulsion to repeat and the conservative character of instinctual life first attracted my attention. Starting from speculations on the beginning of life and from biological parallels, I drew the conclusion that, besides the instinct to preserve living substance and to join it into ever larger units,¹ there must exist another, contrary instinct seeking to dissolve those units and to bring them back to their primaeval, inorganic state. That is to say, as well as Eros there was an instinct of death. The phenomena of life could be explained from the concurrent or mutually opposing action of these two instincts. It was not easy, however, to demonstrate the activities of this supposed death instinct. The manifestations of Eros were conspicuous and noisy enough. It might be assumed that the death instinct operated silently within the organism towards its dissolution, but that, of course, was no proof. A more fruitful idea was that a portion of the instinct is diverted towards the external world and comes to light as an instinct of aggressiveness and destructiveness. In this way the instinct itself could be pressed into the service of Eros, in that the organism was destroying some other thing, whether animate or inanimate, instead of destroying its own self. Conversely, any restriction of this aggressiveness directed outwards would be bound to increase the self-destruction, which is in any case proceeding. At the same time one can suspect from this example that the two kinds of instinct seldom - perhaps never - appear in isolation from each other, but are alloyed with each other in varying and very different proportions and so become unrecognizable to our judgement. In sadism, long since known to us as a component instinct of sexuality, we should have before us a particularly strong alloy of this kind between trends of love and the destructive instinct; while its counterpart, masochism, would be a union between destructiveness directed inwards and sexuality - a union which makes what is otherwise an imperceptible trend into a conspicuous and tangible one.

¹[1930a, 4509]

But how can this conservative characteristic of instincts help us to understand our self-destructiveness? What earlier state of things does an instinct such as this want to restore? Well, the answer is not far to seek and opens wide perspectives. If it is true that - at some immeasurably remote time and in a manner we cannot conceive - life once proceeded out of inorganic matter, then, according to our presumption, an instinct must have arisen which sought to do away with life once more and to re-establish the inorganic state. If we recognize in this instinct the self-destructiveness of our hypothesis, we may regard the self-destructiveness as an expression of a 'death instinct' which cannot fail to be present in every vital process. And now the instincts that we believe in divide themselves into two groups - the erotic instincts, which seek to combine more and more living substance into ever greater unities, and the death instincts, which oppose this effort and lead what is living back into an inorganic state. From the concurrent and opposing action of these two proceed the phenomena of life which are brought to an end by death.

¹[1933a, 4711]
According to our hypothesis human instincts are of only two kinds: those which seek to preserve and unite - which we call 'erotic', exactly in the sense in which Plato uses the word 'Eros' in his *Symposium*, or 'sexual', with a deliberate extension of the popular conception of 'sexuality' - and those which seek to destroy and kill and which we group together as the aggressive or destructive instinct. As you see, this is in fact no more than a theoretical clarification of the universally familiar opposition between Love and Hate which may perhaps have some fundamental relation to the polarity of attraction and repulsion that plays a part in your own field of knowledge. But we must not be too hasty in introducing ethical judgements of good and evil. Neither of these instincts is any less essential than the other; the phenomena of life arise from the concurrent or mutually opposing action of both. Now it seems as though an instinct of the one sort can scarcely ever operate in isolation; it is always accompanied - or, as we say, alloyed - with a certain quota from the other side, which modifies its aim or is, in some cases, what enables it to achieve that aim. Thus, for instance, the instinct of self-preservation is certainly of an erotic kind, but it must nevertheless have aggressiveness at its disposal if it is to fulfil its purpose. So, too, the instinct of love, when it is directed towards an object, stands in need of some contribution from the instinct for mastery if it is in any way to obtain possession of that object. The difficulty of isolating the two classes of instinct in their actual manifestations is indeed what has so long prevented us from recognizing them.

[1933b, 4798]

In biological functions the two basic instincts operate against each other or combine with each other. Thus, the act of eating is a destruction of the object with the final aim of incorporating it, and the sexual act is an act of aggression with the purpose of the most intimate union. This concurrent and mutually opposing action of the two basic instincts gives rise to the whole variegation of the phenomena of life. The analogy of our two basic instincts extends from the sphere of living things to the pair of opposing forces - attraction and repulsion - which rule in the inorganic world.¹

[1940a [1938], 4960]

In yet another group of cases the distinguishing characteristics of the ego, which are to be held responsible as sources of resistance against analytic treatment and as impediments to therapeutic success, may spring from different and deeper roots. Here we are dealing with the ultimate things which psychological research can learn about: the behaviour of the two primal instincts, their distribution, mingling and defusion - things which we cannot think of as being confined to a single province of the mental apparatus, the id, the ego or the super-ego. No stronger impression arises from the resistances during the work of analysis than of there being a force which is defending itself by every possible means against recovery and which is absolutely resolved to hold on to illness and suffering. One portion of this force has been recognized by us, undoubtedly with justice, as the sense of guilt and need for punishment, and has been localized by us in the ego's relation to the super-ego. But this is only the portion of it which is, as it were, psychically bound by the super-ego and thus becomes recognizable; other quotas of the same force, whether bound or free, may be at work in other, unspecified places. If we take into consideration the total picture made up of the phenomena of masochism immanent in so many people, the negative therapeutic reaction and the sense of guilt found in so many neurotics, we shall no longer be able to adhere to the belief that mental events are exclusively governed by the desire for pleasure. These phenomena are unmistakable indications of the presence of a power in mental life which we call the instinct of aggression or of destruction according to its aims, and which we trace back to the original death instinct of living matter. It is not a question of an antithesis between an optimistic and a pessimistic theory of life. Only by the concurrent or mutually opposing action of the two primal instincts - Eros and the death instinct -, never by one or the other alone, can we explain the rich multiplicity of the phenomena of life.

[1937c, 5037]
This view of instincts strikes us as strange because we have become used to see in them a factor impelling towards change and development, whereas we are now asked to recognize in them the precise contrary - an expression of the conservative nature of living substance. On the other hand we soon call to mind examples from animal life which seem to confirm the view that instincts are historically determined. Certain fishes, for instance, undertake laborious migrations at spawning-time in order to deposit their spawn in particular waters far removed from their customary haunts. In the opinion of many biologists what they are doing is merely to seek out the localities in which their species formerly resided but which in the course of time they have exchanged for others. The same explanation is believed to apply to the migratory flights of birds of passage - but we are quickly relieved of the necessity for seeking for further examples by the reflection that the most impressive proofs of there being an organic compulsion to repeat lie in the phenomena of heredity and the facts of embryology. We see how the germ of a living animal is obliged in the course of its development to recapitulate (even if only in a transient and abbreviated fashion) the structures of all the forms from which it is sprung, instead of proceeding quickly by the shortest path to its final shape. This behaviour is only to a very slight degree attributable to mechanical causes, and the historical explanation cannot accordingly be neglected. So too the power of regenerating a lost organ by growing afresh a precisely similar one extends far up into the animal kingdom.

We shall be met by the plausible objection that it may very well be that, in addition to the conservative instincts which impel towards repetition, there may be others which push forward towards progress and the production of new forms. This argument must certainly not be overlooked, and it will be taken into account at a later stage. But for the moment it is tempting to pursue to its logical conclusion the hypothesis that all instincts tend towards the restoration of an earlier state of things. The outcome may give an impression of mysticism or of sham profundity; but we can feel quite innocent of having had any such purpose in view. We seek only for the sober results of research or of reflection based on it; and we have no wish to find in those results any quality other than certainty.¹

Let us suppose, then, that all the organic instincts are conservative, are acquired historically and tend towards the restoration of an earlier state of things. It follows that the phenomena of organic development must be attributed to external disturbing and diverting influences. The elementary living entity would from its very beginning have had no wish to change; if conditions remained the same, it would do no more than constantly repeat the same course of life. In the last resort, what has left its mark on the development of organisms must be the history of the earth we live in and of its relation to the sun. Every modification which is thus imposed upon the course of the organism's life is accepted by the conservative organic instincts and stored up for further repetition. Those instincts are therefore bound to give a deceptive appearance of being forces tending towards change and progress, whilst in fact they are merely seeking to reach an ancient goal by paths alike old and new. Moreover it is possible to specify this final goal of all organic striving. It would be in contradiction to the conservative nature of the instincts if the goal of life were a state of things which had never yet been attained. On the contrary, it must be an old state of things, an initial state from which the living entity has at one time or other departed and to which it is striving to return by the circuitous paths along which its development leads. If we are to take it as a truth that knows no exception that everything living dies for internal reasons - becomes inorganic once again - then we shall be compelled to say that 'the aim of life is death' and, looking backwards, that 'inanimate things existed before living ones'.
The attributes of life were at some time evoked in inanimate matter by the action of a force of whose nature we can form no conception. It may perhaps have been a process similar in type to that which later caused the development of consciousness in a particular stratum of living matter. The tension which then arose in what had hitherto been an inanimate substance endeavoured to cancel itself out. In this way the first instinct came into being: the instinct to return to the inanimate state. It was still an easy matter at that time for a living substance to die; the course of its life was probably only a brief one, whose direction was determined by the chemical structure of the young life. For a long time, perhaps, living substance was thus being constantly created afresh and easily dying, till decisive external influences altered in such a way as to oblige the still surviving substance to diverge ever more widely from its original course of life and to make ever more complicated détours before reaching its aim of death. These circuitous paths to death, faithfully kept to by the conservative instincts, would thus present us to-day with the picture of the phenomena of life. If we firmly maintain the exclusively conservative nature of instincts, we cannot arrive at any other notions as to the origin and aim of life.

[1920g, 3740]

The instincts which watch over the destinies of these elementary organisms that survive the whole individual, which provide them with a safe shelter while they are defenceless against the stimuli of the external world, which bring about their meeting with other germ-cells, and so on - these constitute the group of the sexual instincts. They are conservative in the same sense as the other instincts in that they bring back earlier states of living substance; but they are conservative to a higher degree in that they are peculiarly resistant to external influences; and they are conservative too in another sense in that they preserve life itself for a comparatively long period.¹ They are the true life instincts. They operate against the purpose of the other instincts, which leads, by reason of their function, to death; and this fact indicates that there is an opposition between them and the other instincts, an opposition whose importance was long ago recognized by the theory of the neuroses. It is as though the life of the organism moved with a vacillating rhythm. One group of instincts rushes forward so as to reach the final aim of life as swiftly as possible; but when a particular stage in the advance has been reached, the other group jerks back to a certain point to make a fresh start and so prolong the journey. And even though it is certain that sexuality and the distinction between the sexes did not exist when life began, the possibility remains that the instincts which were later to be described as sexual may have been in operation from the very first, and it may not be true that it was only at a later time that they started upon their work of opposing the activities of the 'ego-instincts'.²

[1920g, 3742]
The upshot of our enquiry so far has been the drawing of a sharp distinction between the 'ego-instincts' and the sexual instincts, and the view that the former exercise pressure towards death and the latter towards a prolongation of life. But this conclusion is bound to be unsatisfactory in many respects even to ourselves. Moreover, it is actually only of the former group of instincts that we can predicate a conservative, or rather retrograde, character corresponding to a compulsion to repeat. For on our hypothesis the ego-instincts arise from the coming to life of inanimate matter and seek to restore the inanimate state; whereas as regards the sexual instincts, though it is true that they reproduce primitive states of the organism, what they are clearly aiming at by every possible means is the coalescence of two germ-cells which are differentiated in a particular way. If this union is not effected, the germ-cell dies along with all the other elements of the multicellular organism. It is only on this condition that the sexual function can prolong the cell's life and lend it the appearance of immortality. But what is the important event in the development of living substance which is being repeated in sexual reproduction, or in its fore-runner, the conjugation of two protista? We cannot say; and we should consequently feel relieved if the whole structure of our argument turned out to be mistaken. The opposition between the ego or death instincts and the sexual or life instincts would then cease to hold and the compulsion to repeat would no longer possess the importance we have ascribed to it.

[1920g, 3745]

The Nature of the Instincts. - This view would enable us to characterize instincts as tendencies inherent in living substance towards restoring an earlier state of things: that is to say, they would be historically determined and of a conservative nature and, as it were, the expression of an inertia or elasticity present in what is organic. Both classes of instincts, Eros as well as the death instinct, would, on this view, have been in operation and working against each other from the first origin of life.

[1923a, 3934]

I have lately developed a view of the instincts¹ which I shall here hold to and take as the basis of my further discussions. According to this view we have to distinguish two classes of instincts, one of which, the sexual instincts or Eros, is by far the more conspicuous and accessible to study. It comprises not merely the uninhibited sexual instinct proper and the instinctual impulses of an aim-inhibited or sublimated nature derived from it, but also the self-preservative instinct, which must be assigned to the ego and which at the beginning of our analytic work we had good reason for contrasting with the sexual object-instincts. The second class of instincts was not so easy to point to; in the end we came to recognize sadism as its representative. On the basis of theoretical considerations, supported by biology, we put forward the hypothesis of a death instinct, the task of which is to lead organic life back into the inanimate state; on the other hand, we supposed that Eros, by bringing about a more and more far-reaching combination of the particles into which living substance is dispersed, aims at complicating life and at the same time, of course, at preserving it. Acting in this way, both the instincts would be conservative in the strictest sense of the word, since both would be endeavouring to re-establish a state of things that was disturbed by the emergence of life. The emergence of life would thus be the cause of the continuance of life and also at the same time of the striving towards death; and life itself would be a conflict and compromise between these two trends. The problem of the origin of life would remain a cosmological one; and the problem of the goal and purpose of life would be answered dualistically.

[1923b, 3974]
In the works of my later years (Beyond the Pleasure Principle, Group Psychology and the Analysis of the Ego, and The Ego and the Id), I have given free rein to the inclination, which I kept down for so long, to speculation, and I have also contemplated a new solution of the problem of the instincts. I have combined the instincts for self-preservation and for the preservation of the species under the concept of Eros and have contrasted with it an instinct of death or destruction which works in silence. Instinct in general is regarded as a kind of elasticity of living things, an impulsion towards the restoration of a situation which once existed but was brought to an end by some external disturbance. This essentially conservative character of instincts is exemplified by the phenomena of the compulsion to repeat. The picture which life presents to us is the result of the concurrent and mutually opposing action of Eros and the death instinct.
[1925d, 4232]

Every analyst will admit that even to-day this view has not the sound of a long-discarded error. Nevertheless, alterations in it became essential, as our enquiries advanced from the repressed to the repressing forces, from the object-instincts to the ego. The decisive step forward was the introduction of the concept of narcissism - that is to say, the discovery that the ego itself is cathexed with libido, that the ego, indeed, is the libido's original home, and remains to some extent its headquarters. This narcissistic libido turns towards objects, and thus becomes object-libido; and it can change back into narcissistic libido once more. The concept of narcissism made it possible to obtain an analytic understanding of the traumatic neuroses and of many of the affections bordering on the psychoses, as well as of the latter themselves. It was not necessary to give up our interpretation of the transference neuroses as attempts made by the ego to defend itself against sexuality; but the concept of libido was endangered. Since the ego-instincts, too, were libidinal, it seemed for a time inevitable that we should make libido coincide with instincntual energy in general, as C. G. Jung had already advocated earlier. Nevertheless, there still remained in me a kind of conviction, for which I was not as yet able to find reasons, that the instincts could not all be of the same kind. My next step was taken in Beyond the Pleasure Principle (1920g), when the compulsion to repeat and the conservative character of instinctual life first attracted my attention. Starting from speculations on the beginning of life and from biological parallels, I drew the conclusion that, besides the instinct to preserve living substance and to join it into ever larger units,¹ there must exist another, contrary instinct seeking to dissolve those units and to bring them back to their primaeval, inorganic state. That is to say, as well as Eros there was an instinct of death. The phenomena of life could be explained from the concurrent or mutually opposing action of these two instincts. It was not easy, however, to demonstrate the activities of this supposed death instinct. The manifestations of Eros were conspicuous and noisy enough. It might be assumed that the death instinct operated silently within the organism towards its dissolution, but that, of course, was no proof. A more fruitful idea was that a portion of the instinct is diverted towards the external world and comes to light as an instinct of aggressiveness and destructiveness. In this way the instinct itself could be pressed into the service of Eros, in that the organism was destroying some other thing, whether animate or inanimate, instead of destroying its own self. Conversely, any restriction of this aggressiveness directed outwards would be bound to increase the self-destruction, which is in any case proceeding. At the same time one can suspect from this example that the two kinds of instinct seldom - perhaps never - appear in isolation from each other, but are alloyed with each other in varying and very different proportions and so become unrecognizable to our judgement. In sadism, long since known to us as a component instinct of sexuality, we should have before us a particularly strong alloy of this kind between trends of love and the destructive instinct; while its counterpart, masochism, would be a union between destructiveness directed inwards and sexuality - a union which makes what is otherwise an imperceptible trend into a conspicuous and tangible one.
[1930a, 4509]
The opposition which thus emerges between the ceaseless trend by Eros towards extension and the general conservative nature of the instincts is striking, and it may become the starting-point for the study of further problems. [1930a, 4509]

But the moralist will console himself for a long time to come with the improbability of our speculations. A queer instinct indeed, directed to the destruction of its own organic home! Poets, it is true, talk of such things; but poets are irresponsible people and enjoy the privilege of poetic licence. Incidentally, such ideas are not foreign even to physiology: consider the notion, for instance, of the mucous membrane of the stomach digesting itself. It must be admitted, however, that our self-destructive instinct calls for support on a wider basis. One cannot, after all, venture on a hypothesis of such a wide range merely because a few poor fools have linked their sexual satisfaction to a peculiar condition. A more profound study of the instincts will, I believe, give us what we need. The instincts rule not only mental but also vegetative life, and these organic instincts exhibit a characteristic which deserves our deepest interest. (We shall not be able to judge until later whether it is a general characteristic of instincts.) For they reveal an effort to restore an earlier state of things. We may suppose that from the moment at which a state of things that has once been attained is upset, an instinct arises to create it afresh and brings about phenomena which we can describe as a ‘compulsion to repeat’. Thus the whole of embryology is an example of the compulsion to repeat. A power of regenerating lost organs extends far up into the animal kingdom, and the instinct for recovery to which, alongside of therapeutic assistance, our cures are due must be the residue of this capacity which is so enormously developed in the lower animals. The spawning migrations of fishes, the migratory flights of birds, and possibly all that we describe as manifestations of instinct in animals, take place under the orders of the compulsion to repeat, which expresses the conservative nature of the instincts. Nor have we far to look in the mental field for its manifestations. We have been struck by the fact that the forgotten and repressed experiences of childhood are reproduced during the work of analysis in dreams and reactions, particularly in those occurring in the transference, although their revival runs counter to the interest of the pleasure principle; and we have explained this by supposing that in these cases a compulsion to repeat is overcoming even the pleasure principle. Outside analysis, too, something similar can be observed. There are people in whose lives the same reactions are perpetually being repeated uncorrected, to their own detriment, or others who seem to be pursued by a relentless fate, though closer investigation teaches us that they are unwittingly bringing this fate on themselves. In such cases we attribute a ‘daemonic’ character to the compulsion to repeat. [1933a, 4710]

But how can this conservative characteristic of instincts help us to understand our self-destructiveness? What earlier state of things does an instinct such as this want to restore? Well, the answer is not far to seek and opens wide perspectives. If it is true that - at some immeasurably remote time and in a manner we cannot conceive - life once proceeded out of inorganic matter, then, according to our presumption, an instinct must have arisen which sought to do away with life once more and to re-establish the inorganic state. If we recognize in this instinct the self-destructiveness of our hypothesis, we may regard the self-destructiveness as an expression of a ‘death instinct’ which cannot fail to be present in every vital process. And now the instincts that we believe in divide themselves into two groups - the erotic instincts, which seek to combine more and more living substance into ever greater unities, and the death instincts, which oppose this effort and lead what is living back into an inorganic state. From the concurrent and opposing action of these two proceed the phenomena of life which are brought to an end by death. [1933a, 4711]
You may perhaps shrug your shoulders and say: 'That isn't natural science, it's Schopenhauer's philosophy!' But, Ladies and Gentlemen, why should not a bold thinker have guessed something that is afterwards confirmed by sober and painstaking detailed research? Moreover, there is nothing that has not been said already, and similar things had been said by many people before Schopenhauer. Furthermore, what we are saying is not even genuine Schopenhauer. We are not asserting that death is the only aim of life; we are not overlooking the fact that there is life as well as death. We recognize two basic instincts and give each of them its own aim. How the two of them are mingled in the process of living, how the death instinct is made to serve the purposes of Eros, especially by being turned outwards as aggressiveness - these are tasks which are left to future investigation. We have not gone beyond the point at which this prospect lies open before us. The question, too, of whether the conservative character may not belong to all instincts without exception, whether the erotic instincts as well may not be seeking to bring back an earlier state of things when they strive to bring about a synthesis of living things into greater unities - this question, too, we must leave unanswered.

[1933a, 4711]

Ten years ago, when the Internationale Zeitschrift dedicated a special number to Ferenczi on his fiftieth birthday, he had already published most of the works which have made all analysts into his pupils. But he was holding back his most brilliant and most fertile achievement. I knew of it, and in the closing sentence of my contribution I urged him to give it to us. Then, in 1924, his Versuch einer Genitaltheorie appeared. This little book is a biological rather than a psycho-analytic study; it is an application of the attitudes and insights associated with psycho-analysis to the biology of the sexual processes and, beyond them, to organic life in general. It was perhaps the boldest application of psycho-analysis that was ever attempted. As its governing thought it lays stress on the conservative nature of the instincts, which seek to re-establish every state of things that has been abandoned owing to an external interference. Symbols are recognized as evidence of ancient connections. Impressive instances are adduced to show how the characteristics of what is psychical preserve traces of primaeval changes in the bodily substance. When one has read this work, one seems to understand many peculiarities of sexual life of which one had never previously been able to obtain a comprehensive view, and one finds oneself the richer for hints that promise a deep insight into wide fields of biology. It is a vain task to attempt already to-day to distinguish what can be accepted as an authentic discovery from what seeks, in the fashion of a scientific phantasy, to guess at future knowledge. We lay the little book aside with a feeling: 'This is almost too much to take in at a first reading; I will read it again after a while.' But it is not only I who feel like this. It is probable that some time in the future there will really be a 'bio-analysis', as Ferenczi has prophesied, and it will have to cast back to the Versuch einer Genitaltheorie.

[1933c, 4815]
The forces which we assume to exist behind the tensions caused by the needs of the id are called *instincts*. They represent the somatic demands upon the mind. Though they are the ultimate cause of all activity, they are of a conservative nature; the state, whatever it may be, which an organism has reached gives rise to a tendency to re-establish that state so soon as it has been abandoned. It is thus possible to distinguish an indeterminate number of instincts, and in common practice this is in fact done. For us, however, the important question arises whether it may not be possible to trace all these numerous instincts back to a few basic ones. We have found that instincts can change their aim (by displacement) and also that they can replace one another - the energy of one instinct passing over to another. This latter process is still insufficiently understood. After long hesitations and vacillations we have decided to assume the existence of only two basic instincts, *Eros* and the destructive instinct. (The contrast between the instincts of self-preservation and the preservation of the species, as well as the contrast between ego-love and object-love, fall within Eros.) The aim of the first of these basic instincts is to establish ever greater unities and to preserve them thus - in short, to bind together; the aim of the second is, on the contrary, to undo connections and so to destroy things. In the case of the destructive instinct we may suppose that its final aim is to lead what is living into an inorganic state. For this reason we also call it the *death instinct*. If we assume that living things came later than inanimate ones and arose from them, then the death instinct fits in with the formula we have proposed to the effect that instincts tend towards a return to an earlier state. In the case of Eros (or the love instinct) we cannot apply this formula. To do so would presuppose that living substance was once a unity which had later been torn apart and was now striving towards reunion.¹

[1940a [1938], 4959]

It is best to begin by pointing out that the formation of a dream can be provoked in two different ways. Either, on the one hand, an instinctual impulse which is ordinarily suppressed (an unconscious wish) finds enough strength during sleep to make itself felt by the ego, or, on the other hand, an urge left over from waking life, a preconscious train of thought with all the conflicting impulses attached to it, finds reinforcement during sleep from an unconscious element. In short, dreams may arise either from the id or from the ego. The mechanism of dream-formation is in both cases the same and so also is the necessary dynamic precondition. The ego gives evidence of its original derivation from the id by occasionally ceasing its functions and allowing a reversion to an earlier state of things. This is logically brought about by its breaking off its relations with the external world and withdrawing its cathexes from the sense organs. We are justified in saying that there arises at birth an instinct to return to the intra-uterine life that has been abandoned - an instinct to sleep. Sleep is a return of this kind to the womb. Since the waking ego governs motility, that function is paralysed in sleep, and accordingly a good part of the inhibitions imposed on the unconscious id become superfluous. The withdrawal or reduction of these 'anticathexes' thus allows the id what is now a harmless amount of liberty.

[1940a [1938], 4976]
It must be understood that each individual, through the combined operation of his innate disposition and the influences brought to bear on him during his early years, has acquired a specific method of his own in his conduct of his erotic life - that is, in the preconditions to falling in love which he lays down, in the instincts he satisfies and the aims he sets himself in the course of it.¹ This produces what might be described as a stereotype plate (or several such), which is constantly repeated - constantly reprinted afresh - in the course of the person's life, so far as external circumstances and the nature of the love objects accessible to him permit, and which is certainly not entirely insusceptible to change in the face of recent experiences. Now, our observations have shown that only a portion of these impulses which determine the course of erotic life have passed through the full process of psychical development. That portion is directed towards reality, is at the disposal of the conscious personality, and forms a part of it. Another portion of the libidinal impulses has been held up in the course of development; it has been kept away from the conscious personality and from reality, and has either been prevented from further expansion except in phantasy or has remained wholly in the unconscious so that it is unknown to the personality's consciousness. If someone's need for love is not entirely satisfied by reality, he is bound to approach every new person whom he meets with libidinal anticipatory ideas; and it is highly probable that both portions of his libido, the portion that is capable of becoming conscious as well as the unconscious one, have a share in forming that attitude.

[1912b, 2457]

How exactly we can trace back to infantile psychology the uncanny effect of such similar recurrences is a question I can only lightly touch on in these pages; and I must refer the reader instead to another work, already completed, in which this has been gone into in detail, but in a different connection. For it is possible to recognize the dominance in the unconscious mind of a 'compulsion to repeat' proceeding from the instinctual impulses and probably inherent in the very nature of the instincts - a compulsion powerful enough to overrule the pleasure principle, lending to certain aspects of the mind their daemonic character, and still very clearly expressed in the impulses of small children; a compulsion, too, which is responsible for a part of the course taken by the analyses of neurotic patients. All these considerations prepare us for the discovery that whatever reminds us of this inner 'compulsion to repeat' is perceived as uncanny.

[1919h, 3690]

Nevertheless, it emerges from this discussion that there is no need to assume the existence of a special imitative instinct in order to provide a motive for play. Finally, a reminder may be added that the artistic play and artistic imitation carried out by adults, which, unlike children's, are aimed at an audience, do not spare the spectators (for instance, in tragedy) the most painful experiences and can yet be felt by them as highly enjoyable. This is convincing proof that, even under the dominance of the pleasure principle, there are ways and means enough of making what is in itself unpleasurable into a subject to be recollected and worked over in the mind. The consideration of these cases and situations, which have a yield of pleasure as their final outcome, should be undertaken by some system of aesthetics with an economic approach to its subject-matter. They are of no use for our purposes, since they presuppose the existence and dominance of the pleasure principle; they give no evidence of the operation of tendencies beyond the pleasure principle, that is, of tendencies more primitive than it and independent of it.

[1920g, 3722]
There is no doubt that the resistance of the conscious and unconscious ego operates under the sway of the pleasure principle: it seeks to avoid the unpleasure which would be produced by the liberation of the repressed. Our efforts, on the other hand, are directed towards procuring the toleration of that unpleasure by an appeal to the reality principle. But how is the compulsion to repeat - the manifestation of the power of the repressed - related to the pleasure principle? It is clear that the greater part of what is re-experienced under the compulsion to repeat must cause the ego unpleasure, since it brings to light activities of repressed instinctual impulses. That, however, is unpleasure of a kind we have already considered and does not contradict the pleasure principle: unpleasure for one system and simultaneously satisfaction for the other. But we come now to a new and remarkable fact, namely that the compulsion to repeat also recalls from the past experiences which include no possibility of pleasure, and which can never, even long ago, have brought satisfaction even to instinctual impulses which have since been repressed. [1920g, 3725]

Patients repeat all of these unwanted situations and painful emotions in the transference and revive them with the greatest ingenuity. They seek to bring about the interruption of the treatment while it is still incomplete; they contrive once more to feel themselves scorned, to oblige the physician to speak severely to them and treat them coldly; they discover appropriate objects for their jealousy; instead of the passionately desired baby of their childhood, they produce a plan or a promise of some grand present - which turns out as a rule to be no less unreal. None of these things can have produced pleasure in the past, and it might be supposed that they would cause less unpleasure to-day if they emerged as memories or dreams instead of taking the form of fresh experiences. They are of course the activities of instincts intended to lead to satisfaction; but no lesson has been learnt from the old experience of these activities having led instead only to unpleasure. In spite of that, they are repeated, under pressure of a compulsion. [1920g, 3725]
What psycho-analysis reveals in the transference phenomena of neurotics can also be observed in the lives of some normal people. The impression they give is of being pursued by a malignant fate or possessed by some ‘daemonic’ power; but psycho-analysis has always taken the view that their fate is for the most part arranged by themselves and determined by early infantile influences. The compulsion which is here in evidence differs in no way from the compulsion to repeat which we have found in neurotics, even though the people we are now considering have never shown any signs of dealing with a neurotic conflict by producing symptoms. Thus we have come across people all of whose human relationships have the same outcome: such as the benefactor who is abandoned in anger after a time by each of his protégés, however much they may otherwise differ from one another, and who thus seems doomed to taste all the bitterness of ingratitude; or the man whose friendships all end in betrayal by his friend; or the man who time after time in the course of his life raises someone else into a position of great private or public authority and then, after a certain interval, himself upsets that authority and replaces him by a new one; or, again, the lover each of whose love affairs with a woman passes through the same phases and reaches the same conclusion. This ‘perpetual recurrence of the same thing’ causes us no astonishment when it relates to active behaviour on the part of the person concerned and when we can discern in him an essential character-trait which always remains the same and which is compelled to find expression in a repetition of the same experiences. We are much more impressed by cases where the subject appears to have a passive experience, over which he has no influence, but in which he meets with a repetition of the same fatality. There is the case, for instance, of the woman who married three successive husbands each of whom fell ill soon afterwards and had to be nursed by her on their death-beds.¹ The most moving poetic picture of a fate such as this is given by Tasso in his romantic epic Gerusalemme Liberata. Its hero, Tancred, unwittingly kills his beloved Clorinda in a duel while she is disguised in the armour of an enemy knight. After her burial he makes his way into a strange magic forest which strikes the Crusaders’ army with terror. He slashes with his sword at a tall tree; but blood streams from the cut and the voice of Clorinda, whose soul is imprisoned in the tree, is heard complaining that he has wounded his beloved once again.

If we take into account observations such as these, based upon behaviour in the transference and upon the life-histories of men and women, we shall find courage to assume that there really does exist in the mind a compulsion to repeat which overrides the pleasure principle. Now too we shall be inclined to relate to this compulsion the dreams which occur in traumatic neuroses and the impulse which leads children to play.

But it is to be noted that only in rare instances can we observe the pure effects of the compulsion to repeat, unsupported by other motives. In the case of children’s play we have already laid stress on the other ways in which the emergence of the compulsion may be interpreted; the compulsion to repeat and instinctual satisfaction which is immediately pleasurable seem to converge here into an intimate partnership. The phenomena of transference are obviously exploited by the resistance which the ego maintains in its pertinacious insistence upon repression; the compulsion to repeat, which the treatment tries to bring into its service is, as it were, drawn over by the ego to its side (clinging as the ego does to the pleasure principle). A great deal of what might be described as the compulsion of destiny seems intelligible on a rational basis; so that we are under no necessity to call in a new and mysterious motive force to explain it.
The least dubious instance is perhaps that of traumatic dreams. But on maturer reflection we shall be forced to admit that even in the other instances the whole ground is not covered by the operation of the familiar motive forces. Enough is left unexplained to justify the hypothesis of a compulsion to repeat - something that seems more primitive, more elementary, more instinctual than the pleasure principle which it overrides. But if a compulsion to repeat does operate in the mind, we should be glad to know something about it, to learn what function it corresponds to, under what conditions it can emerge and what its relation is to the pleasure principle - to which, after all, we have hitherto ascribed dominance over the course of the processes of excitation in mental life.

[1920g, 3727]

We may, I think, tentatively venture to regard the common traumatic neurosis as a consequence of an extensive breach being made in the protective shield against stimuli. This would seem to reinstate the old, naïve theory of shock, in apparent contrast to the later and psychologically more ambitious theory which attributes aetiological importance not to the effects of mechanical violence but to fright and the threat to life. These opposing views are not, however, irreconcilable; nor is the psycho-analytic view of the traumatic neurosis identical with the shock theory in its crudest form. The latter regards the essence of the shock as being the direct damage to the molecular structure or even to the histological structure of the elements of the nervous system; whereas what we seek to understand are the effects produced on the organ of the mind by the breach in the shield against stimuli and by the problems that follow in its train. And we still attribute importance to the element of fright. It is caused by lack of any preparedness for anxiety, including lack of hypercathexis of the systems that would be the first to receive the stimulus. Owing to their low cathexis those systems are not in a good position for binding the inflowing amounts of excitation and the consequences of the breach in the protective shield follow all the more easily. It will be seen, then, that preparedness for anxiety and the hypercathexis of the receptive systems constitute the last line of defence of the shield against stimuli. In the case of quite a number of traumas, the difference between systems that are unprepared and systems that are well prepared through being hypercathected may be a decisive factor in determining the outcome; though where the strength of a trauma exceeds a certain limit this factor will no doubt cease to carry weight. The fulfilment of wishes is, as we know, brought about in a hallucinatory manner by dreams, and under the dominance of the pleasure principle this has become their function. But it is not in the service of that principle that the dreams of patients suffering from traumatic neuroses lead them back with such regularity to the situation in which the trauma occurred. We may assume, rather, that dreams are here helping to carry out another task, which must be accomplished before the dominance of the pleasure principle can ever begin. These dreams are endeavouring to master the stimulus retrospectively, by developing the anxiety whose omission was the cause of the traumatic neurosis. They thus afford us a view of a function of the mental apparatus which, though it does not contradict the pleasure principle, is nevertheless independent of it and seems to be more primitive than the purpose of gaining pleasure and avoiding unpleasure.

[1920g, 3734]
This would seem to be the place, then, at which to admit for the first time an exception to the proposition that dreams are fulfilments of wishes. Anxiety dreams, as I have shown repeatedly and in detail, offer no such exception. Nor do 'punishment dreams', for they merely replace the forbidden wish-fulfilment by the appropriate punishment for it; that is to say, they fulfil the wish of the sense of guilt which is the reaction to the repudiated impulse. But it is impossible to classify as wish-fulfilments the dreams we have been discussing which occur in traumatic neuroses, or the dreams during psycho-analyses which bring to memory the psychical traumas of childhood. They arise, rather, in obedience to the compulsion to repeat, though it is true that in analysis that compulsion is supported by the wish (which is encouraged by 'suggestion') to conjure up what has been forgotten and repressed. Thus it would seem that the function of dreams, which consists in setting aside any motives that might interrupt sleep, by fulfilling the wishes of the disturbing impulses, is not their _original_ function. It would not be possible for them to perform that function until the whole of mental life had accepted the dominance of the pleasure principle. If there is a 'beyond the pleasure principle', it is only consistent to grant that there was also a time before the purpose of dreams was the fulfilment of wishes. This would imply no denial of their later function. But if once this general rule has been broken, a further question arises. May not dreams which, with a view to the psychical binding of traumatic impressions, obey the compulsion to repeat - may not such dreams occur _outside_ analysis as well? And the reply can only be a decided affirmative.

[1920g, 3735]

The manifestations of a compulsion to repeat (which we have described as occurring in the early activities of infantile mental life as well as among the events of psycho-analytic treatment) exhibit to a high degree an instinctual character and, when they act in opposition to the pleasure principle, give the appearance of some 'daemonic' force at work. In the case of children's play we seemed to see that children repeat unpleasurable experiences for the additional reason that they can master a powerful impression far more thoroughly by being active than they could by merely experiencing it passively. Each fresh repetition seems to strengthen the mastery they are in search of. Nor can children have their _pleasurable_ experiences repeated often enough, and they are inexorable in their insistence that the repetition shall be an identical one. This character trait disappears later on. If a joke is heard for a second time it produces almost no effect; a theatrical production never creates so great an impression the second time as the first; indeed, it is hardly possible to persuade an adult who has very much enjoyed reading a book to re-read it immediately. Novelty is always the condition of enjoyment. But children will never tire of asking an adult to repeat a game that he has shown them or played with them, till he is too exhausted to go on. And if a child has been told a nice story, he will insist on hearing it over and over again rather than a new one; and he will remorselessly stipulate that the repetition shall be an identical one and will correct any alterations of which the narrator may be guilty - though they may actually have been made in the hope of gaining fresh approval. None of this contradicts the pleasure principle; repetition, the re-experiencing of something identical, is clearly in itself a source of pleasure. In the case of a person in analysis, on the contrary, the compulsion to repeat the events of his childhood in the transference evidently disregards the pleasure principle in every way. The patient behaves in a purely infantile fashion and thus shows us that the repressed memory-traces of his primaeval experiences are not present in him in a bound state and are indeed in a sense incapable of obeying the secondary process. It is to this fact of not being bound, moreover, that they owe their capacity for forming, in conjunction with the residues of the previous day, a wishful phantasy that emerges in a dream. This same compulsion to repeat frequently meets us as an obstacle to our treatment when at the end of an analysis we try to induce the patient to detach himself completely from his physician. It may be presumed, too, that when people unfamiliar with analysis feel an obscure fear - a dread of rousing something that, so they feel, is better left sleeping - what they are afraid of at bottom is the emergence of this compulsion with its hint of possession by some 'daemonic' power.

[1920g, 3738]
But how is the predicate of being 'instinctual' related to the compulsion to repeat? At this point we cannot escape a suspicion that we may have come upon the track of a universal attribute of instincts and perhaps of organic life in general which has not hitherto been clearly recognized or at least not explicitly stressed. It seems, then, that an instinct is an urge inherent in organic life to restore an earlier state of things which the living entity has been obliged to abandon under the pressure of external disturbing forces; that is, it is a kind of organic elasticity, or, to put it another way, the expression of the inertia inherent in organic life.

This view of instincts strikes us as strange because we have become used to see in them a factor impelling towards change and development, whereas we are now asked to recognize in them the precise contrary - an expression of the conservative nature of living substance. On the other hand we soon call to mind examples from animal life which seem to confirm the view that instincts are historically determined. Certain fishes, for instance, undertake laborious migrations at spawning-time in order to deposit their spawn in particular waters far removed from their customary haunts. In the opinion of many biologists what they are doing is merely to seek out the localities in which their species formerly resided but which in the course of time they have exchanged for others. The same explanation is believed to apply to the migratory flights of birds of passage - but we are quickly relieved of the necessity for seeking for further examples by the reflection that the most impressive proofs of there being an organic compulsion to repeat lie in the phenomena of heredity and the facts of embryology. We see how the germ of a living animal is obliged in the course of its development to recapitulate (even if only in a transient and abbreviated fashion) the structures of all the forms from which it is sprung, instead of proceeding quickly by the shortest path to its final shape. This behaviour is only to a very slight degree attributable to mechanical causes, and the historical explanation cannot accordingly be neglected. So too the power of regenerating a lost organ by growing afresh a precisely similar one extends far up into the animal kingdom.

We shall be met by the plausible objection that it may very well be that, in addition to the conservative instincts which impel towards repetition, there may be others which push forward towards progress and the production of new forms. This argument must certainly not be overlooked, and it will be taken into account at a later stage. But for the moment it is tempting to pursue to its logical conclusion the hypothesis that all instincts tend towards the restoration of an earlier state of things. The outcome may give an impression of mysticism or of sham profundity; but we can feel quite innocent of having had any such purpose in view. We seek only for the sober results of research or of reflection based on it; and we have no wish to find in those results any quality other than certainty.
Let us suppose, then, that all the organic instincts are conservative, are acquired historically and tend towards the restoration of an earlier state of things. It follows that the phenomena of organic development must be attributed to external disturbing and diverting influences. The elementary living entity would from its very beginning have had no wish to change; if conditions remained the same, it would do no more than constantly repeat the same course of life. In the last resort, what has left its mark on the development of organisms must be the history of the earth we live in and of its relation to the sun. Every modification which is thus imposed upon the course of the organism's life is accepted by the conservative organic instincts and stored up for further repetition. Those instincts are therefore bound to give a deceptive appearance of being forces tending towards change and progress, whilst in fact they are merely seeking to reach an ancient goal by paths alike old and new. Moreover it is possible to specify this final goal of all organic striving. It would be in contradiction to the conservative nature of the instincts if the goal of life were a state of things which had never yet been attained. On the contrary, it must be an old state of things, an initial state from which the living entity has at one time or other departed and to which it is striving to return by the circuitous paths along which its development leads. If we are to take it as a truth that knows no exception that everything living dies for internal reasons - becomes inorganic once again - then we shall be compelled to say that 'the aim of life is death' and, looking backwards, that 'inanimate things existed before living ones'.

The upshot of our enquiry so far has been the drawing of a sharp distinction between the 'ego-instincts' and the sexual instincts, and the view that the former exercise pressure towards death and the latter towards a prolongation of life. But this conclusion is bound to be unsatisfactory in many respects even to ourselves. Moreover, it is actually only of the former group of instincts that we can predicate a conservative, or rather retrograde, character corresponding to a compulsion to repeat. For on our hypothesis the ego-instincts arise from the coming to life of inanimate matter and seek to restore the inanimate state; whereas as regards the sexual instincts, though it is true that they reproduce primitive states of the organism, what they are clearly aiming at by every possible means is the coalescence of two germ-cells which are differentiated in a particular way. If this union is not effected, the germ-cell dies along with all the other elements of the multicellular organism. It is only on this condition that the sexual function can prolong the cell's life and lend it the appearance of immortality. But what is the important event in the development of living substance which is being repeated in sexual reproduction, or in its fore-runner, the conjugation of two protista? We cannot say; and we should consequently feel relieved if the whole structure of our argument turned out to be mistaken. The opposition between the ego or death instincts and the sexual or life instincts would then cease to hold and the compulsion to repeat would no longer possess the importance we have ascribed to it.

But we still feel our line of thought appreciably hampered by the fact that we cannot ascribe to the sexual instinct the characteristic of a compulsion to repeat which first put us on the track of the death instincts. The sphere of embryonic developmental processes is no doubt extremely rich in such phenomena of repetition; the two germ-cells that are involved in sexual reproduction and their life history are themselves only repetitions of the beginnings of organic life. But the essence of the processes to which sexual life is directed is the coalescence of two cell-bodies. That alone is what guarantees the immortality of the living substance in the higher organisms.
Apart from this, science has so little to tell us about the origin of sexuality that we can liken the problem to a darkness into which not so much as a ray of a hypothesis has penetrated. In quite a different region, it is true, we do meet with such a hypothesis; but it is of so fantastic a kind - a myth rather than a scientific explanation - that I should not venture to produce it here, were it not that it fulfils precisely the one condition whose fulfilment we desire. For it traces the origin of an instinct to a need to restore an earlier state of things.

[1920g, 3758]

What I have in mind is, of course, the theory which Plato put into the mouth of Aristophanes in the Symposium, and which deals not only with the origin of the sexual instinct but also with the most important of its variations in relation to its object. 'The original human nature was not like the present, but different. In the first place, the sexes were originally three in number, not two as they are now; there was man, woman, and the union of the two. . . .' Everything about these primaeval men was double: they had four hands and four feet, two faces, two privy parts, and so on. Eventually Zeus decided to cut these men in two, 'like a sorb-apple which is halved for pickling'. After the division had been made, 'the two parts of man, each desiring his other half, came together, and threw their arms about one another eager to grow into one'.¹

[1920g, 3758]

Not, however, without the addition of a few words of critical reflection. It may be asked whether and how far I am myself convinced of the truth of the hypotheses that have been set out in these pages. My answer would be that I am not convinced myself and that I do not seek to persuade other people to believe in them. Or, more precisely, that I do not know how far I believe in them. There is no reason, as it seems to me, why the emotional factor of conviction should enter into this question at all. It is surely possible to throw oneself into a line of thought and to follow it wherever it leads out of simple scientific curiosity, or, if the reader prefers, as an advocatus diaboli, who is not on that account himself sold to the devil. I do not dispute the fact that the third step in the theory of the instincts, which I have taken here, cannot lay claim to the same degree of certainty as the two earlier ones - the extension of the concept of sexuality and the hypothesis of narcissism. These two innovations were a direct translation of observation into theory and were no more open to sources of error than is inevitable in all such cases. It is true that my assertion of the regressive character of instincts also rests upon observed material - namely on the facts of the compulsion to repeat. It may be, however, that I have overestimated their significance. And in any case it is impossible to pursue an idea of this kind except by repeatedly combining factual material with what is purely speculative and thus diverging widely from empirical observation. The more frequently this is done in the course of constructing a theory, the more untrustworthy, as we know, must be the final result. But the degree of uncertainty is not assignable. One may have made a lucky hit or one may have gone shamefully astray. I do not think a large part is played by what is called 'intuition' in work of this kind. From what I have seen of intuition, it seems to me to be the product of a kind of intellectual impartiality. Unfortunately, however, people are seldom impartial where ultimate things, the great problems of science and life, are concerned. Each of us is governed in such cases by deep-rooted internal prejudices, into whose hands our speculation unwittingly plays. Since we have such good grounds for being distrustful, our attitude towards the results of our own deliberations cannot well be other than one of cool benevolence. I hasten to add, however, that self-criticism such as this is far from binding one to any special tolerance towards dissentient opinions. It is perfectly legitimate to reject remorselessly theories which are contradicted by the very first steps in the analysis of observed facts, while yet being aware at the same time that the validity of one's own theory is only a provisional one.

[1920g, 3759]
If it is really the case that seeking to restore an earlier state of things is such a universal characteristic of instincts, we need not be surprised that so many processes take place in mental life independently of the pleasure principle. This characteristic would be shared by all the component instincts and in their case would aim at returning once more to a particular stage in the course of development. These are matters over which the pleasure principle has as yet no control; but it does not follow that any of them are necessarily opposed to it, and we have still to solve the problem of the relation of the instinctual processes of repetition to the dominance of the pleasure principle.

In *Beyond the Pleasure Principle* (1920g) I have dealt with the economic problem of how what are in every respect distressing experiences of the early infantile sexual period can succeed in forcing their way through to some kind of reproduction. I was obliged to ascribe to them an extraordinarily strong upward drive in the shape of the 'compulsion to repeat' - a force able to overcome the repression which, in obedience to the pleasure principle, weighs down upon them - though not until 'the work of treatment has gone half-way to meet it and has loosened the repression'. Here we may add that it is the positive transference that gives this assistance to the compulsion to repeat. Thus an alliance has been made between the treatment and the compulsion to repeat, an alliance which is directed in the first instance against the pleasure principle but of which the ultimate purpose is the establishment of the dominion of the reality principle. As I have shown in the passage to which I am referring, it happens only too often that the compulsion to repeat throws over its obligations under this alliance and is not content with the return of the repressed merely in the form of dream-pictures.

In the works of my later years (*Beyond the Pleasure Principle, Group Psychology and the Analysis of the Ego*, and *The Ego and the Id*), I have given free rein to the inclination, which I kept down for so long, to speculation, and I have also contemplated a new solution of the problem of the instincts. I have combined the instincts for self-preservation and for the preservation of the species under the concept of *Eros* and have contrasted with it an *instinct of death or destruction* which works in silence. Instinct in general is regarded as a kind of elasticity of living things, an impulsion towards the restoration of a situation which once existed but was brought to an end by some external disturbance. This essentially conservative character of instincts is exemplified by the phenomena of the *compulsion to repeat*. The picture which life presents to us is the result of the concurrent and mutually opposing action of Eros and the death instinct.
Psycho-analysis leads to less simple and satisfactory conclusions. What I have to say in this connection has long been familiar and I have nothing new to add. If the ego succeeds in protecting itself from a dangerous instinctual impulse, through, for instance, the process of repression, it has certainly inhibited and damaged the particular part of the id concerned; but it has at the same time given it some independence and has renounced some of its own sovereignty. This is inevitable from the nature of repression, which is, fundamentally, an attempt at flight. The repressed is now, as it were, an outlaw; it is excluded from the great organization of the ego and is subject only to the laws which govern the realm of the unconscious. If, now, the danger-situation changes so that the ego has no reason for fending off a new instinctual impulse analogous to the repressed one, the consequence of the restriction of the ego which has taken place will become manifest. The new impulse will run its course under an automatic influence - or, as I should prefer to say, under the influence of the compulsion to repeat. It will follow the same path as the earlier, repressed impulse, as though the danger-situation that had been overcome still existed. The fixating factor in repression, then, is the unconscious id's compulsion to repeat - a compulsion which in normal circumstances is only done away with by the freely mobile function of the ego. The ego may occasionally manage to break down the barriers of repression which it has itself put up and to recover its influence over the instinctual impulse and direct the course of the new impulse in accordance with the changed danger-situation. But in point of fact the ego very seldom succeeds in doing this: it cannot undo its repressions. It is possible that the way the struggle will go depends upon quantitative relations. In some cases one has the impression that the outcome is an enforced one: the regressive attraction exerted by the repressed impulse and the strength of the repression are so great that the new impulse has no choice but to obey the compulsion to repeat. In other cases we perceive a contribution from another play of forces: the attraction exerted by the repressed prototype is reinforced by a repulsion coming from the direction of difficulties in real life which stand in the way of any different course that might be taken by the new instinctual impulse.

[1926d, 4307]

From the first of these standpoints, the *dynamic* one, psycho-analysis derives all mental processes (apart from the reception of external stimuli) from the interplay of forces, which assist or inhibit one another, combine with one another, enter into compromises with one another, etc. All of these forces are originally in the nature of *instincts*; thus they have an organic origin. They are characterized by possessing an immense (somatic) store of power ('the compulsion to repeat'); and they are represented mentally as images or ideas with an affective charge. In psycho-analysis, no less than in other sciences, the theory of the instincts is an obscure subject. An empirical analysis leads to the formulation of two groups of instincts: the so-called 'ego-instincts', which are directed towards self-preservation, and the 'object-instincts', which are concerned with relations to an external object. The social instincts are not regarded as elementary or irreducible. Theoretical speculation leads to the suspicion that there are two fundamental instincts which lie concealed behind the manifest ego-instincts and object-instincts: namely (a) Eros, the instinct which strives for ever closer union, and (b) the instinct of destruction, which leads towards the dissolution of what is living. In psycho-analysis the manifestation of the force of Eros is given the name 'libido'.

[1926f, 4403]
Every analyst will admit that even to-day this view has not the sound of a long-discarded error. Nevertheless, alterations in it became essential, as our enquiries advanced from the repressed to the repressing forces, from the object-instincts to the ego. The decisive step forward was the introduction of the concept of narcissism - that is to say, the discovery that the ego itself is cathexed with libido, that the ego, indeed, is the libido's original home, and remains to some extent its headquarters. This narcissistic libido turns towards objects, and thus becomes object-libido; and it can change back into narcissistic libido once more. The concept of narcissism made it possible to obtain an analytic understanding of the traumatic neuroses and of many of the affections bordering on the psychoses, as well as of the latter themselves. It was not necessary to give up our interpretation of the transference neuroses as attempts made by the ego to defend itself against sexuality; but the concept of libido was endangered. Since the ego-instincts, too, were libidinal, it seemed for a time inevitable that we should make libido coincide with instinctual energy in general, as C. G. Jung had already advocated earlier. Nevertheless, there still remained in me a kind of conviction, for which I was not as yet able to find reasons, that the instincts could not all be of the same kind. My next step was taken in *Beyond the Pleasure Principle* (1920), when the compulsion to repeat and the conservative character of instinctual life first attracted my attention. Starting from speculations on the beginning of life and from biological parallels, I drew the conclusion that, besides the instinct to preserve living substance and to join it into ever larger units,¹ there must exist another, contrary instinct seeking to dissolve those units and to bring them back to their primaeval, inorganic state. That is to say, as well as Eros there was an instinct of death. The phenomena of life could be explained from the concurrent or mutually opposing action of these two instincts. It was not easy, however, to demonstrate the activities of this supposed death instinct. The manifestations of Eros were conspicuous and noisy enough. It might be assumed that the death instinct operated silently within the organism towards its dissolution, but that, of course, was no proof. A more fruitful idea was that a portion of the instinct is diverted towards the external world and comes to light as an instinct of aggressiveness and destructiveness. In this way the instinct itself could be pressed into the service of Eros, in that the organism was destroying some other thing, whether animate or inanimate, instead of destroying its own self. Conversely, any restriction of this aggressiveness directed outwards would be bound to increase the self-destruction, which is in any case proceeding. At the same time one can suspect from this example that the two kinds of instinct seldom - perhaps never - appear in isolation from each other, but are alloyed with each other in varying and very different proportions and so become unrecognizable to our judgement. In sadism, long since known to us as a component instinct of sexuality, we should have before us a particularly strong alloy of this kind between trends of love and the destructive instinct; while its counterpart, masochism, would be a union between destructiveness directed inwards and sexuality - a union which makes what is otherwise an imperceptible trend into a conspicuous and tangible one.

[1930a, 4509]
But the moralist will console himself for a long time to come with the improbability of our speculations. A queer instinct indeed, directed to the destruction of its own organic home! Poets, it is true, talk of such things; but poets are irresponsible people and enjoy the privilege of poetic licence. Incidentally, such ideas are not foreign even to physiology: consider the notion, for instance, of the mucous membrane of the stomach digesting itself. It must be admitted, however, that our self-destructive instinct calls for support on a wider basis. One cannot, after all, venture on a hypothesis of such a wide range merely because a few poor fools have linked their sexual satisfaction to a peculiar condition. A more profound study of the instincts will, I believe, give us what we need. The instincts rule not only mental but also vegetative life, and these organic instincts exhibit a characteristic which deserves our deepest interest. (We shall not be able to judge until later whether it is a general characteristic of instincts.) For they reveal an effort to restore an earlier state of things. We may suppose that from the moment at which a state of things that has once been attained is upset, an instinct arises to create it afresh and brings about phenomena which we can describe as a 'compulsion to repeat'. Thus the whole of embryology is an example of the compulsion to repeat. A power of regenerating lost organs extends far up into the animal kingdom, and the instinct for recovery to which, alongside of therapeutic assistance, our cures are due must be the residue of this capacity which is so enormously developed in the lower animals. The spawning migrations of fishes, the migratory flights of birds, and possibly all that we describe as manifestations of instinct in animals, take place under the orders of the compulsion to repeat, which expresses the conservative nature of the instincts. Nor have we far to look in the mental field for its manifestations. We have been struck by the fact that the forgotten and repressed experiences of childhood are reproduced during the work of analysis in dreams and reactions, particularly in those occurring in the transference, although their revival runs counter to the interest of the pleasure principle; and we have explained this by supposing that in these cases a compulsion to repeat is overcoming even the pleasure principle. Outside analysis, too, something similar can be observed. There are people in whose lives the same reactions are perpetually being repeated uncorrected, to their own detriment, or others who seem to be pursued by a relentless fate, though closer investigation teaches us that they are unwittingly bringing this fate on themselves. In such cases we attribute a 'daemonic' character to the compulsion to repeat.
[1933a, 4710]
The determinants of women's choice of an object are often made unrecognizable by social conditions. Where the choice is able to show itself freely, it is often made in accordance with the narcissistic ideal of the man whom the girl had wished to become. If the girl has remained in her attachment to her father - that is, in the Oedipus complex - her choice is made according to the paternal type. Since, when she turned from her mother to her father, the hostility of her ambivalent relation remained with her mother, a choice of this kind should guarantee a happy marriage. But very often the outcome is of a kind that presents a general threat to such a settlement of the conflict due to ambivalence. The hostility that has been left behind follows in the train of the positive attachment and spreads over on to the new object. The woman's husband, who to begin with inherited from her father, becomes after a time her mother's heir as well. So it may easily happen that the second half of a woman's life may be filled by the struggle against her husband, just as the shorter first half was filled by her rebellion against her mother. When this reaction has been lived through, a second marriage may easily turn out very much more satisfying. Another alteration in a woman's nature, for which lovers are unprepared, may occur in a marriage after the first child is born. Under the influence of a woman's becoming a mother herself, an identification with her own mother may be revived, against which she had striven up till the time of her marriage, and this may attract all the available libido to itself, so that the compulsion to repeat reproduces an unhappy marriage between her parents. The difference in a mother's reaction to the birth of a son or a daughter shows that the old factor of lack of a penis has even now not lost its strength. A mother is only brought unlimited satisfaction by her relation to a son; this is altogether the most perfect, the most free from ambivalence of all human relationships. A mother can transfer to her son the ambition which she has been obliged to suppress in herself, and she can expect from him the satisfaction of all that has been left over in her of her masculinity complex. Even a marriage is not made secure until the wife has succeeded in making her husband her child as well and in acting as a mother to him. [1933a, 4735]

(2) Two points must be stressed in regard to the common characteristics or peculiarities of neurotic phenomena: (a) The effects of traumas are of two kinds, positive and negative. The former are attempts to bring the trauma into operation once again - that is, to remember the forgotten experience or, better still, to make it real, to experience a repetition of it anew, or, even if it was only an early emotional relationship, to revive it in an analogous relationship with someone else. We summarize these efforts under the name of 'fixations' to the trauma and as a 'compulsion to repeat'. They may be taken up into what passes as a normal ego and, as permanent trends in it, may lend it unalterable character-traits, although, or rather precisely because, their true basis and historical origin are forgotten. Thus a man who has spent his childhood in an excessive and to-day forgotten attachment to his mother, may spend his whole life looking for a wife on whom he can make himself dependent and by whom he can arrange to be nourished and supported. A girl who was made the object of a sexual seduction in her early childhood may direct her later sexual life so as constantly to provoke similar attacks. It may easily be guessed that from such discoveries about the problem of neurosis we can penetrate to an understanding of the formation of character in general. [1939a, 4901]
The instincts which watch over the destinies of these elementary organisms that survive the whole individual, which provide them with a safe shelter while they are defenceless against the stimuli of the external world, which bring about their meeting with other germ-cells, and so on - these constitute the group of the sexual instincts. They are conservative in the same sense as the other instincts in that they bring back earlier states of living substance; but they are conservative to a higher degree in that they are peculiarly resistant to external influences; and they are conservative too in another sense in that they preserve life itself for a comparatively long period.¹ They are the true life instincts. They operate against the purpose of the other instincts, which leads, by reason of their function, to death; and this fact indicates that there is an opposition between them and the other instincts, an opposition whose importance was long ago recognized by the theory of the neuroses. It is as though the life of the organism moved with a vacillating rhythm. One group of instincts rushes forward so as to reach the final aim of life as swiftly as possible; but when a particular stage in the advance has been reached, the other group jerks back to a certain point to make a fresh start and so prolong the journey. And even though it is certain that sexuality and the distinction between the sexes did not exist when life began, the possibility remains that the instincts which were later to be described as sexual may have been in operation from the very first, and it may not be true that it was only at a later time that they started upon their work of opposing the activities of the 'ego-instincts'.²

[1920g, 3742]

The upshot of our enquiry so far has been the drawing of a sharp distinction between the 'ego-instincts' and the sexual instincts, and the view that the former exercise pressure towards death and the latter towards a prolongation of life. But this conclusion is bound to be unsatisfactory in many respects even to ourselves. Moreover, it is actually only of the former group of instincts that we can predicate a conservative, or rather retrograde, character corresponding to a compulsion to repeat. For on our hypothesis the ego-instincts arise from the coming to life of inanimate matter and seek to restore the inanimate state; whereas as regards the sexual instincts, though it is true that they reproduce primitive states of the organism, what they are clearly aiming at by every possible means is the coalescence of two germ-cells which are differentiated in a particular way. If this union is not effected, the germ-cell dies along with all the other elements of the multicellular organism. It is only on this condition that the sexual function can prolong the cell's life and lend it the appearance of immortality. But what is the important event in the development of living substance which is being repeated in sexual reproduction, or in its fore-runner, the conjugation of two protista? We cannot say; and we should consequently feel relieved if the whole structure of our argument turned out to be mistaken. The opposition between the ego or death instincts and the sexual or life instincts would then cease to hold and the compulsion to repeat would no longer possess the importance we have ascribed to it.
[1920g, 3745]

But we still feel our line of thought appreciably hampered by the fact that we cannot ascribe to the sexual instinct the characteristic of a compulsion to repeat which first put us on the track of the death instincts. The sphere of embryonic developmental processes is no doubt extremely rich in such phenomena of repetition; the two germ-cells that are involved in sexual reproduction and their life history are themselves only repetitions of the beginnings of organic life. But the essence of the processes to which sexual life is directed is the coalescence of two cell-bodies. That alone is what guarantees the immortality of the living substance in the higher organisms.
[1920g, 3757]
Apart from this, science has so little to tell us about the origin of sexuality that we can liken the
textbook to a darkness into which not so much as a ray of a hypothesis has penetrated. In quite
a different region, it is true, we do meet with such a hypothesis; but it is of so fantastic a kind - a
myth rather than a scientific explanation - that I should not venture to produce it here, were it not
that it fulfils precisely the one condition whose fulfilment we desire. For it traces the origin of an
instinct to a need to restore an earlier state of things.
[1920g, 3758]

What I have in mind is, of course, the theory which Plato put into the mouth of Aristophanes in
the Symposium, and which deals not only with the origin of the sexual instinct but also with the
most important of its variations in relation to its object. "The original human nature was not like
the present, but different. In the first place, the sexes were originally three in number, not two as
they are now; there was man, woman, and the union of the two. . . ." Everything about these
primaeval men was double: they had four hands and four feet, two faces, two privy parts, and
so on. Eventually Zeus decided to cut these men in two, 'like a sorb-apple which is halved for
pickling'. After the division had been made, 'the two parts of man, each desiring his other half,
came together, and threw their arms about one another eager to grow into one'.¹
[1920g, 3758]

If it is really the case that seeking to restore an earlier state of things is such a universal
characteristic of instincts, we need not be surprised that so many processes take place in
mental life independently of the pleasure principle. This characteristic would be shared by all the
component instincts and in their case would aim at returning once more to a particular stage in
the course of development. These are matters over which the pleasure principle has as yet no
control; but it does not follow that any of them are necessarily opposed to it, and we have still to
solve the problem of the relation of the instinctual processes of repetition to the dominance of
the pleasure principle.
[1920g, 3761]

I have lately developed a view of the instincts¹ which I shall here hold to and take as the basis
of my further discussions. According to this view we have to distinguish two classes of instincts,
one of which, the sexual instincts or Eros, is by far the more conspicuous and accessible to
study. It comprises not merely the uninhibited sexual instinct proper and the instinctual impulses
of an aim-inhibited or sublimated nature derived from it, but also the self-preservative instinct,
which must be assigned to the ego and which at the beginning of our analytic work we had good
reason for contrasting with the sexual object-instincts. The second class of instincts was not so
easy to point to; in the end we came to recognize sadism as its representative. On the basis of
theoretical considerations, supported by biology, we put forward the hypothesis of a death
instinct, the task of which is to lead organic life back into the inanimate state; on the other hand,
we supposed that Eros, by bringing about a more and more far-reaching combination of the
particles into which living substance is dispersed, aims at complicating life and at the same
time, of course, at preserving it. Acting in this way, both the instincts would be conservative in
the strictest sense of the word, since both would be endeavouring to re-establish a state of
things that was disturbed by the emergence of life. The emergence of life would thus be the
cause of the continuance of life and also at the same time of the striving towards death; and life
itself would be a conflict and compromise between these two trends. The problem of the origin
of life would remain a cosmological one; and the problem of the goal and purpose of life would
be answered dualistically.
[1923b, 3974]
You may perhaps shrug your shoulders and say: 'That isn't natural science, it's Schopenhauer's philosophy!' But, Ladies and Gentlemen, why should not a bold thinker have guessed something that is afterwards confirmed by sober and painstaking detailed research? Moreover, there is nothing that has not been said already, and similar things had been said by many people before Schopenhauer. Furthermore, what we are saying is not even genuine Schopenhauer. We are not asserting that death is the only aim of life; we are not overlooking the fact that there is life as well as death. We recognize two basic instincts and give each of them its own aim. How the two of them are mingled in the process of living, how the death instinct is made to serve the purposes of Eros, especially by being turned outwards as aggressiveness - these are tasks which are left to future investigation. We have not gone beyond the point at which this prospect lies open before us. The question, too, of whether the conservative character may not belong to all instincts without exception, whether the erotic instincts as well may not be seeking to bring back an earlier state of things when they strive to bring about a synthesis of living things into greater unities - this question, too, we must leave unanswered.

[1933a, 4711]

The forces which we assume to exist behind the tensions caused by the needs of the id are called instincts. They represent the somatic demands upon the mind. Though they are the ultimate cause of all activity, they are of a conservative nature; the state, whatever it may be, which an organism has reached gives rise to a tendency to re-establish that state so soon as it has been abandoned. It is thus possible to distinguish an indeterminate number of instincts, and in common practice this is in fact done. For us, however, the important question arises whether it may not be possible to trace all these numerous instincts back to a few basic ones. We have found that instincts can change their aim (by displacement) and also that they can replace one another - the energy of one instinct passing over to another. This latter process is still insufficiently understood. After long hesitations and vacillations we have decided to assume the existence of only two basic instincts, Eros and the destructive instinct. (The contrast between the instincts of self-preservation and the preservation of the species, as well as the contrast between ego-love and object-love, fall within Eros.) The aim of the first of these basic instincts is to establish ever greater unities and to preserve them thus - in short, to bind together; the aim of the second is, on the contrary, to undo connections and so to destroy things. In the case of the destructive instinct we may suppose that its final aim is to lead what is living into an inorganic state. For this reason we also call it the death instinct. If we assume that living things came later than inanimate ones and arose from them, then the death instinct fits in with the formula we have proposed to the effect that instincts tend towards a return to an earlier state. In the case of Eros (or the love instinct) we cannot apply this formula. To do so would presuppose that living substance was once a unity which had later been torn apart and was now striving towards reunion.

[1940a [1938], 4959]

¹ Creative writers have imagined something of the sort, but nothing like it is known to us from the actual history of living substance.

[1940a [1938], 4959]
Let us suppose, then, that all the organic instincts are conservative, are acquired historically and tend towards the restoration of an earlier state of things. It follows that the phenomena of organic development must be attributed to external disturbing and diverting influences. The elementary living entity would from its very beginning have had no wish to change; if conditions remained the same, it would do no more than constantly repeat the same course of life. In the last resort, what has left its mark on the development of organisms must be the history of the earth we live in and of its relation to the sun. Every modification which is thus imposed upon the course of the organism's life is accepted by the conservative organic instincts and stored up for further repetition. Those instincts are therefore bound to give a deceptive appearance of being forces tending towards change and progress, whilst in fact they are merely seeking to reach an ancient goal by paths alike old and new. Moreover it is possible to specify this final goal of all organic striving. It would be in contradiction to the conservative nature of the instincts if the goal of life were a state of things which had never yet been attained. On the contrary, it must be an old state of things, an initial state from which the living entity has at one time or other departed and to which it is striving to return by the circuitous paths along which its development leads. If we are to take it as a truth that knows no exception that everything living dies for internal reasons - becomes inorganic once again - then we shall be compelled to say that 'the aim of life is death' and, looking backwards, that 'inanimate things existed before living ones'.

The upshot of our enquiry so far has been the drawing of a sharp distinction between the 'ego-instincts' and the sexual instincts, and the view that the former exercise pressure towards death and the latter towards a prolongation of life. But this conclusion is bound to be unsatisfactory in many respects even to ourselves. Moreover, it is actually only of the former group of instincts that we can predicate a conservative, or rather retrograde, character corresponding to a compulsion to repeat. For on our hypothesis the ego-instincts arise from the coming to life of inanimate matter and seek to restore the inanimate state; whereas as regards the sexual instincts, though it is true that they reproduce primitive states of the organism, what they are clearly aiming at by every possible means is the coalescence of two germ-cells which are differentiated in a particular way. If this union is not effected, the germ-cell dies along with all the other elements of the multicellular organism. It is only on this condition that the sexual function can prolong the cell's life and lend it the appearance of immortality. But what is the important event in the development of living substance which is being repeated in sexual reproduction, or in its fore-runner, the conjugation of two protista? We cannot say; and we should consequently feel relieved if the whole structure of our argument turned out to be mistaken. The opposition between the ego or death instincts and the sexual or life instincts would then cease to hold and the compulsion to repeat would no longer possess the importance we have ascribed to it.

But we still feel our line of thought appreciably hampered by the fact that we cannot ascribe to the sexual instinct the characteristic of a compulsion to repeat which first put us on the track of the death instincts. The sphere of embryonic developmental processes is no doubt extremely rich in such phenomena of repetition; the two germ-cells that are involved in sexual reproduction and their life history are themselves only repetitions of the beginnings of organic life. But the essence of the processes to which sexual life is directed is the coalescence of two cell-bodies. That alone is what guarantees the immortality of the living substance in the higher organisms.
If it is really the case that seeking to restore an earlier state of things is such a universal characteristic of instincts, we need not be surprised that so many processes take place in mental life independently of the pleasure principle. This characteristic would be shared by all the component instincts and in their case would aim at returning once more to a particular stage in the course of development. These are matters over which the pleasure principle has as yet no control; but it does not follow that any of them are necessarily opposed to it, and we have still to solve the problem of the relation of the instinctual processes of repetition to the dominance of the pleasure principle.

[1920g, 3761]

I have lately developed a view of the instincts¹ which I shall here hold to and take as the basis of my further discussions. According to this view we have to distinguish two classes of instincts, one of which, the sexual instincts or Eros, is by far the more conspicuous and accessible to study. It comprises not merely the uninhibited sexual instinct proper and the instinctual impulses of an aim-inhibited or sublimated nature derived from it, but also the self-preservative instinct, which must be assigned to the ego and which at the beginning of our analytic work we had good reason for contrasting with the sexual object-instincts. The second class of instincts was not so easy to point to; in the end we came to recognize sadism as its representative. On the basis of theoretical considerations, supported by biology, we put forward the hypothesis of a death instinct, the task of which is to lead organic life back into the inanimate state; on the other hand, we supposed that Eros, by bringing about a more and more far-reaching combination of the particles into which living substance is dispersed, aims at complicating life and at the same time, of course, at preserving it. Acting in this way, both the instincts would be conservative in the strictest sense of the word, since both would be endeavouring to re-establish a state of things that was disturbed by the emergence of life. The emergence of life would thus be the cause of the continuance of life and also at the same time of the striving towards death; and life itself would be a conflict and compromise between these two trends. The problem of the origin of life would remain a cosmological one; and the problem of the goal and purpose of life would be answered dualistically.

[1923b, 3974]

In the works of my later years (Beyond the Pleasure Principle, Group Psychology and the Analysis of the Ego, and The Ego and the Id), I have given free rein to the inclination, which I kept down for so long, to speculation, and I have also contemplated a new solution of the problem of the instincts. I have combined the instincts for self-preservation and for the preservation of the species under the concept of Eros and have contrasted with it an instinct of death or destruction which works in silence. Instinct in general is regarded as a kind of elasticity of living things, an impulsion towards the restoration of a situation which once existed but was brought to an end by some external disturbance. This essentially conservative character of instincts is exemplified by the phenomena of the compulsion to repeat. The picture which life presents to us is the result of the concurrent and mutually opposing action of Eros and the death instinct.

[1925d, 4232]
But how can this conservative characteristic of instincts help us to understand our self-destructiveness? What earlier state of things does an instinct such as this want to restore? Well, the answer is not far to seek and opens wide perspectives. If it is true that - at some immeasurably remote time and in a manner we cannot conceive - life once proceeded out of inorganic matter, then, according to our presumption, an instinct must have arisen which sought to do away with life once more and to re-establish the inorganic state. If we recognize in this instinct the self-destructiveness of our hypothesis, we may regard the self-destructiveness as an expression of a ‘death instinct’ which cannot fail to be present in every vital process. And now the instincts that we believe in divide themselves into two groups - the erotic instincts, which seek to combine more and more living substance into ever greater unities, and the death instincts, which oppose this effort and lead what is living back into an inorganic state. From the concurrent and opposing action of these two proceed the phenomena of life which are brought to an end by death. [1933a, 4711]

The forces which we assume to exist behind the tensions caused by the needs of the id are called instincts. They represent the somatic demands upon the mind. Though they are the ultimate cause of all activity, they are of a conservative nature; the state, whatever it may be, which an organism has reached gives rise to a tendency to re-establish that state so soon as it has been abandoned. It is thus possible to distinguish an indeterminate number of instincts, and in common practice this is in fact done. For us, however, the important question arises whether it may not be possible to trace all these numerous instincts back to a few basic ones. We have found that instincts can change their aim (by displacement) and also that they can replace one another - the energy of one instinct passing over to another. This latter process is still insufficiently understood. After long hesitancies and vacillations we have decided to assume the existence of only two basic instincts, Eros and the destructive instinct. (The contrast between the instincts of self-preservation and the preservation of the species, as well as the contrast between ego-love and object-love, fall within Eros.) The aim of the first of these basic instincts is to establish ever greater unities and to preserve them thus - in short, to bind together; the aim of the second is, on the contrary, to undo connections and so to destroy things. In the case of the destructive instinct we may suppose that its final aim is to lead what is living into an inorganic state. For this reason we also call it the death instinct. If we assume that living things came later than inanimate ones and arose from them, then the death instinct fits in with the formula we have proposed to the effect that instincts tend towards a return to an earlier state. In the case of Eros (or the love instinct) we cannot apply this formula. To do so would presuppose that living substance was once a unity which had later been torn apart and was now striving towards re-union.¹ [1940a [1938], 4959]
(3) A third consideration which arises from the views that have been developed in these pages is as follows. Are we to suppose that a general detachment of the libido from the external world would be an effective enough agent to account for the 'end of the world'? Or would not the ego-cathexes which still remained in existence have been sufficient to maintain rapport with the external world? To meet this difficulty we should either have to assume that what we call libidinal cathexis (that is, interest emanating from erotic sources) coincides with interest in general, or we should have to consider the possibility that a very widespread disturbance in the distribution of libido may bring about a corresponding disturbance in the ego-cathexes. But these are problems which we are still quite helpless and incompetent to solve. It would be otherwise if we could start out from some well-grounded theory of instincts; but in fact we have nothing of the kind at our disposal. We regard instinct as being the concept on the frontier-line between the somatic and the mental, and see in it the psychical representative of organic forces. Further, we accept the popular distinction between ego-instincts and a sexual instinct; for such a distinction seems to agree with the biological conception that the individual has a double orientation, aiming on the one hand at self-preservation and on the other at the preservation of the species. But beyond this are only hypotheses, which we have taken up - and are quite ready to drop again - in order to help us to find our bearings in the chaos of the obscurer processes of the mind. What we expect from psycho-analytic investigations of pathological mental processes is precisely that they shall drive us to some conclusions on questions connected with the theory of instincts. These investigations, however, are in their infancy and are only being carried out by isolated workers, so that the hopes we place in them must still remain unfulfilled. We can no more dismiss the possibility that disturbances of the libido may react upon the ego-cathexes than we can overlook the converse possibility - namely, that a secondary or induced disturbance of the libidinal processes may result from abnormal changes in the ego. Indeed, it is probable that processes of this kind constitute the distinctive characteristic of psychoses. How much of all this may apply to paranoia it is impossible at present to say. There is one consideration, however, on which I should like to lay stress. It cannot be asserted that a paranoic, even at the height of the repression, withdraws his interest from the external world completely - as must be considered to occur in certain other kinds of hallucinatory psychosis (such a Meynert's amentia). The paranoic perceives the external world and takes into account any alterations that may happen in it, and the effect it makes upon him stimulates him to invent explanatory theories (such as Schreber's 'cursorily improvised men'). It therefore appears to me far more probable that the paranoic's altered relation to the world is to be explained entirely or in the main by the loss of his libidinal interest.

[1911c, 2440]

These lectures were delivered in 1916 and 1917; they gave a fairly accurate account of the position of the young science at that period and they contained more than their title indicated. They provided not only an introduction to psycho-analysis but covered the greater part of its subject-matter. This is naturally no longer true. Advances have in the meantime taken place in its theory and important additions have been made to it, such as the division of the personality into an ego, a super-ego and an id, a radical alteration in the theory of the instincts, and discoveries concerning the origin of conscience and the sense of guilt. These lectures have thus become to a large extent incomplete; it is in fact only now that they have become truly 'introductory'. But in another sense, even to-day they have not been superseded or become obsolete. What they contain is still believed and taught, apart from a few modifications, in psycho-analytic training schools.

[1916-1917, 3127]
Shortly before I wrote this study it seemed as though my life would soon be brought to an end by the recurrence of a malignant disease; but surgical skill saved me in 1923 and I was able to continue my life and my work, though no longer in freedom from pain. In the period of more than ten years that has passed since then, I have never ceased my analytic work nor my writing - as is proved by the completion of the twelfth volume of the German edition of my collected works. But I myself find that a significant change has come about. Threads which in the course of my development had become intertangled have now begun to separate; interests which I had acquired in the later part of my life have receded, while the older and original ones become prominent once more. It is true that in this last decade I have carried out some important pieces of analytic work, such as the revision of the problem of anxiety in my book Inhibitions, Symptoms and Anxiety (1926d) or the simple explanation of sexual 'fetishism' which I was able to make a year later (1927e). Nevertheless it would be true to say that, since I put forward my hypothesis of the existence of two classes of instinct (Eros and the death instinct) and since I proposed a division of the mental personality into an ego, a super-ego, and an id (1923b), I have made no further decisive contributions to psycho-analysis: what I have written on the subject since then has been either unessential or would soon have been supplied by someone else. This circumstance is connected with an alteration in myself, with what might be described as a phase of regressive development. My interest, after making a lifelong détour through the natural sciences, medicine and psychotherapy, returned to the cultural problems which had fascinated me long before, when I was a youth scarcely old enough for thinking. At the very climax of my psycho-analytic work, in 1912, I had already attempted in Totem and Taboo to make use of the newly discovered findings of analysis in order to investigate the origins of religion and morality. I now carried this work a stage further in two later essays, The Future of an Illusion (1927c) and Civilization and its Discontents (1930a). I perceived ever more clearly that the events of human history, the interactions between human nature, cultural development and the precipitates of primeval experiences (the most prominent example of which is religion) are no more than a reflection of the dynamic conflicts between the ego, the id and the super-ego, which psycho-analysis studies in the individual - are the very same processes repeated upon a wider stage. In The Future of an Illusion I expressed an essentially negative valuation of religion. Later, I found a formula which did better justice to it: while granting that its power lies in the truth which it contains, I showed that that truth was not a material but a historical truth.

In none of my previous writings have I had so strong a feeling as now that what I am describing is common knowledge and that I am using up paper and ink and, in due course, the compositor's and printer's work and material in order to expound things which are, in fact, self-evident. For that reason I should be glad to seize the point if it were to appear that the recognition of a special, independent aggressive instinct means an alteration of the psycho-analytic theory of the instincts.

[1925d, 4244]

[1930a, 4508]
We shall see, however, that this is not so and that it is merely a matter of bringing into sharper focus a turn of thought arrived at long ago and of following out its consequences. Of all the slowly developed parts of analytic theory, the theory of the instincts is the one that has felt its way the most painfully forward. And yet that theory was so indispensable to the whole structure that something had to be put in its place. In what was at first my utter perplexity, I took as my starting-point a saying of the poet-philosopher, Schiller, that ‘hunger and love are what moves the world’. Hunger could be taken to represent the instincts which aim at preserving the individual; while love strives after objects, and its chief function, favoured in every way by nature, is the preservation of the species. Thus, to begin with, ego-instincts and object-instincts confronted each other. It was to denote the energy of the latter and only the latter instinct that I introduced the term ‘libido’. Thus the antithesis was between the ego-instincts and the ‘libidinal’ instincts of love (in its widest sense) which were directed to an object. One of these object-instincts, the sadistic instinct, stood out from the rest, it is true, in that its aim was so very far from being loving. Moreover it was obviously in some respects attached to the ego-instincts: it could not hide its close affinity with instincts of mastery which have no libidinal purpose. But these discrepancies were got over; after all, sadism was clearly a part of sexual life, in the activities of which affection could be replaced by cruelty. Neurosis was regarded as the outcome of a struggle between the interest of self-preservation and the demands of the libido, a struggle in which the ego had been victorious but at the price of severe sufferings and renunciations.

[1930a, 4508]
Every analyst will admit that even to-day this view has not the sound of a long-discarded error. Nevertheless, alterations in it became essential, as our enquiries advanced from the repressed to the repressing forces, from the object-instincts to the ego. The decisive step forward was the introduction of the concept of narcissism - that is to say, the discovery that the ego itself is cathexed with libido, that the ego, indeed, is the libido's original home, and remains to some extent its headquarters. This narcissistic libido turns towards objects, and thus becomes object-libido; and it can change back into narcissistic libido once more. The concept of narcissism made it possible to obtain an analytic understanding of the traumatic neuroses and of many of the affections bordering on the psychoses, as well as of the latter themselves. It was not necessary to give up our interpretation of the transference neuroses as attempts made by the ego to defend itself against sexuality; but the concept of libido was endangered. Since the ego-instincts, too, were libidinal, it seemed for a time inevitable that we should make libido coincide with instinctual energy in general, as C. G. Jung had already advocated earlier. Nevertheless, there still remained in me a kind of conviction, for which I was not as yet able to find reasons, that the instincts could not all be of the same kind. My next step was taken in Beyond the Pleasure Principle (1920), when the compulsion to repeat and the conservative character of instinctual life first attracted my attention. Starting from speculations on the beginning of life and from biological parallels, I drew the conclusion that, besides the instinct to preserve living substance and to join it into ever larger units,¹ there must exist another, contrary instinct seeking to dissolve those units and to bring them back to their primaeval, inorganic state. That is to say, as well as Eros there was an instinct of death. The phenomena of life could be explained from the concurrent or mutually opposing action of these two instincts. It was not easy, however, to demonstrate the activities of this supposed death instinct. The manifestations of Eros were conspicuous and noisy enough. It might be assumed that the death instinct operated silently within the organism towards its dissolution, but that, of course, was no proof. A more fruitful idea was that a portion of the instinct is diverted towards the external world and comes to light as an instinct of aggressiveness and destructiveness. In this way the instinct itself could be pressed into the service of Eros, in that the organism was destroying some other thing, whether animate or inanimate, instead of destroying its own self. Conversely, any restriction of this aggressiveness directed outwards would be bound to increase the self-destruction, which is in any case proceeding. At the same time one can suspect from this example that the two kinds of instinct seldom - perhaps never - appear in isolation from each other, but are alloyed with each other in varying and very different proportions and so become unrecognizable to our judgement. In sadism, long since known to us as a component instinct of sexuality, we should have before us a particularly strong alloy of this kind between trends of love and the destructive instinct; while its counterpart, masochism, would be a union between destructiveness directed inwards and sexuality - a union which makes what is otherwise an imperceptible trend into a conspicuous and tangible one.

[1930a, 4509]
The assumption of the existence of an instinct of death or destruction has met with resistance even in analytic circles; I am aware that there is a frequent inclination rather to ascribe whatever is dangerous and hostile in love to an original bipolarity in its own nature. To begin with it was only tentatively that I put forward the views I have developed here, but in the course of time they have gained such a hold upon me that I can no longer think in any other way. To my mind, they are far more serviceable from a theoretical standpoint than any other possible ones; they provide that simplification, without either ignoring or doing violence to the facts, for which we strive in scientific work. I know that in sadism and masochism we have always seen before us manifestations of the destructive instinct (directed outwards and inwards), strongly alloyed with erotism; but I can no longer understand how we can have overlooked the ubiquity of non-erotic aggressivity and destructiveness and can have failed to give it its due place in our interpretation of life. (The desire for destruction when it is directed *inwards* mostly eludes our perception, of course, unless it is tinged with erotism.) I remember my own defensive attitude when the idea of an instinct of destruction first emerged in psycho-analytic literature, and how long it took before I became receptive to it. That others should have shown, and still show, the same attitude of rejection surprises me less. For 'little children do not like it' when there is talk of the inborn human inclination to 'badness', to aggressiveness and destructiveness, and so to cruelty as well. God has made them in the image of His own perfection; nobody wants to be reminded how hard it is to reconcile the undeniable existence of evil - despite the protestations of Christian Science - with His all-powerfulness or His all-goodness. The Devil would be the best way out as an excuse for God; in that way he would be playing the same part as an agent of economic discharge as the Jew does in the world of the Aryan ideal. But even so, one can hold God responsible for the existence of the Devil just as well as for the existence of the wickedness which the Devil embodies. In view of these difficulties, each of us will be well advised, on some suitable occasion, to make a low bow to the deeply moral nature of mankind; it will help us to be generally popular and much will be forgiven us for it.¹

[1930a, 4510]
If, then, as we have learnt, psychogenic disturbances of vision depend on certain ideas connected with seeing being cut off from consciousness, we must, on the psycho-analytic view, assume that these ideas have come into opposition to other, more powerful ones, for which we use the collective concept of the 'ego'- a compound which is made up variously at different times - and have for that reason come under repression. But what can be the origin of this opposition, which makes for repression, between the ego and various groups of ideas? You will no doubt notice that it was not possible to frame such a question before the advent of psycho-analysis, for nothing was known earlier of psychical conflict and repression. Our researches, however, have put us in a position to give us the desired answer. Our attention has been drawn to the importance of the instincts in ideational life. We have discovered that every instinct tries to make itself effective by activating ideas that are in keeping with its aims. These instincts are not always compatible with one another; their interests often come into conflict. Opposition between ideas is only an expression of struggles between the various instincts. From the point of view of our attempted explanation, a quite specially important part is played by the undeniable opposition between the instincts which subserve sexuality, the attainment of sexual pleasure, and those other instincts, which have as their aim the self-preservation of the individual - the ego-instincts. As the poet has said, all the organic instincts that operate in our mind may be classified as 'hunger' or 'love'. We have traced the 'sexual instinct' from its first manifestations in children to its final form, which is described as 'normal'. We have found that it is put together from numerous 'component instincts' which are attached to excitations of regions of the body; and we have come to see that these separate instincts have to pass through a complicated development before they can be brought effectively to serve the aims of reproduction. The light thrown by psychology on the evolution of our civilization has shown us that it originates mainly at the cost of the sexual component instincts, and that these must be suppressed, restricted, transformed and directed to higher aims, in order that the mental constructions of civilization may be established. We have been able to recognize as a valuable outcome of these researches something that our colleagues have not yet been willing to believe, namely that the human ailments known as 'neuroses' are derived from the many different ways in which these processes of transformation in the sexual component instincts may miscarry. The 'ego' feels threatened by the claims of the sexual instincts and fends them off by repressions; these, however, do not always have the desired result, but lead to the formation of dangerous substitutes for the repressed and to burdensome reactions on the part of the ego. From these two classes of phenomena taken together there emerge what we call the symptoms of neuroses.

[1910i, 2368]
A third consideration which arises from the views that have been developed in these pages is as follows. Are we to suppose that a general detachment of the libido from the external world would be an effective enough agent to account for the ‘end of the world’? Or would not the ego-cathexes which still remained in existence have been sufficient to maintain rapport with the external world? To meet this difficulty we should either have to assume that what we call libidinal cathexis (that is, interest emanating from erotic sources) coincides with interest in general, or we should have to consider the possibility that a very widespread disturbance in the distribution of libido may bring about a corresponding disturbance in the ego-cathexes. But these are problems which we are still quite helpless and incompetent to solve. It would be otherwise if we could start out from some well-grounded theory of instincts; but in fact we have nothing of the kind at our disposal. We regard instinct as being the concept on the frontier-line between the somatic and the mental, and see in it the psychical representative of organic forces. Further, we accept the popular distinction between ego-instincts and a sexual instinct; for such a distinction seems to agree with the biological conception that the individual has a double orientation, aiming on the one hand at self-preservation and on the other at the preservation of the species. But beyond this are only hypotheses, which we have taken up - and are quite ready to drop again - in order to help us to find our bearings in the chaos of the obscurer processes of the mind. What we expect from psycho-analytic investigations of pathological mental processes is precisely that they shall drive us to some conclusions on questions connected with the theory of instincts. These investigations, however, are in their infancy and are only being carried out by isolated workers, so that the hopes we place in them must still remain unfulfilled. We can no more dismiss the possibility that disturbances of the libido may react upon the ego-cathexes than we can overlook the converse possibility - namely, that a secondary or induced disturbance of the libidinal processes may result from abnormal changes in the ego. Indeed, it is probable that processes of this kind constitute the distinctive characteristic of psychoses. How much of all this may apply to paranoia it is impossible at present to say. There is one consideration, however, on which I should like to lay stress. It cannot be asserted that a paranoic, even at the height of the repression, withdraws his interest from the external world completely - as must be considered to occur in certain other kinds of hallucinatory psychosis (such a Meynert’s amentia). The paranoic perceives the external world and takes into account any alterations that may happen in it, and the effect it makes upon him stimulates him to invent explanatory theories (such as Schreber's ‘cursorily improvised men’). It therefore appears to me far more probable that the paranoic’s altered relation to the world is to be explained entirely or in the main by the loss of his libidinal interest.

But what are the powers from which the objection to the libidinal trend arises? What is the other party to the pathogenic conflict? These powers, to put it quite generally, are the non-sexual instinctual forces. We class them together as the ‘ego instincts’. The psycho-analysis of the transference-neuroses gives us no easy access to a further dissecting of them; at most we come to know them to some extent by the resistances which oppose analysis. The pathogenic conflict is thus one between the ego-instincts and the sexual instincts. In a whole number of cases, it looks as though there might also be a conflict between different purely sexual trends. But in essence that is the same thing; for, of the two sexual trends that are in conflict, one is always, as we might say, ‘ego-syntonic’, while the other provokes the ego’s defence. It therefore still remains a conflict between the ego and sexuality.
Over and over again, Gentlemen, when psycho-analysis has claimed that some mental event is the product of the sexual instincts, it has been angrily pointed out to it by way of defence that human beings do not consist only of sexuality, that there are instincts and interests in mental life other than sexual ones, that it ought not to derive ‘everything’ from sexuality, and so on. Well, it is most gratifying for once in a way to find ourselves in agreement with our opponents. Psycho-analysis has never forgotten that there are instinctual forces as well which are not sexual. It was based on a sharp distinction between the sexual instincts and the ego-instincts, and, in spite of all objections, it has maintained not that the neuroses are derived from sexuality but that their origin is due to a conflict between the ego and sexuality. Nor has it any conceivable reason for disputing the existence or significance of the ego-instincts while it pursues the part played by the sexual instincts in illness and in ordinary life. It has simply been its fate to begin by concerning itself with the sexual instincts because the transference neuroses made them the most easily accessible to examination and because it was incumbent on it to study what other people had neglected. [1916-1917, 3412]

I will dwell for a little to-day on yet another point in ego development, partly because I have some remoter aims in view, but also because what follows is precisely calculated to justify the sharp separation between the ego-instincts and the sexual instincts which we favour but which is not self-evident. In forming our judgement of the two courses of development both of the ego and of the libido - we must lay emphasis on a consideration which has not often hitherto been taken into account. For both of them are at bottom heritages, abbreviated recapitulations of the development which all mankind has passed through from its primaeval days over long periods of time. In the case of the development of the libido, this phylogenetic origin is, I venture to think, immediately obvious. Consider how in one class of animals the genital apparatus is brought into the closest relation to the mouth, while in another it cannot be distinguished from the excretory apparatus, and in yet others it is linked to the motor organs - all of which you will find attractively set out in W. Bölsche's valuable book. Among animals one can find, so to speak in petrified form, every species of perversion of the sexual organization. In the case of human beings, however, this phylogenetic point of view is partly veiled by the fact that what is at bottom inherited is nevertheless freshly acquired in the development of the individual, probably because the same conditions which originally necessitated its acquisition persist and continue to operate upon each individual. I should like to add that originally the operation of these conditions was creative but that it is now evocative. Besides this, there is no doubt that the prescribed course of development can be disturbed and altered in each individual by recent external influences. But we know the power which forced a development of this kind upon humanity and maintains its pressure in the same direction to-day. It is, once again, frustration by reality, or, if we are to give it its true, grand name, the pressure of vital needs - Necessity \(\text{(Άνάγκη)}\). She has been a strict educator and has made much out of us. The neurotics are among those of her children to whom her strictness has brought evil results; but that is a risk with all education. This appreciation of the necessities of life need not, incidentally, weigh against the importance, of 'internal developmental trends', if such can be shown to be present. [1916-1917, 3414]
In order to appreciate the full significance of the difference which I have pointed out between the two groups of instincts, we shall have to go back a long way and introduce one of those considerations which deserve to be described as economic. This leads us to one of the most important, but unluckily also one of the most obscure, regions of psycho-analysis. We may ask whether in the operation of our mental apparatus a main purpose can be detected, and we may reply as a first approximation that that purpose is directed to obtaining pleasure. It seems as though our total mental activity is directed towards achieving pleasure and avoiding unpleasure - that it is automatically regulated by the pleasure principle. We should of all things like to know, then, what determines the generation of pleasure and unpleasure; but that is just what we are ignorant of. We can only venture to say this much: that pleasure is in some way connected with the diminution, reduction or extinction of the amounts of stimulus prevailing in the mental apparatus, and that similarly unpleasure is connected with their increase. An examination of the most intense pleasure which is accessible to human beings, the pleasure of accomplishing the sexual act, leaves little doubt on this point. Since in such processes related to pleasure it is a question of what happens to quantities of mental excitation or energy, we call considerations of this kind economic. It will be noticed that we can describe the tasks and achievements of the mental apparatus in another and more general way than by stressing the acquisition of pleasure. We can say that the mental apparatus serves the purpose of mastering and disposing of the amounts of stimulus and sums of excitation that impinge on it from outside and inside. It is immediately obvious that the sexual instincts, from beginning to end of their development, work towards obtaining pleasure; they retain their original function unaltered. The other instincts, the ego-instincts, have the same aim to start with. But under the influence of the instructress Necessity, they soon learn to replace the pleasure principle by a modification of it. For them the task of avoiding unpleasure turns out to be almost as important as that of obtaining pleasure. The ego discovers that it is inevitable for it to renounce immediate satisfaction, to postpone the obtaining of pleasure, to put up with a little unpleasure and to abandon certain sources of pleasure altogether. An ego thus educated has become 'reasonable'; it no longer lets itself be governed by the pleasure principle, but obeys the reality principle, which also at bottom seeks to obtain pleasure, but pleasure which is assured through taking account of reality, even though it is pleasure postponed and diminished.

LADIES AND GENTLEMEN, - We have repeatedly (and only recently once again) had to deal with the distinction between the ego-instincts and the sexual instincts. In the first place, repression showed us that the two can come into opposition to each other, that the sexual instincts are then ostensibly subdued and are obliged to find satisfaction for themselves along regressive and roundabout paths, and that in doing so they are able to find compensation for their defeat in their indomitability. We next learnt that the two kinds of instincts are from the first differently related to Necessity the educator, so that their course of development is not the same and they do not enter into the same connection with the reality principle. Lastly, we seem to have found that the sexual instincts are linked by much closer bonds than the ego-instincts to the affective state of anxiety - a conclusion which seems incomplete in only one important respect. In order to establish it more firmly, therefore, I will bring forward the further noteworthy fact that if hunger and thirst (the two most elementary self-preservative instincts) are unsatisfied, the result is never their transformation into anxiety, whereas the changing of unsatisfied libido into anxiety is, as we have seen, among the best known and most frequently observed of phenomena.

[1916-1917, 3415]

[1916-1917, 3458]
Our right to separate the ego-instincts from the sexual ones cannot, no doubt, be shaken: it is implied in the existence of sexual life as a distinct activity of the individual. The only question is what importance we attribute to this separation, how deep-going we wish to consider it. The answer to this question, however, will be guided by how far we are able to establish the extent to which the sexual instincts behave differently in their somatic and mental manifestations from the others which we are contrasting with them, and how important the consequences are which arise from those differences. Moreover, we have, of course, no motive for asserting an essential difference between the two groups of instincts which is not plainly appreciable. Both of them come before us merely as designations of sources of energy in the individual, and the discussion as to whether they are fundamentally one or essentially different and as to when, if they are one, they became separate from each other - this discussion cannot be conducted on the basis of the connotation of the terms but must keep to the biological facts lying behind them. At the moment we know too little about these, and even if we knew more it would have no relevance for our analytic task.

[1916-1917, 3458]

In my opinion, therefore, the question of how we are to carry the undoubtedly justifiable separation between the sexual and self-preservation instincts is not of much importance for psycho-analysis. Nor is psycho-analysis competent to answer the question. Biology, however, offers a number of suggestive possibilities which speak in favour of the distinction having some importance. Sexuality is, indeed, the single function of the living organism which extends beyond the individual and is concerned with his relation to the species. It is an unmistakable fact that it does not always, like the individual organism's other functions, bring it advantages, but, in return for an unusually high degree of pleasure, brings dangers which threaten the individual's life and often enough destroy it. It is probable, too, that quite special metabolic processes are necessary, differing from all others, in order to maintain a portion of the individual life as a disposition for its descendants. And finally, the individual organism, which regards itself as the main thing and its sexuality as a means, like any other, for its own satisfaction, is from the point of view of biology only an episode in a succession of generations, a short-lived appendage to a germ-plasm endowed with virtual immortality - like the temporary holder of an entail which will outlast him.

[1916-1917, 3459]

The psycho-analytic explanation of the neuroses does not, however, call for such far-ranging considerations. The separate following-up of the sexual and ego-instincts has helped us to find the key to an understanding of the group of transference neuroses. We have been able to trace them back to the basic situation in which the sexual instincts have come into a dispute with the self-preservation instincts, or, to put it in biological (though less precise) terms, a situation in which one aspect of the ego, as an independent individual organism, comes into conflict with its other aspect, as a member of a succession of generations. A dissension of this kind may perhaps only occur in human beings, and on that account neurosis may, generally speaking, constitute their prerogative over the animals. The excessive development of their libido and - what is perhaps made possible precisely by that - their development of a richly articulated mental life seem to have created the determinants for the occurrence of such a conflict. It is at once obvious that these are also the determinants for the great advances that human beings have made beyond what they have in common with the animals; so that their susceptibility to neurosis would only be the reverse side of their other endowments. But these too are only speculations, which are diverting us from our immediate task.

[1916-1917, 3460]
Hitherto it has been a premiss of our work that we can distinguish the ego-instincts from the sexual ones by their manifestations. With the transference neuroses this could be done without difficulty. We termed the cathexes of energy which the ego directs towards the objects of its sexual desires 'libido'; all the others, which are sent out by the self-preservative instincts, we termed 'interest'. By tracing the course of the libidinal cathexes, their transformations and final vicissitudes, we were able to obtain a first insight into the machinery of the mental forces. For this purpose the transference neuroses offered us the most favourable material. But the ego, its composition out of various organizations and their construction and mode of functioning, remained hidden from us; and we were driven to suspect that only the analysis of other neurotic disorders would be able to bring us the necessary insight.

[1916-1917, 3460]

Here is my reply. Your first objection sounds well enough. Consideration of the states of sleep, of illness and of being in love in themselves would probably never have led us to distinguish an ego-libido from an object-libido or libido from interest. But there you are neglecting the investigations from which we started and in the light of which we now look at the mental situations under discussion. The differentiation between libido and interest - that is to say, between the sexual and the self-preservative instincts - was forced upon us by our discovery of the conflict out of which the transference neuroses arise. Since then we cannot give it up. The hypothesis that object-libido can be transformed into ego-libido, that we must therefore take an ego-libido into account, seems to us the only one which is able to resolve the enigma of what are termed the narcissistic neuroses - dementia praecox, for instance - and to account for the resemblances and dissimilarities between them and hysteria or obsessions. We are now applying to illness, sleep and being in love what we have elsewhere found inescapably established. We should proceed further with applications of this kind and see where they will take us to. The only thesis which is not an immediate precipitate of our analytic experience is to the effect that libido remains libido, whether it is directed to objects or to one's own ego, and never turns into egoistic interest, and the converse is also true. This thesis, however, is equivalent to the separation between the sexual and ego-instincts which we have already considered critically and to which we shall continue to hold for heuristic reasons until its possible collapse.

[1916-1917, 3465]

It is open to us to make our first soundings as we please. The popular view distinguishes between hunger and love, as being the representatives of the instincts which aim respectively at the preservation of the individual and at the reproduction of the species. We accept this very evident distinction, so that in psycho-analysis too we make a distinction between the self-preservative or ego-instincts on the one hand and the sexual instincts on the other. The force by which the sexual instinct is represented in the mind we call 'libido' - sexual desire - and we regard it as something analogous to hunger, the will to power, and so on, where the ego-instincts are concerned.

[1917a, 3608]
The implications in regard to the great groups of instincts which, as we believe, lie behind the phenomena of life in organisms must appear no less bewildering. The hypothesis of self-preservation instincts, such as we attribute to all living beings, stands in marked opposition to the idea that instinctual life as a whole serves to bring about death. Seen in this light, the theoretical importance of the instincts of self-preservation, of self-assertion and of mastery greatly diminishes. They are component instincts whose function it is to assure that the organism shall follow its own path to death, and to ward off any possible ways of returning to inorganic existence other than those which are immanent in the organism itself. We have no longer to reckon with the organism's puzzling determination (so hard to fit into any context) to maintain its own existence in the face of every obstacle. What we are left with is the fact that the organism wishes to die only in its own fashion. Thus these guardians of life, too, were originally the myrmidons of death. Hence arises the paradoxical situation that the living organism struggles most energetically against events (dangers, in fact) which might help it to attain its life's aim rapidly - by a kind of short-circuit. Such behaviour is, however, precisely what characterizes purely instinctual as contrasted with intelligent efforts.

[1920g, 3741]

The upshot of our enquiry so far has been the drawing of a sharp distinction between the 'ego-instincts' and the sexual instincts, and the view that the former exercise pressure towards death and the latter towards a prolongation of life. But this conclusion is bound to be unsatisfactory in many respects even to ourselves. Moreover, it is actually only of the former group of instincts that we can predicate a conservative, or rather retrograde, character corresponding to a compulsion to repeat. For on our hypothesis the ego-instincts arise from the coming to life of inanimate matter and seek to restore the inanimate state; whereas as regards the sexual instincts, though it is true that they reproduce primitive states of the organism, what they are clearly aiming at by every possible means is the coalescence of two germ-cells which are differentiated in a particular way. If this union is not effected, the germ-cell dies along with all the other elements of the multicellular organism. It is only on this condition that the sexual function can prolong the cell's life and lend it the appearance of immortality. But what is the important event in the development of living substance which is being repeated in sexual reproduction, or in its fore-runner, the conjugation of two protista? We cannot say; and we should consequently feel relieved if the whole structure of our argument turned out to be mistaken. The opposition between the ego or death instincts and the sexual or life instincts would then cease to hold and the compulsion to repeat would no longer possess the importance we have ascribed to it.

[1920g, 3745]
Here then is an opportunity for looking back over the slow development of our libido theory. In the first instance the analysis of the transference neuroses forced upon our notice the opposition between the 'sexual instincts', which are directed towards an object, and certain other instincts, with which we were very insufficiently acquainted and which we described provisionally as the 'ego-instincts'. A foremost place among these was necessarily given to the instincts serving the self-preservation of the individual. It was impossible to say what other distinctions were to be drawn among them. No knowledge would have been more valuable as a foundation for true psychological science than an approximate grasp of the common characteristics and possible distinctive features of the instincts. But in no region of psychology were we groping more in the dark. Everyone assumed the existence of as many instincts or 'basic instincts' as he chose, and juggled with them like the ancient Greek natural philosophers with their four elements - earth, air, fire and water. Psycho-analysis, which could not escape making some assumption about the instincts, kept at first to the popular division of instincts typified in the phrase 'hunger and love'. At least there was nothing arbitrary in this; and by its help the analysis of the psychoneuroses was carried forward quite a distance. The concept of 'sexuality', and at the same time of the sexual instinct, had, it is true, to be extended so as to cover many things which could not be classed under the reproductive function; and this caused no little hubbub in an austere, respectable or merely hypocritical world.

The next step was taken when psycho-analysis felt its way closer towards the psychological ego, which it had first come to know only as a repressive, censoring agency, capable of erecting protective structures and reactive formations. Critical and far-seeing minds had, it is true, long since objected to the concept of libido being restricted to the energy of the sexual instincts directed towards an object. But they failed to explain how they had arrived at their better knowledge or to derive from it anything of which analysis could make use. Advancing more cautiously, psycho-analysis observed the regularity with which libido is withdrawn from the object and directed on to the ego (the process of introversion); and, by studying the libidinal development of children in its earliest phases, came to the conclusion that the ego is the true and original reservoir of libido, and that it is only from that reservoir that libido is extended on to objects. The ego now found its position among sexual objects and was at once given the foremost place among them. Libido which was in this way lodged in the ego was described as 'narcissistic'.¹ This narcissistic libido was of course also a manifestation of the force of the sexual instinct in the analytical sense of those words, and it had necessarily to be identified with the 'self-preservative instincts' whose existence had been recognized from the first. Thus the original opposition between the ego-instincts and the sexual instincts proved to be inadequate. A portion of the ego-instincts was seen to be libidinal; sexual instincts - probably alongside others - operated in the ego. Nevertheless we are justified in saying that the old formula which lays it down that psychoneuroses are based on a conflict between ego-instincts and sexual instincts contains nothing that we need reject to-day. It is merely that the distinction between the two kinds of instinct, which was originally regarded as in some sort of way qualitative, must now be characterized differently - namely as being topographical. And in particular it is still true that the transference neuroses, the essential subject of psycho-analytic study, are the result of a conflict between the ego and the libidinal cathexis of objects.

[1920g, 3753]
It was not our *intention* at all events to produce such a result. Our argument had as its point of
departure a sharp distinction between ego-instincts, which we equated with death instincts, and
sexual instincts, which we equated with life instincts. (We were prepared at one stage to include
the so-called self-preservation instincts of the ego among the death instincts; but we
subsequently corrected ourselves on this point and withdrew it.) Our views have from the very
first been dualistic, and to-day they are even more definitely dualistic than before - now that we
describe the opposition as being, not between ego-instincts and sexual instincts but between
life instincts and death instincts. Jung's libido theory is on the contrary monistic; the fact that he
has called his one instinctual force 'libido' is bound to cause confusion, but need not affect us
otherwise. We suspect that instincts other than those of self-preservation operate in the ego,
and it ought to be possible for us to point to them. Unfortunately, however, the analysis of the
ego has made so little headway that it is very difficult for us to do so. It is possible, indeed, that
the libidinal instincts in the ego may be linked in a peculiar manner with these other ego-
instincts which are still strange to us. Even before we had any clear understanding of
narcissism, psycho-analysts had a suspicion that the 'ego-instincts' had libidinal components
attached to them. But these are very uncertain possibilities, to which our opponents will pay
very little attention. The difficulty remains that psycho-analysis has not enabled us hitherto to
point to any instincts other than the libidinal ones. That, however, is no reason for our falling in
with the conclusion that no others in fact exist.

¹ I will add a few words to clarify our terminology, which has undergone some development in the course
of the present work. We came to know what the 'sexual instincts' were from their relation to the sexes and
to the reproductive function. We retained this name after we had been obliged by the findings of psycho-
analysis to connect them less closely with reproduction. With the hypothesis of narcissistic libido and the
extension of the concept of libido to the individual cells, the sexual instinct was transformed for us into
Eros, which seeks to force together and hold together the portions of living substance. What are commonly
called the sexual instincts are looked upon by us as the part of Eros which is directed towards objects. Our
speculations have suggested that Eros operates from the beginning of life and appears as a 'life instinct' in
opposition to the 'death instinct' which was brought into being by the coming to life of inorganic substance.
These speculations seek to solve the riddle of life by supposing that these two instincts were struggling
with each other from the very first. It is not so easy, perhaps, to follow the transformations though which
the concept of the 'ego-instincts' has passed. To begin with we applied that name to all the instinctual
trends (of which we had no closer knowledge) which could be distinguished from the sexual instincts
directed towards an object; and we opposed the ego-instincts to the sexual instincts of which the libido is
the manifestation. Subsequently we came to closer grips with the analysis of the ego and recognized that
a portion of the 'ego-instincts' is also of a libidinal character and has taken the subject's own ego as its
object. These narcissistic self-preservation instincts had thenceforward to be counted among the libidinal
sexual instincts. The opposition between the ego-instincts and the sexual instincts was transformed into
one between the ego-instincts and the object-instincts, both of a libidinal nature. But in its place a fresh
opposition appeared between the libidinal (ego- and object-) instincts and others, which must be presumed
to be present in the ego and which may perhaps actually be observed in the destructive instincts. Our
speculations have transformed this opposition into one between the life instincts (Eros) and the death
instincts.

[1920g, 3754]

[1920g, 3760]
Criticisms and Misunderstandings of Psycho-Analysis. - Most of what is brought up against psycho-analysis, even in scientific works, is based upon insufficient information which in its turn seems to be determined by emotional resistances. Thus it is a mistake to accuse psycho-analysis of 'pan-sexualism' and to allege that it derives all mental occurrences from sexuality and traces them all back to it. On the contrary, psycho-analysis has from the very first distinguished the sexual instincts from others which it has provisionally termed 'ego instincts'. It has never dreamt of trying to explain 'everything', and even the neuroses it has traced back not to sexuality alone but to the conflict between the sexual impulses and the ego. In psycho-analysis (unlike the works of C. G. Jung) the term 'libido' does not mean psychical energy in general but the motive force of the sexual instincts. Some assertions, such as that every dream is the fulfilment of a sexual wish, have never been maintained by it at all. The charge of one-sidedness made against psycho-analysis, which, as the science of the unconscious mind, has its own definite and restricted field of work, is as inapplicable as it would be if it were made against chemistry. To believe that psycho-analysis seeks a cure for neurotic disorders by giving a free rein to sexuality is a serious misunderstanding which can only be excused by ignorance. The making conscious of repressed sexual desires in analysis makes it possible, on the contrary, to obtain a mastery over them which the previous repression had been unable to achieve. It can more truly be said that analysis sets the neurotic free from the chains of his sexuality. Moreover, it is quite unscientific to judge analysis by whether it is calculated to undermine religion, authority and morals; for, like all sciences, it is entirely non-tendentious and has only a single aim - namely to arrive at a consistent view of one portion of reality. Finally, one can only characterize as simple-minded the fear which is sometimes expressed that all the highest goods of humanity, as they are called - research, art, love, ethical and social sense - will lose their value or their dignity because psycho-analysis is in a position to demonstrate their origin in elementary and animal instinctual impulses.

[1923a, 3928]

Contrast between Sexual and Ego Instincts. - Psycho-analysis early became aware that all mental occurrences must be regarded as built on the basis of an interplay of the forces of the elementary instincts. This, however, led to a difficult predicament, since psychology included no theory of the instincts. No one could say what an instinct really was, the question was left entirely to individual caprice, and every psychologist was in the habit of postulating any instincts in any number that he chose. The first sphere of phenomena to be studied by psycho-analysis comprised what are known as the transference neuroses (hysteria and obsessional neurosis). It was found that their symptoms came about by sexual instinctual impulses being rejected (repressed) by the subject's personality (his ego) and then finding expression by circuitous paths through the unconscious. These facts could be met by drawing a contrast between the sexual instincts and ego instincts (instincts of self-preservation), which was in line with the popular saying that hunger and love are what make the world go round: libido was the manifestation of the force of love in the same sense as was hunger of the self-preservation instinct. The nature of the ego instincts remained for the time being undefined and, like all the other characteristics of the ego, inaccessible to analysis. There was no means of deciding whether, and if so what, qualitative differences were to be assumed to exist between the two classes of instincts.

[1923a, 3931]
Narcissism. - A decisive advance was made when the analysis of dementia praecox and other psychotic disorders was ventured upon and thus the examination was begun of the ego itself, which had so far been known only as the agency of repression and opposition. It was found that the pathogenic process in dementia praecox is the withdrawal of the libido from objects and its introduction into the ego, while the clamorous symptoms of the disease arise from the vain struggles of the libido to find a pathway back to objects. It thus turned out to be possible for object-libido to change into cathexis of the ego and vice versa. Further reflection showed that this process must be presumed to occur on the largest scale and that the ego is to be regarded as a great reservoir of libido from which libido is sent out to objects and which is always ready to absorb libido flowing back from objects. Thus the instincts of self-preservation were also of a libidinal nature: they were sexual instincts which, instead of external objects, had taken the subject's own ego as an object. Clinical experience had made us familiar with people who behaved in a striking fashion as though they were in love with themselves and this perversion had been given the name of narcissism. The libido of the self-preservative instincts was now described as narcissistic libido and it was recognized that a high degree of this self-love constituted the primary and normal state of things. The earlier formula laid down for the transference neuroses consequently required to be modified, though not corrected. It was better, instead of speaking of a conflict between sexual instincts and ego instincts, to speak of a conflict between object-libido and ego-libido, or, since the nature of these instincts was the same, between the object-cathexes and the ego.

[1923a, 3933]

Apparent Approach to Jung's Views. - It thus seemed on the face of it as though the slow process of psycho-analytic research was following in the steps of Jung's speculation about a primal libido, especially because the transformation of object-libido into narcissism necessarily carried along with it a certain degree of desexualization, or abandonment of the specifically sexual aims. Nevertheless, it has to be borne in mind that the fact that the self-preservation instincts of the ego are recognized as libidinal does not necessarily prove that there are no other instincts operating in the ego.

[1923a, 3933]

I have lately developed a view of the instincts¹ which I shall here hold to and take as the basis of my further discussions. According to this view we have to distinguish two classes of instincts, one of which, the sexual instincts or Eros, is by far the more conspicuous and accessible to study. It comprises not merely the uninhibited sexual instinct proper and the instinctual impulses of an aim-inhibited or sublimated nature derived from it, but also the self-preservative instinct, which must be assigned to the ego and which at the beginning of our analytic work we had good reason for contrasting with the sexual object-instincts. The second class of instincts was not so easy to point to; in the end we came to recognize sadism as its representative. On the basis of theoretical considerations, supported by biology, we put forward the hypothesis of a death instinct, the task of which is to lead organic life back into the inanimate state; on the other hand, we supposed that Eros, by bringing about a more and more far-reaching combination of the particles into which living substance is dispersed, aims at complicating life and at the same time, of course, at preserving it. Acting in this way, both the instincts would be conservative in the strictest sense of the word, since both would be endeavouring to re-establish a state of things that was disturbed by the emergence of life. The emergence of life would thus be the cause of the continuance of life and also at the same time of the striving towards death; and life itself would be a conflict and compromise between these two trends. The problem of the origin of life would remain a cosmological one; and the problem of the goal and purpose of life would be answered dualistically.

[1923b, 3974]
But the opponents of psycho-analysis forgot its illustrious forerunners; they fell upon it as though it had made an assault upon the dignity of the human race. They accused it of 'pan-sexualism', though the psycho-analytic theory of the instincts had always been strictly dualistic and had at no time failed to recognize, alongside the sexual instincts, others to which it actually ascribed force enough to suppress the sexual instincts. (These mutually opposing forces were described to begin with as the sexual instincts and the ego instincts. A later theoretical development changed them into Eros and the instinct of death or destruction.) The suggestion that art, religion and social order originated in part in a contribution from the sexual instincts was represented by the opponents of analysis as a degradation of the highest cultural values. They emphatically declared that men have other interests besides this eternal one of sex, overlooking in their zeal the fact that animals too have other interests - indeed they are subject to sexuality, not permanently like men, but only in bouts occurring at specific periods - overlooking, too, the fact that the existence of these other interests in men had never been disputed and that nothing can be altered in the value of a cultural achievement by its being shown to have been derived from elementary animal instinctual sources. [1925e, 4126]

There is no more urgent need in psychology than for a securely founded theory of the instincts on which it might then be possible to build further. Nothing of the sort exists, however, and psycho-analysis is driven to making tentative efforts towards some such theory. It began by drawing a contrast between the ego-instincts (the instinct of self-preservation, hunger) and the libidinal instincts (love), but later replaced it by a new contrast between narcissistic and object-libido. This was clearly not the last word on the subject; biological considerations seemed to make it impossible to remain content with assuming the existence of only a single class of instincts. [1925d, 4232]

In the works of my later years (Beyond the Pleasure Principle, Group Psychology and the Analysis of the Ego, and The Ego and the Id), I have given free rein to the inclination, which I kept down for so long, to speculation, and I have also contemplated a new solution of the problem of the instincts. I have combined the instincts for self-preservation and for the preservation of the species under the concept of Eros and have contrasted with it an instinct of death or destruction which works in silence. Instinct in general is regarded as a kind of elasticity of living things, an impulsion towards the restoration of a situation which once existed but was brought to an end by some external disturbance. This essentially conservative character of instincts is exemplified by the phenomena of the compulsion to repeat. The picture which life presents to us is the result of the concurrent and mutually opposing action of Eros and the death instinct. [1925d, 4232]
From the first of these standpoints, the *dynamic* one, psycho-analysis derives all mental processes (apart from the reception of external stimuli) from the interplay of forces, which assist or inhibit one another, combine with one another, enter into compromises with one another, etc. All of these forces are originally in the nature of *instincts*; thus they have an organic origin. They are characterized by possessing an immense (somatic) store of power ("the compulsion to repeat"); and they are represented mentally as images or ideas with an affective charge. In psycho-analysis, no less than in other sciences, the theory of the instincts is an obscure subject. An empirical analysis leads to the formulation of two groups of instincts: the so-called 'ego-instincts', which are directed towards self-preservation, and the 'object-instincts', which are concerned with relations to an external object. The social instincts are not regarded as elementary or irreducible. Theoretical speculation leads to the suspicion that there are two fundamental instincts which lie concealed behind the manifest ego-instincts and object-instincts: namely (a) Eros, the instinct which strives for ever closer union, and (b) the instinct of destruction, which leads towards the dissolution of what is living. In psycho-analysis the manifestation of the force of Eros is given the name 'libido'.

We shall see, however, that this is not so and that it is merely a matter of bringing into sharper focus a turn of thought arrived at long ago and of following out its consequences. Of all the slowly developed parts of analytic theory, the theory of the instincts is the one that has felt its way the most painfully forward. And yet that theory was so indispensable to the whole structure that something had to be put in its place. In what was at first my utter perplexity, I took as my starting-point a saying of the poet-philosopher, Schiller, that 'hunger and love are what moves the world'. Hunger could be taken to represent the instincts which aim at preserving the individual; while love strives after objects, and its chief function, favoured in every way by nature, is the preservation of the species. Thus, to begin with, ego-instincts and object-instincts confronted each other. It was to denote the energy of the latter and only the latter instinct that I introduced the term 'libido'. Thus the antithesis was between the ego-instincts and the 'libidinal' instincts of love (in its widest sense) which were directed to an object. One of these object-instincts, the sadistic instinct, stood out from the rest, it is true, in that its aim was so very far from being loving. Moreover it was obviously in some respects attached to the ego-instincts: it could not hide its close affinity with instincts of mastery which have no libidinal purpose. But these discrepancies were got over; after all, sadism was clearly a part of sexual life, in the activities of which affection could be replaced by cruelty. Neurosis was regarded as the outcome of a struggle between the interest of self-preservation and the demands of the libido, a struggle in which the ego had been victorious but at the price of severe sufferings and renunciations.

[1926f, 4403]

[1930a, 4508]
Every analyst will admit that even to-day this view has not the sound of a long-discarded error. Nevertheless, alterations in it became essential, as our enquiries advanced from the repressed to the repressing forces, from the object-instincts to the ego. The decisive step forward was the introduction of the concept of narcissism - that is to say, the discovery that the ego itself is cathected with libido, that the ego, indeed, is the libido's original home, and remains to some extent its headquarters. This narcissistic libido turns towards objects, and thus becomes object-libido; and it can change back into narcissistic libido once more. The concept of narcissism made it possible to obtain an analytic understanding of the traumatic neuroses and of many of the affections bordering on the psychoses, as well as of the latter themselves. It was not necessary to give up our interpretation of the transference neuroses as attempts made by the ego to defend itself against sexuality; but the concept of libido was endangered. Since the ego-instincts, too, were libidinal, it seemed for a time inevitable that we should make libido coincide with instinctual energy in general, as C. G. Jung had already advocated earlier. Nevertheless, there still remained in me a kind of conviction, for which I was not as yet able to find reasons, that the instincts could not all be of the same kind. My next step was taken in Beyond the Pleasure Principle (1920g), when the compulsion to repeat and the conservative character of instinctual life first attracted my attention. Starting from speculations on the beginning of life and from biological parallels, I drew the conclusion that, besides the instinct to preserve living substance and to join it into ever larger units,¹ there must exist another, contrary instinct seeking to dissolve those units and to bring them back to their primaeval, inorganic state. That is to say, as well as Eros there was an instinct of death. The phenomena of life could be explained from the concurrent or mutually opposing action of these two instincts. It was not easy, however, to demonstrate the activities of this supposed death instinct. The manifestations of Eros were conspicuous and noisy enough. It might be assumed that the death instinct operated silently within the organism towards its dissolution, but that, of course, was no proof. A more fruitful idea was that a portion of the instinct is diverted towards the external world and comes to light as an instinct of aggressiveness and destructiveness. In this way the instinct itself could be pressed into the service of Eros, in that the organism was destroying some other thing, whether animate or inanimate, instead of destroying its own self. Conversely, any restriction of this aggressiveness directed outwards would be bound to increase the self-destruction, which is in any case proceeding. At the same time one can suspect from this example that the two kinds of instinct seldom - perhaps never - appear in isolation from each other, but are alloyed with each other in varying and very different proportions and so become unrecognizable to our judgement. In sadism, long since known to us as a component instinct of sexuality, we should have before us a particularly strong alloy of this kind between trends of love and the destructive instinct; while its counterpart, masochism, would be a union between destructiveness directed inwards and sexuality - a union which makes what is otherwise an imperceptible trend into a conspicuous and tangible one.

[1930a, 4509]
The theory of the instincts is so to say our mythology. Instincts are mythical entities, magnificent in their indefiniteness. In our work we cannot for a moment disregard them, yet we are never sure that we are seeing them clearly. You know how popular thinking deals with the instincts. People assume as many and as various instincts as they happen to need at the moment - a self-assertive instinct, an imitative instinct, an instinct of play, a gregarious instinct and many others like them. People take them up, as it were, make each of them do its particular job, and then drop them again. We have always been moved by a suspicion that behind all these little \textit{ad hoc} instincts there lay concealed something serious and powerful which we should like to approach cautiously. Our first step was modest enough. We told ourselves we should probably not be going astray if we began by separating two main instincts or classes of instincts or groups of instincts in accordance with the two great needs - hunger and love. However jealously we usually defend the independence of psychology from every other science, here we stood in the shadow of the unshakable biological fact that the living individual organism is at the command of two intentions, self-preservation and the preservation of the species, which seem to be independent of each other, which, so far as we know at present, have no common origin and whose interests are often in conflict in animal life. Actually what we are talking now is biological psychology, we are studying the psychical accompaniments of biological processes. It was as representing this aspect of the subject that the 'ego-instincts' and the 'sexual instincts' were introduced into psycho-analysis. We included in the former everything that had to do with the preservation, assertion and magnification of the individual. To the latter we had to attribute the copiousness called for by infantile and perverse sexual life. In the course of investigating the neuroses we came to know the ego as the restricting and repressing power and the sexual trends as the restricted and repressed one; we therefore believed that we had clear evidence not only of the difference between the two groups of instincts but also of the conflict between them. The first object of our study was only the sexual instincts, whose energy we named 'libido'. It was in relation to them that we sought to clarify our ideas of what an instinct is and what is to be attributed to it. Here we have the libido theory. [1933a, 4701]

You see how many of the characteristics and vicissitudes of the instincts still escape our comprehension. A further distinction should be mentioned here which is exhibited between the sexual and self-preservation instincts and which would be of the greatest theoretical importance if it applied to the groups as a whole. The sexual instincts are noticeable to us for their plasticity, their capacity for altering their aims, their replaceability, which admits of one instinctual satisfaction being replaced by another, and their readiness for being deferred, of which we have just given a good example in the aim-inhibited instincts. We should be glad to deny these characteristics to the self-preservation instincts, and to say of them that they are inflexible, admit of no delay, are imperative in a very different sense and have a quite other relation to repression and to anxiety. But a little reflection tells us that this exceptional position applies, not to all the ego-instincts, but only to hunger and thirst, and is evidently based on a peculiar character of the sources of those instincts. A good part of the confusing impression made by all this is that we have not given separate consideration to the alterations which the influence of the organized ego makes in the instinctual impulses that belonged originally to the id. [1933a, 4703]
It is now time, however, for me to go back both in history and in my subject-matter and once more to take up the most general problems of instinctual life. To begin with, the opposition between the ego-instincts and the sexual instincts lay at the base of our libido theory. When later on we began to study the ego itself more closely and arrived at the conception of narcissism, this distinction itself lost its foundation. In rare cases one can observe that the ego has taken itself as an object and is behaving as though it were in love with itself. Hence the term 'narcissism', borrowed from the Greek myth. But that is only an extreme exaggeration of a normal state of affairs. We came to understand that the ego is always the main reservoir of libido, from which libidinal cathexes of objects go out and into which they return again, while the major part of this libido remains permanently in the ego. Thus ego-libido is being constantly changed into object-libido and object-libido into ego-libido. But in that case they could not be different in their nature and it could have no sense to distinguish the energy of the one from the energy of the other; we could either drop the term 'libido' or use it as synonymous with psychical energy in general.

[1933a, 4706]

We did not maintain this position for long. Our feeling of their being a contrariety in instinctual life soon found another and sharper expression. It is not my wish, however, to put before you the origin of this novelty in the theory of the instincts; it too is based essentially on biological considerations. I shall offer it to you as a ready-made product. Our hypothesis is that there are two essentially different classes of instincts: the sexual instincts, understood in the widest sense - Eros, if you prefer that name - and the aggressive instincts, whose aim is destruction. When it is put to you like this, you will scarcely regard it as a novelty. It looks like an attempt at a theoretical transfiguration of the commonplace opposition between loving and hating, which coincides, perhaps, with the other polarity, of attraction and repulsion, which physics assumes in the inorganic world. But it is a remarkable thing that this hypothesis is nevertheless felt by many people as an innovation and, indeed, as a most undesirable one which should be got rid of as quickly as possible. I presume that a strong affective factor is coming into effect in this rejection. Why have we ourselves needed such a long time before we decided to recognize an aggressive instinct? Why did we hesitate to make use, on behalf of our theory, of facts which were obvious and familiar to everyone? We should probably have met with little resistance if we had wanted to ascribe an instinct with such an aim to animals. But to include it in the human constitution appears sacrilegious; it contradicts too many religious presumptions and social conventions. No, man must be naturally good or at least good-natured. If he occasionally shows himself brutal, violent or cruel, these are only passing disturbances of his emotional life, for the most part provoked, or perhaps only consequences of the inexpedient social regulations which he has hitherto imposed on himself.

[1933a, 4707]
Contrast between Sexual and Ego Instincts. - Psycho-analysis early became aware that all mental occurrences must be regarded as built on the basis of an interplay of the forces of the elementary instincts. This, however, led to a difficult predicament, since psychology included no theory of the instincts. No one could say what an instinct really was, the question was left entirely to individual caprice, and every psychologist was in the habit of postulating any instincts in any number that he chose. The first sphere of phenomena to be studied by psycho-analysis comprised what are known as the transference neuroses (hysteria and obsessional neurosis). It was found that their symptoms came about by sexual instinctual impulses being rejected (repressed) by the subject’s personality (his ego) and then finding expression by circuitous paths through the unconscious. These facts could be met by drawing a contrast between the sexual instincts and ego instincts (instincts of self-preservation), which was in line with the popular saying that hunger and love are what make the world go round: libido was the manifestation of the force of love in the same sense as was hunger of the self-preservation instinct. The nature of the ego instincts remained for the time being undefined and, like all the other characteristics of the ego, inaccessible to analysis. There was no means of deciding whether, and if so what, qualitative differences were to be assumed to exist between the two classes of instincts.

[1923a, 3931]
The theory of the instincts is so to say our mythology. Instincts are mythical entities, magnificent in their indefiniteness. In our work we cannot for a moment disregard them, yet we are never sure that we are seeing them clearly. You know how popular thinking deals with the instincts. People assume as many and as various instincts as they happen to need at the moment - a self-assertive instinct, an imitative instinct, an instinct of play, a gregarious instinct and many others like them. People take them up, as it were, make each of them do its particular job, and then drop them again. We have always been moved by a suspicion that behind all these little ad hoc instincts there lay concealed something serious and powerful which we should like to approach cautiously. Our first step was modest enough. We told ourselves we should probably not be going astray if we began by separating two main instincts or classes of instincts or groups of instincts in accordance with the two great needs - hunger and love. However jealously we usually defend the independence of psychology from every other science, here we stood in the shadow of the unshakable biological fact that the living individual organism is at the command of two intentions, self-preservation and the preservation of the species, which seem to be independent of each other, which, so far as we know at present, have no common origin and whose interests are often in conflict in animal life. Actually what we are talking now is biological psychology, we are studying the psychical accompaniments of biological processes. It was as representing this aspect of the subject that the 'ego-instincts' and the 'sexual instincts' were introduced into psycho-analysis. We included in the former everything that had to do with the preservation, assertion and magnification of the individual. To the latter we had to attribute the copiousness called for by infantile and perverse sexual life. In the course of investigating the neuroses we came to know the ego as the restricting and repressing power and the sexual trends as the restricted and repressed one; we therefore believed that we had clear evidence not only of the difference between the two groups of instincts but also of the conflict between them. The first object of our study was only the sexual instincts, whose energy we named 'libido'. It was in relation to them that we sought to clarify our ideas of what an instinct is and what is to be attributed to it. Here we have the libido theory. [1933a, 4701]
PSYCHO-ANALYSIS  An important addition to our knowledge of the sexual instinct in certain people who at least approximate to the normal can be obtained from a source which can only be reached in one particular way. There is only one means of obtaining exhaustive information that will not be misleading about the sexual life of the persons known as ‘psychoneurotics’ - sufferers from hysteria, from obsessional neurosis, from what is wrongly described as neurasthenia, and, undoubtedly, from dementia praecox and paranoia was well. They must be subjected to psycho-analytic investigation, which is employed in the therapeutic procedure introduced by Josef Breuer and myself in 1893 and known at that time as ‘catharsis’.

By demonstrating the part played by perverse impulses in the formation of symptoms in the psychoneuroses, we have quite remarkably increased the number of people who might be regarded as perverts. It is not only that neurotics in themselves constitute a very numerous class, but it must also be considered that an unbroken chain bridges the gap between the neuroses in all their manifestations and normality. After all, Moebius could say with justice that we are all to some extent hysterics. Thus the extraordinarily wide dissemination of the perversions forces us to suppose that the disposition to perversions is itself of no great rarity but must form a part of what passes as the normal constitution.

LADIES AND GENTLEMEN, - You will want to know now what we have found out about the pathogenic complexes and repressed wishful impulses of neurotics with the help of the technical methods I have described.

Let me now proceed with my account of our findings. In another set of cases psycho-analytic investigation traces the symptoms back, it is true, not to sexual experiences but to commonplace traumatic ones. But this distinction loses its significance owing to another circumstance. For the work of analysis required for the thorough explanation and complete recovery of a case never comes to a stop at events that occurred at the time of the onset of the illness, but invariably goes back to the patient's puberty and early childhood; and it is only there that it comes upon the impressions and events which determined the later onset of the illness. It is only experiences in childhood that explain susceptibility to later traumas and it is only by uncovering these almost invariably forgotten memory-traces and by making them conscious that we acquire the power to get rid of the symptoms. And here we reach the same conclusion as in our investigation of dreams: the imperishable, repressed wishful impulses of childhood have alone provided the power for the construction of symptoms, and without them the reaction to later traumas would have taken a normal course. But these powerful wishful impulses of childhood may without exception be described as sexual.

The predisposition to neurosis is traceable to impaired sexual development in a different way. Neuroses are related to perversions as negative to positive. The same instinctual components as in the perversions can be observed in the neuroses as vehicles of complexes and constructors of symptoms, but in the latter case they operate from the unconscious. Thus they have undergone repression, but have been able, in defiance of it, to persist in the unconscious. Psycho-analysis makes it clear that an excessively strong manifestation of these instincts at a very early age leads to a kind of partial fixation, which then constitutes a weak point in the structure of the sexual function. If in maturity the performance of the normal sexual function comes up against obstacles, the repression that took place during the course of development will be broken through at the precise points at which the infantile fixations occurred.
Let us remember, however, that our attitude to life ought not to be that of a fanatic for hygiene or therapy. We must admit that the ideal prevention of neurotic illnesses which we have in mind would not be of advantage to every individual. A good number of those who now take flight into illness would not, under the conditions we have assumed, support the conflict but would rapidly succumb or would cause a mischief greater than their own neurotic illness. Neuroses have in fact their biological function as a protective contrivance and they have their social justification: the 'gain from illness' they provide is not always a purely subjective one. Is there one of you who has not at some time looked into the causation of a neurosis and had to allow that it was the mildest possible outcome of the situation? And should such heavy sacrifices be made in order to eradicate the neuroses in particular, when the world is full of other unavoidable misery? [1910d, 2314]

In the years following 1907, when the schools of Vienna and Zurich were united, psycho-analysis made the extraordinary surge forward of which the momentum is felt even to-day; this is shown both by the spread of psycho-analytic literature and by the constant increase in the number of doctors who are practising or studying it, as well as by the frequency of the attacks made on it at Congresses and in learned societies. It has penetrated into the most distant lands and has everywhere not merely startled psychiatrists but commanded the attention of the educated public and of scientific workers in other fields. Havelock Ellis, who has followed its development with sympathy though without ever calling himself an adherent, wrote in 1911 in a report for the Australasian Medical Congress: 'Freud's psycho-analysis is now championed and carried out not only in Austria and in Switzerland, but in the United States, in England, in India, in Canada, and, I doubt not, in Australasia.'¹ A physician from Chile (probably a German) spoke at the International Congress at Buenos Aires in 1910 in support of the existence of infantile sexuality and commended highly the effects of psycho-analytic therapy on obsessional symptoms.² An English neurologist in Central India (Berkeley-Hill) informed me, through a distinguished colleague who was visiting Europe, that the analyses of Mohammedan Indians which he had carried out showed that the aetiology of their neuroses was no different from what we find in our European patients. [1914d, 2896]
The Theory of Repression. - These theoretical considerations, taken together with the immediate impressions derived from analytic work, lead to a view of the neuroses which may be described in the roughest outline as follows. The neuroses are the expression of conflicts between the ego and such of the sexual impulses as seem to the ego incompatible with its integrity or with its ethical standards. Since these impulses are not ego-syntonic, the ego has repressed them: that is to say, it has withdrawn its interest from them and has shut them off from becoming conscious as well as from obtaining satisfaction by motor discharge. If in the course of analytic work one attempts to make these repressed impulses conscious, one becomes aware of the repressive forces in the form of resistance. But the achievement of repression fails particularly readily in the case of the sexual instincts. Their dammed-up libido finds other ways out from the unconscious: for it regresses to earlier phases of development and earlier attitudes towards objects, and, at weak points in the libidinal development where there are infantile fixations, it breaks through into consciousness and obtains discharge. What results is a symptom and consequently in its essence a substitutive sexual satisfaction. Nevertheless the symptom cannot entirely escape from the repressive forces of the ego and must therefore submit to modifications and displacements exactly as happens with dreams - by means of which its characteristic of being a sexual satisfaction becomes unrecognizable. Consequently symptoms are in the nature of compromises between the repressed sexual instincts and the repressing ego-instincts; they represent a wish-fulfilment for both partners to the conflict simultaneously, but one which is incomplete for each of them. This is quite strictly true of the symptoms of hysteria, while in the symptoms of obsessional neurosis there is often a stronger emphasis upon the side of the repressing function owing to the erection of reaction-formation, which are assurances against sexual satisfaction.

[1923a, 3923]

There are certainly good grounds for being suspicious of such simple solutions of a problem. Moreover, the most that we may expect is that this formula will turn out to be correct in the roughest outline. But even that would be something. One recalls at once, too, a whole number of discoveries and findings which seem to support our thesis. All our analyses go to show that the transference neuroses originate from the ego's refusing to accept a powerful instinctual impulse in the id or to help it to find a motor outlet, or from the ego's forbidding that impulse the object at which it is aiming. In such a case the ego defends itself against the instinctual impulse by the mechanism of repression. The repressed material struggles against this fate. It creates for itself, along paths over which the ego has no power, a substitutive representation (which forces itself upon the ego by way of a compromise) - the symptom. The ego finds its unity threatened and impaired by this intruder, and it continues to struggle against the symptom, just as it fended off the original instinctual impulse. All this produces the picture of a neurosis. It is no contradiction to this that, in undertaking the repression, the ego is at bottom following the commands of its super-ego - commands which, in their turn, originate from influences in the external world that have found representation in the super-ego. The fact remains that the ego has taken sides with those powers, that in it their demands have more strength than the instinctual demands of the id, and that the ego is the power which sets the repression in motion against the portion of the id concerned and which fortifies the repression by means of the anticathexis of resistance. The ego has come into conflict with the id in the service of the super-ego and of reality; and this is the state of affairs in every transference neurosis.

[1924b, 4066]
We shall only find the standpoint we are in search of if we turn from scientific medicine to practical therapeutics. A sick person is a complicated organism. He may remind us that even the mental phenomena which are so hard to grasp should not be effaced from the picture of life. Neurotics, indeed, are an undesired complication, an embarrassment as much to therapeutics as to jurisprudence and to military service. But they exist and are a particular concern of medicine. Medical education, however, does nothing, literally nothing, towards their understanding and treatment. In view of the intimate connection between the things that we distinguish as physical and mental, we may look forward to a day when paths of knowledge and, let us hope, of influence will be opened up, leading from organic biology and chemistry to the field of neurotic phenomena. That day still seems a distant one, and for the present these illnesses are inaccessible to us from the direction of medicine.

[1926e, 4373]

Not at all. It merely confirms once again the fact that neurotics are a nuisance and an embarrassment for all concerned - including the analysts. But perhaps I shall clear up your confusion if I state my new information in more correct terms. It would probably be more correct to say of the cases we are now dealing with that they have readily developed a neurosis, but that it is not psychogenic but somatogenic - that its causes are not mental but physical. Do you understand?

[1926e, 4382]

I cannot foresee the way out of these difficulties, nor is it my business to point it out. I see only two things, first that analysis is an embarrassment to you and that the best thing would be for it not to exist - though neurotics, no doubt, are an embarrassment too; and secondly, that the interests of everyone concerned would for the time being be met if the doctors could make up their minds to tolerate a class of therapists which would relieve them of the tedium of treating the enormously common psychogenic neuroses while remaining in constant touch with them to the benefit of the patients.

[1926e, 4388]
It would be more dignified as well as more helpful to the patient - who, after all, has to come to terms with his ailments - for the doctor to tell the truth, as he knows it from his daily practice. The psychoneuroses as a genus are by no means mild illnesses. When hysteria sets in, no one can foretell when it will come to an end. We mostly comfort ourselves with the vain prophecy that 'one day it will suddenly disappear'. Recovery often enough turns out to be merely an agreement to mutual toleration between the sick part of the patient and the healthy part; or it is the result of the transformation of a symptom into a phobia. A girl's hysteria, calmed down with difficulty, revives in her as a wife after the short interruption of young married happiness. The only difference is that another person, the husband, is now driven by his own interests to keep silence about her condition. Even if an illness of this kind leads to no manifest incapacity on the patients' part to carry on their life, it nearly always prevents free unfolding of their mental powers. Obsessions recur throughout their lives; and phobias and other restrictions upon the will have hitherto been unamenable to treatment of any kind. All this is kept from the knowledge of the layman. The father of a hysterical girl is consequently horrified if, for instance, he is asked to agree to her being given a year's treatment, when she has perhaps only been ill for a few months. The layman is, as it were, deeply convinced in himself that all these psychoneuroses are unnecessary; so he has no patience with the processes of the illness and no readiness to make sacrifices for its treatment. If, in face of a case of typhus which lasts three weeks, or of a broken leg which takes six months to mend, he adopts a more understanding attitude, and if, as soon as his child shows the first signs of a curvature of the spine, he finds it reasonable that orthopaedic treatment should be carried on over several years, the difference in his behaviour is due to the better knowledge on the part of the physicians who pass on their knowledge honestly to the layman. Honesty on the part of the physician and willing acquiescence on the part of the layman will be established for the neuroses too, as soon as an insight into the nature of those affections becomes common property in the medical world. Radical treatment of these disorders will no doubt always require special training and will be incompatible with other kinds of medical activity. On the other hand, this class of physicians, which will, I believe, be a large one in the future, has the prospect of achieving noteworthy results and of obtaining a satisfying insight into the mental life of mankind.

[1897b, 475]

Psycho-analytic research into the neuroses (the various forms of nervous illness with a mental causation) has endeavoured to trace their connection with instinctual life and the restrictions imposed on it by the claims of civilization, with the activities of the normal individual in phantasies and dreams, and with the creations of the popular mind in religion, myths and fairy tales. The psycho-analytic treatment of neurotic patients, based on this method of research, makes far higher demands on doctor and patient than the methods hitherto in common use, which operate through medicaments, diet, hydropathy and suggestion. But it brings the patients so much more relief and permanent strengthening in the face of life's problems, that there is no cause for surprise at the continual advances made by this therapeutic method in spite of violent opposition.

[1910b, 1995]
It is true that during the analysis Hans had to be told many things that he could not say himself, that he had to be presented with thoughts which he had so far shown no signs of possessing, and that his attention had to be turned in the direction from which his father was expecting something to come. This detracts from the evidential value of the analysis; but the procedure is the same in every case. For a psycho-analysis is not an impartial scientific investigation, but a therapeutic measure. Its essence is not to prove anything, but merely to alter something. In a psycho-analysis the physician always gives his patient (sometimes to a greater and some times to a less extent) the conscious anticipatory ideas by the help of which he is put in a position to recognize and to grasp the unconscious material. For there are some patients who need more of such assistance and some who need less; but there are none who get through without some of it. Slight disorders may perhaps be brought to an end by the subject's unaided efforts, but never a neurosis - a thing which has set itself up against the ego as an element alien to it. To get the better of such an element another person must be brought in, and in so far as that other person can be of assistance the neurosis will be curable. If it is in the very nature of any neurosis to turn away from the 'other person' - and this seems to be one of the characteristics of the states grouped together under the name of dementia praecox - then for that very reason such a state will be incurable by any efforts of ours. It is true that a child, on account of the small development of his intellectual systems, requires especially energetic assistance. But, after all, the information which the physician gives his patient is itself derived in its turn from analytical experience; and indeed it is sufficiently convincing if, at the cost of this intervention by the physician, we are enabled to discover the structure of the pathogenic material and simultaneously to dissipate it.

[1909b, 2089]

With this as a starting-point we go on to make our first important discovery. We learn that, when we try to understand neurotic disorders, by far the greater significance attaches to the sexual instincts; that in fact neuroses are the specific disorders, so to speak, of the sexual function; that in general whether or not a person develops a neurosis depends on the quantity of his libido, and on the possibility of satisfying it and of discharging it through satisfaction; that the form taken by the disease is determined by the way in which the individual passes through the course of development of his sexual function, or, as we put it, by the fixations his libido has undergone in the course of its development; and, further, that by a special, not very simple technique for influencing the mind we are able to throw light on the nature of some groups of neuroses and at the same time to do away with them. Our therapeutic efforts have their greatest success with a certain class of neuroses which proceed from a conflict between the ego-instincts and the sexual instincts. For in human beings it may happen that the demands of the sexual instincts, whose reach of course extends far beyond the individual, seem to the ego to constitute a danger which threatens its self-preservation or its self-esteem. The ego then assumes the defensive, denies the sexual instincts the satisfaction they desire and forces them into those by-paths of substitutive satisfaction which become manifest as nervous symptoms.

[1917a, 3609]

For the contradiction exists only as long as we keep our eyes fixed on the situation at the beginning of the neurosis, in which the ego, in the service of reality, sets about the repression of an instinctual impulse. This, however, is not yet the neurosis itself. The neurosis consists rather in the processes which provide a compensation for the portion of the id that has been damaged - that is to say, in the reaction against the repression and in the failure of the repression. The loosening of the relation to reality is a consequence of this second step in the formation of a neurosis, and it ought not to surprise us if a detailed examination shows that the loss of reality affects precisely that piece of reality as a result of whose demands the instinctual repression ensued.

[1924e, 4094]
There is nothing new in our characterization of neurosis as the result of a repression that has failed. We have said this all along, and it is only because of the new context in which we are viewing the subject that it has been necessary to repeat it.  

[1924e, 4094]

We might expect that when a psychosis comes into being, something analogous to the process in a neurosis occurs, though, of course, between different agencies of the mind; thus we might expect that in a psychosis, too, two steps could be discerned, of which the first would drag the ego away, this time from reality, while the second would try to make good the damage done and re-establish the subject's relations to reality at the expense of the id. And, in fact, some analogy of the sort can be observed in a psychosis. Here, too, there are two steps, the second of which has the character of a reparation. But beyond that the analogy gives way to a far more extensive similarity between the two processes. The second step of the psychosis is indeed intended to make good the loss of reality, not, however, at the expense of a restriction of the id - as happens in neurosis at the expense of the relation to reality - but in another, more autocratic manner, by the creation of a new reality which no longer raises the same objections as the old one that has been given up. The second step, therefore, both in neurosis and psychosis, is supported by the same trends. In both cases it serves the desire for power of the id, which will not allow itself to be dictated to by reality. Both neurosis and psychosis are thus the expression of a rebellion on the part of the id against the external world, of its unwillingness - or, if one prefers, its incapacity - to adapt itself to the exigencies of reality, to \textit{Αυάγχη} [Necessity]. Neurosis and psychosis differ from each other far more in their first, introductory, reaction than in the attempt at reparation which follows it.  

[1924e, 4095]

A conflict between two groups of mental trends had to be looked on as the ground for repression and accordingly as the cause of every neurotic illness. And here experience taught us a new and surprising fact about the nature of the forces that were struggling against each other. Repression invariably proceeded from the sick person's conscious personality (his ego) and took its stand on aesthetic and ethical motives; the impulses that were subjected to repression were those of selfishness and cruelty, which can be summed up in general as evil, but above all sexual wishful impulses, often of the crudest and most forbidden kind. Thus the symptoms were a substitute for forbidden satisfactions and the illness seemed to correspond to an incomplete subjugation of the immoral side of human beings.  

[1924f, 4106]

The third, psychological, factor resides in a defect of our mental apparatus which has to do precisely with its differentiation into an id and an ego, and which is therefore also attributable ultimately to the influence of the external world. In view of the dangers of reality, the ego is obliged to guard against certain instinctual impulses in the id and to treat them as dangers. But it cannot protect itself from internal instinctual dangers as effectively as it can from some piece of reality that is not part of itself. Intimately bound up with the id as it is, it can only fend off an instinctual danger by restricting its own organization and by acquiescing in the formation of symptoms in exchange for having impaired the instinct. If the rejected instinct renews its attack, the ego is overtaken by all those difficulties which are known to us as neurotic ailments.  

[1926d, 4309]
You have no notion how close I am to fulfilling my promise. Even in organisms which later develop an efficient ego-organization, their ego is feeble and little differentiated from their id to begin with, during their first years of childhood. Imagine now what will happen if this powerless ego experiences an instinctual demand from the id which it would already like to resist (because it senses that to satisfy it is dangerous and would conjure up a traumatic situation, a collision with the external world) but which it cannot control, because it does not yet possess enough strength to do so. In such a case the ego treats the instinctual danger as if it was an external one; it makes an attempt at flight, draws back from this portion of the id and leaves it to its fate, after withholding from it all the contributions which it usually makes to instinctual impulses. The ego, as we put it, institutes a repression of these instinctual impulses. For the moment this has the effect of fending off the danger; but one cannot confuse the inside and the outside with impunity. One cannot run away from oneself. In repression the ego is following the pleasure principle, which it is usually in the habit of correcting; and it is bound to suffer damage in revenge. This lies in the ego's having permanently narrowed its sphere of influence. The repressed instinctual impulse is now isolated, left to itself, inaccessible, but also uninfluenciable. It goes its own way. Even later, as a rule, when the ego has grown stronger, it still cannot lift the repression; its synthesis is impaired, a part of the id remains forbidden ground to the ego. Nor does the isolated instinctual impulse remain idle; it understands how to make up for being denied normal satisfaction; it produces psychical derivatives which take its place; it links itself to other processes which by its influence it likewise tears away from the ego; and finally it breaks through into the ego and into consciousness in the form of an unrecognizably distorted substitute, and creates what we call a symptom. All at once the nature of a neurotic disorder becomes clear to us: on the one hand an ego which is inhibited in its synthesis, which has no influence on parts of the id, which must renounce some of its activities in order to avoid a fresh collision with what has been repressed, and which exhausts itself in what are for the most part vain acts of defence against the symptoms, the derivatives of the repressed impulses; and on the other hand an id in which individual instincts have made themselves independent, pursue their aims regardless of the interests of the person as a whole and henceforth obey the laws only of the primitive psychology that rules in the depths of the id. If we survey the whole situation we arrive at a simple formula for the origin of a neurosis: the ego has made an attempt to suppress certain portions of the id in an inappropriate manner, this attempt has failed and the id has taken its revenge. A neurosis is thus the result of a conflict between the ego and the id, upon which the ego has embarked because, as careful investigation shows, it wishes at all costs to retain its adaptability in relation to the real external world. The disagreement is between the external world and the id; and it is because the ego, loyal to its inmost nature, takes sides with the external world that it becomes involved in a conflict with its id. But please observe that what creates the determinant for the illness is not the fact of this conflict - for disagreements of this kind between reality and the id are unavoidable and it is one of the ego's standing tasks to mediate in them - but the circumstance that the ego has made use of the inefficient instrument of repression for dealing with the conflict. But this in turn is due to the fact that the ego, at the time at which it was set the task, was undeveloped and powerless. The decisive repressions all take place in early childhood.

[1926e, 4346]

"Everything you have told me so far has been psychology. It has often sounded strange, difficult, or obscure; but it has always been - if I may put it so - "pure". I have known very little hitherto, no doubt, about your psycho-analysis; but the rumour has nevertheless reached my ears that you are principally occupied with things that have no claim to that predicate. The fact that you have not yet touched on anything of the kind makes me feel that you are deliberately keeping something back. And there is another doubt that I cannot suppress. After all, as you yourself say, neuroses are disturbances of mental life. Is it possible, then, that such important things as our ethics, our conscience, our ideals, play no part at all in these profound disturbances?"

[1926e, 4349]
That can be managed, though, if one bears in mind the complexities of living substance. In what did we find the essence of a neurosis? In the fact that the ego, the higher organization of the mental apparatus (elevated through the influence of the external world), is not able to fulfill its function of mediating between the id and reality, that in its feebleness it draws back from some instinctual portions of the id and, to make up for this, has to put up with the consequences of its renunciation in the form of restrictions, symptoms and unsuccessful reaction-formation. 

[1926e, 4382]

We shall see, however, that this is not so and that it is merely a matter of bringing into sharper focus a turn of thought arrived at long ago and of following out its consequences. Of all the slowly developed parts of analytic theory, the theory of the instincts is the one that has felt its way the most painfully forward. And yet that theory was so indispensable to the whole structure that something had to be put in its place. In what was at first my utter perplexity, I took as my starting-point a saying of the poet-philosopher, Schiller, that 'hunger and love are what moves the world'. Hunger could be taken to represent the instincts which aim at preserving the individual; while love strives after objects, and its chief function, favoured in every way by nature, is the preservation of the species. Thus, to begin with, ego instincts and object instincts confronted each other. It was to denote the energy of the latter and only the latter instinct that I introduced the term 'libido'. Thus the antithesis was between the ego instincts and the 'libidinal' instincts of love (in its widest sense) which were directed to an object. One of these object instincts, the sadistic instinct, stood out from the rest, it is true, in that its aim was so very far from being loving. Moreover it was obviously in some respects attached to the ego instincts: it could not hide its close affinity with instincts of mastery which have no libidinal purpose. But these discrepancies were got over; after all, sadism was clearly a part of sexual life, in the activities of which affection could be replaced by cruelty. Neurosis was regarded as the outcome of a struggle between the interest of self-preservation and the demands of the libido, a struggle in which the ego had been victorious but at the price of severe sufferings and renunciations. 

[1930a, 4508]

We have arrived at a general acquaintance with the psychical apparatus, with the parts, organs and agencies of which it is composed, with the forces which operate in it and with the functions allotted to its parts. The neuroses and psychoses are the states in which disturbances in the functioning of the apparatus come to expression. We have chosen the neuroses as the subjects of our study because they alone seem accessible to the psychological methods of our intervention. While we are trying to influence them, we collect observations which give us a picture of their origin and of the manner in which they arise. 

[1940a [1938], 4992]
We can speak with a fair degree of certainty about the part played by the period of life. It seems that neuroses are acquired only in early childhood (up to the age of six), even though their symptoms may not make their appearance till much later. The childhood neurosis may become manifest for a short time or may even be overlooked. In every case the later neurotic illness links up with the prelude in childhood. It is possible that what are known as traumatic neuroses (due to excessive fright or severe somatic shocks, such as railway collisions, burial under falls of earth, and so on) are an exception to this: their relations to determinants in childhood have hitherto eluded investigation. There is no difficulty in accounting for this aetiological preference for the first period of childhood. The neuroses are, as we know, disorders of the ego; and it is not to be wondered at if the ego, so long as it is feeble, immature and incapable of resistance, fails to deal with tasks which it could cope with later on with the utmost ease. In these circumstances instinctual demands from within, no less than excitations from the external world, operate as 'traumas', particularly if they are met half way by certain innate dispositions. The helpless ego fends them off by means of attempts at flight (repression), which later turn out to be inefficient and which involve permanent restrictions on further development. The damage inflicted on the ego by its first experiences gives us the appearance of being disproportionately great; but we have only to take as an analogy the differences in the results produced by the prick of a needle into a mass of cells in the act of cell-division (as in Roux's experiments) and into the fully grown animal which eventually develops out of them. No human individual is spared such traumatic experiences; none escapes the repressions to which they give rise. These questionable reactions on the part of the ego may perhaps be indispensable for the attainment of another aim which is set for the same period of life: in the space of a few years the little primitive creature must turn into a civilized human being; he must pass through an immensely long stretch of human cultural development in an almost uncannily abbreviated form. This is made possible by hereditary disposition; but it can almost never be achieved without the additional help of upbringing, of parental influence, which, as a precursor of the super-ego, restricts the ego's activity by prohibitions and punishments, and encourages or compels the setting-up of repressions. We must therefore not forget to include the influence of civilization among the determinants of neurosis. It is easy, as we can see, for a barbarian to be healthy; for a civilized man the task is hard. The desire for a powerful, uninhibited ego may seem to us intelligible; but, as we are taught by the times we live in, it is in the profoundest sense hostile to civilization. And since the demands of civilization are represented by family upbringing, we must bear in mind the part played by this biological characteristic of the human species - the prolonged period of its childhood dependence - in the aetiology of the neuroses. [1940a [1938], 4993]
I have laid it down as the task of dream-interpretation to replace the dream by the latent dream-thoughts, that is, to unravel what the dream-work has woven. In so doing I have raised a number of new psychological problems dealing with the mechanism of this dream-work itself, as well as with the nature and conditions of what is described as repression; on the other hand I have asserted the existence of the dream-thoughts - a copious store of psychical structures of the highest order, which is characterized by all the signs of normal intellectual functioning, but is nevertheless withdrawn from consciousness till it emerges in distorted form in the dream-content. I cannot but assume that thoughts of this kind are present in everyone, since almost everyone, including the most normal people, is capable of dreaming. The unconscious material of the dream-thoughts and its relation to consciousness and to repression raise further questions of significance to psychology, the answers to which must no doubt be postponed until analysis has clarified the origin of other psychopathological structures, such as hysterical symptoms and obsessional ideas.

[1901a, 1098]

I next proceed to mention more particularly what is to be found in this paper and what is not to be found in it. The title of the work was originally 'Dreams and Hysteria', for it seemed to me peculiarly well-adapted for showing how dream-interpretation is woven into the history of a treatment and how it can become the means of filling in amnesias and elucidating symptoms. It was not without good reasons that in the year 1900 I gave precedence to a laborious and exhaustive study of dreams (The Interpretation of Dreams) over the publications upon the psychology of the neuroses which I had in view. And incidentally I was able to judge from its reception with what an inadequate degree of comprehension such efforts are met by other specialists at the present time. In this instance there was no validity in the objection that the material upon which had based my assertions had been withheld and that it was therefore impossible to become convinced of their truth by testing and checking them. For every one can submit his own dreams to analytic examination, and the technique of interpreting dreams may be easily learnt from the instructions and examples which I have given. I must once more insist, just as I did at that time, that a thorough investigation of the problems of dreams is an indispensable prerequisite for any comprehension of the mental processes in hysteria and the other psychoneuroses, and that no one who wishes to shirk that preparatory labour has the smallest prospect of advancing even a few steps into this region of knowledge. Since, therefore, this case history presupposes a knowledge of the interpretation of dreams, it will seem highly unsatisfactory to any reader to whom this presupposition does not apply. Such a reader will find only bewilderment in these pages instead of the enlightenment he is in search of, and he will certainly be inclined to project the cause of his bewilderment on to the author and to pronounce his views fantastic. But in reality this bewildering character attaches to the phenomena of the neurosis itself; its presence there is only concealed by the physician's familiarity with the facts, and it comes to light again with every attempt a explaining them. It could only be completely banished if we could succeed in tracing back every single element of a neurosis to factors with which we were already familiar. But everything tends to show that, on the contrary, we shall be driven by the study of neuroses to assume the existence of many new thing which will later on gradually become the subject of more certain knowledge. What is new has always aroused bewilderment and resistance.

[1905e, 1353]
The answer to the first question touches on a problem which has often been discussed and cannot be exhaustively treated here - that of sexual abstinence. Our third stage of civilization demands of individuals of both sexes that they shall practise abstinence until they are married and that all who do not contract a legal marriage shall remain abstinent throughout their lives. The position, agreeable to all the authorities, that sexual abstinence is not harmful and not difficult to maintain, has also been widely supported by the medical profession. It may be asserted, however, that the task of mastering such a powerful impulse as that of the sexual instinct by any other means than satisfying it is one which can call for the whole of a man's forces. Mastering it by sublimation, by deflecting the sexual instinctual forces away from their sexual aim to higher cultural aims, can be achieved by a minority and then only intermittently, and least easily during the period of ardent and vigorous youth. Most of the rest become neurotic or are harmed in one way or another. Experience shows that the majority of the people who make up our society are constitutionally unfit to face the task of abstinence. Those who would have fallen ill under milder sexual restrictions fall ill all the more readily and more severely before the demands of our cultural sexual morality of to-day; for we know no better safe-guard against the threat to normal sexual life offered by defective innate dispositions or disturbances of development than sexual satisfaction itself. The more a person is disposed to neurosis, the less can he tolerate abstinence; instincts which have been withdrawn from normal development, in the sense in which it has been described above, become at the same time all the more uninhibitable. But even those people who would have retained their health under the requirements of the second stage of civilization will now succumb to neurosis in great numbers. For the psychical value of sexual satisfaction increases with its frustration. The dammed-up libido is now put in a position to detect one or other of the weaker spots which are seldom absent in the structure of sexual life, and there to break through and obtain substitutive satisfaction of a neurotic kind in the form of pathological symptoms. Anyone who is able to penetrate the determinants of nervous illness will soon become convinced that its increase in our society arises from the intensification of sexual restrictions.

[1908d, 1956]

For a small child his parents are at first the only authority and the, source of all belief. The child's most intense and most momentous wish during these early years is to be like his parents (that is, the parent of his own sex) and to be big like his father and mother. But as intellectual growth increases, the child cannot help discovering by degrees the category to which his parents belong. He gets to know other parents and compares them with his own, and so acquires the right to doubt the incomparable and unique quality which he had attributed to them. Small events in the child's life which make him feel dissatisfied afford him provocation for beginning to criticize his parents, and for using, in order to support his critical attitude, the knowledge which he has acquired that other parents are in some respects preferable to them. The psychology of the neuroses teaches us that, among other factors, the most intense impulses of sexual rivalry contribute to this result. A feeling of being slighted is obviously what constitutes the subject-matter of such provocations. There are only too many occasions on which a child is slighted, or at least feels he has been slighted, on which he feels he is not receiving the whole of his parents' love, and, most of all, of which he feels regrets at having to share it with brothers and sisters. His sense that his own affection is not being fully reciprocated then finds a vent in the idea, often consciously recollected later from early childhood, of being a step-child or an adopted child. People who have not developed neuroses very frequently remember such occasions, on which - usually as a result of something they have read - they interpreted and responded to their parent's hostile behaviour in this fashion. But here the influence of sex is already in evidence, for a boy is far more inclined to feel hostile impulses towards his father than towards his mother and has a far more intense desire to get free from him than from her. In this respect the imagination of girls is apt to show itself much weaker. These consciously remembered mental impulses of childhood embody the factor which enables us to understand the nature of myths.

[1909c, 1987]
My investigations into the aetiology and psychical mechanism of neurotic illnesses, which I have pursued since 1893, attracted little notice to begin with among my fellow specialists. At length, however, those investigations have met with recognition from a number of medical research workers and have also drawn attention to the psycho-analytic methods of examination and treatment to which I owe my findings. Dr. Wilhelm Stekel, who was one of the first of the colleagues to whom I was able to impart a knowledge of psycho-analysis, and who has himself become familiar with its technique through many years of practice in it, has now undertaken the task of working over one topic in the clinical aspect of these neuroses on the basis of my views and of presenting medical readers with the experiences he has obtained through the psycho-analytic method. If I am glad to take the responsibility for his work in the sense which I have just indicated, I think it is only right to declare explicitly that my direct influence upon the volume on nervous states of anxiety which lies before us has been a very slight one. The observations and all the detailed opinions and interpretations are the author's own. My share has been limited to proposing the use of the term 'anxiety hysteria'.

[1908f, 1994]

Starting from dreams, the investigations of psycho-analysis have enabled it to construct a psychology of the neuroses which is being continuously built up piece by piece. But what we are here concerned with - the psychological interest of psycho-analysis - obliges us to enter more fully into only two sides of this far reaching subject: the evidence that many pathological phenomena which had hitherto been believed to require physiological explanations are in fact psychical acts, and the evidence that the processes which lead to abnormal consequences can be traced back to psychical motive forces.

[1913j, 2809]
The World War, which broke up so many other organizations, could do nothing against our 'International'. The first meeting after the war took place in 1920, at The Hague, on neutral ground. It was moving to see how hospitably the Dutch welcomed the starving and impoverished subjects of the Central European states; and I believe this was the first occasion in a ruined world on which Englishmen and Germans sat at the same table for the friendly discussion of scientific interests. Both in Germany and in the countries of Western Europe the war had actually stimulated interest in psycho-analysis. The observation of war neuroses had at last opened the eyes of the medical profession to the importance of psychogenesis in neurotic disturbances, and some of our psychological conceptions, such as the 'gain from illness' and the 'flight into illness', quickly became popular. The last Congress before the German collapse, which was held at Budapest in 1918, was attended by official representatives of the allied governments of the Central European powers, and they agreed to the establishment of psycho-analytic Centres for the treatment of war neuroses. But this point was never reached. Similarly too the comprehensive plans made by one of our leading members, Dr. Anton von Freund, for establishing in Budapest a centre for analytic study and treatment came to grief as a result of the political upheavals that followed soon afterwards and of the premature death of their irreplaceable author. At a later date some of his ideas were put into execution by Max Eitingon, who in 1920 founded a psycho-analytical clinic in Berlin. During the brief period of Bolshevik rule in Hungary, Ferenczi was still able to carry on a successful course of instruction as the official representative of psycho-analysis at the University of Budapest. After the war our opponents were pleased to announce that events had produced a conclusive argument against the validity of the theses of analysis. The war neuroses, they said, had proved that sexual factors were unnecessary to the aetiology of neurotic disorders. But their triumph was frivolous and premature. For on the one hand no one had been able to carry out a thorough analysis of a case of war neurosis, so that in fact nothing whatever was known for certain as to their motivation and no conclusions could be drawn from this uncertainty; while on the other hand psycho-analysis had long before arrived at the concept of narcissism and of narcissistic neuroses, in which the subject's libido is attached to his own ego instead of to an object. Though on other occasions, therefore, the charge was brought against psycho-analysis of having made an unjustifiable extension of the concept of sexuality, yet, when it became convenient for controversial ends, this crime was forgotten and we were once more held down to the narrowest meaning of the word.

[1925d, 4229]

It is a familiar fact that the aetiological preconditions of neurosis are not yet known with certainty. The precipitating causes of it are frustrations and internal conflicts: conflicts between the three major psychical agencies, conflicts arising within the libidinal economy in consequence of our bisexual disposition and conflicts between the erotic and the aggressive instinctual components. It is the endeavour of the psychology of the neuroses to discover what makes these processes, which belong to the normal course of mental life, become pathogenic.

[1931a, 4587]

For these new experiments made it a certainty that the patients whom we described as neurotic were in some sense suffering from mental disturbances and ought therefore to be treated by psychological methods. Our interest therefore necessarily turned to psychology. The psychology which ruled at that time in the academic schools of philosophy had very little to offer and nothing at all for our purposes: we had to discover from the start both our methods and the theoretical hypotheses behind them. So I worked in this direction, first in collaboration with Breuer and afterwards independently of him. In the end I made it a part of my technique to require my patients to tell me without criticism whatever occurred to their minds, even if they were ideas which did not seem to make sense or which it was distressing to report.

[1932c, 4807]
(a) No one who is altogether opposed to a psychological view of hysteria, who is unwilling to give up the hope that some day it will be possible to trace back its symptoms to 'finer anatomical changes’ and who has rejected the view that the material foundations of hysterical changes are bound to be of the same kind as those of our normal mental processes - no one who adopts this attitude will, of course, put any faith in the results of our analyses; however, the difference in principle between his premisses and ours absolves us from the obligation of convincing him on individual points.

[1896c, 417]

In its time, hypnotic treatment by suggestion very soon passed beyond the sphere of medical application and entered the service of the education¹ of young people. If we are to believe the reports, it proved to be an effective means forgetting rid of childish faults, of inconvenient physical habits and of character traits that were otherwise irreducible. No one at that time objected to, or was surprised at, this extension of its uses, which, incidentally, has only been made fully understandable by the researches of psycho-analysis. For we know to-day that pathological symptoms are often nothing but substitutes for bad (that is, unserviceable) inclinations, and that the determinants of these symptoms are laid down in the years of childhood and youth - during the same period in which human beings are the subject of education - whether the illnesses themselves already emerge in youth or only at a later time of life.

[1913b, 2634]

Its further course led it away from the study of the somatic determinants of nervous disease to an extent that was bewildering to physicians. Instead, it was brought into contact with the mental substance of human lives - the lives not only of the sick, but of the healthy, the normal and the supernormal. It had to deal with emotions and passions, and most of all with those which the poets never tire of depicting and celebrating - the emotions of love. It learnt to recognize the power of memories, the unsuspected importance of the years of childhood in shaping the adult, and the strength of wishes, which falsify human judgements and lay down fixed lines for human endeavour.

[1919g, 3703]

For these new experiments made it a certainty that the patients whom we described as neurotic were in some sense suffering from mental disturbances and ought therefore to be treated by psychological methods. Our interest therefore necessarily turned to psychology. The psychology which ruled at that time in the academic schools of philosophy had very little to offer and nothing at all for our purposes: we had to discover from the start both our methods and the theoretical hypotheses behind them. So I worked in this direction, first in collaboration with Breuer and afterwards independently of him. In the end I made it a part of my technique to require my patients to tell me without criticism whatever occurred to their minds, even if they were ideas which did not seem to make sense or which it was distressing to report.

[1932c, 4807]
And yet illnesses of this kind are the result of intention for the purposes they serve. They are as a rule levelled at a particular person, and consequently vanish with that person's departure. The crudest and most commonplace views on the character of hysterical disorder - such as are to be heard from uneducated relatives or nurses - are in a certain sense right. It is true that the paralysed and bedridden woman would spring to her feet if a fire were to break out in her room, and that the spoiled wife would forget all her sufferings if her child were to fall dangerously ill or if some catastrophe were to threaten the family circumstances. People who speak of the patients in this way are right except upon a single point: they overlook the psychological distinction between what is conscious and what is unconscious. This may be permissible where children are concerned, but with adults it is no longer possible. That is why all these asseverations that it is 'only a question of willing' and all the encouragements and abuse that are addressed to the patient are of no avail. An attempt must first be made by the roundabout methods of analysis to convince the patient herself of the existence in her of an intention to be ill.

[1905e, 1382]

LADIES AND GENTLEMEN, - For laymen the symptoms constitute the essence of a disease and its cure consists in the removal of the symptoms. Physicians attach importance to distinguishing the symptoms from the disease and declare that getting rid of the symptoms does not amount to curing the disease. But the only tangible thing left of the disease after the symptoms have been got rid of is the capacity to form new symptoms. For that reason we will for the moment adopt the layman's position and assume that to unravel the symptoms means the same thing as to understand the disease.

[1916-1917, 3417]

So much for experiences. They show us that in renouncing direct suggestion we are not giving up anything of irreplaceable value. Now let us add a few reflections to this. The practice of hypnotic therapy makes very small demands on either the patient or the doctor. It agrees most beautifully with the estimate in which neuroses are still held by the majority of doctors. The doctor says to the neurotic patient: 'There's nothing wrong with you, it's only a question of nerves; so I can blow away your trouble in two or three minutes with just a few words.' But our views on the laws of energy are offended by the notion of its being possible to move a great weight by a tiny application of force, attacking it directly, without the outside help of any appropriate appliances. In so far as the conditions are comparable, experience shows that this feat is not successfully accomplished in the case of the neuroses either. But I am aware that this argument is not unimpeachable. There is such a thing as a 'trigger-action'.

[1916-1917, 3492]
Compared with the other psychotherapeutic procedures psycho-analysis is beyond any doubt the most powerful. It is just and fair, too, that this should be so for it is also the most laborious and time-consuming; it would not be used on slight cases. In suitable cases it is possible by its means to get rid of disturbances and bring about changes for which in pre-analytic times one would not have ventured to hope. But it has its very appreciable limits. The therapeutic ambition of some of my adherents has made the greatest efforts to overcome these obstacles so that every sort of neurotic disorder might be curable by psycho-analysis. They have endeavoured to compress the work of analysis into a shorter duration, to intensify transference so that it may be able to overcome any resistance, to unite other forms of influence with it so as to compel a cure. These efforts are certainly praiseworthy, but, in my opinion, they are vain. They bring with them, too, a danger of being oneself forced away from analysis and drawn into a boundless course of experimentation. The expectation that every neurotic phenomenon can be cured may, I suspect, be derived from the layman’s belief that the neuroses are something quite unnecessary which have no right whatever to exist. Whereas in fact they are severe, constitutionally fixed illnesses, which rarely restrict themselves to only a few attacks but persist as a rule over long periods or throughout life. Our analytic experience that they can be extensively influenced, if the historical precipitating causes and accidental auxiliary factors of the illness can be dealt with, has led us to neglect the constitutional factor in our therapeutic practice, and in any case we can do nothing about it; but in theory we ought always to bear it in mind. The radical inaccessibility of the psychoses to analytic treatment should, in view of their close relationship to the neuroses, restrict our pretensions in regard to these latter. The therapeutic effectiveness of psycho-analysis remains cramped by a number of weighty and scarcely assailable factors. In the case of children, where one might count on the greatest successes, the difficulties are the external ones connected with their relation to their parents, though these difficulties are after all a necessary part of being a child. In the case of adults the difficulties arise in the first instance from two factors: the amount of psychical rigidity present and the form of the illness with all that that covers in the way of deeper determinants.

[1933a, 4752]
But the series of possibilities grows wider; and psychological drama turns into psychopathological drama when the source of the suffering in which we take part and from which we are meant to derive pleasure is no longer a conflict between two almost equally conscious impulses but between a conscious impulse and a repressed one. Here the precondition of enjoyment is that the spectator should himself be a neurotic, for it is only such people who can derive pleasure instead of simple aversion from the revelation and the more or less conscious recognition of a repressed impulse. In anyone who is not neurotic this recognition will meet only with aversion and will call up a readiness to repeat the act of repression which has earlier been successfully brought to bear on the impulse: for in such people a single expenditure of repression has been enough to hold the repressed impulse completely in check. But in neurotics the repression is on the brink of failing; it is unstable and needs a constant renewal of expenditure, and this expenditure is spared if recognition of the impulse is brought about. Thus it is only in neurotics that a struggle can occur of a kind which can be made the subject of a drama; but even in them the dramatist will provoke not merely an enjoyment of the liberation but a resistance to it as well.

[1942a [1905], 1610]

The liberation of an individual, as he grows up, from the authority of his parents is one of the most necessary though one of the most painful results brought about by the course of his development. It is quite essential that that liberation should occur and it may be presumed that it has been to some extent achieved by everyone who has reached a normal state. Indeed, the whole progress of society rests upon the opposition between successive generations. On the other hand, there is a class of neurotics whose condition is recognizably determined by their having failed in this task.

[1909c, 1987]

(c) The next type, which I shall describe as falling ill from an inhibition in development, looks like an exaggeration of the second one - falling ill from the demands of reality. There is no theoretical reason for distinguishing it, but only a practical one; for those we are here concerned with are people who fall ill as soon as they get beyond the irresponsible age of childhood, and who have thus never reached a phase of health - a phase, that is, of capacity for achievement and enjoyment which is on the whole unrestricted. The essential feature of the dispositional process is in these cases quite plain. Their libido has never left its infantile fixations; the demands of reality are not suddenly made upon a wholly or partly mature person, but arise from the very fact of growing older, since it is obvious that they constantly alter with the subject's increasing age. Thus conflict falls into the background in comparison with insufficiency. But here, too, all our other experience leads us to postulate an effort at overcoming the fixations of childhood; for otherwise the outcome of the process could never be neurosis but only a stationary infantilism.

[1912c, 2563]
But I should like to say a few words to you to relieve you of your surprise at the emergence of this unexpected phenomenon. We must not forget that the patient's illness, which we have undertaken to analyse, is not something which has been rounded off and become rigid but that it is still growing and developing like a living organism. The beginning of the treatment does not put an end to this development; when, however, the treatment has obtained mastery over the patient, what happens is that the whole of his illness's new production is concentrated upon a single point - his relation to the doctor. Thus the transference may be compared to the cambium layer in a tree between the wood and the bark, from which the new formation of tissue and the increase in the girth of the trunk derive. When the transference has risen to this significance, work upon the patient's memories retreats far into the background. Thereafter it is not incorrect to say that we are no longer concerned with the patient's earlier illness but with a newly created and transformed neurosis which has taken the former's place. We have followed this new edition of the old disorder from its start, we have observed its origin and growth, and we are especially well able to find our way about in it since, as its object, we are situated at its very centre. All the patient's symptoms have abandoned their original meaning and have take on a new sense which lies in a relation to the transference; or only such symptoms have persisted as are capable of undergoing such a transformation. But the mastering of this new, artificial neurosis coincides with getting rid of the illness which was originally brought to the treatment - with the accomplishment of our therapeutic task. A person who has become normal and free from the operation of repressed instinctual impulse in his relation to the doctor will remain so in his own life after the doctor has once more withdrawn from it.

A capacity for directing libidinal object-cathexes on to people must of course be attributed to every normal person. The tendency to transference of the neurotics I have spoken of is only an extraordinary increase of this universal characteristic. It would indeed be very strange if a human trait so widespread and so important had never been noticed or appreciated. And in fact it has been. Bernheim, with an unerring eye based his theory of hypnotic phenomena on the thesis that everyone is in some way 'suggestible'. His suggestibility was nothing other than the tendency to transference, somewhat too narrowly conceived, so that it did not include negative transference. But Bernheim was never able to say what suggestion actually was and how it came about. For him it was a fundamental fact on whose origin he could throw no light. He did not know that his 'suggesibilite' depended on sexuality, on the activity of the libido. And it must dawn on us that in our technique we have abandoned hypnosis only to rediscover suggestion in the shape of transference.

Thus in our view the individual advances from narcissism to object-love. But we do not believe that the whole of the libido ever passes over from the ego to objects. A certain quantity of libido is always retained in the ego; even when object-love is highly developed, a certain amount of narcissism persists. The ego is a great reservoir from which the libido that is destined for objects flows out and into which it flows back from those objects. Object-libido was at first ego-libido and can be transformed back into ego-libido. For complete health it is essential that the libido should not lose this full mobility. As an illustration of this state of things we may think of an amoeba, whose viscous substance puts out pseudopodia, elongations into which the substance of the body extends but which can be retracted at any time so that the form of the protoplasmic mass is restored.
This revolt against castration or a feminine attitude has been torn out of its organic context by Alfred Adler. He has linked it superficially or falsely with the longing for power, and has postulated it as an independent 'masculine protest'. Since a neurosis can only arise from a conflict between two trends, it is as justifiable to see the cause of 'every' neurosis in the masculine protest as it is to see it in the feminine attitude against which the protest is being made. It is quite true that this masculine protest plays a regular part in the formation of character - in some types of people a very large part - and that we meet it in the analysis of neurotic men as a vigorous resistance. Psycho-analysis has attached due importance to the masculine protest in connection with the castration complex, without being able to accept its omnipotence or its omnipresence in neuroses. The most marked case of a masculine protest with all its manifest reactions and character-traits that I have met with in analysis was that of a patient who came to me for treatment on account of an obsessional neurosis in whose symptoms the unresolved conflict between a masculine and a feminine attitude (fear of castration and desire for castration) found clear expression. In addition, the patient had developed masochistic phantasies which were wholly derived from a wish to accept castration; and he had even gone beyond these phantasies to real satisfaction in perverse situations. The whole of his state rested - like Adler's theory itself - on the repression and denial of early infantile fixations of love.

Accordingly, the initial difference is expressed thus in the final outcome: in neurosis a piece of reality is avoided by a sort of flight, whereas in psychosis it is remodelled. Or we might say: in psychosis, the initial flight is succeeded by an active phase of remodelling; in neurosis, the initial obedience is succeeded by a deferred attempt at flight. Or again, expressed in yet another way: neurosis does not disavow the reality, it only ignores it; psychosis disavows it and tries to replace it. We call behaviour 'normal' or 'healthy', if it combines certain features of both reactions - if it disavows the reality as little as does a neurosis, but if it then exerts itself, as does a psychosis, to effect an alteration of that reality. Of course, this expedient, normal, behaviour leads to work being carried out on the external world; it does not stop, as in psychosis, at effecting internal changes. It is no longer autoplastic but alloplastic.

An investigation of normal, stable states, in which the frontiers of the ego are safeguarded against the id by resistances (anticathexes) and have held firm, and in which the super-ego is not distinguished from the ego, because they work together harmoniously - an investigation of that kind would teach us little. The only thing that can help us are states of conflict and uproar, when the contents of the unconscious id have a prospect of forcing their way into the ego and into consciousness and the ego puts itself once more on the defensive against this invasion. It is only under these conditions that we can make such observations as will confirm or correct our statements about the two partners. Now, our nightly sleep is precisely a state of this sort, and for that reason psychical activity during sleep, which we perceive as dreams, is our most favourable object of study. In that way, too, we avoid the familiar reproach that we base our constructions of normal mental life on pathological findings; for dreams are regular events in the life of a normal person, however much their characteristics may differ from the productions of our waking life. Dreams, as everyone knows, may be confused, unintelligible or positively nonsensical, what they say may contradict all that we know of reality, and we behave in them like insane people, since, so long as we are dreaming, we attribute objective reality to the contents of the dream.
Perhaps, too, in most people's eyes we are doing our author a poor service in declaring his work to be a psychiatric study. An author, we hear them say, should keep out of the way of any contact with psychiatry and should leave the description of pathological mental states to the doctors. The truth is that no truly creative writer has ever obeyed this injunction. The description of the human mind is indeed the domain which is most his own; he has from time immemorial been the precursor of science, and so too of scientific psychology. But the frontier between states of mind described as normal and pathological is in part a conventional one and in part so fluctuating that each of us probably crosses it many times in the course of a day. On the other hand, psychiatry would be doing wrong if it tried to restrict itself permanently to the study of the severe and gloomy illnesses that arise from gross injuries to the delicate apparatus of the mind. Deviations from health which are slighter and capable of correction, and which to-day we can trace back no further than to disturbances in the interplay of mental forces, arouse its interest no less. Indeed, only through the medium of these can it understand either normal states or the phenomena of severe illness. Thus the creative writer cannot evade the psychiatrist nor the psychiatrist the creative writer, and the poetic treatment of a psychiatric theme can turn out to be correct without any sacrifice of its beauty.

[1907a, 1843]

(c) The next type, which I shall describe as falling ill from an inhibition in development, looks like an exaggeration of the second one - falling ill from the demands of reality. There is no theoretical reason for distinguishing it, but only a practical one; for those we are here concerned with are people who fall ill as soon as they get beyond the irresponsible age of childhood, and who have thus never reached a phase of health - a phase, that is, of capacity for achievement and enjoyment which is on the whole unrestricted. The essential feature of the dispositional process is in these cases quite plain. Their libido has never left its infantile fixations; the demands of reality are not suddenly made upon a wholly or partly mature person, but arise from the very fact of growing older, since it is obvious that they constantly alter with the subject's increasing age. Thus conflict falls into the background in comparison with insufficiency. But here, too, all our other experience leads us to postulate an effort at overcoming the fixations of childhood; for otherwise the outcome of the process could never be neurosis but only a stationary infantilism.

[1912c, 2563]

² Here we have a justification of the claim to aetiological importance of such non-specific factors as overwork, shock, etc. These factors have always been assured of general recognition, but have had to be pushed into the background precisely by psycho-analysis. It is impossible to define health except in metapsychological terms: i.e. by reference to the dynamic relations between the agencies of the mental apparatus which have been recognized - or (if that is preferred) inferred or conjectured - by us.

[1937c, 5023]
But the series of possibilities grows wider; and psychological drama turns into psychopathological drama when the source of the suffering in which we take part and from which we are meant to derive pleasure is no longer a conflict between two almost equally conscious impulses but between a conscious impulse and a repressed one. Here the precondition of enjoyment is that the spectator should himself be a neurotic, for it is only such people who can derive pleasure instead of simple aversion from the revelation and the more or less conscious recognition of a repressed impulse. In anyone who is not neurotic this recognition will meet only with aversion and will call up a readiness to repeat the act of repression which has earlier been successfully brought to bear on the impulse: for in such people a single expenditure of repression has been enough to hold the repressed impulse completely in check. But in neurotics the repression is on the brink of failing; it is unstable and needs a constant renewal of expenditure, and this expenditure is spared if recognition of the impulse is brought about. Thus it is only in neurotics that a struggle can occur of a kind which can be made the subject of a drama; but even in them the dramatist will provoke not merely an enjoyment of the liberation but a resistance to it as well.

[1942a [1905], 1610]

But on the other hand Hanold did not enjoy this victory over his erotism. The suppressed mental impulse remained powerful enough to revenge itself on the suppressing one with discontent and inhibition. His longings turned into restlessness and dissatisfaction, which made his journey seem pointless to him. His insight into his reasons for the journey at the bidding of the delusion was inhibited and his relations with his science, which in such a spot should have stirred all his interest, were interfered with. So the author shows us his hero after his flight from love in a kind of crisis, in a state of complete confusion and distraction, in a turmoil such as we usually find at the climax of an illness, when neither of the two conflicting powers has any longer a sufficiently superior strength over the other for the margin between them to make it possible to establish a vigorous mental régime. But here the author intervenes helpfully, and smoothes things out by making Gradiva appear at this juncture and undertake the cure of the delusion. By the power he possesses of guiding the people of his creation towards a happy destiny, in spite of all the laws of necessity which he makes them obey, he arranges that the girl, to avoid whom Hanold had fled to Pompeii, shall be transported to that very place. In this way he corrects the folly to which the young man was led by his delusion - the folly of exchanging the home of the living girl whom he loved for the burial-place of her imaginary substitute.

[1907a, 1864]

The content of the system Pcs. (or Cs.) is derived partly from instinctual life (through the medium of the Ucs.), and partly from perception. It is doubtful how far the processes of this system can exert a direct influence on the Ucs.; examination of pathological cases often reveals an almost incredible independence and lack of susceptibility to influence on the part of the Ucs. A complete divergence of their trends, a total severance of the two systems, is what above all characterizes a condition of illness. Nevertheless, psycho-analytic treatment is based upon an influencing of the Ucs. from the direction of the Cs., and at any rate shows that this, though a laborious task, is not impossible. The derivatives of the Ucs. which act as intermediaries between the two systems open the way, as we have already said, towards accomplishing this. But we may safely assume that a spontaneously effected alteration in the Ucs. from the direction of the Cs. is a difficult and slow process.

[1915e, 3016]
But, Ladies and Gentlemen, who has so seriously misinformed you? A recommendation to the patient to 'live a full life' sexually could not possibly play a part in analytic therapy - if only because we ourselves have declared that an obstinate conflict is taking place in him between a libidinal impulse and sexual repression, between a sensual and an ascetic trend. This conflict would not be solved by our helping one of these trends to victory over its opponent. We see, indeed, that in neurotics asceticism has the upper hand; and the consequence of this is precisely that the suppressed sexual tendency finds a way out in symptoms. If, on the contrary, we were to secure victory for sensuality, then the sexual repression that had been put on one side would necessarily be replaced by symptom. Neither of these two alternative decisions could end the internal conflict; in either case one party to it would remain unsatisfied. There are only a few cases in which the conflict is so unstable that a factor such as the doctor's taking sides could decide it; and such cases do not in fact stand in need of analytic treatment. Anyone on whom the doctor could have so much influence would have found the same way out without the doctor. You must be aware that if an abstinent young man decides in favour of illicit sexual intercourse or if an unsatisfied wife seeks relief with another man, they have not as a rule waited for permission from a doctor or even from their analyst.

[1916-1917, 3476]

I will now complete my picture of the mechanism of cure by clothing it in the formulas of the libido theory. A neurotic is incapable of enjoyment and of efficiency - the former because his libido is not directed on to any real object and the latter because he is obliged to employ a great deal of this available energy on keeping his libido under repression and on warding off its assaults. He would become healthy if the conflict between his ego and his libido came to an end and if his ego had his libido again at its disposal. The therapeutic task consists, therefore, in freeing the libido from its present attachments, which are withdrawn from the ego, and in making it once more serviceable to the ego. Where, then, is the neurotic's libido situated? It is easily found: it is attached to the symptoms, which yield it the only substitutive satisfaction possible at the time. We must therefore make ourselves masters of the symptoms and resolve them - which is precisely the same thing that the patient requires of us. In order to resolve the symptoms, we must go back as far as their origin, we must renew the conflict from which they arose, and, with the help of motive forces which were not at the patient's disposal in the past, we must guide it to a different outcome. This revision of the process of repression can be accomplished only in part in connection with the memory traces of the processes which led to repression. The decisive part of the work is achieved by creating in the patient's relation to the doctor - in the 'transference' - new editions of the old conflicts; in these the patient would like to behave in the same way as he did in the past, while we, by summoning up every available mental force, compel him to come to a fresh decision. Thus the transference becomes the battlefield on which all the mutually struggling forces should meet one another.

[1916-1917, 3494]
With this as a starting-point we go on to make our first important discovery. We learn that, when we try to understand neurotic disorders, by far the greater significance attaches to the sexual instincts; that in fact neuroses are the specific disorders, so to speak, of the sexual function; that in general whether or not a person develops a neurosis depends on the quantity of his libido, and on the possibility of satisfying it and of discharging it through satisfaction; that the form taken by the disease is determined by the way in which the individual passes through the course of development of his sexual function, or, as we put it, by the fixations his libido has undergone in the course of its development; and, further, that by a special, not very simple technique for influencing the mind we are able to throw light on the nature of some groups of neuroses and at the same time to do away with them. Our therapeutic efforts have their greatest success with a certain class of neuroses which proceed from a conflict between the ego-instincts and the sexual instincts. For in human beings it may happen that the demands of the sexual instincts, whose reach of course extends far beyond the individual, seem to the ego to constitute a danger which threatens its self-preservation or its self-esteem. The ego then assumes the defensive, denies the sexual instincts the satisfaction they desire and forces them into those by-paths of substitutive satisfaction which become manifest as nervous symptoms. [1917a, 3609]

'Nothing has entered into you from without; a part of the activity of your own mind has been withdrawn from your knowledge and from the command of your will. That, too, is why you are so weak in your defence; you are using one part of your force to fight the other part and you cannot concentrate the whole of your force as you would against an external enemy. And it is not even the worst or least important part of your mental forces that has thus become antagonistic to you and independent of you. The blame, I am bound to say, lies with yourself. You over-estimated your strength when you thought you could treat your sexual instincts as you liked and could utterly ignore their intentions. The result is that they have rebelled and have taken their own obscure paths to escape this suppression; they have established their rights in a manner you cannot approve. How they have achieved this, and the paths which they have taken, have not come to your knowledge. All you have learned is the outcome of their work - the symptom which you experience as suffering. Thus you do not recognize it as a derivative of your own rejected instincts and do not know that it is a substitutive satisfaction of them. [1917a, 3613]

In actual fact, indeed, the neurotic patient presents us with a torn mind, divided by resistances. As we analyse it and remove the resistances, it grows together; the great unity which we call his ego fits into itself all the instinctual impulses which before had been split off and held apart from it. The psycho-synthesis is thus achieved during analytic treatment without our intervention, automatically and inevitably. We have created the conditions for it by breaking up the symptoms into their elements and by removing the resistances. It is not true that something in the patient has been divided into its components and is now quietly waiting for us to put it somehow together again. [1919a, 3630]
For a time psycho-analysis seemed fated to merge into psychology without being able to show why the psychology of the sick differed from that of the normal. In the course of its advance, however, it came up against the problem of dreams, which are abnormal products of the mind created by normal men under regularly recurrent physiological conditions. When psycho-analysis had solved the problem of dreams, it had discovered in *unconscious* psychical processes the common ground in which the highest and the lowest of mental impulses have their roots and from which spring the most normal as well as the most morbid and erratic of mental productions. The new picture of the workings of the mind began to grow ever clearer and more complete. It was a picture of obscure instinctual forces organic in origin, striving towards inborn aims, and, above them, of an agency comprising more highly organized mental structures - acquisitions of human evolution made under the impact of human history -, an agency which has taken over portions of the instinctual impulses, has developed them further or has even directed them towards higher aims, but which in any case binds them firmly and manipulates their energy to suit its own purposes. This higher organization, however, which is known to us as the ego, has rejected another portion of these same elementary instinctual impulses as being unserviceable because they cannot be fitted into the organic unity of the individual or because they rebel against the individual's cultural aims. The ego is not in a position to exterminate these unsubdued mental powers, but it turns its back on them, lets them remain at the lowest psychological level, defends itself from their demands by the energetic erection of protective and antithetical barriers or seeks to come to terms with them by means of substitutive satisfactions. These instincts which have fallen victim to repression - untamed and indestructible, yet inhibited from any kind of activity - together with their primitive mental representatives, constitute the mental underworld, the nucleus of the true unconscious, and are at every moment ready to assert their demands and, by hook or by crook, to force their way forward to satisfaction. To this is due the instability of the proud superstructure of the mind, the emergence at night of the proscribed and repressed material in the form of dreams, and the tendency to fall ill with neuroses and psychoses as soon as the balance of power between the ego and the repressed shifts to the disadvantage of the ego.

[1919g, 3703]

The third, psychological, factor resides in a defect of our mental apparatus which has to do precisely with its differentiation into an id and an ego, and which is therefore also attributable ultimately to the influence of the external world. In view of the dangers of reality, the ego is obliged to guard against certain instinctual impulses in the id and to treat them as dangers. But it cannot protect itself from internal instinctual dangers as effectively as it can from some piece of reality that is not part of itself. Intimately bound up with the id as it is, it can only fend off an instinctual danger by restricting its own organization and by acquiescing in the formation of symptoms in exchange for having impaired the instinct. If the rejected instinct renews its attack, the ego is overtaken by all those difficulties which are known to us as neurotic ailments.

[1926d, 4309]
You have no notion how close I am to fulfilling my promise. Even in organisms which later develop an efficient ego-organization, their ego is feeble and little differentiated from their id to begin with, during their first years of childhood. Imagine now what will happen if this powerless ego experiences an instinctual demand from the id which it would already like to resist (because it senses that to satisfy it is dangerous and would conjure up a traumatic situation, a collision with the external world) but which it cannot control, because it does not yet possess enough strength to do so. In such a case the ego treats the instinctual danger as if it was an external one; it makes an attempt at flight, draws back from this portion of the id and leaves it to its fate, after withholding from it all the contributions which it usually makes to instinctual impulses. The ego, as we put it, institutes a repression of these instinctual impulses. For the moment this has the effect of fending off the danger; but one cannot confuse the inside and the outside with impunity. One cannot run away from oneself. In repression the ego is following the pleasure principle, which it is usually in the habit of correcting; and it is bound to suffer damage in revenge. This lies in the ego's having permanently narrowed its sphere of influence. The repressed instinctual impulse is now isolated, left to itself, inaccessible, but also uninfluenceable. It goes its own way. Even later, as a rule, when the ego has grown stronger, it still cannot lift the repression; its synthesis is impaired, a part of the id remains forbidden ground to the ego. Nor does the isolated instinctual impulse remain idle; it understands how to make up for being denied normal satisfaction; it produces psychical derivatives which take its place; it links itself to other processes which by its influence it likewise tears away from the ego; and finally it breaks through into the ego and into consciousness in the form of an unrecognizably distorted substitute, and creates what we call a symptom. All at once the nature of a neurotic disorder becomes clear to us: on the one hand an ego which is inhibited in its synthesis, which has no influence on parts of the id, which must renounce some of its activities in order to avoid a fresh collision with what has been repressed, and which exhausts itself in what are for the most part vain acts of defence against the symptoms, the derivatives of the repressed impulses; and on the other hand an id in which individual instincts have made themselves independent, pursue their aims regardless of the interests of the person as a whole and henceforth obey the laws only of the primitive psychology that rules in the depths of the id. If we survey the whole situation we arrive at a simple formula for the origin of a neurosis: the ego has made an attempt to suppress certain portions of the id in an inappropriate manner, this attempt has failed and the id has taken its revenge. A neurosis is thus the result of a conflict between the ego and the id, upon which the ego has embarked because, as careful investigation shows, it wishes at all costs to retain its adaptability in relation to the real external world. The disagreement is between the external world and the id; and it is because the ego, loyal to its inmost nature, takes sides with the external world that it becomes involved in a conflict with its id. But please observe that what creates the determinant for the illness is not the fact of this conflict - for disagreements of this kind between reality and the id are unavoidable and it is one of the ego's standing tasks to mediate in them - but the circumstance that the ego has made use of the inefficient instrument of repression for dealing with the conflict. But this in turn is due to the fact that the ego, at the time at which it was set the task, was undeveloped and powerless. The decisive repressions all take place in early childhood.

[1926e, 4346]

Calm yourself! I do mean it. What I said was the truth - not the whole truth, no doubt, but a very noteworthy part of it. The patient wants to be cured - but he also wants not to be. His ego has lost its unity, and for that reason his will has no unity either. If that were not so, he would be no neurotic.

[1926e, 4363]
The derivatives of what is repressed have broken into his ego and established themselves there; and the ego has as little control over trends from that source as it has over what is actually repressed, and as a rule it knows nothing about them. These patients, indeed, are of a peculiar nature and raise difficulties with which we are not accustomed to reckon. All our social institutions are framed for people with a united and normal ego, which one can classify as good or bad, which either fulfils its function or is altogether eliminated by an overpowering influence. Hence the juridical alternative: responsible or irresponsible. None of these distinctions apply to neurotics. It must be admitted that there is difficulty in adapting social demands to their psychological condition. This was experienced on a large scale during the last war. Were the neurotics who evaded service malingerers or not? They were both. If they were treated as malingerers and if their illness was made highly uncomfortable, they recovered; if after being ostensibly restored they were sent back into service, they promptly took flight once more into illness. Nothing could be done with them. And the same is true of neurotics in civil life. They complain of their illness but exploit it with all their strength; and if someone tries to take it away from them they defend it like the proverbial lioness with her young. Yet there would be no sense in reproaching them for this contradiction. [1926e, 4363]

That can be managed, though, if one bears in mind the complexities of living substance. In what did we find the essence of a neurosis? In the fact that the ego, the higher organization of the mental apparatus (elevated through the influence of the external world), is not able to fulfil its function of mediating between the id and reality, that in its feebleness it draws back from some instinctual portions of the id and, to make up for this, has to put up with the consequences of its renunciation in the form of restrictions, symptoms and unsuccessful reaction-formations. [1926e, 4382]

A feebleness of the ego of this sort is to be found in all of us in childhood; and that is why the experiences of the earliest years of childhood are of such great importance for later life. Under the extraordinary burden of this period of childhood we have in a few years to cover the enormous developmental distance between stone-age primitive men and the participants in contemporary civilization, and, at the same time and in particular, we have to fend off the instinctual impulses of the early sexual period - under this burden, then, our ego takes refuge in repression and lays itself open to a childhood neurosis, the precipitate of which it carries with it into maturity as a disposition to a later nervous illness. Everything now depends on how the growing organism is treated by fate. If life becomes too hard, if the gulf between instinctual claims and the demands of reality becomes too great, the ego may fail in its efforts to reconcile the two, and the more readily, the more it is inhibited by the disposition carried over by it from infancy. The process of repression is then repeated, the instincts tear themselves away from the ego's domination, find their substitutive satisfactions along the paths of regression, and the poor ego has become helplessly neurotic. [1926e, 4382]
But if the relative feebleness of the ego is the decisive factor for the genesis of a neurosis, it must also be possible for a later physical illness to produce a neurosis, provided that it can bring about an enfeeblement of the ego. And that, once again, is very frequently found. A physical disorder of this kind can affect the instinctual life in the id and increase the strength of the instincts beyond the limit up to which the ego is capable of coping with them. The normal model of such processes is perhaps the alteration in women caused by the disturbances of menstruation and the menopause. Or again, a general somatic illness, indeed an organic disease of the nervous central organ, may attack the nutritional conditions of the mental apparatus and compel it to reduce its functioning and to bring to a halt its more delicate workings, one of which is the maintenance of the ego organization. In all these cases approximately the same picture of neurosis emerges; neurosis always has the same psychological mechanism, but, as we see, a most varied and often very complex aetiology.

We shall see, however, that this is not so and that it is merely a matter of bringing into sharper focus a turn of thought arrived at long ago and of following out its consequences. Of all the slowly developed parts of analytic theory, the theory of the instincts is the one that has felt its way the most painfully forward. And yet that theory was so indispensable to the whole structure that something had to be put in its place. In what was at first my utter perplexity, I took as my starting-point a saying of the poet-philosopher, Schiller, that 'hunger and love are what moves the world'. Hunger could be taken to represent the instincts which aim at preserving the individual; while love strives after objects, and its chief function, favoured in every way by nature, is the preservation of the species. Thus, to begin with, ego-instincts and object-instincts confronted each other. It was to denote the energy of the latter and only the latter instinct that I introduced the term 'libido'. Thus the antithesis was between the ego-instincts and the 'libidinal' instincts of love (in its widest sense) which were directed to an object. One of these object-instincts, the sadistic instinct, stood out from the rest, it is true, in that its aim was so very far from being loving. Moreover it was obviously in some respects attached to the ego-instincts: it could not hide its close affinity with instincts of mastery which have no libidinal purpose. But these discrepancies were got over; after all, sadism was clearly a part of sexual life, in the activities of which affection could be replaced by cruelty. Neurosis was regarded as the outcome of a struggle between the interest of self-preservation and the demands of the libido, a struggle in which the ego had been victorious but at the price of severe sufferings and renunciations.

It is a familiar fact that the aetiological preconditions of neurosis are not yet known with certainty. The precipitating causes of it are frustrations and internal conflicts: conflicts between the three major psychical agencies, conflicts arising within the libidinal economy in consequence of our bisexual disposition and conflicts between the erotic and the aggressive instinctual components. It is the endeavour of the psychology of the neuroses to discover what makes these processes, which belong to the normal course of mental life, become pathogenic.
An investigation of normal, stable states, in which the frontiers of the ego are safeguarded against the id by resistances (anticathexes) and have held firm, and in which the super-ego is not distinguished from the ego, because they work together harmoniously - an investigation of that kind would teach us little. The only thing that can help us are states of conflict and uproar, when the contents of the unconscious id have a prospect of forcing their way into the ego and into consciousness and the ego puts itself once more on the defensive against this invasion. It is only under these conditions that we can make such observations as will confirm or correct our statements about the two partners. Now, our nightly sleep is precisely a state of this sort, and for that reason psychical activity during sleep, which we perceive as dreams, is our most favourable object of study. In that way, too, we avoid the familiar reproach that we base our constructions of normal mental life on pathological findings; for dreams are regular events in the life of a normal person, however much their characteristics may differ from the productions of our waking life. Dreams, as everyone knows, may be confused, unintelligible or positively nonsensical, what they say may contradict all that we know of reality, and we behave in them like insane people, since, so long as we are dreaming, we attribute objective reality to the contents of the dream.

[1940a [1938], 4975]

Our plan of cure is based on these discoveries. The ego is weakened by the internal conflict and we must go to its help. The position is like that in a civil war which has to be decided by the assistance of an ally from outside. The analytic physician and the patient's weakened ego, basing themselves on the real external world, have to band themselves together into a party against the enemies, the instinctual demands of the id and the conscientious demands of the super-ego. We form a pact with each other. The sick ego promises us the most complete candour - promises, that is, to put at our disposal all the material which its self-perception yields it; we assure the patient of the strictest discretion and place at his service our experience in interpreting material that has been influenced by the unconscious. Our knowledge is to make up for his ignorance and to give his ego back its mastery over lost provinces of his mental life. This pact constitutes the analytic situation.

[1940a [1938], 4983]
The method by which we strengthen the weakened ego has as a starting-point an extending of its self-knowledge. That is not, of course, the whole story but it is a first step. The loss of such knowledge signifies for the ego a surrender of power and influence; it is the first tangible sign that it is being hemmed in and hampered by the demands of the id and the super-ego. Accordingly, the first part of the help we have to offer is intellectual work on our side and encouragement to the patient to collaborate in it. This first kind of activity, as we know, is intended to pave the way to another, more difficult, task. We shall not lose sight of the dynamic element in this task, even during its preliminary stage. We gather the material for our work from a variety of sources - from what is conveyed to us by the information given us by the patient and by his free associations, from what he shows us in his transferences, from what we arrive at by interpreting his dreams and from what he betrays by his slips or parapraxes. All this material helps us to make constructions about what happened to him and has been forgotten as well as about what is happening in him now without his understanding it. But in all this we never fail to make a strict distinction between our knowledge and his knowledge. We avoid telling him at once things that we have often discovered at an early stage, and we avoid telling him the whole of what we think we have discovered. We reflect carefully over when we shall impart the knowledge of one of our constructions to him and we wait for what seems to us the suitable moment - which it is not always easy to decide. As a rule we put off telling him of a construction or explanation till he himself has so nearly arrived at it that only a single step remains to be taken, though that step is in fact the decisive synthesis. If we proceeded in another way and overwhelmed him with our interpretations before he was prepared for them, our information would either produce no effect or it would provoke a violent outbreak of resistance which would make the progress of our work more difficult or might even threaten to stop it altogether. But if we have prepared everything properly, it often happens that the patient will at once confirm our construction and himself recollect the internal or external event which he had forgotten. The more exactly the construction coincides with the details of what has been forgotten the easier will it be for him to assent. On that particular matter our knowledge will then have become his knowledge as well.

[1940a [1938], 4987]
Let us once more glance over the situation which we have reached in our attempt at bringing help to the patient's neurotic ego. That ego is no longer able to fulfil the task set by the external world (including human society). Not all of its experiences are at its disposal, a large proportion of its store of memories have escaped it. Its activity is inhibited by strict prohibitions from the super-ego, its energy is consumed in vain attempts at fending off the demands of the id. Beyond this, as a result of continuous irruptions by the id, its organization is impaired, it is no longer capable of any proper synthesis, it is torn by mutually opposed urges, by unsettled conflicts and by unsolved doubts. To start with, we get the patient's thus weakened ego to take part in the purely intellectual work of interpretation, which aims at provisionally filling the gaps in his mental assets, and to transfer to us the authority of his super-ego; we encourage it to take up the struggle over each individual demand made by the id and to conquer the resistances which arise in connection with it. At the same time we restore order in the ego by detecting the material and urges which have forced their way in from the unconscious, and expose them to criticism by tracing them back to their origin. We serve the patient in various functions, as an authority and a substitute for his parents, as a teacher and educator; and we have done the best for him if, as analysts, we raise the mental processes in his ego to a normal level, transform what has become unconscious and repressed into preconscious material and thus return it once more to the possession of his ego. On the patient's side a few rational factors work in our favour, such as the need for recovery which has its motive in his sufferings, and the intellectual interest that we may awaken in him in the theories and revelations of psycho-analysis; but of far greater force is the positive transference with which he meets us. Fighting against us, on the other hand, are the negative transference, the ego's resistance due to repression (that is, its unpleasure at having to lay itself open to the hard work imposed on it), the sense of guilt arising from its relation to the super-ego and the need to be ill due to deep-going changes in the economics of his instincts. The share taken by the last two factors decides whether the case is to be regarded as slight or severe. Apart from these, a few other factors may be discerned as having a favourable or unfavourable bearing. A certain psychical inertia, a sluggishness of the libido, which is unwilling to abandon its fixations cannot be welcome to us; the patient's capacity for sublimating his instincts plays a large part and so does his capacity for rising above the crude life of the instincts; so, too, does the relative power of his intellectual functions.

[1940a [1938], 4990]
Neurotics, in whose self-feeling we seldom fail to find a strain of depression or anxious expectation, form greater numbers of these antithetic ideas than normal people, or perceive them more easily; and they regard them as of more importance. In our patient's state of exhaustion the antithetic idea, which was normally rejected, proved itself the stronger. It is this idea which put itself into effect and which, to the patient's horror, actually produced the noise she dreaded. In order to explain the whole process it may further be assumed that her exhaustion was only a partial one; it affected, to use the terminology of Janet and his followers, only her 'primary ego' and did not result in a weakening of the antithetic idea as well.

The first time she heard the voices was in the following circumstances. She had been reading Otto Ludwig's fine story, *Die Heiterethei*, with eager interest, and she noticed that while she was reading, thoughts were emerging which claimed her attention. Immediately afterwards, she went for a walk along a country road, and, as she was passing a small peasant's house, the voices suddenly said to her 'That's what the Heiterethei's cottage looked like! There's the spring and there are the bushes! How happy she was in spite of all her poverty!' The voices then repeated to her whole paragraphs from what she had just been reading. But it remained unintelligible why the Heiterethei's cottage and bushes and spring, and precisely the most trivial and irrelevant passages of the story, should be forced on her attention with pathological strength. However, the solution of the puzzle was not difficult. Her analysis showed that while she was reading, she had had other thoughts as well and that she had been excited by quite different passages in the book. Against this material - analogies between the couple in the story and herself and her husband, memories of intimacies in her married life, and of family secrets - against all this a repressing resistance had arisen because it was connected, by easily demonstrable trains of thought, with her aversion to sexuality and thus ultimately went back to the awakening of her old childhood experience. In consequence of this censorship exercised by the repression, the innocuous and idyllic passages, which were connected with the proscribed ones by contrast and also by propinquity, acquired the additional strength in their relation to consciousness which made it possible for them to be spoken aloud. The first of the repressed ideas, for instance, related to the slander to which the heroine, who lived alone, was exposed from her neighbours. My patient easily discovered the analogy with her own self. She, too, lived in a small place, met no one, and thought she was despised by her neighbours. This distrust of her neighbours had a real foundation. She had been obliged at first to be content with a small apartment, and the bedroom wall against which the young couple's double bed stood adjoined a room belonging to their neighbours. With the beginning of her marriage - obviously through an unconscious awakening of her childhood affair, in which she and her brother had played at husband and wife - she had developed a great aversion to sexuality. She was constantly worried in case her neighbours might hear words and noises through the party wall, and this shame turned into suspiciousness towards the neighbours.

For such cases it has quite correctly come to be the therapeutic practice to disregard the psychoneurotic components in the clinical picture and to treat the 'actual neurosis' exclusively. In very many cases it is possible to overcome the neurosis as well which it has brought along with it, provided that the neurasthenia is effectively dealt with. But a different view must be taken in those cases of psychoneurosis which either appear spontaneously or remain behind as an independent entity after an illness composed of neurasthenia and psychoneurosis has run its course. When I speak of a 'spontaneous' appearance of a psychoneurosis, I do not mean that anamnestic investigation shows us no aetiological element whatever. It may do so, no doubt; but it may also happen that our attention is directed to some indifferent factor - an emotional state, an enfeeblement owing to physical illness, and so on. It must, however, be borne in mind in all these cases that the true aetiology of the psychoneuroses does not lie in such precipitating causes, but remains beyond the reach of ordinary anamnestic examination.
It would be more dignified as well as more helpful to the patient - who, after all, has to come to terms with his ailments - for the doctor to tell the truth, as he knows it from his daily practice. The psychoneuroses as a genus are by no means mild illnesses. When hysteria sets in, no one can foretell when it will come to an end. We mostly comfort ourselves with the vain prophecy that 'one day it will suddenly disappear'. Recovery often enough turns out to be merely an agreement to mutual toleration between the sick part of the patient and the healthy part; or it is the result of the transformation of a symptom into a phobia. A girl's hysteria, calmed down with difficulty, revives in her as a wife after the short interruption of young married happiness. The only difference is that another person, the husband, is now driven by his own interests to keep silence about her condition. Even if an illness of this kind leads to no manifest incapacity on the patients' part to carry on their life, it nearly always prevents free unfolding of their mental powers. Obsessions recur throughout their lives; and phobias and other restrictions upon the will have hitherto been unamenable to treatment of any kind. All this is kept from the knowledge of the layman. The father of a hysterical girl is consequently horrified if, for instance, he is asked to agree to her being given a year's treatment, when she has perhaps only been ill for a few months. The layman is, as it were, deeply convinced in himself that all these psychoneuroses are unnecessary; so he has no patience with the processes of the illness and no readiness to make sacrifices for its treatment. If, in face of a case of typhus which lasts three weeks, or of a broken leg which takes six months to mend, he adopts a more understanding attitude, and if, as soon as his child shows the first signs of a curvature of the spine, he finds it reasonable that orthopaedic treatment should be carried on over several years, the difference in his behaviour is due to the better knowledge on the part of the physicians who pass on their knowledge honestly to the layman. Honesty on the part of the physician and willing acquiescence on the part of the layman will be established for the neuroses too, as soon as an insight into the nature of those affections becomes common property in the medical world. Radical treatment of these disorders will no doubt always require special training and will be incompatible with other kinds of medical activity. On the other hand, this class of physicians, which will, I believe, be a large one in the future, has the prospect of achieving noteworthy results and of obtaining a satisfying insight into the mental life of mankind.

¹ The appearance in dreams of things of great size and in great quantities and amounts, and of exaggeration generally, may be another childish characteristic. Children have no more ardent wish than to be big and grown-up and to get as much of things as grown-up people do. They are hard to satisfy, know no such word as 'enough' and insist insatiably on a repetition of things which they have enjoyed or whose taste they liked. It is only the civilizing influence of education that teaches them moderation and how to be content or resigned. Everyone knows that neurotics are equally inclined to be extravagant and immoderate.

One of my patients, a man whose sexual abstinence was imposed on him by a severe neurosis, and whose phantasies were fixed upon his mother, had repeated dreams of going upstairs in her company. I once remarked to him that a moderate amount of masturbation would probably do him less harm than his compulsive self-restraint, and this provoked the following dream:

This was dreamt by a young man who was endeavouring to give up his habit of masturbating in favour of sexual relations with women.
On the other hand, he (the patient) was the material which was being used for the analysis (or synthesis). What was in question was the success of the treatment. The reference to his legs in the dream reminded him of an experience of the previous evening. He had been having a dancing-lesson and had met a lady of whom he had been eager to make a conquest. He clasped her to himself so tightly that on one occasion she gave a scream. As he relaxed his pressure against her legs, he felt her strong responsive pressure against the lower part of his thighs as far down as his knees - the point mentioned in his dream. So that in this connection it was the woman who was the magnesium in the retort - things were working at last. He was feminine in relation to me, just as he was masculine in relation to the woman. If it was working with the lady it was working with him in the treatment. His feeling himself and the sensations in his knees pointed to masturbation and fitted in with his fatigue on the previous day. -His appointment with the lady had in fact been for half-past eleven. His wish to miss it by oversleeping and to stay with his sexual objects at home (that is, to keep to masturbation) corresponded to his resistance.

[1900a, 840]

It would be possible to mention a whole number of other 'typical' dreams if we take the term to mean that the same manifest dream-content is frequently to be found in the dreams of different dreamers. For instance we might mention dreams of passing though narrow streets or of walking through whole suites of rooms, and dreams of burglars - against whom, incidentally, nervous people take precautions before they go to sleep; dreams of being pursued by wild animals (or by bulls or horses) or of being threatened with knives, daggers or lances - these last two classes being characteristic of the manifest content of the dreams of people who suffer from anxiety - and many more. An investigation specially devoted to this material would thoroughly repay the labour involved. But instead of this I have two observations to make, though these do not apply exclusively to typical dreams.

[1900a, 852]

We shall not be able to form a correct picture of the strange psychical work which brings about the occurrence of both parapraxes and dream images until we have learnt that psychoneurotic symptoms, and especially the psychical formations of hysteria and obsessional neurosis, repeat in their mechanism all the essential features of this mode of working. This is therefore the starting-point for the continuation of our researches. For us, however, there is yet another special interest in considering parapraxes, chance actions and symptomatic actions in the light of this last analogy. If we compare them to the products of the psychoneuroses, to neurotic symptoms, two frequently repeated statements - namely, that the borderline between the normal and the abnormal in nervous matters is a fluid one, and that we are all a little neurotic - acquire meaning and support. Without any medical experience we can construct various types of nervous illness of this kind which are merely hinted at - formes frustres¹ - of the neuroses: cases in which the symptoms are few, or occur rarely or not severely - in other words, cases whose comparative mildness is located in the number, intensity and duration of their pathological manifestations. But we might perhaps never arrive by conjecture at precisely the type that appears most frequently to form the transition between health and illness. For the type we are considering, whose pathological manifestations are parapraxes and symptomatic acts, is characterized by the fact that the symptoms are located in the least important psychical functions, while everything that can lay claim to higher psychical value remains free from disturbance. Where the symptoms are distributed in the reverse way - that is, where they make their appearance in the most important individual and social functions and are able to disturb nutrition, sexual intercourse, professional work and social life - this is the mark of severe cases of neurosis and is more characteristic of them than, for example, are the variety and vigour of their pathological manifestations.

[1901b, 1347]
I next proceed to mention more particularly what is to be found in this paper and what is not to be found in it. The title of the work was originally 'Dreams and Hysteria', for it seemed to me peculiarly well-adapted for showing how dream-interpretation is woven into the history of a treatment and how it can become the means of filling in amnesias and elucidating symptoms. It was not without good reasons that in the year 1900 I gave precedence to a laborious and exhaustive study of dreams (The Interpretation of Dreams) over the publications upon the psychology of the neuroses which I had in view. And incidentally I was able to judge from its reception with what an inadequate degree of comprehension such efforts are met by other specialists at the present time. In this instance there was no validity in the objection that the material upon which had based my assertions had been withheld and that it was therefore impossible to become convinced of their truth by testing and checking them. For every one can submit his own dreams to analytic examination, and the technique of interpreting dreams may be easily learnt from the instructions and examples which I have given. I must once more insist, just as I did at that time, that a thorough investigation of the problems of dreams is an indispensable prerequisite for any comprehension of the mental processes in hysteria and the other psychoneuroses, and that no one who wishes to shirk that preparatory labour has the smallest prospect of advancing even a few steps into this region of knowledge. Since, therefore, this case history presupposes a knowledge of the interpretation of dreams, it will seem highly unsatisfactory to any reader to whom this presupposition does not apply. Such a reader will find only bewilderment in these pages instead of the enlightenment he is in search of, and he will certainly be inclined to project the cause of his bewilderment on to the author and to pronounce his views fantastic. But in reality this bewildering character attaches to the phenomena of the neurosis itself; its presence there is only concealed by the physician's familiarity with the facts, and it comes to light again with every attempt a explaining them. It could only be completely banished if we could succeed in tracing back every single element of a neurosis to factors with which we were already familiar. But everything tends to show that, on the contrary, we shall be driven by the study of neuroses to assume the existence of many new thing which will later on gradually become the subject of more certain knowledge. What is new has always aroused bewilderment and resistance.

[1905e, 1353]
If I were to begin by giving a full and consistent case history, it would place the reader in a very different situation from that of the medical observer. The reports of the patient's relatives - in the present case I was given one by the eighteen-year-old girl's father - usually afford a very indistinct picture of the course of the illness. I begin the treatment, indeed, by asking the patient to give me the whole story of his life and illness, but even so the information I receive is never enough to let me see my way about the case. This first account may be compared to an un navigable river whose stream is at one moment choked by masses of rock and at another divided and lost among shallows and sand banks. I cannot help wondering how it is that the authorities can produce such smooth and precise histories in cases of hysteria. As a matter of fact the patients are incapable of giving such reports about themselves. They can, indeed, give the physician plenty of coherent information about this or that period of their lives; but it is sure to be followed by another period as to which their communications run dry, leaving gaps unfilled, and riddles unanswered; and then again will come yet another period which will remain totally obscure and unilluminated by even a single piece of serviceable information. The connections - even the ostensible ones - are for the most part incoherent, and the sequence of different events is uncertain. Even during the course of their story patients will repeatedly correct a particular or a date, and then perhaps, after wavering for some time, return to their first version. The patients' inability to give an ordered history of their life in so far as it coincides with the history of their illness is not merely characteristic of the neurosis.¹ It also possesses great theoretical significance. For this inability has the following grounds. In the first place, patients consciously and intentionally keep back part of what they ought to tell - things that are perfectly well known to them - because they have not got over their feelings of timidity and shame (or discretion, where what they say concerns other people); this is the share taken by conscious disingenuousness. In the second place, part of the anamnestic knowledge, which the patients have at their disposal at other times, disappears while they are actually telling their story, but without their making any deliberate reservations: the share taken by unconscious disingenuousness. In the third place, there are invariably true amnesias - gaps in the memory into which not only old recollections but even quite recent ones have fallen - and paramnesias, formed secondarily so as to fill in those gaps.² When the events themselves have been kept in mind, the purpose underlying the amnesias can be fulfilled just as surely by destroying a connection, and a connection is most surely broken by altering the chronological order of events. The latter always proves to be the most vulnerable element in the store of memory and the one which is most easily subject to repression. Again we meet with many recollections that are in what might be described as the first stage of repression, and these we find surrounded with doubts. At a later period the doubts would be replaced by a loss or a falsification of memory.³

¹ [1905e, 1358]
I add a few remarks which may help towards the synthesis of this dream. The dream-work began on the afternoon of the day after the scene in the wood, after Dora had noticed that she was no longer able to lock the door of her room. She then said to herself: 'I am threatened by a serious danger here,' and formed her intention of not stopping on in the house alone but of going off with her father. This intention became capable of forming a dream, because it succeeded in finding a continuation in the unconscious. What corresponded to it there was her summoning up her infantile love for her father as a protection against the present temptation. The change which thus took place in her became fixed and brought her into the attitude shown by her supervalent train of thought - jealousy of Frau K. on her father's account, as though she herself were in love with him. There was a conflict within her between a temptation to yield to the man's proposal and a composite force rebelling against that feeling. This latter force was made up of motives of respectability and good sense, of hostile feelings caused by the governess's disclosures (jealousy and wounded pride, as we shall see later), and of a neurotic element, namely, the tendency to a repudiation of sexuality which was already present in her and was based on her childhood history. Her love for her father, which she summoned up to protect her against the temptation, had its origin in this same childhood history.

Nor do I know whether Herr K. would have done any better if it had been revealed to him that the slap Dora gave him by no means signified a final 'No' on her part, but that it expressed the jealousy which had lately been roused in her, while her strongest feelings were still on his side. If he had disregarded that first 'No', and had continued to press his suit with a passion which left room for no doubts, the result might very well have been a triumph of the girl's affection for him over all her internal difficulties. But I think she might just as well have been merely provoked into satisfying her craving for revenge upon him all the more thoroughly. It is never possible to calculate towards which side the decision will incline in such a conflict of motives: whether towards the removal of the repression or towards its reinforcement. Incapacity for meeting a real erotic demand is one of the most essential features of a neurosis. Neurotics are dominated by the opposition between reality and phantasy. If what they long for the most intensely in their phantasies is presented to them in reality, they none the less flee from it; and they abandon themselves to their phantasies the most readily where they need no longer fear to see them realized. Nevertheless, the barrier erected by repression can fall before the onslaught of a violent emotional excitement produced by a real cause; it is possible for a neurosis to be overcome by reality. But we have no general means of calculating through what person or what event such a cure can be effected.

[1905e, 1424, 1445]
The preceding discussion may perhaps have placed the sexuality of psychoneurotics in a false light. It may have given the impression that, owing to their disposition, psychoneurotics approximate closely to perverts in their sexual behaviour and are proportionately remote from normal people. It may indeed very well be that the constitutional disposition of these patients (apart from their exaggerated degree of sexual repression and the excessive intensity of their sexual instinct) includes an unusual tendency to perversion, using that word in its widest sense. Nevertheless, investigation of comparatively slight cases shows that this last assumption is not absolutely necessary, or at least that in forming a judgement on these pathological developments there is a factor to be considered which weighs in the other direction. Most psychoneurotics only fall ill after the age of puberty as a result of the demands made upon them by normal sexual life. (It is most particularly against the latter that repression is directed.) Or else illnesses of this kind set in later, when the libido fails to obtain satisfaction along normal lines. In both these cases the libido behaves like a stream whose main bed has become blocked. It proceeds to fill up collateral channels which may hitherto have been empty. Thus, in the same way, what appears to be the strong tendency (though, it is true, a negative one) of psychoneurotics to perversion may be collaterally determined, and must, in any case, be collaterally intensified. The fact is that we must put sexual repression as an internal factor alongside such external factors as limitation of freedom, inaccessibility of a normal sexual object, the dangers of the normal sexual act, etc., which bring about perversions in persons who might perhaps otherwise have remained normal.

On the other hand we must assume, or we can convince ourselves by a psychological examination of other people, that the very same impressions that we have forgotten have none the less left the deepest traces on our minds and have had a determining effect upon the whole of our later development. There can, therefore, be no question of any real abolition of the impressions of childhood, but rather of an amnesia similar to that which neurotics exhibit for later events, and of which the essence consists in a simple withholding of these impressions from consciousness, viz., in their repression. But what are the forces which bring about this repression of the impressions of childhood? Whoever could solve this riddle would, I think, have explained hysterical amnesia as well.

PATHWAYS OF MUTUAL INFLUENCE (b) If we now drop the figurative expression that we have so long adopted in speaking of the 'sources' of sexual excitation, we are led to the suspicion that all the connecting pathways that lead from other functions to sexuality must also be traversable in the reverse direction. If, for instance, the common possession of the labial zone by the two functions is the reason why sexual satisfaction arises during the taking of nourishment, then the same factor also enables us to understand why there should be disorders of nutrition if the erotogenic functions of the common zone are disturbed. Or again, if we know that concentration of attention may give rise to sexual excitation, it seems plausible to assume that by making use of the same path, but in a contrary direction, the condition of sexual excitation may influence the possibility of directing the attention. A good portion of the symptomatology of the neuroses, which I have traced to disturbances of the sexual processes, is expressed in disturbances of other, non-sexual, somatic functions; and this circumstance, which has hitherto been unintelligible, becomes less puzzling if it is only the counterpart of the influences which bring about the production of sexual excitation.
THE SEXUAL OBJECT DURING EARLY INFANCY  But even after sexual activity has become detached from the taking of nourishment, an important part of this first and most significant of all sexual relations is left over, which helps to prepare for the choice of an object and thus to restore the happiness that has been lost. All through the period of latency children learn to feel for other people who help them in their helplessness and satisfy their needs a love which is on the model of, and a continuation of, their relation as sucklings to their nursing mother. There may perhaps be an inclination to dispute the possibility of identifying a child's affection and esteem for those who look after him with sexual love. I think, however, that a closer psychological examination may make it possible to establish this identity beyond any doubt. A child's intercourse with anyone responsible for his care affords him an unending source of sexual excitation and satisfaction from his erotogenic zones. This is especially so since the person in charge of him, who, after all, is as a rule his mother, herself regards him with feelings that are derived from her own sexual life: she strokes him, kisses him, rocks him and quite clearly treats him as a substitute for a complete sexual object.¹ A mother would probably be horrified if she were made aware that all her marks of affection were rousing her child's sexual instinct and preparing for its later intensity. She regards what she does as asexual, 'pure' love, since, after all, she carefully avoids applying more excitations to the child's genitals than are unavoidable in nursery care. As we know, however, the sexual instinct is not aroused only by direct excitation of the genital zone. What we call affection will unfailingly show its effects one day on the genital zones as well. Moreover, if the mother understood more of the high importance of the part played by instincts in mental life as a whole - in all its ethical and psychical achievements - she would spare herself any self-reproaches even after her enlightenment. She is only fulfilling her task in teaching the child to love. After all, he is meant to grow up into a strong and capable person with vigorous sexual needs and to accomplish during his life all the things that human beings are urged to do by their instincts. It is true that an excess of parental affection does harm by causing precocious sexual maturity and also because, by spoiling the child, it makes him incapable in later life of temporarily doing without love or of being content with a smaller amount of it. One of the clearest indications that a child will later become neurotic is to be seen in an insatiable demand for his parents' affection. And on the other hand neuropathic parents, who are inclined as a rule to display excessive affection, are precisely those who are most likely by their caresses to arouse the child's disposition to neurotic illness. Incidentally, this example shows that there are ways more direct than inheritance by which neurotic parents can hand their disorder on to their children.

¹[1905d, 1536]
From certain of my remarks you will have gathered that there are many characteristics in the analytic method which prevent it from being an ideal form of therapy. Tuto, cito, jucunde: investigation and probing do not indicate speedy results, and the resistance I have mentioned would prepare you to expect unpleasantness of various kinds. Psycho-analytic treatment certainly makes great demands upon the patient as well as upon the physician. From the patient it requires perfect sincerity - a sacrifice in itself; it absorbs time and is therefore also costly; for the physician it is no less time-absorbing, and the technique which he must study and practise is fairly laborious. I consider it quite justifiable to resort to more convenient methods of treatment as long as there is any prospect of achieving anything by their means. That, after all, is the only point at issue. If the more difficult and lengthy method accomplishes considerably more than the short and easy one, then, in spite of everything, the use of the former is justified. Only consider, Gentlemen, how much more inconvenient and costly is the Finsen therapy of lupus than the method of cauterizing and scraping previously employed; and yet the use of the former signifies a great advance, for it performs a radical cure. Although I do not wish to carry this comparison to extremes, the psycho-analytic method may claim a similar privilege. Actually, I have been able to elaborate and to test my therapeutic method only on severe, indeed on the severest cases; at first my material consisted entirely of patients who had tried everything else without success, and had spent long years in sanatoria. I have scarcely been able to bring together sufficient material to enable me to say how my method works with those slighter, episodic cases which we see recovering under all kinds of influences and even spontaneously. Psycho-analytic therapy was created through and for the treatment of patients permanently unfit for existence, and its triumph has been that it has made a satisfactorily large number of these permanently fit for existence. In the face of such an achievement all the effort expended seems trivial. We cannot conceal from ourselves what, as physicians, we are in the habit of denying to our patients, namely, that a severe neurosis is no less serious for the sufferer than any cachexia or any of the dreaded major diseases.

[1905a, 1568]

(1) One should look beyond the patient's illness and form an estimate of his whole personality; those patients who do not possess a reasonable degree of education and a fairly reliable character should be refused. It must not be forgotten that there are healthy people as well as unhealthy ones who are good for nothing in life, and that there is a temptation to ascribe to their illness everything that incapacitates them, if they show any sign of neurosis. In my opinion a neurosis is by no means a stamp of degeneracy, though it may often enough be found in one person along with the signs of degeneracy. Now analytic psychotherapy is not a process suited to the treatment of neuropathic degeneracy; on the contrary, degeneracy is a barrier to its effectiveness. Nor is the method applicable to people who are not driven to seek treatment by their own sufferings, but who submit to it only because they are forced to by the authority of relatives. The qualification which is the determining factor of fitness for psycho-analytic treatment - that is, whether the patient is educable - must be discussed further from another standpoint. [1905a, 1569]
This one-sided attitude of medicine towards the body has undergone a gradual change in the course of the last decade and a half, a change brought about directly by clinical experience. There are a large number of patients, suffering from affections of greater or less severity, whose disorders and complaints make great demands on the skill of their physicians, but in whom no visible or observable signs of a pathological process can be discovered either during their life or after their death, in spite of all the advances in the methods of investigation made by scientific medicine. One group of these patients are distinguished by the copiousness and variety of their symptoms: they are incapable of intellectual work because of headaches or inability to concentrate their attention, their eyes ache when they read, their legs become fatigued when they walk, develop dull pains or go to sleep, their digestion is disturbed by distressing sensations, by eructations or gastric spasms, they cannot defaecate without aperients, they are subject to sleeplessness, and so on. They may suffer from all these disorders simultaneously or in succession, or from only a selection of them; but in every case the illness is evidently the same. Moreover, its signs are often variable and replace one another. A patient who has hitherto been incapacitated by headaches but has had a fairly good digestion may next day enjoy a clear head but may thenceforward be unable to manage most kinds of food. Again, his sufferings may suddenly cease if there is a marked change in the circumstances of his existence. If he is travelling he may feel perfectly well and be able to enjoy the most varied diet without any ill effects, but when he gets home he may once more have to restrict himself to sour milk. In a few cases the disorder - whether it is a pain or a weakness resembling a paralysis - may suddenly pass from one side of the body to the other: it may jump from his right side to the corresponding part of the body on his left side. But in every instance it is to be observed that the symptoms are very clearly influenced by excitement, emotion, worry, etc., and also that they can disappear and give place to perfect health without leaving any traces, even if they have persisted over a long period.

Medical research has at last shown that people of this kind are not to be looked upon as suffering from a disease of the stomach or of the eyes or whatever it may be, but that it must be a question in their case of an illness of the nervous system as a whole. Examination of the brain and nerves of these patients has so far, however, revealed no perceptible changes; and, indeed, some of the features of their symptomatology prohibit any expectation that even more accurate methods of investigation could ever discover changes of a sort that would throw light upon the illness. This condition has been described as 'nervousness' (neurasthenia or hysteria) and has been characterized as a merely 'functional' disorder of the nervous system.¹ Incidentally, an exhaustive examination of the brain (after the patient's death) has been equally without results in the case of many more permanent nervous disorders, as well as in illnesses with exclusively mental symptoms, such as what are known as obsessions and delusional insanity.

Physicians were thus faced by the problem of investigating the nature and origin of the symptoms shown by these nervous or neurotic patients. In the course of this investigation it was found that in some at least of these patients the signs of their illness originate from nothing other than a change in the action of their minds upon their bodies and that the immediate cause of their disorder is to be looked for in their minds. What may be the remoter causes of the disturbance which affects their minds is another question, with which we need not now concern ourselves. But medical science was here provided with an opportunity for directing its full attention to what had previously been the neglected side of the mutual relation between body and mind.

¹
But the series of possibilities grows wider; and psychological drama turns into psychopathological drama when the source of the suffering in which we take part and from which we are meant to derive pleasure is no longer a conflict between two almost equally conscious impulses but between a conscious impulse and a repressed one. Here the precondition of enjoyment is that the spectator should himself be a neurotic, for it is only such people who can derive pleasure instead of simple aversion from the revelation and the more or less conscious recognition of a repressed impulse. In anyone who is not neurotic this recognition will meet only with aversion and will call up a readiness to repeat the act of repression which has earlier been successfully brought to bear on the impulse: for in such people a single expenditure of repression has been enough to hold the repressed impulse completely in check. But in neurotics the repression is on the brink of failing; it is unstable and needs a constant renewal of expenditure, and this expenditure is spared if recognition of the impulse is brought about. Thus it is only in neurotics that a struggle can occur of a kind which can be made the subject of a drama; but even in them the dramatist will provoke not merely an enjoyment of the liberation but a resistance to it as well.

[1942a [1905], 1610]

We should thus find no difficulty in indicating the aims of any new attempt to throw light on jokes. To be able to count on success, we should have either to approach the work from new angles or to endeavour to penetrate further by increased attention and deeper interest. We can resolve that we will at least not fail in this last respect. It is striking with what a small number of instances of jokes recognized as such the authorities are satisfied for the purposes of their enquiries, and how each of them takes the same ones over from his predecessors. We must not shirk the duty of analysing the same instances that have already served the classical authorities on jokes. But it is our intention to turn besides to fresh material so as to obtain a broader foundation for our conclusions. It is natural then that we should choose as the subjects of our investigation examples of jokes by which we ourselves have been most struck in the course of our lives and which have made us laugh the most.

[1905c, 1621]

The second case, in which the comic depends entirely on 'empathy', includes the most numerous possibilities - the comic of situation, of exaggeration (caricature), of mimicry, of degradation and of unmasking. This is the case in which the introduction of the infantile point of view proves most useful. For the comic of situation is mostly based on embarrassments, in which we rediscover the child's helplessness. The worst of the embarrassments, the interference by the peremptory demands of natural needs with other functions, corresponds to the child's incomplete control over his bodily functions. Where the comic of situation operates by means of repetitions, it is based on the child's peculiar pleasure in constant repetition (of questions or of being told stories) which make him a nuisance to the adult. Exaggeration, which still gives pleasure to adults in so far as it can find justification with their critical faculty, is connected with the child's peculiar lack of a sense of proportion, his ignorance of all quantitative relations, which he comes to know later than qualitative ones. The use of moderation and restraint, even in the case of permitted impulses, is a late fruit of education and is acquired by the mutual inhibition of mental activities brought together in a combination. Where such combinations are weakened, as in the unconscious of dreams or in the mono-ideism of psychoneuroses, the child's lack of moderation re-emerges.

[1905c, 1801]
Let us pause for a moment at this journey, planned for such remarkably uncogent reasons, and take a closer look at our hero's personality and behaviour. He still appears to us as incomprehensible and foolish; we have no idea how his peculiar folly will be linked to human feeling and so arouse our sympathy. It is an author's privilege to be allowed to leave us in such uncertainty. The charm of his language and the ingenuity of his ideas offer us a provisional reward for the reliance we place in him and for the still unearned sympathy which we are ready to feel for his hero. Of this hero we are further told that he was pre-ordained by family tradition to become an archaeologist, that in his later isolation and independence he was wholly absorbed in his studies and had turned completely away from life and its pleasures. Marble and bronze alone were truly alive for him; they alone expressed the purpose and value of human life. But nature, perhaps with benevolent intent, had infused into his blood a corrective of an entirely unscientific sort - an extremely lively imagination, which could show itself not only in his dreams but often in his waking life as well. This division between imagination and intellect destined him to become an artist or a neurotic; he was one of those whose kingdom is not of this world. Thus it was that it could come about that his interest was attached to a relief representing a girl stepping along in a peculiar fashion, that he wove his phantasies around her, imagined a name and origin for her, placed the figure he had created in the setting of the Pompeii that was buried more than eighteen hundred years before, and finally, after a strange anxiety-dream, magnified his phantasy of the existence and death of this girl named Gradiva into a delusion, which gained an influence over his actions. Such products of the imagination would seem to us astonishing and inexplicable if we met them in someone in real life. Since our hero, Norbert Hanold, is a fictitious person, we may perhaps put a timid question to his author, and ask whether his imagination was determined by forces other than its own arbitrary choice.

This view of Hanold's journey as a flight from his awakening erotic longing for the girl whom he loved and who was so close to him is the only one which will fit in with the description of his emotional states during his stay in Italy. The repudiation of erotism which dominated him was expressed there in his disgust at the honeymooners. A short dream which he had in his albergo in Rome, and which was occasioned by the proximity of a German loving couple, 'Edwin and Angelina', whose evening conversation he could not help hearing through the thin partition-wall, throws a retrospective light, as it were, on the erotic drift of his first major dream. In the new dream he was once again in Pompeii and Vesuvius was once again erupting, and it was thus linked to the earlier dream whose effects persisted during the journey. This time, however, among the people imperilled were - not, as on the former occasion, himself and Gradiva but - the Apollo Belvedere and the Capitoline Venus, no doubt by way of an ironical exaltation of the couple in the next room. Apollo lifted Venus up, carried her out, and laid her down on some object in the dark which seemed to be a carriage or cart, since it emitted 'a creaking noise'. Apart from this, the interpretation of the dream calls for no special skill. (31.)

Our author, who, as we have long since realized, never introduces a single idle or unintentional feature into history, has given us another piece of evidence of the asexual current which dominated Hanold during his journey. As he roamed about for hours in Pompeii, 'strangely enough it never once recurred to his memory that a short time before he had dreamt of being present at the burial of Pompeii in the eruption of 79 A.D.' (47.) It was only when he caught sight of Gradiva that he suddenly remembered the dream and became conscious at the same time of the delusional reason for his puzzling journey. How could this forgetting of the dream, this barrier of repression between the dream and his mental state during the journey, be explained, except by supposing that the journey was undertaken not at the direct inspiration of the dream but as a revolt against it, as an emanation of a mental power that refused to know anything of the secret meaning of the dream?
But on the other hand Hanold did not enjoy this victory over his erotism. The suppressed mental impulse remained powerful enough to revenge itself on the suppressing one with discontent and inhibition. His longings turned into restlessness and dissatisfaction, which made his journey seem pointless to him. His insight into his reasons for the journey at the bidding of the delusion was inhibited and his relations with his science, which in such a spot should have stirred all his interest, were interfered with. So the author shows us his hero after his flight from love in a kind of crisis, in a state of complete confusion and distraction, in a turmoil such as we usually find at the climax of an illness, when neither of the two conflicting powers has any longer a sufficiently superior strength over the other for the margin between them to make it possible to establish a vigorous mental régime. But here the author intervenes helpfully, and smoothes things out by making Gradiva appear at this juncture and undertake the cure of the delusion. By the power he possesses of guiding the people of his creation towards a happy destiny, in spite of all the laws of necessity which he makes them obey, he arranges that the girl, to avoid whom Hanold had fled to Pompeii, shall be transported to that very place. In this way he corrects the folly to which the young man was led by his delusion - the folly of exchanging the home of the living girl whom he loved for the burial-place of her imaginary substitute.

I should also like to point out that your test may possibly be subject to a complication which does not, by its very nature, arise in psycho-analysis. In your examination you may be led astray by a neurotic who, although he is innocent, reacts as if he were guilty, because a lurking sense of guilt that already exists in him seizes upon the accusation made in the particular instance. You must not regard this possibility as an idle fiction; you have only to think of life in the nursery, where such events can often enough be observed. It sometimes happens that a child who has been accused of a misdeed strongly denies the charge but at the same time weeps like a detected sinner. You may perhaps think that the child is lying when he asserts his innocence; but this is not necessarily so. It can be that he has in fact not committed the particular crime with which you have charged him but that he has committed one of which you know nothing and of which you are not accusing him. He therefore quite truthfully denies being guilty of the one misdeed, while at the same time betraying his sense of guilt on account of the other. In this respect - as in so many others - the adult neurotic behaves just like a child. Many people are like this, and it is still open to question whether your technique will succeed in distinguishing self-accusing individuals of this kind from those who are really guilty. Finally, one more point. You know that, according to the rules governing criminal proceedings, you may not subject the accused to any procedure which takes him by surprise. He will therefore have been made aware that in this experiment it is a matter for him of not betraying himself. It must then be asked whether one can expect the same reactions when the subject's attention is directed towards the complex as when it is directed away from it, and how far the intention to conceal something may affect modes of reaction in different people.

It is remarkable that both compulsions and prohibitions (having to do something and having not to do something) apply in the first instance only to the subject's solitary activities and for a long time leave his social behaviour unaffected. Sufferers from this illness are consequently able to treat their affliction as a private matter and keep it concealed for many years. And, indeed, many more people suffer from these forms of obsessional neurosis than doctors hear of. For many sufferers, too, concealment is made easier from the fact that they are quite well able to fulfil their social duties during a part of the day, once they have devoted a number of hours to their secret doings, hidden from view like Mélusine.
If we take the second of these stages as an average, we must point out that a number of people are, on account of their organization, not equal to meeting its demands. In whole classes of individuals the development of the sexual instinct, as we have described it above, from auto-erotism to object-love with its aim of uniting the genitals, has not been carried out correctly and sufficiently fully. As a result of these disturbances of development two kinds of harmful deviation from normal sexuality - that is, sexuality which is serviceable to civilization - come about; and the relation between these two is almost that of positive and negative.¹
[1908d, 1953]

Where the sexual instinct is fairly intense, but perverse, there are two possible outcomes. The first, which we shall not discuss further, is that the person affected remains a pervert and has to put up with the consequences of his deviation from the standard of civilization. The second is far more interesting. It is that, under the influence of education and social demands, a suppression of the perverse instincts is indeed achieved, but it is a kind of suppression which is really no suppression at all. It can better be described as a suppression that has failed. The inhibited sexual instincts are, it is true, no longer expressed as such - and this constitutes the success of the process - but they find expression in other ways, which are quite as injurious to the subject and make him quite as useless for society as satisfaction of the suppressed instincts in an unmodified form would have done. This constitutes the failure of the process, which in the long run more than counterbalances its success. The substitutive phenomena which emerge in consequence of the suppression of the instinct amount to what we call nervous illness, or, more precisely, the psychoneuroses.¹ Neurotics are the class of people who, since they possess a recalcitrant organization, only succeed, under the influence of cultural requirements, in achieving a suppression of their instincts which is apparent and which becomes increasingly unsuccessful. They therefore only carry on their collaboration with cultural activities by a great expenditure of force and at the cost of an internal impoverishment, or are obliged at times to interrupt it and fall ill. I have described the neuroses as the ‘negative’ of the perversions because in the neuroses the perverse impulses, after being repressed, manifest themselves from the unconscious part of the mind - because the neuroses contain the same tendencies, though in a state of ‘repression’, as do the positive perversions.
[1908d, 1954]
I return now to my earlier assertion that, in judging the neuroses, their full importance is not as a rule taken into account. I do not mean by this the undervaluation of these states shown in their frivolous dismissal by relatives and in the boasting assurances by doctors that a few weeks of cold water treatment or a few months of rest and convalescence will cure the condition. These are merely the opinions of quite ignorant doctors and laymen and are mostly no more than words intended to give the sufferer a short-lived consolation. It is, on the contrary, a well-known fact that a chronic neurosis, even if it does not totally put an end to the subject's capacity for existence, represents a severe handicap in his life, of the same order, perhaps, as tuberculosis or a cardiac defect. The situation would even be tolerable if neurotic illness were to exclude from civilized activities only a number of individuals who were in any case of the weaker sort, and allowed the rest to play their part in it at the cost of troubles that were merely subjective. But, far from this being so, I must insist upon the view that neuroses, whatever their extent and wherever they occur, always succeed in frustrating the purposes of civilization, and in that way actually perform the work of the suppressed mental forces that are hostile to civilization. Thus, when society pays for obedience to its far-reaching regulations by an increase in nervous illness, it cannot claim to have purchased a gain at the price of sacrifices; it cannot claim a gain at all. Let us, for instance, consider the very common case of a woman who does not love her husband, because, owing to the conditions under which she entered marriage, she has no reason to love him, but who very much wants to love him, because that alone corresponds to the ideal of marriage to which she has been brought up. She will in that case suppress every impulse which would express the truth and contradict her endeavours to fulfil her ideal, and she will make special efforts to play the part of a loving, affectionate and attentive wife. The outcome of this self-suppression will be a neurotic illness; and this neurosis will in a short time have taken revenge on the unloved husband and have caused him just as much lack of satisfaction and worry as would have resulted from an acknowledgement of the true state of affairs. This example is completely typical of what a neurosis achieves. A similar failure to obtain compensation is to be seen after the suppression of impulses inimical to civilization which are not directly sexual. If a man, for example, has become over-kind as a result of a violent suppression of a constitutional inclination to harshness and cruelty, he often loses so much energy in doing this that he fails to carry out all that his compensatory impulses require, and he may, after all, do less good on the whole than he would have done without the suppression.

[1908d, 1962]
I do not think much of the objection that neurotics are a special class of people, marked by an innate disposition that is 'degenerate', from whose childhood life we must not be allowed to infer anything about the childhood of other people. Neurotics are people much like others. They cannot be sharply differentiated from normal people, and in their childhood they are not always easily distinguishable from those who remain healthy in later life. It is one of the most valuable results of our psycho-analytic investigations to have discovered that the neuroses of such people have no special mental content that is peculiar to them, but that, as Jung has expressed it, they fall ill of the same complexes against which we healthy people struggle as well. The only difference is that healthy people know how to overcome those complexes without any gross damage demonstrable in practical life, whereas in nervous cases the suppression of the complexes succeeds only at the price of costly substitutive formations - that is to say, from a practical point of view it is a failure. In childhood neurotic and normal people naturally approximate to each other much more closely than they do in later life, so that I cannot regard it as a methodological error to make use of the communications of neurotics about their childhood for drawing conclusions by analogy about normal childhood life. But since those who later become neurotics very often have in their inborn constitution an especially strong sexual instinct and a tendency to precocity and to a premature expression of that instinct, they make it possible for us to recognize a great deal of infantile activity more sharply and clearly than our capacity for observation (which is in any case a blunted one) would enable us to do in other children. But we shall of course only be able to assess the true value of these communications made by neurotic adults when, following Havelock Ellis's example, we shall have thought it worth while to collect the childhood memories of healthy adults as well.

[1908c, 1967]

The liberation of an individual, as he grows up, from the authority of his parents is one of the most necessary though one of the most painful results brought about by the course of his development. It is quite essential that that liberation should occur and it may be presumed that it has been to some extent achieved by everyone who has reached a normal state. Indeed, the whole progress of society rests upon the opposition between successive generations. On the other hand, there is a class of neurotics whose condition is recognizably determined by their having failed in this task.

[1909c, 1987]
The later stage in the development of the neurotic's estrangement from his parents, begun in this manner, might be described as 'the neurotic's family romance'. It is seldom remembered consciously but can almost always be revealed by psycho-analysis. For a quite peculiarly marked imaginative activity is one of the essential characteristics of neurotics and also of all comparatively highly gifted people. This activity emerges first in children's play, and then, starting roughly from the period before puberty, takes over the topic of family relations. A characteristic example of this peculiar imaginative activity is to be seen in the familiar day-dreaming¹ which persists far beyond puberty. If these day-dreams are carefully examined, they are found to serve as the fulfilment of wishes and as a correction of actual life. They have two principal aims, an erotic and an ambitious one - though an erotic aim is usually concealed behind the latter too. At about the period I have mentioned, then, the child's imagination becomes engaged in the task of getting free from the parents of whom he now has a low opinion and of replacing them by others, who, as a rule, are of higher social standing. He will make use in this connection of any opportune coincidences from his actual experience, such as his becoming acquainted with the Lord of the Manor or some landed proprietor if he lives in the country or with some member of the aristocracy if he lives in town. Chance occurrences of this kind arouse the child's envy, which finds expression in a phantasy in which both his parents are replaced by others of better birth. The technique used in developing phantasies like this (which are, of course, conscious at this period) depends upon the ingenuity and the material which the child has at his disposal. There is also the question of whether the phantasies are worked out with greater or less effort to obtain verisimilitude. This state is reached at a time at which the child is still in ignorance of the sexual determinants of procreation.

I will add that Dr. Stekel's work is founded upon rich experience and is calculated to stimulate other physicians into confirming by their own efforts our views on the aetiology of these conditions. His work reveals many unexpected glimpses of the realities of life, which so often lie concealed behind neurotic symptoms; and it may well convince our colleagues that the attitude they choose to adopt to the hints and explanations given in these pages cannot be a matter of indifference from the point of view either of their understanding or of their therapeutic efficiency.

¹ I cannot interrupt the discussion so far as to demonstrate the typical character of the unconscious train of thought which I think there is here reason for attributing to little Hans. The castration complex is the deepest unconscious root of anti-semitism; for even in the nursery little boys hear that a Jew has something cut off his penis - a piece of his penis, they think - and this gives them a right to despise Jews. And there is no stronger unconscious root for the sense of superiority over women. Weininger (the young philosopher who, highly gifted but sexually deranged, committed suicide after producing his remarkable book, Geschlecht und Charakter), in a chapter that attracted much attention, treated Jews and women with equal hostility and overwhelmed them with the same insults. Being a neurotic, Weininger was completely under the sway of his infantile complexes; and from that standpoint what is common to Jews and women is their relation to the castration complex.

[1909c, 1988]

[1908f, 1994]
It is true that during the analysis Hans had to be told many things that he could not say himself, that he had to be presented with thoughts which he had so far shown no signs of possessing, and that his attention had to be turned in the direction from which his father was expecting something to come. This detracts from the evidential value of the analysis; but the procedure is the same in every case. For a psycho-analysis is not an impartial scientific investigation, but a therapeutic measure. Its essence is not to prove anything, but merely to alter something. In a psycho-analysis the physician always gives his patient (sometimes to a greater and some times to a less extent) the conscious anticipatory ideas by the help of which he is put in a position to recognize and to grasp the unconscious material. For there are some patients who need more of such assistance and some who need less; but there are none who get through without some of it. Slight disorders may perhaps be brought to an end by the subject's unaided efforts, but never a neurosis - a thing which has set itself up against the ego as an element alien to it. To get the better of such an element another person must be brought in, and in so far as that other person can be of assistance the neurosis will be curable. If it is in the very nature of any neurosis to turn away from the 'other person' - and this seems to be one of the characteristics of the states grouped together under the name of dementia praecox - then for that very reason such a state will be incurable by any efforts of ours. It is true that a child, on account of the small development of his intellectual systems, requires especially energetic assistance. But, after all, the information which the physician gives his patient is itself derived in its turn from analytical experience; and indeed it is sufficiently convincing if, at the cost of this intervention by the physician, we are enabled to discover the structure of the pathogenic material and simultaneously to dissipate it.

A sexual constitution like that of little Hans does not appear to carry with it a predisposition to the development either of perversions or of their negative (we will limit ourselves to a consideration of hysteria). As far as my experience goes (and there is still a real need for speaking with caution on this point) the innate constitution of hysterics - that this is also true of perverts is almost self-evident - is marked by the genital zone being relatively less prominent than the other erotogenic zones. But we must expressly except from this rule one particular 'aberration' of sexual life. In those who later become homosexuals we meet with the same predominance in infancy of the genital zone (and especially of the penis) as in normal persons.¹ Indeed it is the high esteem felt by the homosexual for the male organ which decides his fate. In his childhood he chooses women as his sexual object, so long as he assumes that they too possess what in his eyes is an indispensable part of the body; when he becomes convinced that women have deceived him in this particular, they cease to be acceptable to him as a sexual object. He cannot forgo a penis in any one who is to attract him to sexual intercourse; and if circumstances are favourable he will fix his libido upon the 'woman with a penis', a youth of feminine appearance. Homosexuals, then, are persons who, owing to the erotic importance of their own genitals, cannot do without a similar feature in their sexual object. In the course of their development from auto-erotism to object-love, they have remained at a point of fixation between the two.

Before I can regard this synthesis as completed I must turn to yet another aspect of the case, which will take us into the very heart of the difficulties that lie in the way of our understanding of neurotic states. We have seen how our little patient was overtaken by a great wave of repression and that it caught precisely those of his sexual components that were dominant.¹ He gave up masturbation, and turned away in disgust from everything that reminded him of excrement and of looking on at other people performing their natural functions. But these were not the components which were stirred up by the precipitating cause of the illness (his seeing the horse fall down) or which provided the material for the symptoms, that is, the content of the phobia.
To this unimpeachable body of evidence we shall be able to add fresh material, if we turn to the history of the masturbatory side of our patient's sexual activities. There is a conflict between the opinions of doctors and patients on this subject which has not hitherto been properly appreciated. The patients are unanimous in their belief that masturbation, by which they mean masturbation during puberty, is the root and origin of all their troubles. The doctors are, upon the whole, unable to decide what line to take; but, influenced by the knowledge that not only neurotics but most normal people pass through a period of masturbation during their puberty, the majority of them are inclined to dismiss the patients' assertions as gross exaggerations. In my opinion the patients are once again nearer to a correct view than the doctors; for the patients have some glimmering notion of the truth, while the doctors are in danger of overlooking an essential point. The thesis propounded by the patients certainly does not correspond to the facts in the sense in which they themselves construe it, namely, that masturbation during puberty (which may almost be described as a typical occurrence) is responsible for all neurotic disturbances. Their thesis requires interpretation. The masturbation of puberty is in fact no more than a revival of the masturbation of infancy, a subject which has hitherto invariably been neglected. Infantile masturbation reaches a kind of climax, as a rule, between the ages of three and four or five; and it is the clearest expression of a child's sexual constitution, in which the aetiology of subsequent neurones must be sought. In this disguised way, therefore, the patients are putting the blame for their illnesses upon their infantile sexuality; and they are perfectly right in doing so. On the other hand, the problem of masturbation becomes insoluble if we attempt to treat it as a clinical unit, and forget that it can represent the discharge of every variety of sexual component and of every sort of phantasy to which such components can give rise. The injurious effects of masturbation are only in a very small degree autonomous - that is to say, determined by its own nature. They are in substance merely part and parcel of the pathogenic significance of the subject's sexual life as a whole. The fact that so many people can tolerate masturbation - that is, a certain amount of it - without injury merely shows that their sexual constitution and the course of development of their sexual life have been such as to allow them to exercise the sexual function within the limits of what is culturally permissible; whereas other people, because their sexual constitution has been less favourable or their development has been disturbed, fall ill as a result of their sexuality - they cannot, that is, achieve the necessary suppression or sublimation of their sexual components without having recourse to inhibitions or substitutes.¹

[1909d, 2159]
Ladies and Gentlemen, if I may be allowed to generalize - which is unavoidable in so condensed an account as this - I should like to formulate what we have learned so far as follows: our hysterical patients suffer from reminiscences. Their symptoms are residues and mnemonic symbols of particular (traumatic) experiences. We may perhaps obtain a deeper understanding of this kind of symbolism if we compare them with other mnemonic symbols in other fields. The monuments and memorials with which large cities are adorned are also mnemonic symbols. If you take a walk through the streets of London, you will find, in front of one of the great railway termini, a richly carved Gothic column - Charing Cross. One of the old Plantagenet kings of the thirteenth century ordered the body of his beloved Queen Eleanor to be carried to Westminster; and at every stage at which the coffin rested he erected a Gothic cross. Charing Cross is the last of the monuments that commemorate the funeral cortège.¹ At another point in the same town, not far from London Bridge, you will find, a towering, and more modern, column, which is simply known as 'The Monument'. It was designed as a memorial of the Great Fire, which broke out in that neighbourhood in 1666 and destroyed a large part of the city. These monuments, then, resemble hysterical symptoms in being mnemonic symbols; up to that point the comparison seems justifiable. But what should we think of a Londoner who paused to-day in deep melancholy before the memorial of Queen Eleanor's funeral instead of going about his business in the hurry that modern working conditions demand or instead of feeling joy over the youthful queen of his own heart? Or again what should we think of a Londoner who shed tears before the Monument that commemorates the reduction of his beloved metropolis to ashes although it has long since risen again in far greater brilliance? Yet every single hysteric and neurotic behaves like these two unpractical Londoners. Not only do they remember painful experiences of the remote past, but they still cling to them emotionally; they cannot get free of the past and for its sake they neglect what is real and immediate. This fixation of mental life to pathogenic traumas is one of the most significant and practically important characteristics of neurosis.

I am quite ready to allow the justice of an objection that you are probably raising at this moment on the basis of the case history of Breuer's patient. It is quite true that all her traumas dated from the period when she was nursing her sick father and that her symptoms can only be regarded as mnemonic signs of his illness and death. Thus they correspond to a display of mourning, and there is certainly nothing pathological in being fixated to the memory of a dead person so short a time after his decease; on the contrary, it would be a normal emotional process. I grant you that in the case of Breuer's patient there is nothing striking in her fixation to her trauma. But in other cases - such as that of the tic that I treated myself, where the determinants dated back more than fifteen and ten years - the feature of an abnormal attachment to the past is very clear; and it seems likely that Breuer's patient would have developed a similar feature if she had not received cathartic treatment so soon after experiencing the traumas and developing the symptoms.
A second outcome of the work of psycho-analysis is that it then becomes possible for the unconscious instincts revealed by it to be employed for the useful purposes which they would have found earlier if development had not been interrupted. For the extirpation of the infantile wishful impulses is by no means the ideal aim of development. Owing to their repressions, neurotics have sacrificed many sources of mental energy whose contributions would have been of great value in the formation of their character and in their activity in life. We know of a far more expedient process of development, called 'sublimation', in which the energy of the infantile wishful impulses is not cut off but remains ready for use - the un service able aim of the various impulses being replaced by one that is higher, and perhaps no longer sexual. It happens to be precisely the components of the sexual instinct that are specially marked by a capacity of this kind for sublimation, for exchanging their sexual aim for another one which is comparatively remote and socially valuable. It is probable that we owe our highest cultural successes to the contributions of energy made in this way to our mental functions. Premature repression makes the sublimation of the repressed instinct impossible; when the repression is lifted, the path to sublimation becomes free once more.

[1910a, 2238]

When the period of infantile sexual researches has been terminated by a wave of energetic sexual repression, the instinct for research has three distinct possible vicissitudes open to it owing to its early connection with sexual interests. In the first of these, research shares the fate of sexuality; thenceforward curiosity remains inhibited and the free activity of intelligence may be limited for the whole of the subject's lifetime, especially as shortly after this the powerful religious inhibition of thought is brought into play by education. This is the type characterized by neurotic inhibition. We know very well that the intellectual weakness which has been acquired in this way gives an effective impetus to the outbreak of a neurotic illness. In a second type the intellectual development is sufficiently strong to resist the sexual repression which has hold of it. Some time after the infantile sexual researches have come to an end, the intelligence, having grown stronger, recalls the old association and offers its help in evading sexual repression, and the suppressed sexual activities of research return from the unconscious in the form of compulsive brooding, naturally in a distorted and unfree form, but sufficiently powerful to sexualize thinking itself and to colour intellectual operations with the pleasure and anxiety that belong to sexual processes proper. Here investigation becomes a sexual activity, often the exclusive one, and the feeling that comes from settling things in one's mind and explaining them replaces sexual satisfaction; but the interminable character of the child's researches is also repeated in the fact that this brooding never ends and that the intellectual feeling, so much desired, of having found a solution recedes more and more into the distance.

[1910c, 2256]

In virtue of a special disposition, the third type, which is the rarest and most perfect, escapes both inhibition of thought and neurotic compulsive thinking. It is true that here too sexual repression comes about, but it does not succeed in relegating a component instinct of sexual desire to the unconscious. Instead, the libido evades the fate of repression by being sublimated from the very beginning into curiosity and by becoming attached to the powerful instinct for research as a reinforcement. Here, too, the research becomes to some extent compulsive and a substitute for sexual activity; but owing to the complete difference in the underlying psychical processes (sublimation instead of an irruption from the unconscious ) the quality of neurosis is absent; there is no attachment to the original complexes of infantile sexual research, and the instinct can operate freely in the service of intellectual interest. Sexual repression, which has made the instinct so strong through the addition to it of sublimated libido, is still taken into account by the instinct, in that it avoids any concern with sexual themes.

[1910c, 2257]
If we are to understand the love-objects chosen by our type as being above all mother-surrogates, then the formation of a series of them, which seems so flatly to contradict the condition of being faithful to one, can now also be understood. We have learnt from psycho-analysis in other examples that the notion of something irreplaceable, when it is active in the unconscious, frequently appears as broken up into an endless series: endless for the reason that every surrogate nevertheless fails to provide the desired satisfaction. This is the explanation of the insatiable urge to ask questions shown by children at a certain age: they have one single question to ask, but it never crosses their lips. It explains, too, the garrulity of some people affected by neurosis; they are under the pressure of a secret which is burning to be disclosed but which, despite all temptation, they never reveal.

It is true that psycho-analysis puts forward absence of sexual satisfaction as the cause of nervous disorders. But does it not say more than this? Is its teaching to be ignored as too complicated when it declares that nervous symptoms arise from a conflict between two forces - on the one hand, the libido (which has as a rule become excessive), and on the other, a rejection of sexuality, or a repression which is over-severe? No one who remembers this second factor, which is by no means secondary in importance, can ever believe that sexual satisfaction in itself constitutes a remedy of general reliability for the sufferings of neurotics. A good number of these people are, indeed, either in their actual circumstances or in general incapable of satisfaction. If they were capable of it, if they were without their inner resistances, the strength of the instinct itself would point the way to satisfaction for them even though no doctor advised it. What is the good, therefore, of medical advice such as that supposed to have been given to this lady?
Our second problem - the problem of why transference appears in psycho-analysis as resistance - has been left for the moment untouched; and we must now approach it more closely. Let us picture the psychological situation during the treatment. An invariable and indispensable precondition of every onset of a psychoneurosis is the process to which Jung has given the appropriate name of 'introversion'.¹ That is to say: the portion of libido which is capable of becoming conscious and is directed towards reality is diminished, and the portion which is directed away from reality and is unconscious, and which, though it may still feed the subject's phantasies, nevertheless belongs to the unconscious, is proportionately increased. The libido (whether wholly or in part) has entered on a regressive course and has revived the subject's infantile imagos.² The analytic treatment now proceeds to follow it; it seeks to track down the libido, to make it accessible to consciousness and, in the end, serviceable for reality. Where the investigations of analysis come upon the libido withdrawn into its hiding-place, a struggle is bound to break out; all the forces which have caused the libido to regress will rise up as 'resistances' against the work of analysis, in order to conserve the new state of things. For if the libido's introversion or regression had not been justified by a particular relation between the subject and the external world - stated in the most general terms, by the frustration of satisfaction - and if it had not for the moment even become expedient, it could never have taken place at all. But the resistances from this source are not the only ones or indeed the most powerful. The libido at the disposal of the subject's personality had always been under the influence of the attraction of his unconscious complexes (or more correctly, of the portions of those complexes belonging to the unconscious), and it entered on a regressive course because the attraction of reality had diminished. In order to liberate it, this attraction of the unconscious has to be overcome; that is, the repression of the unconscious instincts and of their productions, which has meanwhile been set up in the subject, must be removed. This is responsible for by far the largest part of the resistance, which so often causes the illness to persist even after the turning away from reality has lost its temporary justification. The analysis has to struggle against the resistances from both these sources. The resistance accompanies the treatment step by step. Every single association, every act of the person under treatment must reckon with the resistance and represents a compromise between the forces that are striving towards recovery and the opposing ones which I have described.

[1912b, 2459]

(i) To what extent should the patient's intellectual co-operation be sought for in the treatment? It is difficult to say anything of general applicability on this point: the patient's personality is the determining factor. But in any case caution and self-restraint must be observed in this connection. It is wrong to set a patient tasks, such as collecting his memories or thinking over some particular period of his life. On the contrary, he has to learn above all - what never comes easily to anyone - that mental activities such as thinking something over or concentrating the attention solve none of the riddles of a neurosis; that can only be done by patiently obeying the psycho-analytic rule, which enjoins the exclusion of all criticism of the unconscious or of its derivatives. One must be especially unyielding about obedience to that rule with patients who practise the art of sheering off into intellectual discussion during their treatment, who speculate a great deal and often very wisely about their condition and in that way avoid doing anything to overcome it. For this reason I dislike making use of analytic writings as an assistance to my patients; I require them to learn by personal experience, and I assure them that they will acquire wider and more valuable knowledge than the whole literature of psycho-analysis could teach them. I recognize, however, that under institutional conditions it may be of great advantage to employ reading as a preparation for patients in analysis and as a means of creating an atmosphere of influence.

[1912e, 2474]
No one who is familiar with the nature of neurosis will be astonished to hear that even a man who is very well able to carry out an analysis on other people can behave like any other mortal and be capable of producing the most intense resistances as soon as he himself becomes the object of analytic investigation. When this happens we are once again reminded of the dimension of depth in the mind, and it does not surprise us to find that the neurosis has its roots in psychical strata to which an intellectual knowledge of analysis has not penetrated.

[1913c, 2479]

To shorten analytic treatment is a justifiable wish, and its fulfilment, as we shall learn, is being attempted along various lines. Unfortunately, it is opposed by a very important factor, namely, the slowness with which deep-going changes in the mind are accomplished - in the last resort, no doubt, the 'timelessness' of our unconscious processes. When patients are faced with the difficulty of the great expenditure of time required for analysis they not infrequently manage to propose a way out of it. They divide up their ailments and describe some as unbearable, and others as secondary, and then say: 'If only you will relieve me from this one (for instance, a headache or a particular fear) I can deal with the other one on my own in my ordinary life.' In doing this, however, they over-estimate the selective power of analysis. The analyst is certainly able to do a great deal, but he cannot determine beforehand exactly what results he will effect. He sets in motion a process, that of the resolving of existing repressions. He can supervise this process, further it, remove obstacles in its way, and he can undoubtedly vitiate he effect. He sets in motion a process, determined by events in the remote past, which ends with the severance of the child from its mother. A neurosis as well has the character of an organism. Its component manifestations are not independent of one another; they condition one another and give one another mutual support. A person suffers from one neurosis only, never from several which have accidentally met together in a single individual. The patient freed, according to his wish, from his one unendurable symptom might easily find that a symptom which had previously been negligible had now increased and grown unendurable. The analyst who wishes the treatment to owe its success as little as possible to its elements of suggestion (i.e. to the transference) will do well to refrain from making use of even the trace of selective influence upon the results of the therapy which may perhaps be open to him. The patients who are bound to be most welcome to him are those who ask him to give them complete health, in so far as that is attainable, and who place as much time at his disposal as is necessary for the process of recovery. Such favourable conditions as these are, of course, to be looked for in only a few cases.

[1913c, 2483]
I have no doubt that the patient's relatives and friends will decide as emphatically for the first of these two alternatives as the analyst will for the second. But I think that here is a case in which the decision cannot be left to the tender - or rather, the egoistic and jealous - concern of her relatives. The welfare of the patient alone should be the touchstone; her relatives' love cannot cure her neurosis. The analyst need not push himself forward, but he may insist that he is indispensable for the achievement of certain ends. Any relative who adopts Tolstoy's attitude to this problem can remain in undisturbed possession of his wife or daughter; but he will have to try to put up with the fact that she, for her part, retains her neurosis and the interference with her capacity for love which it involves. The situation, after all, is similar to that in a gynaecological treatment. Moreover, the jealous father or husband is greatly mistaken if he thinks that the patient will escape falling in love with her doctor if he hands her over to some kind of treatment other than analysis for combating her neurosis. The difference, on the contrary, will only be that a love of this kind, which is bound to remain unexpressed and unanalysed, can never make the contribution to the patient's recovery which analysis would have extracted from it.

[1915a, 2511]

The analytic psychotherapist thus has a threefold battle to wage - in his own mind against the forces which seek to drag him down from the analytic level; outside the analysis, against opponents who dispute the importance he attaches to the sexual instinctual forces and hinder him from making use of them in his scientific technique; and inside the analysis, against his patients, who at first behave like opponents but later on reveal the overvaluation of sexual life which dominates them, and who try to make him captive to their socially untamed passion.

[1915a, 2520]

We have long observed that every neurosis has as its result, and probably therefore as its purpose, a forcing of the patient out of real life, an alienating of him from reality. Nor could a fact such as this escape the observation of Pierre Janet; he spoke: of a loss of *la fonction du réel* ['the function of reality'] as being a special characteristic of neurotics, but without discovering the connection of this disturbance with the fundamental determinants of neurosis.¹ By introducing the process of repression into the genesis of the neuroses we have been able to gain some insight into this connection. Neurotics turn away from reality because they find it unbearable - either the whole or parts of it. The most extreme type of this turning away from reality is shown by certain cases of hallucinatory psychosis which seek to deny the particular event that occasioned the outbreak of their insanity (Griesinger). But in fact every neurotic does the same with some fragment of reality.² And we are now confronted with the task of investigating the development of the relation of neurotics and of mankind in general to reality, and in this way of bringing the psychological significance of the real external world into the structure of our theories.

[1911b, 2552]
There has been little opportunity in the preceding pages for showing how new light can be thrown upon the facts of social psychology by the adoption of a psycho-analytic method of approach: for the horror of incest displayed by savages has long been recognized as such and stands in need of no further interpretation. All that I have been able to add to our understanding of it is to emphasize the fact that it is essentially an infantile feature and that it reveals a striking agreement with the mental life of neurotic patients. Psycho-analysis has taught us that a boy’s earliest choice of objects for his love is incestuous and that those objects are forbidden ones - his mother and his sister. We have learnt, too, the manner in which, as he grows up, he liberates himself from this incestuous attraction. A neurotic, on the other hand, invariably exhibits some degree of psychical infantilism. He has either failed to get free from the psychosexual conditions that prevailed in his childhood or he has returned to them - two possibilities which may be summed up as developmental inhibition and regression. Thus incestuous fixations of libido continue to play (or begin once more to play) the principal part in his unconscious mental life. We have arrived at the point of regarding a child’s relation to his parents, dominated as it is by incestuous longings, as the nuclear complex of neurosis. This revelation of the importance of incest in neurosis is naturally received with universal scepticism by adults and normal people. Similar expressions of disbelief, for instance, inevitably greet the writings of Otto Rank, which have brought more and more evidence to show the extent to which the interest of creative writers centres round the theme of incest and how the same theme, in countless variations and distortions, provides the subject-matter of poetry. We are driven to believe that this rejection is principally a product of the distaste which human beings feel for their early incestuous wishes, now over taken by repression. It is therefore of no small importance that we are able to show that these same incestuous wishes, which are later destined to become unconscious, are still regarded by savage peoples as immediate perils against which the most severe measures of defence must be enforced.

[1912-1913, 2665]
So far so good; but the technique of psycho-analysis allows us to go into the question further and to enter more into the details of these various impulses. If we submit the recorded facts to analysis, as though they formed part of the symptoms presented by a neurosis, our starting-point must be the excessive apprehensiveness and solicitude which is put forward as the reason for the taboo ceremonials. The occurrence of excessive solicitude of this kind is very common in neuroses, and especially in obsessional neuroses, with which our comparison is chiefly drawn. We have come to understand its origin quite clearly. It appears wherever, in addition to a predominant feeling of affection, there is also a contrary, but unconscious, current of hostility - a state of affairs which represents a typical instance of an ambivalent emotional attitude. The hostility is then shouted down, as it were, by an excessive intensification of the affection, which is expressed as solicitude and becomes compulsive, because it might otherwise be inadequate to perform its task of keeping the unconscious contrary current of feeling under repression. Every psycho-analyst knows from experience with what certainty this explanation of solicitous over-affection is found to apply even in the most unlikely circumstances - in cases, for instance, of attachments between a mother and child or between a devoted married couple. If we now apply this to the case of privileged persons, we shall realize that alongside the veneration, and indeed idolization, felt towards them, there is in the unconscious an opposing current of intense hostility; that, in fact, as we expected, we are faced by a situation of emotional ambivalence. The distrust which provides one of the unmistakable elements in kingly taboos would thus be another, more direct, expression of the same unconscious hostility. Indeed, owing to the variety of outcomes of a conflict of this kind which are reached among different peoples, we are not at a loss for examples in which the existence of this hostility is still more obviously shown. 'The savage Timmes of Sierra Leone', we learn from Frazer,¹ 'who elect their king, reserve to themselves the right of beating him on the eve of his coronation; and they avail themselves of this constitutional privilege with such hearty goodwill that sometimes the unhappy monarch does not long survive his elevation to the throne. Hence when the leading chiefs have a spite at a man and wish to rid themselves of him, they elect him king.' Even in glaring instances like this, however, the hostility is not admitted as such, but masquerades as a ceremonial.

[1912-1913, 2695]

Another side of the attitude of primitive peoples towards their rulers recalls a procedure which is common in neuroses generally but comes into the open in what are known as delusions of persecution. The importance of one particular person is immensely exaggerated and his absolute power is magnified to the most improbable degree, in order that it may be easier to make him responsible for everything disagreeable that the patient may experience. Savages are really behaving in just the same way with their kings when they ascribe to them power over rain and sunshine, wind and weather, and then depose them or kill them because Nature disappoints their hopes of a successful hunt or a rich harvest. The model upon which paranoics base their delusions of persecution is the relation of a child to his father. A son's picture of his father is habitually clothed with excessive powers of this kind, and it is found that distrust of the father is intimately linked with admiration for him. When a paranoic turns the figure of one of his associates into a 'persecutor', he is raising him to the rank of a father: he is putting him into a position in which he can blame him for all his misfortunes. Thus this second analogy between savages and neurotics gives us a glimpse of the truth that much of a savage's attitude to his ruler is derived from a child's infantile attitude to his father.

[1912-1913, 2696]
If we follow the changing relations between survivors and the dead through the course of ages, it becomes obvious that there has been an extraordinary diminution in ambivalence. It is now quite easy to keep down the unconscious hostility to the dead (though its existence can still be traced) without any particular expenditure of psychical energy. Where, in earlier times, satisfied hatred and pained affection fought each other, we now find that a kind of scar has been formed in the shape of piety, which declares ‘de mortuis nil nisi bonum’. It is only neurotics whose mourning for the loss of those dear to them is still troubled by obsessive self-reproaches - the secret of which is revealed by psycho-analysis as the old emotional ambivalence. We need not discuss here how this alteration came about or how much share in it is due to a constitutional modification and how much to a real improvement in family relations. But this example suggests the probability that the psychical impulses of primitive peoples were characterized by a higher amount of ambivalence than is to be found in modern civilized man. It is to be supposed that as this ambivalence diminished, taboo (a symptom of the ambivalence and a compromise between two conflicting impulses) slowly disappeared Neurotics, who are obliged to reproduce the struggle and the taboo resulting from it, may be said to have inherited an archaic constitution as an atavistic vestige; the need to compensate for this at the behest of civilization is what drives them to their immense expenditure of mental energy.

[1912-1913, 2710]

The neuroses exhibit on the one hand striking and far-reaching points of agreement with those great social institutions, art, religion and philosophy. But on the other hand they seem like distortions of them. It might be maintained that a case of hysteria is a caricature of a work of art, that an obsessional neurosis is a caricature of a religion and that a paranoid delusion is a caricature of a philosophical system. The divergence resolves itself ultimately into the fact that the neuroses are asocial structures; they endeavour to achieve by private means what is effected in society by collective effort. If we analyse the instincts at work in the neuroses, we find that the determining influence in them is exercised by instinctual forces of sexual origin; the corresponding cultural formations, on the other hand, are based upon social instincts, originating from the combination of egoistic and erotic elements. Sexual needs are not capable of uniting men in the same way as are the demands of self-preservation. Sexual satisfaction is essentially the private affair of each individual.

[1912-1913, 2717]

The asocial nature of neuroses has its genetic origin in their most fundamental purpose, which is to take flight from an unsatisfying reality into a more pleasurable world of phantasy. The real world, which is avoided in this way by neurotics, is under the sway of human society and of the institutions collectively created by it. To turn away from reality is at the same time to withdraw from the community of man.

[1912-1913, 2717]
It is in obsessional neuroses that the survival of the omnipotence of thoughts is most clearly visible and that the consequences of this primitive mode of thinking come closest to consciousness. But we must not be misled into supposing that it is a distinguishing feature of this particular neurosis, for analytic investigation reveals the same thing in the other neuroses as well. In all of them what determines the formation of symptoms is the reality not of experience but of thought. Neurotics live in a world apart, where, as I have said elsewhere, only 'neurotic currency' is legal tender; that is to say, they are only affected by what is thought with intensity and pictured with emotion, whereas agreement with external reality is a matter of no importance. What hysterics repeat in their attacks and fix by means of their symptoms are experiences which have occurred in that form only in their imagination though it is true that in the last resort those imagined experiences go back to actual events or are based upon them. To attribute the neurotic sense of guilt to real misdeeds would show an equal misunderstanding. An obsessional neurotic may be weighed down by a sense of guilt that would be appropriate in a mass-murderer, while in fact, from his childhood onwards, he has behaved to his fellow-men as the most considerate and scrupulous member of society. Nevertheless, his sense of guilt has a justification: it is founded on the intense and frequent death wishes against his fellows which are unconsciously at work in him. It has a justification if what we take into account are unconscious thoughts and not intentional deeds. Thus the omnipotence of thoughts, the overvaluation of mental processes as compared with reality, is seen to have unrestricted play in the emotional life of neurotic patients and in everything that derives from it. If one of them undergoes psycho-analytic treatment, which makes what is unconscious in him conscious, he will be unable to believe that thoughts are free and will constantly be afraid of expressing evil wishes, as though their expression would lead inevitably to their fulfilment. This behaviour, as well as the superstitions which he practises in ordinary life, reveals his resemblance to the savages who believe they can alter the external world by mere thinking.

[1912-1913, 2729]

Primitive men and neurotics, as we have seen, attach a high valuation - in our eyes an over-valuation - to psychical acts. This attitude may plausibly be brought into relation with narcissism and regarded as an essential component of it. It may be said that in primitive men the process of thinking is still to a great extent sexualized. This is the origin of their belief in the omnipotence of thoughts, their unshakable confidence in the possibility of controlling the world and their inaccessibility to the experiences, so easily obtainable, which could teach them man's true position in the universe. As regards neurotics, we find that on the one hand a considerable part of this primitive attitude has survived in their constitution, and on the other hand that the sexual repression that has occurred in them has brought about a further sexualization of their thinking processes. The psychological results must be the same in both cases, whether the libidinal hypercathexis of thinking is an original one or has been produced by regression: intellectual narcissism and the omnipotence of thoughts.¹

[1912-1913, 2732]
In just the same way, an inhibition upon movement (an abasia or an agoraphobia) will gradually become more complete and more detailed, when once that system has succeeded in installing itself as a representative of an unconscious wish and of the defence against the wish. Whatever other unconscious phantasies and operative reminiscences may be present in the patient force their way to expression as symptoms along this same path, once it has been opened, and group themselves into an appropriate new arrangement within the framework of the inhibition upon movement. Thus it would be a vain and indeed a foolish task to attempt to understand the complexities and details of the symptoms of (for example) an agoraphobia on the basis of its underlying premises; for the whole consistency and strictness of the combination are merely apparent. Just as with the façades of dreams, if we look more attentively we find the most blatant inconsistency and arbitrariness in the structure of symptoms. The real reason for the details of a systematic phobia of this kind lies in concealed determinants, which need have nothing to do with an inhibition upon movement; and that, too, is why these phobias take such various and contradictory shapes in different people.

Another difficulty might actually be brought forward from psycho-analytic quarters. The earliest moral precepts and restrictions in primitive society have been explained by us as reactions to a deed which gave those who performed it the concept of 'crime'. They felt remorse for the deed and decided that it should never be repeated and that its performance should bring no advantage. This creative sense of guilt still persists among us. We find it operating in an asocial manner in neurotics, and producing new moral precepts and persistent restrictions, as an atonement for crimes that have been committed and as a precaution against the committing of new ones.¹ If, however, we enquire among these neurotics to discover what were the deeds which provoked these reactions, we shall be disappointed. We find no deeds, but only impulses and emotions, set upon evil ends but held back from their achievement. What lie behind the sense of guilt of neurotics are always psychical realities and never factual ones. What characterizes neurotics is that they prefer psychical to factual reality and react just as seriously to thoughts as normal people do to realities.

May not the same have been true of primitive men? We are justified in believing that, as one of the phenomena of their narcissistic organization, they overvalued their psychical acts to an extraordinary degree.² Accordingly the mere hostile impulse against the father, the mere existence of a wishful phantasy of killing and devouring him, would have been enough to produce the moral reaction that created totemism and taboo. In this way we should avoid the necessity for deriving the origin of our cultural legacy, of which we justly feel so proud, from a hideous crime, revolting to all our feelings. No damage would thus be done to the causal chain stretching from the beginning to the present day, for psychical reality would be strong enough to bear the weight of these consequences. To this it may be objected that an alteration in the form of society from a patriarchal horde to a fraternal clan did actually take place. This is a powerful argument, but not a conclusive one. The alteration might have been effected in a less violent fashion and none the less have been capable of determining the appearance of the moral reaction. So long as the pressure exercised by the primal father could be felt, the hostile feelings towards him were justified, and remorse on their account would have to await a later day. And if it is further argued that everything derived from the ambivalent relation to the father - taboo and the sacrificial ordinance - is characterized by the deepest seriousness and the most complete reality, this further objection carries just as little weight. For the ceremonials and inhibitions of obsessional neurotics show these same characteristics and are nevertheless derived only from psychical reality - from intentions and not from their execution. We must avoid transplanting a contempt for what is merely thought or wished from our commonplace world, with its wealth of material values, into the world of primitive men and neurotics, of which the wealth lies only within themselves.

¹ 1912-1913, 2738
² 1912-1913, 2798
Here we are faced by a decision which is indeed no easy one. First, however, it must be confessed that the distinction, which may seem fundamental to other people, does not in our judgement affect the heart of the matter. If wishes and impulses have the full value of facts for primitive men, it is our business to give their attitude our understanding attention instead of correcting it in accordance with our own standards. Let us, then, examine more closely the case of neurosis - comparison with which led us into our present uncertainty. It is not accurate to say that obsessional neurotics, weighed down under the burden of an excessive morality, are defending themselves only against psychological reality and are punishing themselves for impulses which were merely felt. Historical reality has a share in the matter as well. In their childhood they had these evil impulses pure and simple, and turned them into acts so far as the impotence of childhood allowed. Each of these excessively virtuous individuals passed through an evil period in his infancy - a phase of perversion which was the forerunner and precondition of the later period of excessive morality. The analogy between primitive men and neurotics will therefore be far more fully established if we suppose that in the former instance, too, psychical reality - as to the form taken by which we are in no doubt - coincided at the beginning with factual reality: that primitive men actually did what all the evidence shows that they intended to do.

Nor must we let ourselves be influenced too far in our judgement of primitive men by the analogy of neurotics. There are distinctions, too, which must be borne in mind. It is no doubt true that the sharp contrast that we make between thinking and doing is absent in both of them. But neurotics are above all inhibited in their actions: with them the thought is a complete substitute for the deed. Primitive men, on the other hand, are uninhibited: thought passes directly into action. With them it is rather the deed that is a substitute for the thought. And that is why, without laying claim to any finality of judgement, I think that in the case before us it may safely be assumed that 'in the beginning was the Deed'.

Our knowledge of the neurotic illnesses of individuals has been of much assistance to our understanding of the great social institutions. For the neuroses themselves have turned out to be attempts to find individual solutions for the problems of compensating for unsatisfied wishes, while the institutions seek to provide social solutions for these same problems. The recession of the social factor and the predominance of the sexual one turns these neurotic solutions of the psychological problem into caricatures which are of no service except to help us in explaining such important questions.

It is true that psycho-analysis has taken the individual mind as its subject, but in investigating the individual it could not avoid dealing with the emotional basis of the relation of the individual to society. It has found that the social feelings invariably contain an erotic element - an element which, if it is over- emphasized and then repressed, becomes one of the marks of a particular group of mental disorders. Psycho-analysis has recognized that in general the neuroses are asocial in their nature and that they always aim at driving the individual out of society and at replacing the safe monastic seclusion of earlier days by the isolation of illness. The intense feeling of guilt which dominates so many neuroses has been shown to be a social modification of neurotic anxiety.
The formation of an ego ideal is often confused with the sublimation of instinct, to the detriment of our understanding of the facts. A man who has exchanged his narcissism for homage to a high ego ideal has not necessarily on that account succeeded in sublimating his libidinal instincts. It is true that the ego ideal demands such sublimation, but it cannot enforce it; sublimation remains a special process which may be prompted by the ideal but the execution of which is entirely independent of any such prompting. It is precisely in neurotics that we find the highest differences of potential between the development of their ego ideal and the amount of sublimation of their primitive libidinal instincts; and in general it is far harder to convince an idealist of the inexpedient location of his libido than a plain man whose pretensions have remained more moderate. Further, the formation of an ego ideal and sublimation are quite differently related to the causation of neurosis. As we have learnt, the formation of an ideal heightens the demands of the ego and is the most powerful factor favouring repression; sublimation is a way out, a way by which those demands can be met *without* involving repression.

[1914c, 2948]

The sexual ideal may enter into an interesting auxiliary relation to the ego ideal. It may be used for substitutive satisfaction where narcissistic satisfaction encounters real hindrances. In that case a person will love in conformity with the narcissistic type of object-choice, will love what he once was and no longer is, or else what possesses the excellences which he never had at all (cf. (c)). The formula parallel to the one there stated runs thus: what possesses the excellence which the ego lacks for making it an ideal, is loved. This expedient is of special importance for the neurotic, who, on account of his excessive object-cathexes, is impoverished in his ego and is incapable of fulfilling his ego ideal. He then seeks a way back to narcissism from his prodigal expenditure of libido upon objects, by choosing a sexual ideal after the narcissistic type which possesses the excellences to which he cannot attain. This is the cure by love, which he generally prefers to cure by analysis. Indeed, he cannot believe in any other mechanism of cure; he usually brings expectations of this sort with him to the treatment and directs them towards the person of the physician. The patient's incapacity for love, resulting from his extensive repressions, naturally stands in the way of a therapeutic plan of this kind. An unintended result is often met with when, by means of the treatment, he has been partially freed from his repressions: he withdraws from further treatment in order to choose a love-object, leaving his cure to be continued by a life with someone he loves. We might be satisfied with this result, if it did not bring with it all the dangers of a crippling dependence upon his helper in need.

[1914c, 2954]

Why did I not begin my introduction to the theory of neuroses with what you yourselves know of the neurotic state and what has long aroused your interest - with the peculiar characteristics of neurotic people, their incomprehensible reactions to human intercourse and external influences, their irritability, their incalculable and inexpedient behaviour? Why did I not lead you step by step from an understanding of the simpler, everyday forms of the neurotic state to the problems of its enigmatic, extreme manifestations?

[1916-1917, 3431]
But, Ladies and Gentlemen, who has so seriously misinformed you? A recommendation to the
patient to 'live a full life' sexually could not possibly play a part in analytic therapy - if only because
we ourselves have declared that an obstinate conflict is taking place in him between a libidinal
impulse and sexual repression, between a sensual and an ascetic trend. This conflict would not
be solved by our helping one of these trends to victory over its opponent. We see, indeed, that in
neurotics asceticism has the upper hand; and the consequence of this is precisely that the
suppressed sexual tendency finds a way out in symptoms. If, on the contrary, we were to secure
victory for sensuality, then the sexual repression that had been put on one side would necessarily
be replaced by symptom. Neither of these two alternative decisions could end the internal conflict;
in either case one party to it would remain unsatisfied. There are only a few cases in which the
conflict is so unstable that a factor such as the doctor's taking sides could decide it; and such
cases do not in fact stand in need of analytic treatment. Anyone on whom the doctor could have
so much influence would have found the same way out without the doctor. You must be aware
that if an abstinent young man decides in favour of illicit sexual intercourse or if an unsatisfied
wife seeks relief with another man, they have not as a rule waited for permission from a doctor or
even from their analyst.

If we are able once more to clarify the position, we find that the cause of the disturbance is that
the patient has transferred on to the doctor intense feelings of affection which are justified neither
by the doctor's behaviour nor by the situation that has developed during the treatment. The form
in which this affection is expressed and what its aims are depend of course on the personal
relation between the two people involved. If those concerned are a young girl and a youngish
man, we shall get the impression of a normal case of falling in love; we shall find it
understandable that a girl should fall in love with a man with whom she can be much alone and
talk of intimate things and who has the advantage of having met her as a helpful superior; and we
shall probably overlook the fact that what we should expect from a neurotic girl would rather be
an impediment in her capacity for love. The further the personal relations between doctor and
patient diverge from this supposed case, the more we shall be surprised to find nevertheless the
same emotional relationship constantly recurring. It may still pass muster if a woman who is
unhappy in her marriage appears to be seized with a serious passion for a doctor who is still
unattached, if she is ready to seek a divorce in order to be his or if, where there are social
obstacles, she even expresses no hesitation about entering into a secret liaison with him. Such
things come about even outside psycho-analysis. But in these circumstances we are astonished
to hear declarations by married women and girls which bear witness to a quite particular attitude
to the therapeutic problem: they had always known, they say, that they could only be cured by
love, and before the treatment began they had expected that through this relation they would at
last be granted what life had hitherto withheld from them; it had only been in this hope that they
had taken so much trouble over the treatment and overcome all the difficulties in communicating
their thoughts - and we on our part can add: and had so easily understood what is otherwise so
hard to believe. But an admission of this sort surprises us: it throws all our calculations to the
winds. Can it be that we have left the most important item out of our account?

[1916-1917, 3476]

[1916-1917, 3483]
But I should like to say a few words to you to relieve you of your surprise at the emergence of this unexpected phenomenon. We must not forget that the patient's illness, which we have undertaken to analyse, is not something which has been rounded off and become rigid but that it is still growing and developing like a living organism. The beginning of the treatment does not put an end to this development; when, however, the treatment has obtained mastery over the patient, what happens is that the whole of his illness's new production is concentrated upon a single point - his relation to the doctor. Thus the transference may be compared to the cambium layer in a tree between the wood and the bark, from which the new formation of tissue and the increase in the girth of the trunk derive. When the transference has risen to this significance, work upon the patient's memories retreats far into the background. Thereafter it is not incorrect to say that we are no longer concerned with the patient's earlier illness but with a newly created and transformed neurosis which has taken the former's place. We have followed this new edition of the old disorder from its start, we have observed its origin and growth, and we are especially well able to find our way about in it since, as its object, we are situated at its very centre. All the patient's symptoms have abandoned their original meaning and have take on a new sense which lies in a relation to the transference; or only such symptoms have persisted as are capable of undergoing such a transformation. But the mastering of this new, artificial neurosis coincides with getting rid of the illness which was originally brought to the treatment - with the accomplishment of our therapeutic task. A person who has become normal and free from the operation of repressed instinctual impulse in his relation to the doctor will remain so in his own life after the doctor has once more withdrawn from it.

I will now complete my picture of the mechanism of cure by clothing it in the formulas of the libido theory. A neurotic is incapable of enjoyment and of efficiency - the former because his libido is not directed on to any real object and the latter because he is obliged to employ a great deal of this available energy on keeping his libido under repression and on warding off its assaults. He would become healthy if the conflict between his ego and his libido came to an end and if his ego had his libido again at its disposal. The therapeutic task consists, therefore, in freeing the libido from its present attachments, which are withdrawn from the ego, and in making it once more serviceable to the ego. Where, then, is the neurotic's libido situated? It is easily found: it is attached to the symptoms, which yield it the only substitutive satisfaction possible at the time. We must therefore make ourselves masters of the symptoms and resolve them - which is precisely the same thing that the patient requires of us. In order to resolve the symptoms, we must go back as far as their origin, we must renew the conflict from which they arose, and, with the help of motive forces which were not at the patient's disposal in the past, we must guide it to a different outcome. This revision of the process of repression can be accomplished only in part in connection with the memory traces of the processes which led to repression. The decisive part of the work is achieved by creating in the patient's relation to the doctor - in the 'transference' - new editions of the old conflicts; in these the patient would like to behave in the same way as he did in the past, while we, by summoning up every available mental force, compel him to come to a fresh decision. Thus the transference becomes the battlefield on which all the mutually struggling forces should meet one another.

In actual fact, indeed, the neurotic patient presents us with a torn mind, divided by resistances. As we analyse it and remove the resistances, it grows together; the great unity which we call his ego fits into itself all the instinctual impulses which before had been split off and held apart from it. The psycho-synthesis is thus achieved during analytic treatment without our intervention, automatically and inevitably. We have created the conditions for it by breaking up the symptoms into their elements and by removing the resistances. It is not true that something in the patient has been divided into its components and is now quietly waiting for us to put it somehow together again.

[1916-1917, 3486]

[1916-1917, 3494]

[1919a, 3630]
As far as I can see, the danger threatens from two directions in especial. On the one hand, when the illness has been broken down by the analysis, the patient makes the most assiduous efforts to create for himself in place of his symptoms new substitutive satisfactions, which now lack the feature of suffering. He makes use of the enormous capacity for displacement possessed by the now partly liberated libido, in order to cathect with libido and promote to the position of substitutive satisfactions the most diverse kinds of activities, preferences and habits, not excluding some that have been his already. He continually finds new distractions of this kind, into which the energy necessary to carrying on the treatment escapes, and he knows how to keep them secret for a time. It is the analyst's task to detect these divergent paths and to require him every time to abandon them, however harmless the activity which leads to satisfaction may be in itself. The half-recovered patient may also enter on less harmless paths - as when, for instance, if he is a man, he seeks prematurely to attach himself to a woman. It may be observed, incidentally, that unhappy marriage and physical infirmity are the two things that most often supersede a neurosis. They satisfy in particular the sense of guilt (need for punishment) which makes many patients cling so fast to their neuroses. By a foolish choice in marriage they punish themselves; they regard a long organic illness as a punishment by fate and thereafter often cease to keep up their neurosis.
[1919a, 3632]

There is one more point of general application which I should like to add, though, strictly speaking, it has been included in what has already been said about animism and modes of working of the mental apparatus that have been surmounted; for I think it deserves special emphasis. This is that an uncanny effect is often and easily produced when the distinction between imagination and reality is effaced, as when something that we have hitherto regarded as imaginary appears before us in reality, or when a symbol takes over the full functions of the thing it symbolizes, and so on. It is this factor which contributes not a little to the uncanny effect attaching to magical practices. The infantile element in this, which also dominates the minds of neurotics, is the over-accentuation of psychical reality in comparison with material reality - a feature closely allied to the belief in the omnipotence of thoughts. In the middle of the isolation of war-time a number of the English *Strand Magazine* fell into my hands; and, among other somewhat redundant matter, I read a story about a young married couple who move into a furnished house in which there is a curiously shaped table with carvings of crocodiles on it. Towards evening an intolerable and very specific smell begins to pervade the house; they stumble over something in the dark; they seem to see a vague form gliding over the stairs - in short, we are given to understand that the presence of the table causes ghostly crocodiles to haunt the place, or that the wooden monsters come to life in the dark, or something of the sort. It was a naïve enough story, but the uncanny feeling it produced was quite remarkable.
[1919h, 3694]
The early efflorescence of infantile sexual life is doomed to extinction because its wishes are incompatible with reality and with the inadequate stage of development which the child has reached. That efflorescence comes to an end in the most distressing circumstances and to the accompaniment of the most painful feelings. Loss of love and failure leave behind them a permanent injury to self-regard in the form of a narcissistic scar, which in my opinion, as well as in Marcinowski's (1918), contributes more than anything to the 'sense of inferiority' which is so common in neurotics. The child's sexual researches, on which limits are imposed by his physical development, lead to no satisfactory conclusion; hence such later complaints as 'I can't accomplish anything; I can't succeed in anything'. The tie of affection, which binds the child as a rule to the parent of the opposite sex, succumbs to disappointment, to a vain expectation of satisfaction or to jealousy over the birth of a new baby - unmistakable proof of the infidelity of the object of the child's affections. His own attempt to make a baby himself, carried out with tragic seriousness, fails shamefully. The lessening amount of affection he receives, the increasing demands of education, hard words and an occasional punishment - these show him at last the full extent to which he has been scorned. These are a few typical and constantly recurring instances of the ways in which the love characteristic of the age of childhood is brought to a conclusion.

¹In young children, for instance, ambivalent emotional attitudes towards those who are nearest to them exist side by side for a long time, without either of them interfering with the expression of the other and opposite one. If eventually a conflict breaks out between the two, it is often settled by the child making a change of object and displacing one of the ambivalent emotions on to a substitute. The history of the development of a neurosis in an adult will also show that a suppressed emotion may frequently persist for a long time in unconscious or even in conscious phantasies, the content of which naturally runs directly counter to some predominant tendency, and yet that this opposition does not result in any proceedings on the part of the ego against what it has repudiated. The phantasy is tolerated for quite a long time, until suddenly one day, usually as a result of an increase in the affective cathexis of the phantasy, a conflict breaks out between it and the ego with all the usual consequences. In the process of a child's development into a mature adult there is a more and more extensive integration of his personality, a co-ordination of the separate instinctual impulses and purposive trends which have grown up in him independently of one another. The analogous process in the domain of sexual life has long been known to us as the co-ordination of all the sexual instincts into a definitive genital organization. (Three Essays on the Theory of Sexuality, 1905d.) Moreover, that the unification of the ego is liable to the same interferences as that of the libido is shown by numerous familiar instances, such as that of men of science who have preserved their faith in the Bible, and other similar cases. - The various possible ways in which the ego can later disintegrate form a special chapter in psychopathology.

We have pointed out that this predominance of the life of phantasy and of the illusion born of an unfulfilled wish is the ruling factor in the psychology of neuroses. We have found that what neurotics are guided by is not ordinary objective reality but psychological reality. A hysterical symptom is based upon phantasy instead of upon the repetition of real experience, and the sense of guilt in an obsessional neurosis is based upon the fact of an evil intention which was never carried out. Indeed, just as in dreams and in hypnosis, in the mental operations of a group the function for testing the reality of things falls into the background in comparison with the strength of wishful impulses with their affective cathexis.
The psycho-analytic investigation of the psychoneuroses has taught us that their symptoms are to be traced back to directly sexual impulsions which are repressed but still remain active. We can complete this formula by adding - 'or, to aim-inhibited impulsions, whose inhibition has not been entirely successful or has made room for a return to the repressed sexual aim'. It is in accordance with this that a neurosis should make its victim asocial and should remove him from the usual group formations. It may be said that a neurosis has the same disintegrating effect upon a group as being in love. On the other hand it appears that where a powerful impetus has been given to group formation neuroses may diminish and, at all events temporarily, disappear. Justifiable attempts have also been made to turn this antagonism between neuroses and group formation to therapeutic account. Even those who do not regret the disappearance of religious illusions from the civilized world of to-day will admit that so long as they were in force they offered those who were bound by them the most powerful protection against the danger of neurosis. Nor is it hard to discern that all the ties that bind people to mystico-religious or philosophico-religious sects and communities are expressions of crooked cures of all kinds of neuroses. All of this is correlated with the contrast between directly sexual impulsions and those which are inhibited in their aims.

If he is left to himself, a neurotic is obliged to replace by his own symptom formations the great group formations from which he is excluded. He creates his own world of imagination for himself, his own religion, his own system of delusions, and thus recapitulates the institutions of humanity in a distorted way which is clear evidence of the dominating part played by the directly sexual impulses.¹

Neurosis stands outside this series. It also is based upon a peculiarity in the development of the human libido - the twice repeated start made by the directly sexual function, with an intervening period of latency.¹ To this extent it resembles hypnosis and group formation in having the character of a regression, which is absent from being in love. It makes its appearance wherever the advance from directly sexual instincts to those that are inhibited in their aims has not been wholly successful; and it represents a conflict between those portions of the instincts which have been received into the ego after having passed through this development and those portions of them which, springing from the repressed unconscious, strive - as do other, completely repressed, instinctual impulses - to attain direct satisfaction. Neuroses are extraordinarily rich in content, for they embrace all possible relations between the ego and the object - both those in which the object is retained and others in which it is abandoned or erected inside the ego itself - and also the conflicting relations between the ego and its ego ideal.
Once we have admitted the idea of a fusion of the two classes of instincts with each other, the possibility of a - more or less complete - 'defusion' of them forces itself upon us. The sadistic component of the sexual instinct would be a classical example of a serviceable instinctual fusion; and the sadism which has made itself independent as a perversion would be typical of a defusion, though not of one carried to extremes. From this point we obtain a view of a great domain of facts which has not before been considered in this light. We perceive that for purposes of discharge the instinct of destruction is habitually brought into the service of Eros; we suspect that the epileptic fit is a product and indication of an instinctual defusion; and we come to understand that instinctual defusion and the marked emergence of the death instinct call for particular consideration among the effects of some severe neuroses - for instance, the obsessional neuroses. Making a swift generalization, we might conjecture that the essence of a regression of libido (e.g. from the genital to the sadistic-anal phase) lies in a defusion of instincts, just as, conversely, the advance from the earlier phase to the definitive genital one would be conditioned by an accession of erotic components. The question also arises whether ordinary ambivalence, which is so often unusually strong in the constitutional disposition to neurosis, should not be regarded as the product of a defusion; ambivalence, however, is such a fundamental phenomenon that it more probably represents an instinctual fusion that has not been completed.

An interpretation of the normal, conscious sense of guilt (conscience) presents no difficulties; it is based on the tension between the ego and the ego ideal and is the expression of a condemnation of the ego by its critical agency. The feelings of inferiority so well known in neurotics are presumably not far removed from it. In two very familiar maladies the sense of guilt is over-strongly conscious; in them the ego ideal displays particular severity and often rages against the ego in a cruel fashion. The attitude of the ego ideal in these two conditions, obsessional neurosis and melancholia, presents, alongside of this similarity, differences that are no less significant.

But this does not at all agree with the observation which all of us can make that every neurosis disturbs the patient's relation to reality in some way, that it serves him as a means of withdrawing from reality, and that, in its severe forms, it actually signifies a flight from real life. This contradiction seems a serious one; but it is easily resolved, and the explanation of it will in fact help us to understand neuroses.

For the contradiction exists only as long as we keep our eyes fixed on the situation at the beginning of the neurosis, in which the ego, in the service of reality, sets about the repression of an instinctual impulse. This, however, is not yet the neurosis itself. The neurosis consists rather in the processes which provide a compensation for the portion of the id that has been damaged - that is to say, in the reaction against the repression and in the failure of the repression. The loosening of the relation to reality is a consequence of this second step in the formation of a neurosis, and it ought not to surprise us if a detailed examination shows that the loss of reality affects precisely that piece of reality as a result of whose demands the instinctual repression ensued.

There is nothing new in our characterization of neurosis as the result of a repression that has failed. We have said this all along, and it is only because of the new context in which we are viewing the subject that it has been necessary to repeat it.
We might expect that when a psychosis comes into being, something analogous to the process in a neurosis occurs, though, of course, between different agencies of the mind; thus we might expect that in a psychosis, too, two steps could be discerned, of which the first would drag the ego away, this time from reality, while the second would try to make good the damage done and re-establish the subject's relations to reality at the expense of the id. And, in fact, some analogy of the sort can be observed in a psychosis. Here, too, there are two steps, the second of which has the character of a reparation. But beyond that the analogy gives way to a far more extensive similarity between the two processes. The second step of the psychosis is indeed intended to make good the loss of reality, not, however, at the expense of a restriction of the id - as happens in neurosis at the expense of the relation to reality - but in another, more autocratic manner, by the creation of a new reality which no longer raises the same objections as the old one that has been given up. The second step, therefore, both in neurosis and psychosis, is supported by the same trends. In both cases it serves the desire for power of the id, which will not allow itself to be dictated to by reality. Both neurosis and psychosis are thus the expression of a rebellion on the part of the id against the external world, of its unwillingness - or, if one prefers, its incapacity - to adapt itself to the exigencies of reality, to Αυάγχη [Necessity]. Neurosis and psychosis differ from each other far more in their first, introductory, reaction than in the attempt at reparation which follows it.

From a clinical standpoint the neuroses must necessarily be put alongside the intoxications and such disorders as Graves' disease. These are conditions arising from an excess or a relative lack of certain highly active substances, whether produced inside the body or introduced into it from outside - in short, they are disturbances of the chemistry of the body, toxic conditions. If someone succeeded in isolating and demonstrating the hypothetical substance or substances concerned in neuroses, he would have no need to worry about opposition from the medical profession. For the present, however, no such avenue of approach to the problem is open. At the moment we can only start from the symptoms presented by a neurosis - symptoms which in the case of hysteria, for instance, consist of a combination of somatic and mental disturbances. Now Charcot's experiments as well as Breuer’s clinical observations taught us that the somatic symptoms of hysteria are psychogenic too - that is, that they are precipitates of mental processes that have run their course. By putting a subject into a state of hypnosis it was possible at will to produce the somatic symptoms of hysteria artificially.

If I distrust my memory - neurotics, as we know, do so to a remarkable extent, but normal people have every reason for doing so as well - I am able to supplement and guarantee its working by making a note in writing. In that case the surface upon which this note is preserved, the pocket-book or sheet of paper, is as it were a materialized portion of my mnemic apparatus, which I otherwise carry about with me invisible. I have only to bear in mind the place where this 'memory' has been deposited and I can then 'reproduce' it at any time I like, with the certainty that it will have remained unaltered and so have escaped the possible distortions to which it might have been subjected in my actual memory.
But this last point raises a fresh problem. Instead of the affect of anxiety let us take, for a moment, another affect - that of pain, for instance. It seems quite normal that at four years of age a girl should weep painfully if her doll is broken; or at six, if her governess reproves her; or at sixteen, if she is slighted by her young man; or at twenty-five, perhaps, if a child of her own dies. Each of these determinants of pain has its own time and each passes away when that time is over. Only the final and definitive determinants remain throughout life. We should think it strange if this same girl, after she had grown to be a wife and mother, were to cry over some worthless trinket that had been damaged. Yet that is how the neurotic behaves. Although all the agencies for mastering stimuli have long ago been developed within wide limits in his mental apparatus, and although he is sufficiently grown up to satisfy most of his needs for himself and has long ago learnt that castration is no longer practised as a punishment, he nevertheless behaves as though the old danger-situations still existed, and keeps hold of all the earlier determinants of anxiety.

These minor rectifications cannot in any way alter the fact which is here under discussion, that a great many people remain infantile in their behaviour in regard to danger and do not overcome determinants of anxiety which have grown out of date. To deny this would be to deny the existence of neurosis, for it is precisely such people whom we call neurotics. But how is this possible? Why are not all neuroses episodes in the development of the individual which come to a close when the next phase is reached? Whence comes the element of persistence in these reactions to danger? Why does the affect of anxiety alone seem to enjoy the advantage over all other affects of evoking reactions which are distinguished from the rest in being abnormal and which, through their inexpediency, run counter to the movement of life? In other words, we have once more come unawares upon the riddle which has so often confronted us: whence does neurosis come - what is its ultimate, its own peculiar raison d'être? After tens of years of psychoanalytic labours, we are as much in the dark about this problem as we were at the start.
You have no notion how close I am to fulfilling my promise. Even in organisms which later develop an efficient ego-organization, their ego is feeble and little differentiated from their id to begin with, during their first years of childhood. Imagine now what will happen if this powerless ego experiences an instinctual demand from the id which it would already like to resist (because it senses that to satisfy it is dangerous and would conjure up a traumatic situation, a collision with the external world) but which it cannot control, because it does not yet possess enough strength to do so. In such a case the ego treats the instinctual danger as if it was an external one; it makes an attempt at flight, draws back from this portion of the id and leaves it to its fate, after withholding from it all the contributions which it usually makes to instinctual impulses. The ego, as we put it, institutes a repression of these instinctual impulses. For the moment this has the effect of fending off the danger; but one cannot confuse the inside and the outside with impunity. One cannot run away from oneself. In repression the ego is following the pleasure principle, which it is usually in the habit of correcting; and it is bound to suffer damage in revenge. This lies in the ego's having permanently narrowed its sphere of influence. The repressed instinctual impulse is now isolated, left to itself, inaccessible, but also uninfluenceable. It goes its own way. Even later, as a rule, when the ego has grown stronger, it still cannot lift the repression; its synthesis is impaired, a part of the id remains forbidden ground to the ego. Nor does the isolated instinctual impulse remain idle; it understands how to make up for being denied normal satisfaction; it produces psychical derivatives which take its place; it links itself to other processes which by its influence it likewise tears away from the ego; and finally it breaks through into the ego and into consciousness in the form of an unrecognizably distorted substitute, and creates what we call a symptom. All at once the nature of a neurotic disorder becomes clear to us: on the one hand an ego which is inhibited in its synthesis, which has no influence on parts of the id, which must renounce some of its activities in order to avoid a fresh collision with what has been repressed, and which exhausts itself in what are for the most part vain acts of defence against the symptoms, the derivatives of the repressed impulses; and on the other hand an id in which individual instincts have made themselves independent, pursue their aims regardless of the interests of the person as a whole and henceforth obey the laws only of the primitive psychology that rules in the depths of the id. If we survey the whole situation we arrive at a simple formula for the origin of a neurosis: the ego has made an attempt to suppress certain portions of the id in an inappropriate manner, this attempt has failed and the id has taken its revenge. A neurosis is thus the result of a conflict between the ego and the id, upon which the ego has embarked because, as careful investigation shows, it wishes at all costs to retain its adaptability in relation to the real external world. The disagreement is between the external world and the id; and it is because the ego, loyal to its inmost nature, takes sides with the external world that it becomes involved in a conflict with its id. But please observe that what creates the determinant for the illness is not the fact of this conflict - for disagreements of this kind between reality and the id are unavoidable and it is one of the ego's standing tasks to mediate in them - but the circumstance that the ego has made use of the inefficient instrument of repression for dealing with the conflict. But this in turn is due to the fact that the ego, at the time at which it was set the task, was undeveloped and powerless. The decisive repressions all take place in early childhood.

[1926e, 4346]
The derivatives of what is repressed have broken into his ego and established themselves there; and the ego has as little control over trends from that source as it has over what is actually repressed, and as a rule it knows nothing about them. These patients, indeed, are of a peculiar nature and raise difficulties with which we are not accustomed to reckon. All our social institutions are framed for people with a united and normal ego, which one can classify as good or bad, which either fulfils its function or is altogether eliminated by an overpowering influence. Hence the juridical alternative: responsible or irresponsible. None of these distinctions apply to neurotics. It must be admitted that there is difficulty in adapting social demands to their psychological condition. This was experienced on a large scale during the last war. Were the neurotics who evaded service malingerers or not? They were both. If they were treated as malingerers and if their illness was made highly uncomfortable, they recovered; if after being ostensibly restored they were sent back into service, they promptly took flight once more into illness. Nothing could be done with them. And the same is true of neurotics in civil life. They complain of their illness but exploit it with all their strength; and if someone tries to take it away from them they defend it like the proverbial lioness with her young. Yet there would be no sense in reproaching them for this contradiction.

[1926e, 4363]

This is where a fresh complication arises. It cannot always be recognized with complete certainty. The patient may exhibit the external picture of a neurosis, and yet it may be something else - the beginning of an incurable mental disease or the preliminary of a destructive process in the brain. The distinction - the differential diagnosis - is not always easy and cannot be made immediately in every phase. The responsibility for such a decision can of course only be undertaken by a doctor. As I have said, it is not always easy for him. The illness may have an innocent appearance for a considerable time, till in the end it after all displays its evil character. Indeed, it is one of the regular fears of neurotics that they may become insane. However, if a doctor has been mistaken for a time over a case of this sort or has been in uncertainty about it, no harm has been caused and nothing unnecessary has been done. Nor indeed would the analytic treatment of this case have done any harm, though it would have been exposed as an unnecessary waste. And moreover there would certainly be enough people who would blame the analysis for the unfortunate outcome. Unjustly, no doubt, but such occasions ought to be avoided.

[1926e, 4381]

That can be managed, though, if one bears in mind the complexities of living substance. In what did we find the essence of a neurosis? In the fact that the ego, the higher organization of the mental apparatus (elevated through the influence of the external world), is not able to fulfil its function of mediating between the id and reality, that in its feebleness it draws back from some instinctual portions of the id and, to make up for this, has to put up with the consequences of its renunciation in the form of restrictions, symptoms and unsuccessful reaction- formations.

[1926e, 4382]
A feebleness of the ego of this sort is to be found in all of us in childhood; and that is why the experiences of the earliest years of childhood are of such great importance for later life. Under the extraordinary burden of this period of childhood we have in a few years to cover the enormous developmental distance between stone-age primitive men and the participants in contemporary civilization, and, at the same time and in particular, we have to fend off the instinctual impulses of the early sexual period - under this burden, then, our ego takes refuge in repression and lays itself open to a childhood neurosis, the precipitate of which it carries with it into maturity as a disposition to a later nervous illness. Everything now depends on how the growing organism is treated by fate. If life becomes too hard, if the gulf between instinctual claims and the demands of reality becomes too great, the ego may fail in its efforts to reconcile the two, and the more readily, the more it is inhibited by the disposition carried over by it from infancy. The process of repression is then repeated, the instincts tear themselves away from the ego's domination, find their substitutive satisfactions along the paths of regression, and the poor ego has become helplessly neurotic.
[1926e, 4382]
In the first place, I suspect that the reader has the impression that our discussions on the sense of guilt disrupt the framework of this essay: that they take up too much space, so that the rest of its subject-matter, with which they are not always closely connected, is pushed to one side. This may have spoilt the structure of my paper; but it corresponds faithfully to my intention to represent the sense of guilt as the most important problem in the development of civilization and to show that the price we pay for our advance in civilization is a loss of happiness through the heightening of the sense of guilt.¹ Anything that still sounds strange about this statement, which is the final conclusion of our investigation, can probably be traced to the quite peculiar relationship - as yet completely unexplained - which the sense of guilt has to our consciousness. In the common case of remorse, which we regard as normal, this feeling makes itself clearly enough perceptible to consciousness. Indeed, we are accustomed to speak of a 'consciousness of guilt' instead of a 'sense of guilt'. Our study of the neuroses, to which, after all we owe the most valuable pointers to an understanding of normal conditions, brings us up against some contradictions. In one of those affections, obsessional neurosis, the sense of guilt makes itself noisily heard in consciousness; it dominates the clinical picture and the patient's life as well, and it hardly allows anything else to appear alongside of it. But in most other cases and forms of neurosis it remains completely unconscious, without on that account producing any less important effects. Our patients do not believe us when we attribute an 'unconscious sense of guilt' to them. In order to make ourselves at all intelligible to them, we tell them of an unconscious need for punishment, in which the sense of guilt finds expression. But its connection with a particular form of neurosis must not be over-estimated. Even in obsessional neurosis there are types of patients who are not aware of their sense of guilt, or who only feel it as a tormenting uneasiness, a kind of anxiety, if they are prevented from carrying out certain actions. It ought to be possible eventually to understand these things; but as yet we cannot. Here perhaps we may be glad to have it pointed out that the sense of guilt is at bottom nothing else but a topographical variety of anxiety; in its later phases it coincides completely with fear of the super-ego. And the relations of anxiety to consciousness exhibit the same extraordinary variations. Anxiety is always present somewhere or other behind every symptom; but at one time it takes noisy possession of the whole of consciousness, while at another it conceals itself so completely that we are obliged to speak of unconscious anxiety or, if we want to have a clearer psychological conscience, since anxiety is in the first instance simply a feeling, of possibilities of anxiety. Consequently it is very conceivable that the sense of guilt produced by civilization is not perceived as such either, and remains to a large extent unconscious, or appears as a sort of malaise, a dissatisfaction, for which people seek other motivations. Religions, at any rate, have never overlooked the part played in civilization by a sense of guilt. Furthermore - a point which I failed to appreciate elsewhere² - they claim to redeem mankind from this sense of guilt, which they call sin. From the manner in which, in Christianity, this redemption is achieved - by the sacrificial death of a single person, who in this manner takes upon himself a guilt that is common to everyone - we have been able to infer what the first occasion may have been on which this primal guilt, which was also the beginning of civilization, was acquired.³

[1930a, 4523]
We have selected three factors from Dostoevsky's complex personality, one quantitative and two qualitative: the extraordinary intensity of his emotional life, his perverse innate instinctual disposition, which inevitably marked him out to be a sado-masochist or a criminal, and his unanalysable artistic gift. This combination might very well exist without neurosis; there are people who are complete masochists without being neurotic. Nevertheless, the balance of forces between his instinctual demands and the inhibitions opposing them (plus the available methods of sublimation) would even so make it necessary to classify Dostoevsky as what is known as an 'instinctual character'. But the position is obscured by the simultaneous presence of neurosis, which, as we have said, was not in the circumstances inevitable, but which comes into being the more readily, the richer the complication which has to be mastered by the ego. For neurosis is after all only a sign that the ego has not succeeded in making a synthesis, that in attempting to do so it has forfeited its unity.

[1928b, 4555]

Otto Rank, to whom psycho-analysis is indebted for many excellent contributions, also has the merit of having expressly emphasized the significance of the act of birth and of separation from the mother. Nevertheless we have all found it impossible to accept the extreme inferences which he has drawn from this factor as bearing on the theory of the neuroses and even on analytic therapy. The core of his theory - that the experience of anxiety at birth is the model of all later situations of danger - he found already there. If we dwell on these situations of danger for a moment, we can say that in fact a particular determinant of anxiety (that is, situation of danger) is allotted to every age of development as being appropriate to it. The danger of psychical helplessness fits the stage of the ego's early immaturity; the danger of loss of an object (or loss of love) fits the lack of self-sufficiency in the first years of childhood; the danger of being castrated fits the phallic phase; and finally fear of the super-ego, which assumes a special position, fits the period of latency. In the course of development the old determinants of anxiety should be dropped, since the situations of danger corresponding to them have lost their importance owing to the strengthening of the ego. But this only occurs most incompletely. Many people are unable to surmount the fear of loss of love; they never become sufficiently independent of other people's love and in this respect carry on their behaviour as infants. Fear of the super-ego should normally never cease, since, in the form of moral anxiety, it is indispensable in social relations, and only in the rarest cases can an individual become independent of human society. A few of the old situations of danger, too, succeed in surviving into later periods by making contemporary modifications in their determinants of anxiety. Thus, for instance, the danger of castration persists under the mark of syphilidophobia. It is true that as an adult one knows that castration is no longer customary as a punishment for the indulgence of sexual desires, but on the other hand one has learnt that instinctual liberty of that kind is threatened by serious diseases. There is no doubt that the people we describe as neurotics remain infantile in their attitude to danger and have not surmounted obsolete determinants of anxiety. We may take this as a factual contribution to the characterization of neurotics; it is not so easy to say why it should be so.

[1933a, 4695]
We had no misgivings over applying analytic treatment to children who either exhibited unambiguous neurotic symptoms or who were on the road to an unfavourable development of character. The apprehension expressed by opponents of analysis that the child would be injured by it proved unfounded. What we gained from these undertakings was that we were able to confirm on the living subject what we had inferred (from historical documents, as it were) in the case of adults. But the gain for the children was also very satisfactory. It turned out that a child is a very favourable subject for analytic therapy; the results are thorough and lasting. The technique of treatment worked out for adults must, of course, be largely altered for children. A child is psychologically a different object from an adult. As yet he possesses no super-ego, the method of free association does not carry far with him, transference (since the real parents are still on the spot) plays a different part. The internal resistances against which we struggle in adults are replaced for the most part in children by external difficulties. If the parents make themselves vehicles of the resistance, the aim of the analysis - and even the analysis itself - is often imperilled. Hence it is often necessary to combine with a child's analysis a certain amount of analytic influencing of his parents. On the other hand, the inevitable deviations of analyses of children from those of adults are diminished by the circumstance that some of our patients have retained so many infantile character traits that the analyst (once again adapting himself to his subject) cannot avoid making use with them of certain of the techniques of child-analysis. It has automatically happened that child-analysis has become the domain of women analysts, and no doubt this will remain true.

\[1933a, 4748\]

(b) All these phenomena, the symptoms as well as the restrictions on the ego and the stable character-changes, have a compulsive quality: that is to say that they have great psychical intensity and at the same time exhibit a far-reaching independence of the organization of the other mental processes, which are adjusted to the demands of the real external world and obey the laws of logical thinking. They are insufficiently or not at all influenced by external reality, pay no attention to it or to its psychical representatives, so that they may easily come into active opposition to both of them. They are, one might say, a State within a State, an inaccessible party, with which co-operation is impossible, but which may succeed in overcoming what is known as the normal party and forcing it into its service. If this happens, it implies a domination by an internal psychical reality over the reality of the external world and the path to a psychosis lies open. Even if things do not go so far, the practical importance of this situation can scarcely be overestimated. The inhibition upon the life of those who are dominated by a neurosis and their incapacity for living constitute a most important factor in a human society and we may recognize in their condition a direct expression of their fixation to an early portion of their past.

\[1939a, 4901\]

Moreover, the relation of transference brings with it two further advantages. If the patient puts the analyst in the place of his father (or mother), he is also giving him the power which his super-ego exercises over his ego, since his parents were, as we know, the origin of his super-ego. The new super-ego now has an opportunity for a sort of after-education of the neurotic; it can correct mistakes for which his parents were responsible in educating him. But at this point a warning must be given against misusing this new influence. However much the analyst may be tempted to become a teacher, model and ideal for other people and to create men in his own image, he should not forget that that is not his task in the analytic relationship, and indeed that he will be disloyal to his task if he allows himself to be led on by his inclinations. If he does, he will only be repeating a mistake of the parents who crushed their child's independence by their influence, and he will only be replacing the patient's earlier dependence by a new one. In all his attempts at improving and educating the patient the analyst should respect his individuality. The amount of influence which he may legitimately allow himself will be determined by the degree of developmental inhibition present in the patient. Some neurotics have remained so infantile that in analysis too they can only be treated as children.

\[1940a [1938], 4985\]
The further our work proceeds and the more deeply our insight penetrates into the mental life of neurotics, the more clearly two new factors force themselves on our notice, which demand the closest attention as sources of resistance. Both of them are completely unknown to the patient, neither of them could be taken into account when our pact was made; nor do they arise from the patient's ego. They may both be embraced under the single name of 'need to be ill or to suffer', but they have different origins though in other respects they are of a kindred nature. The first of these two factors is the sense of guilt or consciousness of guilt, as it is called, though the patient does not feel it and is not aware of it. It is evidently the portion of the resistance contributed by a super-ego that has become particularly severe and cruel. The patient must not become well but must remain ill, for he deserves no better. This resistance does not actually interfere with our intellectual work, but it makes it inoperative; indeed, it often allows us to remove one form of neurotic suffering, but is ready at once to replace it by another, or perhaps by some somatic illness. The sense of guilt also explains the cure or improvement of severe neuroses which we occasionally observe after real misfortunes: all that matters is that the patient should be miserable - in what way is of no consequence. The uncomplaining resignation with which such people often put up with their hard fate is most remarkable, but also revealing. In warding off this resistance we are obliged to restrict ourselves to making it conscious and attempting to bring about the slow demolition of the hostile super-ego.

I will state in advance one of our chief findings before proceeding with my description. The neuroses (unlike infectious diseases, for instance) have no specific determinants. It would be idle to seek in them for pathogenic excitants. They shade off by easy transitions into what is described as the normal; and, on the other hand, there is scarcely any state recognized as normal in which indications of neurotic traits could not be pointed out. Neurotics have approximately the same innate dispositions as other people, they have the same experiences and they have the same tasks to perform. Why is it, then, that they live so much worse and with so much greater difficulty and, in the process, suffer more feelings of unpleasure, anxiety and pain?

We need not be at a loss to find an answer to this question. Quantitative disharmonies are what must be held responsible for the inadequacy and sufferings of neurotics. The determining cause of all the forms taken by human mental life, is, indeed, to be sought in the reciprocal action between innate dispositions and accidental experiences. Now a particular instinct may be too strong or too weak innately, or a particular capacity may be stunted or insufficiently developed in life. On the other hand, external impressions and experiences may make demands of differing strength on different people; and what one person's constitution can deal with may prove an unmanageable task for another's. These quantitative differences will determine the variety of the results.

We shall very soon feel, however, that this explanation is unsatisfactory: it is too general, it explains too much. The aetiology put forward applies to every case of mental suffering, misery and disablement, but not every such state can be termed neurotic. The neuroses have specific characteristics, they are miseries of a particular kind. So we must after all expect to find particular causes for them. Or we may adopt the supposition that, among the tasks with which mental life has to deal, there are a few on which it can especially easily come to grief; so that the peculiarity of the phenomena of neurosis, which are often so very remarkable, would follow from this without our needing to withdraw our earlier assertions. If it remains true that the neuroses do not differ in any essential respect from the normal, their study promises to yield us valuable contributions to our knowledge of the normal. It may be that we shall thus discover the 'weak points' in a normal organization.
The facts of this splitting of the ego, which we have just described, are neither so new nor so strange as they may at first appear. It is indeed a universal characteristic of neuroses that there are present in the subject's mental life, as regards some particular behaviour, two different attitudes, contrary to each other and independent of each other. In the case of neuroses, however, one of these attitudes belongs to the ego and the contrary one, which is repressed, belongs to the id. The difference between this case and the other is essentially a topographical or structural one, and it is not always easy to decide in an individual instance with which of the two possibilities one is dealing. They have, however, the following important characteristic in common. Whatever the ego does in its efforts of defence, whether it seeks to disavow a portion of the real external world or whether it seeks to reject an instinctual demand from the internal world, its success is never complete and unqualified. The outcome always lies in two contrary attitudes, of which the defeated, weaker one, no less than the other, leads to psychical complications. In conclusion, it is only necessary to point out how little of all these processes becomes known to us through our conscious perception.

[1940a [1938], 5009]
Indeed, when we look into the matter more closely, we must recognize the fact that the dream-work is doing nothing original in making substitutions of this kind. In order to gain its ends - in this case the possibility of a representation hampered by censorship - it merely follows the paths which it finds already laid down in the unconscious; and it gives preference to those transformations of the repressed material which can also become conscious in the form of jokes or allusions and of which the phantasies of neurotic patients are so full. At this point we suddenly reach an understanding of Scherner's dream interpretations, whose essential correctness I have defended elsewhere. The imagination's pre-occupation with the subject's own body is by no means peculiar to dreams or characteristic only of them. My analyses have shown me that it is habitually present in the unconscious thoughts of neurotics, and that it is derived from sexual curiosity, which, in growing youths or girls, is directed to the genitals of the other sex, and to those of their own as well. Nor, as Scherner and Volkelt have rightly insisted, is a house the only circle of ideas employed for symbolizing the body; and this is equally true of dreams and of the unconscious phantasies of neurosis. It is true that I know patients who have retained an architectural symbolism for the body and the genitals. (Sexual interest ranges far beyond the sphere of the external genitalia.) For these patients pillars and columns represent the legs (as they do in the Song of Solomon), every gateway stands for one of the bodily orifices (a 'hole'), every water-pipe is a reminder of the urinary apparatus, and so on. But the circle of ideas centring round plant-life or the kitchen may just as readily be chosen to conceal sexual images.¹ In the former case the way has been well prepared by linguistic usage, itself the precipitate of imaginative similes reaching back to remote antiquity: e.g. the Lord's vineyard, the seed, and the maiden's garden in the Song of Solomon. The ugliest as well as the most intimate details of sexual life may be thought and dreamt of in seemingly innocent allusions to activities in the kitchen; and the symptoms of hysteria could never be interpreted if we forgot that sexual symbolism can find its best hiding-place behind what is commonplace and inconspicuous. There is a valid sexual meaning behind the neurotic child's intolerance of blood or raw meat, or his nausea at the sight of eggs or macaroni, and behind the enormous exaggeration in neurotics of the natural human dread of snakes. Wherever neuroses make use of such disguises they are following paths along which all humanity passed in the earliest periods of civilization - paths of whose continued existence today, under the thinnest of veils, evidence is to be found in linguistic usages, superstitions and customs.

¹[1900a, 815]

But the patient was also familiar with the fact that rats are carriers of dangerous infectious diseases; he could therefore employ them as symbols of his dread (justifiable enough in the army) of syphilitic infection. This dread concealed all sorts of doubts as to the kind of life his father had led during his term of military service. Again, in another sense, the penis itself is a carrier of syphilitic infection; and in this way he could consider the rat as a male organ of sex. It had a further title to be so regarded; for a penis (especially a child's penis) can easily be compared to a worm, and the captain's story had been about rats burrowing in some one's anus, just as the large round-worms had in his when he was a child. Thus the penis significance of rats was based, once more, upon anal erotism. And apart from this, the rat is a dirty animal, feeding upon excrement and living in sewers.¹ It is perhaps unnecessary to point out how great an extension of the rat delirium became possible owing to this new meaning. For instance, 'So many rats, so many florins' could serve as an excellent characterization of a certain female profession which he particularly detested. On the other hand, it is certainly not a matter of indifference that the substitution of a penis for a rat in the captain's story resulted in a situation of intercourse per anum, which could not fail to be especially revolting to him when brought into connection with his father and the woman he loved. And when we consider that the same situation was reproduced in the compulsive threat which had formed in his mind after the captain had made his request, we shall be forcibly reminded of certain curses in use among the Southern Slavs.² Moreover, all of this material, and more besides, was woven into the fabric of the rat discussions behind the screen-association 'heirateri' ['to marry'].

²[1909d, 2167]
If the reader feels tempted to shake his head at the possibility of such leaps of imagination in the neurotic mind, I may remind him that artists have sometimes indulged in similar freaks of fancy. Such, for instance, are Le Poitevin’s *Diableries érotiques.*

[1909d, 2167]

Some other features in Le Bon’s description show in a clear light how well justified is the identification of the group mind with the mind of primitive people. In groups the most contradictory ideas can exist side by side and tolerate each other, without any conflict arising from the logical contradiction between them. But this is also the case in the unconscious mental life of individuals, of children and of neurotics, as psycho-analysis has long pointed out.¹

[1921c, 3774]

¹ In young children, for instance, ambivalent emotional attitudes towards those who are nearest to them exist side by side for a long time, without either of them interfering with the expression of the other and opposite one. If eventually a conflict breaks out between the two, it is often settled by the child making a change of object and displacing one of the ambivalent emotions on to a substitute. The history of the development of a neurosis in an adult will also show that a suppressed emotion may frequently persist for a long time in unconscious or even in conscious phantasies, the content of which naturally runs directly counter to some predominant tendency, and yet that this opposition does not result in any proceedings on the part of the ego against what it has repudiated. The phantasy is tolerated for quite a long time, until suddenly one day, usually as a result of an increase in the affective cathexis of the phantasy, a conflict breaks out between it and the ego with all the usual consequences. In the process of a child’s development into a mature adult there is a more and more extensive integration of his personality, a co-ordination of the separate instinctual impulses and purposive trends which have grown up in him independently of one another. The analogous process in the domain of sexual life has long been known to us as the co-ordination of all the sexual instincts into a definitive genital organization. ([*Three Essays on the Theory of Sexuality,* 1905d.]) Moreover, that the unification of the ego is liable to the same interferences as that of the libido is shown by numerous familiar instances, such as that of men of science who have preserved their faith in the Bible, and other similar cases. - The various possible ways in which the ego can later disintegrate form a special chapter in psychopathology.

[1921c, 3774]

If we may assume that the most general features of unconscious mental life (conflicts between instinctual impulses, repressions and substitutive satisfactions) are present everywhere, and if there is a depth-psychology which leads to a knowledge of those features, then we may reasonably expect that the application of psycho-analysis to the most varied spheres of human mental activity will everywhere bring to light important and hitherto unattainable results. In an exceedingly valuable study, Otto Rank and Hanns Sachs (1913) have tried to bring together what the work of psycho-analysts had been able to achieve up to that time towards fulfilling these expectations. Lack of space prevents me from attempting to complete their enumeration here. I can only select for mention the most important findings with the addition of a few details.

[1924f, 4116]
Before going further into the question of infantile sexuality I must mention an error into which I fell for a while and which might well have had fatal consequences for the whole of my work. Under the influence of the technical procedure which I used at that time, the majority of my patients reproduced from their childhood scenes in which they were sexually seduced by some grown-up person. With female patients the part of seducer was almost always assigned to their father. I believed these stories, and consequently supposed that I had discovered the roots of the subsequent neurosis in these experiences of sexual seduction in childhood. My confidence was strengthened by a few cases in which relations of this kind with a father, uncle, or elder brother had continued up to an age at which memory was to be trusted. If the reader feels inclined to shake his head at my credulity, I cannot altogether blame him; though I may plead that this was at a time when I was intentionally keeping my critical faculty in abeyance so as to preserve an unprejudiced and receptive attitude towards the many novelties which were coming to my notice every day. When, however, I was at last obliged to recognize that these scenes of seduction had never taken place, and that they were only phantasies which my patients had made up or which I myself had perhaps forced on them, I was for some time completely at a loss. My confidence alike in my technique and in its results suffered a severe blow; it could not be disputed that I had arrived at these scenes by a technical method which I considered correct, and their subject-matter was unquestionably related to the symptoms from which my investigation had started. When I had pulled myself together, I was able to draw the right conclusions from my discovery: namely, that the neurotic symptoms were not related directly to actual events but to wishful phantasies, and that as far as the neurosis was concerned psychical reality was of more importance than material reality. I do not believe even now that I forced the seduction-phantasies on my patients, that I 'suggested' them. I had in fact stumbled for the first time upon the Oedipus complex, which was later to assume such an overwhelming importance, but which I did not recognize as yet in its disguise of phantasy. Moreover, seduction during childhood retained a certain share, though a humbler one, in the aetiology of neuroses. But the seducers turned out as a rule to have been older children.

[1925d, 4210]

The conjecture which goes deepest, however, is the one which takes its start from what I have said above (p. 4495) in my footnote. It is to the effect that, with the assumption of an erect posture by man and with the depreciation of his sense of smell, it was not only his anal erotism which threatened to fall a victim to organic repression, but the whole of his sexuality; so that since this, the sexual function has been accompanied by a repugnance which cannot further be accounted for, and which prevents its complete satisfaction and forces it away from the sexual aim into sublimations and libidinal displacements. I know that Bleuler (1913) once pointed to the existence of a primary repelling attitude like this towards sexual life. All neurotics, and many others besides, take exception to the fact that 'inter urinas et faeces nascimur'. The genitals, too, give rise to strong sensations of smell which many people cannot tolerate and which spoil sexual intercourse for them. Thus we should find that the deepest root of the sexual repression which advances along with civilization is the organic defence of the new form of life achieved with man's erect gait against his earlier animal existence. This result of scientific research coincides in a remarkable way with commonplace prejudices that have often made themselves heard. Nevertheless, these things are at present no more than unconfirmed possibilities which have not been substantiated by science. Nor should we forget that, in spite of the undeniable depreciation of olfactory stimuli, there exist even in Europe people among whom the strong genital odours which are so repellent to us are highly prized as sexual stimulants and who refuse to give them up. (Cf. the collections of folklore obtained from Iwan Bloch's questionnaire on the sense of smell in sexual life published in different volumes of Friedrich S. Krauss's Anthropophyteia.)

[1930a, 4499]
In the first place, I suspect that the reader has the impression that our discussions on the sense of guilt disrupt the framework of this essay: that they take up too much space, so that the rest of its subject-matter, with which they are not always closely connected, is pushed to one side. This may have spoilt the structure of my paper; but it corresponds faithfully to my intention to represent the sense of guilt as the most important problem in the development of civilization and to show that the price we pay for our advance in civilization is a loss of happiness through the heightening of the sense of guilt.¹ Anything that still sounds strange about this statement, which is the final conclusion of our investigation, can probably be traced to the quite peculiar relationship - as yet completely unexplained - which the sense of guilt has to our consciousness. In the common case of remorse, which we regard as normal, this feeling makes itself clearly enough perceptible to consciousness. Indeed, we are accustomed to speak of a 'consciousness of guilt' instead of a 'sense of guilt'. Our study of the neuroses, to which, after all we owe the most valuable pointers to an understanding of normal conditions, brings us up against some contradictions. In one of those affections, obsessional neurosis, the sense of guilt makes itself noisily heard in consciousness; it dominates the clinical picture and the patient's life as well, and it hardly allows anything else to appear alongside of it. But in most other cases and forms of neurosis it remains completely unconscious, without on that account producing any less important effects. Our patients do not believe us when we attribute an 'unconscious sense of guilt' to them. In order to make ourselves at all intelligible to them, we tell them of an unconscious need for punishment, in which the sense of guilt finds expression. But its connection with a particular form of neurosis must not be over-estimated. Even in obsessional neurosis there are types of patients who are not aware of their sense of guilt, or who only feel it as a tormenting uneasiness, a kind of anxiety, if they are prevented from carrying out certain actions. It ought to be possible eventually to understand these things; but as yet we cannot. Here perhaps we may be glad to have it pointed out that the sense of guilt is at bottom nothing else but a topographical variety of anxiety; in its later phases it coincides completely with fear of the super-ego. And the relations of anxiety to consciousness exhibit the same extraordinary variations. Anxiety is always present somewhere or other behind every symptom; but at one time it takes noisy possession of the whole of consciousness, while at another it conceals itself so completely that we are obliged to speak of unconscious anxiety or, if we want to have a clearer psychological conscience, since anxiety is in the first instance simply a feeling, of possibilities of anxiety. Consequently it is very conceivable that the sense of guilt produced by civilization is not perceived as such either, and remains to a large extent unconscious, or appears as a sort of malaise, a dissatisfaction, for which people seek other motivations. Religions, at any rate, have never overlooked the part played in civilization by a sense of guilt. Furthermore - a point which I failed to appreciate elsewhere² - they claim to redeem mankind from this sense of guilt, which they call sin. From the manner in which, in Christianity, this redemption is achieved - by the sacrificial death of a single person, who in this manner takes upon himself a guilt that is common to everyone - we have been able to infer what the first occasion may have been on which this primal guilt, which was also the beginning of civilization, was acquired.³

[1930a, 4523]
The facts of this splitting of the ego, which we have just described, are neither so new nor so strange as they may at first appear. It is indeed a universal characteristic of neuroses that there are present in the subject's mental life, as regards some particular behaviour, two different attitudes, contrary to each other and independent of each other. In the case of neuroses, however, one of these attitudes belongs to the ego and the contrary one, which is repressed, belongs to the id. The difference between this case and the other is essentially a topographical or structural one, and it is not always easy to decide in an individual instance with which of the two possibilities one is dealing. They have, however, the following important characteristic in common. Whatever the ego does in its efforts of defence, whether it seeks to disavow a portion of the real external world or whether it seeks to reject an instinctual demand from the internal world, its success is never complete and unqualified. The outcome always lies in two contrary attitudes, of which the defeated, weaker one, no less than the other, leads to psychical complications. In conclusion, it is only necessary to point out how little of all these processes becomes known to us through our conscious perception.

[1940a [1938], 5009]

This view of delusions is not, I think, entirely new, but it nevertheless emphasizes a point of view which is not usually brought into the foreground. The essence of it is that there is not only method in madness, as the poet has already perceived, but also a fragment of historical truth; and it is plausible to suppose that the compulsive belief attaching to delusions derives its strength precisely from infantile sources of this kind. All that I can produce to-day in support of this theory are reminiscences, not fresh impressions. It would probably be worth while to make an attempt to study cases of the disorder in question on the basis of the hypotheses that have been here put forward and also to carry out their treatment on those same lines. The vain effort would be abandoned of convincing the patient of the error of his delusion and of its contradiction of reality; and, on the contrary, the recognition of its kernel of truth would afford common ground upon which the therapeutic work could develop. That work would consist in liberating the fragment of historical truth from its distortions and its attachments to the actual present day and in leading it back to the point in the past to which it belongs. The transposing of material from a forgotten past on to the present or on to an expectation of the future is indeed a habitual occurrence in neurotics no less than in psychotics. Often enough, when a neurotic is led by an anxiety-state to expect the occurrence of some terrible event, he is in fact merely under the influence of a repressed memory (which is seeking to enter consciousness but cannot become conscious) that something which was at that time terrifying did really happen. I believe that we should gain a great deal of valuable knowledge from work of this kind upon psychotics even if it led to no therapeutic success.

[1937d, 5058]
There are numerous possible types of case in which one psychical content is substituted for another, and these come about in a variety of psychological constellations. One of the simplest of these cases is obviously that occurring in the childhood memories with which we are here concerned - the case, that is, where the essential elements of an experience are represented in memory by the inessential elements of the same experience. It is a case of displacement on to something associated by continuity; or, looking at the process as a whole, a case of repression accompanied by the substitution of something in the neighbourhood (whether in space or time). I have elsewhere¹ had occasion to describe a very similar instance of substitution which occurred in the analysis of a patient suffering from paranoia. The woman in question hallucinated voices, which used to repeat long passages from Otto Ludwig's novel Die Heiterethei to her. But the passages they chose were the most trifling and irrelevant in the book. The analysis showed, however, that there were other passages in the same work which had stirred up the most distressing thoughts in the patient. The distressing affect was a motive for putting up a defence against them, but the motives in favour of pursuing them further were not to be suppressed. The result was a compromise by which the innocent passages emerged in the patient's memory with pathological strength and clarity. The process which we here see at work - conflict, repression, substitution involving a compromise - returns in all psychoneurotic symptoms and gives us the key to understanding their formation. Thus it is not without importance if we are able to show the same process operating in the mental life of normal individuals, and the fact that what it influences in normal people is precisely their choice of childhood memories seems to afford one more indication of the intimate relations which have already been insisted upon between the mental life of children and the psychical material of the neuroses.
[1899a, 491]

The processes of normal and pathological defence and the displacements in which they result are clearly of great importance. But to the best of my knowledge no study whatever has hitherto been made of them by psychologists; and it remains to be ascertained in what strata of psychical activity and under what conditions they come into operation. The reason for this neglect may well be that our mental life, so far as it is the object of our conscious internal perception, shows nothing of these processes, apart from instances which we classify as 'faulty reasoning' and some mental operations which aim at producing a comic effect. The assertion that a psychical intensity can be displaced from one presentation (which is then abandoned) on to another (which thenceforward plays the psychological part of the former one) is as bewildering to us as certain features of Greek mythology - as, for instance, when the gods are said to clothe someone with beauty as though it were with a veil, whereas we think only of a face transfigured by a change of expression.
[1899a, 491]
One objection which is frequently brought forward by opponents of psycho-analysis, and which has lately been voiced by Havelock Ellis (1911, 168), argues that though dream-symbolism may perhaps occur as a product of the neurotic mind, it is not to be found in normal persons. Now psycho-analytic research finds no fundamental, but only quantitative, distinctions between normal and neurotic life; and indeed the analysis of dreams, in which repressed complexes are operative alike in the healthy and the sick, shows a complete identity both in their mechanisms and in their symbolism. The naive dreams of healthy people actually often contain a much simpler, more perspicuous and more characteristic symbolism than those of neurotics; for in the latter, as a result of the more powerful workings of the censorship and of the consequently more far-reaching dream-distortion, the symbolism may be obscure and hard to interpret. The dream recorded below will serve to illustrate this fact. It was dreamt by a girl who is not neurotic but is of a somewhat prudish and reserved character. In the course of conversation with her I learnt that she was engaged, but that there were some difficulties in the way of her marriage which were likely to lead to its postponement. Of her own accord she told me the following dream.

[1900a, 833]

There is no longer anything contradictory to us in the notion that a psychical process which develops anxiety can nevertheless be the fulfilment of a wish. We know that it can be explained by the fact that the wish belongs to one system, the $Ucs$, while it has been repudiated and suppressed by the other system, the $Pcs$.¹ Even where psychical health is perfect, the subjugation of the $Ucs$ by the $Pcs$ is not complete; the measure of suppression indicates the degree of our psychical normality. Neurotic symptoms show that the two systems are in conflict with each other; they are the products of a compromise which brings the conflict to an end for the time being. On the one hand, they allow the $Ucs$ an outlet for the discharge of its excitation, and provide it with a kind of sally-port, while, on the other hand they make it possible for the $Pcs$ to control the $Ucs$ to some extent. It is instructive to consider, for instance, the significance of a hysterical phobia or an agoraphobia. Let us suppose that a neurotic patient is unable to cross the street alone - a condition which we rightly regard as a 'symptom.' If we remove this symptom by compelling him to carry out the act of which he believes himself incapable, the consequence will be an attack of anxiety; and indeed the occurrence of an anxiety-attack in the street is often the precipitating cause of the onset of an agoraphobia. We see, therefore, that the symptom has been constructed in order to avoid an outbreak of anxiety; the phobia is erected like a frontier fortification against the anxiety.

[1900a, 1009]

By analysing dreams we can take a step forward in our understanding of the composition of that most marvellous and most mysterious of all instruments. Only a small step, no doubt; but a beginning. And this beginning will enable us to proceed further with its analysis, on the basis of other structures which must be termed pathological. For illnesses - those, at least, which are rightly named 'functional' - do not presuppose the disintegration of the apparatus or the production of fresh splits in its interior. They are to be explained on a dynamic basis - by the strengthening and weakening of the various components in the interplay of forces, so many of whose effects are hidden from view while functions are normal. I hope to be able to show elsewhere how the compounding of the apparatus out of two agencies makes it possible for the normal mind too to function with greater delicacy than would be possible with only one of them.²

[1900a, 1035]

² Dreams are not the only phenomena which allow us to find a basis for psychopathology in psychology. In a short series of papers (1898b and 1899a) which is not yet completed, I have attempted to interpret number of phenomena of daily life as evidence in favour of the same conclusions. [Added 1909:] These, together with some further papers on forgetting, slips of the tongue, bungled actions, etc., have since been collected under the title of The Psychopathology of Everyday Life (1901b).

[1900a, 1035]
It is not without intention that I speak of 'our' unconscious. For what I thus describe is not the same as the unconscious of the philosophers or even the unconscious of Lipps. By them the term is used merely to indicate a contrast with the conscious: the thesis which they dispute with so much heat and defend with so much energy is the thesis that apart from conscious there are also unconscious psychical processes. Lipps carries things further with his assertion that the whole of what is psychical exists unconsciously and that a part of it also exists consciously. But it is not in order to establish this thesis that we have summoned up the phenomena of dreams and of the formation of hysterical symptoms; the observation of normal waking life would by itself suffice to prove it beyond any doubt. The new discovery that we have been taught by the analysis of psychopathological structures and of the first member of that class - the dream - lies in the fact that the unconscious (that is, the psychical) is found as a function of two separate systems and that this is the case in normal as well as in pathological life. Thus there are two kinds of unconscious, which have not yet been distinguished by psychologists. Both of them are unconscious in the sense used by psychology; but in our sense one of them, which we term the \( Ucs \), is also inadmissible to consciousness, while we term the other the \( Pcs \). because its excitations - after observing certain rules, it is true, and perhaps only after passing a fresh censorship, though nonetheless without regard to the \( Ucs \) - are able to reach consciousness.

The fact that excitations in order to reach consciousness must pass through a fixed series or hierarchy of agencies (which is revealed to us by the modifications made in them by censorship) has enabled us to construct a spatial analogy. We have described the relations of the two systems to each other and to consciousness by saying that the system \( Pcs \) stands like a screen between the system \( Ucs \) and consciousness. The system \( Pcs \) not merely bars access to consciousness, it also controls access to the power of voluntary movement and has at its disposal for distribution a mobile cathectic energy, a part of which is familiar to us in the form of attention.²

We shall not be able to form a correct picture of the strange psychical work which brings about the occurrence of both parapraxes and dream images until we have learnt that psychoneurotic symptoms, and especially the psychical formations of hysteria and obsessional neurosis, repeat in their mechanism all the essential features of this mode of working. This is therefore the starting-point for the continuation of our researches. For us, however, there is yet another special interest in considering parapraxes, chance actions and symptomatic actions in the light of this last analogy. If we compare them to the products of the psychoneuroses, to neurotic symptoms, two frequently repeated statements - namely, that the borderline between the normal and the abnormal in nervous matters is a fluid one, and that we are all a little neurotic - acquire meaning and support. Without any medical experience we can construct various types of nervous illness of this kind which are merely hinted at - formes frustres¹ - of the neuroses: cases in which the symptoms are few, or occur rarely or not severely - in other words, cases whose comparative mildness is located in the number, intensity and duration of their pathological manifestations. But we might perhaps never arrive by conjecture at precisely the type that appears most frequently to form the transition between health and illness. For the type we are considering, whose pathological manifestations are parapraxexes and symptomatic acts, is characterized by the fact that the symptoms are located in the least important psychical functions, while everything that can lay claim to higher psychical value remains free from disturbance. Where the symptoms are distributed in the reverse way - that is, where they make their appearance in the most important individual and social functions and are able to disturb nutrition, sexual intercourse, professional work and social life - this is the mark of severe cases of neurosis and is more characteristic of them than, for example, are the variety and vigour of their pathological manifestations.

[1901b, 1347]
By demonstrating the part played by perverse impulses in the formation of symptoms in the psychoneuroses, we have quite remarkably increased the number of people who might be regarded as perverts. It is not only that neurotics in themselves constitute a very numerous class, but it must also be considered that an unbroken chain bridges the gap between the neuroses in all their manifestations and normality. After all, Moebius could say with justice that we are all to some extent hysteric. Thus the extraordinarily wide dissemination of the perversions forces us to suppose that the disposition to perversions is itself of no great rarity but must form a part of what passes as the normal constitution.

¹ We are able to make use of the second of these two sources material since we are justified in expecting that the early years of children who are later to become neurotic are not likely in this respect to differ essentially from those of children who are to grow up into normal adults, [added 1915:] but only in the intensity and clarity of the phenomena involved.

The time has arrived for me to attempt to summarize what I have said. We started out from the aberrations of the sexual instinct in respect of its object and of its aim and we were faced by the question of whether these arise from an innate disposition or are acquired as a result of experiences in life. We arrived at an answer to this question from an understanding, derived from psycho-analytic investigation, of the workings of the sexual instinct in psychoneurotics, a numerous class of people and one not far removed from the healthy. We found that in them tendencies to every kind of perversion can be shown to exist as unconscious forces and betray their presence as factors leading to the formation of symptoms. It was thus possible to say that neurosis is, as it were, the negative of perversion. In view of what was now seen to be the wide dissemination of tendencies to perversion we were driven to the conclusion that a disposition to perversions is an original and universal disposition of the human sexual instinct and that normal sexual behaviour is developed out of it as a result of organic changes and psychical inhibitions occurring in the course of maturation; we hoped to be able to show the presence of this original disposition in childhood. Among the forces restricting the direction taken by the sexual instinct we laid emphasis upon shame, disgust, pity and the structures of morality and authority erected by society. We were thus led to regard any established aberration from normal sexuality as an instance of developmental inhibition and infantilism. Though it was necessary to place in the foreground the importance of the variations in the original disposition, a co-operative and not an opposing relation was to be assumed as existing between them and the influences of actual life. It appeared, on the other hand, that since the original disposition is necessarily a complex one, the sexual instinct itself must be something put together from various factors, and that in the perversions it falls apart, as it were, into its components. The perversions were thus seen to be on the one hand inhibitions, and on the other hand dissociations, of normal development. Both these aspects were brought together in the supposition that the sexual instinct of adults arises from a combination of a number of impulses of childhood into a unity, an impulsion with a single aim.
The task which the psycho-analytic method seeks to perform may be formulated in different ways, which are, however, in their essence equivalent. It may, for instance, be stated thus: the task of the treatment is to remove the amnesias. When all gaps in memory have been filled in, all the enigmatic products of mental life elucidated, the continuance and even a renewal of the morbid condition are made impossible. Or the formula may be expressed in this fashion: all repressions must be undone. The mental condition is then the same as one in which all amnesias have been removed. Another formulation reaches further: the task consists in making the unconscious accessible to consciousness, which is done by overcoming the resistances. But it must be remembered that an ideal condition such as this is not present even in the normal, and further that it is only rarely possible to carry the treatment to a point approaching it. Just as health and sickness are not different from each other in essence but are only separated by a quantitative line of demarcation which can be determined in practice, so the aim of the treatment will never be anything else but the practical recovery of the patient, the restoration of his ability to lead an active life and of his capacity for enjoyment. In a treatment which is incomplete or in which success is not perfect, one may at any rate achieve a considerable improvement in the general mental condition, while the symptoms (though now of smaller importance to the patient) may continue to exist without stamping him as a sick man.

[1904a, 1559]

As a further corollary to my modified view of 'sexual traumas in childhood', my theory now developed further in a direction which had already been indicated in my publications between 1894 and 1896. At that time, and even before sexuality had been given its rightful place as an aetiological factor, I had maintained that no experience could have a pathogenic effect unless it appeared intolerable to the subject's ego and gave rise to efforts at defence (Freud, 1894a). It was to this defence that I traced back the split in the psyche (or, as we said in those days, in consciousness) which occurs in hysteria. If the defence was successful, the intolerable experience with its affective consequences was expelled from consciousness and from the ego's memory. In certain circumstances, however, what had been expelled pursued its activities in what was now an unconscious state, and found its way back into consciousness by means of symptoms and the affects attaching to them, so that the illness corresponded to a failure in defence. This view had the merit of entering into the interplay of the psychical forces and of thus bringing the mental processes in hysteria nearer to normal ones, instead of characterizing the neurosis as nothing more than a mysterious disorder insusceptible to further analysis.

[1906a, 1580]

Accordingly, the aetiology of the neuroses comprises everything which can act in a detrimental manner upon the processes serving the sexual function. In the forefront, then, are to be ranked the noxae which affect the sexual function itself - in so far as these are regarded as injurious by the sexual constitution, varying as it does with different degrees of culture and education. In the next place comes every other kind of noxa and trauma which, by causing general damage to the organism, may lead secondarily to injury to its sexual processes. It should not, however, be forgotten that the aetiological problem in the case of the neuroses is at least as complicated as the causative factors of any other illness. A single pathogenic influence is scarcely ever sufficient; in the large majority of cases a number of aetiological factors are required, which support one another and must therefore not be regarded as being in mutual opposition. For this reason a state of neurotic illness cannot be sharply differentiated from health. The onset of the illness is the product of a summation and the necessary total of aetiological determinants can be completed from any direction. To look for the aetiology of the neuroses exclusively in heredity or in the constitution would be just as one-sided as to attribute that aetiology solely to the accidental influences brought to bear upon sexuality in the course of the subject's life - whereas better insight shows that the essence of these illnesses lies solely in a disturbance of the organism's sexual processes.

[1906a, 1583]
Perhaps, too, in most people’s eyes we are doing our author a poor service in declaring his work to be a psychiatric study. An author, we hear them say, should keep out of the way of any contact with psychiatry and should leave the description of pathological mental states to the doctors. The truth is that no truly creative writer has ever obeyed this injunction. The description of the human mind is indeed the domain which is most his own; he has from time immemorial been the precursor of science, and so too of scientific psychology. But the frontier between states of mind described as normal and pathological is in part a conventional one and in part so fluctuating that each of us probably crosses it many times in the course of a day. On the other hand, psychiatry would be doing wrong if it tried to restrict itself permanently to the study of the severe and gloomy illnesses that arise from gross injuries to the delicate apparatus of the mind. Deviations from health which are slighter and capable of correction, and which to-day we can trace back no further than to disturbances in the interplay of mental forces, arouse its interest no less. Indeed, only through the medium of these can it understand either normal states or the phenomena of severe illness. Thus the creative writer cannot evade the psychiatrist nor the psychiatrist the creative writer, and the poetic treatment of a psychiatric theme can turn out to be correct without any sacrifice of its beauty.

[1907a, 1843]

But, you will ask, if people make such a mystery of their phantasying, how is it that we know such a lot about it? Well, there is a class of human beings upon whom, not a god, indeed, but a stern goddess - Necessity - has allotted the task of telling what they suffer and what things give them happiness. These are the victims of nervous illness, who are obliged to tell their phantasies, among other things, to the doctor by whom they expect to be cured by mental treatment. This is our best source of knowledge, and we have since found good reason to suppose that our patients tell us nothing that we might not also hear from healthy people.

[1908e, 1924]

I do not think much of the objection that neurotics are a special class of people, marked by an innate disposition that is ‘degenerate’, from whose childhood life we must not be allowed to infer anything about the childhood of other people. Neurotics are people much like others. They cannot be sharply differentiated from normal people, and in their childhood they are not always easily distinguishable from those who remain healthy in later life. It is one of the most valuable results of our psycho-analytic investigations to have discovered that the neuroses of such people have no special mental content that is peculiar to them, but that, as Jung has expressed it, they fall ill of the same complexes against which we healthy people struggle as well. The only difference is that healthy people know how to overcome those complexes without any gross damage demonstrable in practical life, whereas in nervous cases the suppression of the complexes succeeds only at the price of costly substitutive formations - that is to say, from a practical point of view it is a failure. In childhood neurotic and normal people naturally approximate to each other much more closely than they do in later life, so that I cannot regard it as a methodological error to make use of the communications of neurotics about their childhood for drawing conclusions by analogy about normal childhood life. But since those who later become neurotics very often have in their inborn constitution an especially strong sexual instinct and a tendency to precocity and to a premature expression of that instinct, they make it possible for us to recognize a great deal of infantile activity more sharply and clearly than our capacity for observation (which is in any case a blunted one) would enable us to do in other children. But we shall of course only be able to assess the true value of these communications made by neurotic adults when, following Havelock Ellis’s example, we shall have thought it worth while to collect the childhood memories of healthy adults as well.

[1908c, 1967]
But the peculiar value of this observation lies in the considerations which follow. When a physician treats an adult neurotic by psycho-analysis, the process he goes through of uncovering the psychical formations, layer by layer, eventually enables him to frame certain hypotheses as to the patient's infantile sexuality; and it is in the components of the latter that he believes he has discovered the motive forces of all the neurotic symptoms of later life. I have set out these hypotheses in my *Three Essays on the Theory of Sexuality* (1905d), and I am aware that they seem as strange to an outside reader as they seem incontrovertible to a psycho-analyst. But even a psycho-analyst may confess to the wish for a more direct and less roundabout proof of these fundamental theorems. Surely there must be a possibility of observing in children at first hand and in all the freshness of life the sexual impulses and wishes which we dig out so laboriously in adults from among their own débris - especially as it is also our belief that they are the common property of all men, a part of the human constitution, and merely exaggerated or distorted in the case of neurotics.

[1909b, 2002]

That no sharp line can be drawn between 'neurotic' and 'normal' people - whether children or adults - that our conception of 'disease' is a purely practical one and a question of summation, that predisposition and the eventualities of life must combine before the threshold of this summation is overstepped, and that consequently a number of individuals are constantly passing from the class of healthy people into that of neurotic patients, while a far smaller number also make the journey in the opposite direction, - all of these are things which have been said so often and have met with so much agreement that I am certainly not alone in maintaining their truth. It is, to say the least of it, extremely probable that a child's upbringing can exercise a powerful influence for good or for evil upon the predisposition which we have just mentioned as one of the factors in the occurrence of 'disease'; but what that upbringing is to aim at and at what point it is to be brought to bear seem at present to be very doubtful questions. Hitherto education has only set itself the task of controlling, or, it would often be more proper to say, of suppressing, the instincts. The results have been by no means gratifying, and where the process has succeeded it has only been to the advantage of a small number of favoured individuals who have not been required to suppress their instincts. Nor has any one enquired by what means and at what cost the suppression of the inconvenient instincts has been achieved. Supposing now that we substitute another task for this one, and aim instead at making the individual capable of becoming a civilized and useful member of society with the least possible sacrifice of his own activity; in that case the information gained by psycho-analysis, upon the origin of pathogenic complexes and upon the nucleus of every nervous affection, can claim with justice that it deserves to be regarded by educators as an invaluable guide in their conduct towards children. What practical conclusions may follow from this, and how far experience may justify the application of those conclusions within our present social system, are matters which I leave to the examination and decision of others.

[1909b, 2122]

Let me at this point state the principal finding to which we have been led by the psycho-analytic investigation of neurotics. The neuroses have no psychical content that is peculiar to them and that might not equally be found in healthy people. Or, as Jung has expressed it, neurotics fall ill of the same complexes against which we healthy people struggle as well. Whether that struggle ends in health, in neurosis, or in a countervailing superiority of achievement, depends on *quantitative* considerations, on the relative strength of the conflicting forces.

[1910a, 2235]
We must expressly insist that we have never reckoned Leonardo as a neurotic or a 'nerve case', as the awkward phrase goes. Anyone who protests at our so much as daring to examine him in the light of discoveries gained in the field of pathology is still clinging to prejudices which we have to-day rightly abandoned. We no longer think that health and illness, normal and neurotic people, are to be sharply distinguished from each other, and that neurotic traits must necessarily be taken as proofs of a general inferiority. To-day we know that neurotic symptoms are structures which are substitutes for certain achievements of repression that we have to carry out in the course of our development from a child to a civilized human being. We know too that we all produce such substitutive structures, and that it is only their number, intensity and distribution which justify us in using the practical concept of illness and in inferring the presence of constitutional inferiority. From the slight indications we have about Leonardo's personality we should be inclined to place him close to the type of neurotic that we describe as 'obsessional'; and we may compare his researches to the 'obsessive brooding' of neurotics, and his inhibitions to what are known as their 'abulias'.

[1910c, 2300]

We have apparently digressed widely from our problem, though in doing so we have touched on the manner in which neurotic pathological conditions are related to our mental life as a whole. But let us now return to the narrower question. The sexual and ego-instincts alike have in general the same organs and systems of organs at their disposal. Sexual pleasure is not attached merely to the function of the genitals. The mouth serves for kissing as well as for eating and communication by speech; the eyes perceive not only alterations in the external world which are important for the preservation of life, but also characteristics of objects which lead to their being chosen as objects of love - their charms. The saying that it is not easy for anyone to serve two masters is thus confirmed. The closer the relation into which an organ with a dual function of this kind enters with one of the major instincts, the more it with holds itself from the other. This principle is bound to lead to pathological consequences if the two fundamental instincts are disunited and if the ego maintains a repression of the sexual component instinct concerned. It is easy to apply this to the eye and to seeing. Let us suppose that the sexual component instinct which makes use of looking - sexual pleasure in looking - has drawn upon itself defensive action by the ego-instincts in consequence of its excessive demands, so that the ideas in which its desires are expressed succumb to repression and are prevented from becoming conscious; in that case there will be a general disturbance of the relation of the eye and of the act of seeing to the ego and consciousness. The ego will have lost its dominance over the organ, which will now be wholly at the disposal of the repressed sexual instinct. It looks as though the repression had been carried too far by the ego, as though it had emptied the baby out with the bath-water: the ego refuses to see anything at all any more, now that the sexual interest in seeing has made itself so prominent. But the alternative picture seems more to the point. This attributes the active role instead to the repressed pleasure in looking. The repressed instinct takes its revenge for being held back from further psychical expansion, by becoming able to extend its dominance over the organ that is in its service. The loss of conscious dominance over the organ is the detrimental substitute for the repression which had miscarried and was only made possible at that price.

[1910i, 2369]
Recognition of the simultaneous presence of the three factors of 'infantilism', 'sexuality' and 'repression' constitutes the main characteristic of the psycho-analytic theory, and marks its distinction from other views of pathological mental life. At the same time, psycho-analysis has demonstrated that there is no fundamental difference, but only one of degree, between the mental life of normal people, of neurotics and of psychotics. A normal person has to pass through the same repressions and has to struggle with the same substitutive structures; the only difference is that he deals with these events with less trouble and better success. The psycho-analytic method of investigation can accordingly be applied equally to the explanation of normal psychological phenomena, and has made it possible to discover the close relationship between pathological psychological products and normal structures such as dreams, the small blunders of everyday life, and such valuable phenomena as jokes, myths and imaginative works. The explanation of these has been furthest in the case of dreams, and has resulted here in the following general formula: 'A dream is a disguised fulfilment of a repressed wish.' The interpretation of dreams has as its object the removal of the disguise to which the dreamer's thoughts have been subjected. It is, moreover, a highly valuable aid to psycho-analytic technique, for it constitutes the most convenient method of obtaining insight into unconscious psychological life.

The importance in the causation of illness which must be ascribed to quantity of libido is in satisfactory agreement with two main theses of the theory of the neuroses to which psycho-analysis has led us: first, the thesis that the neuroses are derived from the conflict between the ego and the libido, and secondly, the discovery that there is no qualitative distinction between the determinants of health and those of neurosis, and that, on the contrary, healthy people have to contend with the same tasks of mastering their libido - they have simply succeeded better in them.

Stekel shares with many non-psycho-analytic writers an inclination to reject the morphological differentiations which we have made within the jumble of the neuroses and to lump them all together under one heading - under psychasthenia, perhaps. We have often contradicted him on this, and have held fast to our expectation that the morphologico-clinical differences will prove valuable as indications that have not yet been understood of essentially distinct processes. When he - justly - points out to us that he has regularly found the same complexes present in what are termed neurasthenics as in other neurotics, his argument fails to meet the point at issue. We have long known that the same complexes and conflicts are to be looked for, too, in all normal and healthy people. In fact, we have grown accustomed to attributing to every civilized human being a certain amount of repression of perverse impulses, a certain amount of anal erotism, of homosexuality and so on, as well as a piece of father-complex and mother-complex and of other complexes besides - just as in the chemical analysis of an organic substance we have every hope of finding certain elements: carbon, oxygen, hydrogen, nitrogen and a trace of sulphur. What distinguishes organic substances from one another is the relative amounts of these elements and the way in which the links between them are constituted. In the same way, in the case of normal and neurotic people what is in question is not whether these complexes and conflicts exist but whether they have become pathogenic and, if so, by means of what mechanisms they have become so.
There are a large number of phenomena related to facial and other expressive movements and to speech, as well as many processes of thought (both in normal and sick people), which have hitherto escaped the notice of psychology because they have been regarded as no more than the results of organic disorder or of some abnormal failure in function of the mental apparatus. What I have in mind are 'parapraxes' (slips of the tongue or pen, forgetfulness, etc.), haphazard actions and dreams in normal people, and convulsive attacks, deliria, visions, and obsessive ideas or acts in neurotic subjects. These phenomena (in so far as they were not entirely neglected, as was the case with the parapraxes) were relegated to pathology and an attempt was made to find 'physiological' explanations of them, though these were invariably unsatisfactory. Psycho-analysis, on the contrary, has been able to show that all these things can be explained by means of hypotheses of a purely psychological nature and can be fitted into the chain of psychical events already known to us. Thus on the one hand psycho-analysis has narrowed the region subject to the physiological point of view and on the other hand has brought a large section of pathology into the sphere of psychology. In this instance the normal phenomena provide the more convincing evidence. Psycho-analysis cannot be accused of having applied to normal cases findings arrived at from pathological material. The evidence in the latter and in the former was reached independently and shows that normal processes and what are described as pathological ones follow the same rules.

[1913j, 2803]

The psychological novelties inferred from dreams and parapraxes must be applicable as an explanation of other phenomena if we are to believe in the value of these novelties, or, indeed, in their existence. And we do in fact find that psycho-analysis has shown that the hypotheses of unconscious mental activity, of censorship and repression and of distortion and substitution, at which we have arrived from our study of these normal phenomena, also afford us a first understanding of a number of pathological phenomena and, as one might say, put into our hands the key to all the riddles of the psychology of the neuroses. Thus dreams are to be regarded as the normal prototypes of all psychopathological structures. Anyone who understands dreams can also grasp the psychical mechanism of the neuroses and psychoses.

[1913j, 2809]

Just as for primaeval man, so also for our unconscious, there is one case in which the two opposing attitudes towards death, the one which acknowledges it as the annihilation of life and the other which denies it as unreal, collide and come into conflict. This case is the same as in primal ages: the death, or the risk of death, of someone we love, a parent or a partner in marriage, a brother or sister, a child or a dear friend. These loved ones are on the one hand an inner possession, components of our own ego; but on the other hand they are partly strangers, even enemies. With the exception of only a very few situations, there adheres to the tenderest and most intimate of our love-relations a small portion of hostility which can excite an unconscious death-wish. But this conflict due to ambivalence does not now, as it did then, lead to the doctrine of the soul and to ethics, but to neurosis, which affords us deep insight into normal mental life as well. How often have physicians who practise psycho-analysis had to deal with the symptom of an exaggerated worry over the well-being of relatives, or with entirely unfounded self-reproaches after the death of a loved person. The study of such phenomena has left them in no doubt about the extent and importance of unconscious death-wishes.

[1915b, 3090]
I cannot tell what you will think of it, but I must assure you that I do not regret having claimed so much of your interest and of the time available to us for the problems of dreams. There is nothing else from which one can so quickly arrive at a conviction of the correctness of the theses by which psycho-analysis stands or falls. Exacting work over many months and even years is called for to show that the symptoms of a case of neurotic illness have a sense, serve a purpose and arise out of the patient's experiences in life. On the other hand, only a few hours' effort may be enough to prove that the same thing is true of a dream which is, to start with, confused to the point of being unintelligible, and thus to confirm all the premises of psycho-analysis - the unconscious nature of mental processes, the peculiar mechanisms which they obey and the instinctual forces which are expressed in them. And when we bear in mind the sweeping analogy between the structure of dreams and that of neurotic symptoms and at the same time consider the rapidity of the transformation which makes a dreamer into a waking and reasonable man, we arrive at a certainty that neuroses too are based only on an alteration in the play of forces between the powers of mental life.

The reminder of dreams given to us by the mother and wife of Oedipus must not be allowed to remain fruitless. Do you recall the outcome of our dream-analyses - how the wishes that construct dreams are so often of a perverse or incestuous nature or reveal an unsuspected hostility to those who are nearest and dearest to the dreamer? At that time we gave no explanation of the origin of these evil impulses. Now you can find it for yourselves. They are allocations of the libido and object-cathexes which date from early infancy and have long since been abandoned as far as conscious life is concerned, but which prove still to be present at night-time and to be capable of functioning in a certain sense. Since, however, everyone, and not only neurotics, experiences these perverse, incestuous and murderous dreams, we may conclude that people who are normal to-day have passed along a path of development that has led through the perversions and object-cathexes of the Oedipus complex, that that is the path of normal development and that neurotics merely exhibit to us in a magnified and coarsened form what the analysis of dreams reveals to us in healthy people as well. And this is one of the reasons why I dealt with the study of dreams before that of neurotic symptoms.
Symptoms - and of course we are dealing now with psychical (or psychogenic) symptoms and psychical illness - are acts detrimental, or at least useless, to the subject's life as a whole, often complained of by him as unwelcome and bringing unpleasure or suffering to him. The main damage they do resides in the mental expenditure which they themselves involve and in the further expenditure that becomes necessary for fighting against them. Where there is an extensive formation of symptoms, these two sorts of expenditure can result in an extraordinary impoverishment of the subject in regard to the mental energy available to him and so in paralysing him for all the important tasks of life. Since this outcome depends mainly on the quantity of the energy which is thus absorbed, you will easily see that 'being ill' is in its essence a practical concept. But if you take up a theoretical point of view and disregard this matter of quantity, you may quite well say that we are all ill - that is, neurotic - since the preconditions for the formation of symptoms can also be observed in normal people.

[1916-1917, 3417]

You will no doubt have observed that in these last discussions I have introduced a fresh factor into the structure of the aetiological chain - namely the quantity, the magnitude, of the energies concerned. We have still to take this factor into account everywhere. A purely qualitative analysis of the aetiological determinants is not enough. Or, to put it another way, a merely dynamic view of these mental processes is insufficient; an economic line of approach is also needed. We must tell ourselves that the conflict between two trends does not break out till certain intensities of cathexis have been reached, even though the determinants for it have long been present so far as their subject-matter is concerned. In the same way, the pathogenic significance of the constitutional factors must be weighed according to how much more of one component instinct than of another is present in the inherited disposition. It may even be supposed that the disposition of all human beings is qualitatively alike and that they differ only owing to these quantitative conditions. The quantitative factor is no less decisive as regards capacity to resist neurotic illness. It is a matter of what quota of unemployed libido a person is able to hold in suspension and of how large a fraction of his libido he is able to divert from sexual to sublimated aims. The ultimate aim of mental activity, which may be described qualitatively as an endeavour to obtain pleasure and avoid unpleasure, emerges, looked at from the economic point of view, as the task of mastering the amounts of excitation (mass of stimuli) operating in the mental apparatus and of keeping down their accumulation which creates unpleasure.

[1916-1917, 3429]
But I still owe you further enlightenment, Gentlemen, on my reasons for not starting my account of the theory of the neuroses with the common neurotic state. You may perhaps suppose that it was because in that case I should have had greater difficulty in proving the sexual causation of the neuroses. But you would be wrong there. In the case of the transference neuroses one must work one's way through the interpretation of symptoms before one can arrive at that discovery. In the common forms of what are known as the 'actual neuroses' the aetiological significance of sexual life is a crude fact that springs to the observer's eyes. I came upon it more than twenty years ago when one day I asked myself the question of why in the examination of neurotics their sexual activities were so regularly excluded from consideration. At that time I sacrificed my popularity with my patients for the sake of these enquiries; but after only a brief effort I was able to declare that 'if the *vita sexualis* is normal, there can be no neurosis' - and by this I meant no 'actual neurosis'. No doubt this statement passes too lightly over people's individual differences; it suffers, too, from the indefiniteness inseparable from the judgement of what is 'normal'. But as a rough guide it retains its value to this day. I had by then reached the point of establishing specific relations between particular forms of neurosis and particular sexual noxae; and I have no doubt that I could repeat the same observations to-day if similar pathological material were still at my disposal. I found often enough that a man who indulged in a certain kind of incomplete sexual satisfaction (for instance, manual masturbation) had fallen ill of a particular form of 'actual neurosis', and that this neurosis promptly gave place to another if he replaced this sexual régime by another equally far from being irreproachable. I was then in a position to infer the change in a patient's sexual mode of life from an alteration in his condition. I also learnt then to stand obstinately by my suspicions till I had overcome the patients' disingenuousness and compelled them to confirm my views. It is true that thereafter they preferred to go to other doctors who did not make such keen enquiries about their sexual life.

[1916-1917, 3438]

But the dreams of neurotics do not differ in any important respect from those of normal people; it is possible, indeed, that they cannot be distinguished from them at all. It would be absurd to give an account of the dreams of neurotics which could not also apply to the dreams of normal people. We must therefore say that the difference between neurosis and health holds only during the day; it is not prolonged into dream-life. We are obliged to carry over to healthy people a number of hypotheses which arise in connection with neurotics as a result of the link between the latter's dreams and their symptoms. We cannot deny that healthy people as well possess in their mental life what alone makes possible the formation both of dreams and of symptoms, and we must conclude that they too have carried out repressions, that they expend a certain amount of energy in order to maintain them, that their unconscious system conceals repressed impulses which are still cathetted with energy, and that a *portion of their libido is withdrawn from their ego's disposal*. Thus a healthy person, too, is virtually a neurotic; but dreams appear to be the only symptoms which he is capable of forming. It is true that if one subjects his waking life to a closer examination one discovers something that contradicts this appearance - namely that this ostensibly healthy life is interspersed with a great number of trivial and in practice unimportant symptoms.

[1916-1917, 3496]

The distinction between nervous health and neurosis is thus reduced to a practical question and is decided by the outcome - by whether the subject is left with a sufficient amount of capacity for enjoyment and of efficiency. It probably goes back to the relative sizes of the quota of energy that remains free and of that which is bound by repression, and is of a quantitative not of a qualitative nature. I need not tell you that this discovery is the theoretical justification for our conviction that neuroses are in principle curable in spite of their being based on constitutional disposition.

[1916-1917, 3496]
What I have been trying to describe in this outline is the libido theory of the neuroses, upon which are founded all our conceptions of the nature of these morbid states, together with our therapeutic measures for relieving them. We naturally regard the premises of the libido theory as valid for normal behaviour as well. We speak of the narcissism of small children, and it is to the excessive narcissism of primitive man that we ascribe his belief in the omnipotence of his thoughts and his consequent attempts to influence the course of events in the external world by the technique of magic.

[1917a, 3610]

Its further course led it away from the study of the somatic determinants of nervous disease to an extent that was bewildering to physicians. Instead, it was brought into contact with the mental substance of human lives - the lives not only of the sick, but of the healthy, the normal and the supernormal. It had to deal with emotions and passions, and most of all with those which the poets never tire of depicting and celebrating - the emotions of love. It learnt to recognize the power of memories, the unsuspected importance of the years of childhood in shaping the adult, and the strength of wishes, which falsify human judgements and lay down fixed lines for human endeavour.

[1919g, 3703]

A little reflection was bound to show that it would be impossible to restrict to the provinces of dreams and nervous disorders a view such as this of the life of the human mind. If that view has hit upon a truth, it must apply equally to normal mental events, and even the highest achievements of the human spirit must bear a demonstrable relation to the factors found in pathology - to repression, to the efforts at mastering the unconscious and to the possibilities of satisfying the primitive instincts. There was thus an irresistible temptation and, indeed, a scientific duty, to apply the research methods of psycho-analysis, in regions far remote from its native soil, to the various mental sciences. And indeed psycho-analytic work upon patients itself pointed persistently in the direction of this new task, for it was obvious that the forms assumed by the different neuroses echoed the most highly admired productions of our culture. Thus hysterics are undoubtedly imaginative artists, even if they express their phantasies mimetically in the main and without considering their intelligibility to other people; the ceremonials and prohibitions of obsessional neurotics drive us to suppose that they have created a private religion of their own; and the delusions of paranoids have an unpalatable external similarity and internal kinship to the systems of our philosophers. It is impossible to escape the conclusion that these patients are, in an asocial fashion, making the very attempts at solving their conflicts and appeasing their pressing needs which, when those attempts are carried out in a fashion that is acceptable to the majority, are known as poetry, religion and philosophy.

[1919g, 3704]
It seems to me that we have here an important discovery - namely, that the qualitative factor, the presence of certain neurotic formations, has less practical significance than the quantitative factor, the degree of attention or, more correctly, the amount of cathexis that these structures are able to attract to themselves. Our consideration of the first case, the jealous paranoia, led to a similar estimate of the importance of the quantitative factor, by showing that there also the abnormality essentially consisted in the hypercathexis of the interpretations of someone else's unconscious. We have long known of an analogous fact in the analysis of hysteria. The pathogenic phantasies, derivatives of repressed instinctual impulses, are for a long time tolerated alongside the normal life of the mind, and have no pathogenic effect until by a revolution in the libidinal economy they receive a hypercathexis; not till then does the conflict which leads to the formation of symptoms break out. Thus as our knowledge grows we are increasingly impelled to bring the economic point of view into the foreground. I should also like to throw out the question whether this quantitative factor that I am now dwelling on does not suffice to cover the phenomena which Bleuler and others have lately proposed to name 'switching'. One need only assume that an increase in resistance in the course taken by the psychical current in one direction results in a hypercathexis of another path and thus causes the flow to be switched into that path.

[1922b, 3905]

The Interpretation of Parapraxes and Haphazard Acts. - It was a triumph for the interpretative art of psycho-analysis when it succeeded in demonstrating that certain common mental acts of normal people, for which no one had hitherto attempted to put forward a psychological explanation, were to be regarded in the same light as the symptoms of neurotics: that is to say, they had a meaning, which was unknown to the subject but which could easily be discovered by analytic means. The phenomena in question were such events as the temporary forgetting of familiar words and names, forgetting to carry out prescribed tasks, everyday slips of the tongue and of the pen, misreadings, losses and mislayings of objects, certain errors, instances of apparently accidental self-injury, and finally habitual movements carried out seemingly without intention or in play, tunes hummed 'thoughtlessly', and so on. All of these were shorn of their physiological explanation, if any such had ever been attempted, were shown to be strictly determined and were revealed as an expression of the subject's suppressed intentions or as a result of a clash between two intentions one of which was permanently or temporarily unconscious. The importance of this contribution to psychology was of many kinds. The range of mental determinism was extended by it in an unforeseen manner; the supposed gulf between normal and pathological mental events was narrowed; in many cases a useful insight was afforded into the play of mental forces that must be suspected to lie behind the phenomena. Finally, a class of material was brought to light which is calculated better than any other to stimulate a belief in the existence of unconscious mental acts even in people to whom the hypothesis of something at once mental and unconscious seems strange and even absurd. The study of one's own parapraxes and haphazard acts, for which most people have ample opportunities, is even to-day the best preparation for an approach to psycho-analysis. In analytic treatment, the interpretation of parapraxes retains a place as a means of uncovering the unconscious, alongside the immeasurably more important interpretation of associations.

[1923a, 3917]
It has been worth while to enter in some detail into the explanation of dreams, since analytic work has shown that the dynamics of the formation of dreams are the same as those of the formation of symptoms. In both cases we find a struggle between two trends, of which one is unconscious and ordinarily repressed and strives towards satisfaction - that is, wish-fulfilment - while the other, belonging probably to the conscious ego, is disapproving and repressive. The outcome of this conflict is a compromise-formation (the dream or the symptom) in which both trends have found an incomplete expression. The theoretical importance of this conformity between dreams and symptoms is illuminating. Since dreams are not pathological phenomena, the fact shows that the mental mechanisms which produce the symptoms of illness are equally present in normal mental life, that the same uniform law embraces both the normal and the abnormal and that the findings of research into neurotics or psychotics cannot be without significance for our understanding of the healthy mind.

[1923a, 3919]

The Non-Medical Applications and Correlations of Psycho-analysis. - Any estimate of psycho-analysis would be incomplete if it failed to make clear that, alone among the medical disciplines, it has the most extensive relations with the mental sciences, and that it is in a position to play a part of the same importance in the studies of religious and cultural history and in the sciences of mythology and literature as it is in psychiatry. This may seem strange when we reflect that originally its only object was the understanding and improvement of neurotic symptoms. But it is easy to indicate the starting-point of the bridge that leads over to the mental sciences. The analysis of dreams gave us an insight into the unconscious processes of the mind and showed us that the mechanisms which produce pathological symptoms are also operative in the normal mind. Thus psychoanalysis became a depth-psychology and capable as such of being applied to the mental sciences, and it was able to answer a good number of questions with which the academic psychology of consciousness was helpless to deal. At quite an early stage problems of human phyllogenesis arose. It became clear that pathological function was often nothing more than a regression to an earlier stage in the development of normal function. C. G. Jung was the first to draw explicit attention to the striking similarity between the disordered phantasies of sufferers from dementia praecox and the myths of primitive peoples; while the present writer pointed out that the two wishes which combine to form the Oedipus complex coincide precisely with the two principal prohibitions imposed by totemism (not to kill the tribal ancestor and not to marry any woman belonging to one’s own clan) and drew far-reaching conclusions from this fact. The significance of the Oedipus complex began to grow to gigantic proportions and it looked as though social order, morals, justice and religion had arisen together in the primaeval ages of mankind as reaction-formations against the Oedipus complex. Otto Rank threw a brilliant light upon mythology and the history of literature by the application of psycho-analytic views, as did Theodor Reik upon the history of morals and religions, while Dr. Pfister, of Zurich, aroused the interest of religious and secular teachers and demonstrated the importance of the psycho-analytic standpoint for education. Further discussion of these applications of psycho-analysis would be out of place here, and it is enough to say that the limits of their influence are not yet in sight.

[1923a, 3929]
There is, therefore, a further analogy between a neurosis and a psychosis, in that in both of them the task which is undertaken in the second step is partly unsuccessful. For the repressed instinct is unable to procure a full substitute (in neurosis); and the representation of reality cannot be remodelled into satisfying forms (not, at least, in every species of mental illness). But the emphasis is different in the two cases. In a psychosis it falls entirely on the first step, which is pathological in itself and cannot but lead to illness. In a neurosis, on the other hand, it falls on the second step, on the failure of the repression, whereas the first step may succeed, and does succeed in innumerable instances without overstepping the bounds of health - even though it does so at a certain price and not without leaving behind traces of the psychical expenditure it has called for. These distinctions, and perhaps many others as well, are a result of the topographical difference in the initial situation of the pathogenic conflict - namely whether in it the ego yielded to its allegiance to the real world or to its dependence on the id.

[1924e, 4097]

The psycho-analytic view would also have to include in narcissistic disorders all the ailments described in psychiatry as 'functional psychoses'. It could not be doubted that neuroses and psychoses are not separated by a hard and fast line, any more than health and neurosis; and it was plausible to explain the mysterious psychotic phenomena by the discoveries achieved on the neuroses, which had hitherto been equally incomprehensible. The present writer had himself, during the period of his isolation, made a case of paranoid illness partly intelligible by an analytic investigation and had pointed out in this unquestionable psychosis the same contents (complexes) and a similar interplay of forces as in the simple neuroses. Bleuler followed out the indications of what he called 'Freudian mechanisms' in a whole number of psychoses, and Jung won high opinions as an analyst at a single blow when, in 1907, he explained the most eccentric symptoms in the end-stages of dementia praecox from the individual life-histories of the patients. The comprehensive study of schizophrenia by Bleuler (1911) probably demonstrated once and for all the justification of a psycho-analytic angle of approach for the understanding of these psychoses.

[1924f, 4114]

If we may assume that the most general features of unconscious mental life (conflicts between instinctual impulses, repressions and substitutive satisfactions) are present everywhere, and if there is a depth-psychology which leads to a knowledge of those features, then we may reasonably expect that the application of psycho-analysis to the most varied spheres of human mental activity will everywhere bring to light important and hitherto unattainable results. In an exceedingly valuable study, Otto Rank and Hanns Sachs (1913) have tried to bring together what the work of psycho-analysts had been able to achieve up to that time towards fulfilling these expectations. Lack of space prevents me from attempting to complete their enumeration here. I can only select for mention the most important findings with the addition of a few details.

[1924f, 4116]
I must begin by adding that increasing experience showed more and more plainly that the Oedipus complex was the nucleus of the neurosis. It was at once the climax of infantile sexual life and the point of junction from which all of its later developments proceeded. But if so, it was no longer possible to expect analysis to discover a factor that was specific in the aetiology of the neuroses. It must be true, as Jung expressed it so well in the early days when he was still an analyst, that neuroses have no peculiar content which belongs exclusively to them but that neurotics break down at the same difficulties that are successfully overcome by normal people. This discovery was very far from being a disappointment. It was in complete harmony with another one: that the depth-psychology revealed by psycho-analysis was in fact the psychology of the normal mind. Our path had been like that of chemistry: the great qualitative differences between substances were traced back to quantitative variations in the proportions in which the same elements were combined.

[1925d, 4230]

Why this should be so calls for a rather long reply. First of all, we must sift the facts. In a great number of cases the old determinants of anxiety do really lapse, after having produced neurotic reactions. The phobias of very young children, fears of being alone or in the dark or with strangers - phobias which can almost be called normal - usually pass off later on; the child 'grows out of them', as we say about some other disturbances of childhood. Animal phobias, which are of such frequent occurrence, undergo the same fate and many conversion hysterias of early years find no continuation in later life. Ceremonial actions appear extremely often in the latency period, but only a very small percentage of them develop later into a full obsessional neurosis. In general, so far as we can tell from our observations of town children belonging to the white races and living according to fairly high cultural standards, the neuroses of childhood are in the nature of regular episodes in a child's development, although too little attention is still being paid to them. Signs of childhood neuroses can be detected in all adult neurotics without exception; but by no means all children who show those signs become neurotic in later life. It must be, therefore, that certain determinants of anxiety are relinquished and certain danger-situations lose their significance as the individual becomes more mature. Moreover, some of these danger-situations manage to survive into later times by modifying their determinants of anxiety so as to bring them up to date. Thus, for instance, a man may retain his fear of castration in the guise of a syphilidophobia, after he has come to know that it is no longer customary to castrate people for indulging their sexual lusts, but that, on the other hand, severe diseases may overtake anyone who thus gives way to his instincts. Other determinants of anxiety, such as fear of the super-ego, are destined not to disappear at all but to accompany people throughout their lives. In that case the neurotic will differ from the normal person in that his reactions to the dangers in question will be unduly strong. Finally, being grown-up affords no absolute protection against a return of the original traumatic anxiety-situation. Each individual has in all probability a limit beyond which his mental apparatus fails in its function of mastering the quantities of excitation which require to be disposed of.

[1926d, 4302]
I am aware, of course, that our recognition of sexuality has become - whether admittedly or not - the strongest motive for other people's hostility to analysis. Can that shake our confidence? It merely shows us how neurotic our whole civilized life is, since ostensibly normal people do not behave very differently from neurotics. At a time when psycho-analysis was solemnly put on its trial before the learned societies of Germany - to-day things have grown altogether quieter - one of the speakers claimed to possess peculiar authority because, so he said, he even allowed his patients to talk: for diagnostic purposes, clearly, and to test the assertions of analysts. 'But', he added, 'if they begin to talk about sexual matters I shut their mouths.' What do you think of that as a method of demonstration? The learned society applauded the speaker to the echo instead of feeling suitably ashamed on his account. Only the triumphant certainty afforded by the consciousness of prejudices held in common can explain this speaker's want of logical thought. Years later a few of those who had at that time been my followers gave in to the need to free human society from the yoke of sexuality which psycho-analysis was seeking to impose on it. One of them explained that what is sexual does not mean sexuality at all, but something else, something abstract and mystical. And another actually declared that sexual life is merely one of the spheres in which human beings seek to put in action their driving need for power and domination. They have met with much applause, for the moment at least.

[1926e, 4350]

(2) For cultural reasons the most intense repression falls upon the sexual instincts; but it is precisely in connection with them that repression most easily miscarries, so that neurotic symptoms are found to be substitutive satisfactions of repressed sexuality. The belief that in man sexual life begins only at puberty is incorrect. On the contrary, signs of it can be detected from the beginning of extra-uterine existence; it reaches a first culminating point at or before the fifth year ('early period'), after which it is inhibited or interrupted ('latency period') until the age of puberty, which is the second climax of its development. This diphasic onset of sexual development seems to be distinctive of the genus Homo. All experiences during the first period of childhood are of the greatest importance to the individual, and in combination with his inherited sexual constitution form the dispositions for the subsequent development of character and disease. It is wrong to make sexuality coincide with 'genitality'. The sexual instincts pass through a complicated course of development, and it is only at the end of it that the 'primacy of the genital zones' is attained. Before this there are a number of 'pregenital' organizations of the libido - points at which it may become 'fixated' and to which, in the event of subsequent repression, it will return ('regression'). The infantile fixations of the libido are what determine the form of any later neurosis. Thus the neuroses are to be regarded as inhibitions in the development of the libido. There are no specific causes of nervous disorders; the question whether a conflict finds a healthy solution or leads to a neurotic inhibition of function depends upon quantitative considerations.

[1926f, 4405]
It is doubtful whether we are as yet in a position to discover types to fulfil this requirement - as we shall no doubt be able to do later, on some basis of which we are still ignorant. If we confine our effort to setting up purely psychological types, the libidinal situation will have a first claim to serve as a basis for our classification. It may fairly be demanded that this classification should not merely be deduced from our knowledge or our hypotheses about the libido, but that it should be easily confirmed in actual experience and that it should contribute to the clarification of the mass of our observations and help us to grasp them. It may at once be admitted that these libidinal types need not be the only possible ones even in the psychological field, and that, if we proceeded from other qualities, we might perhaps establish a whole set of other psychological types. But it must be required of all such types that they shall not coincide with clinical pictures. On the contrary, they must comprehend all the variations which according to our practical judgement fall within the limits of the normal. In their extreme developments, however, they may well approximate to clinical pictures and in that way help to bridge the gulf that is supposed to lie between the normal and the pathological.

[1931a, 4585]

It is a familiar fact that the aetiological preconditions of neurosis are not yet known with certainty. The precipitating causes of it are frustrations and internal conflicts: conflicts between the three major psychical agencies, conflicts arising within the libidinal economy in consequence of our bisexual disposition and conflicts between the erotic and the aggressive instinctual components. It is the endeavour of the psychology of the neuroses to discover what makes these processes, which belong to the normal course of mental life, become pathogenic.

[1931a, 4587]

There are a quantity of similar processes among those which the analytic investigation of mental life has taught us to know. Some of them are described as pathological, others are counted among the diversity of normal events. But that matters little, since the boundaries between the two are not sharply drawn, their mechanisms are to a large extent the same, and it is of far more importance whether the alterations in question take place in the ego itself or whether they confront it as alien to it - in which case they are known as symptoms.

[1939a, 4943]

I will state in advance one of our chief findings before proceeding with my description. The neuroses (unlike infectious diseases, for instance) have no specific determinants. It would be idle to seek in them for pathogenic excitants. They shade off by easy transitions into what is described as the normal; and, on the other hand, there is scarcely any state recognized as normal in which indications of neurotic traits could not be pointed out. Neurotics have approximately the same innate dispositions as other people, they have the same experiences and they have the same tasks to perform. Why is it, then, that they live so much worse and with so much greater difficulty and, in the process, suffer more feelings of unpleasure, anxiety and pain?

[1940a [1938], 4992]

We need not be at a loss to find an answer to this question. Quantitative disharmonies are what must be held responsible for the inadequacy and sufferings of neurotics. The determining cause of all the forms taken by human mental life, is, indeed, to be sought in the reciprocal action between innate dispositions and accidental experiences. Now a particular instinct may be too strong or too weak innately, or a particular capacity may be stunted or insufficiently developed in life. On the other hand, external impressions and experiences may make demands of differing strength on different people; and what one person’s constitution can deal with may prove an unmanageable task for another’s. These quantitative differences will determine the variety of the results.

[1940a [1938], 4992]
We shall very soon feel, however, that this explanation is unsatisfactory: it is too general, it explains too much. The aetiology put forward applies to every case of mental suffering, misery and disablement, but not every such state can be termed neurotic. The neuroses have specific characteristics, they are miseries of a particular kind. So we must after all expect to find particular causes for them. Or we may adopt the supposition that, among the tasks with which mental life has to deal, there are a few on which it can especially easily come to grief; so that the peculiarity of the phenomena of neurosis, which are often so very remarkable, would follow from this without our needing to withdraw our earlier assertions. If it remains true that the neuroses do not differ in any essential respect from the normal, their study promises to yield us valuable contributions to our knowledge of the normal. It may be that we shall thus discover the 'weak points' in a normal organization.

But let us for the moment keep to psychology. We have seen that it is not scientifically feasible to draw a line of demarcation between what is psychically normal and abnormal; so that that distinction, in spite of its practical importance, possesses only a conventional value. We have thus established a right to arrive at an understanding of the normal life of the mind from a study of its disorders - which would not be admissible if these pathological states, neuroses and psychoses, had specific causes operating in the manner of foreign bodies.
To this I must reply in the first place that, considering the admittedly enormous frequency of the neuroses and especially of anxiety neurosis, it would certainly not be right to expect to find an aetiological factor for them that is of rare occurrence; in the second place, that a postulate of pathology is in fact satisfied, if in an aetiological investigation it can be shown that the presence of an aetiological factor is more frequent than its effects, since, in order for these latter to occur, other conditions may have to exist in addition (such as disposition, summation of specific aetiological elements, or reinforcement by other stock noxae); and further, that a detailed dissection of suitable cases of anxiety neurosis proves beyond question the importance of the sexual factor. I will confine myself here, however, to the single aetiological factor of coitus interruptus and to bringing out certain observations which confirm it.

[1895b, 340]

The time has arrived for me to attempt to summarize what I have said. We started out from the aberrations of the sexual instinct in respect of its object and of its aim and we were faced by the question of whether these arise from an innate disposition or are acquired as a result of experiences in life. We arrived at an answer to this question from an understanding, derived from psycho-analytic investigation, of the workings of the sexual instinct in psychoneurotics, a numerous class of people and one not far removed from the healthy. We found that in them tendencies to every kind of perversion can be shown to exist as unconscious forces and betray their presence as factors leading to the formation of symptoms. It was thus possible to say that neurosis is, as it were, the negative of perversion. In view of what was now seen to be the wide dissemination of tendencies to perversion we were driven to the conclusion that a disposition to perversions is an original and universal disposition of the human sexual instinct and that normal sexual behaviour is developed out of it as a result of organic changes and psychical inhibitions occurring in the course of maturation; we hoped to be able to show the presence of this original disposition in childhood. Among the forces restricting the direction taken by the sexual instinct we laid emphasis upon shame, disgust, pity and the structures of morality and authority erected by society. We were thus led to regard any established aberration from normal sexuality as an instance of developmental inhibition and infantilism. Though it was necessary to place in the foreground the importance of the variations in the original disposition, a co-operative and not an opposing relation was to be assumed as existing between them and the influences of actual life. It appeared, on the other hand, that since the original disposition is necessarily a complex one, the sexual instinct itself must be something put together from various factors, and that in the perversions it falls apart, as it were, into its components. The perversions were thus seen to be on the one hand inhibitions, and on the other hand dissociations, of normal development. Both these aspects were brought together in the supposition that the sexual instinct of adults arises from a combination of a number of impulses of childhood into a unity, an impulsion with a single aim.

[1905d, 1542]

In general, it may perhaps be said that the neurotic instability of the public and the dramatist's skill in avoiding resistances and offering fore-pleasures can alone determine the limits set upon the employment of abnormal characters on the stage.

[1942a [1905], 1612]

It is remarkable that both compulsions and prohibitions (having to do something and having not to do something) apply in the first instance only to the subject's solitary activities and for a long time leave his social behaviour unaffected. Sufferers from this illness are consequently able to treat their affliction as a private matter and keep it concealed for many years. And, indeed, many more people suffer from these forms of obsessional neurosis than doctors hear of. For many sufferers, too, concealment is made easier from the fact that they are quite well able to fulfill their social duties during a part of the day, once they have devoted a number of hours to their secret doings, hidden from view like Mélusine.
But even if the damage done by civilized sexual morality is admitted, it may be argued in reply to our third question that the cultural gain derived from such an extensive restriction of sexuality probably more than balances these sufferings, which, after all, only affect a minority in any severe form. I must confess that I am unable to balance gain against loss correctly on this point, but I could advance a great many more considerations on the side of the loss. Going back to the subject of abstinence, which I have already touched on, I must insist that it brings in its train other noxae besides those involved in the neuroses and that the importance of the neuroses has for the most part not been fully appreciated.

I return now to my earlier assertion that, in judging the neuroses, their full importance is not as a rule taken into account. I do not mean by this the undervaluation of these states shown in their frivolous dismissal by relatives and in the boasting assurances by doctors that a few weeks of cold water treatment or a few months of rest and convalescence will cure the condition. These are merely the opinions of quite ignorant doctors and laymen and are mostly no more than words intended to give the sufferer a short-lived consolation. It is, on the contrary, a well-known fact that a chronic neurosis, even if it does not totally put an end to the subject's capacity for existence, represents a severe handicap in his life, of the same order, perhaps, as tuberculosis or a cardiac defect. The situation would even be tolerable if neurotic illness were to exclude from civilized activities only a number of individuals who were in any case of the weaker sort, and allowed the rest to play their part in it at the cost of troubles that were merely subjective. But, far from this being so, I must insist upon the view that neuroses, whatever their extent and wherever they occur, always succeed in frustrating the purposes of civilization, and in that way actually perform the work of the suppressed mental forces that are hostile to civilization. Thus, when society pays for obedience to its far-reaching regulations by an increase in nervous illness, it cannot claim to have purchased a gain at the price of sacrifices; it cannot claim a gain at all. Let us, for instance, consider the very common case of a woman who does not love her husband, because, owing to the conditions under which she entered marriage, she has no reason to love him, but who very much wants to love him, because that alone corresponds to the ideal of marriage to which she has been brought up. She will in that case suppress every impulse which would express the truth and contradict her endeavours to fulfil her ideal, and she will make special efforts to play the part of a loving, affectionate and attentive wife. The outcome of this self-suppression will be a neurotic illness; and this neurosis will in a short time have taken revenge on the unloved husband and have caused him just as much lack of satisfaction and worry as would have resulted from an acknowledgement of the true state of affairs. This example is completely typical of what a neurosis achieves. A similar failure to obtain compensation is to be seen after the suppression of impulses inimical to civilization which are not directly sexual. If a man, for example, has become over-kind as a result of a violent suppression of a constitutional inclination to harshness and cruelty, he often loses so much energy in doing this that he fails to carry out all that his compensatory impulses require, and he may, after all, do less good on the whole than he would have done without the suppression.
In the first place observation shows, in a manner that excludes all doubt, that the infantile experiences have an importance of their own and give evidence of it already in childhood. Children too have their neuroses, in which the factor of displacement backwards in time is necessarily very much reduced or is even completely absent, since the onset of the illness follows the traumatic experiences immediately. The study of these infantile neuroses protects us from more than one dangerous misunderstanding of the neuroses of adults, just as the dreams of children gave the key to an understanding of adult dreams. Children's neuroses are very common, much commoner than is supposed. They are often overlooked, regarded as signs of a bad or naughty child, often, too, kept under by the nursery authorities; but they can always be easily recognized in retrospect. They usually appear in the form of anxiety hysteria. We shall learn on a later occasion what that means. If a neurosis breaks out in later life, analysis regularly reveals it as a direct continuation of the infantile illness which may have emerged as no more than a veiled hint. As I have said, however, there are cases in which these signs of neurosis in childhood proceed uninterruptedly into a lifelong illness. We have been able to analyse a few examples of these children's neuroses in childhood itself - when they were actually present; but far more often we have had to be content with someone who has fallen ill in adult life enabling us to obtain a deferred insight into his childhood neurosis. In such cases we must not fail to make certain corrections and take certain precautions.

[1916-1917, 3421]

And now in conclusion I will cast a glance at a situation which belongs to the future - one that will seem fantastic to many of you, but which I think, nevertheless, deserves that we should be prepared for it in our minds. You know that our therapeutic activities are not very far-reaching. There are only a handful of us, and even by working very hard each one can devote himself in a year to only a small number of patients. Compared to the vast amount of neurotic misery which there is in the world, and perhaps need not be, the quantity we can do away with is almost negligible. Besides this, the necessities of our existence limit our work to the well-to-do classes, who are accustomed to choose their own physicians and whose choice is diverted away from psycho-analysis by all kinds of prejudices. At present we can do nothing for the wider social strata, who suffer extremely seriously from neuroses.

[1919a, 3635]

Now let us assume that by some kind of organization we succeeded in increasing our numbers to an extent sufficient for treating a considerable mass of the population. On the other hand, it is possible to foresee that at some time or other the conscience of society will awake and remind it that the poor man should have just as much right to assistance for his mind as he now has to the life-saving help offered by surgery; and that the neuroses threaten public health no less than tuberculosis, and can be left as little as the latter to the impotent care of individual members of the community. When this happens, institutions or out-patient clinics will be started, to which analytically-trained physicians will be appointed, so that men who would otherwise give way to drink, women who have nearly succumbed under their burden of privations, children for whom there is no choice but between running wild or neurosis, may be made capable, by analysis, of resistance and of efficient work. Such treatments will be free. It may be a long time before the State comes to see these duties as urgent. Present conditions may delay its arrival even longer. Probably these institutions will first be started by private charity. Some time or other, however, it must come to this.

[1919a, 3635]
The division of the psychical into what is conscious and what is unconscious is the fundamental premiss of psycho-analysis; and it alone makes it possible for psycho-analysis to understand the pathological processes in mental life, which are as common as they are important, and to find a place for them in the framework of science. To put it once more, in a different way: psycho-analysis cannot situate the essence of the psychical in consciousness, but is obliged to regard consciousness as a quality of the psychical, which may be present in addition to other qualities or may be absent.

This implied, of course, that I abandoned the treatment of organic nervous diseases; but that was of little importance. For on the one hand the prospects in the treatment of such disorders were in any case never promising, while, on the other hand, in the private practice of a physician working in a large town, the quantity of such patients was nothing compared to the crowds of neurotics, whose number seemed further multiplied by the way in which they hurried, with their troubles unsolved, from one physician to another. And, apart from this, there was something positively seductive in working with hypnotism. For the first time there was a sense of having overcome one's helplessness; and it was highly flattering to enjoy the reputation of being a miracle-worker. It was not until later that I was to discover the drawbacks of the procedure. At the moment there were only two points to complain of: first, that I could not succeed in hypnotizing every patient, and secondly, that I was unable to put individual patients into as deep a state of hypnosis as I should have wished. With the idea of perfecting my hypnotic technique, I made a journey to Nancy in the summer of 1889 and spent several weeks there. I witnessed the moving spectacle of old Liébeault working among the poor women and children of the labouring classes. I was a spectator of Bernheim's astonishing experiments upon his hospital patients, and I received the profoundest impression of the possibility that there could be powerful mental processes which nevertheless remained hidden from the consciousness of men. Thinking it would be instructive, I had persuaded one of my patients to follow me to Nancy. This patient was a very highly gifted hysteric, a woman of good birth, who had been handed over to me because no one knew what to do with her. By hypnotic influence I had made it possible for her to lead a tolerable existence and I was always able to take her out of the misery of her condition. But she always relapsed again after a short time, and in my ignorance I attributed this to the fact that her hypnosis had never reached the stage of somnambulism with amnesia. Bernheim now attempted several times to bring this about, but he too failed. He frankly admitted to me that his great therapeutic successes by means of suggestion were only achieved in his hospital practice and not with his private patients. I had many stimulating conversations with him, and undertook to translate into German his two works upon suggestion and its therapeutic effects.

[1923b, 3947]

[1925d, 4195]
I am aware, of course, that our recognition of sexuality has become - whether admittedly or not - the strongest motive for other people's hostility to analysis. Can that shake our confidence? It merely shows us how neurotic our whole civilized life is, since ostensibly normal people do not behave very differently from neurotics. At a time when psycho-analysis was solemnly put on its trial before the learned societies of Germany - to-day things have grown altogether quieter - one of the speakers claimed to possess peculiar authority because, so he said, he even allowed his patients to talk: for diagnostic purposes, clearly, and to test the assertions of analysts. 'But', he added, 'if they begin to talk about sexual matters I shut their mouths.' What do you think of that as a method of demonstration? The learned society applauded the speaker to the echo instead of feeling suitably ashamed on his account. Only the triumphant certainty afforded by the consciousness of prejudices held in common can explain this speaker's want of logical thought. Years later a few of those who had at that time been my followers gave in to the need to free human society from the yoke of sexuality which psycho-analysis was seeking to impose on it. One of them explained that what is sexual does not mean sexuality at all, but something else, something abstract and mystical. And another actually declared that sexual life is merely one of the spheres in which human beings seek to put in action their driving need for power and domination. They have met with much applause, for the moment at least.

I cannot foresee the way out of these difficulties, nor is it my business to point it out. I see only two things, first that analysis is an embarrassment to you and that the best thing would be for it not to exist - though neurotics, no doubt, are an embarrassment too; and secondly, that the interests of everyone concerned would for the time being be met if the doctors could make up their minds to tolerate a class of therapists which would relieve them of the tedium of treating the enormously common psychogenic neuroses while remaining in constant touch with them to the benefit of the patients.

It was in the winter of 1899 that my book on *The Interpretation of Dreams* (though its title-page was post-dated into the new century) at length lay before me. This work was the product of the labours of four or five years and its origin was unusual. Holding a lectureship in Nervous Diseases at the University, I had attempted to support myself and my rapidly increasing family by a medical practice among the so-called 'neurotics' of whom there were only too many in our society. But the task proved harder than I had expected. The ordinary methods of treatment clearly offered little or no help: other paths must be followed. And how was it by any means possible to give patients help when one understood nothing of their illness, nothing of the causes of their sufferings or of the meaning of their complaints? So I eagerly sought direction and instruction from the great Charcot in Paris and from Bernheim at Nancy; finally, an observation made by my teacher and friend, Josef Breuer of Vienna, seemed to open a new prospect for understanding and therapeutic success.

There is, however, another class of psychical patients who clearly resemble the psychotics very closely - the vast number of people suffering severely from neuroses. The determinants of their illness as well as its pathogenic mechanisms must be the same or at least very similar. But their ego has proved more resistant and has become less disorganized. Many of them, in spite of their maladies and the inadequacies resulting from them, have been able to maintain themselves in real life. These neurotics may show themselves ready to accept our help. We will confine our interest to *them* and see how far and by what methods we are able to 'cure' them.
I had already made attempts at earlier stages of my work to arrive at some more general points of view on the basis of psycho-analytic observation. In a short essay, 'Formulations on the Two Principles of Mental Functioning', I drew attention (and there was, of course, nothing original in this) to the domination of the pleasure-unpleasure principle in mental life and to its displacement by what is called the reality principle. Later on I made an attempt to produce a 'Metapsychology'. By this I meant a method of approach according to which every mental process is considered in relation to three co-ordinates, which I described as dynamic, topographical, and economic respectively; and this seemed to me to represent the furthest goal that psychology could attain. The attempt remained no more than a torso; after writing two or three papers - 'Instincts and their Vicissitudes', 'Repression', 'The Unconscious', 'Mourning and Melancholia', etc. - I broke off, wisely perhaps, since the time for theoretical predications of this kind had not yet come. In my latest speculative works I have set about the task of dissecting our mental apparatus on the basis of the analytic view of pathological facts and have divided it into an ego, an id, and a super-ego.¹ The super-ego is the heir of the Oedipus complex and represents the ethical standards of mankind.

[1925d, 4234]

In order to remain faithful to our customary phraseology, we shall have to speak, not of transposing the psychical accent, but of displacing large amounts of cathexis. The question then is whether we are entitled to picture extensive displacements like this from one agency of the mental apparatus to another. It looks like a new hypothesis constructed ad hoc. Yet we may remind ourselves that we have repeatedly (even though not sufficiently often) taken a factor of this kind into account in our attempts at a metapsychological picture of mental events. Thus, for instance, we supposed that the difference between an ordinary erotic object-cathexis and the state of being in love is that in the latter incomparably more cathexis passes over to the object and that the ego empties itself as it were in favour of the object. In studying some cases of paranoia I was able to establish the fact that ideas of persecution are formed early and exist for a long time without any perceptible effect, until, as the result of some particular precipitating event, they receive sufficient amounts of cathexis to cause them to become dominant. The cure, too, of such paranoic attacks would lie not so much in a resolution and correction of the delusional ideas as in a withdrawal from them of the cathexis which has been lent to them. The alternations between melancholia and mania, between a cruel suppression of the ego by the super-ego and a liberation of the ego after that pressure, suggests a shift of cathexis of this kind; such a shift, moreover, would have to be brought in to explain a whole number of phenomena belonging to normal mental life. If this has been done hitherto only to a very limited extent, that is on account of our usual caution - something which deserves only praise. The region in which we feel secure is that of the pathology of mental life; it is here that we make our observations and acquire our convictions. For the present we venture to form a judgement on the normal mind only in so far as we can discern what is normal in the isolations and distortions of the pathological material. When once we have overcome this hesitancy we shall recognize what a large contribution is made to the understanding of mental processes by the static conditions as well as by the dynamic changes in the quantity of energetic cathexis.

[1927d, 4544]
In a first period - the period of childhood immorality - the events occur which contain the germ of the later neurosis. First of all, in earliest childhood, we have the experiences of sexual seduction that will later on make repression possible; and then come the acts of sexual aggression against the other sex, which will later appear in the form of acts involving self-reproach.
[1896b, 389]

This period is brought to a close by the advent of sexual 'maturation', often itself unduly early. A self-reproach now becomes attached to the memory of these pleasurable actions; and the connection with the initial experience of passivity makes it possible - often only after conscious and remembered efforts - to repress them and to replace them by a primary symptom of defence. Conscientiousness, shame and self-distrust are symptoms of this kind, with which the third period begins - the period of apparent health, but actually, of successful defence.
[1896b, 389]

In order to describe clearly and with probable accuracy the processes of repression, the return of the repressed and the formation of pathological compromise-ideas, one would have to make up one's mind to quite definite assumptions about the substratum of psychical events and of consciousness. So long as one seeks to avoid this, one must be content with the following remarks which are intended more or less figuratively. There are two forms of obsessional neurosis, according to whether what forces an entrance into consciousness is solely the mnemonic content of the act involving self-reproach, or whether the self-reproachful affect connected with the act does so as well.
[1896b, 390]

You may, however, rightly object to this justification of the hysterical reaction to psychical stimuli and say that nevertheless the reaction is not a normal one. For why do healthy people behave differently? Why do not all their excitations of long ago come into operation once more when a new, present-day, excitation takes place? One has an impression, indeed, that with hysterical patients it is as if all their old experiences - to which they have already reacted so often and, moreover, so violently - had retained their effective power; as if such people were incapable of disposing of their psychical stimuli. Quite true, Gentlemen, something of the sort must really be assumed. You must not forget that in hysterical people when there is a present-day precipitating cause, the old experiences come into operation in the form of unconscious memories. It looks as though the difficulty of disposing of a present impression, the impossibility of transforming it into a powerless memory, is attached precisely to the character of the psychical unconscious. You see that the remainder of the problem lies once more in the field of psychology - and, what is more, a psychology of a kind for which philosophers have done little to prepare the way for us.
[1896c, 431]
There are numerous possible types of case in which one psychical content is substituted for another, and these come about in a variety of psychological constellations. One of the simplest of these cases is obviously that occurring in the childhood memories with which we are here concerned - the case, that is, where the essential elements of an experience are represented in memory by the inessential elements of the same experience. It is a case of displacement on to something associated by continuity; or, looking at the process as a whole, a case of repression accompanied by the substitution of something in the neighbourhood (whether in space or time). I have elsewhere¹ had occasion to describe a very similar instance of substitution which occurred in the analysis of a patient suffering from paranoia. The woman in question hallucinated voices, which used to repeat long passages from Otto Ludwig's novel *Die Heiterethei* to her. But the passages they chose were the most trifling and irrelevant in the book. The analysis showed, however, that there were other passages in the same work which had stirred up the most distressing thoughts in the patient. The distressing affect was a motive for putting up a defence against them, but the motives in favour of pursuing them further were not to be suppressed. The result was a compromise by which the innocent passages emerged in the patient's memory with pathological strength and clarity. The process which we here see at work - conflict, repression, substitution involving a compromise - returns in all psychoneurotic symptoms and gives us the key to understanding their formation. Thus it is not without importance if we are able to show the same process operating in the mental life of normal individuals, and the fact that what it influences in normal people is precisely their choice of childhood memories seems to afford one more indication of the intimate relations which have already been insisted upon between the mental life of children and the psychical material of the neuroses.

[1899a, 491]

The processes of normal and pathological defence and the displacements in which they result are clearly of great importance. But to the best of my knowledge no study whatever has hitherto been made of them by psychologists; and it remains to be ascertained in what strata of psychical activity and under what conditions they come into operation. The reason for this neglect may well be that our mental life, so far as it is the object of our conscious internal perception, shows nothing of these processes, apart from instances which we classify as 'faulty reasoning' and some mental operations which aim at producing a comic effect. The assertion that a psychical intensity can be displaced from one presentation (which is then abandoned) on to another (which thenceforward plays the psychological part of the former one) is as bewildering to us as certain features of Greek mythology - as, for instance, when the gods are said to clothe someone with beauty as though it were with a veil, whereas we think only of a face transfigured by a change of expression.

[1899a, 491]

But there is one thing which the severest and the mildest cases all have in common, and which is equally found in parapraxes and chance actions: the phenomena can be traced back to incompletely suppressed psychical material, which, although pushed away by consciousness, has nevertheless not been robbed of all capacity for expressing itself.

[1901b, 1347]
I add a few remarks which may help towards the synthesis of this dream. The dream-work began on the afternoon of the day after the scene in the wood, after Dora had noticed that she was no longer able to lock the door of her room. She then said to herself: ‘I am threatened by a serious danger here,’ and formed her intention of not stopping on in the house alone but of going off with her father. This intention became capable of forming a dream, because it succeeded in finding a continuation in the unconscious. What corresponded to it there was her summoning up her infantile love for her father as a protection against the present temptation. The change which thus took place in her became fixed and brought her into the attitude shown by her supervenal train of thought - jealousy of Frau K. on her father's account, as though she herself were in love with him. There was a conflict within her between a temptation to yield to the man's proposal and a composite force rebelling against that feeling. This latter force was made up of motives of respectability and good sense, of hostile feelings caused by the governess's disclosures (jealousy and wounded pride, as we shall see later), and of a neurotic element, namely, the tendency to a repudiation of sexuality which was already present in her and was based on her childhood history. Her love for her father, which she summoned up to protect her against the temptation, had its origin in this same childhood history.

Nevertheless, in publishing this paper, incomplete though it is, I had two objects in view. In the first place, I wished to supplement my book on the interpretation of dreams by showing how an art, which would otherwise be useless, can be turned to account for the discovery of the hidden and repressed parts of mental life. (Incidentally, in the process of analysing the two dreams dealt with in the paper, the technique of dream-interpretation, which is similar to that of psycho-analysis, has come under consideration.) In the second place, I wished to stimulate interest in a whole group of phenomena of which science is still in complete ignorance to-day because they can only be brought to light by the use of this particular method. No one, I believe, can have had any true conception of the complexity of the psychological events in a case of hysteria - the juxtaposition of the most dissimilar tendencies, the mutual dependence of contrary ideas, the repressions and displacements, and so on. The emphasis laid by Janet upon the 'idée fixe' which becomes transformed into a symptom amounts to no more than an extremely meagre attempt at schematization. Moreover, it is impossible to avoid the suspicion that, when the ideas attaching to certain excitations are incapable of becoming conscious, those excitations must act upon one another differently, run a different course, and manifest themselves differently from those other excitations which we describe as 'normal' and which have ideas attaching to them of which we become conscious. When once things have been made clear up to this point, no obstacle can remain in the way of an understanding of a therapeutic method which removes neurotic symptoms by transforming ideas of the former kind into normal ones.

When erotogenic susceptibility to stimulation has been successfully transferred by a woman from the clitoris to the vaginal orifice, it implies that she has adopted a new leading zone for the purposes of her later sexual activity. A man, on the other hand, retains his leading zone unchanged from childhood. The fact that women change their leading erotogenic zone in this way, together with the wave of repression at puberty, which, as it were, puts aside their childish masculinity, are the chief determinants of the greater proneness of woman to neurosis and especially to hysteria. These determinants, therefore, are intimately related to the essence of femininity.
Further information now became available relating to people who had remained normal; and this led to the unexpected finding that the sexual history of their childhood did not necessarily differ in essentials from that of neurotics, and, in particular, that the part played by seduction was the same in both cases. As a consequence, accidental influences receded still further into the background as compared with 'repression' (as I now began to say instead of 'defence'). Thus it was no longer a question of what sexual experiences a particular individual had had in his childhood, but rather of his reaction to those experiences - of whether he had reacted to them by 'repression' or not. It could be shown how in the course of development a spontaneous infantile sexual activity was often broken off by an act of repression. Thus a mature neurotic individual was invariably pursued by a certain amount of 'sexual repression' from his childhood; this found expression when he was faced by the demands of real life, and the psycho-analyses of hysterics showed that they fell ill as a result of the conflict between their libido and their sexual repression and that their symptoms were in the nature of compromises between the two mental currents.

I could not further elucidate this part of my theory without a detailed discussion of my views on repression. It will be enough here to refer to my Three Essays (1905d), in which I have attempted to throw some light - if only a feeble one - on the somatic processes in which the essential nature of sexuality is to be looked for. I have there shown that the constitutional sexual disposition of children is incomparably more variegated than might have been expected, that it deserves to be described as 'polymorphously perverse' and that what is spoken of as the normal behaviour of the sexual function emerges from this disposition after certain of its components have been repressed. By pointing out the infantile elements in sexuality I was able to establish a simple correlation between health, perversion and neurosis. I showed that normality is a result of the repression of certain component instincts and constituents of the infantile disposition and of the subordination of the remaining constituents under the primacy of the genital zones in the service of the reproductive function. I showed that perversions correspond to disturbances of this coalescence owing to the overpowering and compulsive development of certain of the component instincts, while neuroses can be traced back to an excessive repression of the libidinal trends. Since almost all the perverse instincts of the infantile disposition can be recognized as the forces concerned in the formation of symptoms in neuroses, though in a state of repression, I was able to describe neurosis as being the 'negative' of perversion.

Accordingly, the aetiology of the neuroses comprises everything which can act in a detrimental manner upon the processes serving the sexual function. In the forefront, then, are to be ranked the noxae which affect the sexual function itself - in so far as these are regarded as injurious by the sexual constitution, varying as it does with different degrees of culture and education. In the next place comes every other kind of noxa and trauma which, by causing general damage to the organism, may lead secondarily to injury to its sexual processes. It should not, however, be forgotten that the aetiological problem in the case of the neuroses is at least as complicated as the causative factors of any other illness. A single pathogenic influence is scarcely ever sufficient; in the large majority of cases a number of aetiological factors are required, which support one another and must therefore not be regarded as being in mutual opposition. For this reason a state of neurotic illness cannot be sharply differentiated from health. The onset of the illness is the product of a summation and the necessary total of aetiological determinants can be completed from any direction. To look for the aetiology of the neuroses exclusively in heredity or in the constitution would be just as one-sided as to attribute that aetiology solely to the accidental influences brought to bear upon sexuality in the course of the subject's life - whereas better insight shows that the essence of these illnesses lies solely in a disturbance of the organism's sexual processes.
Perhaps, too, in most people’s eyes we are doing our author a poor service in declaring his work to be a psychiatric study. An author, we hear them say, should keep out of the way of any contact with psychiatry and should leave the description of pathological mental states to the doctors. The truth is that no truly creative writer has ever obeyed this injunction. The description of the human mind is indeed the domain which is most his own; he has from time immemorial been the precursor of science, and so too of scientific psychology. But the frontier between states of mind described as normal and pathological is in part a conventional one and in part so fluctuating that each of us probably crosses it many times in the course of a day. On the other hand, psychiatry would be doing wrong if it tried to restrict itself permanently to the study of the severe and gloomy illnesses that arise from gross injuries to the delicate apparatus of the mind. Deviations from health which are slighter and capable of correction, and which to-day we can trace back no further than to disturbances in the interplay of mental forces, arouse its interest no less. Indeed, only through the medium of these can it understand either normal states or the phenomena of severe illness. Thus the creative writer cannot evade the psychiatrist nor the psychiatrist the creative writer, and the poetic treatment of a psychiatric theme can turn out to be correct without any sacrifice of its beauty.

[1907a, 1843]

The development of Norbert Hanold’s delusion proceeded with a dream which, since it was not occasioned by any new event, seems to have arisen entirely out of his mind, filled as it was by a conflict. But let us pause before we enquire whether, in the construction of his dreams, too, the author meets our expectation that he possesses a deep understanding. Let us ask first what psychiatric science has to say to his hypotheses about the origin of a delusion and what attitude it takes to the part played by repression and the unconscious, to conflict and to the formation of compromises. In short, let us ask whether this imaginative representation of the genesis of a delusion can hold its own before the judgement of science.

[1907a, 1850]
And here we must give what will perhaps be an unexpected answer. In fact the situation is quite the reverse: it is science that cannot hold its own before the achievement of the author. Science allows a gulf to yawn between the hereditary and constitutional preconditions of a delusion and its creations, which seem to emerge ready-made - a gulf which we find that our author has filled. Science does not as yet suspect the importance of repression, it does not recognize that in order to explain the world of psychopathological phenomena the unconscious is absolutely essential, it does not look for the basis of delusions in a psychical conflict, and it does not regard their symptoms as compromises. Does our author stand alone, then, in the face of united science? No, that is not the case (if, that is, I may count my own works as part of science), since for a number of years - and, until recently, more or less alone¹ - I myself have supported all the views that I have here extracted from Jensen's *Gradiva* and stated in technical terms. I indicated, in most detail in connection with the states known as hysteria and obsessions, that the individual determinant of these psychical disorders is the suppression of a part of instinctual life and the repression of the ideas by which the suppressed instinct is represented, and soon afterwards I repeated the same views in relation to some forms of delusion.² The question whether the instincts concerned in this causation are always components of the sexual instinct or may be of another kind as well is a problem which may be regarded as a matter of indifference in the particular case of the analysis of *Gradiva*; for in the instance chosen by our author what was at issue was quite certainly nothing other than the suppression of erotic feelings. The validity of the hypotheses of psychical conflict and of the formation of symptoms by means of compromises between the two mental currents struggling against each other has been demonstrated by me in the case of patients observed and medically treated in real life, just as I have been able to in the imaginary case of Norbert Hanold.³ Even before me, Pierre Janet, a pupil of the great Charcot, and Josef Breuer, in collaboration with me, had traced back the products of neurotic, and especially of hysterical, illness to the power of unconscious thoughts.⁴

[1907a, 1851]

But the similarity between Gradiva's procedure and the analytic method of psychotherapy is not limited to these two points - the making conscious of what has been repressed and the coinciding of explanation with cure. It also extends to what turns out to be the essence of the whole change - to the awakening of feelings. Every disorder analogous to Hanold's delusion, what in scientific terms we are in the habit of calling 'psychoneuroses', has as its precondition the repression of a portion of instinctual life, or, as we can safely say, of the sexual instinct. At every attempt to introduce the unconscious and repressed causes of the illness into consciousness, the instinctual component concerned is necessarily aroused to a renewed struggle with the repressing powers, only to come to terms with them in the final outcome, often to the accompaniment of violent manifestations of reaction. The process of cure is accomplished in a relapse into love, if we combine all the many components of the sexual instinct under the term 'love'; and such a relapse is indispensable, for the symptoms on account of which the treatment has been undertaken are nothing other than precipitates of earlier struggles connected with repression or the return of the repressed, and they can only be resolved and washed away by a fresh high tide of the same passions. Every psycho-analytic treatment is an attempt at liberating repressed love which has found a meagre outlet in the compromise of a symptom. Indeed, the agreement between such treatments and the process of cure described by the author of *Gradiva* reaches its climax in the further fact that in analytic psychotherapy too the re-awakened passion, whether it is love or hate, invariably chooses as its object the figure of the doctor.

[1907a, 1881]
Psycho-analytic research into the neuroses (the various forms of nervous illness with a mental causation) has endeavoured to trace their connection with instinctual life and the restrictions imposed on it by the claims of civilization, with the activities of the normal individual in phantasies and dreams, and with the creations of the popular mind in religion, myths and fairy tales. The psycho-analytic treatment of neurotic patients, based on this method of research, makes far higher demands on doctor and patient than the methods hitherto in common use, which operate through medicaments, diet, hydropathy and suggestion. But it brings the patients so much more relief and permanent strengthening in the face of life's problems, that there is no cause for surprise at the continual advances made by this therapeutic method in spite of violent opposition.

[1910b, 1995]

But the peculiar value of this observation lies in the considerations which follow. When a physician treats an adult neurotic by psycho-analysis, the process he goes through of uncovering the psychical formations, layer by layer, eventually enables him to frame certain hypotheses as to the patient's infantile sexuality; and it is in the components of the latter that he believes he has discovered the motive forces of all the neurotic symptoms of later life. I have set out these hypotheses in my *Three Essays on the Theory of Sexuality* (1905d), and I am aware that they seem as strange to an outside reader as they seem incontrovertible to a psycho-analyst. But even a psycho-analyst may confess to the wish for a more direct and less roundabout proof of these fundamental theorems. Surely there must be a possibility of observing in children at first hand and in all the freshness of life the sexual impulses and wishes which we dig out so laboriously in adults from among their own débris - especially as it is also our belief that they are the common property of all men, a part of the human constitution, and merely exaggerated or distorted in the case of neurotics.

[1909b, 2002]

While the analysis of a case is in progress it is impossible to obtain any clear impression of the structure and development of the neurosis. That is the business of a synthetic process which must be performed subsequently. In attempting to carry out such a synthesis of little Hans's phobia we shall take as our basis the account of his mental constitution, of his governing sexual wishes, and of his experiences up to the time of his sister's birth, which we have given in an earlier part of this paper.

[1909b, 2112]

I cannot take leave of our small patient's phobia without giving expression to a notion which has made its analysis, leading as it did to a recovery, seem of especial value to me. Strictly speaking, I learnt nothing new from this analysis, nothing that I had not already been able to discover (though often less distinctly and more indirectly) from other patients analysed at a more advanced age. But the neuroses of these other patients could in every instance be traced back to the same infantile complexes that were revealed behind Hans's phobia. I am therefore tempted to claim for this neurosis of childhood the significance of being a type and a model, and to suppose that the multiplicity of the phenomena of repression exhibited by neuroses and the abundance of their pathogenic material do not prevent their being derived from a very limited number of processes concerned with identical ideational complexes.

[1909b, 2123]
We find, accordingly: an erotic instinct and a revolt against it; a wish which has not yet become compulsive and, struggling against it, a fear which is already compulsive; a distressing affect and an impulsion towards the performance of defensive acts. The inventory of the neurosis has reached its full muster. Indeed, something more is present, namely, a kind of delusion or delirium with the strange content that his parents knew his thoughts because he spoke them out loud without his hearing himself do it. We shall not go far astray if we suppose that in making this attempt at an explanation the child had some inkling of those remarkable mental processes which we describe as unconscious and which we cannot dispense with if we are to throw any scientific light upon this obscure subject. 'I speak my thoughts out loud, without hearing them' sounds like a projection into the external world of our own hypothesis that he had thoughts without knowing anything about them; it sounds like an endopsychic perception of what has been repressed.

² These alternatives did not exhaust the possibilities. His father had overlooked the commonest outcome of such premature passions - a neurosis.

In my description I shall, as I have already said, content myself with the briefest possible summary of the circumstances. Obviously the first problem to be solved was why the two speeches of the Czech captain - his rat story, and his request to the patient that he should pay back the money to Lieutenant A. - should have had such an agitating effect on him and should have provoked such violently pathological reactions. The presumption was that it was a question of 'complexive sensitiveness', and that the speeches had jarred upon certain hyperaesthetic spots in his unconscious. And so it proved to be. As always happened with the patient in connection with military matters, he had been in a state of unconscious identification with his father, who had seen many years' service and had been full of stories of his soldiering days. Now it happened by chance - for chance may play a part in the formation of a symptom, just as the wording may help in the making of a joke - that one of his father's little adventures had an important element in common with the captain's request. His father, in his capacity as non-commissioned officer, had control over a small sum of money and had on one occasion lost it at cards. (Thus he had been a 'Spielratte'.¹) He would have found himself in a serious position if one of his comrades had not advanced him the amount. After he had left the army and become well-off, he had tried to find this friend in need so as to pay him back the money, but had not managed to trace him. The patient was uncertain whether he had ever succeeded in returning the money. The recollection of this sin of his father's youth was painful to him, for, in spite of appearances, his unconscious was filled with hostile strictures upon his father's character. The captain's words, 'You must pay back the 3.80 kronen to Lieutenant A.‘, had sounded to his ears like an allusion to this unpaid debt of his father's.

[1909d, 2134]

[1909d, 2161]
When the period of infantile sexual researches has been terminated by a wave of energetic sexual repression, the instinct for research has three distinct possible vicissitudes open to it owing to its early connection with sexual interests. In the first of these, research shares the fate of sexuality; thenceforward curiosity remains inhibited and the free activity of intelligence may be limited for the whole of the subject's lifetime, especially as shortly after this the powerful religious inhibition of thought is brought into play by education. This is the type characterized by neurotic inhibition. We know very well that the intellectual weakness which has been acquired in this way gives an effective impetus to the outbreak of a neurotic illness. In a second type the intellectual development is sufficiently strong to resist the sexual repression which has hold of it. Some time after the infantile sexual researches have come to an end, the intelligence, having grown stronger, recalls the old association and offers its help in evading sexual repression, and the suppressed sexual activities of research return from the unconscious in the form of compulsive brooding, naturally in a distorted and unfree form, but sufficiently powerful to sexualize thinking itself and to colour intellectual operations with the pleasure and anxiety that belong to sexual processes proper. Here investigation becomes a sexual activity, often the exclusive one, and the feeling that comes from settling things in one's mind and explaining them replaces sexual satisfaction; but the interminable character of the child's researches is also repeated in the fact that this brooding never ends and that the intellectual feeling, so much desired, of having found a solution recedes more and more into the distance.

[1910c, 2256]

Two factors will decide whether this advance in the developmental path of the libido is to fail. First, there is the amount of frustration in reality, which opposes the new object-choice and reduces its value for the person concerned. There is after all no point in embarking upon an object-choice if no choice is to be allowed at all or if there is no prospect of being able to choose anything suitable. Secondly, there is the amount of attraction which the infantile objects that have to be relinquished are able to exercise, and which is in proportion to the erotic cathexis attaching to them in childhood. If these two factors are sufficiently strong, the general mechanism by which the neuroses are formed comes into operation. The libido turns away from reality, is taken over by imaginative activity (the process of introversion), strengthens the images of the first sexual objects and becomes fixated to them. The obstacle raised against incest, however, compels the libido that has turned to these objects to remain in the unconscious. The masturbatory activity carried out by the sensual current, which is now part of the unconscious, makes its own contribution in strengthening this fixation. Nothing is altered in this state of affairs if the advance which has miscarried in reality is now completed in phantasy, and if in the phantasy-situations that lead to masturbatory satisfaction the original sexual objects are replaced by different ones. As a result of this substitution the phantasies become admissible to consciousness, but no progress is made in the allocation of the libido in reality. In this way it can happen that the whole of a young man's sensuality becomes tied to incestuous objects in the unconscious, or to put it another way, becomes fixated to unconscious incestuous phantasies. The result is then total impotence, which is perhaps further ensured by the simultaneous onset of an actual weakening of the organs that perform the sexual act.

[1912d, 2339]
However, this motive does not go deep enough either; besides, being bound up with civilized conditions, it fails to provide a satisfactory connection with the state of affairs among primitive people. All the more important, therefore, is the next factor, which is based on the evolution of the libido. We have learnt from analytic researches how universal and how powerful the earliest allocations of libido are. In these we are concerned with infantile sexual wishes which are clung to (in women usually a fixation of the libido on the father or a brother who takes his place) - wishes which frequently enough were directed towards other things than intercourse, or included it only as a dimly perceived goal. The husband is almost always so to speak only a substitute, never the right man; it is another man - in typical cases the father - who has first claim to a woman's love, the husband at most takes second place. It depends on how intense this fixation is and on how obstinately it is maintained whether the substitute is rejected as unsatisfying. Frigidity is thus among the genetic determinants of neuroses. The more powerful the psychical element in a woman's sexual life is, the greater will be the capacity for resistance shown by her distribution of libido to the upheaval of the first sexual act, and the less overpowering will be the effect which bodily possession of her can produce. Frigidity may then become established as a neurotic inhibition or provide the foundation for the development of other neuroses and even a moderate diminution of potency in the man will greatly contribute to help this process. [1918a, 2358]
If, then, as we have learnt, psychogenic disturbances of vision depend on certain ideas connected with seeing being cut off from consciousness, we must, on the psycho-analytic view, assume that these ideas have come into opposition to other, more powerful ones, for which we use the collective concept of the ‘ego’ - a compound which is made up variously at different times - and have for that reason come under repression. But what can be the origin of this opposition, which makes for repression, between the ego and various groups of ideas? You will no doubt notice that it was not possible to frame such a question before the advent of psycho-analysis, for nothing was known earlier of psychical conflict and repression. Our researches, however, have put us in a position to give us the desired answer. Our attention has been drawn to the importance of the instincts in ideational life. We have discovered that every instinct tries to make itself effective by activating ideas that are in keeping with its aims. These instincts are not always compatible with one another; their interests often come into conflict. Opposition between ideas is only an expression of struggles between the various instincts. From the point of view of our attempted explanation, a quite specially important part is played by the undeniable opposition between the instincts which subserve sexuality, the attainment of sexual pleasure, and those other instincts, which have as their aim the self-preservation of the individual - the ego-instincts. As the poet has said, all the organic instincts that operate in our mind may be classified as ‘hunger’ or ‘love’. We have traced the ‘sexual instinct’ from its first manifestations in children to its final form, which is described as ‘normal’. We have found that it is put together from numerous ‘component instincts’ which are attached to excitations of regions of the body; and we have come to see that these separate instincts have to pass through a complicated development before they can be brought effectively to serve the aims of reproduction. The light thrown by psychology on the evolution of our civilization has shown us that it originates mainly at the cost of the sexual component instincts, and that these must be suppressed, restricted, transformed and directed to higher aims, in order that the mental constructions of civilization may be established. We have been able to recognize as a valuable outcome of these researches something that our colleagues have not yet been willing to believe, namely that the human ailments known as ‘neuroses’ are derived from the many different ways in which these processes of transformation in the sexual component instincts may miscarry. The ‘ego’ feels threatened by the claims of the sexual instincts and fends them off by repressions; these, however, do not always have the desired result, but lead to the formation of dangerous substitutes for the repressed and to burdensome reactions on the part of the ego. From these two classes of phenomena taken together there emerge what we call the symptoms of neuroses. [1910i, 2368]

It is true that psycho-analysis puts forward absence of sexual satisfaction as the cause of nervous disorders. But does it not say more than this? Is its teaching to be ignored as too complicated when it declares that nervous symptoms arise from a conflict between two forces - on the one hand, the libido (which has as a rule become excessive), and on the other, a rejection of sexuality, or a repression which is over-severe? No one who remembers this second factor, which is by no means secondary in importance, can ever believe that sexual satisfaction in itself constitutes a remedy of general reliability for the sufferings of neurotics. A good number of these people are, indeed, either in their actual circumstances or in general incapable of satisfaction. If they were capable of it, if they were without their inner resistances, the strength of the instinct itself would point the way to satisfaction for them even though no doctor advised it. What is the good, therefore, of medical advice such as that supposed to have been given to this lady? [1910k, 2376]
It will now be asked whether we shall not be giving up too much valuable material which might throw light on the unconscious if dream-interpretation is only to be carried out subject to such restrictions of method. The answer to this is that the loss is by no means so great as might appear from a superficial view of the matter. To begin with, it must be recognized that in cases of severe neurosis any elaborate dream-productions must from the nature of things be regarded as incapable of complete solution. A dream of this kind is often based on the entire pathogenic material of the case, as yet unknown to both doctor and patient (so called 'programme-dreams' and biographical dreams), and is sometimes equivalent to a translation into dream-language of the whole content of the neurosis. In the attempt to interpret such a dream all the latent, as yet untouched, resistances will be roused to activity and soon set a limit to its understanding. The full interpretation of such a dream will coincide with the completion of the whole analysis; if a note is made of it at the beginning, it may be possible to understand it at the end, many months later. It is the same as with the elucidation of a single symptom (the main symptom, perhaps). The whole analysis is needed to explain it; in the course of the treatment one must endeavour to lay hold first of this, then of that, fragment of the symptom's meaning, one after another, until they can all be pieced together. Similarly, no more can be expected of a dream occurring in the early stages of the analysis; one must be content if the attempt at interpretation brings a single pathogenic wishful impulse to light.

[1911e, 2451]

Our second problem - the problem of why transference appears in psycho-analysis as resistance - has been left for the moment untouched; and we must now approach it more closely. Let us picture the psychological situation during the treatment. An invariable and indispensable precondition of every onset of a psychoneurosis is the process to which Jung has given the appropriate name of 'introversion'.¹ That is to say: the portion of libido which is capable of becoming conscious and is directed towards reality is diminished, and the portion which is directed away from reality and is unconscious, and which, though it may still feed the subject's phantasies, nevertheless belongs to the unconscious, is proportionately increased. The libido (whether wholly or in part) has entered on a regressive course and has revived the subject's infantile imagos.² The analytic treatment now proceeds to follow it; it seeks to track down the libido, to make it accessible to consciousness and, in the end, serviceable for reality. Where the investigations of analysis come upon the libido withdrawn into its hiding-place, a struggle is bound to break out; all the forces which have caused the libido to regress will rise up as 'resistances' against the work of analysis, in order to conserve the new state of things. For if the libido's introversion or regression had not been justified by a particular relation between the subject and the external world - stated in the most general terms, by the frustration of satisfaction - and if it had not for the moment even become expedient, it could never have taken place at all. But the resistances from this source are not the only ones or indeed the most powerful. The libido at the disposal of the subject's personality had always been under the influence of the attraction of his unconscious complexes (or more correctly, of the portions of those complexes belonging to the unconscious), and it entered on a regressive course because the attraction of reality had diminished. In order to liberate it, this attraction of the unconscious has to be overcome; that is, the repression of the unconscious instincts and of their productions, which has meanwhile been set up in the subject, must be removed. This is responsible for by far the largest part of the resistance, which so often causes the illness to persist even after the turning away from reality has lost its temporary justification. The analysis has to struggle against the resistances from both these sources. The resistance accompanies the treatment step by step. Every single association, every act of the person under treatment must reckon with the resistance and represents a compromise between the forces that are striving towards recovery and the opposing ones which I have described.

[1912b, 2459]
Researches were further extended to the conditions which determine whether or not psychical conflicts will lead to 'repression' (that is, to dissociation dynamically caused), since it goes without saying that a psychical conflict, \textit{per se}, may also have a normal outcome. The conclusion arrived at by psycho-analysis was that such conflicts were always between the sexual instincts (using the word 'sexual' in the widest sense) and the wishes and trends of the remainder of the ego. In neuroses it is the sexual instincts that succumb to 'repression' and so constitute the most important basis for the genesis of symptoms, which may accordingly be regarded as substitutes for sexual satisfactions.

Rumpelstiltskin was connected with the contemporary thoughts underlying the dream - the day's residues - by a neat antithetic relation. In the fairy tale he comes in order to take away the queen's first child. In the dream the little man comes in the shape of a father, because he had presumably brought a second child. But Rumpelstiltskin also gave access to the deeper, infantile stratum of the dream-thoughts. The droll little fellow, whose very name is unknown, whose secret is so eagerly canvassed, who can perform such extraordinary tricks - in the fairy tale he turns straw into gold - the fury against him, or rather against his possessor, who is envied for possessing him (the girl's envy for the penis) - all of these were elements whose relation to the foundations of the patient's neurosis can, as I have said, barely be touched upon in this paper. The short-cut hair of the manikin in the dream was no doubt also connected with the subject of castration.

The third part of the Adlerian theory, the twisted interpretations and distortions of the disagreeable facts of analysis, are what definitely separate 'Individual Psychology', as it is now to be called, from psycho-analysis. As we know, the principle of Adler's system is that the individual's aim of self-assertion, his 'will to power', is what, in the form of a 'masculine protest', plays a dominating part in the conduct of life, in character-formation and in neurosis. This 'masculine protest', the Adlerian motive force, is nothing else, however, but repression detached from its psychological mechanism and, moreover, sexualized in addition - which ill accords with the vaunted ejection of sexuality from its place in mental life. The 'masculine protest' undoubtedly exists, but if it is made into the motive force of mental life the observed facts are being treated like a spring-board that is left behind after it has been used to jump off from. Let us consider one of the fundamental situations in which desire is felt in infancy: that of a child observing the sexual act between adults. Analysis shows, in the case of people with whose life-story the physician will later be concerned, that at such moments two impulses take possession of the immature spectator. In boys, one is the impulse to put himself in the place of the active man, and the other, the opposing current, is the impulse to identify himself with the passive woman. Between them these two impulses exhaust the pleasurable possibilities of the situation. The first alone can come under the head of the masculine protest, if that concept is to retain any meaning at all. The second, however, the further course of which Adler disregards or which he knows nothing about, is the one that will become the more important in the subsequent neurosis. Adler has so merged himself in the jealous narrowness of the ego that he takes account only of those instinctual impulses which are agreeable to the ego and are encouraged by it; the situation in neurosis, in which the impulses are opposed to the ego, is precisely the one that lies beyond his horizon.
Adler is right in maintaining that when a person with an active mental life recognizes an inferiority in one of his organs, it acts as a spur and calls out a higher level of performance in him through overcompensation. But it would be altogether an exaggeration if, following Adler's example, we sought to attribute every successful achievement to this factor of an original inferiority of an organ. Not all artists are handicapped with bad eyesight, nor were all orators originally stammerers. And there are plenty of instances of excellent achievements springing from superior organic endowment. In the aetiology of neuroses organic inferiority and imperfect development play an insignificant part - much the same as that played by currently active perceptual material in the formation of dreams. Neuroses make use of such inferiorities as a pretext, just as they do of every other suitable factor. We may be tempted to believe a neurotic woman patient when she tells us that it was inevitable she should fall ill, since she is ugly, deformed or lacking in charm, so that no one could love her; but the very next neurotic will teach us better - for she persists in her neurosis and in her aversion to sexuality, although she seems more desirable, and is more desired, than the average woman. The majority of hysterical women are among the attractive and even beautiful representatives of their sex, while, on the other hand, the frequency of ugliness, organic defects and infirmities in the lower classes of society does not increase the incidence of neurotic illness among them.

We must now try to obtain some insight into the **mechanism** of the process of repression. In particular we want to know whether there is a single mechanism only, or more than one, and whether perhaps each of the psychoneuroses is distinguished by a mechanism of repression peculiar to it. At the outset of this enquiry, however, we are met by complications. The mechanism of a repression becomes accessible to us only by our deducing that mechanism from the outcome of the repression. Confining our observations to the effect of repression on the ideational portion of the representative, we discover that as a rule it creates a substitutive formation. What is the mechanism by which such a substitute is formed? Or should we distinguish several mechanisms here as well? Further, we know that repression leaves symptoms behind it. May we then suppose that the forming of substitutes and the forming of symptoms coincide, and, if this is so on the whole, is the mechanism of forming symptoms the same as that of repression? The general probability would seem to be that the two are widely different, and that it is not the repression itself which produces substitutive formations and symptoms, but that these latter are indications of a return of the repressed and owe their existence to quite other processes. It would also seem advisable to examine the mechanisms by which substitutes and symptoms are formed before considering the mechanisms of repression.

Since the publication of a work by Abraham (1908) - which that conscientious author has attributed to my instigation - we have tried to base our characterization of Kraepelin's 'dementia praecox' (Bleuler's 'schizophrenia') on its position with reference to the antithesis between ego and object. In the transference neuroses (anxiety hysteria, conversion hysteria and obsessional neurosis) there was nothing to give special prominence to this antithesis. We knew, indeed, that frustration in regard to the object brings on the outbreak of the neurosis and that the neurosis involves a renunciation of the real object; we knew too that the libido that is withdrawn from the real object reverts first to a phantasied object and then to one that had been repressed (introversion). But in these disorders object-cathexis in general is retained with great energy, and more detailed examination of the process of repression has obliged us to assume that object-cathexis persists in the system Ucs. in spite of - or rather in consequence of - repression. Indeed, the capacity for transference, of which we make use for therapeutic purposes in these affections, presupposes an unimpaired object-cathexis.
Think it over! You have learnt all that is essential about the determinants of falling ill as well as all the factors that come into effect after the patient has fallen ill. Where do these leave room for any therapeutic influence? In the first place there is hereditary disposition. We have not talked about it very often because it is emphatically stressed from other directions and we have nothing new to say about it. But do not suppose that we underestimate it; precisely as therapists we come to realize its power clearly enough. In any case we can do nothing to alter it; we too must take it as something given, which sets a limit to our efforts. Next there is the influence of early experiences in childhood, to which we are in the habit of giving prominence in analysis: they belong to the past and we cannot undo them. Then comes everything that we have summarized as 'real frustration' - the misfortunes of life from which arise deprivation of love, poverty, family quarrels, ill-judged choice of a partner in marriage, unfavourable social circumstances, and the strictness of the ethical standards to whose pressure the individual is subject. Here, to be sure, there would be handles enough for a very effective therapy, but it would have to be of the kind which Viennese folklore attributes to the Emperor Joseph - the benevolent interference of a powerful personage before whose will people bow and difficulties vanish. But who are we, that we should be able to adopt benevolence of this kind as an instrument of our therapy? Poor ourselves and socially powerless, and compelled to earn our livelihood from our medical activity, we are not even in a position to extend our efforts to people without means, as other doctors with other methods of treatment are after all able to do. Our therapy is too time-consuming and too laborious for that to be possible. Perhaps, however, you are clutching at one of the factors I have mentioned and believe that there you have found the point at which our influence can make its attack. If the ethical restrictions demanded by society play a part in the deprivation imposed on the patient, treatment can, after all, give him the courage, or perhaps a direct injunction, to disregard those barriers and achieve satisfaction and recovery while forgoing the fulfilment of an ideal that is exalted, but so often not adhered to, by society. The patient will thus become healthy by 'living a full life' sexually. This, it is true, casts a shadow on analytic treatment for not serving general morality. What it has given to the individual it will have taken from the community.

[1916-1917, 3475]

But, Ladies and Gentlemen, who has so seriously misinformed you? A recommendation to the patient to 'live a full life' sexually could not possibly play a part in analytic therapy - if only because we ourselves have declared that an obstinate conflict is taking place in him between a libidinal impulse and sexual repression, between a sensual and an ascetic trend. This conflict would not be solved by our helping one of these trends to victory over its opponent. We see, indeed, that in neurotics asceticism has the upper hand; and the consequence of this is precisely that the suppressed sexual tendency finds a way out in symptoms. If, on the contrary, we were to secure victory for sensuality, then the sexual repression that had been put on one side would necessarily be replaced by symptom. Neither of these two alternative decisions could end the internal conflict; in either case one party to it would remain unsatisfied. There are only a few cases in which the conflict is so unstable that a factor such as the doctor's taking sides could decide it; and such cases do not in fact stand in need of analytic treatment. Anyone on whom the doctor could have so much influence would have found the same way out without the doctor. You must be aware that if an abstinent young man decides in favour of illicit sexual intercourse or if an unsatisfied wife seeks relief with another man, they have not as a rule waited for permission from a doctor or even from their analyst.

[1916-1917, 3476]
I will digress for a moment to ask if you know what is meant by a causal therapy. That is how we describe procedure which does not take the symptoms of an illness as its point of attack but sets about removing its *causes*. Well, then, is our psycho-analytic method a causal therapy or not? The reply is not a simple one, but it may perhaps give us an opportunity of realizing the worthlessness of a question framed in this way. In so far as analytic therapy does not make it its first task to remove the symptoms, it is behaving like a causal therapy. In another respect, you may say, it is not. For we long ago traced the causal chain back through the repressions to the instinctual dispositions, their relative intensities in the constitution and the deviations in the course of their development. Supposing, now, that it was possible, by some chemical means, perhaps, to interfere in this mechanism, to increase or diminish the quantity of libido present at a given time or to strengthen one instinct at the cost of another - this then would be a causal therapy in the true sense of the word, for which our analysis would have carried out the indispensable preliminary work of reconnaissance. At present, as you know, there is no question of any such method of influencing libidinal processes; with our psychical therapy we attack at a different point in the combination - not exactly at what we know are the roots of the phenomena, but nevertheless far enough away from the symptoms, at a point which has been made accessible to us by some very remarkable circumstances.

[1916-1917, 3478]

With this as a starting-point we go on to make our first important discovery. We learn that, when we try to understand neurotic disorders, by far the greater significance attaches to the sexual instincts; that in fact neuroses are the specific disorders, so to speak, of the sexual function; that in general whether or not a person develops a neurosis depends on the quantity of his libido, and on the possibility of satisfying it and of discharging it through satisfaction; that the form taken by the disease is determined by the way in which the individual passes through the course of development of his sexual function, or, as we put it, by the fixations his libido has undergone in the course of its development; and, further, that by a special, not very simple technique for influencing the mind we are able to throw light on the nature of some groups of neuroses and at the same time to do away with them. Our therapeutic efforts have their greatest success with a certain class of neuroses which proceed from a conflict between the ego-instincts and the sexual instincts. For in human beings it may happen that the demands of the sexual instincts, whose reach of course extends far beyond the individual, seem to the ego to constitute a danger which threatens its self-preservation or its self-esteem. The ego then assumes the defensive, denies the sexual instincts the satisfaction they desire and forces them into those by-paths of substitutive satisfaction which become manifest as nervous symptoms.

[1917a, 3609]

But this episode, though it is now closed, was not without an important influence on the spread of psycho-analysis. Medical men who had hitherto held back from any approach to psycho-analytic theories were brought into closer contact with them when, in the course of their duties as army doctors, they were obliged to deal with war neuroses. The reader will be able to gather from Ferenczi's paper with what hesitations and under what disguises these closer contacts were made. Some of the factors which psycho-analysis had recognized and described long before as being at work in peace-time neuroses - the psychogenic origin of the symptoms, the importance of *unconscious* instinctual impulses, the part played in dealing with mental conflicts by the primary gain from being ill ('the flight into illness') - were observed to be present equally in the war neuroses and were accepted almost universally. Simmel's studies show, too, what successes could be achieved by treating war neurotics by the method of catharsis, which, as we know, was the first step towards the psycho-analytic technique.

[1919d, 3665]
For a time psycho-analysis seemed fated to merge into psychology without being able to show why the psychology of the sick differed from that of the normal. In the course of its advance, however, it came up against the problem of dreams, which are abnormal products of the mind created by normal men under regularly recurrent physiological conditions. When psycho-analysis had solved the problem of dreams, it had discovered in unconscious psychological processes the common ground in which the highest and the lowest of mental impulses have their roots and from which spring the most normal as well as the most morbid and erratic of mental productions. The new picture of the workings of the mind began to grow ever clearer and more complete. It was a picture of obscure instinctual forces organic in origin, striving towards inborn aims, and, above them, of an agency comprising more highly organized mental structures - acquisitions of human evolution made under the impact of human history - an agency which has taken over portions of the instinctual impulses, has developed them further or has even directed them towards higher aims, but which in any case binds them firmly and manipulates their energy to suit its own purposes. This higher organization, however, which is known to us as the ego, has rejected another portion of these same elementary instinctual impulses as being unserviceable because they cannot be fitted into the organic unity of the individual or because they rebel against the individual's cultural aims. The ego is not in a position to exterminate these unsubdued mental powers, but it turns its back on them, lets them remain at the lowest psychological level, defends itself from their demands by the energetic erection of protective and antithetical barriers or seeks to come to terms with them by means of substitutive satisfactions. These instincts which have fallen victim to repression - untamed and indestructible, yet inhibited from any kind of activity - together with their primitive mental representatives, constitute the mental underworld, the nucleus of the true unconscious, and are at every moment ready to assert their demands and, by hook or by crook, to force their way forward to satisfaction. To this is due the instability of the proud superstructure of the mind, the emergence at night of the proscribed and repressed material in the form of dreams, and the tendency to fall ill with neuroses and psychoses as soon as the balance of power between the ego and the repressed shifts to the disadvantage of the ego.

[1919g, 3703]

In a far greater number of cases the neurosis is more autonomous and more independent of the interests of self-preservation and self-maintenance. In the conflict which creates the neurosis, what are at stake are either solely libidinal interests or libidinal interests in intimate connections with self-preservative ones. In all three instances the dynamics of the neurosis are the same. A dammed-up libido which cannot be satisfied in reality succeeds, with the help of a regression to old fixations, in finding discharge through the repressed unconscious. The sick man's ego, in so far as it can extract a 'gain from illness' out of this process, countenances the neurosis, although there can be no doubt of its injuriousness in its economic aspect.

[1923d, 4027]
There are certainly good grounds for being suspicious of such simple solutions of a problem. Moreover, the most that we may expect is that this formula will turn out to be correct in the roughest outline. But even that would be something. One recalls at once, too, a whole number of discoveries and findings which seem to support our thesis. All our analyses go to show that the transference neuroses originate from the ego's refusing to accept a powerful instinctual impulse in the id or to help it to find a motor outlet, or from the ego's forbidding that impulse the object at which it is aiming. In such a case the ego defends itself against the instinctual impulse by the mechanism of repression. The repressed material struggles against this fate. It creates for itself, along paths over which the ego has no power, a substitutive representation (which forces itself upon the ego by way of a compromise) - the symptom. The ego finds its unity threatened and impaired by this intruder, and it continues to struggle against the symptom, just as it fended off the original instinctual impulse. All this produces the picture of a neurosis. It is no contradiction to this that, in undertaking the repression, the ego is at bottom following the commands of its super-ego - commands which, in their turn, originate from influences in the external world that have found representation in the super-ego. The fact remains that the ego has taken sides with those powers, that in it their demands have more strength than the instinctual demands of the id, and that the ego is the power which sets the repression in motion against the portion of the id concerned and which fortifies the repression by means of the anticathexis of resistance. The ego has come into conflict with the id in the service of the super-ego and of reality; and this is the state of affairs in every transference neurosis.

A conflict between two groups of mental trends had to be looked on as the ground for repression and accordingly as the cause of every neurotic illness. And here experience taught us a new and surprising fact about the nature of the forces that were struggling against each other. Repression invariably proceeded from the sick person's conscious personality (his ego) and took its stand on aesthetic and ethical motives; the impulses that were subjected to repression were those of selfishness and cruelty, which can be summed up in general as evil, but above all sexual wishful impulses, often of the crudest and most forbidden kind. Thus the symptoms were a substitute for forbidden satisfactions and the illness seemed to correspond to an incomplete subjugation of the immoral side of human beings.

We see from what has been said that quantitative relations - relations which are not directly observable but which can only be inferred - are what determine whether or not old situations of danger shall be preserved, repressions on the part of the ego maintained and childhood neuroses find a continuation. Among the factors that play a part in the causation of neuroses and that have created the conditions under which the forces of the mind are pitted against one another, three emerge into prominence: a biological, a phylogenetic and a purely psychological factor.

That can be managed, though, if one bears in mind the complexities of living substance. In what did we find the essence of a neurosis? In the fact that the ego, the higher organization of the mental apparatus (elevated through the influence of the external world), is not able to fulfil its function of mediating between the id and reality, that in its feebleness it draws back from some instinctual portions of the id and, to make up for this, has to put up with the consequences of its renunciation in the form of restrictions, symptoms and unsuccessful reaction-formation.
A feebleness of the ego of this sort is to be found in all of us in childhood; and that is why the experiences of the earliest years of childhood are of such great importance for later life. Under the extraordinary burden of this period of childhood we have in a few years to cover the enormous developmental distance between stone-age primitive men and the participants in contemporary civilization, and, at the same time and in particular, we have to fend off the instinctual impulses of the early sexual period - under this burden, then, our ego takes refuge in repression and lays itself open to a childhood neurosis, the precipitate of which it carries with it into maturity as a disposition to a later nervous illness. Everything now depends on how the growing organism is treated by fate. If life becomes too hard, if the gulf between instinctual claims and the demands of reality becomes too great, the ego may fail in its efforts to reconcile the two, and the more readily, the more it is inhibited by the disposition carried over by it from infancy. The process of repression is then repeated, the instincts tear themselves away from the ego's domination, find their substitutive satisfactions along the paths of regression, and the poor ego has become helplessly neurotic.

Only let us hold fast to this: the nodal point and pivot of the whole situation is the relative strength of the ego organization. We shall then find it easy to complete our aetiological survey. As what may be called the normal causes of neurotic illness we already know the feebleness of the childhood ego, the task of dealing with the early sexual impulses and the effects of the more or less chance experiences of childhood. Is it not possible, however, that yet other factors play a part, derived from the time before the beginning of the child's life? For instance, an innate strength and unruliness of the instinctual life in the id, which from the outset sets the ego tasks too hard for it? Or a special developmental feebleness of the ego due to unknown reasons? Such factors must of course acquire an aetiological importance, in some cases a transcendent one. We have invariably to reckon with the instinctual strength of the id; if it has developed to excess, the prospects of our therapy are poor. We still know too little of the causes of a developmental inhibition of the ego. These then would be the cases of neurosis with an essentially constitutional basis. Without some such constitutional, congenital favouring factors a neurosis can, no doubt, scarcely come about.

The first task of psycho-analysis was the elucidation of nervous disorders. The analytic theory of the neuroses is based on three corner-stones: the recognition of (1) 'repression', of (2) the importance of the sexual instinct and of (3) 'transference'.
When, burdened by these symptoms and incapacities, he at last, after his father's death, had found a wife, there emerged in him, as though they were the core of his being, character-traits which made contact with him a hard task for those about him. He developed a completely egoistic, despotic, and brutal personality, which clearly felt a need to suppress and insult other people. It was a faithful copy of his father as he had formed a picture of him in his memory: that is to say, a revival of the identification with his father which in the past he had taken on as a little boy from sexual motives. In this part of the story we recognize the return of the repressed, which (along with the immediate effects of the trauma and the phenomenon of latency) we have described as among the essential features of a neurosis.

[1939a, 4904]

Early trauma - defence - latency - outbreak of neurotic illness - partial return of the repressed. Such is the formula which we have laid down for the development of a neurosis. The reader is now invited to take the step of supposing that something occurred in the life of the human species similar to what occurs in the life of individuals: of supposing, that is, that here too events occurred of a sexually aggressive nature, which left behind them permanent consequences but were for the most part fended off and forgotten, and which after a long latency came into effect and created phenomena similar to symptoms in their structure and purpose.

[1939a, 4905]

Thus we have attributed three qualities to psychical processes: they are either conscious, preconscious or unconscious. The division between the three classes of material which possess these qualities is neither absolute nor permanent. What is preconscious becomes conscious, as we have seen, without any assistance from us; what is unconscious can, through our efforts, be made conscious, and in the process we may have a feeling that we are often overcoming very strong resistances. When we attempt to do this with someone else, we should not forget that the conscious filling-in of the gaps in his perceptions - the construction we are presenting him with - does not mean as yet that we have made the unconscious material in question conscious to him. All that is true so far is that the material is present in him in two records, once in the conscious reconstruction he has been given, and besides this in its original unconscious state. Our continued efforts usually succeed eventually in making this unconscious material conscious to him himself, as a result of which the two records are brought to coincide. The amount of effort we have to use, by which we estimate the resistance against the material becoming conscious, varies in magnitude in individual cases. For instance, what comes about in an analytic treatment as a result of our efforts can also occur spontaneously: material which is ordinarily unconscious can transform itself into preconscious material and then becomes conscious - a thing that happens to a large extent in psychotic states. From this we infer that the maintenance of certain internal resistances is a sine qua non of normality. A relaxation of resistances such as this, with a consequent pushing forward of unconscious material, takes place regularly in the state of sleep, and thus brings about a necessary precondition for the construction of dreams.

Conversely, preconscious material can become temporarily inaccessible and cut off by resistances, as happens when something is temporarily forgotten or escapes the memory; or a preconscious thought can even be temporarily put back into the unconscious state, as seems to be a precondition in the case of jokes. We shall see that a similar transformation back of preconscious material or processes into the unconscious state plays a great part in the causation of neurotic disorders.

[1940a [1938], 4970]
In July, 1880, the patient's father, of whom she was passionately fond, fell ill of a peripleuritic abscess which failed to clear up to which he succumbed in April, 1881. During the first months of the illness Anna devoted her whole energy to nursing her father, and no one was much surprised when by degrees her own health greatly deteriorated. No one, perhaps not even the patient herself, knew what was happening to her; but eventually the state of weakness, anaemia and distaste for food became so bad that to her great sorrow she was no longer allowed to continue nursing the patient. The immediate cause of this was a very severe cough, on account of which I examined her for the first time. It was a typical **tussis nervosa**. She soon began to display a marked craving for rest during the afternoon, followed in the evening by a sleep-like state and afterwards a highly excited condition.

And now we must consider how far it is justifiable to suppose that hysteria is produced in an analogous way in other patients, and that the process is similar where no such clearly distinct **condition seconde** has become organized. I may advance in support of this view the fact that in the present case, too, the story of the development of the illness would have remained completely unknown alike to the patient and the physician if it had not been for her peculiarity of remembering things in hypnosis, as I have described, and of relating what she remembered. While she was in her waking state she knew nothing of all this. Thus it is impossible to arrive at what is happening in other cases from an examination of the patients while in a waking state, for with the best will in the world they can give one no information. And I have already pointed out how little those surrounding the present patient were able to observe of what was going on. Accordingly, it would only be possible to discover the state of affairs in other patients by means of some such procedure as was provided in the case of Anna O. by her auto-hypnoses. Provisionally we can only express the view that trains of events similar to those here described occur more commonly than our ignorance of the pathogenic mechanism concerned has led us to suppose.

The reason for the re-appearance of the clacking was that yesterday she had abdominal pains and had tried not to show it by groaning. She knew nothing of the true precipitating cause of the clacking (see above). She remembered, too, that I had instructed her to discover the origin of her gastric pains. She did not know it, however, and asked me to help her. I asked whether, perhaps, on some occasion after a great excitement, she had forced herself to eat. She confirmed this. After her husband's death she had for a long time lost her appetite completely and had only eaten from a sense of duty; and her gastric pains had in fact begun at that time. I then removed her gastric pains by stroking her a few times across the epigastrium. She then began of her own accord to talk about the things that had most affected her. 'I have told you,' she said, 'that I was not fond of the child. But I ought to add that one could not have guessed it from my behaviour. I did everything that was necessary. Even now I reproach myself for being fonder of the elder one.'

It will be agreed that this instance is typical also of the behaviour of a large number of neuropaths in regard to the therapeutic procedures recommended by their physicians. The patient who develops a symptom on a particular day - whether owing to unrest in San Domingo or else where - is always inclined to attribute it to his doctor's latest advice. Of the two conditions necessary for bringing about a false connection of this kind, one, mistrust, seems always to be present; while the other, the splitting of consciousness, is replaced by the fact that most neuropaths have in part no knowledge of the true causes (or at any rate the releasing causes) of their disorder, and in part deliberately avoid such knowledge, because they are unwilling to be reminded of that share of the causes for which they themselves are to blame.
She was thus in very many respects healthier and more capable, but in spite of all my improving suggestions there had been little change in her fundamental character. She seemed not to have accepted the existence of a category of 'indifferent things'. Her inclination to torment herself was scarcely less than it had been at the time of her treatment. Nor had her hysterical disposition been quiescent during this good period. She complained, for instance, of an inability to make journeys of any length by train. This had come on during the last few months. A necessarily hurried attempt to relieve her of this difficulty resulted only in her producing a number of trivial disagreeable impressions left by some recent journeys she had made to D--- and its neighbourhood. She seemed reluctant, however, to be communicative under hypnosis, and even then I began to suspect that she was on the point of withdrawing once more from my influence and that the secret purpose of her railway inhibition was to prevent her making a fresh journey to Vienna.

[1895d, 78]

The period that followed, however, was a hard one for the physician. The recovery of this repressed idea had a shattering effect on the poor girl. She cried aloud when I put the situation drily before her with the words: 'So for a long time you had been in love with your brother-in-law.' She complained at this moment of the most frightful pains, and made one last desperate effort to reject the explanation: it was not true, I had talked her into it, it could not be true, she was incapable of such wickedness, she could never forgive herself for it. It was easy to prove to her that what she herself had told me admitted of no other interpretation. But it was a long time before my two pieces of consolation - that we are not responsible for our feelings, and that her behaviour, the fact that she had fallen ill in these circumstances, was sufficient evidence of her moral character - it was a long time before these consolations of mine made any impression on her.

[1895d, 142]
At about the time at which the clinic was established and at which he gave up the Chair of Pathological Anatomy, a change occurred in the direction of Charcot's scientific pursuits, and to this we owe the finest of his work. He now pronounced that the theory of organic nervous illnesses was for the time being fairly complete, and he began to turn his attention almost exclusively to hysteria, which thus all at once became the focus of general interest. This, the most enigmatic of all nervous diseases, for the evaluation of which medicine had not yet found a serviceable angle of approach, had just then fallen into thorough discredit; and this discredit extended not only to the patients but to the physicians who concerned themselves with the neurosis. It was held that in hysteria anything was possible, and no credence was given to a hysterical about anything. The first thing that Charcot's work did was to restore its dignity to the topic. Little by little, people gave up the scornful smile with which the patient could at that time feel certain of being met. She was no longer necessarily a malingerer, for Charcot had thrown the whole weight of his authority on the side of the genuineness and objectivity of hysterical phenomena. Charcot had repeated on a small scale the act of liberation in memory of which Pinel's portrait hung in the lecture hall of the Salpêtrière. Once the blind fear of being made a fool of by the unfortunate patient had been given up - a fear which till then had stood in the way of a serious study of the neurosis - the question could arise as to what method of approach would lead most quickly to a solution of the problem. A quite unbiased observer might have arrived at this conclusion: if I find someone in a state which bears all the signs of a painful affect - weeping, screaming and raging - the conclusion seems probable that a mental process is going on in him of which those physical phenomena are the appropriate expression. A healthy person, if he were asked, would be in a position to say what impression it was that was tormenting him; but the hysterical would answer that he did not know. The problem would at once arise of how it is that a hysterical patient is overcome by an affect about whose cause he asserts that he knows nothing. If we keep to our conclusion that a corresponding psychical process must be present, and if nevertheless we believe the patient when he denies it; if we bring together the many indications that the patient is behaving as though he does know about it; and if we enter into the history of the patient's life and find some occasion, some trauma, which would appropriately evoke precisely those expressions of feeling - then everything points to one solution: the patient is in a special state of mind in which all his impressions or his recollections of them are no longer held together by an associative chain, a state of mind in which it is possible for a recollection to express its affect by means of somatic phenomena without the group of the other mental processes, the ego, knowing about it or being able to intervene to prevent it. If we had called to mind the familiar psychological difference between sleep and waking, the strangeness of our hypothesis might have seemed less. No one should object that the theory of a splitting of consciousness as a solution to the riddle of hysteria is much too remote to impress an unbiased and untrained observer. For, by pronouncing possession by a demon to be the cause of hysterical phenomena, the Middle Ages in fact chose this solution; it would only have been a matter of exchanging the religious terminology of that dark and superstitious age for the scientific language of to-day.

[1893f, 281]
I cannot say for certain what the upper age-limit is below which sexual injury plays a part in
the aetiology of hysteria; but I doubt whether sexual passivity can bring on repression later than
between the eighth and tenth years, unless it is enabled to do so by previous experiences. The
lower limit extends as far back as memory itself - that is, therefore, to the tender age of one and
a half or two years! (I have had two cases of this.) In a number of my cases the sexual trauma
(or series of traumas) occurred in the third and fourth years of life. I should not lend credence to
these extraordinary findings myself if their complete reliability were not proved by the
development of the subsequent neurosis. In every case a number of pathological symptoms,
habits and phobias are only to be accounted for by going back to these experiences in
childhood, and the logical structure of the neurotic manifestations makes it impossible to reject
these faithfully preserved memories which emerge from childhood life. True, it would be useless
to try to elicit these childhood traumas from a hysteric by questioning him outside psycho-
analysis; their traces are never present in conscious memory, only in the symptoms of the
illness.

² A psychological theory of repression ought also to throw light on the question of why it is only ideas
with a sexual content that can be repressed. Such an explanation might start out from the following
indications. It is known that having ideas with a sexual content produces excitatory processes in the
genitals which are similar to those produced by sexual experience itself. We may assume that this somatic
excitation becomes transposed into the psychical sphere. As a rule the effect in question is much stronger
in the case of the experience than in the case of the memory. But if the sexual experience occurs during
the period of sexual immaturity and the memory of it is aroused during or after maturity, then the memory
will have a far stronger excitatory effect than the experience did at the time it happened; and this is
because in the meantime puberty has immensely increased the capacity of the sexual apparatus for
reaction. An inverted relation of this sort between real experience and memory seems to contain the
psychological precondition for the occurrence of a repression. Sexual life affords - through the retardation
of pubertal maturity as compared with the psychical functions - the only possibility that occurs for this
inversion of relative effectiveness. The traumas of childhood operate in a deferred fashion as though they
were fresh experiences; but they do so unconsciously. I must postpone entering into any more far-
reaching psychological discussion till another occasion. Let me add, however, that the period of 'sexual
maturity' which is in question here does not coincide with puberty but falls earlier (from the eighth to the
tenth year).

What I have to report about this patient concerns the aetiology of the case and the
mechanism of the hallucinations. I discovered the aetiology when I applied Breuer's method,
exact as in a case of hysteria - in the first instance for the investigation and removal of the
hallucinations. In doing so, I started out from the assumption that in this case of paranoia, just
as in the two other defence neuroses with which I was familiar, there must be unconscious
thoughts and repressed memories which could be brought into consciousness in the same way
as they were in those neuroses, by overcoming a certain resistance. The patient at once
confirmed my expectation, for she behaved in analysis exactly like, for instance, a hysterical
patient; with her attention on the pressure of my hand,¹ she produced thoughts which she could
not remember having had, which at first she did not understand and which were contrary to her
expectations. The presence of significant unconscious ideas was thus demonstrated in a case
of paranoia as well, and I was able to hope that I might trace the compulsion of paranoia, too, to
repression. The only peculiarity was that the thoughts which arose from the unconscious were
for the most part heard inwardly or hallucinated by the patient, in the same way as her voices.

[1896b, 386]

[1896b, 387]
GENTLEMEN, - When we set out to form an opinion about the causation of a pathological state such as hysteria, we begin by adopting the method of anamnestic investigation: we question the patient or those about him in order to find out to what harmful influences they themselves attribute his having fallen ill and developed these neurotic symptoms. What we discover in this way is, of course, falsified by all the factors which commonly hide the knowledge of his own state from a patient - by his lack of scientific understanding of aetiological influences, by the fallacy of post hoc, propter hoc, by his reluctance to think about or mention certain noxae and traumas. Thus in making an anamnestic investigation of this sort, we keep to the principle of not adopting the patients' belief without a thorough critical examination, of not allowing them to lay down our scientific opinion for us on the aetiology of the neurosis. Although we do, on the one hand, acknowledge the truth of certain constantly repeated assertions, such as that the hysterical state is a long-persisting after-effect of an emotion experienced in the past, we have, on the other hand, introduced into the aetiology of hysteria a factor which the patient himself never brings forward and whose validity he only reluctantly admits - namely, the hereditary disposition derived from his progenitors. As you know, in the view of the influential school of Charcot heredity alone deserves to be recognized as the true cause of hysteria, while all other noxae of the most various nature and intensity only play the part of incidental causes, of 'agents provocateurs'.

[1896c, 407]

I would ask you to carry this line of thought over on to hysterical patients. It is not the latest slight - which, in itself, is minimal - that produces the fit of crying, the outburst of despair or the attempt at suicide, in disregard of the axiom that an effect must be proportionate to its cause; the small slight of the present moment has aroused and set working the memories of very many, more intense, earlier slights, behind all of which there lies in addition the memory of a serious slight in childhood which has never been overcome. Or again, let us take the instance of a young girl who blames herself most frightfully for having allowed a boy to stroke her hand in secret, and who from that time on has been overtaken by a neurosis. You can, of course, answer the puzzle by pronouncing her an abnormal, eccentrically disposed and over-sensitive person; but you will think differently when analysis shows you that the touching of her hand reminded her of another, similar touching, which had happened very early in her childhood and which formed part of a less innocent whole, so that her self-reproaches were actually reproaches about that old occasion. Finally, the problem of the hysterogenic points is of the same kind. If you touch a particular spot, you do something you did not intend: you awaken a memory which may start off a convulsive attack, and since you know nothing of this psychical intermediate link you refer the attack directly to the operation of your touch. The patients are in the same state of ignorance and therefore fall into similar errors. ie they too are unaware of the re-awakening of the unconscious memory They constantly establish 'false connections' between the most recent cause, which they are conscious of, and the effect, which depends on so many intermediate links. If, however, the physician has been able to bring together the conscious and unconscious motives for the purpose of explaining a hysterical reaction, he is almost always obliged to recognize that the seemingly exaggerated reaction is appropriate and is abnormal only in its form.

[1896c, 430]

'A case of successful treatment by hypnotism with some remarks on the origin of hysterical symptoms through "counter will".'

[1897b, 443]
A young woman after the birth of her first child was compelled to give up breast-feeding it owing to a complex of hysterical symptoms (loss of appetite, sleeplessness, pains in her breasts, failure of milk-secretion, agitation). When, after the birth of a second child, these obstacles recurred, deep hypnosis on two occasions, accompanied by counter-suggestions, succeeded in removing the obstacles, so that the patient became an excellent nursing mother. The same result was brought about a year later in similar circumstances after two more hypnoses. Some remarks are appended on the fact that it is possible in hysterical patients for distressing antithetic or anxious ideas to be realized which normal people are able to inhibit; several observations of tic are traced back to this mechanism of 'counter-will'.

[1897b, 443]

The processes of normal and pathological defence and the displacements in which they result are clearly of great importance. But to the best of my knowledge no study whatever has hitherto been made of them by psychologists; and it remains to be ascertained in what strata of psychical activity and under what conditions they come into operation. The reason for this neglect may well be that our mental life, so far as it is the object of our conscious internal perception, shows nothing of these processes, apart from instances which we classify as 'faulty reasoning' and some mental operations which aim at producing a comic effect. The assertion that a psychical intensity can be displaced from one presentation (which is then abandoned) on to another (which thenceforward plays the psychological part of the former one) is as bewildering to us as certain features of Greek mythology - as, for instance, when the gods are said to clothe someone with beauty as though it were with a veil, whereas we think only of a face transfigured by a change of expression.

[1899a, 491]

What is the meaning of hysterical identification? It requires a somewhat lengthy explanation. Identification is a highly important factor in the mechanism of hysterical symptoms. It enables patients to express in their symptoms not only their own experiences but those of a large number of other people; it enables them, as it were, to suffer on behalf of a whole crowd of people and to act all the parts in a play single-handed. I shall be told that this is not more than the familiar hysterical imitation, the capacity of hysterics to imitate any symptoms in other people that may have struck their attention - sympathy, as it were, intensified to the point of reproduction. This, however, does no more than show us the path along which the psychical process in hysterical imitation proceeds. The path is something different from the mental act which proceeds along it. The latter is a little more complicated than the common picture of hysterical imitation; it consists in the unconscious drawing of an inference, as an example will make clear. Supposing a physician is treating a woman patient, who is subject to a particular kind of spasm, in a hospital ward among a number of other patients. He will show no surprise if he finds one morning that this particular kind of hysterical attack has found imitators. He will merely say: 'The other patients have seen it and copied it; it's a case of psychical infection.' That is true; but the psychical infection has occurred along some such lines as these. As a rule, patients know more about one another than the doctor does about any of them. Let us imagine that this patient had her attack on a particular day; then the others will quickly discover that it was caused by a letter from home, the revival of some unhappy love-affair, or some such thing. Their sympathy is aroused and they draw the following inference, though it fails to penetrate into consciousness: 'If a cause like this can produce an attack like this, I may have the same kind of attack since I have the same grounds for having it.' If this inference were capable of entering consciousness, it might possibly give rise to a fear of having the same kind of attack. But in fact the inference is made in a different psychical region, and consequently results in the actual realization of the dreaded symptom. Thus identification is not simple imitation but assimilation on the basis of a similar aetiological pretension; it expresses a resemblance and is derived from a common element which remains in the unconscious.

[1900a, 644]
We have fully appreciated the importance of the part ascribed by Scherner to 'dream-imagination', as well as Scherner's own interpretations, but we have been obliged to transport them, as it were, to a different position in the problem. The point is not that dreams create the imagination, but rather that the unconscious activity of the imagination has a large share in the construction of the dream-thoughts. We remain in Scherner's debt for having indicated the source of the dream-thoughts; but nearly everything that he ascribes to the dream-work is really attributable to the activity of the unconscious during daytime, which is the instigating agent of dreams no less than of neurotic symptoms. We have been obliged to distinguish the 'dream-work' as something quite different and with a much narrower connotation.

[1900a, 1018]

A dream, as we have discovered, takes the place of a number of thoughts which are derived from our daily life and which form a completely logical sequence. We cannot doubt, then, that these thoughts originate from our normal mental life. All the attributes which we value highly in our trains of thought, and which characterize them as complex achievements of a high order, are to be found once more in dream-thoughts. There is no need to assume, however, that this activity of thought is performed during sleep - a possibility which would gravely confuse what has hitherto been our settled picture of the psychical state of sleep. On the contrary, these thoughts may very well have originated from the previous day, they may have proceeded unobserved by our consciousness from their start, and may already have been completed at the onset of sleep. The most that we can conclude from this is that it proves that the most complicated achievements of thought are possible without the assistance of consciousness - a fact which we could not fail to learn in any case from every psycho-analysis of a patient suffering from hysteria or from obsessional ideas. These dream-thoughts are certainly not in themselves inadmissible to consciousness; there may have been a number of reasons for their not having become conscious to us during the day. Becoming conscious is connected with the application of a particular psychical function, that of attention - a function which, as it seems, is only available in a specific quantity, and this may have been diverted from the train of thought in question on to some other purpose. There is another way, too, in which trains of thought of this kind may be withheld from consciousness. The course of our conscious reflections shows us that we follow a particular path in our application of attention. If, as we follow this path, we come upon an idea which will not bear criticism, we break off: we drop the cathexis of attention. Now it seems that the train of thought which has thus been initiated and dropped can continue to spin itself out without attention being turned to it again, unless at some point or other it reaches a specially high degree of intensity which forces attention to it. Thus, if a train of thought is initially rejected (consciously, perhaps) by a judgement that it is wrong or that it is useless for the immediate intellectual purposes in view, the result may be that this train of thought will proceed, unobserved by consciousness, until the onset of sleep.

[1900a, 1020]
So far we have been psychologizing on our own account. It is time now to consider the theoretical views which govern present-day psychology and to examine their relation to our hypotheses. The problem of the unconscious in psychology is, in the forcible words of Lipps (1897), less a psychological problem than the problem of psychology. So long as psychology dealt with this problem by a verbal explanation to the effect that 'psychical' meant 'conscious' and that to speak of 'unconscious psychical processes' was palpable nonsense, any psychological evaluation of the observations made by physicians upon abnormal mental states was out of the question. The physician and the philosopher can only come together if they both recognize that the term 'unconscious psychical processes' is 'the appropriate and justified expression of a solidly established fact'. The physician can only shrug his shoulders when he is assured that 'consciousness is an indispensable characteristic of what is psychical', and perhaps, if he still feels enough respect for the utterances of philosophers, he may presume that they have not been dealing with the same thing or working at the same science. For even a single understanding observation of a neurotic's mental life or a single analysis of a dream must leave him with an unshakeable conviction that the most complicated and most rational thought-processes, which can surely not be denied the name of psychical processes, can occur without exciting the subject's consciousness.¹ It is true that the physical cannot learn of these unconscious processes until they have produced some effect upon consciousness which can be communicated or observed. But this conscious effect may exhibit a psychical character quite different from that of the unconscious process, so that internal perception cannot possibly regard the one as a substitute for the other. The physician must feel at liberty to proceed by inference from the conscious effect to the unconscious psychical process. He thus learns that the conscious effect is only a remote psychical result of the unconscious process and that the latter has not become conscious as such; and moreover that the latter was present and operative even without betraying its existence in any way to consciousness.

[1900a, 1037]

It is not without intention that I speak of 'our' unconscious. For what I thus describe is not the same as the unconscious of the philosophers or even the unconscious of Lipps. By them the term is used merely to indicate a contrast with the conscious: the thesis which they dispute with so much heat and defend with so much energy is the thesis that apart from conscious there are also unconscious psychical processes. Lipps carries things further with his assertion that the whole of what is psychical exists unconsciously and that a part of it also exists consciously. But it is not in order to establish this thesis that we have summoned up the phenomena of dreams and of the formation of hysterical symptoms; the observation of normal waking life would by itself suffice to prove it beyond any doubt. The new discovery that we have been taught by the analysis of psychopathological structures and of the first member of that class - the dream - lies in the fact that the unconscious (that is, the psychical) is found as a function of two separate systems and that this is the case in normal as well as in pathological life. Thus there are two kinds of unconscious, which have not yet been distinguished by psychologists. Both of them are unconscious in the sense used by psychology; but in our sense one of them, which we term the Ucs., is also inadmissible to consciousness, while we term the other the Pcs. because its excitations - after observing certain rules, it is true, and perhaps only after passing a fresh censorship, though nonetheless without regard to the Ucs. - are able to reach consciousness. The fact that excitations in order to reach consciousness must pass through a fixed series or hierarchy of agencies (which is revealed to us by the modifications made in them by censorship) has enabled us to construct a spatial analogy. We have described the relations of the two systems to each other and to consciousness by saying that the system Pcs. stands like a screen between the system Ucs. and consciousness. The system Pcs. not merely bars access to consciousness, it also controls access to the power of voluntary movement and has at its disposal for distribution a mobile cathetic energy, a part of which is familiar to us in the form of attention.²

[1900a, 1039]
One day I discovered to my great astonishment that the view of dreams which came nearest to the truth was not the medical but the popular one, half-involved though it still was in superstition. For I had been led to fresh conclusions on the subject of dreams by applying to them a new method of psychological investigation which had done excellent service in the solution of phobias, obsessions and delusions, etc. Since then, under the name of 'psychoanalysis', it has found acceptance by a whole school of research workers. The numerous analogies that exist between dream-life and a great variety of conditions of psychical illness in waking life have indeed been correctly observed by many medical investigators. There seemed, therefore, good ground for hoping that a method of investigation which had given satisfactory results in the case of psychopathic structures would also be of use in throwing light upon dreams. Phobias and obsessions are as alien to normal consciousness as dreams are to waking consciousness; their origin is as unknown to consciousness as that of dreams. In the case of these psychopathic structures practical considerations led to an investigation of their origin and mode of development; for experience had shown that the discovery of the trains of thought which, concealed from consciousness, connect the pathological ideas with the remaining contents of the mind is equivalent to a resolution of the symptoms and has as its consequence the mastering of ideas which till then could not be inhibited. Thus psychotherapy was the starting-point of the procedure of which I made use for the explanation of dreams.

[1901a, 1053]

If the dream that I analyse is not my own, but someone else's, the conclusion will be the same, though the grounds for believing it will be different. If the dreamer is a healthy person, there is no other means open to me of obliging him to recognize the repressed ideas that have been discovered than by pointing out the context of the dream-thoughts; and I cannot help it if he refuses to recognize them. If, however, I am dealing with a neurotic patient, with a hysteric for instance, he will find the acceptance of the repressed thought forced upon him, owing to its connection with the symptoms of his illness, and owing to the improvement he experiences when he exchanges those symptoms for the repressed ideas. In the case, for instance, of the woman patient who had the dream I have just quoted about the three theatre tickets which cost 1 florin 50 kreuzers, the analysis led to the inevitable conclusion that she had a low estimate of her husband (cf. her idea that she could have got one 'a hundred times better'), that she regretted having married him, and that she would have liked to exchange him for another one. It is true that she asserted that she loved her husband, and that her emotional life knew nothing of any such low estimate of him, but all her symptoms led to the same conclusion as the dream. And after her repressed memories had been revived of a particular period during which she had consciously not loved her husband, her symptoms cleared up and her resistance against the interpretation of the dream disappeared.

[1901a, 1086]
If a furious raging against one's own integrity and one's own life can be hidden in this way behind apparently accidental clumsiness and motor inefficiency, it is not a very large step to find it possible to transfer the same view to mistakes that seriously endanger the lives and health of other people. What evidence I have to show that this view is a valid one is drawn from my experience with neurotics, and thus does not wholly meet the demands of the situation. I will give an account of a case in which something that was not strictly a faulty action but that rather deserves the name of a symptomatic or chance action gave me the clue which subsequently made it possible to resolve the patient's conflict. I once undertook the task of bringing an improvement to the marriage of a very intelligent man, whose disagreements with his fondly attached young wife could undoubtedly be shown to have a real basis, but could not, as he himself admitted, be completely accounted for in that way. He was continually occupied with the thought of a divorce, which he then dismissed once more because of his warm love for his two small children. In spite of this he constantly returned to his intention and made no attempt to find a way of making the situation tolerable to himself. Such inability to deal with a conflict is taken by me as proof that unconscious and repressed motives have lent a hand in strengthening the conscious ones which are struggling against each other, and I undertake in such cases to end the conflict by psychical analysis. One day the man told me of a small incident which had frightened him extremely. He was romping with his elder child, who was by far his favourite; he was swinging him high in the air and down again, and once he swung him so high while he was standing at a particular spot that the top of the child's head almost struck the heavy gas chandelier that was hanging there. Almost, but not quite - or perhaps just! No harm came to the child, but it was made giddy with fright. The father stood horrified with the child in his arms, and the mother had a hysterical attack. The peculiar adroitness of this imprudent movement and the violence of the parents' reaction prompted me to look for a symptomatic act in this accident - one which aimed at expressing an evil intention directed against the beloved child. I was able to remove the contradiction between this and the father's contemporary affection for his child by shifting the impulse to injure it back to the time when this child had been the only one and had been so small that its father had not yet had any reason to take an affectionate interest in it. It was then easy for me to suppose that, as he was getting little satisfaction from his wife, he may at that time have had a thought or formed a decision of this kind: 'If this little creature that means nothing at all to me dies, I shall be free and able to get a divorce.' A wish for the death of the creature that he now loved so dearly must therefore have persisted unconsciously. From this point it was easy to find the path by which this wish had become unconsciously fixated. A powerful determinant was in fact provided by a memory from the patient's childhood: namely that the death of a small brother, for which his mother blamed his father's negligence, had led to violent quarrels between the parents and threats of a divorce. The subsequent course of my patient's marriage, as well as my therapeutic success, confirmed my conjecture.

I am prepared to be told at this point that there is no very great advantage in having been taught by psycho-analysis that the clue to the problem of hysteria is to be found not in 'a peculiar instability of the molecules of the nerves' or in a liability to 'hypnoid states' - but in a 'somatic compliance'. But in reply to the objection I may remark that this new view has not only to some extent pushed the problem further back, but has also to some extent diminished it. We have no longer to deal with the whole problem, but only with the portion of it involving that particular characteristic of hysteria which differentiates it from other psychoneuroses. The mental events in all psycho-neuroses proceed for a considerable distance along the same lines before any question arises of the 'somatic compliance' which may afford the unconscious mental processes a physical outlet. When this factor is not forthcoming, something other than a hysterical symptom will arise out of the total situation; yet it will still be something of an allied nature, a phobia, perhaps, or an obsession - in short, a psychical symptom.
And yet illnesses of this kind are the result of intention for the purposes they serve. They are as a rule levelled at a particular person, and consequently vanish with that person's departure. The crudest and most commonplace views on the character of hysterical disorder - such as are to be heard from uneducated relatives or nurses - are in a certain sense right. It is true that the paralysed and bedridden woman would spring to her feet if a fire were to break out in her room, and that the spoiled wife would forget all her sufferings if her child were to fall dangerously ill or if some catastrophe were to threaten the family circumstances. People who speak of the patients in this way are right except upon a single point: they overlook the psychological distinction between what is conscious and what is unconscious. This may be permissible where children are concerned, but with adults it is no longer possible. That is why all these asseverations that it is 'only a question of willing' and all the encouragements and abuse that are addressed to the patient are of no avail. An attempt must first be made by the roundabout methods of analysis to convince the patient herself of the existence in her of an intention to be ill.

Let us now apply our theory to the instance provided by Dora's case. We will begin with the first hypothesis, namely, that her preoccupation with her father's relations to Frau K. owed its obsessive character to the fact that its root was unknown to her and lay in the unconscious. It is not difficult to divine the nature of that root from her circumstances and her conduct. Her behaviour obviously went far beyond what would have been appropriate to filial concern. She felt and acted more like a jealous wife - in a way which would have been comprehensible in her mother. By her ultimatum to her father ('either her or me'), by the scenes she used to make, by the suicidal intentions she allowed to transpire, by all this she was clearly putting herself in her mother's place. If we have rightly guessed the nature of the imaginary sexual situation which underlay her cough, in that phantasy she must have been putting herself in Frau K.'s place. She was therefore identifying herself both with the woman her father had once loved and with the woman he loved now. The inference is obvious that her affection for her father was a much stronger one than she knew or than she would have cared to admit: in fact, that she was in love with him.

I have learnt to look upon unconscious love relations like this (which are marked by their abnormal consequences) - between a father and a daughter, or between a mother and a son - as a revival of germs of feeling in infancy. I have shown at length elsewhere¹ at what an early age sexual attraction makes itself felt between parents and children, and I have explained that the legend of Oedipus is probably to be regarded as a poetical rendering of what is typical in these relations. Distinct traces are probably to be found in most people of an early partiality of this kind - on the part of a daughter for her father, or on the part of a son for his mother; but it must be assumed to be more intense from the very first in the case of those children whose constitution marks them down for a neurosis, who develop prematurely and have a craving for love. At this point certain other influences, which need not be discussed here, come into play, and lead to a fixation of this rudimentary feeling of love or to a reinforcement of it; so that it turns into something (either while the child is still young or not until it has reached the age of puberty) which must be put on a par with a sexual inclination and which, like the latter, has the forces of the libido at its command.² The nature of her disposition had always drawn her towards her father, and his numerous illnesses were bound to have increased her affection for him. In some of these illnesses he would allow no one but her to discharge the lighter duties of nursing. He had been so proud of the early growth of her intelligence that he had made her his confidante while she was still a child. It was really she and not her mother whom Frau K.'s appearance had driven out of more than one position.

¹[1905e, 3330]
²[1905e, 1149]
In other cases the replacement of the object by a fetish is determined by a symbolic connection of thought, of which the person concerned is usually not conscious. It is not always possible to trace the course of these connections with certainty (The foot, for instance, is an age-old sexual symbol which occurs even in mythology;¹ no doubt the part played by fur as a fetish owes its origin to an association with the hair of the mons Veneris.) None the less even symbolism such as this is not always unrelated to sexual experiences in childhood.²

[1905d, 1482]

The removal of the symptoms of hysterical patients by psycho-analysis proceeds on the supposition that those symptoms are substitutes - transcriptions as it were - for a number of emotionally cathected mental processes, wishes and desires, which, by the operation of a special psychical procedure (repression), have been prevented from obtaining discharge in psychical activity that is admissible to consciousness. These mental processes, therefore, being held back in a state of unconsciousness, strive to obtain an expression that shall be appropriate to their emotional importance - to obtain discharge; and in the case of hysteria they find such an expression (by means of the process of 'conversion') in somatic phenomena, that is, in hysterical symptoms. By systematically turning these symptoms back (with the help of a special technique ) into emotionally cathected ideas - ideas that will now have become conscious - it is possible to obtain the most accurate knowledge of the nature and origin of these formerly unconscious psychical structures.

[1905d, 1489]

(f) Finally, Gentlemen, I must confess that it is hardly fair to take up your attention for so long on the subject of psycho-analytic therapy without telling you in what this treatment consists and on what it is based. Still, as I am forced to be brief, I can only hint at this: This therapy, then, is based on the recognition that unconscious ideas - or better, the unconsciousness of certain mental processes - are the direct cause of the morbid symptoms. We share this opinion with the French school (Janet) who, by the way, owing to excessive schematization, refer the cause of hysterical symptoms to an unconscious idée fixe. Now please do not be afraid that this is going to land us in the depths of philosophical obscurities. Our unconscious is not quite the same thing as that of philosophers and, moreover, the majority of philosophers will hear nothing of 'unconscious mental processes'. If, however, you will look at the matter from our point of view, you will understand that the transformation of this unconscious material in the mind of the patient into conscious material must have the result of correcting his deviation from normality and of lifting the compulsion to which his mind has been subjected. For conscious will-power governs only conscious mental processes, and every mental compulsion is rooted in the unconscious. Nor need you ever fear that the patient will be harmed by the shock accompanying the introduction of the unconscious into consciousness, for you can convince yourselves theoretically that the somatic and emotional effect of an impulse that has become conscious can never be so powerful as that of an unconscious one. It is only by the application of our highest mental functions, which are bound up with consciousness, that we can control all our impulses.

[1905a, 1571]
The first manifestations of the process that had been set going in Hanold by the relief were phantasies, which played around the figure represented in it. The figure seemed to him to have something 'of to-day' about her, in the best sense of the words, and it was as though the artist had captured her 'from the life' stepping along the street. He gave the girl in the ancient relief the name of 'Gradiva', which he constructed on the model of an epithet of the war-god striding into battle - 'Mars Gradivus'. He endowed her personality with more and more characteristics. She may have been the daughter of a respected personage, of a patrician, perhaps, who was connected with the temple service of a deity. He thought he could trace a Greek origin in her features; and finally he felt compelled to remove her from the busy life of a capital and to transport her to the more peaceful Pompeii, and there he made her step across the lava stepping-stones which made it possible to cross from one side of the street to the other. These products of his phantasy seem arbitrary enough, but at the same time innocently unsuspicious. And, indeed, even when for the first time they gave rise to an incitement to action - when the archaeologist, obsessed by the problem of whether this posture of the feet corresponded to reality, began to make observations from life in order to examine the feet of contemporary women and girls - even this action was screened by conscious scientific motives, as though all his interest in the sculpture of Gradiva had sprung from the soil of his professional concern with archaeology. The women and girls in the street, whom he chose as the subjects of his investigation, must, of course, have taken another, crudely erotic view of his behaviour, and we cannot but think them right. We ourselves can be in no doubt that Hanold was as much in ignorance of the motives of his researches as he was of the origin of his phantasies about Gradiva. These, as we learned later, were echoes of his memories of his youthful love, derivatives of those memories, transformations and distortions of them, after they had failed to make their way into his consciousness in an unmodified form. The ostensibly aesthetic judgement that the sculpture had something 'of to-day' about it took the place of his knowledge that a gait of that kind belonged to a girl whom he knew and who stepped across the street at the present time. Behind the impression of the sculpture being 'from the life' and the phantasy of its subject being Greek lay his memory of the name Zoe, which means 'life' in Greek. 'Gradiva', as we learn from our hero himself at the end of the story, after he has been cured of his delusion, is a good translation of the surname 'Bertgang' which means something like 'someone who steps along brilliantly or splendidly'. The details about Gradiva's father originated from Hanold's knowledge that Zoe Bertgang was the daughter of a respected teacher at the University, which can well be translated into classical terms as 'temple-service'. Finally, his phantasy transported her to Pompeii, not 'because her quiet, calm nature seemed to demand it', but because no other or better analogy could be found in his science for his remarkable state, in which he became aware of his memories of his childhood friendship through obscure channels of information. Once he had made his own childhood coincide with the classical past (which it was so easy for him to do), there was a perfect similarity between the burial of Pompeii - the disappearance of the past combined with its preservation - and repression, of which he possessed a knowledge through what might be described as 'endopsychic' perception. In this he was employing the same symbolism that the author makes the girl use consciously towards the conclusion of the story: 'I told myself I should be able to dig out something interesting here even by myself. Of course I hadn't counted on making the find that I have . . .' (124.) And at the very end she replied to Hanold's plan for their honeymoon with a reference to 'her childhood friend who had also in a sense been dug out of the ruins again'. (150.) [1907a, 1849]
The development of Norbert Hanold's delusion proceeded with a dream which, since it was not occasioned by any new event, seems to have arisen entirely out of his mind, filled as it was by a conflict. But let us pause before we enquire whether, in the construction of his dreams, too, the author meets our expectation that he possesses a deep understanding. Let us ask first what psychiatric science has to say to his hypotheses about the origin of a delusion and what attitude it takes to the part played by repression and the unconscious, to conflict and to the formation of compromises. In short, let us ask whether this imaginative representation of the genesis of a delusion can hold its own before the judgement of science.

[1907a, 1850]

And here we must give what will perhaps be an unexpected answer. In fact the situation is quite the reverse: it is science that cannot hold its own before the achievement of the author. Science allows a gulf to yawn between the hereditary and constitutional preconditions of a delusion and its creations, which seem to emerge ready-made - a gulf which we find that our author has filled. Science does not as yet suspect the importance of repression, it does not recognize that in order to explain the world of psychopathological phenomena the unconscious is absolutely essential, it does not look for the basis of delusions in a psychical conflict, and it does not regard their symptoms as compromises. Does our author stand alone, then, in the face of united science? No, that is not the case (if, that is, I may count my own works as part of science), since for a number of years - and, until recently, more or less alone¹ - I myself have supported all the views that I have here extracted from Jensen's Gradiva and stated in technical terms. I indicated, in most detail in connection with the states known as hysteria and obsessions, that the individual determinant of these psychical disorders is the suppression of a part of instinctual life and the repression of the ideas by which the suppressed instinct is represented, and soon afterwards I repeated the same views in relation to some forms of delusion.² The question whether the instincts concerned in this causation are always components of the sexual instinct or may be of another kind as well is a problem which may be regarded as a matter of indifference in the particular case of the analysis of Gradiva; for in the instance chosen by our author what was at issue was quite certainly nothing other than the suppression of erotic feelings. The validity of the hypotheses of psychical conflict and of the formation of symptoms by means of compromises between the two mental currents struggling against each other has been demonstrated by me in the case of patients observed and medically treated in real life, just as I have been able to in the imaginary case of Norbert Hanold.³ Even before me, Pierre Janet, a pupil of the great Charcot, and Josef Breuer, in collaboration with me, had traced back the products of neurotic, and especially of hysterical, illness to the power of unconscious thoughts.⁴

[1907a, 1851]

Here then we seem to have finished off the interpretation of this second dream as well. Both of them have been made intelligible to us on the presupposition that a dreamer knows in his unconscious thoughts all that he has forgotten in his conscious ones, and that in the former he judges correctly what in the latter he misunderstands in a delusion. In the course of our arguments we have no doubt been obliged to make some assertions which have seemed strange to the reader because of their unfamiliarity; and we have probably often roused a suspicion that what we pretended was the author's meaning was in fact only our own. I am anxious to do all I can to dissipate this suspicion, and for that reason I will gladly enter into more detail over one of the most delicate points - I mean the use of ambiguous words and phrases, such as: 'Somewhere in the Sun Gradiva was sitting.'

[1907a, 1877]
The procedure which the author makes his Zoe adopt for curing her childhood friend's delusion shows a far-reaching similarity - no, a complete agreement in its essence - with a therapeutic method which was introduced into medical practice in 1895 by Dr. Josef Breuer and myself, and to the perfecting of which I have since then devoted myself. This method of treatment, to which Breuer first gave the name of 'cathartic' but which I prefer to describe as 'analytic', consists, as applied to patients suffering from disorders analogous to Hanold's delusion, in bringing to their consciousness, to some extent forcibly, the unconscious whose repression led to their falling ill - exactly as Gradiva did with the repressed memories of their childhood relations. Gradiva, it is true, could carry out this task more easily than a doctor: in several respects she was in what may be described as an ideal position for it. The doctor, who has no pre-existing knowledge of his patient and possesses no conscious memory of what is unconsciously at work in him, must call a complicated technique to his help in order to make up for this disadvantage. He must learn how to infer with great certainty from the conscious associations and communications of the patient what is repressed in him, how to discover his unconscious as it betrays itself behind his conscious words and acts. He then brings about something like what Norbert Hanold grasped at the end of the story when he translated back the name 'Gradiva' into 'Bertgang'. The disorder vanishes while being traced back to its origin; analysis, too, brings simultaneous cure.

[1907a, 1881]

The field I have in mind is indeed very different from yours. I am referring to the therapy employed for certain 'nervous diseases' - what are known as the psychoneuroses - of which hysteria and obsessional ideas may be taken as samples. The method is called 'psycho-analysis'; it was evolved by me from the 'cathartic' method of therapy first practised by Josef Breuer in Vienna.¹ To combat your surprise, I must draw an analogy between the criminal and the hysterical. In both we are concerned with a secret, with something hidden. But in order not to be paradoxical I must at once point out the difference. In the case of the criminal it is a secret which he knows and hides from you, whereas in the case of the hysterical it is a secret which he himself does not know either, which is hidden even from himself. How is this possible? Now we know, through laborious research, that all these illnesses are the result of the patient's having succeeded in repressing certain ideas and memories that are strongly cathected with affect, together with the wishes that arise from them, in such a way that they play no part in his thinking - do not enter into his consciousness - and thus remain unknown to him. But from this repressed psychical material (these 'complexes') are generated the somatic and psychical symptoms which plague the patient in just the same way as a guilty conscience does. In this one respect, therefore, the difference between the criminal and the hysterical is fundamental.

[1906c, 1892]

It is one of the conditions of the illness that the person who is obeying a compulsion carries it out without understanding its meaning - or at any rate its chief meaning. It is only thanks to the efforts of psycho-analytic treatment that he becomes conscious of the meaning of his obsessive action and, with it, of the motives that are impelling him to it. We express this important fact by saying that the obsessive action serves to express unconscious motives and ideas. In this, we seem to find a further departure from religious practices; but we must remember that as a rule the ordinary pious individual, too, performs a ceremonial without concerning himself with its significance, although priests and scientific investigators may be familiar with the - mostly symbolic - meaning of the ritual. In all believers, however, the motives which impel them to religious practices are unknown to them or are represented in consciousness by others which are advanced in their place.

[1907b, 1906]
Unconscious phantasies have either been unconscious all along and have been formed in the unconscious; or - as is more often the case - they were once conscious phantasies, daydreams, and have since been purposely forgotten and have become unconscious through 'repression'. Their content may afterwards either have remained the same or have undergone alterations, so that the present unconscious phantasies are derivatives of the once conscious ones. Now an unconscious phantasy has a very important connection with the subject's sexual life; for it is identical with the phantasy which served to give him sexual satisfaction during a period of masturbation. At that time the masturbatory act (in the widest sense of the term) was compounded of two parts. One was the evocation of a phantasy and the other some active behaviour for obtaining self-gratification at the height of the phantasy. This compound, as we know, was itself merely soldered together.¹ Originally the action was a purely auto-erotic procedure for the purpose of obtaining pleasure from some particular part of the body, which could be described as erotogenic. Later, this action became merged with a wishful idea from the sphere of object-love and served as a partial realization of the situation in which the phantasy culminated. When, subsequently, the subject renounces this type of satisfaction, composed of masturbation and phantasy, the action is given up, while the phantasy, from being conscious, becomes unconscious. If no other mode of sexual satisfaction supervenes, the subject remains abstinent; and if he does not succeed in sublimating his libido - that is, in deflecting his sexual excitation to higher aims -, the condition is now fulfilled for his unconscious phantasy to be revived and to proliferate, and, at least as regards some part of its content, to put itself into effect, with the whole force of his need for love, in the form of a pathological symptom.

[1908a, 1934]

This method of psycho-analytic investigation, which leads from the conspicuous symptoms to the hidden unconscious phantasies, tells us everything that can be known about the sexuality of psychoneurotics, including the fact which is to be the main subject-matter of this short preliminary publication.

[1908a, 1935]

With the psychoneuroses, the influence of heredity is more marked and the causation less transparent. A peculiar method of investigation known as psycho-analysis has, however, enabled us to recognize that the symptoms of these disorders (hysteria, obsessional neurosis, etc.) are psychogenic and depend upon the operation of unconscious (repressed) ideational complexes. This same method has also taught us what those unconscious complexes are and has shown that, quite generally speaking, they have a sexual content. They spring from the sexual needs of people who are unsatisfied and represent for them a kind of substitutive satisfaction. We must therefore view all factors which impair sexual life, suppress its activity or distort its aims as being pathogenic factors in the psychoneuroses as well.

[1908d, 1951]
When one carries out the psycho-analysis of a hysterical woman patient whose complaint is manifested in attacks, one soon becomes convinced that these attacks are nothing else but phantasies translated into the motor sphere, projected on to motility and portrayed in pantomime. It is true that the phantasies are unconscious; but apart from this they are of the same nature as the phantasies which can be observed directly in day-dreams or which can be elicited by interpretation from dreams at night. Often a dream takes the place of an attack, and still more often it explains it, since the same phantasy finds a different expression in a dream and in an attack. We might expect then that by observing an attack we should be able to get to know the phantasy represented in it; but this is seldom possible. As a rule, owing to the influence of the censorship, the pantomimic portrayal of the phantasy has undergone distortions which are completely analogous to the hallucinatory distortions of a dream, so that both of them have, in the first resort, become unintelligible to the subject's own consciousness as well as to the observer's comprehension. A hysterical attack, therefore, needs to be subjected to the same interpretative revision as we employ for night-dreams. But not only are the forces from which the distortion proceeds and the purpose of the distortion the same as those we have come to know through the interpretation of dreams; the technique employed in the distortion is the same too.

The later stage in the development of the neurotic's estrangement from his parents, begun in this manner, might be described as 'the neurotic's family romance'. It is seldom remembered consciously but can almost always be revealed by psycho-analysis. For a quite peculiarly marked imaginative activity is one of the essential characteristics of neurotics and also of all comparatively highly gifted people. This activity emerges first in children's play, and then, starting roughly from the period before puberty, takes over the topic of family relations. A characteristic example of this peculiar imaginative activity is to be seen in the familiar day-dreaming which persists far beyond puberty. If these day-dreams are carefully examined, they are found to serve as the fulfilment of wishes and as a correction of actual life. They have two principal aims, an erotic and an ambitious one - though an erotic aim is usually concealed behind the latter too. At about the period I have mentioned, then, the child's imagination becomes engaged in the task of getting free from the parents of whom he now has a low opinion and of replacing them by others, who, as a rule, are of higher social standing. He will make use in this connection of any opportune coincidences from his actual experience, such as his becoming acquainted with the Lord of the Manor or some landed proprietor if he lives in the country or with some member of the aristocracy if he lives in town. Chance occurrences of this kind arouse the child's envy, which finds expression in a phantasy in which both his parents are replaced by others of better birth. The technique used in developing phantasies like this (which are, of course, conscious at this period) depends upon the ingenuity and the material which the child has at his disposal. There is also the question of whether the phantasies are worked out with greater or less effort to obtain verisimilitude. This state is reached at a time at which the child is still in ignorance of the sexual determinants of procreation.

Little Hans is described by his parents as a cheerful, straightforward child, and so he should have been, considering the education given him by his parents, which consisted essentially in the omission of our usual educational sins. So long as he was able to carry on his researches in a state of happy naiveté, without a suspicion of the conflicts which were soon to arise out of them, he kept nothing back; and the observations made during the period before the phobia admit of no doubt or demur. It was with the outbreak of the illness and during the analysis that discrepancies began to make their appearance between what he said and what he thought; and this was partly because unconscious material, which he was unable to master all at once, was forcing itself upon him, and partly because the content of his thoughts provoked reservations on account of his relation to his parents. It is my unbiased opinion that these difficulties, too, turned out no greater than in many analyses of adults.
If I went more deeply into the details of the analysis I could produce plenty more evidence of Hans's independence of 'suggestion'; but I shall break off the discussion of this preliminary objection at this point. I am aware that even with this analysis I shall not succeed in convincing any one who will not let himself be convinced, and I shall proceed with my discussion of the case for the benefit of those readers who are already convinced of the objective reality of unconscious pathogenic material. And I do this with the agreeable assurance that the number of such readers is steadily increasing.

[1909b, 2090]

I had expressed a suspicion that Hans's repressed wish might now be that he wanted at all costs to see his mother's widdler. As his behaviour to a new maid fitted in with this hypothesis, his father gave him his first piece of enlightenment, namely, that women have no widdlers. He reacted to this first effort at helping him by producing a phantasy that he had seen his mother showing her widdler.¹ This phantasy and a remark made by him in conversation, to the effect that his widdler was 'fixed in, of course', allow us our first glimpse into the patient's unconscious mental processes. The fact was that the threat of castration made to him by his mother some fifteen months earlier was now having a deferred effect upon him. For his phantasy that his mother was doing the same as he had done (the familiar tu quoque repartee of inculpated children) was intended to serve as a piece of self-justification; it was a protective or defensive phantasy. At the same time we must remark that it was Hans's parents who had extracted from the pathogenic material operating in him the particular theme of his interest in widdlers. Hans followed their lead in this matter, but he had not yet taken any line of his own in the analysis. And no therapeutic success was to be observed. The analysis had passed far away from the subject of horses; and the information that women have no widdlers was calculated, if anything, to increase his concern for the preservation of his own.

[1909b, 2102]

We find, accordingly: an erotic instinct and a revolt against it; a wish which has not yet become compulsive and, struggling against it, a fear which is already compulsive; a distressing affect and an impulsion towards the performance of defensive acts. The inventory of the neurosis has reached its full muster. Indeed, something more is present, namely, a kind of delusion or delirium with the strange content that his parents knew his thoughts because he spoke them out loud without his hearing himself do it. We shall not go far astray if we suppose that in making this attempt at an explanation the child had some inkling of those remarkable mental processes which we describe as unconscious and which we cannot dispense with if we are to throw any scientific light upon this obscure subject. 'I speak my thoughts out loud, without hearing them' sounds like a projection into the external world of our own hypothesis that he had thoughts without knowing anything about them; it sounds like an endopsychic perception of what has been repressed.

[1909d, 2134]
Another impulse, which might be described as indirectly suicidal and which was of longer duration, was not so easily explicable. For its relation to the patient's experiences succeeded in concealing itself behind one of those purely external associations which are so obnoxious to our consciousness. One day while he was away on his summer holidays the idea suddenly occurred to him that he was too fat [German 'dick'] and that he must make himself slimmer. So he began getting up from table before the pudding came round and tearing along the road without a hat in the blazing heat of an August sun. Then he would dash up a mountain at the double, till, dripping with perspiration, he was forced to come to a stop. On one occasion his suicidal intentions actually emerged without any disguise from behind this mania for slimming: as he was standing on the edge of a steep precipice he suddenly received a command to jump over, which would have been certain death. Our patient could think of no explanation of this senseless obsessional behaviour until it suddenly occurred to him that at that time his lady had also been stopping at the same resort; but she had been in the company of an English cousin, who was very attentive to her and of whom the patient had been very jealous. This cousin's name was Richard, and, according to the usual practice in England, he was known as Dick. Our patient, then, had wanted to kill this Dick; he had been far more jealous of him and enraged with him than he could admit to himself, and that was why he had imposed on himself this course of slimming by way of a punishment. This obsessional impulse may seem very different from the directly suicidal command which was discussed above, but they have nevertheless one important feature in common. For they both arose as reactions to a tremendous feeling of rage, which was inaccessible to the patient's consciousness and was directed against some one who had cropped up as an interference with the course of his love.¹

But the information that the young lady at the post office at Z-- had herself paid the charges due upon the packet, with a complimentary remark about himself,¹ had intensified his identification with his father in quite another direction. At this stage in the analysis he brought out some new information, to the effect that the landlord of the inn at the little place where the post office was had had a pretty daughter. She had been decidedly encouraging to the smart young officer, so that he could admit to himself, and that was why he had imposed on himself this course of slimming by way of a punishment. This obsessional impulse may seem very different from the directly suicidal command which was discussed above, but they have nevertheless one important feature in common. For they both arose as reactions to a tremendous feeling of rage, which was inaccessible to the patient's consciousness and was directed against some one who had cropped up as an interference with the course of his love.¹

[1909d, 2148]

Only vague intelligence of these events reached the patient's consciousness. But his revolt against the captain's order and the sudden transformation of that revolt into its opposite were both represented there. First had come the idea that he was not to pay back the money, or it (that is, the rat punishment) would happen; and then had come the transformation of this idea into a vow to the opposite effect, as a punishment for his revolt.

[1909d, 2170]
I shall not in the present paper attempt any discussion of the psychological significance of obsessional thinking. Such a discussion would be of extraordinary value in its results, and would do more to clarify our ideas upon the nature of the conscious and the unconscious than any study of hysteria or the phenomena of hypnosis. It would be a most desirable thing if the philosophers and psychologists who develop brilliant theoretical views on the unconscious upon a basis of hearsay knowledge or from their own conventional definitions would first submit to the convincing impressions which may be gained from a first-hand study of the phenomena of obsessional thinking. We might almost go to the length of requiring it of them, if the task were not so far more laborious than the methods of work to which they are accustomed. I will only add here that in obsessional neuroses the unconscious mental processes occasionally break through into consciousness in their pure and undistorted form, that such incursions may take place at every possible stage of the unconscious process of thought, and that at the moment of the incursion the obsessional ideas can, for the most part, be recognized as formations of very long standing. This accounts for the striking circumstance that, when the analyst tries, with the patient's help, to discover the date of the first occurrence of an obsessional idea, the patient is obliged to place it further and further back as the analysis proceeds, and is constantly finding fresh 'first' occasions for the appearance of the obsession.

[1909d, 2178]

I refer to the omnipotence which he ascribed to his thoughts and feelings, and to his wishes, whether good or evil. It is, I must admit, decidedly tempting to declare that this idea was a delusion and that it oversteps the limits of obsessional neurosis. I have, however, come across the same conviction in another obsessional patient; and he was long ago restored to health and is leading a normal life. Indeed, all obsessional neurotics behave as though they shared this conviction. It will be our business to throw some light upon these patients' over-estimation of their powers. Assuming, without more ado, that this belief is a frank acknowledgement of a relic of the old megalomania of infancy, we will proceed to ask our patient for the grounds of his conviction. In reply, he adduces two experiences. When he returned for a second visit to the hydropathic establishment at which his disorder had been relieved for the first and only time, he asked to be given his old room, for its position had facilitated his relations with one of the nurses. He was told that the room was already taken and that it was occupied by an old professor. This piece of news considerably diminished his prospects of successful treatment, and he reacted to it with the unamiable thought: 'I wish he may be struck dead for it!' A fortnight later he was woken up from his sleep by the disturbing idea of a corpse; and in the morning he heard that the professor had really had a stroke, and that he had been carried up into his room at about the time he himself had woken up. The second experience related to an unmarried woman, no longer young, though with a great desire to be loved, who had paid him a great deal of attention and had once asked him point blank whether he could not love her. He had given her an evasive answer. A few days afterwards he heard that she had thrown herself out of a window. He then began to reproach himself, and said to himself that it would have been in his power to save her life by giving her his love. I n this way he became convinced of the omnipotence of his love and of his hatred. Without denying the omnipotence of love we may point out that both these instances were concerned with death, and we may adopt the obvious explanation that, like other obsessional neurotics, our patient was compelled to overestimate the effects of his hostile feelings upon the external world, because a large part of their internal, mental effects escaped his conscious knowledge. His love - or rather his hatred - was in truth overpowering; it was precisely they that created the obsessional thoughts, of which he could not understand the origin and against which he strove in vain to defend himself.¹

[1909d, 2183]
It soon emerged, as though by chance, that this process of sweeping the mind clean could accomplish more than the merely temporary relief of her ever-recurring mental confusion. It was actually possible to bring about the disappearance of the painful symptoms of her illness, if she could be brought to remember under hypnosis, with an accompanying expression of affect, on what occasion and in what connection the symptom had first appeared. 'It was in the summer during a period of extreme heat, and the patient was suffering very badly from thirst; for, without being able to account for it in any way, she suddenly found it impossible to drink. She would take up the glass of water that she longed for, but as soon as it touched her lips she would push it away like someone suffering from hydrophobia. As she did this, she was obviously in an absence for a couple of seconds. She lived only on fruit, such as melons, etc., so as to lessen her tormenting thirst. This had lasted for some six weeks, when one day during hypnosis she grumbled about her English "lady-companion", whom she did not care for, and went on to describe, with every sign of disgust, how she had once gone into this lady's room and how her little dog - horrid creature! - had drunk out of a glass there. The patient had said nothing, as she had wanted to be polite. After giving further energetic expression to the anger she had held back, she asked for something to drink, drank a large quantity of water without any difficulty, and awoke from her hypnosis with the glass at her lips; and thereupon the disturbance vanished, never to return.'¹

A second observation of Breuer's, again, compels us to attach great importance, among the characteristics of the pathological chain of events, to states of consciousness. Breuer's patient exhibited, alongside of her normal state, a number of mental peculiarities: conditions of 'absence', confusion, and alterations of character. In her normal state she knew nothing of the pathogenic scenes or their connection with her symptoms; she had forgotten the scenes, or at all events had severed the pathogenic link. When she was put under hypnosis, it was possible, at the expense of a considerable amount of labour, to recall the scenes to her memory; and, through this work of recollecting, the symptoms were removed. The explanation of this fact would be a most awkward business, were it not that the way is pointed by experiences and experiments in hypnotism. The study of hypnotic phenomena has accustomed us to what was at first a bewildering realization that in one and the same individual there can be several mental groupings, which can remain more or less independent of one another, which can 'know nothing' of one another and which can alternate with one another in their hold upon consciousness. Cases of this kind, too, occasionally appear spontaneously, and are then described as examples of 'double conscience'.¹ If, where a splitting of the personality such as this has occurred, consciousness remains attached regularly to one of the two states, we call it the conscious mental state and the other, which is detached from it, the unconscious one. In the familiar condition known as 'post-hypnotic suggestion', a command given under hypnosis is slavishly carried out subsequently in the normal state. This phenomenon affords an admirable example of the influences which the unconscious state can exercise over the conscious one; moreover, it provides a pattern upon which we can account for the phenomena of hysteria. Breuer adopted a hypothesis that hysterical symptoms arise in peculiar mental conditions to which he gave the name of 'hypnoid'. On this view, excitations occurring during these hypnoid states can easily become pathogenic because such states do not provide opportunities for the normal discharge of the process of excitation. There consequently arises from the process of excitation an unusual product - the symptom. This finds its way, like a foreign body, into the normal state, which in turn is in ignorance of the hypnoid pathogenic situation. Wherever there is a symptom there is also an amnesia, a gap in the memory, and filling up this gap implies the removal of the conditions which led to the production of the symptom.

[1910a, 2203]

[1910a, 2208]
I was driven forward above all by practical necessity. The cathartic procedure, as carried out by Breuer, presupposed putting the patient into a state of deep hypnosis; for it was only in a state of hypnosis that he attained a knowledge of the pathogenic connections which escaped him in his normal state. But I soon came to dislike hypnosis, for it was a temperamental and, one might almost say, a mystical ally. When I found that, in spite of all my efforts, I could not succeed in bringing more than a fraction of my patients into a hypnotic state, I determined to give up hypnosis and to make the cathartic procedure independent of it. Since I was not able at will to alter the mental state of the majority of my patients, I set about working with them in their normal state. At first, I must confess, this seemed a senseless and hopeless undertaking. I was set the task of learning from the patient something that I did not know and that he did not know himself. How could one hope to elicit it? But there came to my help a recollection of a most remarkable and instructive experiment which I had witnessed when I was with Bernheim at Nancy. Bernheim showed us that people whom he had put into a state of hypnotic somnambulism, and who had had all kinds of experiences while they were in that state, only appeared to have lost the memory of what they had experienced during somnambulism; it was possible to revive these memories in their normal state. It is true that, when he questioned them about their somnambulistic experiences, they began by maintaining that they knew nothing about them; but if he refused to give way, and insisted, and assured them that they did know about them, the forgotten experiences always reappeared.

[1910a, 2211]

To take the place of a number of instances, I will relate a single one of my cases, in which the determinants and advantages of repression are sufficiently evident. For my present purpose I shall have once again to abridge the case history and omit some important underlying material. The patient was a girl, who had lost her beloved father after she had taken a share in nursing him - a situation analogous to that of Breuer's patient. Soon afterwards her elder sister married, and her new brother-in-law aroused in her a peculiar feeling of sympathy which was easily masked under a disguise of family affection. Not long afterwards her sister fell ill and died, in the absence of the patient and her mother. They were summoned in all haste without being given any definite information of the tragic event. When the girl reached the bedside of her dead sister, there came to her for a brief moment an idea that might be expressed in these words: 'Now he is free and can marry me.' We may assume with certainty that this idea, which betrayed to her consciousness the intense love for her brother-in-law of which she had not herself been conscious, was surrendered to repression a moment later, owing to the revolt of her feelings. The girl fell ill with severe hysterical symptoms; and while she was under my treatment it turned out that she had completely forgotten the scene by her sister's bedside and the odious egoistic impulse that had emerged in her. She remembered it during the treatment and reproduced the pathogenic moment with signs of the most violent emotion, and, as a result of the treatment, she became healthy once more.

[1910a, 2213]
Before the child comes under the dominance of the castration-complex - at a time when he still holds women at full value - he begins to display an intense desire to look, as an erotic instinctual activity. He wants to see other people's genitals, at first in all probability to compare them with his own. The erotic attraction that comes from his mother soon culminates in a longing for her genital organ, which he takes to be a penis. With the discovery, which is not made till later, that women do not have a penis, this longing often turns into its opposite and gives place to a feeling of disgust which in the years of puberty can become the cause of psychical impotence, misogyny and permanent homosexuality. But the fixation on the object that was once strongly desired, the woman's penis, leaves indelible traces on the mental life of the child, who has pursued that portion of his infantile sexual researches with particular thoroughness. Fetishistic reverence for a woman's foot and shoe appears to take the foot merely as a substitutive symbol for the woman's penis which was once revered and later missed; without knowing it, 'coupeurs de nattes'¹ play the part of people who carry out an act of castration on the female genital organ.

[1910c, 2271]

If the practising psycho-analyst asks himself on account of what disorder people most often come to him for help, he is bound to reply - disregarding the many forms of anxiety - that it is psychical impotence. This singular disturbance affects men of strongly libidinous natures, and manifests itself in a refusal by the executive organs of sexuality to carry out the sexual act, although before and after they may show themselves to be intact and capable of performing the act, and although a strong psychical inclination to carry it out is present. The first clue to understanding his condition is obtained by the sufferer himself on making the discovery that a failure of this kind only arises when the attempt is made with certain individuals; whereas with others there is never any question of such a failure. He now becomes aware that it is some feature of the sexual object which gives rise to the inhibition of his male potency, and sometimes he reports that he has a feeling of an obstacle inside him, the sensation of a counter-will which successfully interferes with his conscious intention. However, he is unable to guess what this internal obstacle is and what feature of the sexual object brings it into operation. If he has had repeated experience of a failure of this kind, he is likely, by the familiar process of 'erroneous connection', to decide that the recollection of the first occasion evoked the disturbing anxiety-idea and so caused the failure to be repeated each time; while he derives the first occasion itself from some 'accidental' impression.

[1912d, 2337]

Psycho-analytic studies of psychical impotence have already been carried out and published by several writers.¹ Every analyst can confirm the explanations provided by them from his own clinical experience. It is in fact a question of the inhibitory influence of certain psychical complexes which are withdrawn from the subject's knowledge. An incestuous fixation on mother or sister, which has never been surmounted, plays a prominent part in this pathogenic material and is its most universal content. In addition there is the influence to be considered of accidental distressing impressions connected with infantile sexual activity, and also those factors which in a general way reduce the libido that is to be directed on to the female sexual object.²

[1912d, 2338]
If now we follow a pathogenic complex from its representation in the conscious (whether this is an obvious one in the form of a symptom or something quite inconspicuous) to its root in the unconscious, we shall soon enter a region in which the resistance makes itself felt so clearly that the next association must take account of it and appear as a compromise between its demands and those of the work of investigation. It is at this point, on the evidence of our experience, that transference enters on the scene. When anything in the complexive material (in the subject-matter of the complex) is suitable for being transferred on to the figure of the doctor, that transference is carried out; it produces the next association, and announces itself by indications of a resistance - by a stoppage, for instance. We infer from this experience that the transference-idea has penetrated into consciousness in front of any other possible associations because it satisfies the resistance. An event of this sort is repeated on countless occasions in the course of an analysis. Over and over again, when we come near to a pathogenic complex, the portion of that complex which is capable of transference is first pushed forward into consciousness and defended with the greatest obstinacy.¹

(i) To what extent should the patient's intellectual co-operation be sought for in the treatment?
It is difficult to say anything of general applicability on this point: the patient's personality is the determining factor. But in any case caution and self-restraint must be observed in this connection. It is wrong to set a patient tasks, such as collecting his memories or thinking over some particular period of his life. On the contrary, he has to learn above all - what never comes easily to anyone - that mental activities such as thinking something over or concentrating the attention solve none of the riddles of a neurosis; that can only be done by patiently obeying the psycho-analytic rule, which enjoins the exclusion of all criticism of the unconscious or of its derivatives. One must be especially unyielding about obedience to that rule with patients who practise the art of sheering off into intellectual discussion during their treatment, who speculate a great deal and often very wisely about their condition and in that way avoid doing anything to overcome it. For this reason I dislike making use of analytic writings as an assistance to my patients; I require them to learn by personal experience, and I assure them that they will acquire wider and more valuable knowledge than the whole literature of psycho-analysis could teach them. I recognize, however, that under institutional conditions it may be of great advantage to employ reading as a preparation for patients in analysis and as a means of creating an atmosphere of influence.

The mind of the hysterical patient is full of active yet unconscious ideas; all her symptoms proceed from such ideas. It is in fact the most striking character of the hysterical mind to be ruled by them. If the hysterical woman vomits, she may do so from the idea of being pregnant. She has, however, no knowledge of this idea, although it can easily be detected in her mind, and made conscious to her, by one of the technical procedures of psycho-analysis. If she is executing the jerks and movements constituting her 'fit', she does not even consciously represent to herself the intended actions, and she may perceive those actions with the detached feelings of an onlooker. Nevertheless analysis will show that she was acting her part in the dramatic reproduction of some incident in her life, the memory of which was unconsciously active during the attack. The same preponderance of active unconscious ideas is revealed by analysis as the essential fact in the psychology of all other forms of neurosis.

¹[1912b, 2460]
²[1912e, 2474]
³[1912g, 2579]
Let us now return to the animistic system with which we are dealing. The insight we have gained into other psychological systems enables us to conclude that with primitive man, too, 'superstition' need not be the only or the real reason for some particular custom or observance and does not excuse us from the duty of searching for its hidden motives. Under the domination of an animistic system it is inevitable that every observance and every activity shall have a systematic basis, which nowadays we describe as 'superstitious'. 'Superstition' - like 'anxiety', 'dreams' and 'demons' - is one of those provisional psychological concepts which have crumbled under the impact of psycho-analytic research. Once we have penetrated behind these constructions, which are like screens erected as defences against correct understanding, we begin to realize that the mental life and cultural level of savages have not hitherto had all the recognition they deserve.

But can psycho-analysis do more here? Yes, it actually can. I hope to be able to show you that, even in a case so hard of access as this, it can discover something which makes a first understanding possible. And to begin with I would draw your attention to the inconspicuous detail that the patient herself positively provoked the anonymous letter, which now gave support to her delusion, by informing the scheming housemaid on the previous day that it would cause her the greatest unhappiness if her husband had a love affair with a young girl. In this way she first put the notion of sending the anonymous Letter into the housemaid's head. Thus the delusion acquires a certain independence of the letter; it had been present already in the patient as a fear - or was it as a wish? Let us now add to this the small further indications yielded by only two analytic sessions. The patient, indeed, behaved in a very unco-operative way when, after telling me her story, she was asked for her further thoughts, ideas and memories. She said that nothing occurred to her, that she had told me everything already, and after two sessions the experiment with me had in fact to be broken off because she announced that she already felt well and that she was sure the pathological idea would not come back. She only said this, of course, from resistance and from dread of the continuation of the analysis. Nevertheless, during these two sessions she let fall a few remarks which allowed of, and indeed necessitated, a particular interpretation; and this interpretation threw a clear light on the genesis of her delusion of jealousy. She herself was intensely in love with a young man, with the same son-in-law who had persuaded her to come to me as a patient. She herself knew nothing, or perhaps only a very little, of this love; in the family relationship that existed between them it was easy for this passionate liking to disguise itself as innocent affection. After all our experiences elsewhere, it is not hard for us to feel our way into the mental life of this upright wife and worthy mother, of the age of fifty-three. Being in love like this, a monstrous and impossible thing, could not become conscious; but it remained in existence and, even though it was unconscious, it exercised a severe pressure. Something had to become of it, some relief had to be looked for; and the easiest mitigation was offered, no doubt, by the mechanism of displacement which plays a part so regularly in the generating of delusional jealousy. If not only were she, the old woman, in love with a young man, but if also her old husband were having a love affair with a young girl, then her conscience would be relieved of the weight of her unfaithfulness. The phantasy of her husband's unfaithfulness thus acted as a cooling compress on her burning wound. Her own love had not become conscious to her, but its mirror-reflection, which brought her such an advantage, now became conscious as an obsession and delusion. No arguments against it could, of course, have any effect, for they were only directed against the mirror-image and not against the original which gave the other its strength and which lay hidden, inviolable, in the unconscious.

[1912-1913, 2739]
And we meet with what is in essence the same thing in our second patient. She had made a rule that the pillow must not touch the back of the bedstead, and she had to obey this rule though she did not know where it came from, what it meant or to what motives it owed its power. Whether she herself regarded the rule as a matter of indifference, or whether she struggled against it or raged against it or decided to transgress it - none of this made any difference to her carrying it out. It had to be obeyed, and she asked herself vainly why. We must recognize, however, that these symptoms of obsessional neurosis, these ideas and impulses which emerge one knows not whence, which prove so resistant to every influence from an otherwise normal mind, which give the patient himself the impression of being all-powerful guests from an alien world, immortal beings intruding into the turmoil of mortal life - these symptoms offer the plainest indication of there being a special region of the mind, shut off from the rest. They lead, by a path that cannot be missed, to a conviction of the existence of the unconscious in the mind; and that is precisely why clinical psychiatry, which is acquainted only with a psychology of consciousness, can deal with these symptoms in no other way than by declaring them to be signs of a special sort of degeneracy. Obsessional ideas and obsessional impulses are not, of course, themselves unconscious, any more than the performance of obsessional actions escapes conscious perception. They would not have become symptoms if they had not forced their way into consciousness. But their psychical predeterminants which we infer by means of analysis, the connections into which we insert them by interpretation, are unconscious, at least until we have made them conscious to the patient by the work of analysis.

[1916-1917, 3355]

If, now, you consider further that the state of affairs which we have established in our two cases is confirmed for every symptom of every neurotic illness - that always and everywhere the sense of the symptoms is unknown to the patient and that analysis regularly shows that these symptoms are derivatives of unconscious processes but can, subject to a variety of favourable circumstances, be made conscious - if you consider this, you will understand that in psycho-analysis we cannot do without what is at the same time unconscious and mental, and are accustomed to operate with it as though it were something palpable to the senses. But you will understand as well, perhaps, how incapable of forming a judgement on this question are all those other people, who are only acquainted with the unconscious as a concept, who have never carried out an analysis and have never interpreted dreams or found a sense and intention in neurotic symptoms. To say it for our ends once again: the possibility of giving a sense to neurotic symptoms by analytic interpretation is an unshakeable proof of the existence - or, if you prefer it, of the necessity for the hypothesis - of unconscious mental processes.

[1916-1917, 3356]

But that is not all. Thanks to a second discovery of Breuer's, which seems to me even more significant than the other and which he shared with no one, we learn still more of the connection between neurotic symptoms and the unconscious. Not only is the sense of the symptoms regularly unconscious, but there is an inseparable relation between this fact of the symptoms being unconscious and the possibility of their existing. You will understand me in a moment. I follow Breuer in asserting that every time we come upon a symptom we can infer that there are certain definite unconscious processes in the patient which contain the sense of the symptom. But it is also necessary for that sense to be unconscious in order that the symptom can come about. Symptoms are never constructed from conscious processes; as soon as the unconscious processes concerned have become conscious, the symptom must disappear. Here you will at once perceive a means of approach to therapy, a way of making symptoms disappear. And in this way Breuer did in fact restore his hysterical patient - that is, freed her from her symptoms; he found a technique for bringing to her consciousness the unconscious processes which contained the sense of the symptoms, and the symptoms disappeared.

[1916-1917, 3356]
Such restrictions upon the faculty of memory are, as I have said, characteristic of hysteria, in which, indeed, states also arise as symptoms - hysterical attacks - which need leave no trace behind them in the memory. If things are different in obsessional neurosis, you may conclude that what we are dealing with in these amnesias is a psychological characteristic of the change that occurs in hysteria and is not a universal feature of neuroses in general. The importance of this distinction is reduced by the following consideration. We have comprised two things as the 'sense' of a symptom: its 'whence' and its 'whither' or 'what for' - that is, the impressions and experiences from which it arose and the intentions which it serves. Thus the 'whence' of a symptom resolves itself into impressions which came from outside, which were necessarily once conscious and may have since become unconscious through forgetting. The 'whither' of a symptom, its purpose, is invariably, however, an endopsychic process, which may possibly have been conscious at first but may equally well never have been conscious and may have remained in the unconscious from the very start. Thus it is not of great importance whether the amnesia has laid hold on the 'whence' as well - the experiences on which the symptom is supported - as happens in hysteria; it is on the 'whither', the purpose of the symptom, which may have been unconscious from the beginning, that its dependence on the unconscious is founded - and no less firmly in obsessional neurosis than in hysteria.

[1916-1917, 3360]

'Nothing has entered into you from without; a part of the activity of your own mind has been withdrawn from your knowledge and from the command of your will. That, too, is why you are so weak in your defence; you are using one part of your force to fight the other part and you cannot concentrate the whole of your force as you would against an external enemy. And it is not even the worst or least important part of your mental forces that has thus become antagonistic to you and independent of you. The blame, I am bound to say, lies with yourself. You over-estimated your strength when you thought you could treat your sexual instincts as you liked and could utterly ignore their intentions. The result is that they have rebelled and have taken their own obscure paths to escape this suppression; they have established their rights in a manner you cannot approve. How they have achieved this, and the paths which they have taken, have not come to your knowledge. All you have learned is the outcome of their work - the symptom which you experience as suffering. Thus you do not recognize it as a derivative of your own rejected instincts and do not know that it is a substitutive satisfaction of them.

[1917a, 3613]
'The whole process, however, only becomes possible through the single circumstance that you are mistaken in another important point as well. You feel sure that you are informed of all that goes on in your mind if it is of any importance at all, because in that case, you believe, your consciousness gives you news of it. And if you have had no information of something in your mind you confidently assume that it does not exist there. Indeed, you go so far as to regard what is "mental" as identical with what is "conscious" - that is, with what is known to you in spite of the most obvious evidence that a great deal more must constantly be going on in your mind than can be known to your consciousness. Come, let yourself be taught something on this one point! What is in your mind does not coincide with what you are conscious of; whether something is going on in your mind and whether you hear of it, are two different things. In the ordinary way, I will admit, the intelligence which reaches your consciousness is enough for your needs; and you may cherish the illusion that you learn of all the more important things. But in some cases, as in that of an instinctual conflict such as I have described, your intelligence service breaks down and your will then extends no further than your knowledge. In every case, however, the news that reaches your consciousness is incomplete and often not to be relied on. Often enough, too, it happens that you get news of events only when they are over and when you can no longer do anything to change them. Even if you are not ill, who can tell all that is stirring in your mind of which you know nothing or are falsely informed? You behave like an absolute ruler who is content with the information supplied him by his highest officials and never goes among the people to hear their voice. Turn your eyes inward, look into your own depths, learn first to know yourself! Then you will understand why you were bound to fall ill; and perhaps, you will avoid falling ill in future.'

[1917a, 3614]

The work by which we bring the repressed mental material into the patient's consciousness has been called by us psycho-analysis. Why 'analysis' - which means breaking up or separating out, and suggests an analogy with the work carried out by chemists on substances which they find in nature and bring into their laboratories? Because in an important respect there really is an analogy between the two. The patient's symptoms and pathological manifestations, like all his mental activities, are of a highly composite kind; the elements of this compound are at bottom motives, instinctual impulses. But the patient knows nothing of these elementary motives or not nearly enough. We teach him to understand the way in which these highly complicated mental formations are compounded; we trace the symptoms back to the instinctual impulses which motivate them; we point out to the patient these instinctual motives, which are present in his symptoms and of which he has hitherto been unaware, - just as a chemist isolates the fundamental substance, the chemical 'element', out of the salt in which it had been combined with other elements and in which it was unrecognizable. In the same way, as regards those of the patient's mental manifestations that were not considered pathological, we show him that he was only to a certain extent conscious of their motivation - that other instinctual impulses of which he had remained in ignorance had co-operated in producing them.

[1919a, 3629]
But this episode, though it is now closed, was not without an important influence on the spread of psycho-analysis. Medical men who had hitherto held back from any approach to psycho-analytic theories were brought into closer contact with them when, in the course of their duties as army doctors, they were obliged to deal with war neuroses. The reader will be able to gather from Ferenczi's paper with what hesitations and under what disguises these closer contacts were made. Some of the factors which psycho-analysis had recognized and described long before as being at work in peace-time neuroses - the psychogenic origin of the symptoms, the importance of unconscious instinctual impulses, the part played in dealing with mental conflicts by the primary gain from being ill ("the flight into illness") - were observed to be present equally in the war neuroses and were accepted almost universally. Simmel's studies show, too, what successes could be achieved by treating war neurotics by the method of catharsis, which, as we know, was the first step towards the psycho-analytic technique.

What is known as the psycho-analytic school of psychiatry, which was brought into being by me, had taught for the last twenty-five years that the neuroses of peace could be traced back to disturbances of emotional life. This explanation was now applied quite generally to war neurotics. We had further asserted that neurotic patients suffered from mental conflicts and that the wishes and inclinations which were expressed in the symptoms were unknown to the patients themselves - were, that is to say, unconscious. It was therefore easy to infer that the immediate cause of all war neuroses was an unconscious inclination in the soldier to withdraw from the demands, dangerous or outrageous to his feelings, made upon him by active service. Fear of losing his own life, opposition to the command to kill other people, rebellion against the ruthless suppression of his own personality by his superiors - these were the most important affective sources on which the inclination to escape from war was nourished.

A soldier in whom these affective motives were very powerful and clearly conscious would, if he was a healthy man, have been obliged to desert or pretend to be ill. Only the smallest proportion of war neurotics, however, were malingerers; the emotional impulses which rebelled in them against active service and drove them into illness were operative in them without becoming conscious to them. They remained unconscious because other motives, such as ambition, self-esteem, patriotism, the habit of obedience and the example of others, were to start with more powerful until, on some appropriate occasion, they were overwhelmed by the other, unconsciously operating motives.
For a time psycho-analysis seemed fated to merge into psychology without being able to show why the psychology of the sick differed from that of the normal. In the course of its advance, however, it came up against the problem of dreams, which are abnormal products of the mind created by normal men under regularly recurrent physiological conditions. When psycho-analysis had solved the problem of dreams, it had discovered in unconscious psychical processes the common ground in which the highest and the lowest of mental impulses have their roots and from which spring the most normal as well as the most morbid and erratic of mental productions. The new picture of the workings of the mind began to grow ever clearer and more complete. It was a picture of obscure instinctual forces organic in origin, striving towards inborn aims, and, above them, of an agency comprising more highly organized mental structures - acquisitions of human evolution made under the impact of human history -, an agency which has taken over portions of the instinctual impulses, has developed them further or has even directed them towards higher aims, but which in any case binds them firmly and manipulates their energy to suit its own purposes. This higher organization, however, which is known to us as the ego, has rejected another portion of these same elementary instinctual impulses as being unserviceable because they cannot be fitted into the organic unity of the individual or because they rebel against the individual's cultural aims. The ego is not in a position to exterminate these unsubdued mental powers, but it turns its back on them, lets them remain at the lowest psychological level, defends itself from their demands by the energetic erection of protective and antithetical barriers or seeks to come to terms with them by means of substitutive satisfactions. These instincts which have fallen victim to repression - untamed and indestructible, yet inhibited from any kind of activity - together with their primitive mental representatives, constitute the mental underworld, the nucleus of the true unconscious, and are at every moment ready to assert their demands and, by hook or by crook, to force their way forward to satisfaction. To this is due the instability of the proud superstructure of the mind, the emergence at night of the proscribed and repressed material in the form of dreams, and the tendency to fall ill with neuroses and psychoses as soon as the balance of power between the ego and the repressed shifts to the disadvantage of the ego.

[1919g, 3703]
I cannot neglect this opportunity of expressing for once my astonishment that human beings can go through such great and important moments of their erotic life without noticing them much, sometimes even, indeed, without having the faintest suspicion of their existence, or else, having become aware of those moments, deceive themselves so thoroughly in their judgement of them. This happens not only under neurotic conditions, where we are familiar with the phenomenon, but seems also to be common enough in ordinary life. In the present case, for example, a girl develops a sentimental adoration for women, which her parents at first find merely vexatious and hardly take seriously; she herself knows quite well that she is very much occupied with these relationships, but still she experiences few of the sensations of intense love until a particular frustration is followed by a quite excessive reaction, which shows everyone concerned that they have to do with a consuming passion of elemental strength. Nor had the girl ever perceived anything of the state of affairs which was a necessary preliminary to the outbreak of this mental storm. In other cases, too, we come across girls or women in a state of severe depression, who on being asked for a possible cause of their condition tell us that they have, it is true, had a slight feeling for a certain person, but that it was nothing deep and that they soon got over it when they had to give it up. And yet it was this renunciation, apparently so easily borne, that became the cause of serious mental disturbance. Again, we come across men who have passed through casual love-affairs and realize only from the subsequent effects that they had been passionately in love with the person whom they had apparently regarded lightly. One is also amazed at the unexpected results that may follow an artificial abortion, the killing of an unborn child, which had been decided upon without remorse and without hesitation. It must be admitted that poets are right in liking to portray people who are in love without knowing it, or uncertain whether they do love, or who think that they hate when in reality they love. It would seem that the information received by our consciousness about our erotic life is especially liable to be incomplete, full of gaps, or falsified. Needless to say, in this discussion I have not omitted to allow for the part played by subsequent forgetting.

But the study of pathogenic repressions and of other phenomena which have still to be mentioned compelled psycho-analysis to take the concept of the 'unconscious' seriously. Psycho-analysis regarded everything mental as being in the first instance unconscious; the further quality of 'consciousness' might also be present, or again it might be absent. This of course provoked a denial from the philosophers, for whom 'conscious' and 'mental' were identical, and who protested that they could not conceive of such an absurdity as the 'unconscious mental'. There was no help for it, however, and this idiosyncrasy of the philosophers could only be disregarded with a shrug. Experience (gained from pathological material, of which the philosophers were ignorant) of the frequency and power of impulses of which one knew nothing directly, and whose existence had to be inferred like some fact in the external world, left no alternative open. It could be pointed out, incidentally, that this was only treating one's own mental life as one had always treated other people's. One did not hesitate to ascribe mental processes to other people, although one had no immediate consciousness of them and could only infer them from their words and actions. But what held good for other people must be applicable to oneself. Anyone who tried to push the argument further and to conclude from it that one's own hidden processes belonged actually to a second consciousness would be faced with the concept of a consciousness of which one knew nothing, of an 'unconscious consciousness' - and this would scarcely be preferable to the assumption of an 'unconscious mental'. If on the other hand one declared, like some other philosophers, that one was prepared to take pathological phenomena into account, but that the processes underlying them ought not to be described as mental but as 'psychoid', the difference of opinion would degenerate into an unfruitful dispute about words, though even so expediency would decide in favour of keeping the expression 'unconscious mental'. The further question as to the ultimate nature of this unconscious is no more sensible or profitable than the older one as to the nature of the conscious.
Oh, that is not so hard to understand. Think of the war neurotics, who do not have to serve, precisely because they are ill. In civil life illness can be used as a screen to gloss over incompetence in one's profession or in competition with other people; while in the family it can serve as a means for sacrificing the other members and extorting proofs of their love or for imposing one's will upon them. All of this lies fairly near the surface; we sum it up in the term 'gain from illness'. It is curious, however, that the patient - that is, his ego - nevertheless knows nothing of the whole concatenation of these motives and the actions which they involve. One combats the influence of these trends by compelling the ego to take cognizance of them. But there are other motives, that lie still deeper, for holding on to being ill, which are not so easily dealt with. But these cannot be understood without a fresh journey into psychological theory.

[1926e, 4364]

‘That really sounds most mysterious. The strangest thing about it is that apparently even this mighty force of the patient's conscience does not reach his consciousness.’

[1926e, 4365]

In the course of these investigations our attention was drawn to a highly significant relation between the generation of anxiety and the formation of symptoms - namely, that these two represent and replace each other. For instance, an agoraphobic patient may start his illness with an attack of anxiety in the street. This would be repeated every time he went into the street again. He will now develop the symptom of agoraphobia; this may also be described as an inhibition, a restriction of the ego's functioning, and by means of it he spares himself anxiety attacks. We can witness the converse of this if we interfere in the formation of symptoms, as is possible, for instance, with obsessions. If we prevent a patient from carrying out a washing ceremonial, he falls into a state of anxiety which he finds hard to tolerate and from which he had evidently been protected by his symptom. And it seems, indeed, that the generation of anxiety is the earlier and the formation of symptoms the later of the two, as though the symptoms are created in order to avoid the outbreak of the anxiety state. This is confirmed too by the fact that the first neuroses of childhood are phobias - states in which we see so clearly how an initial generation of anxiety is replaced by the later formation of a symptom; we get an impression that it is from these interrelations that we shall best obtain access to an understanding of neurotic anxiety. And at the same time we have also succeeded in answering the question of what it is that a person is afraid of in neurotic anxiety and so in establishing the connection between neurotic and realistic anxiety. What he is afraid of is evidently his own libido. The difference between this situation and that of realistic anxiety lies in two points: that the danger is an internal instead of an external one and that it is not consciously recognized.

[1933a, 4690]

The facts of this splitting of the ego, which we have just described, are neither so new nor so strange as they may at first appear. It is indeed a universal characteristic of neuroses that there are present in the subject's mental life, as regards some particular behaviour, two different attitudes, contrary to each other and independent of each other. In the case of neuroses, however, one of these attitudes belongs to the ego and the contrary one, which is repressed, belongs to the id. The difference between this case and the other is essentially a topographical or structural one, and it is not always easy to decide in an individual instance with which of the two possibilities one is dealing. They have, however, the following important characteristic in common. Whatever the ego does in its efforts of defence, whether it seeks to disavow a portion of the real external world or whether it seeks to reject an instinctual demand from the internal world, its success is never complete and unqualified. The outcome always lies in two contrary attitudes, of which the defeated, weaker one, no less than the other, leads to psychical complications. In conclusion, it is only necessary to point out how little of all these processes becomes known to us through our conscious perception.

[1940a [1938], 5009]
If a furious raging against one's own integrity and one's own life can be hidden in this way behind apparently accidental clumsiness and motor inefficiency, it is not a very large step to find it possible to transfer the same view to mistakes that seriously endanger the lives and health of other people. What evidence I have to show that this view is a valid one is drawn from my experience with neurotics, and thus does not wholly meet the demands of the situation. I will give an account of a case in which something that was not strictly a faulty action but that rather deserves the name of a symptomatic or chance action gave me the clue which subsequently made it possible to resolve the patient's conflict. I once undertook the task of bringing an improvement to the marriage of a very intelligent man, whose disagreements with his fondly attached young wife could undoubtedly be shown to have a real basis, but could not, as he himself admitted, be completely accounted for in that way. He was continually occupied with the thought of a divorce, which he then dismissed once more because of his warm love for his two small children. In spite of this he constantly returned to his intention and made no attempt to find a way of making the situation tolerable to himself. Such inability to deal with a conflict is taken by me as proof that unconscious and repressed motives have lent a hand in strengthening the conscious ones which are struggling against each other, and I undertake in such cases to end the conflict by psychical analysis. One day the man told me of a small incident which had frightened him extremely. He was romping with his elder child, who was by far his favourite; he was swinging him high in the air and down again, and once he swung him so high while he was standing at a particular spot that the top of the child's head almost struck the heavy gas chandelier that was hanging there. Almost, but not quite - or perhaps just! No harm came to the child, but it was made giddy with fright. The father stood horrified with the child in his arms, and the mother had a hysterical attack. The peculiar adroitness of this imprudent movement and the violence of the parents' reaction prompted me to look for a symptomatic act in this accident - one which aimed at expressing an evil intention directed against the beloved child. I was able to remove the contradiction between this and the father's contemporary affection for his child by shifting the impulse to injure it back to the time when this child had been the only one and had been so small that its father had not yet had any reason to take an affectionate interest in it. It was then easy for me to suppose that, as he was getting little satisfaction from his wife, he may at that time have had a thought or formed a decision of this kind: 'If this little creature that means nothing at all to me dies, I shall be free and able to get a divorce.' A wish for the death of the creature that he now loved so dearly must therefore have persisted unconsciously. From this point it was easy to find the path by which this wish had become unconsciously fixated. A powerful determinant was in fact provided by a memory from the patient's childhood: namely that the death of a small brother, for which his mother blamed his father's negligence, had led to violent quarrels between the parents and threats of a divorce. The subsequent course of my patient's marriage, as well as my therapeutic success, confirmed my conjecture.

[1901b, 1266]
Where the sexual instinct is fairly intense, but perverse, there are two possible outcomes. The first, which we shall not discuss further, is that the person affected remains a pervert and has to put up with the consequences of his deviation from the standard of civilization. The second is far more interesting. It is that, under the influence of education and social demands, a suppression of the perverse instincts is indeed achieved, but it is a kind of suppression which is really no suppression at all. It can better be described as a suppression that has failed. The inhibited sexual instincts are, it is true, no longer expressed as such - and this constitutes the success of the process - but they find expression in other ways, which are quite as injurious to the subject and make him quite as useless for society as satisfaction of the suppressed instincts in an unmodified form would have done. This constitutes the failure of the process, which in the long run more than counterbalances its success. The substitutive phenomena which emerge in consequence of the suppression of the instinct amount to what we call nervous illness, or, more precisely, the psychoneuroses.¹ Neurotics are the class of people who, since they possess a recalcitrant organization, only succeed, under the influence of cultural requirements, in achieving a suppression of their instincts which is apparent and which becomes increasingly unsuccessful. They therefore only carry on their collaboration with cultural activities by a great expenditure of force and at the cost of an internal impoverishment, or are obliged at times to interrupt it and fall ill. I have described the neuroses as the 'negative' of the perversions because in the neuroses the perverse impulses, after being repressed, manifest themselves from the unconscious part of the mind - because the neuroses contain the same tendencies, though in a state of 'repression', as do the positive perversions.

[1908d, 1954]

With this as a starting-point we go on to make our first important discovery. We learn that, when we try to understand neurotic disorders, by far the greater significance attaches to the sexual instincts; that in fact neuroses are the specific disorders, so to speak, of the sexual function; that in general whether or not a person develops a neurosis depends on the quantity of his libido, and on the possibility of satisfying it and of discharging it through satisfaction; that the form taken by the disease is determined by the way in which the individual passes through the course of development of his sexual function, or, as we put it, by the fixations his libido has undergone in the course of its development; and, further, that by a special, not very simple technique for influencing the mind we are able to throw light on the nature of some groups of neuroses and at the same time to do away with them. Our therapeutic efforts have their greatest success with a certain class of neuroses which proceed from a conflict between the ego-instincts and the sexual instincts. For in human beings it may happen that the demands of the sexual instincts, whose reach of course extends far beyond the individual, seem to the ego to constitute a danger which threatens its self-preservation or its self-esteem. The ego then assumes the defensive, denies the sexual instincts the satisfaction they desire and forces them into those by-paths of substitutive satisfaction which become manifest as nervous symptoms.

[1917a, 3609]
For a time psycho-analysis seemed fated to merge into psychology without being able to show why the psychology of the sick differed from that of the normal. In the course of its advance, however, it came up against the problem of dreams, which are abnormal products of the mind created by normal men under regularly recurrent physiological conditions. When psycho-analysis had solved the problem of dreams, it had discovered in unconscious psychical processes the common ground in which the highest and the lowest of mental impulses have their roots and from which spring the most normal as well as the most morbid and erratic of mental productions. The new picture of the workings of the mind began to grow ever clearer and more complete. It was a picture of obscure instinctual forces organic in origin, striving towards inborn aims, and, above them, of an agency comprising more highly organized mental structures - acquisitions of human evolution made under the impact of human history -, an agency which has taken over portions of the instinctual impulses, has developed them further or has even directed them towards higher aims, but which in any case binds them firmly and manipulates their energy to suit its own purposes. This higher organization, however, which is known to us as the ego, has rejected another portion of these same elementary instinctual impulses as being unserviceable because they cannot be fitted into the organic unity of the individual or because they rebel against the individual's cultural aims. The ego is not in a position to exterminate these unsubdued mental powers, but it turns its back on them, lets them remain at the lowest psychological level, defends itself from their demands by the energetic erection of protective and antithetical barriers or seeks to come to terms with them by means of substitutive satisfactions. These instincts which have fallen victim to repression - untamed and indestructible, yet inhibited from any kind of activity - together with their primitive mental representatives, constitute the mental underworld, the nucleus of the true unconscious, and are at every moment ready to assert their demands and, by hook or by crook, to force their way forward to satisfaction. To this is due the instability of the proud superstructure of the mind, the emergence at night of the proscribed and repressed material in the form of dreams, and the tendency to fall ill with neuroses and psychoses as soon as the balance of power between the ego and the repressed shifts to the disadvantage of the ego.

[1919g, 3703]

In this place I shall only follow up one of the consequences which seem possible from this point of view, thus resuming the discussion of a problem which I was obliged to leave unsolved elsewhere.¹ Each of the mental differentiations that we have become acquainted with represents a fresh aggravation of the difficulties of mental functioning, increases its instability, and may become the starting-point for its breakdown, that is, for the onset of a disease. Thus, by being born we have made the step from an absolutely self-sufficient narcissism to the perception of a changing external world and the beginnings of the discovery of objects. And with this is associated the fact that we cannot endure the new state of things for long, that we periodically revert from it, in our sleep, to our former condition of absence of stimulation and avoidance of objects. It is true, however, that in this we are following a hint from the external world, which, by means of the periodical change of day and night, temporarily withdraws the greater part of the stimuli that affect us. The second example of such a step, pathologically more important, is subject to no such qualification. In the course of development we have effected a separation of our mental existence into a coherent ego and into an unconscious and repressed portion which is left outside it; and we know that the stability of this new acquisition is exposed to constant shocks. In dreams and in neuroses what is thus excluded knocks for admission at the gates, guarded though they are by resistances; and in our waking health we make use of special artifices for allowing what is repressed to circumvent the resistances and for receiving it temporarily into our ego to the increase of our pleasure. Jokes and humour, and to some extent the comic in general, may be regarded in this light. Everyone acquainted with the psychology of the neuroses will think of similar examples of less importance; but I hasten on to the application I have in view.

[1921c, 3821]
Neurosis stands outside this series. It also is based upon a peculiarity in the development of the human libido - the twice repeated start made by the directly sexual function, with an intervening period of latency.¹ To this extent it resembles hypnosis and group formation in having the character of a regression, which is absent from being in love. It makes its appearance wherever the advance from directly sexual instincts to those that are inhibited in their aims has not been wholly successful; and it represents a conflict between those portions of the instincts which have been received into the ego after having passed through this development and those portions of them which, springing from the repressed unconscious, strive - as do other, completely repressed, instinctual impulses - to attain direct satisfaction. Neuroses are extraordinarily rich in content, for they embrace all possible relations between the ego and the object - both those in which the object is retained and others in which it is abandoned or erected inside the ego itself - and also the conflicting relations between the ego and its ego ideal.

[1921c, 3834]

In a far greater number of cases the neurosis is more autonomous and more independent of the interests of self-preservation and self-maintenance. In the conflict which creates the neurosis, what are at stake are either solely libidinal interests or libidinal interests in intimate connections with self-preservation ones. In all three instances the dynamics of the neurosis are the same. A dammed-up libido which cannot be satisfied in reality succeeds, with the help of a regression to old fixations, in finding discharge through the repressed unconscious. The sick man's ego, in so far as it can extract a 'gain from illness' out of this process, countenances the neurosis, although there can be no doubt of its injuriousness in its economic aspect.

[1923d, 4027]

There are certainly good grounds for being suspicious of such simple solutions of a problem. Moreover, the most that we may expect is that this formula will turn out to be correct in the roughest outline. But even that would be something. One recalls at once, too, a whole number of discoveries and findings which seem to support our thesis. All our analyses go to show that the transference neuroses originate from the ego's refusing to accept a powerful instinctual impulse in the id or to help it to find a motor outlet, or from the ego's forbidding that impulse the object at which it is aiming. In such a case the ego defends itself against the instinctual impulse by the mechanism of repression. The repressed material struggles against this fate. It creates for itself, along paths over which the ego has no power, a substitutive representation (which forces itself upon the ego by way of a compromise) - the symptom. The ego finds its unity threatened and impaired by this intruder, and it continues to struggle against the symptom, just as it fended off the original instinctual impulse. All this produces the picture of a neurosis. It is no contradiction to this that, in undertaking the repression, the ego is at bottom following the commands of its super-ego - commands which, in their turn, originate from influences in the external world that have found representation in the super-ego. The fact remains that the ego has taken sides with those powers, that in it their demands have more strength than the instinctual demands of the id, and that the ego is the power which sets the repression in motion against the portion of the id concerned and which fortifies the repression by means of the anticathexis of resistance. The ego has come into conflict with the id in the service of the super-ego and of reality; and this is the state of affairs in every transference neurosis.

[1924b, 4066]
I see no reason for denying the name of a 'repression' to the ego's turning away from the Oedipus complex, although later repressions come about for the most part with the participation of the super-ego, which in this case is only just being formed. But the process we have described is more than a repression. It is equivalent, if it is ideally carried out, to a destruction and an abolition of the complex. We may plausibly assume that we have here come upon the borderline - never a very sharply drawn one - between the normal and the pathological. If the ego has in fact not achieved much more than a repression of the complex, the latter persists in an unconscious state in the id and will later manifest its pathogenic effect.

[1924d, 4089]

The third, psychological, factor resides in a defect of our mental apparatus which has to do precisely with its differentiation into an id and an ego, and which is therefore also attributable ultimately to the influence of the external world. In view of the dangers of reality, the ego is obliged to guard against certain instinctual impulses in the id and to treat them as dangers. But it cannot protect itself from internal instinctual dangers as effectively as it can from some piece of reality that is not part of itself. Intimately bound up with the id as it is, it can only fend off an instinctual danger by restricting its own organization and by acquiescing in the formation of symptoms in exchange for having impaired the instinct. If the rejected instinct renews its attack, the ego is overtaken by all those difficulties which are known to us as neurotic ailments.

[1926d, 4309]

The derivatives of what is repressed have broken into his ego and established themselves there; and the ego has as little control over trends from that source as it has over what is actually repressed, and as a rule it knows nothing about them. These patients, indeed, are of a peculiar nature and raise difficulties with which we are not accustomed to reckon. All our social institutions are framed for people with a united and normal ego, which one can classify as good or bad, which either fulfils its function or is altogether eliminated by an overpowering influence. Hence the juridical alternative: responsible or irresponsible. None of these distinctions apply to neurotics. It must be admitted that there is difficulty in adapting social demands to their psychological condition. This was experienced on a large scale during the last war. Were the neurotics who evaded service malingerers or not? They were both. If they were treated as malingerers and if their illness was made highly uncomfortable, they recovered; if after being ostensibly restored they were sent back into service, they promptly took flight once more into illness. Nothing could be done with them. And the same is true of neurotics in civil life. They complain of their illness but exploit it with all their strength; and if someone tries to take it away from them they defend it like the proverbial lioness with her young. Yet there would be no sense in reproaching them for this contradiction.

[1926e, 4363]
Dream-distortion was the profoundest and most difficult problem of dream life. And light was thrown on it by the following consideration, which placed dreams in a class along with other psychopathological formations and revealed them, as it were, as the normal psychoses of human beings. For our mind, that precious instrument by whose means we maintain ourselves in life, is no peacefully self-contained unity. It is rather to be compared with a modern State in which a mob, eager for enjoyment and destruction, has to be held down forcibly by a prudent superior class. The whole flux of our mental life and everything that finds expression in our thoughts are derivations and representatives of the multifarious instincts that are innate in our physical constitution. But these instincts are not all equally susceptible to direction and education, or equally ready to fall in with the demands of the external world and of human society. A number of them have retained their primitive, ungovernable nature; if we let them have their way, they would infallibly bring us to ruin. Consequently, learning by experience, we have developed organizations in our mind which, in the form of inhibitions, set themselves up against the direct manifestations of the instincts. Every impulse in the nature of a wish that arises from the sources of instinctual energy must submit itself to examination by the highest agencies of our mind, and, if it is not approved, is rejected and restrained from exercising any influence upon our movements - that is, from coming into execution. Often enough, indeed, such wishes are even forbidden to enter consciousness, which is habitually unaware even of the existence of these dangerous instinctual sources. We describe such impulses as being repressed from the point of view of consciousness, and as surviving only in the unconscious. If what is repressed contrives somehow to force its way into consciousness or into movement or into both, we are no longer normal: at that point the whole range of neurotic and psychotic symptoms arise. The maintenance of the necessary inhibitions and repressions imposes upon our mind a great expenditure of energy, from which it is glad to be relieved. A good opportunity for this seems to be offered at night by the state of sleep, since sleep involves a cessation of our motor functions. The situation seems safe, and the severity of our internal police-force may therefore be relaxed. It is not entirely withdrawn, since one cannot be certain: it may be that the unconscious never sleeps at all. And now the reduction of pressure upon the repressed unconscious produces its effect. Wishes arise from it which during sleep might find the entrance to consciousness open. If we were to know them we should be appalled, alike by their subject-matter, their unrestraint and indeed the mere possibility of their existence. This, however, occurs only seldom, and when it does we awake as speedily as possible, in a state of fear. But as a rule our consciousness does not experience the dream as it really was. It is true that the inhibitory forces (the dream censorship, as we may call them) are not completely awake, but neither are they wholly asleep. They have had an influence on the dream while it was struggling to find an expression in words and pictures, they have got rid of what was most objectionable, they have altered other parts of it till they are unrecognizable, they have severed real connections while introducing false ones, until the honest but brutal wishful phantasy which lay behind the dream has turned into the manifest dream as we remember it - more or less confused and almost always strange and incomprehensible. Thus the dream (or the distortion which characterizes it) is the expression of a compromise, the evidence of a conflict between the mutually incompatible impulses and strivings of our mental life. And do not let us forget that the same process, the same interplay of forces, which explains the dreams of a normal sleeper, gives us the key to understanding all the phenomena of neurosis and psychosis.

[1932c, 4809]
When, burdened by these symptoms and incapacities, he at last, after his father's death, had found a wife, there emerged in him, as though they were the core of his being, character-traits which made contact with him a hard task for those about him. He developed a completely egoistic, despotic, and brutal personality, which clearly felt a need to suppress and insult other people. It was a faithful copy of his father as he had formed a picture of him in his memory: that is to say, a revival of the identification with his father which in the past he had taken on as a little boy from sexual motives. In this part of the story we recognize the return of the repressed, which (along with the immediate effects of the trauma and the phenomenon of latency) we have described as among the essential features of a neurosis. [1939a, 4904]
Norbert Hanold's memories of his childhood relations with the girl with the graceful gait were repressed; but this is not yet the correct view of the psychological situation. We remain on the surface so long as we are dealing only with memories and ideas. What is alone of value in mental life is rather the feelings. No mental forces are significant unless they possess the characteristic of arousing feelings. Ideas are only repressed because they are associated with the release of feelings which ought not to occur. It would be more correct to say that repression acts upon feelings, but we can only be aware of these in their association with ideas. So that it was Norbert Hanold's erotic feelings that were repressed; and since his erotism knew and had known no other object than Zoe Bertgang in his childhood, his memories of her were forgotten. The ancient relief aroused the slumbering erotism in him, and made his childhood memories active. On account of a resistance to erotism that was present in him, these memories could only become operative as unconscious ones. What now took place in him was a struggle between the power of erotism and that of the forces that were repressing it; the manifestation of this struggle was a delusion.

[1907a, 1848]

And here we must give what will perhaps be an unexpected answer. In fact the situation is quite the reverse: it is science that cannot hold its own before the achievement of the author. Science allows a gulf to yawn between the hereditary and constitutional preconditions of a delusion and its creations, which seem to emerge ready-made - a gulf which we find that our author has filled. Science does not as yet suspect the importance of repression, it does not recognize that in order to explain the world of psychopathological phenomena the unconscious is absolutely essential, it does not look for the basis of delusions in a psychical conflict, and it does not regard their symptoms as compromises. Does our author stand alone, then, in the face of united science? No, that is not the case (if, that is, I may count my own works as part of science), since for a number of years - and, until recently, more or less alone¹ - I myself have supported all the views that I have here extracted from Jensen's Gradiva and stated in technical terms. I indicated, in most detail in connection with the states known as hysteria and obsessions, that the individual determinant of these psychical disorders is the suppression of a part of instinctual life and the repression of the ideas by which the suppressed instinct is represented, and soon afterwards I repeated the same views in relation to some forms of delusion.² The question whether the instincts concerned in this causation are always components of the sexual instinct or may be of another kind as well is a problem which may be regarded as a matter of indifference in the particular case of the analysis of Gradiva; for in the instance chosen by our author what was at issue was quite certainly nothing other than the suppression of erotic feelings. The validity of the hypotheses of psychical conflict and of the formation of symptoms by means of compromises between the two mental currents struggling against each other has been demonstrated by me in the case of patients observed and medically treated in real life, just as I have been able to in the imaginary case of Norbert Hanold.³ Even before me, Pierre Janet, a pupil of the great Charcot, and Josef Breuer, in collaboration with me, had traced back the products of neurotic, and especially of hysterical, illness to the power of unconscious thoughts.⁴

[1907a, 1851]
But the similarity between Gradiva’s procedure and the analytic method of psychotherapy is not limited to these two points - the making conscious of what has been repressed and the coinciding of explanation with cure. It also extends to what turns out to be the essence of the whole change - to the awakening of feelings. Every disorder analogous to Hanold’s delusion, what in scientific terms we are in the habit of calling ‘psychoneuroses’, has as its precondition the repression of a portion of instinctual life, or, as we can safely say, of the sexual instinct. At every attempt to introduce the unconscious and repressed causes of the illness into consciousness, the instinctual component concerned is necessarily aroused to a renewed struggle with the repressing powers, only to come to terms with them in the final outcome, often to the accompaniment of violent manifestations of reaction. The process of cure is accomplished in a relapse into love, if we combine all the many components of the sexual instinct under the term ‘love’; and such a relapse is indispensable, for the symptoms on account of which the treatment has been undertaken are nothing other than precipitates of earlier struggles connected with repression or the return of the repressed, and they can only be resolved and washed away by a fresh high tide of the same passions. Every psycho-analytic treatment is an attempt at liberating repressed love which has found a meagre outlet in the compromise of a symptom. Indeed, the agreement between such treatments and the process of cure described by the author of *Gradiva* reaches its climax in the further fact that in analytic psychotherapy too the re-awakened passion, whether it is love or hate, invariably chooses as its object the figure of the doctor. [1907a, 1881]

Psycho-analytic research into the neuroses (the various forms of nervous illness with a mental causation) has endeavoured to trace their connection with instinctual life and the restrictions imposed on it by the claims of civilization, with the activities of the normal individual in phantasies and dreams, and with the creations of the popular mind in religion, myths and fairy tales. The psycho-analytic treatment of neurotic patients, based on this method of research, makes far higher demands on doctor and patient than the methods hitherto in common use, which operate through medicaments, diet, hydropathy and suggestion. But it brings the patients so much more relief and permanent strengthening in the face of life’s problems, that there is no cause for surprise at the continual advances made by this therapeutic method in spite of violent opposition. [1910b, 1995]
If, then, as we have learnt, psychogenic disturbances of vision depend on certain ideas connected with seeing being cut off from consciousness, we must, on the psycho-analytic view, assume that these ideas have come into opposition to other, more powerful ones, for which we use the collective concept of the 'ego'- a compound which is made up variously at different times - and have for that reason come under repression. But what can be the origin of this opposition, which makes for repression, between the ego and various groups of ideas? You will no doubt notice that it was not possible to frame such a question before the advent of psycho-analysis, for nothing was known earlier of psychical conflict and repression. Our researches, however, have put us in a position to give us the desired answer. Our attention has been drawn to the importance of the instincts in ideational life. We have discovered that every instinct tries to make itself effective by activating ideas that are in keeping with its aims. These instincts are not always compatible with one another; their interests often come into conflict. Opposition between ideas is only an expression of struggles between the various instincts. From the point of view of our attempted explanation, a quite specially important part is played by the undeniable opposition between the instincts which subserve sexuality, the attainment of sexual pleasure, and those other instincts, which have as their aim the self-preservation of the individual - the ego-instincts. As the poet has said, all the organic instincts that operate in our mind may be classified as 'hunger' or 'love'. We have traced the 'sexual instinct' from its first manifestations in children to its final form, which is described as 'normal'. We have found that it is put together from numerous 'component instincts' which are attached to excitations of regions of the body; and we have come to see that these separate instincts have to pass through a complicated development before they can be brought effectively to serve the aims of reproduction. The light thrown by psychology on the evolution of our civilization has shown us that it originates mainly at the cost of the sexual component instincts, and that these must be suppressed, restricted, transformed and directed to higher aims, in order that the mental constructions of civilization may be established. We have been able to recognize as a valuable outcome of these researches something that our colleagues have not yet been willing to believe, namely that the human ailments known as 'neuroses' are derived from the many different ways in which these processes of transformation in the sexual component instincts may miscarry. The 'ego' feels threatened by the claims of the sexual instincts and fends them off by repressions; these, however, do not always have the desired result, but lead to the formation of dangerous substitutes for the repressed and to burdensome reactions on the part of the ego. From these two classes of phenomena taken together there emerge what we call the symptoms of neuroses.

[1910i, 2368]

In spite of all our efforts to prevent biological terminology and considerations from dominating psycho-analytic work, we cannot avoid using them even in our descriptions of the phenomena that we study. We cannot help regarding the term 'instinct' as a concept on the frontier between the spheres of psychology and biology. We speak, too, of 'masculine' and 'feminine' mental attributes and impulses, although, strictly speaking, the differences between the sexes can lay claim to no special psychical characterization. What we speak of in ordinary life as 'masculine' or 'feminine' reduces itself from the point of view of psychology to the qualities of 'activity' and 'passivity' - that is, to qualities determined not by the instincts themselves but by their aims. The regular association of these 'active' and 'passive' instincts in mental life reflects the bisexuality of individuals, which is among the clinical postulates of psycho-analysis.

[1913], 2818]
I am quite prepared to be told again that I have misunderstood the substance and purpose of the Neo-Zurich theory; but I must protest in advance against any contradictions to my view of it that may be found in the publications of that school being laid at my door instead of theirs. I can find no other way of making the whole range of Jung's innovations intelligible to myself and of grasping all their implications. All the changes that Jung has proposed to make in psycho-analysis flow from his intention to eliminate what is objectionable in the family-complexes, so as not to find it again in religion and ethics. For sexual libido an abstract concept has been substituted, of which one may safely say that it remains mystifying and incomprehensible to wise men and fools alike. The Oedipus complex has a merely 'symbolic' meaning: the mother in it means the unattainable, which must be renounced in the interests of civilization; the father who is killed in the Oedipus myth is the 'inner' father, from whom one must set oneself free in order to become independent. Other parts of the material of sexual ideas will no doubt be subjected to similar re-interpretations in the course of time. In the place of a conflict between ego-dystonic erotic trends and the self-preserved ones a conflict appears between the 'life-task' and 'psychical inertia'; the neurotic's sense of guilt corresponds to his self-reproach for not properly fulfilling his 'life-task'. In this way a new religio-ethical system has been created, which, just like the Adlerian system, was bound to re-interpret, distort or jettison the factual findings of analysis. The truth is that these people have picked out a few cultural overtones from the symphony of life and have once more failed to hear the mighty and primordial melody of the instincts.

[1914d, 2925]

I will digress for a moment to ask if you know what is meant by a causal therapy. That is how we describe procedure which does not take the symptoms of an illness as its point of attack but sets about removing its causes. Well, then, is our psycho-analytic method a causal therapy or not? The reply is not a simple one, but it may perhaps give us an opportunity of realizing the worthlessness of a question framed in this way. In so far as analytic therapy does not make it its first task to remove the symptoms, it is behaving like a causal therapy. In another respect, you may say, it is not. For we long ago traced the causal chain back through the repressions to the instinctual dispositions, their relative intensities in the constitution and the deviations in the course of their development. Supposing, now, that it was possible, by some chemical means, perhaps, to interfere in this mechanism, to increase or diminish the quantity of libido present at a given time or to strengthen one instinct at the cost of another - this then would be a causal therapy in the true sense of the word, for which our analysis would have carried out the indispensable preliminary work of reconnaissance. At present, as you know, there is no question of any such method of influencing libidinal processes; with our psychical therapy we attack at a different point in the combination - not exactly at what we know are the roots of the phenomena, but nevertheless far enough away from the symptoms, at a point which has been made accessible to us by some very remarkable circumstances.

[1916-1917, 3478]

My present readers, I take it, have not so far had anything to do with the subject and I shall be obliged, therefore, to go back some distance. Out of a great number of individual observations and impressions something in the nature of a theory has at last shaped itself in psycho-analysis, and this is known by the name of the 'libido theory'. As is well known, psycho-analysis is concerned with the elucidation and removal of what are called nervous disorders. A starting-point had to be found from which to approach this problem, and it was decided to look for it in the instinctual life of the mind. Hypotheses about the instincts in man came to form the basis, therefore, of our conception of nervous disease.

[1917a, 3608]
The work by which we bring the repressed mental material into the patient's consciousness has been called by us psycho-analysis. Why 'analysis' - which means breaking up or separating out, and suggests an analogy with the work carried out by chemists on substances which they find in nature and bring into their laboratories? Because in an important respect there really is an analogy between the two. The patient's symptoms and pathological manifestations, like all his mental activities, are of a highly composite kind; the elements of this compound are at bottom motives, instinctual impulses. But the patient knows nothing of these elementary motives or not nearly enough. We teach him to understand the way in which these highly complicated mental formations are compounded; we trace the symptoms back to the instinctual impulses which motivate them; we point out to the patient these instinctual motives, which are present in his symptoms and of which he has hitherto been unaware, just as a chemist isolates the fundamental substance, the chemical 'element', out of the salt in which it had been combined with other elements and in which it was unrecognizable. In the same way, as regards those of the patient's mental manifestations that were not considered pathological, we show him that he was only to a certain extent conscious of their motivation - that other instinctual impulses of which he had remained in ignorance had co-operated in producing them.

[1919a, 3629]

But this episode, though it is now closed, was not without an important influence on the spread of psycho-analysis. Medical men who had hitherto held back from any approach to psycho-analytic theories were brought into closer contact with them when, in the course of their duties as army doctors, they were obliged to deal with war neuroses. The reader will be able to gather from Ferenczi's paper with what hesitations and under what disguises these closer contacts were made. Some of the factors which psycho-analysis had recognized and described long before as being at work in peace-time neuroses - the psychogenic origin of the symptoms, the importance of unconscious instinctual impulses, the part played in dealing with mental conflicts by the primary gain from being ill ('the flight into illness') - were observed to be present equally in the war neuroses and were accepted almost universally. Simmel's studies show, too, what successes could be achieved by treating war neurotics by the method of catharsis, which, as we know, was the first step towards the psycho-analytic technique.

[1919d, 3665]
For a time psycho-analysis seemed fated to merge into psychology without being able to show why the psychology of the sick differed from that of the normal. In the course of its advance, however, it came up against the problem of dreams, which are abnormal products of the mind created by normal men under regularly recurrent physiological conditions. When psycho-analysis had solved the problem of dreams, it had discovered in unconscious psychical processes the common ground in which the highest and the lowest of mental impulses have their roots and from which spring the most normal as well as the most morbid and erratic of mental productions. The new picture of the workings of the mind began to grow ever clearer and more complete. It was a picture of obscure instinctual forces organic in origin, striving towards inborn aims, and, above them, of an agency comprising more highly organized mental structures - acquisitions of human evolution made under the impact of human history -, an agency which has taken over portions of the instinctual impulses, has developed them further or has even directed them towards higher aims, but which in any case binds them firmly and manipulates their energy to suit its own purposes. This higher organization, however, which is known to us as the ego, has rejected another portion of these same elementary instinctual impulses as being unserviceable because they cannot be fitted into the organic unity of the individual or because they rebel against the individual's cultural aims. The ego is not in a position to exterminate these unsubdued mental powers, but it turns its back on them, lets them remain at the lowest psychological level, defends itself from their demands by the energetic erection of protective and antithetical barriers or seeks to come to terms with them by means of substitutive satisfactions. These instincts which have fallen victim to repression - untamed and indestructible, yet inhibited from any kind of activity - together with their primitive mental representatives, constitute the mental underworld, the nucleus of the true unconscious, and are at every moment ready to assert their demands and, by hook or by crook, to force their way forward to satisfaction. To this is due the instability of the proud superstructure of the mind, the emergence at night of the proscribed and repressed material in the form of dreams, and the tendency to fall ill with neuroses and psychoses as soon as the balance of power between the ego and the repressed shifts to the disadvantage of the ego.

[1919g, 3703]

The third, psychological, factor resides in a defect of our mental apparatus which has to do precisely with its differentiation into an id and an ego, and which is therefore also attributable ultimately to the influence of the external world. In view of the dangers of reality, the ego is obliged to guard against certain instinctual impulses in the id and to treat them as dangers. But it cannot protect itself from internal instinctual dangers as effectively as it can from some piece of reality that is not part of itself. Intimately bound up with the id as it is, it can only fend off an instinctual danger by restricting its own organization and by acquiescing in the formation of symptoms in exchange for having impaired the instinct. If the rejected instinct renews its attack, the ego is overtaken by all those difficulties which are known to us as neurotic ailments.

[1926d, 4309]
(3) A young married woman who, in five years of marriage, had had only one child, complained to me of an obsessional impulse to throw herself out of the window or from the balcony, and also of a fear which seized her when she saw a sharp knife, of stabbing her child with it. She admitted that marital intercourse seldom occurred, and only subject to precautions against conception, but she did not miss it, she said, as hers was not a sensual nature. At this point I ventured to tell her that at the sight of a man she had erotic ideas and that she had therefore lost confidence in herself and regarded herself as a depraved person, capable of anything. The translation back of the obsessional idea into sexual terms was successful. In tears, she at once confessed the long-concealed poverty of her marriage; and later she told me also of distressing ideas of an unmodified sexual character such as the often-recurring sensation of something forcing itself under her skirt.

[1894a, 312]

To this I must reply in the first place that, considering the admittedly enormous frequency of the neuroses and especially of anxiety neurosis, it would certainly not be right to expect to find an aetiological factor for them that is of rare occurrence; in the second place, that a postulate of pathology is in fact satisfied, if in an aetiological investigation it can be shown that the presence of an aetiological factor is more frequent than its effects, since, in order for these latter to occur, other conditions may have to exist in addition (such as disposition, summation of specific aetiological elements, or reinforcement by other stock noxae); and further, that a detailed dissection of suitable cases of anxiety neurosis proves beyond question the importance of the sexual factor. I will confine myself here, however, to the single aetiological factor of coitus interruptus and to bringing out certain observations which confirm it.

[1895b, 340]

Further information now became available relating to people who had remained normal; and this led to the unexpected finding that the sexual history of their childhood did not necessarily differ in essentials from that of neurotics, and, in particular, that the part played by seduction was the same in both cases. As a consequence, accidental influences receded still further into the background as compared with 'repression' (as I now began to say instead of 'defence'). Thus it was no longer a question of what sexual experiences a particular individual had had in his childhood, but rather of his reaction to those experiences - of whether he had reacted to them by 'repression' or not. It could be shown how in the course of development a spontaneous infantile sexual activity was often broken off by an act of repression. Thus a mature neurotic individual was invariably pursued by a certain amount of 'sexual repression' from his childhood; this found expression when he was faced by the demands of real life, and the psycho-analyses of hysterics showed that they fell ill as a result of the conflict between their libido and their sexual repression and that their symptoms were in the nature of compromises between the two mental currents.

[1906a, 1580]
But the similarity between Gradiva's procedure and the analytic method of psychotherapy is not limited to these two points - the making conscious of what has been repressed and the coinciding of explanation with cure. It also extends to what turns out to be the essence of the whole change - to the awakening of feelings. Every disorder analogous to Hanold's delusion, what in scientific terms we are in the habit of calling 'psychoneuroses', has as its precondition the repression of a portion of instinctual life, or, as we can safely say, of the sexual instinct. At every attempt to introduce the unconscious and repressed causes of the illness into consciousness, the instinctual component concerned is necessarily aroused to a renewed struggle with the repressing powers, only to come to terms with them in the final outcome, often to the accompaniment of violent manifestations of reaction. The process of cure is accomplished in a relapse into love, if we combine all the many components of the sexual instinct under the term 'love'; and such a relapse is indispensable, for the symptoms on account of which the treatment has been undertaken are nothing other than precipitates of earlier struggles connected with repression or the return of the repressed, and they can only be resolved and washed away by a fresh high tide of the same passions. Every psycho-analytic treatment is an attempt at liberating repressed love which has found a meagre outlet in the compromise of a symptom. Indeed, the agreement between such treatments and the process of cure described by the author of Gradiva reaches its climax in the further fact that in analytic psychotherapy too the re-awakened passion, whether it is love or hate, invariably chooses as its object the figure of the doctor.

[1907a, 1881]

We find, accordingly: an erotic instinct and a revolt against it; a wish which has not yet become compulsive and, struggling against it, a fear which is already compulsive; a distressing affect and an impulsion towards the performance of defensive acts. The inventory of the neurosis has reached its full muster. Indeed, something more is present, namely, a kind of delusion or delirium with the strange content that his parents knew his thoughts because he spoke them out loud without his hearing himself do it. We shall not go far astray if we suppose that in making this attempt at an explanation the child had some inkling of those remarkable mental processes which we describe as unconscious and which we cannot dispense with if we are to throw any scientific light upon this obscure subject. 'I speak my thoughts out loud, without hearing them' sounds like a projection into the external world of our own hypothesis that he had thoughts without knowing anything about them; it sounds like an endopsychic perception of what has been repressed.

[1909d, 2134]

To find a chronic obsessional neurosis beginning like this in early childhood, with lascivious wishes of this sort connected with uncanny apprehensions and an inclination to the performance of defensive acts, is no new thing to me. I have come across it in a number of other cases. It is absolutely typical, although probably not the only possible type. Before proceeding to the events of the second session, I should like to add one more word on the subject of the patient's early sexual experiences. It will hardly be disputed that they may be described as having been considerable both in themselves and in their consequences. But it has been the same with the other cases of obsessional neurosis that I have had the opportunity of analysing. Such cases, unlike those of hysteria, invariably possess the characteristic of premature sexual activity. Obsessional neuroses make it much more obvious than hysterias that the factors which go to form a psychoneurosis are to be found in the patient's infantile sexual life and not in his present one. The current sexual life of an obsessional neurotic may often appear perfectly normal to a superficial observer; indeed, it frequently offers to the eye far fewer pathogenic elements and abnormalities than in the instance we are now considering.

[1909d, 2135]
He admitted that all of this sounded quite plausible, but he was naturally not in the very least convinced by it. He would venture to ask, he said, how it was that an idea of this kind could have remissions, how it could appear for a moment when he was twelve years old, and again when he was twenty, and then once more two years later, this time for good. He could not believe that his hostility had been extinguished in the intervals, and yet during them there had been no sign of self-reproaches. - To this I replied that whenever any one asked a question like that, he was already prepared with an answer; he needed only to be encouraged to go on talking. - He then proceeded, somewhat disconnectedly as it seemed, to say that he had been his father's best friend, and that his father had been his. Except on a few subjects, upon which fathers and sons usually hold aloof from one another - (What could he mean by that?) -, there had been a greater intimacy between them than there now was between him and his best friend. As regards the lady for whose sake he had sacrificed his father in that idea of his, it was true that he had loved her very much, but he had never felt really sensual wishes towards her, such as he had constantly had in his childhood. Altogether, in his childhood his sensual impulses had been much stronger than during his puberty. - At this I told him I thought he had now produced the answer we were waiting for, and had at the same time discovered the third great characteristic of the unconscious. The source from which his hostility to his father derived its indestructibility was evidently something in the nature of sensual desires, and in that connection he must have felt his father as in some way or other an interference. A conflict of this kind, I added, between sensuality and childish love was entirely typical. The remissions he had spoken of had occurred because the premature explosion of his sensual feelings had had as its immediate consequence a considerable diminution of their violence. It was not until he was once more seized with intense erotic desires that his hostility reappeared again owing to the revival of the old situation. I then got him to agree that I had not led him on to the subject either of childhood or of sex, but that he had raised them both of his own free will. - He then went on to ask why he had not simply come to a decision, at the time he was in love with the lady, that his father's interference with that love could not for a moment weigh against his love of his father. - I replied that it was scarcely possible to destroy a person in absentia. Such a decision would only have been possible if the wish that he took objection to had made its first appearance on that occasion; whereas, as a matter of fact, it was a long-repressed wish, towards which he could not behave otherwise than he had formerly done, and which was consequently immune from destruction. This wish (to get rid of his father as being an interference) must have originated at a time when circumstances had been very different - at a time, perhaps, when he had not loved his father more than the person whom he desired sensually, or when he was incapable of making a clear decision. It must have been in his very early childhood, therefore, before he had reached the age of six, and before the date at which his memory became continuous; and things must have remained in the same state ever since. - With this piece of construction our discussion was broken off for the time being.

[1909d, 2145]
To this unimpeachable body of evidence we shall be able to add fresh material, if we turn to
the history of the masturbatory side of our patient's sexual activities. There is a conflict between
the opinions of doctors and patients on this subject which has not hitherto been properly
appreciated. The patients are unanimous in their belief that masturbation, by which they mean
masturbation *during puberty*, is the root and origin of all their troubles. The doctors are, upon
the whole, unable to decide what line to take; but, influenced by the knowledge that not only
neurotics but most normal people pass through a period of masturbation during their puberty,
the majority of them are inclined to dismiss the patients' assertions as gross exaggerations. In
my opinion the patients are once again nearer to a correct view than the doctors; for the
patients have some glimmering notion of the truth, while the doctors are in danger of
overlooking an essential point. The thesis propounded by the patients certainly does not
correspond to the facts in the sense in which they themselves construe it, namely, that
masturbation during puberty (which may almost be described as a typical occurrence) is
responsible for all neurotic disturbances. Their thesis requires interpretation. The masturbation
of puberty is in fact no more than a revival of the masturbation of infancy, a subject which has
hitherto invariably been neglected. Infantile masturbation reaches a kind of climax, as a rule,
between the ages of three and four or five; and it is the clearest expression of a child's sexual
constitution, in which the aetiology of subsequent neuroses must be sought. In this disguised
way, therefore, the patients are putting the blame for their illnesses upon their infantile sexuality;
and they are perfectly right in doing so. On the other hand, the problem of masturbation
becomes insoluble if we attempt to treat it as a clinical unit, and forget that it can represent the
discharge of every variety of sexual component and of every sort of phantasy to which such
components can give rise. The injurious effects of masturbation are only in a very small degree
autonomous - that is to say, determined by its own nature. They are in substance merely part
and parcel of the pathogenic significance of the subject's sexual life as a whole. The fact that so
many people can tolerate masturbation - that is, a certain amount of it - without injury merely
shows that their sexual constitution and the course of development of their sexual life have
been such as to allow them to exercise the sexual function within the limits of what is culturally
permissible; whereas other people, because their sexual constitution has been less favourable
or their development has been disturbed, fall ill as a result of their sexuality - they cannot, that
is, achieve the necessary suppression or sublimation of their sexual components without having
recourse to inhibitions or substitutes.¹

[1909d, 2159]
Two factors will decide whether this advance in the developmental path of the libido is to fail. First, there is the amount of frustration in reality, which opposes the new object-choice and reduces its value for the person concerned. There is after all no point in embarking upon an object-choice if no choice is to be allowed at all or if there is no prospect of being able to choose anything suitable. Secondly, there is the amount of attraction which the infantile objects that have to be relinquished are able to exercise, and which is in proportion to the erotic cathexis attaching to them in childhood. If these two factors are sufficiently strong, the general mechanism by which the neuroses are formed comes into operation. The libido turns away from reality, is taken over by imaginative activity (the process of introversion), strengthens the images of the first sexual objects and becomes fixated to them. The obstacle raised against incest, however, compels the libido that has turned to these objects to remain in the unconscious. The masturbatory activity carried out by the sensual current, which is now part of the unconscious, makes its own contribution in strengthening this fixation. Nothing is altered in this state of affairs if the advance which has miscarried in reality is now completed in phantasy, and if in the phantasy-situations that lead to masturbatory satisfaction the original sexual objects are replaced by different ones. As a result of this substitution the phantasies become admissible to consciousness, but no progress is made in the allocation of the libido in reality. In this way it can happen that the whole of a young man's sensuality becomes tied to incestuous objects in the unconscious, or to put it another way, becomes fixated to unconscious incestuous phantasies. The result is then total impotence, which is perhaps further ensured by the simultaneous onset of an actual weakening of the organs that perform the sexual act.

It is true that psycho-analysis puts forward absence of sexual satisfaction as the cause of nervous disorders. But does it not say more than this? Is its teaching to be ignored as too complicated when it declares that nervous symptoms arise from a conflict between two forces - on the one hand, the libido (which has as a rule become excessive), and on the other, a rejection of sexuality, or a repression which is over-severe? No one who remembers this second factor, which is by no means secondary in importance, can ever believe that sexual satisfaction in itself constitutes a remedy of general reliability for the sufferings of neurotics. A good number of these people are, indeed, either in their actual circumstances or in general incapable of satisfaction. If they were capable of it, if they were without their inner resistances, the strength of the instinct itself would point the way to satisfaction for them even though no doctor advised it. What is the good, therefore, of medical advice such as that supposed to have been given to this lady?

You cannot have any notion, either, of what an intimate connection there is between this first piece of audacity on the part of psycho-analysis and the second one, which I must now tell you of. This second thesis, which psycho-analysis puts forward as one of its findings, is an assertion that instinctual impulses which can only be described as sexual, both in the narrower and wider sense of the word, play an extremely large and never hitherto appreciated part in the causation of nervous and mental diseases. It asserts further that these same sexual impulses also make contributions that must not be underestimated to the highest cultural, artistic and social creations of the human spirit.
My present readers, I take it, have not so far had anything to do with the subject and I shall be obliged, therefore, to go back some distance. Out of a great number of individual observations and impressions something in the nature of a theory has at last shaped itself in psycho-analysis, and this is known by the name of the 'libido theory'. As is well known, psycho-analysis is concerned with the elucidation and removal of what are called nervous disorders. A starting-point had to be found from which to approach this problem, and it was decided to look for it in the instinctual life of the mind. Hypotheses about the instincts in man came to form the basis, therefore, of our conception of nervous disease.

With this as a starting-point we go on to make our first important discovery. We learn that, when we try to understand neurotic disorders, by far the greater significance attaches to the sexual instincts; that in fact neuroses are the specific disorders, so to speak, of the sexual function; that in general whether or not a person develops a neurosis depends on the quantity of his libido, and on the possibility of satisfying it and of discharging it through satisfaction; that the form taken by the disease is determined by the way in which the individual passes through the course of development of his sexual function, or, as we put it, by the fixations his libido has undergone in the course of its development; and, further, that by a special, not very simple technique for influencing the mind we are able to throw light on the nature of some groups of neuroses and at the same time to do away with them. Our therapeutic efforts have their greatest success with a certain class of neuroses which proceed from a conflict between the ego-instincts and the sexual instincts. For in human beings it may happen that the demands of the sexual instincts, whose reach of course extends far beyond the individual, seem to the ego to constitute a danger which threatens its self-preservation or its self-esteem. The ego then assumes the defensive, denies the sexual instincts the satisfaction they desire and forces them into those by-paths of substitutive satisfaction which become manifest as nervous symptoms.

'Nothing has entered into you from without; a part of the activity of your own mind has been withdrawn from your knowledge and from the command of your will. That, too, is why you are so weak in your defence; you are using one part of your force to fight the other part and you cannot concentrate the whole of your force as you would against an external enemy. And it is not even the worst or least important part of your mental forces that has thus become antagonistic to you and independent of you. The blame, I am bound to say, lies with yourself. You over-estimated your strength when you thought you could treat your sexual instincts as you liked and could utterly ignore their intentions. The result is that they have rebelled and have taken their own obscure paths to escape this suppression; they have established their rights in a manner you cannot approve. How they have achieved this, and the paths which they have taken, have not come to your knowledge. All you have learned is the outcome of their work - the symptom which you experience as suffering. Thus you do not recognize it as a derivative of your own rejected instincts and do not know that it is a substitutive satisfaction of them.

In a far greater number of cases the neurosis is more autonomous and more independent of the interests of self-preservation and self-maintenance. In the conflict which creates the neurosis, what are at stake are either solely libidinal interests or libidinal interests in intimate connections with self-preservative ones. In all three instances the dynamics of the neurosis are the same. A dammed-up libido which cannot be satisfied in reality succeeds, with the help of a regression to old fixations, in finding discharge through the repressed unconscious. The sick man's ego, in so far as it can extract a 'gain from illness' out of this process, countenances the neurosis, although there can be no doubt of its injuriousness in its economic aspect.
Advance in knowledge made ever clearer the enormous part played in mental life by sexual wishful impulses, and led to a detailed study of the nature and development of the sexual instinct.¹ But we also came upon another purely empirical finding, in the discovery that the experiences and conflicts of the first years of childhood play an unsuspectedly important part in the individual's development and leave behind them ineffaceable dispositions bearing upon the period of maturity. This led to the revelation of something that had hitherto been fundamentally overlooked by science - infantile sexuality, which, from the tenderest age onwards, is manifested both in physical reactions and in mental attitudes. In order to bring together this sexuality of children with what is described as the normal sexuality of adults and the abnormal sexual life of perverts, the concept of what was sexual had itself to be corrected and widened in a manner which could be justified by the evolution of the sexual instinct.

¹ [1924f, 4107]

The first task of psycho-analysis was the elucidation of nervous disorders. The analytic theory of the neuroses is based on three corner-stones: the recognition of (1) 'repression', of (2) the importance of the sexual instinct and of (3) 'transference'.

² [1926f, 4405]

(2) For cultural reasons the most intense repression falls upon the sexual instincts; but it is precisely in connection with them that repression most easily miscarries, so that neurotic symptoms are found to be substitutive satisfactions of repressed sexuality. The belief that in man sexual life begins only at puberty is incorrect. On the contrary, signs of it can be detected from the beginning of extra-uterine existence; it reaches a first culminating point at or before the fifth year ('early period'), after which it is inhibited or interrupted ('latency period') until the age of puberty, which is the second climax of its development. This diphasic onset of sexual development seems to be distinctive of the genus Homo. All experiences during the first period of childhood are of the greatest importance to the individual, and in combination with his inherited sexual constitution form the dispositions for the subsequent development of character and disease. It is wrong to make sexuality coincide with 'genitality'. The sexual instincts pass through a complicated course of development, and it is only at the end of it that the 'primacy of the genital zones' is attained. Before this there are a number of 'pregenital' organizations of the libido - points at which it may become 'fixated' and to which, in the event of subsequent repression, it will return ('regression'). The infantile fixations of the libido are what determine the form of any later neurosis. Thus the neuroses are to be regarded as inhibitions in the development of the libido. There are no specific causes of nervous disorders; the question whether a conflict finds a healthy solution or leads to a neurotic inhibition of function depends upon quantitative considerations.

² [1926f, 4405]
In the course of these investigations our attention was drawn to a highly significant relation between the generation of anxiety and the formation of symptoms - namely, that these two represent and replace each other. For instance, an agoraphobic patient may start his illness with an attack of anxiety in the street. This would be repeated every time he went into the street again. He will now develop the symptom of agoraphobia; this may also be described as an inhibition, a restriction of the ego's functioning, and by means of it he spares himself anxiety attacks. We can witness the converse of this if we interfere in the formation of symptoms, as is possible, for instance, with obsessions. If we prevent a patient from carrying out a washing ceremonial, he falls into a state of anxiety which he finds hard to tolerate and from which he had evidently been protected by his symptom. And it seems, indeed, that the generation of anxiety is the earlier and the formation of symptoms the later of the two, as though the symptoms are created in order to avoid the outbreak of the anxiety state. This is confirmed too by the fact that the first neuroses of childhood are phobias - states in which we see so clearly how an initial generation of anxiety is replaced by the later formation of a symptom; we get an impression that it is from these interrelations that we shall best obtain access to an understanding of neurotic anxiety. And at the same time we have also succeeded in answering the question of what it is that a person is afraid of in neurotic anxiety and so in establishing the connection between neurotic and realistic anxiety. What he is afraid of is evidently his own libido. The difference between this situation and that of realistic anxiety lies in two points: that the danger is an internal instead of an external one and that it is not consciously recognized.

[1933a, 4690]

As regards the other point - the specific instinctual factor - we come upon an interesting discrepancy between theory and experience. Theoretically there is no objection to supposing that any sort of instinctual demand might occasion the same repressions and their consequences; but our observation shows us invariably, so far as we can judge, that the excitations that play this pathogenic part arise from the component instincts of sexual life. The symptoms of neuroses are, it might be said, without exception either a substitutive satisfaction of some sexual urge or measures to prevent such a satisfaction; and as a rule they are compromises between the two, of the kind that come about in accordance with the laws operating between contraries in the unconscious. The gap in our theory cannot at present be filled; our decision is made more difficult by the fact that most of the urges of sexual life are not of a purely erotic nature but have arisen from alloys of the erotic instinct with portions of the destructive instinct. But it cannot be doubted that the instincts which manifest themselves physiologically as sexuality play a prominent, unexpectedly large part in the causation of the neuroses - whether it is an exclusive one remains to be decided. It must also be borne in mind that in the course of cultural development no other function has been so energetically and extensively repudiated as precisely the sexual one. Theory must rest satisfied with a few hints that betray a deeper connection: the fact that the first period of childhood, during which the ego begins to be differentiated from the id, is also the period of the early sexual efflorescence which is brought to an end by the period of latency; that it can hardly be a matter of chance that this momentous early period subsequently falls a victim to infantile amnesia; and lastly, that biological changes in sexual life (such as the function's diphasic onset which we have already mentioned, the disappearance of the periodic character of sexual excitation and the transformation in the relation between female menstruation and male excitation) - that these innovations in sexuality must have been of high importance in the evolution of animals into man. It is left for the science of the future to bring these still isolated data together into a new understanding. It is not in psychology but in biology that there is a gap here. We shall not be wrong, perhaps, in saying that the weak point in the ego's organization seems to lie in its attitude to the sexual function, as though the biological antithesis between self-preservation and the preservation of the species had found a psychological expression at that point.

[1940a [1938], 4994]
Further information now became available relating to people who had remained normal; and this led to the unexpected finding that the sexual history of their childhood did not necessarily differ in essentials from that of neurotics, and, in particular, that the part played by seduction was the same in both cases. As a consequence, accidental influences receded still further into the background as compared with 'repression' (as I now began to say instead of 'defence'). Thus it was no longer a question of what sexual experiences a particular individual had had in his childhood, but rather of his reaction to those experiences - of whether he had reacted to them by 'repression' or not. It could be shown how in the course of development a spontaneous infantile sexual activity was often broken off by an act of repression. Thus a mature neurotic individual was invariably pursued by a certain amount of 'sexual repression' from his childhood; this found expression when he was faced by the demands of real life, and the psycho-analyses of hysterics showed that they fell ill as a result of the conflict between their libido and their sexual repression and that their symptoms were in the nature of compromises between the two mental currents.

The events in his sixth or seventh year which the patient described in the first hour of his treatment were not merely, as he supposed, the beginning of his illness, but were already the illness itself. It was a complete obsessional neurosis, wanting in no essential element, at once the nucleus and the prototype of the later disorder, - an elementary organism, as it were, the study of which could alone enable us to obtain a grasp of the complicated organization of his subsequent illness. The child, as we have seen, was under the domination of a component of the sexual instinct, the desire to look, as a result of which there was a constant recurrence in him of a very intense wish connected with persons of the female sex who pleased him - the wish, that is, to see them naked. This wish corresponds to the later obsessional or compulsive idea; and if the quality of compulsion was not yet present in the wish, this was because the ego had not yet placed itself in complete opposition to it and did not yet regard it as something foreign to itself. Nevertheless, opposition to this wish from some source or other was already in activity, for its occurrence was regularly accompanied by a distressing affect. A conflict was evidently in progress in the mind of this young libertine. Side by side with the obsessive wish, and intimately associated with it, was an obsessive fear: every time he had a wish of this kind he could not help fearing that something dreadful would happen. This something dreadful was already clothed in a characteristic indeterminateness which was thenceforward to be an invariable feature of every manifestation of the neurosis. But in a child it is not hard to discover what it is that is veiled behind an indeterminateness of this kind. If the patient can once be induced to give a particular instance in place of the vague generalities which characterize an obsessional neurosis, it may be confidently assumed that the instance is the original and actual thing which has tried to hide itself behind the generalization. Our present patient's obsessive fear, therefore, when restored to its original meaning, would run as follows: 'If I have this wish to see a woman naked, my father will be bound to die.' The distressing affect was distinctly coloured with a tinge of uncanniness and superstition, and was already beginning to give rise to impulses to do something to ward off the impending evil. These impulses were subsequently to develop into the protective measures which the patient adopted.

[1906a, 1580]

[1909d, 2133]
To find a chronic obsessional neurosis beginning like this in early childhood, with lascivious wishes of this sort connected with uncanny apprehensions and an inclination to the performance of defensive acts, is no new thing to me. I have come across it in a number of other cases. It is absolutely typical, although probably not the only possible type. Before proceeding to the events of the second session, I should like to add one more word on the subject of the patient's early sexual experiences. It will hardly be disputed that they may be described as having been considerable both in themselves and in their consequences. But it has been the same with the other cases of obsessional neurosis that I have had the opportunity of analysing. Such cases, unlike those of hysteria, invariably possess the characteristic of premature sexual activity. Obsessional neuroses make it much more obvious than hysterias that the factors which go to form a psychoneurosis are to be found in the patient's infantile sexual life and not in his present one. The current sexual life of an obsessional neurotic may often appear perfectly normal to a superficial observer; indeed, it frequently offers to the eye far fewer pathogenic elements and abnormalities than in the instance we are now considering.
[1909d, 2135]
At the next session the patient showed great interest in what I had said, but ventured, so he
told me, to bring for ward a few doubts. - How, he asked, could the information that the self-
reproach, the sense of guilt, was justified have a therapeutic effect? - I explained that it was not
the information that had this effect, but the discovery of the unknown content to which the self-
reproach was really attached. - Yes, he said, that was the precise point to which his question
had been directed. - I then made some short observations upon the psychological differences
between the conscious and the unconscious, and upon the fact that everything conscious was
subject to a process of wearing-away, while what was unconscious was relatively
unchangeable; and I illustrated my remarks by pointing to the antiques standing about in my
room. They were, in fact, I said, only objects found in a tomb, and their burial had been their
preservation: the destruction of Pompeii was only beginning now that it had been dug up. - Was
there any guarantee, he next enquired, of what one's attitude would be towards what was
discovered? One man, he thought, would no doubt behave in such a way as to get the better of
his self-reproach, but another would not. - No, I said, it followed from the nature of the
circumstances that in every case the affect would be overcome - for the most part during the
progress of the work itself. Every effort was made to preserve Pompeii, whereas people were
anxious to be rid of tormenting ideas like his. - He had said to himself, he went on, that a self-
reproach could only arise from a breach of a person's own inner moral principles and not from
that of any external ones. - I agreed, and said that the man who merely breaks an external law
often regards himself as a hero. - Such an occurrence, he continued, was thus only possible
where a disintegration of the personality was already present. Was there a possibility of his
effecting a reintegration of his personality? If this could be done, he thought he would be able to
make a success of his life, perhaps more of one than most people. - I replied that I was in
complete agreement with this notion of a splitting of his personality. He had only to assimilate
this new contrast, between a moral self and an evil one, with the contrast I had already
mentioned, between the conscious and the unconscious. The moral self was the conscious, the
evil self was the unconscious.¹ - He then said that, though he considered himself a moral
person, he could quite definitely remember having done things in his childhood which came
from his other self. - I remarked that here he had incidentally hit upon one of the chief
characteristics of the unconscious, namely, its relation to the infantile. The unconscious, I
explained, was the infantile; it was that part of the self which had become separated off from it
in infancy, which had not shared the later stages of its development, and which had in
consequence become repressed. It was the derivatives of this repressed unconscious that were
responsible for the involuntary thoughts which constituted his illness. He might now, I added,
discover yet another characteristic of the unconscious; it was a discovery which I should be glad
to let him make for himself. - He found nothing more to say in this immediate connection, but
instead he expressed a doubt whether it was possible to undo modifications of such long
standing. What, in particular, could be done against his idea about the next world, for it could
not be refuted by logic? - I told him I did not dispute the gravity of his case nor the significance
of his pathological constructions; but at the same time his youth was very much in his favour as
well as the intactness of his personality. In this connection I said a word or two upon the good
opinion I had formed of him, and this gave him visible pleasure.

[1909d, 2143]
He admitted that all of this sounded quite plausible, but he was naturally not in the very least convinced by it. He would venture to ask, he said, how it was that an idea of this kind could have remissions, how it could appear for a moment when he was twelve years old, and again when he was twenty, and then once more two years later, this time for good. He could not believe that his hostility had been extinguished in the intervals, and yet during them there had been no sign of self-reproaches. To this I replied that whenever any one asked a question like that, he was already prepared with an answer; he needed only to be encouraged to go on talking. He then proceeded, somewhat disconnectedly as it seemed, to say that he had been his father's best friend, and that his father had been his. Except on a few subjects, upon which fathers and sons usually hold aloof from one another - (What could he mean by that?) -, there had been a greater intimacy between them than there now was between him and his best friend. As regards the lady for whose sake he had sacrificed his father in that idea of his, it was true that he had loved her very much, but he had never felt really sensual wishes towards her, such as he had constantly had in his childhood. Altogether, in his childhood his sensual impulses had been much stronger than during his puberty. At this I told him I thought he had now produced the answer we were waiting for, and had at the same time discovered the third great characteristic of the unconscious. The source from which his hostility to his father derived its indestructibility was evidently something in the nature of sensual desires, and in that connection he must have felt his father as in some way or other an interference. A conflict of this kind, I added, between sensuality and childish love was entirely typical. The remissions he had spoken of had occurred because the premature explosion of his sensual feelings had had as its immediate consequence a considerable diminution of their violence. It was not until he was once more seized with intense erotic desires that his hostility reappeared again owing to the revival of the old situation. I then got him to agree that I had not led him on to the subject either of childhood or of sex, but that he had raised them both of his own free will. He then went on to ask why he had not simply come to a decision, at the time he was in love with the lady, that his father's interference with that love could not for a moment weigh against his love of his father. I replied that it was scarcely possible to destroy a person in absentia. Such a decision would only have been possible if the wish that he took objection to had made its first appearance on that occasion; whereas, as a matter of fact, it was a long-repressed wish, towards which he could not behave otherwise than he had formerly done, and which was consequently immune from destruction. This wish (to get rid of his father as being an interference) must have originated at a time when circumstances had been very different - at a time, perhaps, when he had not loved his father more than the person whom he desired sensually, or when he was incapable of making a clear decision. It must have been in his very early childhood, therefore, before he had reached the age of six, and before the date at which his memory became continuous; and things must have remained in the same state ever since. With this piece of construction our discussion was broken off for the time being. [1909d, 2145]
To this unimpeachable body of evidence we shall be able to add fresh material, if we turn to the history of the masturbatory side of our patient's sexual activities. There is a conflict between the opinions of doctors and patients on this subject which has not hitherto been properly appreciated. The patients are unanimous in their belief that masturbation, by which they mean masturbation during puberty, is the root and origin of all their troubles. The doctors are, upon the whole, unable to decide what line to take; but, influenced by the knowledge that not only neurotics but most normal people pass through a period of masturbation during their puberty, the majority of them are inclined to dismiss the patients' assertions as gross exaggerations. In my opinion the patients are once again nearer to a correct view than the doctors; for the patients have some glimmering notion of the truth, while the doctors are in danger of overlooking an essential point. The thesis propounded by the patients certainly does not correspond to the facts in the sense in which they themselves construe it, namely, that masturbation during puberty (which may almost be described as a typical occurrence) is responsible for all neurotic disturbances. Their thesis requires interpretation. The masturbation of puberty is in fact no more than a revival of the masturbation of infancy, a subject which has hitherto invariably been neglected. Infantile masturbation reaches a kind of climax, as a rule, between the ages of three and four or five; and it is the clearest expression of a child's sexual constitution, in which the aetiology of subsequent neuroses must be sought. In this disguised way, therefore, the patients are putting the blame for their illnesses upon their infantile sexuality; and they are perfectly right in doing so. On the other hand, the problem of masturbation becomes insoluble if we attempt to treat it as a clinical unit, and forget that it can represent the discharge of every variety of sexual component and of every sort of phantasy to which such components can give rise. The injurious effects of masturbation are only in a very small degree autonomous - that is to say, determined by its own nature. They are in substance merely part and parcel of the pathogenic significance of the subject's sexual life as a whole. The fact that so many people can tolerate masturbation - that is, a certain amount of it - without injury merely shows that their sexual constitution and the course of development of their sexual life have been such as to allow them to exercise the sexual function within the limits of what is culturally permissible; whereas other people, because their sexual constitution has been less favourable or their development has been disturbed, fall ill as a result of their sexuality - they cannot, that is, achieve the necessary suppression or sublimation of their sexual components without having recourse to inhibitions or substitutes.¹

[1909d, 2159]
Two factors will decide whether this advance in the developmental path of the libido is to fail. First, there is the amount of frustration in reality, which opposes the new object-choice and reduces its value for the person concerned. There is after all no point in embarking upon an object-choice if no choice is to be allowed at all or if there is no prospect of being able to choose anything suitable. Secondly, there is the amount of attraction which the infantile objects that have to be relinquished are able to exercise, and which is in proportion to the erotic cathexis attaching to them in childhood. If these two factors are sufficiently strong, the general mechanism by which the neuroses are formed comes into operation. The libido turns away from reality, is taken over by imaginative activity (the process of introversion), strengthens the images of the first sexual objects and becomes fixated to them. The obstacle raised against incest, however, compels the libido that has turned to these objects to remain in the unconscious. The masturbatory activity carried out by the sensual current, which is now part of the unconscious, makes its own contribution in strengthening this fixation. Nothing is altered in this state of affairs if the advance which has miscarried in reality is now completed in phantasy, and if in the phantasy-situations that lead to masturbatory satisfaction the original sexual objects are replaced by different ones. As a result of this substitution the phantasies become admissible to consciousness, but no progress is made in the allocation of the libido in reality. In this way it can happen that the whole of a young man's sensuality becomes tied to incestuous objects in the unconscious, or to put it another way, becomes fixated to unconscious incestuous phantasies. The result is then total impotence, which is perhaps further ensured by the simultaneous onset of an actual weakening of the organs that perform the sexual act.
[1912d, 2339]

Any one who was more daring than I am in making interpretations, or who was in touch with Schreber's family and consequently better acquainted with the society in which he moved and the small events of his life, would find it an easy matter to trace back innumerable details of his delusions to their sources and so discover their meaning, and this in spite of the censorship to which the Denkwürdigkeiten have been subjected. But as it is, we must necessarily content ourselves with this shadowy sketch of the infantile material which was used by the paranoic disorder in portraying the current conflict.
[1911c, 2428]

The two other doubts are based on a low estimate of the importance of early infantile impressions and an unwillingness to ascribe such enduring effects to them. The supporters of this view look for the causes of neuroses almost exclusively in the grave conflicts of later life; they assume that the importance of childhood is only held up before our eyes in analysis on account of the inclination of neurotics for expressing their present interests in reminiscences and symbols from the remote past. Such an estimate of the importance of the infantile factor would involve the disappearance of much that has formed part of the most intimate characteristics of analysis, though also, no doubt, of much that raises resistance to it and alienates the confidence of the outsider.
[1918b, 3536]
Advance in knowledge made ever clearer the enormous part played in mental life by sexual wishful impulses, and led to a detailed study of the nature and development of the sexual instinct.¹ But we also came upon another purely empirical finding, in the discovery that the experiences and conflicts of the first years of childhood play an unsuspectedly important part in the individual's development and leave behind them ineffaceable dispositions bearing upon the period of maturity. This led to the revelation of something that had hitherto been fundamentally overlooked by science - infantile sexuality, which, from the tenderest age onwards, is manifested both in physical reactions and in mental attitudes. In order to bring together this sexuality of children with what is described as the normal sexuality of adults and the abnormal sexual life of perverts, the concept of what was sexual had itself to be corrected and widened in a manner which could be justified by the evolution of the sexual instinct.

None of the applications of psycho-analysis has excited so much interest and aroused so many hopes, and none, consequently, has attracted so many capable workers, as its use in the theory and practice of education. It is easy to understand why; for children have become the main subject of psycho-analytic research and have thus replaced in importance the neurotics on whom its studies began. Analysis has shown how the child lives on, almost unchanged, in the sick man as well as in the dreamer and the artist; it has thrown light on the motive forces and trends which set its characteristic stamp upon the childish nature; and it has traced the stages through which a child grows to maturity. No wonder, therefore, if an expectation has arisen that psycho-analytic concern with children will benefit the work of education, whose aim it is to guide and assist children on their forward path and to shield them from going astray.

Perhaps you do not believe in these purely theoretical interests of psycho-analysis or cannot allow them to affect the practical question of lay analysis. Then let me advise you that psycho-analysis has yet another sphere of application, which is outside the scope of the quackery law and to which the doctors will scarcely lay claim. Its application, I mean, to the bringing-up of children. If a child begins to show signs of an undesirable development, if it grows moody, refractory and inattentive, the paediatrician and even the school doctor can do nothing for it, even if the child produces clear neurotic symptoms, such as nervousness, loss of appetite, vomiting or insomnia. A treatment that combines analytic influence with educational measures, carried out by people who are not ashamed to concern themselves with the affairs in a child's world, and who understand how to find their way into a child's mental life, can bring about two things at once: the removal of the neurotic symptoms and the reversal of the change in character which had begun. Our recognition of the importance of these inconspicuous neuroses of children as laying down the disposition for serious illnesses in later life points to these child analyses as an excellent method of prophylaxis. Analysis undeniably still has its enemies. I do not know whether they have means at their command for stopping the activities of these educational analysts or analytic educationalists. I do not think it very likely; but one can never feel too secure.

[1924f, 4107]

[1925f, 4167]

[1926e, 4390]
We now observe that the store of religious ideas includes not only wish-fulfillments but important historical recollections. This concurrent influence of past and present must give religion a truly incomparable wealth of power. But perhaps with the help of an analogy yet another discovery may begin to dawn on us. Though it is not a good plan to transplant ideas far from the soil in which they grew up, yet here is a conformity which we cannot avoid pointing out. We know that a human child cannot successfully complete its development to the civilized stage without passing through a phase of neurosis sometimes of greater and sometimes of less distinctness. This is because so many instinctual demands which will later be unserviceable cannot be suppressed by the rational operation of the child's intellect but have to be tamed by acts of repression, behind which, as a rule, lies the motive of anxiety. Most of these infantile neuroses are overcome spontaneously in the course of growing up, and this is especially true of the obsessional neuroses of childhood. The remainder can be cleared up later still by psycho-analytic treatment. In just the same way, one might assume, humanity as a whole, in its development through the ages, fell into states analogous to the neuroses, and for the same reasons - namely because in the times of its ignorance and intellectual weakness the instinctual renunciations indispensable for man's communal existence had only been achieved by it by means of purely affective forces. The precipitates of these processes resembling repression which took place in prehistoric times still remained attached to civilization for long periods. Religion would thus be the universal obsessional neurosis of humanity; like the obsessional neuroses of children, it arose out of the Oedipus complex, out of the relation to the father. If this view is right, it is to be supposed that a turning-away from religion is bound to occur with the fatal inevitability of a process of growth, and that we find ourselves at this very juncture in the middle of that phase of development. Our behaviour should therefore be modelled on that of a sensible teacher who does not oppose an impending new development but seeks to ease its path and mitigate the violence of its irruption. Our analogy does not, to be sure, exhaust the essential nature of religion. If, on the one hand, religion brings with it obsessional restrictions, exactly as an individual obsessional neurosis does, on the other hand it comprises a system of wishful illusions together with a disavowal of reality, such as we find in an isolated form nowhere else but in amentia, in a state of blissful hallucinatory confusion. But these are only analogies, by the help of which we endeavour to understand a social phenomenon; the pathology of the individual does not supply us with a fully valid counterpart.

[1927c, 4452]
The road that led to this application is easily traced. When in the treatment of an adult neurotic we followed up the determinants of his symptoms, we were regularly led back to his early childhood. A knowledge of the later aetiological factors was not sufficient either for understanding the case or for producing a therapeutic effect. We were therefore compelled to make ourselves acquainted with the psychical peculiarities of childhood; we learnt a quantity of things which could not have been learnt except through analysis, and we were able to put right many opinions that were generally held about childhood. We recognized that particular importance attached to the first years of childhood - up to the age of five, perhaps - for several reasons. Firstly, because those years include the early efflorescence of sexuality which leaves behind it decisive instigating factors for the sexual life of maturity. Secondly, because the impressions of this period impinge upon an immature and feeble ego, and act upon it like traumas. The ego cannot fend off the emotional storms which they provoke in any way except by repression and in this manner acquires in childhood all its dispositions to later illnesses and functional disturbances. We realized that the difficulty of childhood lies in the fact that in a short span of time a child has to appropriate the results of a cultural evolution which stretches over thousands of years, including the acquisition of control over his instincts and adaptation to society - or at least the first beginnings of these two. He can only achieve a part of this modification through his own development; much must be imposed on him by education. We are not surprised that children often carry out this task very imperfectly. During these early times many of them pass through states that may be put on a par with neuroses - and this is certainly so in the case of all those who produce manifest illnesses later on. In some children the neurotic illness does not wait till maturity but breaks out already in childhood and gives parents and doctors plenty of trouble.

[1933a, 4747]
We can speak with a fair degree of certainty about the part played by the period of life. It seems that neuroses are acquired only in early childhood (up to the age of six), even though their symptoms may not make their appearance till much later. The childhood neurosis may become manifest for a short time or may even be overlooked. In every case the later neurotic illness links up with the prelude in childhood. It is possible that what are known as traumatic neuroses (due to excessive fright or severe somatic shocks, such as railway collisions, burial under falls of earth, and so on) are an exception to this: their relations to determinants in childhood have hitherto eluded investigation. There is no difficulty in accounting for this aetiological preference for the first period of childhood. The neuroses are, as we know, disorders of the ego; and it is not to be wondered at if the ego, so long as it is feeble, immature and incapable of resistance, fails to deal with tasks which it could cope with later on with the utmost ease. In these circumstances instinctual demands from within, no less than excitations from the external world, operate as 'traumas', particularly if they are met half way by certain innate dispositions. The helpless ego fends them off by means of attempts at flight (repression), which later turn out to be inefficient and which involve permanent restrictions on further development. The damage inflicted on the ego by its first experiences gives us the appearance of being disproportionately great; but we have only to take as an analogy the differences in the results produced by the prick of a needle into a mass of cells in the act of cell-division (as in Roux's experiments) and into the fully grown animal which eventually develops out of them. No human individual is spared such traumatic experiences; none escapes the repressions to which they give rise. These questionable reactions on the part of the ego may perhaps be indispensable for the attainment of another aim which is set for the same period of life: in the space of a few years the little primitive creature must turn into a civilized human being; he must pass through an immensely long stretch of human cultural development in an almost uncannily abbreviated form. This is made possible by hereditary disposition; but it can almost never be achieved without the additional help of upbringing, of parental influence, which, as a precursor of the super-ego, restricts the ego's activity by prohibitions and punishments, and encourages or compels the setting-up of repressions. We must therefore not forget to include the influence of civilization among the determinants of neurosis. It is easy, as we can see, for a barbarian to be healthy; for a civilized man the task is hard. The desire for a powerful, uninhibited ego may seem to us intelligible; but, as we are taught by the times we live in, it is in the profoundest sense hostile to civilization. And since the demands of civilization are represented by family upbringing, we must bear in mind the part played by this biological characteristic of the human species - the prolonged period of its childhood dependence - in the aetiology of the neuroses.

[1940a [1938], 4993]
Analytic experience has convinced us of the complete truth of the assertion so often to be heard that the child is psychologically father to the adult and that the events of his first years are of paramount importance for his whole later life. It will thus be of special interest to us if there is something that may be described as the central experience of this period of childhood. Our attention is first attracted by the effects of certain influences which do not apply to all children, though they are common enough - such as the sexual abuse of children by adults, their seduction by other children (brothers or sisters) slightly their seniors, and, what we should not expect, their being deeply stirred by seeing or hearing at first hand sexual behaviour between adults (their parents) mostly at a time at which one would not have thought they could either be interested in or understand any such impressions, or be capable of remembering them later. It is easy to confirm the extent to which such experiences arouse a child's susceptibility and force his own sexual urges into certain channels from which they cannot afterwards depart. Since these impressions are subjected to repression either at once or as soon as they seek to return as memories, they constitute the determinant for the neurotic compulsion which will subsequently make it impossible for the ego to control the sexual function and will probably cause it to turn away from that function permanently. If this latter reaction occurs, the result will be a neurosis; if it is absent, a variety of perversions will develop, or the function, which is of immense importance not only for reproduction but also for the entire shaping of life, will become totally unmanageable.

[1940a [1938], 4995]
¹ I cannot interrupt the discussion so far as to demonstrate the typical character of the unconscious train of thought which I think there is here reason for attributing to little Hans. The castration complex is the deepest unconscious root of anti-semitism; for even in the nursery little boys hear that a Jew has something cut off his penis - a piece of his penis, they think - and this gives them a right to despise Jews. And there is no stronger unconscious root for the sense of superiority over women. Weininger (the young philosopher who, highly gifted but sexually deranged, committed suicide after producing his remarkable book, *Geschlecht und Charakter*), in a chapter that attracted much attention, treated Jews and women with equal hostility and overwhelmed them with the same insults. Being a neurotic, Weininger was completely under the sway of his infantile complexes; and from that standpoint what is common to Jews and women is their relation to the castration complex.

[1909b, 2026]

I cannot take leave of our small patient's phobia without giving expression to a notion which has made its analysis, leading as it did to a recovery, seem of especial value to me. Strictly speaking, I learnt nothing new from this analysis, nothing that I had not already been able to discover (though often less distinctly and more indirectly) from other patients analysed at a more advanced age. But the neuroses of these other patients could in every instance be traced back to the same infantile complexes that were revealed behind Hans's phobia. I am therefore tempted to claim for this neurosis of childhood the significance of being a type and a model, and to suppose that the multiplicity of the phenomena of repression exhibited by neuroses and the abundance of their pathogenic material do not prevent their being derived from a very limited number of processes concerned with identical ideational complexes.

[1909b, 2123]

The events in his sixth or seventh year which the patient described in the first hour of his treatment were not merely, as he supposed, the beginning of his illness, but were already the illness itself. It was a complete obsessional neurosis, wanting in no essential element, at once the nucleus and the prototype of the later disorder, - an elementary organism, as it were, the study of which could alone enable us to obtain a grasp of the complicated organization of his subsequent illness. The child, as we have seen, was under the domination of a component of the sexual instinct, the desire to look, as a result of which there was a constant recurrence in him of a very intense wish connected with persons of the female sex who pleased him - the wish, that is, to see them naked. This wish corresponds to the later obsessional or compulsive idea; and if the quality of compulsion was not yet present in the wish, this was because the ego had not yet placed itself in complete opposition to it and did not yet regard it as something foreign to itself. Nevertheless, opposition to this wish from some source or other was already in activity, for its occurrence was regularly accompanied by a distressing affect. A conflict was evidently in progress in the mind of this young libertine. Side by side with the obsessive wish, and intimately associated with it, was an obsessive fear: every time he had a wish of this kind he could not help fearing that something dreadful would happen. This something dreadful was already clothed in a characteristic indeterminateness which was thenceforward to be an invariable feature of every manifestation of the neurosis. But in a child it is not hard to discover what it is that is veiled behind an indeterminateness of this kind. If the patient can once be induced to give a particular instance in place of the vague generalities which characterize an obsessional neurosis, it may be confidently assumed that the instance is the original and actual thing which has tried to hide itself behind the generalization. Our present patient's obsessive fear, therefore, when restored to its original meaning, would run as follows: 'If I have this wish to see a woman naked, my father will be bound to die.' The distressing affect was distinctly colored with a tinge of uncanniness and superstition, and was already beginning to give rise to impulses to do something to ward off the impending evil. These impulses were subsequently to develop into the *protective measures* which the patient adopted.

[1909d, 2133]
To find a chronic obsessional neurosis beginning like this in early childhood, with lascivious wishes of this sort connected with uncanny apprehensions and an inclination to the performance of defensive acts, is no new thing to me. I have come across it in a number of other cases. It is absolutely typical, although probably not the only possible type. Before proceeding to the events of the second session, I should like to add one more word on the subject of the patient's early sexual experiences. It will hardly be disputed that they may be described as having been considerable both in themselves and in their consequences. But it has been the same with the other cases of obsessional neurosis that I have had the opportunity of analysing. Such cases, unlike those of hysteria, invariably possess the characteristic of premature sexual activity. Obsessional neuroses make it much more obvious than hysteries that the factors which go to form a psychoneurosis are to be found in the patient's infantile sexual life and not in his present one. The current sexual life of an obsessional neurotic may often appear perfectly normal to a superficial observer; indeed, it frequently offers to the eye far fewer pathogenic elements and abnormalities than in the instance we are now considering.

[1909d, 2135]
At the next session the patient showed great interest in what I had said, but ventured, so he told me, to bring for ward a few doubts. - How, he asked, could the information that the self-reproach, the sense of guilt, was justified have a therapeutic effect? - I explained that it was not the information that had this effect, but the discovery of the unknown content to which the self-reproach was really attached. - Yes, he said, that was the precise point to which his question had been directed. - I then made some short observations upon the psychological differences between the conscious and the unconscious, and upon the fact that everything conscious was subject to a process of wearing-away, while what was unconscious was relatively unchangeable; and I illustrated my remarks by pointing to the antiques standing about in my room. They were, in fact, I said, only objects found in a tomb, and their burial had been their preservation: the destruction of Pompeii was only beginning now that it had been dug up. - Was there any guarantee, he next enquired, of what one’s attitude would be towards what was discovered? One man, he thought, would no doubt behave in such a way as to get the better of his self-reproach, but another would not. - No, I said, it followed from the nature of the circumstances that in every case the affect would be overcome - for the most part during the progress of the work itself. Every effort was made to preserve Pompeii, whereas people were anxious to be rid of tormenting ideas like his. - He had said to himself, he went on, that a self-reproach could only arise from a breach of a person’s own inner moral principles and not from that of any external ones. - I agreed, and said that the man who merely breaks an external law often regards himself as a hero. - Such an occurrence, he continued, was thus only possible where a disintegration of the personality was already present. Was there a possibility of his effecting a reintegration of his personality? If this could be done, he thought he would be able to make a success of his life, perhaps more of one than most people. - I replied that I was in complete agreement with this notion of a splitting of his personality. He had only to assimilate this new contrast, between a moral self and an evil one, with the contrast I had already mentioned, between the conscious and the unconscious. The moral self was the conscious, the evil self was the unconscious.¹ - He then said that, though he considered himself a moral person, he could quite definitely remember having done things in his childhood which came from his other self. - I remarked that here he had incidentally hit upon one of the chief characteristics of the unconscious, namely, its relation to the infantile. The unconscious, I explained, was the infantile; it was that part of the self which had become separated off from it in infancy, which had not shared the later stages of its development, and which had in consequence become repressed. It was the derivatives of this repressed unconscious that were responsible for the involuntary thoughts which constituted his illness. He might now, I added, discover yet another characteristic of the unconscious; it was a discovery which I should be glad to let him make for himself. - He found nothing more to say in this immediate connection, but instead he expressed a doubt whether it was possible to undo modifications of such long standing. What, in particular, could be done against his idea about the next world, for it could not be refuted by logic? - I told him I did not dispute the gravity of his case nor the significance of his pathological constructions; but at the same time his youth was very much in his favour as well as the intactness of his personality. In this connection I said a word or two upon the good opinion I had formed of him, and this gave him visible pleasure.

[1909d, 2143]
He admitted that all of this sounded quite plausible, but he was naturally not in the very least convinced by it.¹ He would venture to ask, he said, how it could have remissions, how it could appear for a moment when he was twelve years old, and again when he was twenty, and then once more two years later, this time for good. He could not believe that his hostility had been extinguished in the intervals, and yet during them there had been no sign of self-reproaches. - To this I replied that whenever any one asked a question like that, he was already prepared with an answer; he needed only to be encouraged to go on talking. - He then proceeded, somewhat disconnectedly as it seemed, to say that he had been his father's best friend, and that his father had been his. Except on a few subjects, upon which fathers and sons usually hold aloof from one another - (What could he mean by that?) -, there had been a greater intimacy between them than there now was between him and his best friend. As regards the lady for whose sake he had sacrificed his father in that idea of his, it was true that he had loved her very much, but he had never felt really sensual wishes towards her, such as he had constantly had in his childhood. Altogether, in his childhood his sensual impulses had been much stronger than during his puberty. - At this I told him I thought he had now produced the answer we were waiting for, and had at the same time discovered the third great characteristic of the unconscious. The source from which his hostility to his father derived its indestructibility was evidently something in the nature of sensual desires, and in that connection he must have felt his father as in some way or other an interference. A conflict of this kind, I added, between sensuality and childish love was entirely typical. The remissions he had spoken of had occurred because the premature explosion of his sensual feelings had had as its immediate consequence a considerable diminution of their violence. It was not until he was once more seized with intense erotic desires that his hostility reappeared again owing to the revival of the old situation. I then got him to agree that I had not led him on to the subject either of childhood or of sex, but that he had raised them both of his own free will. - He then went on to ask why he had not simply come to a decision, at the time he was in love with the lady, that his father's interference with that love could not for a moment weigh against his love of his father. - I replied that it was scarcely possible to destroy a person in absentia. Such a decision would only have been possible if the wish that he took objection to had made its first appearance on that occasion; whereas, as a matter of fact, it was a long-repressed wish, towards which he could not behave otherwise than he had formerly done, and which was consequently immune from destruction. This wish (to get rid of his father as being an interference) must have originated at a time when circumstances had been very different - at a time, perhaps, when he had not loved his father more than the person whom he desired sensually, or when he was incapable of making a clear decision. It must have been in his very early childhood, therefore, before he had reached the age of six, and before the date at which his memory became continuous; and things must have remained in the same state ever since. - With this piece of construction our discussion was broken off for the time being.
[1909d, 2145]

The flight from unsatisfactory reality into what, on account of the biological damage involved, we call illness (though it is never without an immediate yield of pleasure to the patient) takes place along the path of involution, of regression, of a return to earlier phases of sexual life, phases from which at one time satisfaction was not withheld. This regression appears to be a twofold one: a temporal one, in so far as the libido, the erotic needs, hark back to stages of development that are earlier in time, and a formal one, in that the original and primitive methods of psychical expression are employed in manifesting those needs. Both these kinds of regression, however, lead back to childhood and unite in bringing about an infantile condition of sexual life.
[1910a, 2234]
The deeper you penetrate into the pathogenesis of nervous illness, the more you will find revealed the connection between the neuroses and other productions of the human mind, including the most valuable. You will be taught that we humans, with the high standards of our civilization and under the pressure of our internal repressions, find reality unsatisfying quite generally, and for that reason entertain a life of phantasy in which we like to make up for the insufficiencies of reality by the production of wish-fulfilments. These phantasies include a great deal of the true constitutional essence of the subject's personality as well as of those of his impulses which are repressed where reality is concerned. The energetic and successful man is one who succeeds by his efforts in turning his wishful phantasies into reality. Where this fails, as a result of the resistances of the external world and of the subject's own weakness, he begins to turn away from reality and withdraws into his more satisfying world of phantasy, the content of which is transformed into symptoms should he fall ill. In certain favourable circumstances, it still remains possible for him to find another path leading from these phantasies to reality, instead of becoming permanently estranged from it by regressing to infancy. If a person who is at loggerheads with reality possesses an *artistic gift* (a thing that is still a psychological mystery to us), he can transform his phantasies into artistic creations instead of into symptoms. In this manner he can escape the doom of neurosis and by this roundabout path regain his contact with reality. (Cf. Rank, 1907.) If there is persistent rebellion against the real world and if this precious gift is absent or insufficient, it is almost inevitable that the libido, keeping to the sources of the phantasies, will follow the path of regression, and will revive infantile wishes and end in neurosis. To-day neurosis takes the place of the monasteries which used to be the refuge of all whom life had disappointed or who felt too weak to face it.
[1910a, 2235]

Any one who was more daring than I am in making interpretations, or who was in touch with Schreber's family and consequently better acquainted with the society in which he moved and the small events of his life, would find it an easy matter to trace back innumerable details of his delusions to their sources and so discover their meaning, and this in spite of the censorship to which the *Denkwürdigkeiten* have been subjected. But as it is, we must necessarily content ourselves with this shadowy sketch of the infantile material which was used by the paranoic disorder in portraying the current conflict.
[1911c, 2428]

Our work on the question of the disposition to neurotic affections has added the 'infantile' factor to the somatic and hereditary ones hitherto recognized. Psycho-analysis was obliged to trace back patients' mental life to their early infancy, and the conclusion was reached that inhibitions of mental development ('infantilisms') present a disposition to neurosis. In particular, we have learnt from our investigations of sexual life that there really is such a thing as 'infantile sexuality', that the sexual instinct is made up of many components and passes through a complicated course of development, the final outcome of which, after many restrictions and transformations, is the 'normal' sexuality of adults. The puzzling perversions of the sexual instinct which occur in adults appear to be either inhibitions of development, fixations or lopsided growths. Thus neuroses are the negative of perversions.
[1913m, 2547]
The two other doubts are based on a low estimate of the importance of early infantile impressions and an unwillingness to ascribe such enduring effects to them. The supporters of this view look for the causes of neuroses almost exclusively in the grave conflicts of later life; they assume that the importance of childhood is only held up before our eyes in analysis on account of the inclination of neurotics for expressing their present interests in reminiscences and symbols from the remote past. Such an estimate of the importance of the infantile factor would involve the disappearance of much that has formed part of the most intimate characteristics of analysis, though also, no doubt, of much that raises resistance to it and alienates the confidence of the outsider.

[1918b, 3536]

What is in dispute, therefore, is the significance of the infantile factor. The problem is to find a case which can establish that significance beyond any doubt. Such, however, is the case which is being dealt with so exhaustively in these pages and which is distinguished by the characteristic that the neurosis in later life was preceded by a neurosis in early childhood. It is for that very reason, indeed, that I have chosen it to report upon. Should any one feel inclined to reject it because the animal phobia strikes him as not sufficiently serious to be recognized as an independent neurosis, I may mention that the phobia was succeeded without any interval by an obsessional ceremonial, and by obsessional acts and thoughts, which will be discussed in the following sections of this paper.

[1918b, 3541]

The occurrence of a neurotic disorder in the fourth and fifth years of childhood proves, first and foremost, that infantile experiences are by themselves in a position to produce a neurosis, without there being any need for the addition of a flight from some task which has to be faced in real life. It may be objected that even a child is constantly being confronted with tasks which it would perhaps be glad to evade. That is so; but the life of a child under school age is easily observable, and we can examine it to see whether any ‘tasks’ are to be found in it capable of determining the causation of a neurosis. But we discover nothing but instinctual impulses which the child cannot satisfy and which it is not old enough to master, and the sources from which these impulses arise.

[1918b, 3541]

I am well aware that a number of cases exhibit a more complicated structure and that many other repressed instinctual impulses can enter into a phobia. But they are only tributary streams which have for the most part joined the main current of the neurosis at a later stage. The symptomatology of agoraphobia is complicated by the fact that the ego does not confine itself to making a renunciation. In order to rob the situation of danger it does more: it usually effects a temporal regression to infancy (in extreme cases, to a time when the subject was in his mother's womb and protected against the dangers which threaten him in the present). Such a regression now becomes a condition whose fulfilment exempts the ego from making its renunciation. For instance, an agoraphobic patient may be able to walk in the street provided he is accompanied, like a small child, by someone he knows and trusts; or, for the same reason, he may be able to go out alone provided he remains within a certain distance of his own house and does not go to places which are not familiar to him or where people do not know him. What these stipulations are will depend in each case on the infantile factors which dominate him through his neurosis. The phobia of being alone is unambiguous in its meaning, irrespective of any infantile regression: it is, ultimately, an endeavour to avoid the temptation to indulge in solitary masturbation. Infantile regression can, of course, only take place when the subject is no longer a child.

[1926d, 4284]
Otto Rank, to whom psycho-analysis is indebted for many excellent contributions, also has the merit of having expressly emphasized the significance of the act of birth and of separation from the mother. Nevertheless we have all found it impossible to accept the extreme inferences which he has drawn from this factor as bearing on the theory of the neuroses and even on analytic therapy. The core of his theory - that the experience of anxiety at birth is the model of all later situations of danger - he found already there. If we dwell on these situations of danger for a moment, we can say that in fact a particular determinant of anxiety (that is, situation of danger) is allotted to every age of development as being appropriate to it. The danger of psychical helplessness fits the stage of the ego's early immaturity; the danger of loss of an object (or loss of love) fits the lack of self-sufficiency in the first years of childhood; the danger of being castrated fits the phallic phase; and finally fear of the super-ego, which assumes a special position, fits the period of latency. In the course of development the old determinants of anxiety should be dropped, since the situations of danger corresponding to them have lost their importance owing to the strengthening of the ego. But this only occurs most incompletely. Many people are unable to surmount the fear of loss of love; they never become sufficiently independent of other people's love and in this respect carry on their behaviour as infants. Fear of the super-ego should normally never cease, since, in the form of moral anxiety, it is indispensable in social relations, and only in the rarest cases can an individual become independent of human society. A few of the old situations of danger, too, succeed in surviving into later periods by making contemporary modifications in their determinants of anxiety. Thus, for instance, the danger of castration persists under the mark of syphilidophobia. It is true that as an adult one knows that castration is no longer customary as a punishment for the indulgence of sexual desires, but on the other hand one has learnt that instinctual liberty of that kind is threatened by serious diseases. There is no doubt that the people we describe as neurotics remain infantile in their attitude to danger and have not surmounted obsolete determinants of anxiety. We may take this as a factual contribution to the characterization of neurotics; it is not so easy to say why it should be so.

The mechanisms of defence serve the purpose of keeping off dangers. It cannot be disputed that they are successful in this; and it is doubtful whether the ego could do without them altogether during its development. But it is also certain that they may become dangers themselves. It sometimes turns out that the ego has paid too high a price for the services they render it. The dynamic expenditure necessary for maintaining them, and the restrictions of the ego which they almost invariably entail, prove a heavy burden on the psychical economy. Moreover, these mechanisms are not relinquished after they have assisted the ego during the difficult years of its development. No one individual, of course, makes use of all the possible mechanisms of defence. Each person uses no more than a selection of them. But these become fixated in his ego. They become regular modes of reaction of his character, which are repeated throughout his life whenever a situation occurs that is similar to the original one. This turns them into infantilisms, and they share the fate of so many institutions which attempt to keep themselves in existence after the time of their usefulness has passed. "Vernunft wird Unsinn, Wohltat Plage" as the poet complains. The adult's ego, with its increased strength, continues to defend itself against dangers which no longer exist in reality; indeed, it finds itself compelled to seek out those situations in reality which can serve as an approximate substitute for the original danger, so as to be able to justify, in relation to them, its maintaining its habitual modes of reaction. Thus we can easily understand how the defensive mechanisms, by bringing about an ever more extensive alienation from the external world and a permanent weakening of the ego, pave the way for, and encourage, the outbreak of neurosis.

[1933a, 4695]

[1937c, 5033]
The events in his sixth or seventh year which the patient described in the first hour of his treatment were not merely, as he supposed, the beginning of his illness, but were already the illness itself. It was a complete obsessional neurosis, wanting in no essential element, at once the nucleus and the prototype of the later disorder, - an elementary organism, as it were, the study of which could alone enable us to obtain a grasp of the complicated organization of his subsequent illness. The child, as we have seen, was under the domination of a component of the sexual instinct, the desire to look, as a result of which there was a constant recurrence in him of a very intense wish connected with persons of the female sex who pleased him - the wish, that is, to see them naked. This wish corresponds to the later obsessional or compulsive idea; and if the quality of compulsion was not yet present in the wish, this was because the ego had not yet placed itself in complete opposition to it and did not yet regard it as something foreign to itself. Nevertheless, opposition to this wish from some source or other was already in activity, for its occurrence was regularly accompanied by a distressing affect.¹ A conflict was evidently in progress in the mind of this young libertine. Side by side with the obsessive wish, and intimately associated with it, was an obsessive fear: every time he had a wish of this kind he could not help fearing that something dreadful would happen. This something dreadful was already clothed in a characteristic indeterminateness which was thenceforward to be an invariable feature of every manifestation of the neurosis. But in a child it is not hard to discover what it is that is veiled behind an indeterminateness of this kind. If the patient can once be induced to give a particular instance in place of the vague generalities which characterize an obsessional neurosis, it may be confidently assumed that the instance is the original and actual thing which has tried to hide itself behind the generalization. Our present patient's obsessive fear, therefore, when restored to its original meaning, would run as follows: 'If I have this wish to see a woman naked, my father will be bound to die.' The distressing affect was distinctly coloured with a tinge of uncanniness and superstition, and was already beginning to give rise to impulses to do something to ward off the impending evil. These impulses were subsequently to develop into the protective measures which the patient adopted.

¹ [1909d, 2133]

To find a chronic obsessional neurosis beginning like this in early childhood, with lascivious wishes of this sort connected with uncanny apprehensions and an inclination to the performance of defensive acts, is no new thing to me. I have come across it in a number of other cases. It is absolutely typical, although probably not the only possible type. Before proceeding to the events of the second session, I should like to add one more word on the subject of the patient's early sexual experiences. It will hardly be disputed that they may be described as having been considerable both in themselves and in their consequences. But it has been the same with the other cases of obsessional neurosis that I have had the opportunity of analysing. Such cases, unlike those of hysteria, invariably possess the characteristic of premature sexual activity. Obsessional neuroses make it much more obvious than hysterias that the factors which go to form a psychoneurosis are to be found in the patient's infantile sexual life and not in his present one. The current sexual life of an obsessional neurotic may often appear perfectly normal to a superficial observer; indeed, it frequently offers to the eye far fewer pathogenic elements and abnormalities than in the instance we are now considering.

¹ [1909d, 2135]
He admitted that all of this sounded quite plausible, but he was naturally not in the very least convinced by it. He would venture to ask, he said, how it was that an idea of this kind could have remissions, how it could appear for a moment when he was twelve years old, and again when he was twenty, and then once more two years later, this time for good. He could not believe that his hostility had been extinguished in the intervals, and yet during them there had been no sign of self-reproaches. - To this I replied that whenever any one asked a question like that, he was already prepared with an answer; he needed only to be encouraged to go on talking. - He then proceeded, somewhat disconnectedly as it seemed, to say that he had been his father's best friend, and that his father had been his. Except on a few subjects, upon which fathers and sons usually hold aloof from one another - (What could he mean by that?) -, there had been a greater intimacy between them than there now was between him and his best friend. As regards the lady for whose sake he had sacrificed his father in that idea of his, it was true that he had loved her very much, but he had never felt really sensual wishes towards her, such as he had constantly had in his childhood. Altogether, in his childhood his sensual impulses had been much stronger than during his puberty. - At this I told him I thought he had now produced the answer we were waiting for, and had at the same time discovered the third great characteristic of the unconscious. The source from which his hostility to his father derived its indestructibility was evidently something in the nature of sensual desires, and in that connection he must have felt his father as in some way or other an interference. A conflict of this kind, I added, between sensuality and childish love was entirely typical. The remissions he had spoken of had occurred because the premature explosion of his sensual feelings had had as its immediate consequence a considerable diminution of their violence. It was not until he was once more seized with intense erotic desires that his hostility reappeared again owing to the revival of the old situation. I then got him to agree that I had not led him on to the subject either of childhood or of sex, but that he had raised them both of his own free will. - He then went on to ask why he had not simply come to a decision, at the time he was in love with the lady, that his father's interference with that love could not for a moment weigh against his love of his father. - I replied that it was scarcely possible to destroy a person in absentia. Such a decision would only have been possible if the wish that he took objection to had made its first appearance on that occasion; whereas, as a matter of fact, it was a long-repressed wish, towards which he could not behave otherwise than he had formerly done, and which was consequently immune from destruction. This wish (to get rid of his father as being an interference) must have originated at a time when circumstances had been very different - at a time, perhaps, when he had not loved his father more than the person whom he desired sensually, or when he was incapable of making a clear decision. It must have been in his very early childhood, therefore, before he had reached the age of six, and before the date at which his memory became continuous; and things must have remained in the same state ever since. - With this piece of construction our discussion was broken off for the time being.

[1909d, 2145]
To this unimpeachable body of evidence we shall be able to add fresh material, if we turn to the history of the masturbatory side of our patient's sexual activities. There is a conflict between the opinions of doctors and patients on this subject which has not hitherto been properly appreciated. The patients are unanimous in their belief that masturbation, by which they mean masturbation during puberty, is the root and origin of all their troubles. The doctors are, upon the whole, unable to decide what line to take; but, influenced by the knowledge that not only neurotics but most normal people pass through a period of masturbation during their puberty, the majority of them are inclined to dismiss the patients' assertions as gross exaggerations. In my opinion the patients are once again nearer to a correct view than the doctors; for the patients have some glimmering notion of the truth, while the doctors are in danger of overlooking an essential point. The thesis propounded by the patients certainly does not correspond to the facts in the sense in which they themselves construe it, namely, that masturbation during puberty (which may almost be described as a typical occurrence) is responsible for all neurotic disturbances. Their thesis requires interpretation. The masturbation of puberty is in fact not more than a revival of the masturbation of infancy, a subject which has hitherto invariably been neglected. Infantile masturbation reaches a kind of climax, as a rule, between the ages of three and four or five; and it is the clearest expression of a child's sexual constitution, in which the aetiology of subsequent neuroses must be sought. In this disguised way, therefore, the patients are putting the blame for their illnesses upon their infantile sexuality; and they are perfectly right in doing so. On the other hand, the problem of masturbation becomes insoluble if we attempt to treat it as a clinical unit, and forget that it can represent the discharge of every variety of sexual component and of every sort of phantasy to which such components can give rise. The injurious effects of masturbation are only in a very small degree autonomous - that is to say, determined by its own nature. They are in substance merely part and parcel of the pathogenic significance of the subject's sexual life as a whole. The fact that so many people can tolerate masturbation - that is, a certain amount of it - without injury merely shows that their sexual constitution and the course of development of their sexual life have been such as to allow them to exercise the sexual function within the limits of what is culturally permissible; whereas other people, because their sexual constitution has been less favourable or their development has been disturbed, fall ill as a result of their sexuality - they cannot, that is, achieve the necessary suppression or sublimation of their sexual components without having recourse to inhibitions or substitutes.¹

¹ [1909d, 2159]

The affectionate current is the older of the two. It springs from the earliest years of childhood; it is formed on the basis of the interests of the self-preservative instinct and is directed to the members of the family and those who look after the child. From the very beginning it carries along with it contributions from the sexual instincts - components of erotic interest - which can already be seen more or less clearly even in childhood and in any event are uncovered in neurotics by psycho-analysis later on. It corresponds to the child's primary object-choice. We learn in this way that the sexual instincts find their first objects by attaching themselves to the valuations made by the ego-instincts, precisely in the way in which the first sexual satisfactions are experienced in attachment to the bodily functions necessary for the preservation of life. The 'affection' shown by the child's parents and those who look after him, which seldom fails to betray its erotic nature ('the child is an erotic plaything'), does a very great deal to raise the contributions made by erotism to the cathexes of his ego-instincts, and to increase them to an amount which is bound to play a part in his later development, especially when certain other circumstances lend their support.

¹ [1912d, 2338]
Two factors will decide whether this advance in the developmental path of the libido is to fail. First, there is the amount of frustration in reality, which opposes the new object-choice and reduces its value for the person concerned. There is after all no point in embarking upon an object-choice if no choice is to be allowed at all or if there is no prospect of being able to choose anything suitable. Secondly, there is the amount of attraction which the infantile objects that have to be relinquished are able to exercise, and which is in proportion to the erotic cathexis attaching to them in childhood. If these two factors are sufficiently strong, the general mechanism by which the neuroses are formed comes into operation. The libido turns away from reality, is taken over by imaginative activity (the process of introversion), strengthens the images of the first sexual objects and becomes fixated to them. The obstacle raised against incest, however, compels the libido that has turned to these objects to remain in the unconscious. The masturbatory activity carried out by the sensual current, which is now part of the unconscious, makes its own contribution in strengthening this fixation. Nothing is altered in this state of affairs if the advance which has miscarried in reality is now completed in phantasy, and if in the phantasy-situations that lead to masturbatory satisfaction the original sexual objects are replaced by different ones. As a result of this substitution the phantasies become admissible to consciousness, but no progress is made in the allocation of the libido in reality. In this way it can happen that the whole of a young man's sensuality becomes tied to incestuous objects in the unconscious, or to put it another way, becomes fixated to unconscious incestuous phantasies. The result is then total impotence, which is perhaps further ensured by the simultaneous onset of an actual weakening of the organs that perform the sexual act.

However, this motive does not go deep enough either; besides, being bound up with civilized conditions, it fails to provide a satisfactory connection with the state of affairs among primitive people. All the more important, therefore, is the next factor, which is based on the evolution of the libido. We have learnt from analytic researches how universal and how powerful the earliest allocations of libido are. In these we are concerned with infantile sexual wishes which are clung to (in women usually a fixation of the libido on the father or a brother who takes his place) - wishes which frequently enough were directed towards other things than intercourse, or included it only as a dimly perceived goal. The husband is almost always so to speak only a substitute, never the right man; it is another man - in typical cases the father - who has first claim to a woman's love, the husband at most takes second place. It depends on how intense this fixation is and on how obstinately it is maintained whether the substitute is rejected as unsatisfying. Frigidity is thus among the genetic determinants of neuroses. The more powerful the psychical element in a woman's sexual life is, the greater will be the capacity for resistance shown by her distribution of libido to the upheaval of the first sexual act, and the less overpowering will be the effect which bodily possession of her can produce. Frigidity may then become established as a neurotic inhibition or provide the foundation for the development of other neuroses and even a moderate diminution of potency in the man will greatly contribute to help this process.
If, however, the derivation of perversions from the Oedipus complex can be generally established, our estimate of its importance will have gained added strength. For in our opinion the Oedipus complex is the actual nucleus of neuroses, and the infantile sexuality which culminates in this complex is the true determinant of neuroses. What remains of the complex in the unconscious represents the disposition to the later development of neuroses in the adult. In this way the beating-phantasy and other analogous perverse fixations would also only be precipitates of the Oedipus complex, scars, so to say, left behind after the process has ended, just as the notorious 'sense of inferiority' corresponds to a narcissistic scar of the same sort. In taking this view of the matter I must express my unreserved agreement with Marcinowski (1918), who has recently put it forward most happily. As is well known, this neurotic delusion of inferiority is only a partial one, and is completely compatible with the existence of a self-overvaluation derived from other sources. The origin of the Oedipus complex itself, and the destiny which compels man, probably alone among all animals, to begin his sexual life twice over, first like all other creatures in his early childhood, and then after a long interruption once more at the age of puberty - all the problems that are connected with man's 'archaic heritage' - have been discussed by me elsewhere, and I have no intention of going into them in this place. [1919e, 3654]

The theory of psycho-analysis (a theory based on observation) holds firmly to the view that the motive forces of repression must not be sexualized. Man's archaic heritage forms the nucleus of the unconscious mind; and whatever part of that heritage has to be left behind in the advance to later phases of development, because it is unserviceable or incompatible with what is new and harmful to it, falls a victim to the process of repression. This selection is made more successfully with one group of instincts than with the other. In virtue of special circumstances which have often been pointed out already, the latter group, that of the sexual instincts, are able to defeat the intentions of repression, and to enforce their representation by substitutive formations of a disturbing kind. For this reason infantile sexuality, which is held under repression, acts as the chief motive force in the formation of symptoms; and the essential part of its content, the Oedipus complex, is the nuclear complex of neuroses. I hope that in this paper I have raised an expectation that the sexual aberrations of childhood, as well as those of mature life, are ramifications of the same complex. [1919e, 3662]

In my own writings and in those of my followers more and more stress is laid on the necessity that the analyses of neurotics shall deal thoroughly with the remotest period of their childhood, the time of the early efflorescence of sexual life. It is only by examining the first manifestations of the patient's innate instinctual constitution and the effects of his earliest experiences that we can accurately gauge the motive forces that have led to his neurosis and can be secure against the errors into which we might be tempted by the degree to which things have become remodelled and overlaid in adult life. This requirement is not only of theoretical but also of practical importance, for it distinguishes our efforts from the work of those physicians whose interests are focused exclusively on therapeutic results and who employ analytic methods, but only up to a certain point. An analysis of early childhood such as we are considering is tedious and laborious and makes demands both upon the physician and upon the patient which cannot always be met. Moreover, it leads us into dark regions where there are as yet no sign posts. Indeed, analysts may feel reassured, I think, that there is no risk of their work becoming mechanical, and so of losing its interest, during the next few decades. [1925j, 4146]
The existence of the second, phylogenetic, factor, is based only upon inference. We have been led to assume its existence by a remarkable feature in the development of the libido. We have found that the sexual life of man, unlike that of most of the animals nearly related to him, does not make a steady advance from birth to maturity, but that, after an early efflorescence up till the fifth year, it undergoes a very decided interruption; and that it then starts on its course once more at puberty, taking up again the beginnings broken off in early childhood. This has led us to suppose that something momentous must have occurred in the vicissitudes of the human species which has left behind this interruption in the sexual development of the individual as a historical precipitate. This factor owes its pathogenic significance to the fact that the majority of the instinctual demands of this infantile sexuality are treated by the ego as dangers and fended off as such, so that the later sexual impulses of puberty, which in the natural course of things would be ego-syntonic, run the risk of succumbing to the attraction of their infantile prototypes and following them into repression. It is here that we come upon the most direct aetiology of the neuroses. It is a curious thing that early contact with the demands of sexuality should have a similar effect on the ego to that produced by premature contact with the external world.

We have heard how the weak and immature ego of the first period of childhood is permanently damaged by the stresses put upon it in its efforts to fend off the dangers that are peculiar to that period of life. Children are protected against the dangers that threaten them from the external world by the solicitude of their parents; they pay for this security by a fear of loss of love which would deliver them over helpless to the dangers of the external world. This factor exerts a decisive influence on the outcome of the conflict when a boy finds himself in the situation of the Oedipus complex, in which the threat to his narcissism by the danger of castration, reinforced from primaeval sources, takes possession of him. Driven by the combined operation of these two influences, the contemporary real danger and the remembered one with its phylogenetic basis, the child embarks on his attempts at defence - repressions - which are effective for the moment but nevertheless turn out to be psychologically inadequate when the later re-animation of sexual life brings a reinforcement to the instinctual demands which have been repudiated in the past. If this is so, it would have to be said from a biological standpoint that the ego comes to grief over the task of mastering the excitations of the early sexual period, at a time when its immaturity makes it incompetent to do so. It is in this lagging of ego development behind libidinal development that we see the essential precondition of neurosis; and we cannot escape the conclusion that neuroses could be avoided if the childish ego were spared this task - if, that is to say, the child's sexual life were allowed free play, as happens among many primitive peoples. It may be that the aetiology of neurotic illnesses is more complicated than we have here described it; if so, we have at least brought out one essential part of the aetiological complex. Nor should we forget the phylogenetic influences, which are represented in some way in the id in forms that we are not yet able to grasp, and which must certainly act upon the ego more powerfully in that early period than later. On the other hand, the realization dawns on us that such an early attempt at damming up the sexual instinct, so decided a partisanship by the young ego in favour of the external as opposed to the internal world, brought about by the prohibition of infantile sexuality, cannot be without its effect on the individual's later readiness for culture. The instinctual demands forced away from direct satisfaction are compelled to enter on new paths leading to substitutive satisfaction, and in the course of these détours they may become desexualized and their connection with their original instinctual aims may become looser. And at this point we may anticipate the thesis that many of the highly valued assets of our civilization were acquired at the cost of sexuality and by the restriction of sexual motive forces.

[1926d, 4309]

[1940a [1938], 5006]
If a furious raging against one's own integrity and one's own life can be hidden in this way behind apparently accidental clumsiness and motor inefficiency, it is not a very large step to find it possible to transfer the same view to mistakes that seriously endanger the lives and health of other people. What evidence I have to show that this view is a valid one is drawn from my experience with neurotics, and thus does not wholly meet the demands of the situation. I will give an account of a case in which something that was not strictly a faulty action but that rather deserves the name of a symptomatic or chance action gave me the clue which subsequently made it possible to resolve the patient's conflict. I once undertook the task of bringing an improvement to the marriage of a very intelligent man, whose disagreements with his fondly attached young wife could undoubtedly be shown to have a real basis, but could not, as he himself admitted, be completely accounted for in that way. He was continually occupied with the thought of a divorce, which he then dismissed once more because of his warm love for his two small children. In spite of this he constantly returned to his intention and made no attempt to find a way of making the situation tolerable to himself. Such inability to deal with a conflict is taken by me as proof that unconscious and repressed motives have lent a hand in strengthening the conscious ones which are struggling against each other, and I undertake in such cases to end the conflict by psychical analysis. One day the man told me of a small incident which had frightened him extremely. He was romping with his elder child, who was by far his favourite; he was swinging him high in the air and down again, and once he swung him so high while he was standing at a particular spot that the top of the child's head almost struck the heavy gas chandelier that was hanging there. Almost, but not quite - or perhaps just! No harm came to the child, but it was made giddy with fright. The father stood horrified with the child in his arms, and the mother had a hysterical attack. The peculiar adroitness of this imprudent movement and the violence of the parents' reaction prompted me to look for a symptomatic act in this accident - one which aimed at expressing an evil intention directed against the beloved child. I was able to remove the contradiction between this and the father's contemporary affection for his child by shifting the impulse to injure it back to the time when this child had been the only one and had been so small that its father had not yet had any reason to take an affectionate interest in it. It was then easy for me to suppose that, as he was getting little satisfaction from his wife, he may at that time have had a thought or formed a decision of this kind: 'If this little creature that means nothing at all to me dies, I shall be free and able to get a divorce.' A wish for the death of the creature that he now loved so dearly must therefore have persisted unconsciously. From this point it was easy to find the path by which this wish had become unconsciously fixated. A powerful determinant was in fact provided by a memory from the patient's childhood: namely that the death of a small brother, for which his mother blamed his father's negligence, had led to violent quarrels between the parents and threats of a divorce. The subsequent course of my patient's marriage, as well as my therapeutic success, confirmed my conjecture.
Nor do I know whether Herr K. would have done any better if it had been revealed to him that the slap Dora gave him by no means signified a final 'No' on her part, but that it expressed the jealousy which had lately been roused in her, while her strongest feelings were still on his side. If he had disregarded that first 'No', and had continued to press his suit with a passion which left room for no doubts, the result might very well have been a triumph of the girl's affection for him over all her internal difficulties. But I think she might just as well have been merely provoked into satisfying her craving for revenge upon him all the more thoroughly. It is never possible to calculate towards which side the decision will incline in such a conflict of motives: whether towards the removal of the repression or towards its reinforcement. Incapacity for meeting a real erotic demand is one of the most essential features of a neurosis. Neurotics are dominated by the opposition between reality and phantasy. If what they long for the most intensely in their phantasies is presented to them in reality, they none the less flee from it; and they abandon themselves to their phantasies the most readily where they need no longer fear to see them realized. Nevertheless, the barrier erected by repression can fall before the onslaught of a violent emotional excitement produced by a real cause; it is possible for a neurosis to be overcome by reality. But we have no general means of calculating through what person or what event such a cure can be effected.¹

¹ I will add a few remarks on the structure of this dream, though it is not possible to understand it thoroughly enough to allow of a synthesis being attempted. A prominent piece of the dream is to be seen in the phantasy of revenge against her father, which stands out like a façade in front of the rest. (She had gone away from home by her own choice; her father was ill, and then dead. . . Then she went home; all the others were already at the cemetery. She went to her room, not the least sadly, and calmly began reading the encyclopaedia.) This part of the material also contained two allusions to her other act of revenge, which she had actually carried out, when she let her parents discover a farewell letter from her. (The letter - from her mother, in the dream and the mention of the funeral of the aunt who had always been her model.) Behind this phantasy lie concealed her thoughts of revenge against Herr K., for which she found an outlet in her behaviour to me. (The maidservant, the invitation, the wood, the two and a half hours - all these came from material connected with the events at L--.) Her recollection of the governess, and of the latter's exchange of letters with her parents, is related, no less than her farewell letter, to the letter in the dream allowing her to come home. Her refusal to let herself be accompanied and her decision to go alone may perhaps be translated into these words: 'Since you have treated me like a servant, I shall take no more notice of you, I shall go my own way by myself, and not marry.' - Screened by these thoughts of revenge, glimpses can be caught in other places of material derived from tender phantasies based upon the love for Herr K. which still persisted unconsciously in Dora. ('I would have waited for you till I could be your wife' - defloration - childbirth.) - Finally, we can see the action of the fourth and most deeply buried group of thoughts - those relating to her love for Frau K. - in the fact that the phantasy of defloration is represented from the man's point of view (her identification of herself with her admirer who lived abroad) and in the fact that in two places there are the clearest allusions to ambiguous speeches ('Does Herr -- live here?') and to that source of her sexual knowledge which had not been oral (the encyclopaedia). - Cruel and sadistic tendencies find satisfaction in this dream.

Now that the flood-waters of war have subsided, it is satisfactory to be able to record the fact that interest in psycho-analytic research remains unimpaired in the world at large. But the different parts of the theory have not all had the same history. The purely psychological theses and findings of psycho-analysis on the unconscious, repression, conflict as a cause of illness, the advantage accruing from illness, the mechanisms of the formation of symptoms, etc., have come to enjoy increasing recognition and have won notice even from those who are in general opposed to our views. That part of the theory, however, which lies on the frontiers of biology and the foundations of which are contained in this little work is still faced with undiminished contradiction. It has even led some who for a time took a very active interest in psycho-analysis to abandon it and to adopt fresh views which were intended to restrict once more the part played by the factor of sexuality in normal and pathological mental life.

[1905e, 1445]

[1905d, 1462]
At this juncture another remark is perhaps not out of place. I know that the emphasis which I lay upon the part played by sexuality in creating the psychoneuroses has become generally known. But I know, too, that qualifications and exact particularization are of little use with the general public; there is very little room in the memory of the multitude; it only retains the bare gist of any thesis and fabricates an extreme version which is easy to remember. It may be, too, that some physicians vaguely apprehend the content of my doctrine to be that I regard sexual privation as the ultimate cause of the neuroses. In the conditions of life in modern society there is certainly no lack of sexual privation. On this basis, would it not be simpler to aim directly at recovery by recommending sexual activity as a therapeutic measure, instead of pursuing the circuitous and laborious path of mental treatment? (I know of nothing which could impel me to suppress such an inference if it were justified. The real state of things, however, is otherwise. Sexual need and privation are merely one factor at work in the mechanism of neurosis; if there were no others the result would be dissipation, not disease. The other, no less essential, factor, which is all too readily forgotten, is the neurotic's aversion from sexuality, his incapacity for loving, that feature of the mind which I have called 'repression'. Not until there is a conflict between the two tendencies does nervous illness break out, and therefore to advise sexual activity in the psychoneuroses can only very rarely be described as good advice. 

Further information now became available relating to people who had remained normal; and this led to the unexpected finding that the sexual history of their childhood did not necessarily differ in essentials from that of neurotics, and, in particular, that the part played by seduction was the same in both cases. As a consequence, accidental influences receded still further into the background as compared with 'repression' (as I now began to say instead of 'defence'). Thus it was no longer a question of what sexual experiences a particular individual had had in his childhood, but rather of his reaction to those experiences - of whether he had reacted to them by 'repression' or not. It could be shown how in the course of development a spontaneous infantile sexual activity was often broken off by an act of repression. Thus a mature neurotic individual was invariably pursued by a certain amount of 'sexual repression' from his childhood; this found expression when he was faced by the demands of real life, and the psycho-analyses of hysterics showed that they fell ill as a result of the conflict between their libido and their sexual repression and that their symptoms were in the nature of compromises between the two mental currents.

It may be in consequence of disregarding these three preconditions that so many other psychopathic characters are as unserviceable on the stage as they are in real life. For the victim of a neurosis is someone into whose conflict we can gain no insight if we first meet it in a fully established state. But, per contra, if we recognize the conflict, we forget that he is a sick man, just as, if he himself recognizes it, he ceases to be ill. It would seem to be the dramatist's business to induce the same illness in us; and this can best be achieved if we are made to follow the development of the illness along with the sufferer. This will be especially necessary where the repression does not already exist in us but has first to be set up; and this represents a step further than Hamlet in the use of neurosis on the stage. If we are faced by an unfamiliar and fully established neurosis, we shall be inclined to send for the doctor (just as we do in real life) and pronounce the character inadmissible to the stage.
Thus in the very first products of Hanold's delusional phantasies and actions we already find a double set of determinants, a derivation from two different sources. One of these is the one that was manifest to Hanold himself, the other is the one which is revealed to us when we examine his mental processes. One of them, looked at from Hanold's point of view, was conscious to him, the other was completely unconscious to him. One of them was derived wholly from the circle of ideas of the science of archaeology, the other arose from the repressed childhood memories that had become active in him and from the emotional instincts attached to them. One might be described as lying on the surface and covering the other, which was, as it were, concealed behind it. The scientific motivation might be said to serve as a pretext for the unconscious erotic one, and science had put itself completely at the service of the delusion. It should not be forgotten, however, that the unconscious determinants could not effect anything that did not simultaneously satisfy the conscious, scientific ones. The symptoms of a delusion - phantasies and actions alike - are in fact the products of compromise between the two mental currents, and in a compromise account is taken of the demands of each of the two parties to it; but each side must also renounce a part of what it wanted to achieve. Where a compromise comes about it must have been preceded by a struggle - in this case it was the conflict we have assumed between suppressed erotism and the forces that were keeping it in repression. In the formation of a delusion this struggle is in fact unending. Assault and resistance are renewed after the construction of each compromise, which is never, so to speak, entirely satisfying. Our author too is aware of this, and that is why he makes a peculiar unrest dominate this stage of his hero's disorder, as a precursor and guarantee of further developments.

[1907a, 1850]

The development of Norbert Hanold's delusion proceeded with a dream which, since it was not occasioned by any new event, seems to have arisen entirely out of his mind, filled as it was by a conflict. But let us pause before we enquire whether, in the construction of his dreams, too, the author meets our expectation that he possesses a deep understanding. Let us ask first what psychiatric science has to say to his hypotheses about the origin of a delusion and what attitude it takes to the part played by repression and the unconscious, to conflict and to the formation of compromises. In short, let us ask whether this imaginative representation of the genesis of a delusion can hold its own before the judgement of science.

[1907a, 1850]
And here we must give what will perhaps be an unexpected answer. In fact the situation is quite the reverse: it is science that cannot hold its own before the achievement of the author. Science allows a gulf to yawn between the hereditary and constitutional preconditions of a delusion and its creations, which seem to emerge ready-made - a gulf which we find that our author has filled. Science does not as yet suspect the importance of repression, it does not recognize that in order to explain the world of psychopathological phenomena the unconscious is absolutely essential, it does not look for the basis of delusions in a psychical conflict, and it does not regard their symptoms as compromises. Does our author stand alone, then, in the face of united science? No, that is not the case (if, that is, I may count my own works as part of science), since for a number of years - and, until recently, more or less alone¹ - I myself have supported all the views that I have here extracted from Jensen's *Gradiva* and stated in technical terms. I indicated, in most detail in connection with the states known as hysteria and obsessions, that the individual determinant of these psychical disorders is the suppression of a part of instinctual life and the repression of the ideas by which the suppressed instinct is represented, and soon afterwards I repeated the same views in relation to some forms of delusion.² The question whether the instincts concerned in this causation are always components of the sexual instinct or may be of another kind as well is a problem which may be regarded as a matter of indifference in the particular case of the analysis of *Gradiva*; for in the instance chosen by our author what was at issue was quite certainly nothing other than the suppression of erotic feelings. The validity of the hypotheses of psychical conflict and of the formation of symptoms by means of compromises between the two mental currents struggling against each other has been demonstrated by me in the case of patients observed and medically treated in real life, just as I have been able to in the imaginary case of Norbert Hanold.³ Even before me, Pierre Janet, a pupil of the great Charcot, and Josef Breuer, in collaboration with me, had traced back the products of neurotic, and especially of hysterical, illness to the power of unconscious thoughts.⁴

[1907a, 1851]

This obscure region of the story is made intelligible to us by some explanations which we derive from the later remarks of Zoe Bertgang. It was in fact the original of Gradiva, Fräulein Zoe herself, whom Hanold saw out of his window walking past in the street (89.) and whom he nearly overtook. If this had happened, the information given him by the dream - that she was in fact living at the same time and in the same town as he was - would by a lucky chance have received an irresistible confirmation, which would have brought about the collapse of his internal struggle. But the canary, whose singing sent Hanold off on his distant journey, belonged to Zoe, and its cage stood in her window diagonally across the street from Hanold's house. (135.) Hanold, who, according to the girl's accusation, had the gift of 'negative hallucination', who possessed the art of not seeing and not recognizing people who were actually present, must from the first have had an unconscious knowledge of what we only learned later. The indications of Zoe's proximity (her appearance in the street and her bird's singing so near his window) intensified the effect of the dream, and in this position, so perilous for his resistance to his erotic feelings, he took to flight. His journey was a result of his resistance gathering new strength after the surge forward of his erotic desires in the dream; it was an attempt at flight from the physical presence of the girl he loved. In a practical sense it meant a victory for repression, just as his earlier activity, his 'pedestrian researches' upon women and girls, had meant a victory for erotism. But everywhere in these oscillations in the struggle the compromise character of the outcome was preserved: the journey to Pompeii, which was supposed to lead him away from the living Zoe, led him at least to her surrogate, to Gradiva. The journey which was undertaken in defiance of the latent dream-thoughts, was nevertheless following the path to Pompeii that was pointed out by the manifest content of the dream. Thus at every fresh struggle between erotism and resistance we find the delusion triumphant.

[1907a, 1862]
Thus the author has drawn the closest link between the clearing up of the delusion and the outbreak of a craving for love, and he has paved the way for the inevitable outcome in a courtship. He knows the essential nature of the delusion better than his critics: he knows that a component of loving desire had combined with a component of resistance to it in bringing about the delusion, and he makes the girl who undertakes the cure sensitive to the element in Hanold's delusion which is agreeable to her. It was only this knowledge which could decide her to devote herself to the treatment; it was only the certainty of being loved by him that could induce her to admit her love to him. The treatment consisted in giving him back from outside the repressed memories which he could not set free from inside; but it would have had no effect if in the course of it the therapist had not taken his feelings into account and if her ultimate translation of the delusion had not been: 'Look, all this only means that you love me. [1907a, 1881]

These considerations have been based so far on the requirement laid down by the second of the stages of civilization which we have postulated, the requirement that every sexual activity of the kind described as perverse is prohibited, while what is called normal sexual intercourse is freely permitted. We have found that even when the line between sexual freedom and restriction is drawn at this point, a number of individuals are ruled out as perverts, and a number of others, who make efforts not to be perverts whilst constitutionally they should be so, are forced into nervous illness. It is easy to predict the result that will follow if sexual freedom is still further circumscribed and the requirements of civilization are raised to the level of the third stage, which bans all sexual activity outside legal marriage. The number of strong natures who openly oppose the demands of civilization will increase enormously, and so will the number of weaker ones who, faced with the conflict between the pressure of cultural influences and the resistance of their constitution, take flight into neurotic illness. [1908d, 1955]

I ask any well-informed person to bear witness to the fact that I am not exaggerating but that I am describing a state of affairs of which equally bad instances can be observed over and over again. To the uninitiated it is hardly credible how seldom normal potency is to be found in a husband and how often a wife is frigid among married couples who live under the dominance of our civilized sexual morality, what a degree of renunciation, often on both sides, is entailed by marriage, and to what narrow limits married life - the happiness that is so ardently desired - is narrowed down. I have already explained that in these circumstances the most obvious outcome is nervous illness; but I must further point out the way in which a marriage of this kind continues to exercise its influence on the few children, or the only child born of it. At a first glance, it seems to be a case of transmission by inheritance; but closer inspection shows that it is really a question of the effect of powerful infantile impressions. A neurotic wife who is unsatisfied by her husband is, as a mother, over-tender and over-anxious towards her child, on to whom she transfers her need for love; and she awakens it to sexual precocity. The bad relations between its parents, moreover, excite its emotional life and cause it to feel love and hatred to an intense degree while it is still at a very tender age. Its strict upbringing, which tolerates no activity of the sexual life that has been aroused so early, lends support to the suppressing force and this conflict at such an age contains everything necessary for bringing about lifelong nervous illness. [1908d, 1961]
I shall now proceed to what I hope will be a brief discussion of how far little Hans's phobia offers any contribution of general importance to our views upon the life and upbringing of children. But before doing so I must return to the objection which has so long been held over, and according to which Hans was a neurotic, a 'degenerate' with a bad heredity, and not a normal child, knowledge about whom could be applied to other children. I have for some time been thinking with pain of the way in which the adherents of 'the normal person' will fall upon poor little Hans as soon as they are told that he can in fact be shown to have had a hereditary taint. His beautiful mother fell ill with a neurosis as a result of a conflict during her girlhood. I was able to be of assistance to her at the time, and this had in fact been the beginning of my connection with Hans's parents. It is only with the greatest diffidence that I venture to bring forward one or two considerations in his favour.

The events in his sixth or seventh year which the patient described in the first hour of his treatment were not merely, as he supposed, the beginning of his illness, but were already the illness itself. It was a complete obsessional neurosis, wanting in no essential element, at once the nucleus and the prototype of the later disorder, - an elementary organism, as it were, the study of which could alone enable us to obtain a grasp of the complicated organization of his subsequent illness. The child, as we have seen, was under the domination of a component of the sexual instinct, the desire to look, as a result of which there was a constant recurrence in him of a very intense wish connected with persons of the female sex who pleased him - the wish, that is, to see them naked. This wish corresponds to the later obsessional or compulsive idea; and if the quality of compulsion was not yet present in the wish, this was because the ego had not yet placed itself in complete opposition to it and did not yet regard it as something foreign to itself. Nevertheless, opposition to this wish from some source or other was already in activity, for its occurrence was regularly accompanied by a distressing affect.¹ A conflict was evidently in progress in the mind of this young libertine. Side by side with the obsessive wish, and intimately associated with it, was an obsessive fear: every time he had a wish of this kind he could not help fearing that something dreadful would happen. This something dreadful was already clothed in a characteristic indeterminateness which was thenceforward to be an invariable feature of every manifestation of the neurosis. But in a child it is not hard to discover what it is that is veiled behind an indeterminateness of this kind. If the patient can once be induced to give a particular instance in place of the vague generalities which characterize an obsessional neurosis, it may be confidently assumed that the instance is the original and actual thing which has tried to hide itself behind the generalization. Our present patient's obsessive fear, therefore, when restored to its original meaning, would run as follows: 'If I have this wish to see a woman naked, my father will be bound to die.' The distressing affect was distinctly coloured with a tinge of uncanniness and superstition, and was already beginning to give rise to impulses to do something to ward off the impending evil. These impulses were subsequently to develop into the protective measures which the patient adopted.

If we apply knowledge gained elsewhere to this case of childhood neurosis, we shall not be able to avoid a suspicion that in this instance as in others (that is to say, before the child had reached his sixth year) there had been conflicts and repressions, which had themselves been overtaken by amnesia, but had left behind them as a residuum the particular content of this obsessive fear. Later on we shall learn how far it is possible for us to rediscover those forgotten experiences or to reconstruct them with some degree of certainty. In the meantime stress may be laid on the fact, which is probably more than a mere coincidence, that the patient's infantile amnesia ended precisely with his sixth year.
He admitted that all of this sounded quite plausible, but he was naturally not in the very least convinced by it. He would venture to ask, he said, how it was that an idea of this kind could have remissions, how it could appear for a moment when he was twelve years old, and again when he was twenty, and then once more two years later, this time for good. He could not believe that his hostility had been extinguished in the intervals, and yet during them there had been no sign of self-reproaches. - To this I replied that whenever any one asked a question like that, he was already prepared with an answer; he needed only to be encouraged to go on talking. - He then proceeded, somewhat disconnectedly as it seemed, to say that he had been his father's best friend, and that his father had been his. Except on a few subjects, upon which fathers and sons usually hold aloof from one another - (What could he mean by that?) -, there had been a greater intimacy between them than there now was between him and his best friend. As regards the lady for whose sake he had sacrificed his father in that idea of his, it was true that he had loved her very much, but he had never felt really sensual wishes towards her, such as he had constantly had in his childhood. Altogether, in his childhood his sensual impulses had been much stronger than during his puberty. - At this I told him I thought he had now produced the answer we were waiting for, and had at the same time discovered the third great characteristic of the unconscious. The source from which his hostility to his father derived its indestructibility was evidently something in the nature of sensual desires, and in that connection he must have felt his father as in some way or other an interference. A conflict of this kind, I added, between sensuality and childish love was entirely typical. The remissions he had spoken of had occurred because the premature explosion of his sensual feelings had had as its immediate consequence a considerable diminution of their violence. It was not until he was once more seized with intense erotic desires that his hostility reappeared again owing to the revival of the old situation. I then got him to agree that I had not led him on to the subject either of childhood or of sex, but that he had raised them both of his own free will. - He then went on to ask why he had not simply come to a decision, at the time he was in love with the lady, that his father's interference with that love could not for a moment weigh against his love of his father. - I replied that it was scarcely possible to destroy a person in absentia. Such a decision would only have been possible if the wish that he took objection to had made its first appearance on that occasion; whereas, as a matter of fact, it was a long-repressed wish, towards which he could not behave otherwise than he had formerly done, and which was consequently immune from destruction. This wish (to get rid of his father as being an interference) must have originated at a time when circumstances had been very different - at a time, perhaps, when he had not loved his father more than the person whom he desired sensually, or when he was incapable of making a clear decision. It must have been in his very early childhood, therefore, before he had reached the age of six, and before the date at which his memory became continuous; and things must have remained in the same state ever since. - With this piece of construction our discussion was broken off for the time being.

[1909d, 2145]
But I must now return to a more detailed examination of the precipitating cause of our present patient's illness. His mother was brought up in a wealthy family with which she was distantly connected. This family carried on a large industrial concern. His father, at the time of his marriage, had been taken into the business, and had thus by his marriage made himself a fairly comfortable position. The patient had learnt from some chaff exchanged between his parents (whose marriage was an extremely happy one) that his father, some time before making his mother's acquaintance, had made advances to a pretty but penniless girl of humble birth. So much by way of introduction. After his father's death the patient's mother told him one day that she had been discussing his future with her rich relations, and that one of her cousins had declared himself ready to let him marry one of his daughters when his education was completed; a business connection with the firm would offer him a brilliant opening in his profession. This family plan stirred up in him a conflict as to whether he should remain faithful to the lady he loved in spite of her poverty, or whether he should follow in his father's footsteps and marry the lovely, rich, and well-connected girl who had been assigned to him. And he resolved this conflict, which was in fact one between his love and the persisting influence of his father's wishes, by falling ill; or, to put it more correctly, by falling ill he avoided the task of resolving it in real life.¹

From the precipitating cause of the patient's illness in his adult years there was a thread leading back to his childhood. He had found himself in a situation similar to that in which, as he knew or suspected, his father had been before his marriage; and he had thus been able to identify himself with his father. But his dead father was involved in his recent attack in yet another way. The conflict at the root of his illness was in essentials a struggle between the persisting influence of his father's wishes and his own amatory predilections. If we take into consideration what the patient reported in the course of the first hours of his treatment, we shall not be able to avoid a suspicion that this struggle was a very ancient one and had arisen as far back as in his childhood.

Let us, further, picture to ourselves the general conditions under which the formation of the patient's great obsessional idea occurred. His libido had been increased by a long period of abstinence coupled with the friendly welcome which a young officer can always reckon upon receiving when he goes among women. Moreover, at the time when he had started for the manoeuvres, there had been a certain coolness between himself and his lady. This intensification of his libido had inclined him to a renewal of his ancient struggle against his father's authority, and he had dared to think of having sexual intercourse with other women. His loyalty to his father's memory had grown weaker, his doubts as to his lady's merits had increased; and in that frame of mind he let himself be dragged into insulting the two of them, and had then punished himself for it. In doing so he had copied an old model. And when at the end of the manoeuvres he had hesitated so long whether he should travel to Vienna or whether he should stop and fulfil his vow, he had represented in a single picture the two conflicts by which he had from the very first been torn - whether or no he should remain obedient to his father and whether or no he should remain faithful to his beloved.¹

[1909d, 2156]

[1909d, 2158]

[1909d, 2170]
If we wish to obtain a grasp of the psychical forces whose interplay built up this neurosis, we must turn back to what we have learnt from the patient on the subject of the precipitating causes of his falling ill as a grown-up man and as a child. He fell ill when he was in his twenties on being faced with a temptation to marry another woman instead of the one whom he had loved so long; and he avoided a decision of this conflict by postponing all the necessary preliminary actions. The means for doing this was given him by his neurosis. His hesitation between the lady he loved and the other girl can be reduced to a conflict between his father's influence and his love for his lady, or, in other words, to a conflicting choice between his father and his sexual object, such as had already subsisted (judging from his recollections and obsessional ideas) in his remote childhood. All through his life, moreover, he was unmistakably victim to a conflict between love and hatred, in regard both to his lady and to his father. His phantasies of revenge and such obsessional phenomena as his obsession for understanding and his exploit with the stone in the road bore witness to his divided feelings; and they were to a certain degree comprehensible and normal, for the lady by her original refusal and subsequently by her coolness had given him some excuse for hostility. But his relations with his father were dominated by a similar division of feeling, as we have seen from our translation of his obsessional thoughts; and his father, too, must have given him an excuse for hostility in his childhood, as indeed we have been able to establish almost beyond question. His attitude towards the lady - a compound of tenderness and hostility - came to a great extent within the scope of his conscious knowledge; at most he deceived himself over the degree and violence of his negative feelings. But his hostility towards his father, on the contrary, though he had once been acutely conscious of it, had long since vanished from his ken, and it was only in the teeth of the most violent resistance that it could be brought back into his consciousness. We may regard the repression of his infantile hatred of his father as the event which brought his whole subsequent career under the dominion of the neurosis.

The conflicts of feeling in our patient which we have here enumerated separately were not independent of each other, but were bound together in pairs. His hatred of his lady was inevitably coupled with his attachment to his father, and inversely his hatred of his father with his attachment to his lady. But the two conflicts of feeling which result from this simplification - namely, the opposition between his relation to his father and to his lady, and the contradiction between his love and his hatred within each of these relations - had no connection whatever with each other, either in their content or in their origin. The first of these two conflicts corresponds to the normal vacillation between male and female which characterizes every one's choice of a love-object. It is first brought to the child's notice by the time-honoured question: 'Which do you love most, Daddy or Mummy?' and it accompanies him through his whole life, whatever may be the relative intensity of his feelings to the two sexes or whatever may be the sexual aim upon which he finally becomes fixed. But normally this opposition soon loses the character of a hard-and-fast contradiction, of an inexorable 'either-or'. Room is found for satisfying the unequal demands of both sides, although even in a normal person the higher estimation of one sex is always thrown into relief by a depreciation of the other.
The other conflict, that between love and hatred, strikes us more strangely. We know that incipient love is often perceived as hatred, and that love, if it is denied satisfaction, may easily be partly converted into hatred, and poets tell us that in the more tempestuous stages of love the two opposed feelings may subsist side by side for a while as though in rivalry with each other. But the chronic co-existence of love and hatred, both directed towards the same person and both of the highest degree of intensity, cannot fail to astonish us. We should have expected that the passionate love would long ago have conquered the hatred or been devoured by it. And in fact such a protracted survival of two opposites is only possible under quite peculiar psychological conditions and with the co-operation of the state of affairs in the unconscious. The love has not succeeded in extinguishing the hatred but only in driving it down into the unconscious; and in the unconscious the hatred, safe from the danger of being destroyed by the operations of consciousness, is able to persist and even to grow. In such circumstances the conscious love attains as a rule, by way of reaction, an especially high degree of intensity, so as to be strong enough for the perpetual task of keeping its opponent under repression. The necessary condition for the occurrence of such a strange state of affairs in a person's erotic life appears to be that at a very early age, somewhere in the prehistoric period of his infancy, the two opposites should have been split apart and one of them, usually the hatred, have been repressed.¹

The further question could then be raised as to what these forces were and what the determinants were of the repression in which we now recognized the pathogenic mechanism of hysteria. A comparative study of the pathogenic situations which we had come to know through the cathartic procedure made it possible to answer this question. All these experiences had involved the emergence of a wishful impulse which was in sharp contrast to the subject's other wishes and which proved incompatible with the ethical and aesthetic standards of his personality. There had been a short conflict, and the end of this internal struggle was that the idea which had appeared before consciousness as the vehicle of this irreconcilable wish fell a victim to repression, was pushed out of consciousness with all its attached memories, and was forgotten. Thus the incompatibility of the wish in question with the patient's ego was the motive for the repression; the subject's ethical and other standards were the repressing forces. An acceptance of the incompatible wishful impulse or a prolongation of the conflict would have produced a high degree of unpleasure; this unpleasure was avoided by means of repression, which was thus revealed as one of the devices serving to protect the mental personality.

You will now see in what it is that the difference lies between our view and Janet's. We do not derive the psychical splitting from an innate incapacity for synthesis on the part of the mental apparatus; we explain it dynamically, from the conflict of opposing mental forces and recognize it as the outcome of an active struggling on the part of the two psychical groupings against each other. But our view gives rise to a large number of fresh problems. Situations of mental conflict are, of course, exceedingly common; efforts by the ego to ward off painful memories are quite regularly to be observed without their producing the result of a mental split. The reflection cannot be escaped that further determinants must be present if the conflict is to lead to dissociation. I will also readily grant you that the hypothesis of repression leaves us not at the end but at the beginning of a psychological theory. We can only go forward step by step however, and complete knowledge must await the results of further and deeper researches.
To put the matter more directly. The investigation of hysterical patients and of other neurotics leads us to the conclusion that their repression of the idea to which the intolerable wish is attached has been a failure. It is true that they have driven it out of consciousness and out of memory and have apparently saved themselves a large amount of unpleasure. But the repressed wishful impulse continues to exist in the unconscious. It is on the look-out for an opportunity of being activated, and when that happens it succeeds in sending into consciousness a disguised and unrecognizable substitute for what had been repressed, and to this there soon become attached the same feelings of unpleasure which it was hoped had been saved by the repression. This substitute for the repressed idea - the symptom - is proof against further attacks from the defensive ego; and in place of the short conflict an ailment now appears which is not brought to an end by the passage of time. Alongside the indication of distortion in the symptom, we can trace in it the remains of some kind of indirect resemblance to the idea that was originally repressed. The paths along which the substitution was effected can be traced in the course of the patient's psycho-analytic treatment; and in order to bring about recovery, the symptom must be led back along the same paths and once more turned into the repressed idea. If what was repressed is brought back again into conscious mental activity - a process which presupposes the overcoming of considerable resistances - the resulting psychical conflict, which the patient had tried to avoid, can, under the physician's guidance, reach a better outcome than was offered by repression. There are a number of such opportune solutions, which may bring the conflict and the neurosis to a happy end, and which may in certain instances be combined. The patient's personality may be convinced that it has been wrong in rejecting the pathogenic wish and may be led into accepting it wholly or in part; or the wish itself may be directed to a higher and consequently unobjectionable aim (this is what we call its 'sublimation'); or the rejection of the wish may be recognized as a justifiable one, but the automatic and therefore inefficient mechanism of repression may be replaced by a condemning judgement with the help of the highest human mental functions - conscious control of the wish is attained.

Let us return to our more serious case. A certain number of people, faced in their lives by conflicts which they have found too difficult to solve, have taken flight into neurosis and in this way won an unmistakable, although in the long run too costly, gain from illness. What will these people have to do if their flight into illness is barred by the indiscreet revelations of psycho-analysis? They will have to be honest, confess to the instincts that are at work in them, face the conflict, fight for what they want, or go without it; and the tolerance of society, which is bound to ensue as a result of psycho-analytic enlightenment, will help them in their task.

Psycho-analysis, too, accepts the assumptions of dissociation and the unconscious, but relates them differently to each other. Its view is a dynamic one, which traces mental life back to an interplay between forces that favour or inhibit one another. If in any instance one group of ideas remains in the unconscious, psycho-analysis does not infer that there is a constitutional incapacity for synthesis which is showing itself in this particular dissociation, but maintains that the isolation and state of unconsciousness of this group of ideas have been caused by an active opposition on the part of other groups. The process owing to which it has met with this fate is known as 'repression' and we regard it as something analogous to a condemning judgement in the field of logic. Psycho-analysis points out that repression of this kind play an extraordinarily important part in our mental life, but that they may also frequently fail and that such failures of repression are the precondition of the formation of symptoms.
It is true that psycho-analysis puts forward absence of sexual satisfaction as the cause of nervous disorders. But does it not say more than this? Is its teaching to be ignored as too complicated when it declares that nervous symptoms arise from a conflict between two forces - on the one hand, the libido (which has as a rule become excessive), and on the other, a rejection of sexuality, or a repression which is over-severe? No one who remembers this second factor, which is by no means secondary in importance, can ever believe that sexual satisfaction in itself constitutes a remedy of general reliability for the sufferings of neurotics. A good number of these people are, indeed, either in their actual circumstances or in general incapable of satisfaction. If they were capable of it, if they were without their inner resistances, the strength of the instinct itself would point the way to satisfaction for them even though no doctor advised it. What is the good, therefore, of medical advice such as that supposed to have been given to this lady?

[1910k, 2376]

Any one who was more daring than I am in making interpretations, or who was in touch with Schreber's family and consequently better acquainted with the society in which he moved and the small events of his life, would find it an easy matter to trace back innumerable details of his delusions to their sources and so discover their meaning, and this in spite of the censorship to which the Denkwürdigkeiten have been subjected. But as it is, we must necessarily content ourselves with this shadowy sketch of the infantile material which was used by the paranoid disorder in portraying the current conflict.

[1911c, 2428]

Perhaps I may be allowed to add a few words with a view to establishing the causes of this conflict that broke out in relation to the feminine wishful phantasy. As we know, when a wishful phantasy makes its appearance, our business is to bring it into connection with some frustration, some privation in real life. Now Schreber admits having suffered a privation of the kind. His marriage, which he describes as being in other respects a happy one, brought him no children; and in particular it brought him no son who might have consoled him for the loss of his father and brother and upon whom he might have drained off his unsatisfied homosexual affections.¹ His family line threatened to die out, and it seems that he felt no little pride in his birth and lineage. "Both the Flechtsigs and the Schrebers were members of "the highest nobility of Heaven", as the phrase went. The Schrebers in particular bore the title of "Margraves of Tuscany and Tasmania"; for souls, urged by some sort of personal vanity, have a custom of adorning themselves with somewhat high-sounding titles borrowed from this world."² (24.) The great Napoleon obtained a divorce from Josephine (though only after severe internal struggles) because she could not propagate the dynasty.³ Dr. Schreber may have formed a phantasy that if he were a woman he would manage the business of having children more successfully; and he may thus have found his way back into the feminine attitude towards his father which he had exhibited in the earliest years of his childhood. If that were so, then his delusion that as a result of his emasculation the world was to be peopled with 'a new race of men, born from the spirit of Schreber' (288) - a delusion the realization of which he was continually postponing to a more and more remote future - would also be designed to offer him an escape from his childlessness. If the 'little men' whom Schreber himself finds so puzzling were children, then we should have no difficulty in understanding why they were collected in such great numbers on his head (158): they were in truth the 'children of his spirit'.⁴

[1911c, 2428]

Lastly, I cannot conclude the present work, which is once again only a fragment of a larger whole, without foreshadowing the two chief theses towards the establishment of which the libido theory of the neuroses and psychoses is advancing: namely, that the neuroses arise in the main from a conflict between the ego and the sexual instinct, and that the forms which the neuroses assume retain the imprint of the course of development followed by the libido - and by the ego.

[1911c, 2444]
Furthermore, it has been shown to be true quite generally that in all neuroses the pathological symptoms are really the end-products of such conflicts, which have led to 'repression' and 'splitting' of the mind. The symptoms are generated by different mechanisms: (a) either as formations in substitution for the repressed forces, or (b) as compromises between the repressing and repressed forces, or (c) as reaction-formations and safeguards against the repressed forces.

[1913m, 2546]

Researches were further extended to the conditions which determine whether or not psychical conflicts will lead to 'repression' (that is, to dissociation dynamically caused), since it goes without saying that a psychical conflict, per se, may also have a normal outcome. The conclusion arrived at by psycho-analysis was that such conflicts were always between the sexual instincts (using the word 'sexual' in the widest sense) and the wishes and trends of the remainder of the ego. In neuroses it is the sexual instincts that succumb to 'repression' and so constitute the most important basis for the genesis of symptoms, which may accordingly be regarded as substitutes for sexual satisfactions.

[1913m, 2546]

Where these are present and sufficiently strongly developed, there is a risk of the libido becoming 'introverted'.¹ It turns away from reality, which, owing to the obstinate frustration, has lost its value for the subject, and turns towards the life of phantasy, in which it creates new wishful structures and revives the traces of earlier, forgotten ones. In consequence of the intimate connection between the activity of phantasy and material present in everyone which is infantile and repressed and has become unconscious, and thanks to the exceptional position enjoyed by the life of phantasy in regard to reality-testing,² the libido may thenceforward move on a backward course; it may follow the path of regression along infantile lines, and strive after aims that correspond with them. If these strivings, which are incompatible with the subject's present-day individuality, acquire enough intensity, a conflict must result between them and the other portion of his personality, which has maintained its relation to reality. This conflict is resolved by the formation of symptoms, and is followed by the onset of manifest illness. The fact that the whole process originated from frustration in the real world is reflected in the resulting event that the symptoms, in which the ground of reality is reached once more, represent substitutive satisfactions.

[1912c, 2560]

It is advisable to draw a sharp distinction between the two types of onset of illness - a sharper distinction than observation as a rule permits. In the first type what is prominent is a change in the external world; in the second type the accent falls on an internal change. In the first type the subject falls ill from an experience; in the second type it is from a developmental process. In the first case he is faced by the task of renouncing satisfaction, and he falls ill from his incapacity for resistance; in the second case his task is to exchange one kind of satisfaction for another, and he breaks down from his inflexibility. In the second case the conflict, which is between the subject's effort to remain as he is and the effort to change himself in order to meet fresh purposes and fresh demands from reality, is present from the first. In the former case the conflict only arises after the dammed-up libido has chosen other, and incompatible, possibilities of satisfaction. The part played by the conflict and the previous fixation of the libido is incomparably more obvious in the second type than in the first, in which such unserviceable fixations may perhaps only emerge as a result of the external frustration.

[1912c, 2561]
The importance in the causation of illness which must be ascribed to quantity of libido is in satisfactory agreement with two main theses of the theory of the neuroses to which psychoanalysis has led us: first, the thesis that the neuroses are derived from the conflict between the ego and the libido, and secondly, the discovery that there is no qualitative distinction between the determinants of health and those of neurosis, and that, on the contrary, healthy people have to contend with the same tasks of mastering their libido - they have simply succeeded better in them.

I must confess that here again I am unable to share Stekel's point of view, in spite of the many courageous and correct comments that he has made to us on the question. As he sees it, the injuriousness of masturbation amounts to no more than a senseless prejudice which, purely as a result of personal limitations, we are unwilling to cast off with sufficient thoroughness. I believe, however, that if we fix our eyes on the problem sine ira et studio¹ - so far, of course, as we are able to, - we shall be obliged to declare, rather, that to take up such a position contradicts our fundamental views on the aetiology of the neuroses. Masturbation corresponds essentially to infantile sexual activity and to its subsequent retention at a more mature age. We derive the neuroses from a conflict between a person's sexual urges and his other (ego) trends. Now someone might say: 'In my view the pathogenic factor in this aetiological relation lies solely in the ego's reaction to its sexuality.' By this he would be asserting that anyone could keep free of neurosis if only he were willing to allow unrestricted satisfaction to his sexual urges. But it is clearly arbitrary, and evidently pointless as well, to come to such a decision, and not to allow the sexual urges themselves to have any share in the pathogenic process. But if you admit that the sexual urges can have a pathogenic effect, you should no longer deny a similar significance to masturbation, which after all only consists in carrying out such sexual instinctual impulses. In every case which seems to show that masturbation is pathogenic, you will, no doubt, be able to trace the operation further back - to the instincts which manifest themselves in the masturbation and to the resistances which are directed against those instincts. Masturbation is not anything ultimate - whether somatically or psychologically - it is not a real 'agent', but merely the name for certain activities. Yet, however much we may trace things further back, our judgement on the causation of the illness will nevertheless rightly remain attached to this activity. And do not forget that masturbation is not to be equated with sexual activity in general: it is sexual activity subjected to certain limiting conditions. Thus it also remains possible that it is precisely these peculiarities of masturbatory activity which are the vehicles of its pathogenic effects.

Furthermore, I think we may with advantage distinguish what we may describe as the direct injuries caused by masturbation from those which arise indirectly from the ego's resistance and indignation against that sexual activity. I have not entered into these latter consequences.

A comparison between such a change of character and obsessional neurosis is very impressive. In both cases the work of regression is apparent. But whereas in the former we find complete regression following repression (or suppression) that has occurred smoothly, in the neurosis there are conflict, an effort to prevent regression from occurring, reaction-formations against it and symptom-formations produced by compromises between the two opposing sides, and a splitting of the psychical activities into some that are admissible to consciousness and others that are unconscious.
But we are able to bring forward other motives than these, thanks to the knowledge of concealed mental impulses which we have acquired from the psycho-analytic examination of individual human beings. A woman whose psychosexual needs should find satisfaction in her marriage and her family life is often threatened with the danger of being left unsatisfied, because her marriage relation has come to a premature end and because of the uneventfulness of her emotional life. A mother, as she grows older, saves herself from this by putting herself in her children's place, by identifying herself with them; and this she does by making their emotional experiences her own. Parents are said to stay young with their children, and that is indeed one of the most precious psychological gains that parents derive from their children. Where a marriage is childless, the wife has lost one of the things which might be of most help to her in tolerating the resignation that her own marriage demands from her. A mother's sympathetic identification with her daughter can easily go so far that she herself falls in love with the man her daughter loves; and in glaring instances this may lead to severe forms of neurotic illness as a result of her violent mental struggles against this emotional situation. In any case, it very frequently happens that a mother-in-law is subject to an impulse to fall in love in this way, and this impulse itself or an opposing trend are added to the tumult of conflicting forces in her mind. And very often the unkind, sadistic components of her love are directed on to her son-in-law in order that the forbidden, affectionate ones may be the more severely suppressed.

Now both the clinical history and the psychical mechanism of obsessional neurosis have become known to us through psycho-analysis. The clinical history of a typical case of 'touching phobia' is as follows. Right at the beginning, in very early childhood, the patient shows a strong desire to touch, the aim of which is of a far more specialized kind that one would have been inclined to expect. This desire is promptly met by an external prohibition against carrying out that particular kind of touching.¹ The prohibition is accepted, since it finds support from powerful internal forces,² and proves stronger than the instinct which is seeking to express itself in the touching. In consequence, however, of the child's primitive psychical constitution, the prohibition does not succeed in abolishing the instinct. Its only result is to repress the instinct (the desire to touch) and banish it into the unconscious. Both the prohibition and the instinct persist: the instinct because it has only been repressed and not abolished, and the prohibition because, if it ceased, the instinct would force its way through into consciousness and into actual operation. A situation is created which remains undealt with - a psychical fixation - and everything else follows from the continuing conflict between the prohibition and the instinct.

The principal characteristic of the psychological constellation which becomes fixed in this way is what might be described as the subject's ambivalent attitude towards a single object, or rather towards one act in connection with that object. He is constantly wishing to perform this act (the touching), and detests it as well. The conflict between these two currents cannot be promptly settled because - there is no other way of putting it - they are localized in the subject's mind in such a manner that they cannot come up against each other. The prohibition is noisily conscious, while the persistent desire to touch is unconscious and the subject knows nothing of it. If it were not for this psychological factor, an ambivalence like this could neither last so long nor lead to such consequences.
I propose to avoid (as I have already done elsewhere⁴) entering into the general problem of the origin of the tendency to project mental processes into the outside. It is, however, safe to assume that that tendency will be intensified when projection promises to bring with it the advantage of mental relief. Such an advantage may be expected with certainty where a conflict has arisen between different impulses all of which are striving towards omnipotence - for they clearly cannot all become omnipotent. The pathological process in paranoia in fact makes use of the mechanism of projection in order to deal with mental conflicts of this kind. The typical case of such a conflict is one between the two members of a pair of opposites - the case of an ambivalent attitude, which we have examined in detail as it appears in someone mourning the death of a loved relative. This kind of case must seem particularly likely to provide a motive for the creation of projections. Here again we are in agreement with the writers who maintain that the first born spirits were evil spirits, and who derive the idea of a soul from the impression made by death upon the survivors. The only difference is that we do not lay stress on the intellectual problem with which death confronts the living; in our view the force which gives the impetus to research is rather to be attributed to the emotional conflict into which the survivors are plunged.

[1912-1913, 2735]

Analysis is able to trace the associative paths along which this displacement passes - both the fortuitous paths and those with a significant content. Analysis also enables us to discover the motives for the displacement. The hatred of his father that arises in a boy from rivalry for his mother is not able to achieve uninhibited sway over his mind; it has to contend against his old-established affection and admiration for the very same person. The child finds relief from the conflict arising out of this double-sided, this ambivalent emotional attitude towards his father by displacing his hostile and fearful feelings on to a substitute for his father. The displacement cannot, however, bring the conflict to an end, it cannot effect a clear-cut severance between the affectionate and the hostile feelings. On the contrary, the conflict is resumed in relation to the object on to which the displacement has been made: the ambivalence is extended to it. There could be no doubt that little Hans was not only frightened of horses; he also approached them with admiration and interest. As soon as his anxiety began to diminish, he identified himself with the dreaded creature: he began to jump about like a horse and in his turn bit his father.¹ At another stage in the resolution of his phobia he did not hesitate to identify his parents with some other large animals.²

[1912-1913, 2769]

I will illustrate the first of these theses by a few examples. Hysterical attacks have long been recognized as signs of increased emotional excitement and equated with outbreaks of affect. Charcot attempted to reduce the multiplicity of their modes of manifestation by means of descriptive formulas; Pierre Janet recognized the unconscious ideas operating behind such attacks; while psycho-analysis has shown that they are mimetic representations of scenes (whether actually experienced or only invented ) with which the patient's imagination is occupied without his becoming conscious of them. The meaning of these pantomimes is concealed from the spectators by means of condensations and distortions of the acts which they represent. And this applies equally to what are described as the 'chronic' symptoms of hysterical patients. All of them are mimetic or hallucinatory representations of phantasies which unconsciously dominate the subject's emotional life and which have the meaning of fulfilsments of secret and repressed wishes. The tormenting character of these symptoms is due to the internal conflict into which these patients' minds are driven by the need to combat such unconscious wishes.

[1913], 2809]
In another neurotic disorder, obsessional neurosis, the patients become the victims of distressing and apparently senseless ceremonials which take the form of the rhythmical repetition of the most trivial acts (such as washing or dressing) or of carrying out meaningless injunctions or of obeying mysterious prohibitions. It was nothing less than a triumph of psychoanalytic research when it succeeded in showing that all these obsessive acts, even the most insignificant and trivial of them, have a meaning, and that they are reflections, translated into indifferent terms, of conflicts in the patients' lives, of the struggle between temptations and moral restraints - reflections of the proscribed wish itself and of the punishment and atonement which that wish incurs. In another form of the same disorder the victim suffers from tormenting ideas (obsessions) which force themselves upon him and are accompanied by affects whose character and intensity are often only quite inadequately accounted for by the terms of the obsessive ideas themselves. Analytic investigation has shown in their case that the affects are entirely justified, since they correspond to self-reproaches which are based on something that is at least psychically real. But the ideas to which these affects are attached are not the original ones, but have found their way into their present position by a process of displacement - by being substituted for something that has been repressed. If these displacements can be reversed, the way is open to the discovery of the repressed ideas, and the relation between affect and idea is found to be perfectly appropriate.

[1913j, 2810]

If we examine sexuality in the adult with the help of psycho-analysis, and consider the life of children in the light of the knowledge thus gained, we perceive that sexuality is not merely a function serving the purposes of reproduction, on a par with digestion, respiration, etc. It is something far more independent, which stands in contrast to all the individual's other activities and is only forced into an alliance with the individual's economy after a complicated course of development involving the imposition of numerous restrictions. Cases, theoretically quite conceivable, in which the interests of these sexual impulses fail to coincide with the self-preservation of the individual seem actually to be presented by the group of neurotic illnesses. For the final formula which psycho-analysis has arrived at on the nature of the neuroses runs thus: The primal conflict which leads to neuroses is one between the sexual instincts and those which maintain the ego. The neuroses represent a more or less partial overpowering of the ego by sexuality after the ego's attempts at suppressing sexuality have failed.

[1913j, 2817]

We have found it necessary to hold aloof from biological considerations during our psychoanalytic work and to refrain from using them for heuristic purposes, so that we may not be misled in our impartial judgement of the psycho-analytic facts before us. But after we have completed our psycho-analytic work we shall have to find a point of contact with biology; and we may rightly feel glad if that contact is already assured at one important point or another. The contrast between the ego instincts and the sexual instinct, to which we have been obliged to trace back the origin of the neuroses, is carried into the sphere of biology in the contrast between the instincts which serve the preservation of the individual and those which serve the survival of the species. In biology we come upon the more comprehensive conception of an immortal germ-plasm to which the different transitory individuals are attached like organs that develop successively. It is only this conception which enables us rightly to understand the part played by the sexual instinctual forces in physiology and psychology.

[1913j, 2818]
I am quite prepared to be told again that I have misunderstood the substance and purpose of the Neo-Zurich theory; but I must protest in advance against any contradictions to my view of it that may be found in the publications of that school being laid at my door instead of theirs. I can find no other way of making the whole range of Jung's innovations intelligible to myself and of grasping all their implications. All the changes that Jung has proposed to make in psycho-analysis flow from his intention to eliminate what is objectionable in the family-complexes, so as not to find it again in religion and ethics. For sexual libido an abstract concept has been substituted, of which one may safely say that it remains mystifying and incomprehensible to wise men and fools alike. The Oedipus complex has a merely 'symbolic' meaning: the mother in it means the unattainable, which must be renounced in the interests of civilization; the father who is killed in the Oedipus myth is the 'inner' father, from whom one must set oneself free in order to become independent. Other parts of the material of sexual ideas will no doubt be subjected to similar re-interpretations in the course of time. In the place of a conflict between ego-dystonic erotic trends and the self-preservative ones a conflict appears between the 'life-task' and 'psychical inertia'; the neurotic's sense of guilt corresponds to his self-reproach for not properly fulfilling his 'life-task'. In this way a new religio-ethical system has been created, which, just like the Adlerian system, was bound to re-interpret, distort or jettison the factual findings of analysis. The truth is that these people have picked out a few cultural overtones from the symphony of life and have once more failed to hear the mighty and primordial melody of the instincts.

[1914d, 2925]

I have proposed that two groups of such primal instincts should be distinguished: the ego, or self-preservative, instincts and the sexual instincts. But this supposition has not the status of a necessary postulate, as has, for instance, our assumption about the biological purpose of the mental apparatus (p. 2960); it is merely a working hypothesis, to be retained only so long as it proves useful, and it will make little difference to the results of our work of description and classification if it is replaced by another. The occasion for this hypothesis arose in the course of the evolution of psycho-analysis, which was first employed upon the psychoneuroses, or, more precisely, upon the group described as 'transference neuroses' (hysteria and obsessional neurosis); these showed that at the root of all such affections there is to be found a conflict between the claims of sexuality and those of the ego. It is always possible that an exhaustive study of the other neurotic affections (especially of the narcissistic psychoneuroses, the schizophrenias) may oblige us to alter this formula and to make a different classification of the primal instincts. But for the present we do not know of any such formula, nor have we met with any argument unfavourable to drawing this contrast between sexual and ego-instincts.

[1915c, 2962]
These then are phenomena of an attempted advance from the new ground which has as a rule been regressively acquired; and we may set alongside them the efforts made in some neuroses to regain a position of the libido which was once held and subsequently lost. Indeed we can hardly draw any conceptual distinction between these two classes of phenomena. We are too apt to think that the conflict underlying a neurosis is brought to an end when the symptom has been formed. In reality the struggle can go on in many ways after this. Fresh instinctual components arise on both sides, and these prolong it. The symptom itself becomes an object of this struggle: certain trends anxious to preserve it conflict with others which strive to remove it and to re-establish the status quo ante. Methods are often sought of rendering the symptom nugatory by trying to regain along other lines of approach what has been lost and is now withheld by the symptom. These facts throw much light on a statement made by C. G. Jung to the effect that a peculiar ‘psychical inertia’, which opposes change and progress, is the fundamental precondition of neurosis. This inertia is indeed most peculiar; it is not a general one, but is highly specialized; it is not even all-powerful within its own field, but fights against tendencies towards progress and recovery which remain active even after the formation of neurotic symptoms. If we search for the starting-point of this special inertia, we discover that it is the manifestation of very early linkages - linkages which it is hard to resolve - between instincts and impressions and the objects involved in those impressions. These linkages have the effect of bringing the development of the instincts concerned to a standstill. Or in other words, this specialized ‘psychical inertia’ is only a different term, though hardly a better one, for what in psycho-analysis we are accustomed to call a ‘fixation’.

Psycho-analytic work has furnished us with the thesis that people fall ill of a neurosis as a result of frustration. What is meant is the frustration of the satisfaction of their libidinal wishes, and some digression is necessary in order to make the thesis intelligible. For a neurosis to be generated there must be a conflict between a person’s libidinal wishes and the part of his personality we call his ego, which is the expression of his instinct of self-preservation and which also includes his ideals of his personality. A pathogenic conflict of this kind takes place only when the libido tries to follow paths and aims which the ego has long since overcome and condemned and has therefore prohibited forever; and this the libido only does if it is deprived of the possibility of an ideal ego-syntonic satisfaction. Hence privation, frustration of a real satisfaction, is the first condition for the generation of a neurosis, although, indeed, it is far from being the only one.

Thus the problem of the causation of the neuroses seems to grow more complicated. In fact, psycho-analytic investigation makes us acquainted with a fresh factor, which is not taken into account in our aetiological series and which we can recognize easiest in cases in which what has hitherto been a healthy condition is suddenly disturbed by an onset of neurotic illness. In such people we regularly find indications of a contention between wishful impulses or, as we are in the habit of saying, a psychical conflict. One part of the personality champions certain wishes while another part opposes them and fends them off. Without such a conflict there is no neurosis. There would not seem to be anything peculiar in this. Our mental life is, as you know, perpetually agitated by conflicts which we have to settle. No doubt, therefore, special conditions must be fulfilled if such a conflict is to become pathogenic. We must ask what these conditions are, between what mental powers these pathogenic conflicts are played out, and what the relation is between the conflict and the other causative factors.
I hope to be able to give you adequate replies to these questions, even though the replies may be reduced to schematic dimensions. The conflict is conjured up by frustration, as a result of which the libido, deprived of satisfaction, is driven to look for other objects and paths. The necessary precondition of the conflict is that these other paths and objects arouse displeasure in one part of the personality, so that a veto is imposed which makes the new method of satisfaction impossible as it stands. From this point the construction of symptoms pursues its course, which we shall follow later. The repudiated libidinal trends nevertheless succeed in getting their way by certain roundabout paths, though not, it is true, without taking the objection into account by submitting to some distortions and mitigations. The roundabout paths are those taken by the construction of symptoms; the symptoms are the fresh or substitute satisfaction which has become necessary owing to the fact of frustration. [1916-1917, 3411]

The meaning of psychical conflict can be adequately expressed in another way by saying that for an *external* frustration to become pathogenic an *internal* frustration must be added to it. In that case, of course, the external and internal frustration relate to different paths and objects. The external frustration removes one possibility of satisfaction and the internal frustration seeks to exclude another possibility, about which the conflict then breaks out. I prefer this way of representing the matter because it has a secret content. For it hints at the probability that the internal impediments arose from real external obstacles during the prehistoric periods of human development. [1916-1917, 3411]

But what are the powers from which the objection to the libidinal trend arises? What is the other party to the pathogenic conflict? These powers, to put it quite generally, are the non-sexual instinctual forces. We class them together as the 'ego instincts'. The psycho-analysis of the transference-neuroses gives us no easy access to a further dissecting of them; at most we come to know them to some extent by the resistances which oppose analysis. The pathogenic conflict is thus one between the ego-instincts and the sexual instincts. In a whole number of cases, it looks as though there might also be a conflict between different purely sexual trends. But in essence that is the same thing; for, of the two sexual trends that are in conflict, one is always, as we might say, 'ego-syntonic', while the other provokes the ego's defence. It therefore still remains a conflict between the ego and sexuality. [1916-1917, 3411]

Thus we discover that the third factor in the aetiology of the neuroses, the tendency to conflict, is as much dependent on the development of the ego as on that of the libido. Our insight into the causation of the neuroses is thus made more complete. First there is the most general precondition - frustration; next, fixation of the libido which forces it into particular directions; and thirdly, the tendency to conflict, arising from the development of the ego, which rejects these libidinal impulses. The situation, then, is not so very confused and hard to penetrate as it probably seemed to you during the course of my remarks. It is true, however, that we shall find we have not yet finished with it. There is something new to be added and something already familiar to be further examined. [1916-1917, 3413]
Let us now go back to the symptoms. They create a substitute, then, for the frustrated satisfaction by means of a regression of the libido to earlier times, with which a return to earlier stages of object-choice or of the organization is inseparably bound up. We discovered some time ago that neurotics are anchored somewhere in their past; we know now that it is at a period of their past in which their libido did not lack satisfaction, in which they were happy. They search about in the history of their life till they find a period of that sort, even if they have to go back as far as the time when they were infants in arms - as they remember it or as they imagine it from later hints. In some way the symptom repeats this early infantile kind of satisfaction, distorted by the censorship arising from the conflict, turned as a rule to a feeling of suffering, and mingled with elements from the precipitating cause of the illness. The kind of satisfaction which the symptom brings has much that is strange about it.

[1916-1917, 3423]

We may disregard the fact that it is unrecognizable to the subject, who, on the contrary, feels the alleged satisfaction as suffering and complains of it. This transformation is a function of the psychical conflict under pressure of which the symptom had to be formed. What was once a satisfaction to the subject is, indeed, bound to arouse his resistance or his disgust to-day. We are familiar with a trivial but instructive model of this change of mind. The same child who once eagerly sucked the milk from his mother's breast is likely a few years later to display a strong dislike to drinking milk, which his upbringing has difficulties in overcoming. This dislike increases to disgust if a skin forms on the milk or the drink containing it. We cannot exclude the possibility, perhaps, that the skin conjures up a memory of the mother's breast, once so ardently desired. Between the two situations, however, there lies the experience of weaning, with its traumatic effects.

[1916-1917, 3423]

The importance of the part played by phantasy in the formation of symptoms will be made clear to you by what I have to tell you. I have explained how in the case of frustration the libido cathects regressively the positions which it has given up but to which some quotas of it have remained adhering. I shall not withdraw this or correct it, but I have to insert a connecting link. How does the libido find its way to these points of fixation? All the objects and trends which the libido has given up have not yet been given up in every sense. They or their derivatives are still retained with a certain intensity in phantasies. Thus the libido need only withdraw on to phantasies in order to find the path open to every repressed fixation. These phantasies have enjoyed a certain amount of toleration: they have not come into conflict with the ego, however sharp the contrasts between them may have been, so long as a particular condition is observed. This condition is of a quantitative nature and it is now upset by the backward flow of libido on to the phantasies. As a result of this surplus, the energetic cathexis of the phantasies is so much increased that they begin to raise claims, that they develop a pressure in the direction of becoming realized. But this makes a conflict between them and the ego inevitable. Whether they were previously preconscious or conscious, they are now subjected to repression from the direction of the ego and are at the mercy of attraction from the direction of the unconscious. From what are now unconscious phantasies the libido travels back to their origins in the unconscious - to its own points of fixation.

[1916-1917, 3428]
In general, however, I should like to recommend that, while not under-estimating the practical importance of the gain from illness, you should not let yourselves be impressed by it theoretically. After all, apart from the exceptions recognized earlier, it always calls to mind the examples of 'animal intelligence' illustrated by Oberländer in Fliegende Blätter. An Arab was riding his camel along a narrow path cut in the steep face of a mountain. At a turn in the path he suddenly found himself face to face with a lion, which prepared to make a spring. He saw no way out: on one side a perpendicular cliff and on the other a precipice; retreat and flight were impossible. He gave himself up for lost. But the animal thought otherwise. He took one leap with his rider into the abyss - and the lion was left in the lurch. The help provided by a neurosis has as a rule no better success with the patient. This may be because dealing with a conflict by forming symptoms is after all an automatic process which cannot prove adequate to meeting the demands of life, and in which the subject has abandoned the use of his best and highest powers. If there were a choice, it would be preferable to go down in an honourable struggle with fate.
[1916-1917, 3437]

We finally arrive at the connection we are in search of, if we take as our starting-point the opposition we have so often asserted between the ego and the libido. As we know, the generation of anxiety is the ego's reaction to danger and the signal for taking flight. If so, it seems plausible to suppose that in neurotic anxiety the ego is making a similar attempt at flight from the demand by its libido, that it is treating this internal danger as though it were an external one. This would therefore fulfil our expectation that where anxiety is shown there is something one is afraid of. But the analogy could be carried further. Just as the attempt at flight from an external danger is replaced by standing firm and the adoption of expedient measures of defence, so too the generation of neurotic anxiety gives place to the formation of symptoms, which results in the anxiety being bound.
[1916-1917, 3452]

The difficulty in understanding now lies else here. The anxiety which signifies a flight of the ego from its libido is after all supposed to be derived from that libido itself. This is obscure and it reminds us not to forget that after all a person's libido is fundamentally something of his and cannot be contrasted with him as something external. It is the topographical dynamics of the generation of anxiety which are still obscure to us - the question of what mental energies are produced in what process and from what mental systems they derive. This is once more a question which I cannot promise to answer: but there are two other tracks which we must not fail to follow and in doing so we shall once more be making use of direct observation and analytic enquiry as a help to our speculations. We will turn to the genesis of anxiety in children and to the source of the neurotic anxiety which is attached to phobias.
[1916-1917, 3452]
LADIES AND GENTLEMEN, - We have repeatedly (and only recently once again) had to deal with the distinction between the ego-instincts and the sexual instincts. In the first place, repression showed us that the two can come into opposition to each other, that the sexual instincts are then ostensibly subdued and are obliged to find satisfaction for themselves along regressive and roundabout paths, and that in doing so they are able to find compensation for their defeat in their indomitability. We next learnt that the two kinds of instincts are from the first differently related to Necessity the educator, so that their course of development is not the same and they do not enter into the same connection with the reality principle. Lastly, we seem to have found that the sexual instincts are linked by much closer bonds than the ego-instincts to the affective state of anxiety - a conclusion which seems incomplete in only one important respect. In order to establish it more firmly, therefore, I will bring forward the further noteworthy fact that if hunger and thirst (the two most elementary self-preservative instincts) are unsatisfied, the result is never their transformation into anxiety, whereas the changing of unsatisfied libido into anxiety is, as we have seen, among the best known and most frequently observed of phenomena.

[1916-1917, 3458]

The psycho-analytic explanation of the neuroses does not, however, call for such far-ranging considerations. The separate following-up of the sexual and ego-instincts has helped us to find the key to an understanding of the group of transference neuroses. We have been able to trace them back to the basic situation in which the sexual instincts have come into a dispute with the self-preservative instincts, or, to put it in biological (though less precise) terms, a situation in which one aspect of the ego, as an independent individual organism, comes into conflict with its other aspect, as a member of a succession of generations. A dissension of this kind may perhaps only occur in human beings, and on that account neurosis may, generally speaking, constitute their prerogative over the animals. The excessive development of their libido and - what is perhaps made possible precisely by that - their development of a richly articulated mental life seem to have created the determinants for the occurrence of such a conflict. It is at once obvious that these are also the determinants for the great advances that human beings have made beyond what they have in common with the animals; so that their susceptibility to neurosis would only be the reverse side of their other endowments. But these too are only speculations, which are diverting us from our immediate task.

[1916-1917, 3460]

Here is my reply. Your first objection sounds well enough. Consideration of the states of sleep, of illness and of being in love in themselves would probably never have led us to distinguish an ego-libido from an object-libido or libido from interest. But there you are neglecting the investigations from which we started and in the light of which we now look at the mental situations under discussion. The differentiation between libido and interest - that is to say, between the sexual and the self-preservative instincts - was forced upon us by our discovery of the conflict out of which the transference neuroses arise. Since then we cannot give it up. The hypothesis that object-libido can be transformed into ego-libido, that we must therefore take an ego-libido into account, seems to us the only one which is able to resolve the enigma of what are termed the narcissistic neuroses - dementia praecox, for instance - and to account for the resemblances and dissimilarities between them and hysteria or obsessions. We are now applying to illness, sleep and being in love what we have elsewhere found inescapably established. We should proceed further with applications of this kind and see where they will take us to. The only thesis which is not an immediate precipitate of our analytic experience is to the effect that libido remains libido, whether it is directed to objects or to one's own ego, and never turns into egoistic interest, and the converse is also true. This thesis, however, is equivalent to the separation between the sexual and ego-instincts which we have already considered critically and to which we shall continue to hold for heuristic reasons until its possible collapse.

[1916-1917, 3465]
In addition to narcissistic identification, there is a hysterical kind, which has been familiar to us very much longer. I wish it were possible to illustrate for you the differences between the two forms by a few clear specifications. There is something I can tell you about the periodic and cyclical forms of melancholia which I am sure you will be glad to hear. For in favourable circumstances - I have experienced this twice - it is possible by analytic treatment in the lucid intervals to prevent the return of the condition in the same or the opposite emotional mood. We learn from such cases that in melancholia and mania we are concerned once more with a special method of dealing with a conflict whose underlying determinants agree precisely with those of the other neuroses. You can imagine how much more there is for psycho-analysis to learn in this field of knowledge.

But, Ladies and Gentlemen, who has so seriously misinformed you? A recommendation to the patient to 'live a full life' sexually could not possibly play a part in analytic therapy - if only because we ourselves have declared that an obstinate conflict is taking place in him between a libidinal impulse and sexual repression, between a sensual and an ascetic trend. This conflict would not be solved by our helping one of these trends to victory over its opponent. We see, indeed, that in neurotics asceticism has the upper hand; and the consequence of this is precisely that the suppressed sexual tendency finds a way out in symptoms. If, on the contrary, we were to secure victory for sensuality, then the sexual repression that had been put on one side would necessarily be replaced by symptom. Neither of these two alternative decisions could end the internal conflict; in either case one party to it would remain unsatisfied. There are only a few cases in which the conflict is so unstable that a factor such as the doctor's taking sides could decide it; and such cases do not in fact stand in need of analytic treatment. Anyone on whom the doctor could have so much influence would have found the same way out without the doctor. You must be aware that if an abstinent young man decides in favour of illicit sexual intercourse or if an unsatisfied wife seeks relief with another man, they have not as a rule waited for permission from a doctor or even from their analyst.

In this connection people usually overlook the one essential point - that the pathogenic conflict in neurotics is not to be confused with a normal struggle between mental impulses both of which are on the same psychological footing. In the former case the dissension is between two powers, one of which has made its way to the stage of what is preconscious or conscious while the other has been held back at the stage of the unconscious. For that reason the conflict cannot be brought to an issue; the disputants can no more come to grips than, in the familiar simile, a polar bear and a whale. A true decision can only be reached when they both meet on the same ground. To make this possible is, I think, the sole task of our therapy.

Thus you cannot explain the therapeutic effect of psycho-analysis by its permitting a full sexual life. Look around, then, for something else. I fancy that, while I was rejecting this suggestion of yours, one remark of mine put you on the right track. What we make use of must no doubt be the replacing of what is unconscious by what is conscious, the translation of what is unconscious into what is conscious. Yes, that is it. By carrying what is unconscious on into what is conscious, we lift the repressions, we remove the preconditions for the formation of symptoms, we transform the pathogenic conflict to a normal one for which it must be possible somehow to find a solution. All that we bring about in a patient is this single psychical change: the length to which it is carried is the measure of the help we provide. Where no repressions (or analogous psychical processes) can be undone, our therapy has nothing to expect.
There are, however, other forms of illness in which, in spite of the conditions being the same, our therapeutic procedure is never successful. In them, too, it had been a question of an original conflict between the ego and the libido which led to repression - though this may call for a different topographical description; in them, too, it is possible to trace the points in the patient's life at which the repressions occurred; we make use of the same procedure, are ready to make the same promises and give the same help by the offer of anticipatory ideas; and once again the lapse of time between the repressions and the present day favours a different outcome to the conflict. And yet we do not succeed in lifting a single resistance or getting rid of a single repression. These patients, paranoics, melancholics, sufferers from dementia praecox, remain on the whole unaffected and proof against psycho-analytic therapy. What can be the reason for this? Not any lack of intelligence. A certain amount of intellectual capacity is naturally required in our patients; but there is certainly no lack of it in, for instance, the extremely shrewd combinatorial paranoics. Nor do any of the other motives seem to be absent. Thus the melancholics have a very high degree of consciousness, absent in paranoics, that they are ill and that that is why they suffer so much; but this does not make them more accessible. We are faced here by a fact which we do not understand and which therefore leads us to doubt whether we have really understood all the determinants of our possible success with the other neuroses. [1916-1917, 3480]

In the light of the knowledge we have gained from psycho-analysis we can describe the difference between hypnotic and psycho-analytic suggestion as follows. Hypnotic treatment seeks to cover up and gloss over something in mental life; analytic treatment seeks to expose and get rid of something. The former acts like a cosmetic, the latter like surgery. The former makes use of suggestion in order to forbid the symptoms; it strengthens the repressions, but, apart from that, leaves all the processes that have led to the formation of the symptoms unaltered. Analytic treatment makes its impact further back towards the roots, where the conflicts are which gave rise to the symptoms, and uses suggestion in order to alter the outcome of those conflicts. Hypnotic treatment leaves the patient inert and unchanged, and for that reason, too, equally unable to resist any fresh occasion for falling ill. An analytic treatment demands from both doctor and patient the accomplishment of serious work, which is employed in lifting internal resistances. Through the overcoming of these resistances the patient's mental life is permanently changed, is raised to a high level of development and remains protected against fresh possibilities of falling ill. This work of overcoming resistances is the essential function of analytic treatment; the patient has to accomplish it and the doctor makes this possible for him with the help of suggestion operating in an educative sense. For that reason psycho-analytic treatment has justly been described as a kind of after-education. [1916-1917, 3492]
But you will now tell me that, no matter whether we call the motive force of our analysis transference or suggestion, there is a risk that the influencing of our patient may make the objective certainty of our findings doubtful. What is advantageous to our therapy is damaging to our researches. This is the objection that is most often raised against psycho-analysis, and it must be admitted that, though it is groundless, it cannot be rejected as unreasonable. If it were justified, psycho-analysis would be nothing more than a particularly well-disguised and particularly effective form of suggestive treatment and we should have to attach little weight to all that it tells us about what influences our lives, the dynamics of the mind or the unconscious. That is what our opponents believe; and in especial they think that we have "talked" the patients into everything relating to the importance of sexual experiences - or even into those experiences themselves - after such notions have grown up in our own depraved imagination. These accusations are contradicted more easily by an appeal to experience than by the help of theory. Anyone who has himself carried out psycho-analyses will have been able to convince himself on countless occasions that it is impossible to make suggestions to a patient in that way. The doctor has no difficulty, of course, in making him a supporter of some particular theory and in thus making him share some possible error of his own. In this respect the patient is behaving like anyone else - like a pupil - but this only affects his intelligence, not his illness. After all, his conflicts will only be successfully solved and his resistances overcome if the anticipatory ideas he is given tally with what is real in him. Whatever in the doctor's conjectures is inaccurate drops out in the course of the analysis; it has to be withdrawn and replaced by something more correct. We endeavour by a careful technique to avoid the occurrence of premature successes due to suggestion; but no harm is done even if they do occur, for we are not satisfied by a first success. We do not regard an analysis as at an end until all the obscurities of the case are cleared up, the gaps in the patient's memory filled in, the precipitating causes of the repressions discovered. We look upon successes that set in too soon as obstacles rather than as a help to the work of analysis; and we put an end to such successes by constantly resolving the transference on which they are based. It is this last characteristic which is the fundamental distinction between analytic and purely suggestive therapy, and which frees the results of analysis from the suspicion of being successes due to suggestion. In every other kind of suggestive treatment the transference is carefully preserved and left untouched; in analysis it is itself subjected to treatment and is dissected in all the shapes in which it appears. At the end of an analytic treatment the transference must itself be cleared away; and if success is then obtained or continues, it rests, not on suggestion, but on the achievement by its means of an overcoming of internal resistances, on the internal change that has been brought about in the patient.

[1916-1917, 3493]
I will now complete my picture of the mechanism of cure by clothing it in the formulas of the libido theory. A neurotic is incapable of enjoyment and of efficiency - the former because his libido is not directed on to any real object and the latter because he is obliged to employ a great deal of this available energy on keeping his libido under repression and on warding off its assaults. He would become healthy if the conflict between his ego and his libido came to an end and if his ego had his libido again at its disposal. The therapeutic task consists, therefore, in freeing the libido from its present attachments, which are withdrawn from the ego, and in making it once more serviceable to the ego. Where, then, is the neurotic's libido situated? It is easily found: it is attached to the symptoms, which yield it the only substitutive satisfaction possible at the time. We must therefore make ourselves masters of the symptoms and resolve them - which is precisely the same thing that the patient requires of us. In order to resolve the symptoms, we must go back as far as their origin, we must renew the conflict from which they arose, and, with the help of motive forces which were not at the patient's disposal in the past, we must guide it to a different outcome. This revision of the process of repression can be accomplished only in part in connection with the memory traces of the processes which led to repression. The decisive part of the work is achieved by creating in the patient's relation to the doctor - in the 'transference' - new editions of the old conflicts; in these the patient would like to behave in the same way as he did in the past, while we, by summoning up every available mental force, compel him to come to a fresh decision. Thus the transference becomes the battlefield on which all the mutually struggling forces should meet one another.

[1916-1917, 3494]

Thus our therapeutic work falls into two phases. In the first, all the libido is forced from the symptoms into the transference and concentrated there; in the second, the struggle is waged around this new object and the libido is liberated from it. The change which is decisive for a favourable outcome is the elimination of repression in this renewed conflict so that the libido cannot withdraw once more from the ego by flight into the unconscious. This is made possible by the alteration of the ego which is accomplished under the influence of the doctor's suggestion. By means of the work of interpretation, which transforms what is unconscious into what is conscious, the ego is enlarged at the cost of this unconscious; by means of instruction, it is made conciliatory towards the libido and inclined to grant it some satisfaction, and its repugnance to the claims of the libido is diminished by the possibility of disposing of a portion of it by sublimation. The more closely events in the treatment coincide with this ideal description, the greater will be the success of the psycho-analytic therapy. It finds its limits in the lack of mobility of the libido, which may refuse to leave its objects, and the rigidity of narcissism, which will not allow transference on to objects to increase beyond certain bounds. Further light may perhaps be thrown on the dynamics of the process of cure if I say that we get hold of the whole of the libido which has been withdrawn from the dominance of the ego by attracting a portion of it on to ourselves by means of the transference.

[1916-1917, 3495]
With this as a starting-point we go on to make our first important discovery. We learn that, when we try to understand neurotic disorders, by far the greater significance attaches to the sexual instincts; that in fact neuroses are the specific disorders, so to speak, of the sexual function; that in general whether or not a person develops a neurosis depends on the quantity of his libido, and on the possibility of satisfying it and of discharging it through satisfaction; that the form taken by the disease is determined by the way in which the individual passes through the course of development of his sexual function, or, as we put it, by the fixations his libido has undergone in the course of its development; and, further, that by a special, not very simple technique for influencing the mind we are able to throw light on the nature of some groups of neuroses and at the same time to do away with them. Our therapeutic efforts have their greatest success with a certain class of neuroses which proceed from a conflict between the ego-instincts and the sexual instincts. For in human beings it may happen that the demands of the sexual instincts, whose reach of course extends far beyond the individual, seem to the ego to constitute a danger which threatens its self-preservation or its self-esteem. The ego then assumes the defensive, denies the sexual instincts the satisfaction they desire and forces them into those by-paths of substitutive satisfaction which become manifest as nervous symptoms. [1917a, 3609]

The psycho-analytic method of treatment is then able to subject this process of repression to revision and to bring about a better solution of the conflict - one that is compatible with health. Unintelligent opposition accuses us of one-sidedness in our estimate of the sexual instincts. 'Human beings have other interests besides sexual ones,' they say. We have not forgotten or denied this for a moment. Our one-sidedness is like that of the chemist, who traces all compounds back to the force of chemical attraction. He is not on that account denying the force of gravity; he leaves that to the physicist to deal with. [1917a, 3609]

But this episode, though it is now closed, was not without an important influence on the spread of psycho-analysis. Medical men who had hitherto held back from any approach to psycho-analytic theories were brought into closer contact with them when, in the course of their duties as army doctors, they were obliged to deal with war neuroses. The reader will be able to gather from Ferenczi's paper with what hesitations and under what disguises these closer contacts were made. Some of the factors which psycho-analysis had recognized and described long before as being at work in peace-time neuroses - the psychogenic origin of the symptoms, the importance of unconscious instinctual impulses, the part played in dealing with mental conflicts by the primary gain from being ill ('the flight into illness') - were observed to be present equally in the war neuroses and were accepted almost universally. Simmel's studies show, too, what successes could be achieved by treating war neurotics by the method of catharsis, which, as we know, was the first step towards the psycho-analytic technique. [1919d, 3665]

The war neuroses, in so far as they are distinguished from the ordinary neuroses of peace-time by special characteristics, are to be regarded as traumatic neuroses whose occurrence has been made possible or has been promoted by a conflict in the ego. Abraham's paper affords good evidence for this conflict, which has also been recognized by the English and American writers quoted by Jones. The conflict is between the soldier's old peaceful ego and his new warlike one, and it becomes acute as soon as the peace-ego realizes what danger it runs of losing its life owing to the rashness of its newly formed, parasitic double. It would be equally true to say that the old ego is protecting itself from a mortal danger by taking flight into a traumatic neurosis or to say that it is defending itself against the new ego which it sees is threatening its life. Thus the precondition of the war neuroses, the soil that nourishes them, would seem to be a national army; there would be no possibility of their arising in an army of professional soldiers or mercenaries. [1919d, 3667]
What is known as the psycho-analytic school of psychiatry, which was brought into being by me, had taught for the last twenty-five years that the neuroses of peace could be traced back to disturbances of emotional life. This explanation was now applied quite generally to war neurotics. We had further asserted that neurotic patients suffered from mental conflicts and that the wishes and inclinations which were expressed in the symptoms were unknown to the patients themselves - were, that is to say, unconscious. It was therefore easy to infer that the immediate cause of all war neuroses was an unconscious inclination in the soldier to withdraw from the demands, dangerous or outrageous to his feelings, made upon him by active service. Fear of losing his own life, opposition to the command to kill other people, rebellion against the ruthless suppression of his own personality by his superiors - these were the most important affective sources on which the inclination to escape from war was nourished.

There can be no doubt, however, that the replacement of the pleasure principle by the reality principle can only be made responsible for a small number, and by no means the most intense, of unpleasurable experiences. Another occasion of the release of unpleasure, which occurs with no less regularity, is to be found in the conflicts and dissensions that take place in the mental apparatus while the ego is passing through its development into more highly composite organizations. Almost all the energy with which the apparatus is filled arises from its innate instinctual impulses. But these are not all allowed to reach the same phases of development. In the course of things it happens again and again that individual instincts or parts of instincts turn out to be incompatible in their aims or demands with the remaining ones, which are able to combine into the inclusive unity of the ego. The former are then split off from this unity by the process of repression, held back at lower levels of psychical development and cut off, to begin with, from the possibility of satisfaction. If they succeed subsequently, as can so easily happen with repressed sexual instincts, in struggling through, by roundabout paths, to a direct or to a substitutive satisfaction, that event, which would in other cases have been an opportunity for pleasure, is felt by the ego as unpleasure. As a consequence of the old conflict which ended in repression, a new breach has occurred in the pleasure principle at the very time when certain instincts were endeavouring, in accordance with the principle, to obtain fresh pleasure. The details of the process by which repression turns a possibility of pleasure into a source of unpleasure are not yet clearly understood or cannot be clearly represented; but there is no doubt that all neurotic unpleasure is of that kind - pleasure that cannot be felt as such.¹

Neurosis stands outside this series. It also is based upon a peculiarity in the development of the human libido - the twice repeated start made by the directly sexual function, with an intervening period of latency.¹ To this extent it resembles hypnosis and group formation in having the character of a regression, which is absent from being in love. It makes its appearance wherever the advance from directly sexual instincts to those that are inhibited in their aims has not been wholly successful; and it represents a conflict between those portions of the instincts which have been received into the ego after having passed through this development and those portions of them which, springing from the repressed unconscious, strive - as do other, completely repressed, instinctual impulses - to attain direct satisfaction. Neuroses are extraordinarily rich in content, for they embrace all possible relations between the ego and the object - both those in which the object is retained and others in which it is abandoned or erected inside the ego itself - and also the conflicting relations between the ego and its ego ideal.

¹ [1920g, 3717]
To a physician who was to undertake psycho-analytic treatment of the girl there were many grounds for misgiving. The situation he had to deal with was not the one that analysis demands, in which alone it can demonstrate its effectiveness. As is well known, the ideal situation for analysis is when someone who is otherwise his own master is suffering from an inner conflict which he is unable to resolve alone, so that he brings his trouble to the analyst and begs for his help. The physician then works hand in hand with one portion of the pathologically divided personality, against the other party in the conflict. Any situation which differs from this is to a greater or lesser degree unfavourable for psycho-analysis and adds fresh difficulties to the internal ones already present. Situations like that of a prospective house-owner who orders an architect to build him a villa to his own tastes and requirements, or of a pious donor who commissions an artist to paint a sacred picture in the corner of which is to be a portrait of himself in adoration, are at bottom incompatible with the conditions necessary for psycho-analysis. Thus, it constantly happens that a husband instructs the physician as follows: 'My wife suffers from nerves, and for that reason gets on badly with me; please cure her, so that we may lead a happy married life again.' But often enough it turns out that such a request is impossible to fulfil - that is to say, the physician cannot bring about the result for which the husband sought the treatment. As soon as the wife is freed from her neurotic inhibitions she sets about getting a separation, for her neurosis was the sole condition under which the marriage could be maintained. Or else parents expect one to cure their nervous and unruly child. By a healthy child they mean one who never causes his parents trouble, and gives them nothing but pleasure. The physician may succeed in curing the child, but after that it goes its own way all the more decidedly, and the parents are now far more dissatisfied than before. In short, it is not a matter of indifference whether someone comes to analysis of his own accord or because he is brought to it - whether it is he himself who desires to be changed, or only his relatives, who love him (or who might be expected to love him).

[1920a, 3840]

It has been worth while to enter in some detail into the explanation of dreams, since analytic work has shown that the dynamics of the formation of dreams are the same as those of the formation of symptoms. In both cases we find a struggle between two trends, of which one is unconscious and ordinarily repressed and strives towards satisfaction - that is, wish-fulfilment - while the other, belonging probably to the conscious ego, is disapproving and repressive. The outcome of this conflict is a compromise-formation (the dream or the symptom) in which both trends have found an incomplete expression. The theoretical importance of this conformity between dreams and symptoms is illuminating. Since dreams are not pathological phenomena, the fact shows that the mental mechanisms which produce the symptoms of illness are equally present in normal mental life, that the same uniform law embraces both the normal and the abnormal and that the findings of research into neurotics or psychotics cannot be without significance for our understanding of the healthy mind.

[1923a, 3919]
The Theory of Repression. - These theoretical considerations, taken together with the immediate impressions derived from analytic work, lead to a view of the neuroses which may be described in the roughest outline as follows. The neuroses are the expression of conflicts between the ego and such of the sexual impulses as seem to the ego incompatible with its integrity or with its ethical standards. Since these impulses are not ego-syntonic, the ego has repressed them; that is to say, it has withdrawn its interest from them and has shut them off from becoming conscious as well as from obtaining satisfaction by motor discharge. If in the course of analytic work one attempts to make these repressed impulses conscious, one becomes aware of the repressive forces in the form of resistance. But the achievement of repression fails particularly readily in the case of the sexual instincts. Their dammed-up libido finds other ways out from the unconscious: for it regresses to earlier phases of development and earlier attitudes towards objects, and, at weak points in the libidinal development where there are infantile fixations, it breaks through into consciousness and obtains discharge. What results is a symptom and consequently in its essence a substitutive sexual satisfaction. Nevertheless the symptom cannot entirely escape from the repressive forces of the ego and must therefore submit to modifications and displacements exactly as happens with dreams - by means of which its characteristic of being a sexual satisfaction becomes unrecognizable. Consequently symptoms are in the nature of compromises between the repressed sexual instincts and the repressing ego-instincts; they represent a wish-fulfilment for both partners to the conflict simultaneously, but one which is incomplete for each of them. This is quite strictly true of the symptoms of hysteria, while in the symptoms of obsessional neurosis there is often a stronger emphasis upon the side of the repressing function owing to the erection of reaction-formations, which are assurances against sexual satisfaction.

[1923a, 3923]

Narcissism. - A decisive advance was made when the analysis of dementia praecox and other psychotic disorders was ventured upon and thus the examination was begun of the ego itself, which had so far been known only as the agency of repression and opposition. It was found that the pathogenic process in dementia praecox is the withdrawal of the libido from objects and its introduction into the ego, while the clamorous symptoms of the disease arise from the vain struggles of the libido to find a pathway back to objects. It thus turned out to be possible for object-libido to change into cathexis of the ego and vice versa. Further reflection showed that this process must be presumed to occur on the largest scale and that the ego is to be regarded as a great reservoir of libido from which libido is sent out to objects and which is always ready to absorb libido flowing back from objects. Thus the instincts of self-preservation were also of a libidinal nature: they were sexual instincts which, instead of external objects, had taken the subject's own ego as an object. Clinical experience had made us familiar with people who behaved in a striking fashion as though they were in love with themselves and this perversion had been given the name of narcissism. The libido of the self-preservative instincts was now described as narcissistic libido and it was recognized that a high degree of this self-love constituted the primary and normal state of things. The earlier formula laid down for the transference neuroses consequently required to be modified, though not corrected. It was better, instead of speaking of a conflict between sexual instincts and ego instincts, to speak of a conflict between object-libido and ego-libido, or, since the nature of these instincts was the same, between the object-cathexes and the ego.

[1923a, 3933]
In the further course of psycho-analytic work, however, even these distinctions have proved to be inadequate and, for practical purposes, insufficient. This has become clear in more ways than one; but the decisive instance is as follows. We have formed the idea that in each individual there is a coherent organization of mental processes; and we call this his ego. It is to this ego that consciousness is attached; the ego controls the approaches to motility - that is, to the discharge of excitations into the external world; it is the mental agency which supervises all its own constituent processes, and which goes to sleep at night, though even then it exercises the censorship on dreams. From this ego proceed the repressions, too, by means of which it is sought to exclude certain trends in the mind not merely from consciousness but also from other forms of effectiveness and activity. In analysis these trends which have been shut out stand in opposition to the ego, and the analysis is faced with the task of removing the resistances which the ego displays against concerning itself with the repressed. Now we find during analysis that, when we put certain tasks before the patient, he gets into difficulties; his associations fail when they should be coming near the repressed. We then tell him that he is dominated by a resistance; but he is quite unaware of the fact, and, even if he guesses from his unpleasurable feelings that a resistance is now at work in him, he does not know what it is or how to describe it. Since, however, there can be no question but that this resistance emanates from his ego and belongs to it, we find ourselves in an unforeseen situation. We have come upon something in the ego itself which is also unconscious, which behaves exactly like the repressed - that is, which produces powerful effects without itself being conscious and which requires special work before it can be made conscious. From the point of view of analytic practice, the consequence of this discovery is that we land in endless obscurities and difficulties if we keep to our habitual forms of expression and try, for instance, to derive neuroses from a conflict between the conscious and the unconscious. We shall have to substitute for this antithesis another, taken from our insight into the structural conditions of the mind - the antithesis between the coherent ego and the repressed which is split off from it.¹

This revolt against castration or a feminine attitude has been torn out of its organic context by Alfred Adler. He has linked it superficially or falsely with the longing for power, and has postulated it as an independent 'masculine protest'. Since a neurosis can only arise from a conflict between two trends, it is as justifiable to see the cause of 'every' neurosis in the masculine protest as it is to see it in the feminine attitude against which the protest is being made. It is quite true that this masculine protest plays a regular part in the formation of character - in some types of people a very large part - and that we meet it in the analysis of neurotic men as a vigorous resistance. Psycho-analysis has attached due importance to the masculine protest in connection with the castration complex, without being able to accept its omnipotence or its omnipresence in neuroses. The most marked case of a masculine protest with all its manifest reactions and character-traits that I have met with in analysis was that of a patient who came to me for treatment on account of an obsessional neurosis in whose symptoms the unresolved conflict between a masculine and a feminine attitude (fear of castration and desire for castration) found clear expression. In addition, the patient had developed masochistic phantasies which were wholly derived from a wish to accept castration; and he had even gone beyond these phantasies to real satisfaction in perverse situations. The whole of his state rested - like Adler's theory itself - on the repression and denial of early infantile fixations of love.

¹ [1923b, 3951]

[1923d, 4016]
In a far greater number of cases the neurosis is more autonomous and more independent of the interests of self-preservation and self-maintenance. In the conflict which creates the neurosis, what are at stake are either solely libidinal interests or libidinal interests in intimate connections with self-preservation ones. In all three instances the dynamics of the neurosis are the same. A dammed-up libido which cannot be satisfied in reality succeeds, with the help of a regression to old fixations, in finding discharge through the repressed unconscious. The sick man's ego, in so far as it can extract a 'gain from illness' out of this process, countenances the neurosis, although there can be no doubt of its injuriousness in its economic aspect.

[1923d, 4027]

It is by no means easy to arrive at general conclusions upon the value of correctly translated dreams. If a conflict due to ambivalence is taking place in a patient, then the emergence in him of a hostile thought certainly does not imply a permanent overcoming of his affectionate impulse - that is to say, a resolution of the conflict: neither does any such implication follow from a dream with a similarly hostile content. During a conflict such as this arising from ambivalence, there are often two dreams every night, each of them representing an opposite attitude. In that case the progress lies in the fact that a complete isolation of the two contrasted impulses has been achieved and that each of them, with the help of its unconscious reinforcements, can be followed and understood to its extreme limits. And if it sometimes happens that one of the two ambivalent dreams has been forgotten, one must not be deceived into assuming that a decision has been made in favour of the one side. The fact that one of the dreams has been forgotten shows, it is true, that for the moment one tendency is in the ascendant, but that is true only of the one day, and may be changed. The next night may perhaps bring the opposite expression into the foreground. The true state of the conflict can only be determined by taking into account all the other indications, including those of waking life.

[1923c, 4034]

In the work I have mentioned I described the numerous dependent relationships of the ego, its intermediate position between the external world and the id and its efforts to humour all its masters at once. In connection with a train of thought raised in other quarters, which was concerned with the origin and prevention of the psychoses, a simple formula has now occurred to me which deals with what is perhaps the most important genetic difference between a neurosis and a psychosis: neurosis is the result of a conflict between the ego and its id, whereas psychosis in the analogous outcome of a similar disturbance in the relations between the ego and the external world.

[1924b, 4065]
There are certainly good grounds for being suspicious of such simple solutions of a problem. Moreover, the most that we may expect is that this formula will turn out to be correct in the roughest outline. But even that would be something. One recalls at once, too, a whole number of discoveries and findings which seem to support our thesis. All our analyses go to show that the transference neuroses originate from the ego's refusing to accept a powerful instinctual impulse in the id or to help it to find a motor outlet, or from the ego's forbidding that impulse the object at which it is aiming. In such a case the ego defends itself against the instinctual impulse by the mechanism of repression. The repressed material struggles against this fate. It creates for itself, along paths over which the ego has no power, a substitutive representation (which forces itself upon the ego by way of a compromise) - the symptom. The ego finds its unity threatened and impaired by this intruder, and it continues to struggle against the symptom, just as it fended off the original instinctual impulse. All this produces the picture of a neurosis. It is no contradiction to this that, in undertaking the repression, the ego is at bottom following the commands of its super-ego - commands which, in their turn, originate from influences in the external world that have found representation in the super-ego. The fact remains that the ego has taken sides with those powers, that in it their demands have more strength than the instinctual demands of the id, and that the ego is the power which sets the repression in motion against the portion of the id concerned and which fortifies the repression by means of the anticaathexis of resistance. The ego has come into conflict with the id in the service of the super-ego and of reality; and this is the state of affairs in every transference neurosis.  

The aetiology common to the onset of a psychoneurosis and of a psychosis always remains the same. It consists in a frustration, a non-fulfilment of one of those childhood wishes which are for ever undefeated and which are so deeply rooted in our phylogenetically determined organization. This frustration is in the last resort always an external one; but in the individual case it may proceed from the internal agency (in the super-ego) which has taken over the representation of the demands of reality. The pathogenic effect depends on whether, in a conflictual tension of this kind, the ego remains true to its dependence on the external world and attempts to silence the id, or whether it lets itself be overcome by the id and thus torn away from reality. A complication is introduced into this apparently simple situation, however, by the existence of the super-ego, which, though a link that is not yet clear to us, unites in itself influences coming from the id as well as from the external world, and is to some extent an ideal model of what the whole endeavour of the ego is aiming at - a reconciliation between its various dependent relationships. The attitude of the super-ego should be taken into account - which has not hitherto been done - in every form of psychical illness. We may provisionally assume that there must also be illnesses which are based on a conflict between the ego and the super-ego. Analysis gives us a right to suppose that melancholia is a typical example of this group; and we would set aside the name of 'narcissistic psychoneuroses' for disorders of that kind. Nor will it clash with our impressions if we find reasons for separating states like melancholia from the other psychoses. We now see that we have been able to make our simple genetic formula more complete, without dropping it. Transference neuroses correspond to a conflict between the ego and the id; narcissistic neuroses, to a conflict between the ego and the super-ego; and psychoses, to one between the ego and the external world. It is true that we cannot tell at once whether we have really gained any new knowledge by this, or have only enriched our store of formulas; but I think that this possible application of the proposed differentiation of the mental apparatus into an ego, a super-ego and an id cannot fail to give us courage to keep that hypothesis steadily in view.
We might expect that when a psychosis comes into being, something analogous to the process in a neurosis occurs, though, of course, between different agencies of the mind; thus we might expect that in a psychosis, too, two steps could be discerned, of which the first would drag the ego away, this time from reality, while the second would try to make good the damage done and re-establish the subject's relations to reality at the expense of the id. And, in fact, some analogy of the sort can be observed in a psychosis. Here, too, there are two steps, the second of which has the character of a reparation. But beyond that the analogy gives way to a far more extensive similarity between the two processes. The second step of the psychosis is indeed intended to make good the loss of reality, not, however, at the expense of a restriction of the id - as happens in neurosis at the expense of the relation to reality - but in another, more autocratic manner, by the creation of a new reality which no longer raises the same objections as the old one that has been given up. The second step, therefore, both in neurosis and psychosis, is supported by the same trends. In both cases it serves the desire for power of the id, which will not allow itself to be dictated to by reality. Both neurosis and psychosis are thus the expression of a rebellion on the part of the id against the external world, of its unwillingness - or, if one prefers, its incapacity - to adapt itself to the exigencies of reality, to 'Ανάγχη [Necessity]. Neurosis and psychosis differ from each other far more in their first, introductory, reaction than in the attempt at reparation which follows it.

[1924e, 4095]

A conflict between two groups of mental trends had to be looked on as the ground for repression and accordingly as the cause of every neurotic illness. And here experience taught us a new and surprising fact about the nature of the forces that were struggling against each other. Repression invariably proceeded from the sick person's conscious personality (his ego) and took its stand on aesthetic and ethical motives; the impulses that were subjected to repression were those of selfishness and cruelty, which can be summed up in general as evil, but above all sexual wishful impulses, often of the crudest and most forbidden kind. Thus the symptoms were a substitute for forbidden satisfactions and the illness seemed to correspond to an incomplete subjugation of the immoral side of human beings.

[1924f, 4106]

After hypnosis was replaced by the technique of free association, Breuer's cathartic procedure turned into psycho-analysis, which for more than a decade was developed by the author (Freud) alone. During that time psycho-analysis gradually acquired a theory which appeared to give a satisfactory account of the origin, meaning and purpose of neurotic symptoms and provided a rational basis for medical attempts at curing the complaint. I will once again enumerate the factors that go to make up this theory. They are: emphasis on instinctual life (affectivity), on mental dynamics, on the fact that even the apparently most obscure and arbitrary mental phenomena invariably have a meaning and a causation, the theory of psychical conflict and of the pathogenic nature of repression, the view that symptoms are substitutive satisfactions, the recognition of the aetiological importance of sexual life, and in particular of the beginnings of infantile sexuality. From a philosophical standpoint this theory was bound to adopt the view that the mental does not coincide with the conscious, that mental processes are in themselves unconscious and are only made conscious by the functioning of special organs (agencies or systems). By way of completing this list, I will add that among the affective attitudes of childhood the complicated emotional relation of children to their parents - what is known as the Oedipus complex - came into prominence. It became ever clearer that this was the nucleus of every case of neurosis, and in the patient's behaviour towards his analyst certain phenomena of his emotional transference emerged which came to be of great importance for theory and technique alike.

[1924f, 4107]
The analysis of dreams led further: it was brought to public notice by the present writer as early as in 1900 in *The Interpretation of Dreams*. This showed that dreams are constructed in just the same way as neurotic symptoms. Like them, they may appear strange and senseless; but, if we examine them by a technique which differs little from the free association used in psycho-analysis, we are led from their manifest content to a secret meaning, to the latent dream-thoughts. This latent meaning is always a wishful impulse which is represented as fulfilled at the moment of the dream. But, except in young children and under the pressure of imperative physical needs, this secret wish can never be expressed recognizably. It has first to submit to a distortion, which is the work of restrictive, censoring forces in the dreamer's ego. In this way the manifest dream, as it is remembered in waking life, comes about. It is distorted, to the pitch of being unrecognizable, by concessions made to the dream-censorship; but it can be revealed once more by analysis as an expression of a situation of satisfaction or as the fulfilment of a wish. It is a compromise between two conflicting groups of mental trends, just as we have found to be the case with hysterical symptoms. The formula which, at bottom, best meets the essence of the dream is this: a dream is a (disguised) fulfilment of a (repressed) wish. The study of the process which transforms the latent dream-wish into the manifest content of the dream - a process known as the 'dream-work' - has taught us the best part of what we know of unconscious mental life.

It was now easy to reconstruct the pathogenic process. Let us keep to a simple example, in which a particular impulsion had arisen in the subject's mind but was opposed by other powerful impulsions. We should have expected the mental conflict which now arose to take the following course. The two dynamic quantities - for our present purposes let us call them 'the instinct' and 'the resistance' - would struggle with each other for some time in the fullest light of consciousness, until the instinct was repudiated and the cathexis of energy withdrawn from its impulsion. This would have been the normal solution. In a neurosis, however (for reasons which were still unknown), the conflict found a different outcome. The ego drew back, as it were, on its first collision with the objectionable instinctual impulse; it debarred the impulse from access to consciousness and to direct motor discharge, but at the same time the impulse retained its full cathexis of energy. I named this process repression; it was a novelty, and nothing like it had ever before been recognized in mental life. It was obviously a primary mechanism of defence, comparable to an attempt at flight, and was only a forerunner of the later-developed normal condemning judgement. The first act of repression involved further consequences. In the first place the ego was obliged to protect itself against the constant threat of a renewed advance on the part of the repressed impulse by making a permanent expenditure of energy, an anticathexis, and it thus impoverished itself. On the other hand, the repressed impulse, which was now unconscious, was able to find means of discharge and of substitutive satisfaction by circuitous routes and thus to bring the whole purpose of the repression to nothing. In the case of conversion hysteria the circuitous route led to the somatic innervation; the repressed impulse broke its way through at some point or other and produced symptoms. The symptoms were thus results of a compromise, for although they were substitutive satisfactions they were nevertheless distorted and deflected from their aim owing to the resistance of the ego.
It is possible to take repression as a centre and to bring all the elements of psycho-analytic theory into relation with it. But before doing so I have a further comment of a polemical nature to make. According to Janet's view a hysterical woman was a wretched creature who, on account of a constitutional weakness, was unable to hold her mental acts together, and it was for that reason that she fell a victim to a splitting of her mind and to a restriction of the field of her consciousness. The outcome of psycho-analytic investigations, on the other hand, showed that these phenomena were the result of dynamic factors - of mental conflict and of repression. This distinction seems to me to be far-reaching enough to put an end to the glib repetition of the view that whatever is of value in psycho-analysis is merely borrowed from the ideas of Janet. The reader will have learned from my account that historically psycho-analysis is completely independent of Janet's discoveries, just as in its content it diverges from them and goes far beyond them. Janet's works would never have had the implications which have made psycho-analysis of such importance to the mental sciences and have made it attract such universal interest. I always treated Janet himself with respect, since his discoveries coincided to a considerable extent with those of Breuer, which had been made earlier but were published later than his. But when in the course of time psycho-analysis became a subject of discussion in France, Janet behaved ill, showed ignorance of the facts and used ugly arguments. And finally he revealed himself to my eyes and destroyed the value of his own work by declaring that when he had spoken of 'unconscious' mental acts he had meant nothing by the phrase - it had been no more than a façon de parler.

I have already mentioned that my investigation of the precipitating and underlying causes of the neuroses led me more and more frequently to conflicts between the subject's sexual impulses and his resistances to sexuality. In my search for the pathogenic situations in which the repressions of sexuality had set in and in which the symptoms, as substitutes for what was repressed, had had their origin, I was carried further and further back into the patient's life and ended by reaching the first years of his childhood. What poets and students of human nature had always asserted turned out to be true: the impressions of that early period of life, though they were for the most part buried in amnesia, left ineradicable traces upon the individual's growth and in particular laid down the disposition to any nervous disorder that was to follow. But since these experiences of childhood were always concerned with sexual excitations and the reaction against them, I found myself faced by the fact of infantile sexuality - once again a novelty and a contradiction of one of the strongest of human prejudices. Childhood was looked upon as 'innocent' and free from the lusts of sex, and the fight with the demon of 'sensuality' was not thought to begin until the troubled age of puberty. Such occasional sexual activities as it had been impossible to overlook in children were put down as signs of degeneracy or premature depravity or as a curious freak of nature. Few of the findings of psycho-analysis have met with such universal contradiction or have aroused such an outburst of indignation as the assertion that the sexual function starts at the beginning of life and reveals its presence by important signs even in childhood. And yet no other finding of analysis can be demonstrated so easily and so completely.

[1925d, 4207]
We shall not make any headway until we have reviewed the little boy's psychical situation as a whole as it came to light in the course of the analytic treatment. He was at the time in the jealous and hostile Oedipus attitude towards his father, whom nevertheless - except in so far as his mother was the cause of estrangement - he dearly loved. Here, then, we have a conflict due to ambivalence: a well-grounded love and a no less justifiable hatred directed towards one and the same person. 'Little Hans's' phobia must have been an attempt to solve this conflict. Conflicts of this kind due to ambivalence are very frequent and they can have another typical outcome, in which one of the two conflicting feelings (usually that of affection) becomes enormously intensified and the other vanishes. The exaggerated degree and compulsive character of the affection alone betray the fact that it is not the only one present but is continually on the alert to keep the opposite feeling under suppression, and enable us to postulate the operation of a process which we call repression by means of reaction-formation (in the ego). Cases like 'Little Hans's' show no traces of a reaction-formation of this kind. There are clearly different ways of egress from a conflict due to ambivalence.

So far there seem to be no connecting links between 'Little Hans's' repressed instinctual impulse and the substitute for it which we suspect is to be seen in his phobia of horses. Let us simplify his psychical situation by setting on one side the infantile factor and the ambivalence. Let us imagine that he is a young servant who is in love with the mistress of the house and has received some tokens of her favour. He hates his master, who is more powerful than he is, and he would like to have him out of the way. It would then be eminently natural for him to dread his master's vengeance and to develop a fear of him - just as 'Little Hans' developed a phobia of horses. We cannot, therefore, describe the fear belonging to this phobia as a symptom. If 'Little Hans', being in love with his mother, had shown fear of his father, we should have no right to say that he had a neurosis or a phobia. His emotional reaction would have been entirely comprehensible. What made it a neurosis was one thing alone: the replacement of his father by a horse. It is this displacement, then, which has a claim to be called a symptom, and which, incidentally, constitutes the alternative mechanism which enables a conflict due to ambivalence to be resolved without the aid of a reaction-formation. Such a displacement is made possible or facilitated at 'Little Hans's' early age because the inborn traces of totemic thought can still be easily revived. Children do not as yet recognize or, at any rate, lay such exaggerated stress upon the gulf that separates human beings from the animal world. In their eyes the grown man, the object of their fear and admiration, still belongs to the same category as the big animal who has so many enviable attributes but against whom they have been warned because he may become dangerous. As we see, the conflict due to ambivalence is not dealt with in relation to one and the same person: it is circumvented, as it were, by one of the pair of conflicting impulses being directed to another person as a substitutive object.
The advent of puberty opens a decisive chapter in the history of an obsessional neurosis. The genital organization which has been broken off in childhood starts again with great vigour. But, as we know, the sexual development in childhood determines what direction this new start at puberty will take. Not only will the early aggressive impulses be re-awakened; but a greater or lesser proportion of the new libidinal impulses - in bad cases the whole of them - will have to follow the course prescribed for them by regression and will emerge as aggressive and destructive tendencies. In consequence of the erotic trends being disguised in this way and owing to the powerful reaction-formations in the ego, the struggle against sexuality will henceforward be carried on under the banner of ethical principles. The ego will recoil with astonishment from promptings to cruelty and violence which enter consciousness from the id, and it has no notion that in them it is combating erotic wishes, including some to which it would not otherwise have taken exception. The overstrict super-ego insists all the more strongly on the suppression of sexuality, since this has assumed such repellent forms. Thus in obsessional neurosis the conflict is aggravated in two directions: the defensive forces become more intolerant and the forces that are to be fended off become more intolerable. Both effects are due to a single factor, namely, regression of the libido. [1926d, 4275]

I have already described the general tendency of symptom-formation in obsessional neurosis. It is to give ever greater room to substitutive satisfaction at the expense of frustration. Symptoms which once stood for a restriction of the ego come later on to represent satisfactions as well, thanks to the ego's inclination to synthesis, and it is quite clear that this second meaning gradually becomes the more important of the two. The result of this process, which approximates more and more to a complete failure of the original purpose of defence, is an extremely restricted ego which is reduced to seeking satisfaction in the symptoms. The displacement of the distribution of forces in favour of satisfaction may have the dreaded final outcome of paralysing the will of the ego, which in every decision it has to make is almost as strongly impelled from the one side as from the other. The over-acute conflict between id and super-ego which has dominated the illness from the very beginning may assume such extensive proportions that the ego, unable to carry out its office of mediator, can undertake nothing which is not drawn into the sphere of that conflict. [1926d, 4277]

We have all found by experience that it is especially difficult for an obsessional neurotic to carry out the fundamental rule of psycho-analysis. His ego is more watchful and makes sharper isolations, probably because of the high degree of tension due to conflict that exists between his super-ego and his id. While he is engaged in thinking, his ego has to keep off too much - the intrusion of unconscious phantasies and the manifestation of ambivalent trends. It must not relax, but is constantly prepared for a struggle. It fortifies this compulsion to concentrate and to isolate by the help of the magical acts of isolation which, in the form of symptoms, grow to be so noticeable and to have so much practical importance for the patient, but which are, of course, useless in themselves and are in the nature of ceremonials. [1926d, 4280]
Let us go back again to infantile phobias of animals; for, when all is said and done, we understand them better than any other cases. In animal phobias, then, the ego has to oppose a libidinal object-cathexis coming from the id - a cathexis that belongs either to the positive or the negative Oedipus complex - because it believes that to give way to it would entail the danger of castration. This question has already been discussed, but there still remains a doubtful point to clear up. In 'Little Hans's' case - that is, in the case of a positive Oedipus complex - was it his fondness for his mother or was it his aggressiveness towards his father which called out the defence by the ego? In practice it seems to make no difference, especially as each set of feelings implies the other; but the question has a theoretical interest, since it is only the feeling of affection for the mother which can count as a purely erotic one. The aggressive impulse flows mainly from the destructive instinct; and we have always believed that in a neurosis it is against the demands of the libido and not against those of any other instinct that the ego is defending itself. In point of fact we know that after 'Hans's' phobia had been formed, his tender attachment to his mother seemed to disappear, having been completely disposed of by repression, while the formation of the symptom (the substitutive formation) took place in relation to his aggressive impulses. In the 'Wolf Man' the situation was simpler. The impulse that was repressed - his feminine attitude towards his father - was a genuinely erotic one; and it was in relation to that impulse that the formation of his symptoms took place.

This time we will not lose sight of the part played by anxiety. We have said that as soon as the ego recognizes the danger of castration it gives the signal of anxiety and inhibits through the pleasure-unpleasure agency (in a way which we cannot as yet understand) the impending cathetic process in the id. At the same time the phobia is formed. And now the castration anxiety is directed to a different object and expressed in a distorted form, so that the patient is afraid, not of being castrated by his father, but of being bitten by a horse or devoured by a wolf. This substitutive formation has two obvious advantages. In the first place it avoids a conflict due to ambivalence (for the father was a loved object, too), and in the second place it enables the ego to cease generating anxiety. For the anxiety belonging to a phobia is conditional; it only emerges when the object of it is perceived - and rightly so, since it is only then that the danger-situation is present. There is no need to be afraid of being castrated by a father who is not there. On the other hand one cannot get rid of a father; he can appear whenever he chooses. But if he is replaced by an animal, all one has to do is to avoid the sight of it - that is, its presence - in order to be free from danger and anxiety. 'Little Hans', therefore, imposed a restriction upon his ego. He produced the inhibition of not leaving the house, so as not to come across any horses. The young Russian had an even easier time of it, for it was hardly a privation for him not to look at a particular picture-book any more. If his naughty sister had not kept on showing him the book with the picture of the wolf standing upright in it, he would have been able to feel safe from his fear.

In the course of discussing the problem of anxiety I have revived a concept or, to put it more modestly, a term, of which I made exclusive use thirty years ago when I first began to study the subject but which I later abandoned. I refer to the term 'defensive process'. I afterwards replaced it by the word 'repression', but the relation between the two remained uncertain. It will be an undoubted advantage, I think, to revert to the old concept of 'defence', provided we employ it explicitly as a general designation for all the techniques which the ego makes use of in conflicts which may lead to a neurosis, while we retain the word 'repression' for the special method of defence which the line of approach taken by our investigations made us better acquainted with in the first instance.
You have no notion how close I am to fulfilling my promise. Even in organisms which later develop an efficient ego-organization, their ego is feeble and little differentiated from their id to begin with, during their first years of childhood. Imagine now what will happen if this powerless ego experiences an instinctual demand from the id which it would already like to resist (because it senses that to satisfy it is dangerous and would conjure up a traumatic situation, a collision with the external world) but which it cannot control, because it does not yet possess enough strength to do so. In such a case the ego treats the instinctual danger as if it was an external one; it makes an attempt at flight, draws back from this portion of the id and leaves it to its fate, after withholding from it all the contributions which it usually makes to instinctual impulses. The ego, as we put it, institutes a repression of these instinctual impulses. For the moment this has the effect of fending off the danger; but one cannot confuse the inside and the outside with impunity. One cannot run away from oneself. In repression the ego is following the pleasure principle, which it is usually in the habit of correcting; and it is bound to suffer damage in revenge. This lies in the ego's having permanently narrowed its sphere of influence. The repressed instinctual impulse is now isolated, left to itself, inaccessible, but also uninfluenceable. It goes its own way. Even later, as a rule, when the ego has grown stronger, it still cannot lift the repression; its synthesis is impaired, a part of the id remains forbidden ground to the ego. Nor does the isolated instinctual impulse remain idle; it understands how to make up for being denied normal satisfaction; it produces psychical derivatives which take its place; it links itself to other processes which by its influence it likewise tears away from the ego; and finally it breaks through into the ego and into consciousness in the form of an unrecognizably distorted substitute, and creates what we call a symptom. All at once the nature of a neurotic disorder becomes clear to us: on the one hand an ego which is inhibited in its synthesis, which has no influence on parts of the id, which must renounce some of its activities in order to avoid a fresh collision with what has been repressed, and which exhausts itself in what are for the most part vain acts of defence against the symptoms, the derivatives of the repressed impulses; and on the other hand an id in which individual instincts have made themselves independent, pursue their aims regardless of the interests of the person as a whole and henceforth obey the laws only of the primitive psychology that rules in the depths of the id. If we survey the whole situation we arrive at a simple formula for the origin of a neurosis: the ego has made an attempt to suppress certain portions of the id in an inappropriate manner, this attempt has failed and the id has taken its revenge. A neurosis is thus the result of a conflict between the ego and the id, upon which the ego has embarked because, as careful investigation shows, it wishes at all costs to retain its adaptability in relation to the real external world. The disagreement is between the external world and the id; and it is because the ego, loyal to its inmost nature, takes sides with the external world that it becomes involved in a conflict with its id. But please observe that what creates the determinant for the illness is not the fact of this conflict - for disagreements of this kind between reality and the id are unavoidable and it is one of the ego's standing tasks to mediate in them - but the circumstance that the ego has made use of the inefficient instrument of repression for dealing with the conflict. But this in turn is due to the fact that the ego, at the time at which it was set the task, was undeveloped and powerless. The decisive repressions all take place in early childhood.

[1926e, 4346]
It is easy now to describe our therapeutic aim. We try to restore the ego, to free it from its restrictions, and to give it back the command over the id which it has lost owing to its early repressions. It is for this one purpose that we carry out analysis, our whole technique is directed to this aim. We have to seek out the repressions which have been set up and to urge the ego to correct them with our help and to deal with conflicts better than by an attempt at flight. Since these repressions belong to the very early years of childhood, the work of analysis leads us, too, back to that period. Our path to these situations of conflict, which have for the most part been forgotten and which we try to revive in the patient's memory, is pointed out to us by his symptoms, dreams and free associations. These must, however, first be interpreted - translated - for, under the influence of the psychology of the id, they have assumed forms of expression that are strange to our comprehension. We may assume that whatever associations, thoughts and memories the patient is unable to communicate to us without internal struggles are in some way connected with the repressed material or are its derivatives. By encouraging the patient to disregard his resistances to telling us these things, we are educating his ego to overcome its inclination towards attempts at flight and to tolerate an approach to what is repressed. In the end, if the situation of the repression can be successfully reproduced in his memory, his compliance will be brilliantly rewarded. The whole difference between his age then and now works in his favour; and the thing from which his childish ego fled in terror will often seem to his adult and strengthened ego no more than child's play.

[1926e, 4348]

(2) For cultural reasons the most intense repression falls upon the sexual instincts; but it is precisely in connection with them that repression most easily miscarries, so that neurotic symptoms are found to be substitutive satisfactions of repressed sexuality. The belief that in man sexual life begins only at puberty is incorrect. On the contrary, signs of it can be detected from the beginning of extra-uterine existence; it reaches a first culminating point at or before the fifth year ('early period'), after which it is inhibited or interrupted ('latency period') until the age of puberty, which is the second climax of its development. This diphasic onset of sexual development seems to be distinctive of the genus Homo. All experiences during the first period of childhood are of the greatest importance to the individual, and in combination with his inherited sexual constitution form the dispositions for the subsequent development of character and disease. It is wrong to make sexuality coincide with 'genitality'. The sexual instincts pass through a complicated course of development, and it is only at the end of it that the 'primacy of the genital zones' is attained. Before this there are a number of 'pregenital' organizations of the libido - points at which it may become 'fixated' and to which, in the event of subsequent repression, it will return ('regression'). The infantile fixations of the libido are what determine the form of any later neurosis. Thus the neuroses are to be regarded as inhibitions in the development of the libido. There are no specific causes of nervous disorders; the question whether a conflict finds a healthy solution or leads to a neurotic inhibition of function depends upon quantitative considerations.

[1926f, 4405]

It is a familiar fact that the aetiological preconditions of neurosis are not yet known with certainty. The precipitating causes of it are frustrations and internal conflicts: conflicts between the three major psychical agencies, conflicts arising within the libidinal economy in consequence of our bisexual disposition and conflicts between the erotic and the aggressive instinctual components. It is the endeavour of the psychology of the neuroses to discover what makes these processes, which belong to the normal course of mental life, become pathogenic.

[1931a, 4587]
You know better. From the very first we have said that human beings fall ill of a conflict between the claims of instinctual life and the resistance which arises within them against it; and not for a moment have we forgotten this resisting, repelling, repressing agency, which we thought of as equipped with its special forces, the ego-instincts, and which coincides with the ego of popular psychology. The truth was merely that, in view of the laborious nature of the progress made by scientific work, even psycho-analysis was not able to study every field simultaneously and to express its views on every problem in a single breath. But at last the point was reached when it was possible for us to divert our attention from the repressed to the repressing forces, and we faced this ego, which had seemed so self-evident, with the secure expectation that here once again we should find things for which we could not have been prepared. It was not easy, however, to find a first approach; and that is what I intend to talk to you about to-day.

[1933a, 4666]

The theory of the instincts is so to say our mythology. Instincts are mythical entities, magnificent in their indefiniteness. In our work we cannot for a moment disregard them, yet we are never sure that we are seeing them clearly. You know how popular thinking deals with the instincts. People assume as many and as various instincts as they happen to need at the moment - a self-assertive instinct, an imitative instinct, an instinct of play, a gregarious instinct and many others like them. People take them up, as it were, make each of them do its particular job, and then drop them again. We have always been moved by a suspicion that behind all these little ad hoc instincts there lay concealed something serious and powerful which we should like to approach cautiously. Our first step was modest enough. We told ourselves we should probably not be going astray if we began by separating two main instincts or classes of instincts or groups of instincts in accordance with the two great needs - hunger and love. However jealously we usually defend the independence of psychology from every other science, here we stood in the shadow of the unshakable biological fact that the living individual organism is at the command of two intentions, self-preservation and the preservation of the species, which seem to be independent of each other, which, so far as we know at present, have no common origin and whose interests are often in conflict in animal life. Actually what we are talking now is biological psychology, we are studying the psychical accompaniments of biological processes. It was as representing this aspect of the subject that the 'ego-instincts' and the 'sexual instincts' were introduced into psycho-analysis. We included in the former everything that had to do with the preservation, assertion and magnification of the individual. To the latter we had to attribute the copiousness called for by infantile and perverse sexual life. In the course of investigating the neuroses we came to know the ego as the restricting and repressing power and the sexual trends as the restricted and repressed one; we therefore believed that we had clear evidence not only of the difference between the two groups of instincts but also of the conflict between them. The first object of our study was only the sexual instincts, whose energy we named 'libido'. It was in relation to them that we sought to clarify our ideas of what an instinct is and what is to be attributed to it. Here we have the libido theory.

[1933a, 4701]
The fact that women must be regarded as having little sense of justice is no doubt related to the predominance of envy in their mental life; for the demand for justice is a modification of envy and lays down the condition subject to which one can put envy aside. We also regard women as weaker in their social interests and as having less capacity for sublimating their instincts than men. The former is no doubt derived from the dissocial quality which unquestionably characterizes all sexual relations. Lovers find sufficiency in each other, and families too resist inclusion in more comprehensive associations. The aptitude for sublimation is subject to the greatest individual variations. On the other hand I cannot help mentioning an impression that we are constantly receiving during analytic practice. A man of about thirty strikes us as a youthful, somewhat unformed individual, whom we expect to make powerful use of the possibilities for development opened up to him by analysis. A woman of the same age, however, often frightens us by her psychical rigidity and unchangeability. Her libido has taken up final positions and seems incapable of exchanging them for others. There are no paths open to further development; it is as though the whole process had already run its course and remains thenceforward insusceptible to influence - as though, indeed, the difficult development to femininity had exhausted the possibilities of the person concerned. As therapists we lament this state of things, even if we succeed in putting an end to our patient's ailment by doing away with her neurotic conflict. [1933a, 4736]

The negative reactions follow the opposite aim: that nothing of the forgotten traumas shall be remembered and nothing repeated. We can summarize them as 'defensive reactions'. Their principal expression are what are called 'avoidances', which may be intensified into 'inhibitions' and 'phobias'. These negative reactions too make the most powerful contributions to the stamping of character. Fundamentally they are just as much fixations to the trauma as their opposites, except that they are fixations with a contrary purpose. The symptoms of neurosis in the narrower sense are compromises in which both the trends proceeding from traumas come together, so that the share, now of one and now of the other tendency, finds preponderant expression in them. This opposition between the reactions sets up conflicts which in the ordinary course of events can reach no conclusion. [1939a, 4901]
And now let us enquire about latency, which, in view of the analogy, is bound to interest us especially. A trauma in childhood may be followed immediately by a neurotic outbreak, an infantile neurosis, with an abundance of efforts at defence, and accompanied by the formation of symptoms. This neurosis may last a considerable time and cause marked disturbances, but it may also run a latent course and be overlooked. As a rule defence retains the upper hand in it; in any case alterations of the ego, comparable to scars, are left behind. It is only rarely that an infantile neurosis continues without interruption into an adult one. Far more often it is succeeded by a period of apparently undisturbed development - a course of things which is supported or made possible by the intervention of the physiological period of latency. Not until later does the change take place with which the definitive neurosis becomes manifest as a belated effect of the trauma. This occurs either at the irruption of puberty or some while later. In the former case it happens because the instincts, intensified by physical maturation, are able now to take up the struggle again in which they were at first defeated by the defence. In the latter case it happens because the reactions and alterations of the ego brought about by the defence now prove a hindrance in dealing with the new tasks of life, so that severe conflicts come about between the demands of the real external world and the ego, which seeks to maintain the organization which it has painstakingly achieved in its defensive struggle. The phenomenon of a latency of the neurosis between the first reactions to the trauma and the later outbreak of the illness must be regarded as typical. This latter illness may also be looked upon as an attempt at cure - as an effort once more to reconcile with the rest those portions of the ego that have been split off by the influence of the trauma and to unite them into a powerful whole vis-à-vis the external world. An attempt of this kind seldom succeeds, however, unless the work of analysis comes to its help, and even then not always; it ends often enough in a complete devastation or fragmentation of the ego or in its being overwhelmed by the portion which was early split off and which is dominated by the trauma.

[1939a, 4902]

We already know a number of things preliminary to such an undertaking. According to our hypothesis it is the ego's task to meet the demands raised by its three dependent relations to reality, to the id and to the super-ego - and nevertheless at the same time to preserve its own organization and maintain its own autonomy. The necessary precondition of the pathological states under discussion can only be a relative or absolute weakening of the ego which makes the fulfillment of its tasks impossible. The severest demand on the ego is probably the keeping down of the instinctual claims of the id, to accomplish which it is obliged to maintain large expenditures of energy on anticathexes. But the demands made by the super-ego too may become so powerful and so relentless that the ego may be paralysed, as it were, in the face of its other tasks. We may suspect that, in the economic conflicts which arise at this point, the id and the super-ego often make common cause against the hard-pressed ego which tries to cling to reality in order to retain its normal state. If the other two become too strong, they succeed in loosening and altering the ego's organization, so that its proper relation to reality is disturbed or even brought to an end. We have seen it happen in dreaming: when the ego is detached from the reality of the external world, it slips down, under the influence of the internal world, into psychosis.

[1940a [1938], 4982]
Our plan of cure is based on these discoveries. The ego is weakened by the internal conflict and we must go to its help. The position is like that in a civil war which has to be decided by the assistance of an ally from outside. The analytic physician and the patient's weakened ego, basing themselves on the real external world, have to band themselves together into a party against the enemies, the instinctual demands of the id and the conscientious demands of the super-ego. We form a pact with each other. The sick ego promises us the most complete candour - promises, that is, to put at our disposal all the material which its self-perception yields it; we assure the patient of the strictest discretion and place at his service our experience in interpreting material that has been influenced by the unconscious. Our knowledge is to make up for his ignorance and to give his ego back its mastery over lost provinces of his mental life. This pact constitutes the analytic situation.

[1940a [1938], 4983]

Let us once more glance over the situation which we have reached in our attempt at bringing help to the patient's neurotic ego. That ego is no longer able to fulfil the task set it by the external world (including human society). Not all of its experiences are at its disposal, a large proportion of its store of memories have escaped it. Its activity is inhibited by strict prohibitions from the super-ego, its energy is consumed in vain attempts at fending off the demands of the id. Beyond this, as a result of continuous irruptions by the id, its organization is impaired, it is no longer capable of any proper synthesis, it is torn by mutually opposed urges, by unsettled conflicts and by unsolved doubts. To start with, we get the patient's thus weakened ego to take part in the purely intellectual work of interpretation, which aims at provisionally filling the gaps in his mental assets, and to transfer to us the authority of his super-ego; we encourage it to take up the struggle over each individual demand made by the id and to conquer the resistances which arise in connection with it. At the same time we restore order in the ego by detecting the material and urges which have forced their way in from the unconscious, and expose them to criticism by tracing them back to their origin. We serve the patient in various functions, as an authority and a substitute for his parents, as a teacher and educator; and we have done the best for him if, as analysts, we raise the mental processes in his ego to a normal level, transform what has become unconscious and repressed into preconscious material and thus return it once more to the possession of his ego. On the patient's side a few rational factors work in our favour, such as the need for recovery which has its motive in his sufferings, and the intellectual interest that we may awaken in him in the theories and revelations of psychoanalysis; but of far greater force is the positive transference with which he meets us. Fighting against us, on the other hand, are the negative transference, the ego's resistance due to repression (that is, its unpleasure at having to lay itself open to the hard work imposed on it), the sense of guilt arising from its relation to the super-ego and the need to be ill due to deep-going changes in the economics of his instincts. The share taken by the last two factors decides whether the case is to be regarded as slight or severe. Apart from these, a few other factors may be discerned as having a favourable or unfavourable bearing. A certain psychical inertia, a sluggishness of the libido, which is unwilling to abandon its fixations cannot be welcome to us; the patient's capacity for sublimating his instincts plays a large part and so does his capacity for rising above the crude life of the instincts; so, too, does the relative power of his intellectual functions.

[1940a [1938], 4990]
But what are the powers from which the objection to the libidinal trend arises? What is the other party to the pathogenic conflict? These powers, to put it quite generally, are the non-sexual instinctual forces. We class them together as the 'ego instincts'. The psycho-analysis of the transference-neuroses gives us no easy access to a further dissecting of them; at most we come to know them to some extent by the resistances which oppose analysis. The pathogenic conflict is thus one between the ego-instincts and the sexual instincts. In a whole number of cases, it looks as though there might also be a conflict between different purely sexual trends. But in essence that is the same thing; for, of the two sexual trends that are in conflict, one is always, as we might say, 'ego-syntonic', while the other provokes the ego's defence. It therefore still remains a conflict between the ego and sexuality.

[1916-1917, 3411]

Over and over again, Gentlemen, when psycho-analysis has claimed that some mental event is the product of the sexual instincts, it has been angrily pointed out to it by way of defence that human beings do not consist only of sexuality, that there are instincts and interests in mental life other than sexual ones, that it ought not to derive 'everything' from sexuality, and so on. Well, it is most gratifying for once in a way to find ourselves in agreement with our opponents. Psycho-analysis has never forgotten that there are instinctual forces as well which are not sexual. It was based on a sharp distinction between the sexual instincts and the ego-instincts, and, in spite of all objections, it has maintained not that the neuroses are derived from sexuality but that their origin is due to a conflict between the ego and sexuality. Nor has it any conceivable reason for disputing the existence or significance of the ego-instincts while it pursues the part played by the sexual instincts in illness and in ordinary life. It has simply been its fate to begin by concerning itself with the sexual instincts because the transference neuroses made them the most easily accessible to examination and because it was incumbent on it to study what other people had neglected.

[1916-1917, 3412]

Thus we discover that the third factor in the aetiology of the neuroses, the tendency to conflict, is as much dependent on the development of the ego as on that of the libido. Our insight into the causation of the neuroses is thus made more complete. First there is the most general precondition - frustration; next, fixation of the libido which forces it into particular directions; and thirdly, the tendency to conflict, arising from the development of the ego, which rejects these libidinal impulses. The situation, then, is not so very confused and hard to penetrate as it probably seemed to you during the course of my remarks. It is true, however, that we shall find we have not yet finished with it. There is something new to be added and something already familiar to be further examined.

[1916-1917, 3413]

We finally arrive at the connection we are in search of, if we take as our starting-point the opposition we have so often asserted between the ego and the libido. As we know, the generation of anxiety is the ego's reaction to danger and the signal for taking flight. If so, it seems plausible to suppose that in neurotic anxiety the ego is making a similar attempt at flight from the demand by its libido, that it is treating this internal danger as though it were an external one. This would therefore fulfil our expectation that where anxiety is shown there is something one is afraid of. But the analogy could be carried further. Just as the attempt at flight from an external danger is replaced by standing firm and the adoption of expedient measures of defence, so too the generation of neurotic anxiety gives place to the formation of symptoms, which results in the anxiety being bound.

[1916-1917, 3452]
The difficulty in understanding now lies else here. The anxiety which signifies a flight of the ego from its libido is after all supposed to be derived from that libido itself. This is obscure and it reminds us not to forget that after all a person's libido is fundamentally something of his and cannot be contrasted with him as something external. It is the topographical dynamics of the generation of anxiety which are still obscure to us - the question of what mental energies are produced in what process and from what mental systems they derive. This is once more a question which I cannot promise to answer: but there are two other tracks which we must not fail to follow and in doing so we shall once more be making use of direct observation and analytic enquiry as a help to our speculations. We will turn to the genesis of anxiety in children and to the source of the neurotic anxiety which is attached to phobias.

LADIES AND GENTLEMEN, - We have repeatedly (and only recently once again) had to deal with the distinction between the ego-instincts and the sexual instincts. In the first place, repression showed us that the two can come into opposition to each other, that the sexual instincts are then ostensibly subdued and are obliged to find satisfaction for themselves along regressive and roundabout paths, and that in doing so they are able to find compensation for their defeat in their indomitability. We next learnt that the two kinds of instincts are from the first differently related to Necessity the educator, so that their course of development is not the same and they do not enter into the same connection with the reality principle. Lastly, we seem to have found that the sexual instincts are linked by much closer bonds than the ego-instincts to the affective state of anxiety - a conclusion which seems incomplete in only one important respect. In order to establish it more firmly, therefore, I will bring forward the further noteworthy fact that if hunger and thirst (the two most elementary self-preservative instincts) are unsatisfied, the result is never their transformation into anxiety, whereas the changing of unsatisfied libido into anxiety is, as we have seen, among the best known and most frequently observed of phenomena.

The psycho-analytic explanation of the neuroses does not, however, call for such far-ranging considerations. The separate following-up of the sexual and ego-instincts has helped us to find the key to an understanding of the group of transference neuroses. We have been able to trace them back to the basic situation in which the sexual instincts have come into a dispute with the self-preservative instincts, or, to put it in biological (though less precise) terms, a situation in which one aspect of the ego, as an independent individual organism, comes into conflict with its other aspect, as a member of a succession of generations. A dissension of this kind may perhaps only occur in human beings, and on that account neurosis may, generally speaking, constitute their prerogative over the animals. The excessive development of their libido and - what is perhaps made possible precisely by that - their development of a richly articulated mental life seem to have created the determinants for the occurrence of such a conflict. It is at once obvious that these are also the determinants for the great advances that human beings have made beyond what they have in common with the animals; so that their susceptibility to neurosis would only be the reverse side of their other endowments. But these too are only speculations, which are diverting us from our immediate task.
But, Ladies and Gentlemen, who has so seriously misinformed you? A recommendation to the patient to 'live a full life' sexually could not possibly play a part in analytic therapy - if only because we ourselves have declared that an obstinate conflict is taking place in him between a libidinal impulse and sexual repression, between a sensual and an ascetic trend. This conflict would not be solved by our helping one of these trends to victory over its opponent. We see, indeed, that in neurotics asceticism has the upper hand; and the consequence of this is precisely that the suppressed sexual tendency finds a way out in symptoms. If, on the contrary, we were to secure victory for sensuality, then the sexual repression that had been put on one side would necessarily be replaced by symptom. Neither of these two alternative decisions could end the internal conflict; in either case one party to it would remain unsatisfied. There are only a few cases in which the conflict is so unstable that a factor such as the doctor's taking sides could decide it; and such cases do not in fact stand in need of analytic treatment. Anyone on whom the doctor could have so much influence would have found the same way out without the doctor. You must be aware that if an abstinent young man decides in favour of illicit sexual intercourse or if an unsatisfied wife seeks relief with another man, they have not as a rule waited for permission from a doctor or even from their analyst.

[1916-1917, 3476]

There are, however, other forms of illness in which, in spite of the conditions being the same, our therapeutic procedure is never successful. In them, too, it had been a question of an original conflict between the ego and the libido which led to repression - though this may call for a different topographical description; in them, too, it is possible to trace the points in the patient's life at which the repressions occurred; we make use of the same procedure, are ready to make the same promises and give the same help by the offer of anticipatory ideas; and once again the lapse of time between the repressions and the present day favours a different outcome to the conflict. And yet we do not succeed in lifting a single resistance or getting rid of a single repression. These patients, paranoids, melancholics, sufferers from dementia praecox, remain on the whole unaffected and proof against psycho-analytic therapy. What can be the reason for this? Not any lack of intelligence. A certain amount of intellectual capacity is naturally required in our patients; but there is certainly no lack of it in, for instance, the extremely shrewd combinatory paranoids. Nor do any of the other motives seem to be absent. Thus the melancholics have a very high degree of consciousness, absent in paranoids, that they are ill and that that is why they suffer so much; but this does not make them more accessible. We are faced here by a fact which we do not understand and which therefore leads us to doubt whether we have really understood all the determinants of our possible success with the other neuroses.

[1916-1917, 3480]
I will now complete my picture of the mechanism of cure by clothing it in the formulas of the libido theory. A neurotic is incapable of enjoyment and of efficiency - the former because his libido is not directed on to any real object and the latter because he is obliged to employ a great deal of this available energy on keeping his libido under repression and on warding off its assaults. He would become healthy if the conflict between his ego and his libido came to an end and if his ego had his libido again at its disposal. The therapeutic task consists, therefore, in freeing the libido from its present attachments, which are withdrawn from the ego, and in making it once more serviceable to the ego. Where, then, is the neurotic's libido situated? It is easily found: it is attached to the symptoms, which yield it the only substitutive satisfaction possible at the time. We must therefore make ourselves masters of the symptoms and resolve them - which is precisely the same thing that the patient requires of us. In order to resolve the symptoms, we must go back as far as their origin, we must renew the conflict from which they arose, and, with the help of motive forces which were not at the patient's disposal in the past, we must guide it to a different outcome. This revision of the process of repression can be accomplished only in part in connection with the memory traces of the processes which led to repression. The decisive part of the work is achieved by creating in the patient's relation to the doctor - in the 'transference' - new editions of the old conflicts; in these the patient would like to behave in the same way as he did in the past, while we, by summoning up every available mental force, compel him to come to a fresh decision. Thus the transference becomes the battlefield on which all the mutually struggling forces should meet one another.

All the libido, as well as everything opposing it, is made to converge solely on the relation with the doctor. In this process the symptoms are inevitably divested of libido. In place of his patient's true illness there appears the artificially constructed transference illness, in place of the various unreal objects of the libido there appears a single, and once more imaginary, object in the person of the doctor. But, by the help of he doctor's suggestion, the new struggle around this object is lifted to the highest psychical level: it takes place as a normal mental conflict. Since a fresh repression is avoided, the alienation between ego and libido is brought to an end and the subject's mental unity is restored. When the libido is released once more from its temporary object in the person of the doctor, it cannot return to its earlier objects, but is at the disposal of the ego. The forces against which we have been struggling during our work of therapy are, on the one hand, the ego's antipathy to certain trends of the libido - an antipathy expressed in a tendency to repression - and, on the other hand, the tenacity or adhesiveness of the libido, which dislikes leaving objects that it has once cathected. Since a fresh repression is avoided, the alienation between ego and libido is brought to an end and the subject's mental unity is restored. When the libido is released once more from its temporary object in the person of the doctor, it cannot return to its earlier objects, but is at the disposal of the ego. The forces against which we have been struggling during our work of therapy are, on the one hand, the ego's antipathy to certain trends of the libido - an antipathy expressed in a tendency to repression - and, on the other hand, the tenacity or adhesiveness of the libido, which dislikes leaving objects that it has once cathected.

One might be tempted at this point to introduce a slight alteration into psycho-analytic theory. It would seem palpably obvious that the repression and the formation of the neurosis must have originated out of the conflict between masculine and feminine tendencies, that is out of bisexuality. This view of the situation, however is incomplete. Of the two conflicting sexual impulses one was ego-syntonic, while the other offended the boy's narcissistic interest; it was on that account that the latter underwent repression. So that in this case, too, it was the ego that put the repression into operation, for the benefit of one of the sexual tendencies. In other cases there is no such conflict between masculinity and femininity; there is only a single sexual tendency present, which seeks for acceptance, but offends against certain forces of the ego and is consequently repelled. Indeed, conflicts between sexuality and the moral ego trends are far more common than such as take place within the sphere of sexuality; but a moral conflict of this kind is lacking in our present case. To insist that bisexuality is the motive force leading to repression is to take too narrow a view; whereas if we assert the same of the conflict between the ego and the sexual tendencies (that is, the libido) we shall have covered all possible cases.
Moreover, a juster appreciation of the process of repression in our present case would lead us to deny that narcissistic masculinity was the sole motive force. The homosexual attitude which came into being during the dream was of such overwhelming intensity that the little boy's ego found itself unable to cope with it and so defended itself against it by the process of repression. The narcissistic masculinity which attached to his genitals, being opposed to the homosexual attitude, was drawn in, in order to assist the ego in carrying out the task. Merely to avoid misunderstandings, I will add that all narcissistic impulses operate from the ego and have their permanent seat in the ego, and that repressions are directed against libidinal object cathexes.

With this as a starting-point we go on to make our first important discovery. We learn that, when we try to understand neurotic disorders, by far the greater significance attaches to the sexual instincts; that in fact neuroses are the specific disorders, so to speak, of the sexual function; that in general whether or not a person develops a neurosis depends on the quantity of his libido, and on the possibility of satisfying it and of discharging it through satisfaction; that the form taken by the disease is determined by the way in which the individual passes through the course of development of his sexual function, or, as we put it, by the fixations his libido has undergone in the course of its development; and, further, that by a special, not very simple technique for influencing the mind we are able to throw light on the nature of some groups of neuroses and at the same time to do away with them. Our therapeutic efforts have their greatest success with a certain class of neuroses which proceed from a conflict between the ego-insects and the sexual instincts. For in human beings it may happen that the demands of the sexual instincts, whose reach of course extends far beyond the individual, seem to the ego to constitute a danger which threatens its self-preservation or its self-esteem. The ego then assumes the defensive, denies the sexual instincts the satisfaction they desire and forces them into those by-paths of substitutive satisfaction which become manifest as nervous symptoms.

'Nothing has entered into you from without; a part of the activity of your own mind has been withdrawn from your knowledge and from the command of your will. That, too, is why you are so weak in your defence; you are using one part of your force to fight the other part and you cannot concentrate the whole of your force as you would against an external enemy. And it is not even the worst or least important part of your mental forces that has thus become antagonistic to you and independent of you. The blame, I am bound to say, lies with yourself. You over-estimated your strength when you thought you could treat your sexual instincts as you liked and could utterly ignore their intentions. The result is that they have rebelled and have taken their own obscure paths to escape this suppression; they have established their rights in a manner you cannot approve. How they have achieved this, and the paths which they have taken, have not come to your knowledge. All you have learned is the outcome of their work - the symptom which you experience as suffering. Thus you do not recognize it as a derivative of your own rejected instincts and do not know that it is a substitutive satisfaction of them.
There is, however, no need to consider that these approaches to psycho-analysis imply any reconciliation or any appeasement of opposition. Suppose someone has hitherto rejected the whole of a complex of interdependent propositions, but now suddenly finds himself in a position to convince himself of the truth of one portion of the whole. It might be thought that he will begin to hesitate about his opposition in general and permit himself some degree of deferent expectation that the other portion, about which he has had no personal experience and can consequently form no judgement of his own, may also turn out to be true. This other portion of psycho-analytic theory, with which the study of the war neuroses did not come into contact, is to the effect that the motive forces which are expressed in the formation of symptoms are sexual and that neuroses arise from a conflict between the ego and the sexual instincts which it repudiates. (‘Sexuality’ in this context is to be understood in the extended sense in which it is used in psycho-analysis and is not to be confused with the narrower concept of ‘genitality’.) Now it is quite true, as Ernest Jones remarks in his contribution to this volume, that this portion of the theory has not yet been proved to apply to the war neuroses. The work that might prove it has not yet been taken in hand. It may be that the war neuroses are altogether unsuitable material for the purpose. But the opponents of psycho-analysis, whose dislike of sexuality is evidently stronger than their logic, have been in a hurry to proclaim that the investigation of the war neuroses has finally disproved this portion of psycho-analytic theory. They have been guilty here of a slight confusion. If the investigation of the war neuroses (and a very superficial one at that) has not shown that the sexual theory of the neuroses is correct, that is something very different from its showing that that theory is incorrect. With the help of an impartial attitude and a little good will, it should not be hard to find the way to a further clarification of the subject.

The traumatic neuroses and war neuroses may proclaim too loudly the effects of mortal danger and may be silent or speak only in muted tones of the effects of frustration in love. But, on the other hand, the ordinary transference neuroses of peace-time set no aetiological store by the factor of mortal danger which, in the former class of neuroses, plays so mighty a part. It is even held that the peace-time neuroses are promoted by indulgence, good living and inactivity - which would afford an interesting contrast to the living-conditions under which the war neuroses develop. If they were to follow the example of their opponents, psycho-analysts, finding that their patients had fallen ill owing to frustration in love (owing to the claims of the libido being unsatisfied) would have to maintain that there can be no such things as danger-neuroses or that the disorders that appear after frightening experiences are not neuroses. They have, of course, no notion of maintaining any such thing. On the contrary, a convenient possibility occurs to them of bringing the two apparently divergent sets of facts together under a single hypothesis. In traumatic and war neuroses the human ego is defending itself from a danger which threatens it from without or which is embodied in a shape assumed by the ego itself. In the transference neuroses of peace the enemy from which the ego is defending itself is actually the libido, whose demands seem to it to be menacing. In both cases the ego is afraid of being damaged - in the latter case by the libido and in the former by external violence. It might, indeed, be said that in the case of the war neuroses, in contrast to the pure traumatic neuroses and in approximation to the transference neuroses, what is feared is nevertheless an internal enemy. The theoretical difficulties standing in the way of a unifying hypothesis of this kind do not seem insuperable: after all, we have a perfect right to describe repression, which lies at the basis of every neurosis, as a reaction to a trauma - as an elementary traumatic neurosis.
The next step was taken when psycho-analysis felt its way closer towards the psychological ego, which it had first come to know only as a repressive, censoring agency, capable of erecting protective structures and reactive formations. Critical and far-seeing minds had, it is true, long since objected to the concept of libido being restricted to the energy of the sexual instincts directed towards an object. But they failed to explain how they had arrived at their better knowledge or to derive from it anything of which analysis could make use. Advancing more cautiously, psycho-analysis observed the regularity with which libido is withdrawn from the object and directed on to the ego (the process of introversion); and, by studying the libidinal development of children in its earliest phases, came to the conclusion that the ego is the true original reservoir of libido, and that it is only from that reservoir that libido is extended on to objects. The ego now found its position among sexual objects and was at once given the foremost place among them. Libido which was in this way lodged in the ego was described as ‘narcissistic’.¹ This narcissistic libido was of course also a manifestation of the force of the sexual instinct in the analytical sense of those words, and it had necessarily to be identified with the ‘self-preservative instincts’ whose existence had been recognized from the first. Thus the original opposition between the ego-instincts and the sexual instincts proved to be inadequate. A portion of the ego-instincts was seen to be libidinal; sexual instincts - probably alongside others - operated in the ego. Nevertheless we are justified in saying that the old formula which lays it down that psychoneuroses are based on a conflict between ego-instincts and sexual instincts contains nothing that we need reject to-day. It is merely that the distinction between the two kinds of instinct, which was originally regarded as in some sort of way qualitative, must now be characterized differently - namely as being topographical. And in particular it is still true that the transference neuroses, the essential subject of psycho-analytic study, are the result of a conflict between the ego and the libidinal cathexis of objects. [1920g, 3753]

Neurosis stands outside this series. It also is based upon a peculiarity in the development of the human libido - the twice repeated start made by the directly sexual function, with an intervening period of latency.¹ To this extent it resembles hypnosis and group formation in having the character of a regression, which is absent from being in love. It makes its appearance wherever the advance from directly sexual instincts to those that are inhibited in their aims has not been wholly successful; and it represents a conflict between those portions of the instincts which have been received into the ego after having passed through this development and those portions of them which, springing from the repressed unconscious, strive - as do other, completely repressed, instinctual impulses - to attain direct satisfaction. Neuroses are extraordinarily rich in content, for they embrace all possible relations between the ego and the object - both those in which the object is retained and others in which it is abandoned or erected inside the ego itself - and also the conflicting relations between the ego and its ego ideal. [1921c, 3834]

It has been worth while to enter in some detail into the explanation of dreams, since analytic work has shown that the dynamics of the formation of dreams are the same as those of the formation of symptoms. In both cases we find a struggle between two trends, of which one is unconscious and ordinarily repressed and strives towards satisfaction - that is, wish-fulfilment - while the other, belonging probably to the conscious ego, is disapproving and repressive. The outcome of this conflict is a compromise-formation (the dream or the symptom) in which both trends have found an incomplete expression. The theoretical importance of this conformity between dreams and symptoms is illuminating. Since dreams are not pathological phenomena, the fact shows that the mental mechanisms which produce the symptoms of illness are equally present in normal mental life, that the same uniform law embraces both the normal and the abnormal and that the findings of research into neurotics or psychotics cannot be without significance for our understanding of the healthy mind. [1923a, 3919]
The Theory of Repression. - These theoretical considerations, taken together with the immediate impressions derived from analytic work, lead to a view of the neuroses which may be described in the roughest outline as follows. The neuroses are the expression of conflicts between the ego and such of the sexual impulses as seem to the ego incompatible with its integrity or with its ethical standards. Since these impulses are not ego-syntonic, the ego has repressed them: that is to say, it has withdrawn its interest from them and has shut them off from becoming conscious as well as from obtaining satisfaction by motor discharge. If in the course of analytic work one attempts to make these repressed impulses conscious, one becomes aware of the repressive forces in the form of resistance. But the achievement of repression fails particularly readily in the case of the sexual instincts. Their dammed-up libido finds other ways out from the unconscious: for it regresses to earlier phases of development and earlier attitudes towards objects, and, at weak points in the libidinal development where there are infantile fixations, it breaks through into consciousness and obtains discharge. What results is a symptom and consequently in its essence a substitutive sexual satisfaction. Nevertheless the symptom cannot entirely escape from the repressive forces of the ego and must therefore submit to modifications and displacements exactly as happens with dreams - by means of which its characteristic of being a sexual satisfaction becomes unrecognizable. Consequently symptoms are in the nature of compromises between the repressed sexual instincts and the repressing ego-instincts; they represent a wish-fulfilment for both partners to the conflict simultaneously, but one which is incomplete for each of them. This is quite strictly true of the symptoms of hysteria, while in the symptoms of obsessional neurosis there is often a stronger emphasis upon the side of the repressing function owing to the erection of reaction-formations, which are assurances against sexual satisfaction.

Criticisms and Misunderstandings of Psycho-Analysis. - Most of what is brought up against psycho-analysis, even in scientific works, is based upon insufficient information which in its turn seems to be determined by emotional resistances. Thus it is a mistake to accuse psycho-analysis of 'pan-sexualism' and to allege that it derives all mental occurrences from sexuality and traces them all back to it. On the contrary, psycho-analysis has from the very first distinguished the sexual instincts from others which it has provisionally termed 'ego instincts'. It has never dreamt of trying to explain 'everything', and even the neuroses it has traced back not to sexuality alone but to the conflict between the sexual impulses and the ego. In psycho-analysis (unlike the works of C. G. Jung) the term 'libido' does not mean psychical energy in general but the motive force of the sexual instincts. Some assertions, such as that every dream is the fulfilment of a sexual wish, have never been maintained by it at all. The charge of one-sidedness made against psycho-analysis, which, as the science of the unconscious mind, has its own definite and restricted field of work, is as inapplicable as it would be if it were made against chemistry. To believe that psycho-analysis seeks a cure for neurotic disorders by giving a free rein to sexuality is a serious misunderstanding which can only be excused by ignorance. The making conscious of repressed sexual desires in analysis makes it possible, on the contrary, to obtain a mastery over them which the previous repression had been unable to achieve. It can more truly be said that analysis sets the neurotic free from the chains of his sexuality. Moreover, it is quite unscientific to judge analysis by whether it is calculated to undermine religion, authority and morals; for, like all sciences, it is entirely non-tendentious and has only a single aim - namely to arrive at a consistent view of one portion of reality. Finally, one can only characterize as simple-minded the fear which is sometimes expressed that all the highest goods of humanity, as they are called - research, art, love, ethical and social sense - will lose their value or their dignity because psycho-analysis is in a position to demonstrate their origin in elementary and animal instinctual impulses.
Contrast between Sexual and Ego Instincts. - Psycho-analysis early became aware that all mental occurrences must be regarded as built on the basis of an interplay of the forces of the elementary instincts. This, however, led to a difficult predicament, since psychology included no theory of the instincts. No one could say what an instinct really was, the question was left entirely to individual caprice, and every psychologist was in the habit of postulating any instincts in any number that he chose. The first sphere of phenomena to be studied by psycho-analysis comprised what are known as the transference neuroses (hysteria and obsessional neurosis). It was found that their symptoms came about by sexual instinctual impulses being rejected (repressed) by the subject’s personality (his ego) and then finding expression by circuitous paths through the unconscious. These facts could be met by drawing a contrast between the sexual instincts and ego instincts (in\_stincts of self-preservation), which was in line with the popular saying that hunger and love are what make the world go round: libido was the manifestation of the force of love in the same sense as was hunger of the self-preservation instinct. The nature of the ego instincts remained for the time being undefined and, like all the other characteristics of the ego, inaccessible to analysis. There was no means of deciding whether, and if so what, qualitative differences were to be assumed to exist between the two classes of instincts.

[1923a, 3931]

Narcissism. - A decisive advance was made when the analysis of dementia praecox and other psychotic disorders was ventured upon and thus the examination was begun of the ego itself, which had so far been known only as the agency of repression and opposition. It was found that the pathogenic process in dementia praecox is the withdrawal of the libido from objects and its introduction into the ego, while the clamorous symptoms of the disease arise from the vain struggles of the libido to find a pathway back to objects. It thus turned out to be possible for object-libido to change into cathexis of the ego and vice versa. Further reflection showed that this process must be presumed to occur on the largest scale and that the ego is to be regarded as a great reservoir of libido from which libido is sent out to objects and which is always ready to absorb libido flowing back from objects. Thus the instincts of self-preservation were also of a libidinal nature: they were sexual instincts which, instead of external objects, had taken the subject’s own ego as an object. Clinical experience had made us familiar with people who behaved in a striking fashion as though they were in love with themselves and this perversion had been given the name of narcissism. The libido of the self-preservation instincts was now described as narcissistic libido and it was recognized that a high degree of this self-love constituted the primary and normal state of things. The earlier formula laid down for the transference neuroses consequently required to be modified, though not corrected. It was better, instead of speaking of a conflict between sexual instincts and ego instincts, to speak of a conflict between object-libido and ego-libido, or, since the nature of these instincts was the same, between the object-cathexes and the ego.

[1923a, 3933]
In the further course of psycho-analytic work, however, even these distinctions have proved to be inadequate and, for practical purposes, insufficient. This has become clear in more ways than one; but the decisive instance is as follows. We have formed the idea that in each individual there is a coherent organization of mental processes; and we call this his ego. It is to this ego that consciousness is attached; the ego controls the approaches to motility - that is, to the discharge of excitations into the external world; it is the mental agency which supervises all its own constituent processes, and which goes to sleep at night, though even then it exercises the censorship on dreams. From this ego proceed the repressions, too, by means of which it is sought to exclude certain trends in the mind not merely from consciousness but also from other forms of effectiveness and activity. In analysis these trends which have been shut out stand in opposition to the ego, and the analysis is faced with the task of removing the resistances which the ego displays against concerning itself with the repressed. Now we find during analysis that, when we put certain tasks before the patient, he gets into difficulties; his associations fail when they should be coming near the repressed. We then tell him that he is dominated by a resistance; but he is quite unaware of the fact, and, even if he guesses from his unpleasurable feelings that a resistance is now at work in him, he does not know what it is or how to describe it. Since, however, there can be no question but that this resistance emanates from his ego and belongs to it, we find ourselves in an unforeseen situation. We have come upon something in the ego itself which is also unconscious, which behaves exactly like the repressed - that is, which produces powerful effects without itself being conscious and which requires special work before it can be made conscious. From the point of view of analytic practice, the consequence of this discovery is that we land in endless obscurities and difficulties if we keep to our habitual forms of expression and try, for instance, to derive neuroses from a conflict between the conscious and the unconscious. We shall have to substitute for this antithesis another, taken from our insight into the structural conditions of the mind - the antithesis between the coherent ego and the repressed which is split off from it.¹

[1923b, 3951]

In the work I have mentioned I described the numerous dependent relationships of the ego, its intermediate position between the external world and the id and its efforts to humour all its masters at once. In connection with a train of thought raised in other quarters, which was concerned with the origin and prevention of the psychoses, a simple formula has now occurred to me which deals with what is perhaps the most important genetic difference between a neurosis and a psychosis: neurosis is the result of a conflict between the ego and its id, whereas psychosis is the analogous outcome of a similar disturbance in the relations between the ego and the external world.

[1924b, 4065]
There are certainly good grounds for being suspicious of such simple solutions of a problem. Moreover, the most that we may expect is that this formula will turn out to be correct in the roughest outline. But even that would be something. One recalls at once, too, a whole number of discoveries and findings which seem to support our thesis. All our analyses go to show that the transference neuroses originate from the ego's refusing to accept a powerful instinctual impulse in the id or to help it to find a motor outlet, or from the ego's forbidding that impulse the object at which it is aiming. In such a case the ego defends itself against the instinctual impulse by the mechanism of repression. The repressed material struggles against this fate. It creates for itself, along paths over which the ego has no power, a substitutive representation (which forces itself upon the ego by way of a compromise) - the symptom. The ego finds its unity threatened and impaired by this intruder, and it continues to struggle against the symptom, just as it fended off the original instinctual impulse. All this produces the picture of a neurosis. It is no contradiction to this that, in undertaking the repression, the ego is at bottom following the commands of its super-ego - commands which, in their turn, originate from influences in the external world that have found representation in the super-ego. The fact remains that the ego has taken sides with those powers, that in it their demands have more strength than the instinctual demands of the id, and that the ego is the power which sets the repression in motion against the portion of the id concerned and which fortifies the repression by means of the anticathexis of resistance. The ego has come into conflict with the id in the service of the super-ego and of reality; and this is the state of affairs in every transference neurosis.

[1924b, 4066]

The aetiology common to the onset of a psychoneurosis and of a psychosis always remains the same. It consists in a frustration, a non-fulfilment of one of those childhood wishes which are for ever undefeated and which are so deeply rooted in our phylogenetically determined organization. This frustration is in the last resort always an external one; but in the individual case it may proceed from the internal agency (in the super-ego) which has taken over the representation of the demands of reality. The pathogenic effect depends on whether, in a conflictual tension of this kind, the ego remains true to its dependence on the external world and attempts to silence the id, or whether it lets itself be overcome by the id and thus torn away from reality. A complication is introduced into this apparently simple situation, however, by the existence of the super-ego, which, though a link that is not yet clear to us, unites in itself influences coming from the id as well as from the external world, and is to some extent an ideal model of what the whole endeavour of the ego is aiming at - a reconciliation between its various dependent relationships. The attitude of the super-ego should be taken into account - which has not hitherto been done - in every form of psychical illness. We may provisionally assume that there must also be illnesses which are based on a conflict between the ego and the super-ego. Analysis gives us a right to suppose that melancholia is a typical example of this group; and we would set aside the name of 'narcissistic psychoneuroses' for disorders of that kind. Nor will it clash with our impressions if we find reasons for separating states like melancholia from the other psychoses. We now see that we have been able to make our simple genetic formula more complete, without dropping it. Transference neuroses correspond to a conflict between the ego and the id; narcissistic neuroses, to a conflict between the ego and the super-ego; and psychoses, to one between the ego and the external world. It is true that we cannot tell at once whether we have really gained any new knowledge by this, or have only enriched our store of formulas; but I think that this possible application of the proposed differentiation of the mental apparatus into an ego, a super-ego and an id cannot fail to give us courage to keep that hypothesis steadily in view.

[1924b, 4067]
For the contradiction exists only as long as we keep our eyes fixed on the situation at the beginning of the neurosis, in which the ego, in the service of reality, sets about the repression of an instinctual impulse. This, however, is not yet the neurosis itself. The neurosis consists rather in the processes which provide a compensation for the portion of the id that has been damaged - that is to say, in the reaction against the repression and in the failure of the repression. The loosening of the relation to reality is a consequence of this second step in the formation of a neurosis, and it ought not to surprise us if a detailed examination shows that the loss of reality affects precisely that piece of reality as a result of whose demands the instinctual repression ensued.

[1924e, 4094]

We might expect that when a psychosis comes into being, something analogous to the process in a neurosis occurs, though, of course, between different agencies of the mind; thus we might expect that in a psychosis, too, two steps could be discerned, of which the first would drag the ego away, this time from reality, while the second would try to make good the damage done and re-establish the subject's relations to reality at the expense of the id. And, in fact, some analogy of the sort can be observed in a psychosis. Here, too, there are two steps, the second of which has the character of a reparation. But beyond that the analogy gives way to a far more extensive similarity between the two processes. The second step of the psychosis is indeed intended to make good the loss of reality, not, however, at the expense of a restriction of the id - as happens in neurosis at the expense of the relation to reality - but in another, more autocratic manner, by the creation of a new reality which no longer raises the same objections as the old one that has been given up. The second step, therefore, both in neurosis and psychosis, is supported by the same trends. In both cases it serves the desire for power of the id, which will not allow itself to be dictated to by reality. Both neurosis and psychosis are thus the expression of a rebellion on the part of the id against the external world, of its unwillingness - or, if one prefers, its incapacity - to adapt itself to the exigencies of reality, to *Αυάγχη [Necessity]. Neurosis and psychosis differ from each other far more in their first, introductory, reaction than in the attempt at reparation which follows it.

[1924e, 4095]

The Oedipus complex, however, is such an important thing that the manner in which one enters and leaves it cannot be without its effects. In boys (as I have shown at length in the paper to which I have just referred and to which all of my present remarks are closely related) the complex is not simply repressed, it is literally smashed to pieces by the shock of threatened castration. Its libidinal cathexes are abandoned, desexualized and in part sublimated; its objects are incorporated into the ego, where they form the nucleus of the super-ego and give that new structure its characteristic qualities. In normal, or, it is better to say, in ideal cases, the Oedipus complex exists no longer, even in the unconscious; the super-ego has become its heir. Since the penis (to follow Ferenczi) owes its extraordinarily high narcissistic cathexis to its organic significance for the propagation of the species, the catastrophe to the Oedipus complex (the abandonment of incest and the institution of conscience and morality) may be regarded as a victory of the race over the individual. This is an interesting point of view when one considers that neurosis is based upon a struggle of the ego against the demands of the sexual function. But to leave the standpoint of individual psychology is not of any immediate help in clarifying this complicated situation.

[1925j, 4155]
I have already mentioned that my investigation of the precipitating and underlying causes of the neuroses led me more and more frequently to conflicts between the subject's sexual impulses and his resistances to sexuality. In my search for the pathogenic situations in which the repressions of sexuality had set in and in which the symptoms, as substitutes for what was repressed, had had their origin, I was carried further and further back into the patient's life and ended by reaching the first years of his childhood. What poets and students of human nature had always asserted turned out to be true: the impressions of that early period of life, though they were for the most part buried in amnesia, left ineradicable traces upon the individual's growth and in particular laid down the disposition to any nervous disorder that was to follow. But since these experiences of childhood were always concerned with sexual excitations and the reaction against them, I found myself faced by the fact of infantile sexuality - once again a novelty and a contradiction of one of the strongest of human prejudices. Childhood was looked upon as 'innocent' and free from the lusts of sex, and the fight with the demon of 'sensuality' was not thought to begin until the troubled age of puberty. Such occasional sexual activities as it had been impossible to overlook in children were put down as signs of degeneracy or premature depravity or as a curious freak of nature. Few of the findings of psycho-analysis have met with such universal contradiction or have aroused such an outburst of indignation as the assertion that the sexual function starts at the beginning of life and reveals its presence by important signs even in childhood. And yet no other finding of analysis can be demonstrated so easily and so completely.

In the Oedipus complex the libido was seen to be attached to the image of the parental figures. But earlier there was a period in which there were no such objects. There followed from this fact the concept (of fundamental importance for the libido theory) of a state in which the subject's libido filled his own ego and had that for its object. This state could be called narcissism or self-love. A moment's reflection showed that this state never completely ceases. All through the subject's life his ego remains the great reservoir of his libido, from which object-cathexes are sent out and into which the libido can stream back again from the objects. Thus narcissistic libido is constantly being transformed into object-libido, and vice versa. An excellent instance of the length to which this transformation can go is afforded by the state of being in love, whether in a sexual or sublimated manner, which goes so far as involving a sacrifice of the self. Whereas hitherto in considering the process of repression attention had only been paid to what was repressed, these ideas made it possible to form a correct estimate of the repressing forces too. It had been said that repression was set in action by the instincts of self-preservation operating in the ego (the 'ego-instincts') and that it was brought to bear upon the libidinal instincts. But since the instincts of self-preservation were now recognized as also being of a libidinal nature, as being narcissistic libido, the process of repression was seen to be a process occurring within the libido itself; narcissistic libido was opposed to object-libido, the interest of self-preservation was defending itself against the demands of object-love, and therefore against the demands of sexuality in the narrower sense as well.
This purpose is more easily recognizable in the specific inhibitions. Analysis shows that when activities like playing the piano, writing or even walking are subjected to neurotic inhibitions it is because the physical organs brought into play - the fingers or the legs - have become too strongly erotized. It has been discovered as a general fact that the ego-function of an organ is impaired if its erotogenicity - its sexual significance - is increased. It behaves, if I may be allowed a rather absurd analogy, like a maid-servant who refuses to go on cooking because her master has started a love-affair with her. As soon as writing, which entails making a liquid flow out of a tube on to a piece of white paper, assumes the significance of copulation, or as soon as walking becomes a symbolic substitute for treading upon the body of mother earth, both writing and walking are stopped because they represent the performance of a forbidden sexual act. The ego renounces these functions, which are within its sphere, in order not to have to undertake fresh measures of repression - in order to avoid a conflict with the id.
[1926d, 4250]

The main characteristics of the formation of symptoms have long since been studied and, I hope, established beyond dispute. A symptom is a sign of, and a substitute for, an instinctual satisfaction which has remained in abeyance; it is a consequence of the process of repression. Repression proceeds from the ego when the latter - it may be at the behest of the super-ego - refuses to associate itself with an instinctual cathexis which has been aroused in the id. The ego is able by means of repression to keep the idea which is the vehicle of the reprehensible impulse from becoming conscious. Analysis shows that the idea often persists as an unconscious formation.
[1926d, 4252]

In enforcing regression, the ego scores its first success in its defensive struggle against the demands of the libido. (In this connection it is of advantage to distinguish the more general notion of 'defence' from 'repression'. Repression is only one of the mechanisms which defence makes use of.) It is perhaps in obsessional cases more than in normal or hysterical ones that we can most clearly recognize that the motive force of defence is the castration complex and that what is being fended off are the trends of the Oedipus complex. We are at present dealing with the beginning of the latency period, a period which is characterized by the dissolution of the Oedipus complex, the creation or consolidation of the super-ego and the erection of ethical and aesthetic barriers in the ego. In obsessional neuroses these processes are carried further than is normal. In addition to the destruction of the Oedipus complex a regressive degradation of the libido takes place, the super-ego becomes exceptionally severe and unkind, and the ego, in obedience to the super-ego, produces strong reaction-formation in the shape of conscientiousness, pity and cleanliness. Implacable, though not always on that account successful, severity is shown in condemning the temptation to continue early infantile masturbation, which now attaches itself to regressive (sadistic-anal) ideas but which nevertheless represents the unsubjugated part of the phallic organization. There is an inherent contradiction about this state of affairs, in which, precisely in the interests of masculinity (that is to say, from fear of castration), every activity belonging to masculinity is stopped. But here, too, obsessional neurosis is only overdoing the normal method of getting rid of the Oedipus complex. We once more find here an illustration of the truth that every exaggeration contains the seed of its own undoing. For, under the guise of obsessional acts, the masturbation that has been suppressed approaches ever more closely to satisfaction.
[1926d, 4273]
Let us go back again to infantile phobias of animals; for, when all is said and done, we understand them better than any other cases. In animal phobias, then, the ego has to oppose a libidinal object-cathexis coming from the id - a cathexis that belongs either to the positive or the negative Oedipus complex - because it believes that to give way to it would entail the danger of castration. This question has already been discussed, but there still remains a doubtful point to clear up. In 'Little Hans's' case - that is, in the case of a positive Oedipus complex - was it his fondness for his mother or was it his aggressiveness towards his father which called out the defence by the ego? In practice it seems to make no difference, especially as each set of feelings implies the other; but the question has a theoretical interest, since it is only the feeling of affection for the mother which can count as a purely erotic one. The aggressive impulse flows mainly from the destructive instinct; and we have always believed that in a neurosis it is against the demands of the libido and not against those of any other instinct that the ego is defending itself. In point of fact we know that after 'Hans's' phobia had been formed, his tender attachment to his mother seemed to disappear, having been completely disposed of by repression, while the formation of the symptom (the substitutive formation) took place in relation to his aggressive impulses. In the 'Wolf Man' the situation was simpler. The impulse that was repressed - his feminine attitude towards his father - was a genuinely erotic one; and it was in relation to that impulse that the formation of his symptoms took place.

[1926d, 4282]

The third, psychological, factor resides in a defect of our mental apparatus which has to do precisely with its differentiation into an id and an ego, and which is therefore also attributable ultimately to the influence of the external world. In view of the dangers of reality, the ego is obliged to guard against certain instinctual impulses in the id and to treat them as dangers. But it cannot protect itself from internal instinctual dangers as effectively as it can from some piece of reality that is not part of itself. Intimately bound up with the id as it is, it can only fend off an instinctual danger by restricting its own organization and by acquiescing in the formation of symptoms in exchange for having impaired the instinct. If the rejected instinct renews its attack, the ego is overtaken by all those difficulties which are known to us as neurotic ailments.

[1926d, 4309]
Even a purely terminological innovation ought to justify its adoption; it ought to reflect some new point of view or some extension of knowledge. The revival of the concept of defence and the restriction of that of repression takes into account a fact which has long since been known but which has received added importance owing to some new discoveries. Our first observations of repression and of the formation of symptoms were made in connection with hysteria. We found that the perceptual content of exciting experiences and the ideational content of pathogenic structures of thought were forgotten and debarred from being reproduced in memory, and we therefore concluded that the keeping away from consciousness was a main characteristic of hysterical repression. Later on, when we came to study the obsessional neuroses, we found that in that illness pathogenic occurrences are not forgotten. They remain conscious but they are 'isolated' in some way that we cannot as yet grasp, so that much the same result is obtained as in hysterical amnesia. Nevertheless the difference is great enough to justify the belief that the process by which instinctual demands are set aside in obsessional neurosis cannot be the same as in hysteria. Further investigations have shown that in obsessional neurosis a regression of the instinctual impulses to an earlier libidinal stage is brought about through the opposition of the ego, and that this regression, although it does not make repression unnecessary, clearly works in the same sense as repression. We have seen, too, that in obsessional neurosis anticathexis, which is also presumably present in hysteria, plays a specially large part in protecting the ego by effecting a reactive alteration in it. Our attention has, moreover, been drawn to a process of 'isolation' (whose technique cannot as yet be elucidated) which finds direct symptomatic manifestation, and to a procedure, that may be called magical, of 'undoing' what has been done - a procedure about whose defensive purpose there can be no doubt, but which has no longer any resemblance to the process of 'repression'. These observations provide good enough grounds for re-introducing the old concept of defence, which can cover all these processes that have the same purpose - namely, the protection of the ego against instinctual demands - and for subsuming repression under it as a special case. The importance of this nomenclature is heightened if we consider the possibility that further investigations may show that there is an intimate connection between special forms of defence and particular illnesses, as, for instance, between repression and hysteria. In addition we may look forward to the possible discovery of yet another important correlation. It may well be that before its sharp cleavage into an ego and an id, and before the formation of a super-ego, the mental apparatus makes use of different methods of defence from those which it employs after it has reached these stages of organization.

[1926d, 4316]
You have no notion how close I am to fulfilling my promise. Even in organisms which later develop an efficient ego-organization, their ego is feeble and little differentiated from their id to begin with, during their first years of childhood. Imagine now what will happen if this powerless ego experiences an instinctual demand from the id which it would already like to resist (because it senses that to satisfy it is dangerous and would conjure up a traumatic situation, a collision with the external world) but which it cannot control, because it does not yet possess enough strength to do so. In such a case the ego treats the instinctual danger as if it was an external one; it makes an attempt at flight, draws back from this portion of the id and leaves it to its fate, after withholding from it all the contributions which it usually makes to instinctual impulses. The ego, as we put it, institutes a repression of these instinctual impulses. For the moment this has the effect of fending off the danger; but one cannot confuse the inside and the outside with impunity. One cannot run away from oneself. In repression the ego is following the pleasure principle, which it is usually in the habit of correcting; and it is bound to suffer damage in revenge. This lies in the ego's having permanently narrowed its sphere of influence. The repressed instinctual impulse is now isolated, left to itself, inaccessible, but also uninfluenceable. It goes its own way. Even later, as a rule, when the ego has grown stronger, it still cannot lift the repression; its synthesis is impaired, a part of the id remains forbidden ground to the ego. Nor does the isolated instinctual impulse remain idle; it understands how to make up for being denied normal satisfaction; it produces psychical derivatives which take its place; it links itself to other processes which by its influence it likewise tears away from the ego; and finally it breaks through into the ego and into consciousness in the form of an unrecognizably distorted substitute, and creates what we call a symptom. All at once the nature of a neurotic disorder becomes clear to us: on the one hand an ego which is inhibited in its synthesis, which has no influence on parts of the id, which must renounce some of its activities in order to avoid a fresh collision with what has been repressed, and which exhausts itself in what are for the most part vain acts of defence against the symptoms, the derivatives of the repressed impulses; and on the other hand an id in which individual instincts have made themselves independent, pursue their aims regardless of the interests of the person as a whole and henceforth obey the laws only of the primitive psychology that rules in the depths of the id. If we survey the whole situation we arrive at a simple formula for the origin of a neurosis: the ego has made an attempt to suppress certain portions of the id in an inappropriate manner, this attempt has failed and the id has taken its revenge. A neurosis is thus the result of a conflict between the ego and the id, upon which the ego has embarked because, as careful investigation shows, it wishes at all costs to retain its adaptability in relation to the real external world. The disagreement is between the external world and the id; and it is because the ego, loyal to its inmost nature, takes sides with the external world that it becomes involved in a conflict with its id. But please observe that what creates the determinant for the illness is not the fact of this conflict - for disagreements of this kind between reality and the id are unavoidable and it is one of the ego's standing tasks to mediate in them - but the circumstance that the ego has made use of the inefficient instrument of repression for dealing with the conflict. But this in turn is due to the fact that the ego, at the time at which it was set the task, was undeveloped and powerless. The decisive repressions all take place in early childhood. 
[1926e, 4346]
What a remarkable business! I shall follow your advice and not make criticisms, since you only want to show me what psycho-analysis believes about the origin of neurosis so that you can go on to say how it sets about combating it. I should have various questions to ask and later on I shall raise some of them. But at the moment I myself feel tempted for once to carry your train of thought further and to venture upon a theory of my own. You have expounded the relation between external world, ego and id, and you have laid it down as the determinant of a neurosis that the ego in its dependence on the external world struggles against the id. Is not the opposite case conceivable of the ego in a conflict of this kind allowing itself to be dragged away by the id and disavowing its regard for the external world? What happens in a case like that? From my lay notions of the nature of insanity I should say that such a decision on the part of the ego might be the determinant of insanity. After all, a turning-away of that kind from reality seems to be the essence of insanity.

A feebleness of the ego of this sort is to be found in all of us in childhood; and that is why the experiences of the earliest years of childhood are of such great importance for later life. Under the extraordinary burden of this period of childhood we have in a few years to cover the enormous developmental distance between stone-age primitive men and the participants in contemporary civilization, and, at the same time and in particular, we have to fend off the instinctual impulses of the early sexual period - under this burden, then, our ego takes refuge in repression and lays itself open to a childhood neurosis, the precipitate of which it carries with it into maturity as a disposition to a later nervous illness. Everything now depends on how the growing organism is treated by fate. If life becomes too hard, if the gulf between instinctual claims and the demands of reality becomes too great, the ego may fail in its efforts to reconcile the two, and the more readily, the more it is inhibited by the disposition carried over by it from infancy. The process of repression is then repeated, the instincts tear themselves away from the ego's domination, find their substitutive satisfactions along the paths of regression, and the poor ego has become helplessly neurotic.

We shall see, however, that this is not so and that it is merely a matter of bringing into sharper focus a turn of thought arrived at long ago and of following out its consequences. Of all the slowly developed parts of analytic theory, the theory of the instincts is the one that has felt its way the most painfully forward. And yet that theory was so indispensable to the whole structure that something had to be put in its place. In what was at first my utter perplexity, I took as my starting-point a saying of the poet-philosopher, Schiller, that 'hunger and love are what moves the world'. Hunger could be taken to represent the instincts which aim at preserving the individual; while love strives after objects, and its chief function, favoured in every way by nature, is the preservation of the species. Thus, to begin with, ego-instincts and object-instincts confronted each other. It was to denote the energy of the latter and only the latter instinct that I introduced the term 'libido'. Thus the antithesis was between the ego-instincts and the 'libidinal' instincts of love (in its widest sense) which were directed to an object. One of these object-instincts, the sadistic instinct, stood out from the rest, it is true, in that its aim was so very far from being loving. Moreover it was obviously in some respects attached to the ego-instincts: it could not hide its close affinity with instincts of mastery which have no libidinal purpose. But these discrepancies were got over; after all, sadism was clearly a part of sexual life, in the activities of which affection could be replaced by cruelty. Neurosis was regarded as the outcome of a struggle between the interest of self-preservation and the demands of the libido, a struggle in which the ego had been victorious but at the price of severe sufferings and renunciations.
Every analyst will admit that even to-day this view has not the sound of a long-discarded error. Nevertheless, alterations in it became essential, as our enquiries advanced from the repressed to the repressing forces, from the object-instincts to the ego. The decisive step forward was the introduction of the concept of narcissism - that is to say, the discovery that the ego itself is cathected with libido, that the ego, indeed, is the libido's original home, and remains to some extent its headquarters. This narcissistic libido turns towards objects, and thus becomes object-libido; and it can change back into narcissistic libido once more. The concept of narcissism made it possible to obtain an analytic understanding of the traumatic neuroses and of many of the affections bordering on the psychoses, as well as of the latter themselves. It was not necessary to give up our interpretation of the transference neuroses as attempts made by the ego to defend itself against sexuality; but the concept of libido was endangered. Since the ego-instincts, too, were libidinal, it seemed for a time inevitable that we should make libido coincide with instinctual energy in general, as C. G. Jung had already advocated earlier. Nevertheless, there still remained in me a kind of conviction, for which I was not as yet able to find reasons, that the instincts could not all be of the same kind. My next step was taken in Beyond the Pleasure Principle (1920g), when the compulsion to repeat and the conservative character of instinctual life first attracted my attention. Starting from speculations on the beginning of life and from biological parallels, I drew the conclusion that, besides the instinct to preserve living substance and to join it into ever larger units,¹ there must exist another, contrary instinct seeking to dissolve those units and to bring them back to their primaeval, inorganic state. That is to say, as well as Eros there was an instinct of death. The phenomena of life could be explained from the concurrent or mutually opposing action of these two instincts. It was not easy, however, to demonstrate the activities of this supposed death instinct. The manifestations of Eros were conspicuous and noisy enough. It might be assumed that the death instinct operated silently within the organism towards its dissolution, but that, of course, was no proof. A more fruitful idea was that a portion of the instinct is diverted towards the external world and comes to light as an instinct of aggressiveness and destructiveness. In this way the instinct itself could be pressed into the service of Eros, in that the organism was destroying some other thing, whether animate or inanimate, instead of destroying its own self. Conversely, any restriction of this aggressiveness directed outwards would be bound to increase the self-destruction, which is in any case proceeding. At the same time one can suspect from this example that the two kinds of instinct seldom - perhaps never - appear in isolation from each other, but are alloyed with each other in varying and very different proportions and so become unrecognizable to our judgement. In sadism, long since known to us as a component instinct of sexuality, we should have before us a particularly strong alloy of this kind between trends of love and the destructive instinct; while its counterpart, masochism, would be a union between destructiveness directed inwards and sexuality - a union which makes what is otherwise an imperceptible trend into a conspicuous and tangible one.

[1930a, 4509]
You have long been aware that this censorship is not an institution peculiar to dream-life. You know that the conflict between the two psychical agencies, which we inaccurately describe as the 'unconscious repressed' and the 'conscious', dominates our whole mental life and that the resistance against the interpretation of dreams, the sign of the dream-censorship, is nothing other than the resistance due to repression by which the two agencies are separated. You know too that the conflict between these two agencies may under certain conditions produce other psychical structures which, like dreams, are the outcome of compromises; and you will not expect me to repeat to you here everything that was contained in my introduction to the theory of the neuroses in order to demonstrate to you what we know of the determinants of the formation of such compromises. You have realized that the dream is a pathological product, the first member of the class which includes hysterical symptoms, obsessions and delusions, but that it is distinguished from the others by its transitoriness and by its occurrence under conditions which are part of normal life. For let us bear firmly in mind that, as was already pointed out by Aristotle, dream life is the way in which our mind works during the state of sleep. The state of sleep involves a turning-away from the real external world, and there we have the necessary condition for the development of a psychosis. The most careful study of the severe psychoses will not reveal to us a single feature that is more characteristic of those pathological conditions. In psychoses, however, the turning-away from reality is brought about in two kinds of way: either by the unconscious repressed becoming excessively strong so that it overwhelms the conscious, which is attached to reality, or because reality has become so intolerably distressing that the threatened ego throws itself into the arms of the unconscious instinctual forces in a desperate revolt. The harmless dream-psychosis is the result of a withdrawal from the external world which is consciously willed and only temporary, and it disappears when relations to the external world are resumed. During the isolation of the sleeping individual an alteration in the distribution of his psychical energy also sets in; a part of the expenditure on repression, which is normally required in order to hold the unconscious down, can be saved, for if the unconscious makes use of its relative liberation for active purposes, it finds its path to motility closed and the only path open to it is the harmless one leading to hallucinatory satisfaction. Now, therefore, a dream can be formed; but the fact of the dream-censorship shows that even during sleep enough of the resistance due to repression is retained.

[1933a, 4629]

You know better. From the very first we have said that human beings fall ill of a conflict between the claims of instinctual life and the resistance which arises within them against it; and not for a moment have we forgotten this resisting, repelling, repressing agency, which we thought of as equipped with its special forces, the ego-instincts, and which coincides with the ego of popular psychology. The truth was merely that, in view of the laborious nature of the progress made by scientific work, even psycho-analysis was not able to study every field simultaneously and to express its views on every problem in a single breath. But at last the point was reached when it was possible for us to divert our attention from the repressed to the repressing forces, and we faced this ego, which had seemed so self-evident, with the secure expectation that here once again we should find things for which we could not have been prepared. It was not easy, however, to find a first approach; and that is what I intend to talk to you about to-day.

[1933a, 4666]
The theory of the instincts is so to say our mythology. Instincts are mythical entities, magnificent in their indefiniteness. In our work we cannot for a moment disregard them, yet we are never sure that we are seeing them clearly. You know how popular thinking deals with the instincts. People assume as many and as various instincts as they happen to need at the moment - a self-assertive instinct, an imitative instinct, an instinct of play, a gregarious instinct and many others like them. People take them up, as it were, make each of them do its particular job, and then drop them again. We have always been moved by a suspicion that behind all these little ad hoc instincts there lay concealed something serious and powerful which we should like to approach cautiously. Our first step was modest enough. We told ourselves we should probably not be going astray if we began by separating two main instincts or classes of instincts or groups of instincts in accordance with the two great needs - hunger and love. However jealously we usually defend the independence of psychology from every other science, here we stood in the shadow of the unshakable biological fact that the living individual organism is at the command of two intentions, self-preservation and the preservation of the species, which seem to be independent of each other, which, so far as we know at present, have no common origin and whose interests are often in conflict in animal life. Actually what we are talking now is biological psychology, we are studying the psychical accompaniments of biological processes. It was as representing this aspect of the subject that the 'ego-instincts' and the 'sexual instincts' were introduced into psycho-analysis. We included in the former everything that had to do with the preservation, assertion and magnification of the individual. To the latter we had to attribute the copiousness called for by infantile and perverse sexual life. In the course of investigating the neuroses we came to know the ego as the restricting and repressing power and the sexual trends as the restricted and repressed one; we therefore believed that we had clear evidence not only of the difference between the two groups of instincts but also of the conflict between them. The first object of our study was only the sexual instincts, whose energy we named 'libido'. It was in relation to them that we sought to clarify our ideas of what an instinct is and what is to be attributed to it. Here we have the libido theory.

Our plan of cure is based on these discoveries. The ego is weakened by the internal conflict and we must go to its help. The position is like that in a civil war which has to be decided by the assistance of an ally from outside. The analytic physician and the patient's weakened ego, basing themselves on the real external world, have to band themselves together into a party against the enemies, the instinctual demands of the id and the conscientious demands of the super-ego. We form a pact with each other. The sick ego promises us the most complete candour - promises, that is, to put at our disposal all the material which its self-perception yields; we assure the patient of the strictest discretion and place at his service our experience in interpreting material that has been influenced by the unconscious. Our knowledge is to make up for his ignorance and to give his ego back its mastery over lost provinces of his mental life. This pact constitutes the analytic situation.

[1933a, 4701]

[1940a [1938], 4983]
His anxiety, then, corresponded to repressed longing. But it was not the same thing as the longing: the repression must be taken into account too. Longing can be completely transformed into satisfaction if it is presented with the object longed for. Therapy of that kind is no longer effective in dealing with anxiety. The anxiety remains even when the longing can be satisfied. It can no longer be completely retransformed into libido; there is something that keeps the libido back under repression.¹ This was shown to be so in the case of Hans on the occasion of his next walk, when his mother went with him. He was with his mother, and yet he still suffered from anxiety - that is to say, from an unsatisfied longing for her. It is true that the anxiety was less; for he did allow himself to be induced to go for the walk, whereas he had obliged the nursemaid to turn back. Nor is a street quite the right place for 'coaxing', or whatever else this young lover may have wanted. But his anxiety had stood the test; and the next thing for it to do was to find an object. It was on this walk that he first expressed a fear that a horse would bite him. Where did the material for this phobia come from? Probably from the complexes, as yet unknown to us, which had contributed to the repression and were keeping under repression his libidinal feelings towards his mother. That is an unsolved problem, and we shall now have to follow the development of the case in order to arrive at its solution. Hans's father has already given us certain clues, probably trustworthy ones, such as that Hans had always observed horses with interest on account of their large widdlers, that he had supposed that his mother must have a widdler like a horse, and so on. We might thus be led to think that the horse was merely a substitute for his mother. But if so, what would be the meaning of his being afraid in the evening that a horse would come into the room? A small boy's foolish fears, it will be said. But a neurosis never says foolish things, any more than a dream. When we cannot understand something, we always fall back on abuse. An excellent way of making a task lighter.

¹[1909b, 2019]

'All day long to-day Hans has been playing at loading and unloading packing-cases; he said he wished he could have a toy waggon and boxes of that kind to play with. What used most to interest him in the courtyard of the Customs House opposite was the loading and unloading of the carts. And he used to be frightened most when a cart had been loaded up and was on the point of driving off. "The horses'll fall down,"¹ he used to say. He used to call the doors of the Head Customs House shed "holes" (e.g. the first hole, second hole, third hole, etc.). But now, instead of "hole", he says "behind-hole".

[1909b, 2082]

After hypnosis was replaced by the technique of free association, Breuer's cathartic procedure turned into psycho-analysis, which for more than a decade was developed by the author (Freud) alone. During that time psycho-analysis gradually acquired a theory which appeared to give a satisfactory account of the origin, meaning and purpose of neurotic symptoms and provided a rational basis for medical attempts at curing the complaint. I will once again enumerate the factors that go to make up this theory. They are: emphasis on instinctual life (affectivity), on mental dynamics, on the fact that even the apparently most obscure and arbitrary mental phenomena invariably have a meaning and a causation, the theory of psychical conflict and of the pathogenic nature of repression, the view that symptoms are substitutive satisfactions, the recognition of the aetiological importance of sexual life, and in particular of the beginnings of infantile sexuality. From a philosophical standpoint this theory was bound to adopt the view that the mental does not coincide with the conscious, that mental processes are in themselves unconscious and are only made conscious by the functioning of special organs (agencies or systems). By way of completing this list, I will add that among the affective attitudes of childhood the complicated emotional relation of children to their parents - what is known as the Oedipus complex - came into prominence. It became ever clearer that this was the nucleus of every case of neurosis, and in the patient's behaviour towards his analyst certain phenomena of his emotional transference emerged which came to be of great importance for theory and technique alike.

[1924f, 4107]
¹ It must therefore be admitted that in an obsessional neurosis there are two kinds of knowledge, and it is just as reasonable to hold that the patient 'knows' his traumas as that he does not 'know' them. For he knows them in that he has not forgotten them, and he does not know them in that he is unaware of their significance. It is often the same in ordinary life. The waiters who used to serve Schopenhauer at his regular restaurant 'knew' him in a certain sense, at a time when, apart from that, he was not known either in Frankfurt or outside it; but they did not 'know' him in the sense in which we speak to-day of 'knowing' Schopenhauer.

[1909d, 2154]

Since I do not intend to treat of sublimation here and since repression requires a special chapter to itself, it only remains for us to describe and discuss the two first points. Bearing in mind that there are motive forces which work against an instinct's being carried through in an unmodified form, we may also regard these vicissitudes as modes of defence against the instincts.

[1915c, 2964]

I have said that transformation into anxiety - it would be better to say discharge in the form of anxiety - is the immediate vicissitude of libido which is subjected to repression. I must add that that vicissitude is not the only or the definitive one. In the neuroses processes are in action which endeavour to bind this generating of anxiety and which even succeed in doing so in various ways. In phobias, for instance, two phases of the neurotic process can be clearly distinguished. The first is concerned with repression and the changing of libido into anxiety, which is then bound to an external danger. The second consists in the erection of all the precautions and guarantees by means of which any contact can be avoided with this danger, treated as it is like an external thing. Repression corresponds to an attempt at flight by the ego from libido which is felt as a danger. A phobia may be compared to an entrenchment against an external danger which now represents the dreaded libido. The weakness of the defensive system in phobias lies, of course, in the fact that the fortress which has been so greatly strengthened towards the outside remains assailable from within. A projection outwards of the danger of libido can never succeed thoroughly. For that reason, in other neuroses other systems of defence are in use against the possible generation of anxiety. That is a most interesting part of the psychology of the neuroses; but unluckily it would lead us too far and it presupposes a deeper specialized knowledge. I will only add one thing more. I have already spoken to you of the 'anticathexis' which is employed by the ego in the process of repression and which must be permanently maintained in order that the repression may have stability. This anticathexis has the task of carrying through the various forms of defence against the generating of anxiety after repression.

[1916-1917, 3456]
The idea of being devoured by the father is typical age-old childhood material. It has familiar parallels in mythology (e.g. the myth of Kronos) and in the animal kingdom. Yet in spite of this confirmation the idea is so strange to us that we can hardly credit its existence in a child. Nor do we know whether it really means what it seems to say, and we cannot understand how it can have become the subject of a phobia. Analytic observation supplies the requisite information. It shows that the idea of being devoured by the father gives expression, in a form that has undergone regressive degradation, to a passive, tender impulse to be loved by him in a genital-erotic sense. Further investigation of the case history leaves no doubt of the correctness of this explanation. The genital impulse, it is true, betrays no sign of its tender purpose when it is expressed in the language belonging to the superseded transitional phase between the oral and sadistic organizations of the libido. Is it, moreover, a question merely of the replacement of the representative by a regressive form of expression or is it a question of a genuine regressive degradation of the genitally-directed impulse in the id? It is not at all easy to make certain. The case history of the Russian 'Wolf Man' gives very definite support to the second, more serious, view; for, from the time of the decisive dream onward, the boy became naughty, tormenting and sadistic, and soon afterwards developed a regular obsessional neurosis. At any rate, we can see that repression is not the only means which the ego can employ for the purpose of defence against an unwelcome instinctual impulse. If it succeeds in making an instinct regress, it will actually have done it more injury than it could have by repressing it. Sometimes, indeed, after forcing an instinct to regress in this way, it goes on to repress it.

In enforcing regression, the ego scores its first success in its defensive struggle against the demands of the libido. (In this connection it is of advantage to distinguish the more general notion of 'defence' from 'repression'. Repression is only one of the mechanisms which defence makes use of.) It is perhaps in obsessional cases more than in normal or hysterical ones that we can most clearly recognize that the motive force of defence is the castration complex and that what is being fended off are the trends of the Oedipus complex. We are at present dealing with the beginning of the latency period, a period which is characterized by the dissolution of the Oedipus complex, the creation or consolidation of the super-ego and the erection of ethical and aesthetic barriers in the ego. In obsessional neuroses these processes are carried further than is normal. In addition to the destruction of the Oedipus complex a regressive degradation of the libido takes place, the super-ego becomes exceptionally severe and unkind, and the ego, in obedience to the super-ego, produces strong reaction-formations in the shape of conscientiousness, pity and cleanliness. Implacable, though not always on that account successful, severity is shown in condemning the temptation to continue early infantile masturbation, which now attaches itself to regressive (sadistic-anal) ideas but which nevertheless represents the unsubjugated part of the phallic organization. There is an inherent contradiction about this state of affairs, in which, precisely in the interests of masculinity (that is to say, from fear of castration), every activity belonging to masculinity is stopped. But here, too, obsessional neurosis is only overdoing the normal method of getting rid of the Oedipus complex. We once more find here an illustration of the truth that every exaggeration contains the seed of its own undoing. For, under the guise of obsessional acts, the masturbation that has been suppressed approaches ever more closely to satisfaction.

[1926d, 4273]
The reaction-formations in the ego of the obsessional neurotic, which we recognize as exaggerations of normal character-formation, should be regarded, I think, as yet another mechanism of defence and placed alongside of regression and repression. They seem to be absent or very much weaker in hysteria. Looking back, we can now get an idea of what is peculiar to the defensive process in hysteria. It seems that in it the process is limited to repression alone. The ego turns away from the disagreeable instinctual impulse, leaves it to pursue its course in the unconscious, and takes no further part in its fortunes. This view cannot be absolutely correct, for we are acquainted with the case in which a hysterical symptom is at the same time a fulfilment of a penalty imposed by the super-ego; but it may describe a general characteristic of the behaviour of the ego in hysteria.

[1926d, 4274]

The two techniques I refer to are undoing what has been done and isolating. The first of these has a wide range of application and goes back very far. It is, as it were, negative magic, and endeavours, by means of motor symbolism, to 'blow away' not merely the consequences of some event (or experience or impression) but the event itself. I choose the term 'blow away' advisedly, so as to remind the reader of the part played by this technique not only in neuroses but in magical acts, popular customs and religious ceremonies as well. In obsessional neurosis the technique of undoing what has been done is first met with in the 'diphasic' symptoms, in which one action is cancelled out by a second, so that it is as though neither action had taken place, whereas, in reality, both have. This aim of undoing is the second underlying motive of obsessional ceremonials, the first being to take precautions in order to prevent the occurrence or recurrence of some particular event. The difference between the two is easily seen: the precautionary measures are rational, while trying to get rid of something by 'making it not to have happened' is irrational and in the nature of magic. It is of course to be suspected that the latter is the earlier motive of the two and proceeds from the animistic attitude towards the environment. This endeavour to undo shades off into normal behaviour in the case in which a person decides to regard an event as not having happened. But whereas he will take no direct steps against the event, and will simply pay no further attention to it or its consequences, the neurotic person will try to make the past itself non-existent. He will try to repress it by motor means. The same purpose may perhaps account for the obsession for repeating which is so frequently met with in this neurosis and the carrying out of which serves a number of contradictory intentions at once. When anything has not happened in the desired way it is undone by being repeated in a different way; and thereupon all the motives that exist for lingering over such repetitions come into play as well. As the neurosis proceeds, we often find that the endeavour to undo a traumatic experience is a motive of first-rate importance in the formation of symptoms. We thus unexpectedly discover a new, motor technique of defence, or (as we may say in this case with less inaccuracy) of repression.

[1926d, 4278]
It is almost humiliating that, after working so long, we should still be having difficulty in understanding the most fundamental facts. But we have made up our minds to simplify nothing and to hide nothing. If we cannot see things clearly we will at least see clearly what the obscurities are. What is hampering us here is evidently some hitch in the development of our theory of the instincts. We began by tracing the organization of the libido through its successive stages - from the oral through the sadistic-anal to the genital - and in doing so placed all the components of the sexual instinct on the same footing. Later it appeared that sadism was the representative of another instinct, which was opposed to Eros. This new view, that the instincts fall into two groups, seems to explode the earlier construction of the successive stages of libidinal organization. But we do not have to break fresh ground in order to find a way out of the difficulty. The solution has been at hand for a long time and lies in the fact that what we are concerned with are scarcely ever pure instinctual impulses but mixtures in various proportions of the two groups of instincts. If this is so, there is no need to revise our view of the organizations of the libido. A sadistic cathexis of an object may also legitimately claim to be treated as a libidinal one; and an aggressive impulse against the father can just as well be subjected to repression as a tender impulse towards the mother. Nevertheless we shall bear in mind for future consideration the possibility that repression is a process which has a special relation to the genital organization of the libido and that the ego resorts to other methods of defence when it has to secure itself against the libido on other levels of organization. To continue: a case like 'Little Hans's' does not enable us to come to any clear conclusion. It is true that in him an aggressive impulse was disposed of by repression, but this happened after the genital organization had been reached.
[1926d, 4282]

It would, however, be more correct to ascribe to the defensive process what we have just said about symptom-formation and to use the latter term as synonymous with substitute-formation. It will then be clear that the defensive process is analogous to the flight by means of which the ego removes itself from a danger that threatens it from outside. The defensive process is an attempt at flight from an instinctual danger. An examination of the weak points in this comparison will make things clearer.
[1926d, 4300]
Psycho-analysis leads to less simple and satisfactory conclusions. What I have to say in this connection has long been familiar and I have nothing new to add. If the ego succeeds in protecting itself from a dangerous instinctual impulse, through, for instance, the process of repression, it has certainly inhibited and damaged the particular part of the id concerned; but it has at the same time given it some independence and has renounced some of its own sovereignty. This is inevitable from the nature of repression, which is, fundamentally, an attempt at flight. The repressed is now, as it were, an outlaw; it is excluded from the great organization of the ego and is subject only to the laws which govern the realm of the unconscious. If, now, the danger-situation changes so that the ego has no reason for fending off a new instinctual impulse analogous to the repressed one, the consequence of the restriction of the ego which has taken place will become manifest. The new impulse will run its course under an automatic influence - or, as I should prefer to say, under the influence of the compulsion to repeat. It will follow the same path as the earlier, repressed impulse, as though the danger-situation that had been overcome still existed. The fixating factor in repression, then, is the unconscious id's compulsion to repeat - a compulsion which in normal circumstances is only done away with by the freely mobile function of the ego. The ego may occasionally manage to break down the barriers of repression which it has itself put up and to recover its influence over the instinctual impulse and direct the course of the new impulse in accordance with the changed danger-situation. But in point of fact the ego very seldom succeeds in doing this: it cannot undo its repressions. It is possible that the way the struggle will go depends upon quantitative relations. In some cases one has the impression that the outcome is an enforced one: the regressive attraction exerted by the repressed impulse and the strength of the repression are so great that the new impulse has no choice but to obey the compulsion to repeat. In other cases we perceive a contribution from another play of forces: the attraction exerted by the repressed prototype is reinforced by a repulsion coming from the direction of difficulties in real life which stand in the way of any different course that might be taken by the new instinctual impulse.

There is another kind of anticathexis, however, which seems more suited to the peculiar character of hysteria. A repressed instinctual impulse can be activated (newly cathected) from two directions: from within, through reinforcement from its internal sources of excitation, and from without, through the perception of an object that it desires. The hysterical anticathexis is mainly directed outwards, against dangerous perceptions. It takes the form of a special kind of vigilance which, by means of restrictions of the ego, causes situations to be avoided that would entail such perceptions, or, if they do occur, manages to withdraw the subject's attention from them. Some French analysts, in particular Laforgue, have recently given this action of hysteria the special name of 'scotomization'. This technique of anticathexis is still more noticeable in the phobias, whose interest is concentrated on removing the subject ever further from the possibility of the occurrence of the feared perception. The fact that anticathexis has an opposite direction in hysteria and the phobias from what it has in obsessional neurosis - though the distinction is not an absolute one - seems to be significant. It suggests that there is an intimate connection between repression and external anticathexis on the one hand and between regression and internal anticathexis (i.e. alteration in the ego through reaction-formation) on the other. The task of defence against a dangerous perception is, incidentally, common to all neuroses. Various commands and prohibitions in obsessional neurosis have the same end in view.
Repression and Defence

In the course of discussing the problem of anxiety I have revived a concept or, to put it more modestly, a term, of which I made exclusive use thirty years ago when I first began to study the subject but which I later abandoned. I refer to the term 'defensive process'.¹ I afterwards replaced it by the word 'repression', but the relation between the two remained uncertain. It will be an undoubted advantage, I think, to revert to the old concept of 'defence', provided we employ it explicitly as a general designation for all the techniques which the ego makes use of in conflicts which may lead to a neurosis, while we retain the word 'repression' for the special method of defence which the line of approach taken by our investigations made us better acquainted with in the first instance.

Even a purely terminological innovation ought to justify its adoption; it ought to reflect some new point of view or some extension of knowledge. The revival of the concept of defence and the restriction of that of repression takes into account a fact which has long since been known but which has received added importance owing to some new discoveries. Our first observations of repression and of the formation of symptoms were made in connection with hysteria. We found that the perceptual content of exciting experiences and the ideational content of pathogenic structures of thought were forgotten and debarred from being reproduced in memory, and we therefore concluded that the keeping away from consciousness was a main characteristic of hysterical repression. Later on, when we came to study the obsessional neuroses, we found that in that illness pathogenic occurrences are not forgotten. They remain conscious but they are 'isolated' in some way that we cannot as yet grasp, so that much the same result is obtained as in hysterical amnesia. Nevertheless the difference is great enough to justify the belief that the process by which instinctual demands are set aside in obsessional neurosis cannot be the same as in hysteria. Further investigations have shown that in obsessional neurosis a regression of the instinctual impulses to an earlier libidinal stage is brought about through the opposition of the ego, and that this regression, although it does not make repression unnecessary, clearly works in the same sense as repression. We have seen, too, that in obsessional neurosis anticathexis, which is also presumably present in hysteria, plays a specially large part in protecting the ego by effecting a reactive alteration in it. Our attention has, moreover, been drawn to a process of 'isolation' (whose technique cannot as yet be elucidated) which finds direct symptomatic manifestation, and to a procedure, that may be called magical, of 'undoing' what has been done - a procedure about whose defensive purpose there can be no doubt, but which has no longer any resemblance to the process of 'repression'. These observations provide good enough grounds for re-introducing the old concept of defence, which can cover all these processes that have the same purpose - namely, the protection of the ego against instinctual demands - and for subsuming repression under it as a special case. The importance of this nomenclature is heightened if we consider the possibility that further investigations may show that there is an intimate connection between special forms of defence and particular illnesses, as, for instance, between repression and hysteria. In addition we may look forward to the possible discovery of yet another important correlation. It may well be that before its sharp cleavage into an ego and an id, and before the formation of a super-ego, the mental apparatus makes use of different methods of defence from those which it employs after it has reached these stages of organization.

[1926d, 4316]
It will be enough for my purposes if I return to two general characteristics of the phenomena of derealization. The first is that they all serve the purpose of defence; they aim at keeping something away from the ego, at disavowing it. Now, new elements, which may give occasion for defensive measures, approach the ego from two directions - from the real external world and from the internal world of thoughts and impulses that emerge in the ego. It is possible that this alternative coincides with the choice between derealizations proper and depersonalizations. There are an extraordinarily large number of methods (or mechanisms, as we say) used by our ego in the discharge of its defensive functions. An investigation is at this moment being carried on close at hand which is devoted to the study of these methods of defence: my daughter, the child analyst, is writing a book upon them. The most primitive and thorough-going of these methods, 'repression', was the starting point of the whole of our deeper understanding of psychopathology. Between repression and what may be termed the normal method of fending off what is distressing or unbearable, by means of recognizing it, considering it, making a judgement upon it and taking appropriate action about it, there lie a whole series of more or less clearly pathological methods of behaviour on the part of the ego. May I stop for a moment to remind you of a marginal case of this kind of defence? You remember the famous lament of the Spanish Moors 'Ay de mi Alhama', which tells how King Boabdil received the news of the fall of his city of Alhama. He feels that this loss means the end of his rule. He will not 'let it be true', he determines to treat the news as 'non arrivé'. The verse runs:

[1936a, 4829]

It was from one of those mechanisms, repression, that the study of neurotic processes took its whole start. There was never any doubt that repression was not the only procedure which the ego could employ for its purposes. Nevertheless, repression is something quite peculiar and is more sharply differentiated from the other mechanisms than they are from one another. I should like to make this relation to the other mechanisms clear by an analogy, though I know that in these matters analogies never carry us very far. Let us imagine what might have happened to a book, at a time when books were not printed in editions but were written out individually. We will suppose that a book of this kind contained statements which in later times were regarded as undesirable - as, for instance, according to Robert Eisler (1929), the writings of Flavius Josephus must have contained passages about Jesus Christ which were offensive to later Christendom. At the present day, the only defensive mechanism to which the official censorship could resort would be to confiscate and destroy every copy of the whole edition. At that time, however, various methods were used for making the book innocuous. One way would be for the offending passages to be thickly crossed through so that they were illegible. In that case they could not be transcribed, and the next copyist of the book would produce a text which was unexceptionable but which had gaps in certain passages, and so might be unintelligible in them. Another way, however, if the authorities were not satisfied with this, but wanted also to conceal any indication that the text had been mutilated, would be for them to proceed to distort the text. Single words would be left out or replaced by others, and new sentences interpolated. Best of all, the whole passage would be erased and a new one which said exactly the opposite put in its place. The next transcriber could then produce a text that aroused no suspicion but which was falsified. It no longer contained what the author wanted to say; and it is highly probable that the corrections had not been made in the direction of truth. [1937c, 5032]
If the analogy is not pursued too strictly, we may say that repression has the same relation to the other methods of defence as omission has to distortion of the text, and we may discover in the different forms of this falsification parallels to the variety of ways in which the ego is altered. An attempt may be made to raise the objection that the analogy goes wrong in an essential point, for the distortion of a text is the work of a tendentious censorship, no counterpart to which is to be found in the development of the ego. But this is not so; for a tendentious purpose of this kind is to a great extent represented by the compelling force of the pleasure principle. The psychical apparatus is intolerant of unpleasure; it has to fend it off at all costs, and if the perception of reality entails unpleasure, that perception - that is, the truth - must be sacrificed. Where external dangers are concerned, the individual can help himself for some time by flight and by avoiding the situation of danger, until he is strong enough later on to remove the threat by actively altering reality. But one cannot flee from oneself; flight is no help against internal dangers. And for that reason the defensive mechanisms of the ego are condemned to falsify one's internal perception and to give one only an imperfect and distorted picture of one's id. In its relations to the id, therefore, the ego is paralysed by its restrictions or blinded by its errors; and the result of this in the sphere of psychical events can only be compared to being out walking in a country one does not know and without having a good pair of legs.

[1937c, 5033]

The mechanisms of defence serve the purpose of keeping off dangers. It cannot be disputed that they are successful in this; and it is doubtful whether the ego could do without them altogether during its development. But it is also certain that they may become dangers themselves. It sometimes turns out that the ego has paid too high a price for the services they render it. The dynamic expenditure necessary for maintaining them, and the restrictions of the ego which they almost invariably entail, prove a heavy burden on the psychical economy. Moreover, these mechanisms are not relinquished after they have assisted the ego during the difficult years of its development. No one individual, of course, makes use of all the possible mechanisms of defence. Each person uses no more than a selection of them. But these become fixated in his ego. They become regular modes of reaction of his character, which are repeated throughout his life whenever a situation occurs that is similar to the original one. This turns them into infantilisms, and they share the fate of so many institutions which attempt to keep themselves in existence after the time of their usefulness has passed. "Vernunft wird Unsinn, Wohltat Plage"¹ as the poet complains. The adult's ego, with its increased strength, continues to defend itself against dangers which no longer exist in reality; indeed, it finds itself compelled to seek out those situations in reality which can serve as an approximate substitute for the original danger, so as to be able to justify, in relation to them, its maintaining its habitual modes of reaction. Thus we can easily understand how the defensive mechanisms, by bringing about an ever more extensive alienation from the external world and a permanent weakening of the ego, pave the way for, and encourage, the outbreak of neurosis.

[1937c, 5033]
(c) Repression and Defence

In the course of discussing the problem of anxiety I have revived a concept or, to put it more modestly, a term, of which I made exclusive use thirty years ago when I first began to study the subject but which I later abandoned. I refer to the term 'defensive process'.¹ I afterwards replaced it by the word 'repression', but the relation between the two remained uncertain. It will be an undoubted advantage, I think, to revert to the old concept of 'defence', provided we employ it explicitly as a general designation for all the techniques which the ego makes use of in conflicts which may lead to a neurosis, while we retain the word 'repression' for the special method of defence which the line of approach taken by our investigations made us better acquainted with in the first instance.

[1926d, 4316]

Even a purely terminological innovation ought to justify its adoption; it ought to reflect some new point of view or some extension of knowledge. The revival of the concept of defence and the restriction of that of repression takes into account a fact which has long since been known but which has received added importance owing to some new discoveries. Our first observations of repression and of the formation of symptoms were made in connection with hysteria. We found that the perceptual content of exciting experiences and the ideational content of pathogenic structures of thought were forgotten and debarred from being reproduced in memory, and we therefore concluded that the keeping away from consciousness was a main characteristic of hysterical repression. Later on, when we came to study the obsessional neuroses, we found that in that illness pathogenic occurrences are not forgotten. They remain conscious but they are 'isolated' in some way that we cannot as yet grasp, so that much the same result is obtained as in hysterical amnesia. Nevertheless the difference is great enough to justify the belief that the process by which instinctual demands are set aside in obsessional neurosis cannot be the same as in hysteria. Further investigations have shown that in obsessional neurosis a regression of the instinctual impulses to an earlier libidinal stage is brought about through the opposition of the ego, and that this regression, although it does not make repression unnecessary, clearly works in the same sense as repression. We have seen, too, that in obsessional neurosis anticathexis, which is also presumably present in hysteria, plays a specially large part in protecting the ego by effecting a reactive alteration in it. Our attention has, moreover, been drawn to a process of 'isolation' (whose technique cannot as yet be elucidated) which finds direct symptomatic manifestation, and to a procedure, that may be called magical, of 'undoing' what has been done - a procedure about whose defensive purpose there can be no doubt, but which has no longer any resemblance to the process of 'repression'. These observations provide good enough grounds for re-introducing the old concept of defence, which can cover all these processes that have the same purpose - namely, the protection of the ego against instinctual demands - and for subsuming repression under it as a special case. The importance of this nomenclature is heightened if we consider the possibility that further investigations may show that there is an intimate connection between special forms of defence and particular illnesses, as, for instance, between repression and hysteria. In addition we may look forward to the possible discovery of yet another important correlation. It may well be that before its sharp cleavage into an ego and an id, and before the formation of a super-ego, the mental apparatus makes use of different methods of defence from those which it employs after it has reached these stages of organization.

[1926d, 4316]
Thus in the very first products of Hanold's delusional phantasies and actions we already find a double set of determinants, a derivation from two different sources. One of these is the one that was manifest to Hanold himself, the other is the one which is revealed to us when we examine his mental processes. One of them, looked at from Hanold's point of view, was conscious to him, the other was completely unconscious to him. One of them was derived wholly from the circle of ideas of the science of archaeology, the other arose from the repressed childhood memories that had become active in him and from the emotional instincts attached to them. One might be described as lying on the surface and covering the other, which was, as it were, concealed behind it. The scientific motivation might be said to serve as a pretext for the unconscious erotic one, and science had put itself completely at the service of the delusion. It should not be forgotten, however, that the unconscious determinants could not effect anything that did not simultaneously satisfy the conscious, scientific ones. The symptoms of a delusion - phantasies and actions alike - are in fact the products of compromise between the two mental currents, and in a compromise account is taken of the demands of each of the two parties to it; but each side must also renounce a part of what it wanted to achieve. Where a compromise comes about it must have been preceded by a struggle - in this case it was the conflict we have assumed between suppressed erotism and the forces that were keeping it in repression. In the formation of a delusion this struggle is in fact unending. Assault and resistance are renewed after the construction of each compromise, which is never, so to speak, entirely satisfying. Our author too is aware of this, and that is why he makes a peculiar unrest dominate this stage of his hero's disorder, as a precursor and guarantee of further developments.

[1907a, 1850]

I have said that transformation into anxiety - it would be better to say discharge in the form of anxiety - is the immediate vicissitude of libido which is subjected to repression. I must add that that vicissitude is not the only or the definitive one. In the neuroses processes are in action which endeavour to bind this generating of anxiety and which even succeed in doing so in various ways. In phobias, for instance, two phases of the neurotic process can be clearly distinguished. The first is concerned with repression and the changing of libido into anxiety, which is then bound to an external danger. The second consists in the erection of all the precautions and guarantees by means of which any contact can be avoided with this danger, treated as it is like an external thing. Repression corresponds to an attempt at flight by the ego from libido which is felt as a danger. A phobia may be compared to an entrenchment against an external danger which now represents the dreaded libido. The weakness of the defensive system in phobias lies, of course, in the fact that the fortress which has been so greatly strengthened towards the outside remains assailable from within. A projection outwards of the danger of libido can never succeed thoroughly. For that reason, in other neuroses other systems of defence are in use against the possible generation of anxiety. That is a most interesting part of the psychology of the neuroses; but unluckily it would lead us too far and it presupposes a deeper specialized knowledge. I will only add one thing more. I have already spoken to you of the 'anticathexis' which is employed by the ego in the process of repression and which must be permanently maintained in order that the repression may have stability. This anticathexis has the task of carrying through the various forms of defence against the generating of anxiety after repression.

[1916-1917, 3456]
I will now complete my picture of the mechanism of cure by clothing it in the formulas of the libido theory. A neurotic is incapable of enjoyment and of efficiency - the former because his libido is not directed on to any real object and the latter because he is obliged to employ a great deal of this available energy on keeping his libido under repression and on warding off its assaults. He would become healthy if the conflict between his ego and his libido came to an end and if his ego had his libido again at its disposal. The therapeutic task consists, therefore, in freeing the libido from its present attachments, which are withdrawn from the ego, and in making it once more serviceable to the ego. Where, then, is the neurotic's libido situated? It is easily found: it is attached to the symptoms, which yield it the only substitutive satisfaction possible at the time. We must therefore make ourselves masters of the symptoms and resolve them - which is precisely the same thing that the patient requires of us. In order to resolve the symptoms, we must go back as far as their origin, we must renew the conflict from which they arose, and, with the help of motive forces which were not at the patient's disposal in the past, we must guide it to a different outcome. This revision of the process of repression can be accomplished only in part in connection with the memory traces of the processes which led to repression. The decisive part of the work is achieved by creating in the patient's relation to the doctor - in the 'transference' - new editions of the old conflicts; in these the patient would like to behave in the same way as he did in the past, while we, by summoning up every available mental force, compel him to come to a fresh decision. Thus the transference becomes the battlefield on which all the mutually struggling forces should meet one another.

It was now easy to reconstruct the pathogenic process. Let us keep to a simple example, in which a particular impulsion had arisen in the subject's mind but was opposed by other powerful impulsons. We should have expected the mental conflict which now arose to take the following course. The two dynamic quantities - for our present purposes let us call them 'the instinct' and 'the resistance' - would struggle with each other for some time in the fullest light of consciousness, until the instinct was repudiated and the cathexis of energy withdrawn from its impulsion. This would have been the normal solution. In a neurosis, however (for reasons which were still unknown), the conflict found a different outcome. The ego drew back, as it were, on its first collision with the objectionable instinctual impulse; it debarred the impulse from access to consciousness and to direct motor discharge, but at the same time the impulse retained its full cathexis of energy. I named this process repression; it was a novelty, and nothing like it had ever before been recognized in mental life. It was obviously a primary mechanism of defence, comparable to an attempt at flight, and was only a forerunner of the later-developed normal condemning judgement. The first act of repression involved further consequences. In the first place the ego was obliged to protect itself against the constant threat of a renewed advance on the part of the repressed impulse by making a permanent expenditure of energy, an anticathexis, and it thus impoverished itself. On the other hand, the repressed impulse, which was now unconscious, was able to find means of discharge and of substitutive satisfaction by circuitous routes and thus to bring the whole purpose of the repression to nothing. In the case of conversion hysteria the circuitous route led to the somatic innervation; the repressed impulse broke its way through at some point or other and produced symptoms. The symptoms were thus results of a compromise, for although they were substitutive satisfactions they were nevertheless distorted and deflected from their aim owing to the resistance of the ego.
Psycho-analysis leads to less simple and satisfactory conclusions. What I have to say in this connection has long been familiar and I have nothing new to add. If the ego succeeds in protecting itself from a dangerous instinctual impulse, through, for instance, the process of repression, it has certainly inhibited and damaged the particular part of the id concerned; but it has at the same time given it some independence and has renounced some of its own sovereignty. This is inevitable from the nature of repression, which is, fundamentally, an attempt at flight. The repressed is now, as it were, an outlaw; it is excluded from the great organization of the ego and is subject only to the laws which govern the realm of the unconscious. If, now, the danger-situation changes so that the ego has no reason for fending off a new instinctual impulse analogous to the repressed one, the consequence of the restriction of the ego which has taken place will become manifest. The new impulse will run its course under an automatic influence - or, as I should prefer to say, under the influence of the compulsion to repeat. It will follow the same path as the earlier, repressed impulse, as though the danger-situation that had been overcome still existed. The fixating factor in repression, then, is the unconscious id's compulsion to repeat - a compulsion which in normal circumstances is only done away with by the freely mobile function of the ego. The ego may occasionally manage to break down the barriers of repression which it has itself put up and to recover its influence over the instinctual impulse and direct the course of the new impulse in accordance with the changed danger-situation. But in point of fact the ego very seldom succeeds in doing this: it cannot undo its repressions. It is possible that the way the struggle will go depends upon quantitative relations. In some cases one has the impression that the outcome is an enforced one: the regressive attraction exerted by the repressed impulse and the strength of the repression are so great that the new impulse has no choice but to obey the compulsion to repeat. In other cases we perceive a contribution from another play of forces: the attraction exerted by the repressed prototype is reinforced by a repulsion coming from the direction of difficulties in real life which stand in the way of any different course that might be taken by the new instinctual impulse.

The existence of the second, phylogenetic, factor, is based only upon inference. We have been led to assume its existence by a remarkable feature in the development of the libido. We have found that the sexual life of man, unlike that of most of the animals nearly related to him, does not make a steady advance from birth to maturity, but that, after an early efflorescence up till the fifth year, it undergoes a very decided interruption; and that it then starts on its course once more at puberty, taking up again the beginnings broken off in early childhood. This has led us to suppose that something momentous must have occurred in the vicissitudes of the human species which has left behind this interruption in the sexual development of the individual as a historical precipitate. This factor owes its pathogenic significance to the fact that the majority of the instinctual demands of this infantile sexuality are treated by the ego as dangers and fended off as such, so that the later sexual impulses of puberty, which in the natural course of things would be ego-syntonic, run the risk of succumbing to the attraction of their infantile prototypes and following them into repression. It is here that we come upon the most direct etiology of the neuroses. It is a curious thing that early contact with the demands of sexuality should have a similar effect on the ego to that produced by premature contact with the external world.
The third, psychological, factor resides in a defect of our mental apparatus which has to do precisely with its differentiation into an id and an ego, and which is therefore also attributable ultimately to the influence of the external world. In view of the dangers of reality, the ego is obliged to guard against certain instinctual impulses in the id and to treat them as dangers. But it cannot protect itself from internal instinctual dangers as effectively as it can from some piece of reality that is not part of itself. Intimately bound up with the id as it is, it can only fend off an instinctual danger by restricting its own organization and by acquiescing in the formation of symptoms in exchange for having impaired the instinct. If the rejected instinct renews its attack, the ego is overtaken by all those difficulties which are known to us as neurotic ailments.

[1926d, 4309]

An important element in the theory of repression is the view that repression is not an event that occurs once but that it requires a permanent expenditure. If this expenditure were to cease, the repressed impulse, which is being fed all the time from its sources, would on the next occasion flow along the channels from which it had been forced away, and the repression would either fail in its purpose or would have to be repeated an indefinite number of times. Thus it is because instincts are continuous in their nature that the ego has to make its defensive action secure by a permanent expenditure. This action undertaken to protect repression is observable in analytic treatment as resistance. Resistance presupposes the existence of what I have called anticathexis. An anticathexis of this kind is clearly seen in obsessional neurosis. It appears there in the form of an alteration of the ego, as a reaction-formation in the ego, and is effected by the reinforcement of the attitude which is the opposite of the instinctual trend that has to be repressed - as, for instance, in pity, conscientiousness and cleanliness. These reaction-formations of obsessional neurosis are essentially exaggerations of the normal traits of character which develop during the latency period. The presence of an anticathexis in hysteria is much more difficult to detect, though theoretically it is equally indispensable. In hysteria, too, a certain amount of alteration of the ego through reaction-formation is unmistakable and in some circumstances becomes so marked that it forces itself on our attention as the principal symptom. The conflict due to ambivalence, for instance, is resolved in hysteria by this means. The subject's hatred of a person whom he loves is kept down by an exaggerated amount of tenderness for him and apprehensiveness about him. But the difference between reaction-formations in obsessional neurosis and in hysteria is that in the latter they do not have the universality of a character-trait but are confined to particular relationships. A hysterical woman, for instance, may be specially affectionate with her own children whom at bottom she hates; but she will not on that account be more loving in general than other women or even more affectionate to other children. The reaction-formation of hysteria clings tenaciously to a particular object and never spreads over into a general disposition of the ego, whereas what is characteristic of obsessional neurosis is precisely a spreading-over of this kind - a loosening of relations to the object and a facilitation of displacement in the choice of object.

[1926d, 4310]
There is another kind of anticathexis, however, which seems more suited to the peculiar character of hysteria. A repressed instinctual impulse can be activated (newly cathected) from two directions: from within, through reinforcement from its internal sources of excitation, and from without, through the perception of an object that it desires. The hysterical anticathexis is mainly directed outwards, against dangerous perceptions. It takes the form of a special kind of vigilance which, by means of restrictions of the ego, causes situations to be avoided that would entail such perceptions, or, if they do occur, manages to withdraw the subject's attention from them. Some French analysts, in particular Laforgue, have recently given this action of hysteria the special name of 'scotomization'. This technique of anticathexis is still more noticeable in the phobias, whose interest is concentrated on removing the subject ever further from the possibility of the occurrence of the feared perception. The fact that anticathexis has an opposite direction in hysteria and the phobias from what it has in obsessional neurosis - though the distinction is not an absolute one - seems to be significant. It suggests that there is an intimate connection between repression and external anticathexis on the one hand and between regression and internal anticathexis (i.e. alteration in the ego through reaction-formation) on the other. The task of defence against a dangerous perception is, incidentally, common to all neuroses. Various commands and prohibitions in obsessional neurosis have the same end in view.

[1926d, 4311]

We showed on an earlier occasion that the resistance that has to be overcome in analysis proceeds from the ego, which clings to its anticathexes. It is hard for the ego to direct its attention to perceptions and ideas which it has up till now made a rule of avoiding, or to acknowledge as belonging to itself impulses that are the complete opposite of those which it knows as its own. Our fight against resistance in analysis is based upon this view of the facts. If the resistance is itself unconscious, as so often happens owing to its connection with the repressed material, we make it conscious. If it is conscious, or when it has become conscious, we bring forward logical arguments against it; we promise the ego rewards and advantages if it will give up its resistance. There can be no doubt or mistake about the existence of this resistance on the part of the ego. But we have to ask ourselves whether it covers the whole state of affairs in analysis. For we find that even after the ego has decided to relinquish its resistances it still has difficulty in undoing the repressions; and we have called the period of strenuous effort which follows after its praiseworthy decision, the phase of 'working-through'. The dynamic factor which makes a working-through of this kind necessary and comprehensible is not far to seek. It must be that after the ego's resistance has been removed the power of the compulsion to repeat - the attraction exerted by the unconscious prototype upon the repressed instinctual process - has still to be overcome. There is nothing to be said against describing this factor as the resistance of the unconscious. There is no need to be discouraged by these emendations. They are to be welcomed if they add something to our knowledge, and they are no disgrace to us so long as they enrich rather than invalidate our earlier views - by limiting some statement, perhaps, that was too general or by enlarging some idea that was too narrowly formulated.

[1926d, 4312]
Even a purely terminological innovation ought to justify its adoption; it ought to reflect some new point of view or some extension of knowledge. The revival of the concept of defence and the restriction of that of repression takes into account a fact which has long since been known but which has received added importance owing to some new discoveries. Our first observations of repression and of the formation of symptoms were made in connection with hysteria. We found that the perceptual content of exciting experiences and the ideational content of pathogenic structures of thought were forgotten and debarred from being reproduced in memory, and we therefore concluded that the keeping away from consciousness was a main characteristic of hysterical repression. Later on, when we came to study the obsessional neuroses, we found that in that illness pathogenic occurrences are not forgotten. They remain conscious but they are 'isolated' in some way that we cannot as yet grasp, so that much the same result is obtained as in hysterical amnesia. Nevertheless the difference is great enough to justify the belief that the process by which instinctual demands are set aside in obsessional neurosis cannot be the same as in hysteria. Further investigations have shown that in obsessional neurosis a regression of the instinctual impulses to an earlier libidinal stage is brought about through the opposition of the ego, and that this regression, although it does not make repression unnecessary, clearly works in the same sense as repression. We have seen, too, that in obsessional neurosis anticathexis, which is also presumably present in hysteria, plays a specially large part in protecting the ego by effecting a reactive alteration in it. Our attention has, moreover, been drawn to a process of 'isolation' (whose technique cannot as yet be elucidated) which finds direct symptomatic manifestation, and to a procedure, that may be called magical, of 'undoing' what has been done - a procedure about whose defensive purpose there can be no doubt, but which has no longer any resemblance to the process of 'repression'. These observations provide good enough grounds for re-introducing the old concept of defence, which can cover all these processes that have the same purpose - namely, the protection of the ego against instinctual demands - and for subsuming repression under it as a special case. The importance of this nomenclature is heightened if we consider the possibility that further investigations may show that there is an intimate connection between special forms of defence and particular illnesses, as, for instance, between repression and hysteria. In addition we may look forward to the possible discovery of yet another important correlation. It may well be that before its sharp cleavage into an ego and an id, and before the formation of a super-ego, the mental apparatus makes use of different methods of defence from those which it employs after it has reached these stages of organization.

[1926d, 4316]
You have no notion how close I am to fulfilling my promise. Even in organisms which later develop an efficient ego-organization, their ego is feeble and little differentiated from their id to begin with, during their first years of childhood. Imagine now what will happen if this powerless ego experiences an instinctual demand from the id which it would already like to resist (because it senses that to satisfy it is dangerous and would conjure up a traumatic situation, a collision with the external world) but which it cannot control, because it does not yet possess enough strength to do so. In such a case the ego treats the instinctual danger as if it was an external one; it makes an attempt at flight, draws back from this portion of the id and leaves it to its fate, after withholding from it all the contributions which it usually makes to instinctual impulses. The ego, as we put it, institutes a repression of these instinctual impulses. For the moment this has the effect of fending off the danger; but one cannot confuse the inside and the outside with impunity. One cannot run away from oneself. In repression the ego is following the pleasure principle, which it is usually in the habit of correcting; and it is bound to suffer damage in revenge. This lies in the ego's having permanently narrowed its sphere of influence. The repressed instinctual impulse is now isolated, left to itself, inaccessible, but also uninfluenceable. It goes its own way. Even later, as a rule, when the ego has grown stronger, it still cannot lift the repression; its synthesis is impaired, a part of the id remains forbidden ground to the ego. Nor does the isolated instinctual impulse remain idle; it understands how to make up for being denied normal satisfaction; it produces psychical derivatives which take its place; it links itself to other processes which by its influence it likewise tears away from the ego; and finally it breaks through into the ego and into consciousness in the form of an unrecognizably distorted substitute, and creates what we call a symptom. All at once the nature of a neurotic disorder becomes clear to us: on the one hand an ego which is inhibited in its synthesis, which has no influence on parts of the id, which must renounce some of its activities in order to avoid a fresh collision with what has been repressed, and which exhausts itself in what are for the most part vain acts of defence against the symptoms, the derivatives of the repressed impulses; and on the other hand an id in which individual instincts have made themselves independent, pursue their aims regardless of the interests of the person as a whole and henceforth obey the laws only of the primitive psychology that rules in the depths of the id. If we survey the whole situation we arrive at a simple formula for the origin of a neurosis: the ego has made an attempt to suppress certain portions of the id in an inappropriate manner, this attempt has failed and the id has taken its revenge. A neurosis is thus the result of a conflict between the ego and the id, upon which the ego has embarked because, as careful investigation shows, it wishes at all costs to retain its adaptability in relation to the real external world. The disagreement is between the external world and the id; and it is because the ego, loyal to its inmost nature, takes sides with the external world that it becomes involved in a conflict with its id. But please observe that what creates the determinant for the illness is not the fact of this conflict - for disagreements of this kind between reality and the id are unavoidable and it is one of the ego's standing tasks to mediate in them - but the circumstance that the ego has made use of the inefficient instrument of repression for dealing with the conflict. But this in turn is due to the fact that the ego, at the time at which it was set the task, was undeveloped and powerless. The decisive repressions all take place in early childhood.

[1926e, 4346]
The derivatives of what is repressed have broken into his ego and established themselves there; and the ego has as little control over trends from that source as it has over what is actually repressed, and as a rule it knows nothing about them. These patients, indeed, are of a peculiar nature and raise difficulties with which we are not accustomed to reckon. All our social institutions are framed for people with a united and normal ego, which one can classify as good or bad, which either fulfils its function or is altogether eliminated by an overpowering influence. Hence the juridical alternative: responsible or irresponsible. None of these distinctions apply to neurotics. It must be admitted that there is difficulty in adapting social demands to their psychological condition. This was experienced on a large scale during the last war. Were the neurotics who evaded service malingerers or not? They were both. If they were treated as malingerers and if their illness was made highly uncomfortable, they recovered; if after being ostensibly restored they were sent back into service, they promptly took flight once more into illness. Nothing could be done with them. And the same is true of neurotics in civil life. They complain of their illness but exploit it with all their strength; and if someone tries to take it away from them they defend it like the proverbial lioness with her young. Yet there would be no sense in reproaching them for this contradiction.

Again, I attach no great importance to the argument that a lay analyst, because he must be prepared to consult a doctor, will have no authority in the eyes of his patients and will be treated with no more respect than such people as bone-setters or masseurs. Once again, the analogy is an imperfect one - quite apart from the fact that what governs patients in their recognition of authority is usually their emotional transference and that the possession of a medical diploma does not impress them nearly so much as doctors believe. A professional lay analyst will have no difficulty in winning as much respect as is due to a secular pastoral worker. Indeed, the words, 'secular pastoral worker', might well serve as a general formula for describing the function which the analyst, whether he is a doctor or a layman, has to perform in his relation to the public. Our friends among the protestant clergy, and more recently among the catholic clergy as well, are often able to relieve their parishioners of the inhibitions of their daily life by confirming their faith - after having first offered them a little analytic information about the nature of their conflicts. Our opponents, the Adlerian 'individual psychologists', endeavour to produce a similar result in people who have become unstable and inefficient by arousing their interest in the social community after having first thrown some light upon a single corner of their mental life and shown them the part played in their illness by their egoistic and distrustful impulses. Both of these procedures, which derive their power from being based on analysis, have their place in psychotherapy. We who are analysts set before us as our aim the most complete and profoundest possible analysis of whoever may be our patient. We do not seek to bring him relief by receiving him into the catholic, protestant or socialist community. We seek rather to enrich him from his own internal sources, by putting at the disposal of his ego those energies which, owing to repression, are inaccessibly confined in his unconscious, as well as those which his ego is obliged to squander in the fruitless task of maintaining these repressions. Such activity as this is pastoral work in the best sense of the words. Have we set ourselves too high an aim? Are the majority of our patients worth the pains that this work requires of us? Would it not be more economical to prop up their weaknesses from without rather than to rebuild them from within? I cannot say; but there is something else that I do know. In psycho-analysis there has existed from the very first an inseparable bond between cure and research. Knowledge brought therapeutic success. It was impossible to treat a patient without learning something new; it was impossible to gain fresh insight without perceiving its beneficent results. Our analytic procedure is the only one in which this precious conjunction is assured. It is only by carrying on our analytic pastoral work that we can deepen our dawning comprehension of the human mind. This prospect of scientific gain has been the proudest and happiest feature of analytic work. Are we to sacrifice it for the sake of any considerations of a practical sort?

[1926e, 4396]
What happened, therefore, was that the boy refused to take cognizance of the fact of his having perceived that a woman does not possess a penis. No, that could not be true: for if a woman had been castrated, then his own possession of a penis was in danger; and against that there rose in rebellion the portion of his narcissism which Nature has, as a precaution, attached to that particular organ. In later life a grown man may perhaps experience a similar panic when the cry goes up that Throne and Altar are in danger, and similar illogical consequences will ensue. If I am not mistaken, Laforgue would say in this case that the boy 'scotomizes' his perception of the woman's lack of a penis.¹ A new technical term is justified when it describes a new fact or emphasizes it. This is not so here. The oldest word in our psycho-analytic terminology, 'repression', already relates to this pathological process. If we wanted to differentiate more sharply between the vicissitude of the idea as distinct from that of the affect, and reserve the word 'Verdrängung' ['repression'] for the affect, then the correct German word for the vicissitude of the idea would be 'Verleugnung' ['disavowal']. 'Scotomization' seems to me particularly unsuitable, for it suggests that the perception is entirely wiped out, so that the result is the same as when a visual impression falls on the blind spot in the retina. In the situation we are considering, on the contrary, we see that the perception has persisted, and that a very energetic action has been undertaken to maintain the disavowal. It is not true that, after the child has made his observation of the woman, he has preserved unaltered his belief that women have a phallus. He has retained that belief, but he has also given it up. In the conflict between the weight of the unwelcome perception and the force of his counter-wish, a compromise has been reached, as is only possible under the dominance of the unconscious laws of thought - the primary processes. Yes, in his mind the woman has got a penis, in spite of everything; but this penis is no longer the same as it was before. Something else has taken its place, has been appointed its substitute, as it were, and now inherits the interest which was formerly directed to its predecessor. But this interest suffers an extraordinary increase as well, because the horror of castration has set up a memorial to itself in the creation of this substitute. Furthermore, an aversion, which is never absent in any fetishist, to the real female genitals remains a stigma indelebile of the repression that has taken place. We can now see what the fetish achieves and what it is that maintains it. It remains a token of triumph over the threat of castration and a protection against it. It also saves the fetishist from becoming a homosexual, by endowing women with the characteristic which makes them tolerable as sexual objects. In later life, the fetishist feels that he enjoys yet another advantage from his substitute for a genital. The meaning of the fetish is not known to other people, so the fetish is not withheld from him: it is easily accessible and he can readily obtain the sexual satisfaction attached to it. What other men have to woo and make exertions for can be had by the fetishist with no trouble at all.

¹[1927e, 4536]
'Stop a moment!' you will exclaim; 'we can't follow you any further there!' You are quite right; I must add a little more before it can seem acceptable to you. First, I must admit that I have tried to translate into the language of our normal thinking what must in fact be a process that is neither conscious nor preconscious, taking place between quotas of energy in some unimaginable substratum. But that is not a strong objection, for it cannot be done in any other way. What is more important is that we should distinguish clearly what happens in the ego and what happens in the id when there is a repression. We have just said what the ego does: it makes use of an experimental cathexis and starts up the pleasure-unpleasure automatism by means of a signal of anxiety. After that, several reactions are possible or a combination of them in varying proportions. Either the anxiety attack is fully generated and the ego withdraws entirely from the objectionable excitation; or, in place of the experimental cathexis it opposes the excitation with an anticathexis, and this combines with the energy of the repressed impulse to form a symptom; or the anticathexis is taken up into the ego as a reaction-formation, as an intensification of certain of the ego's dispositions, as a permanent alteration of it. The more the generation of anxiety can be restricted to a mere signal, so much the more does the ego expend on actions of defence which amount to the psychical binding of the repressed, and so much the closer, too, does the process approximate to a normal working-over of it, though no doubt without attaining to it.

[1933a, 4697]

Now let us go back and turn to the id. It is not so easy to guess what occurs during repression in connection with the instinctual impulse that is being fought against. The main question which our interest raises is as to what happens to the energy, to the libidinal charge, of that excitation - how is it employed? You recollect that the earlier hypothesis was that it is precisely this that is transformed by repression into anxiety. We no longer feel able to say that. The modest reply will rather be that what happens to it is probably not always the same thing. There is probably an intimate correspondence which we ought to get to know about between what is occurring at the time in the ego and in the id in connection with the repressed impulse. For since we have decided that the pleasure-unpleasure principle, which is set in action by the signal of anxiety, plays a part in repression, we must alter our expectations. That principle exercises an entirely unrestricted dominance over what happens in the id. We can rely on its bringing about quite profound changes in the instinctual impulse in question. We are prepared to find that repression will have very various consequences, more or less far-reaching. In some cases the repressed instinctual impulse may retain its libidinal cathexis, and may persist in the id unchanged, although subject to constant pressure from the ego. In other cases what seems to happen is that it is totally destroyed, while its libido is permanently diverted along other paths. I expressed the view that this is what happens when the Oedipus complex is dealt with normally - in this desirable case, therefore, being not simply repressed but destroyed in the id. Clinical experience has further shown us that in many cases, instead of the customary result of repression, a degradation of the libido takes place - a regression of the libidinal organization to an earlier stage. This can, of course, only occur in the id, and if it occurs it will be under the influence of the same conflict which was introduced by the signal of anxiety. The most striking example of this kind is provided by the obsessional neurosis, in which libidinal regression and repression operate together.

[1933a, 4698]
And now let us enquire about latency, which, in view of the analogy, is bound to interest us especially. A trauma in childhood may be followed immediately by a neurotic outbreak, an infantile neurosis, with an abundance of efforts at defence, and accompanied by the formation of symptoms. This neurosis may last a considerable time and cause marked disturbances, but it may also run a latent course and be overlooked. As a rule defence retains the upper hand in it; in any case alterations of the ego, comparable to scars, are left behind. It is only rarely that an infantile neurosis continues without interruption into an adult one. Far more often it is succeeded by a period of apparently undisturbed development - a course of things which is supported or made possible by the intervention of the physiological period of latency. Not until later does the change take place with which the definitive neurosis becomes manifest as a belated effect of the trauma. This occurs either at the irruption of puberty or some while later. In the former case it happens because the instincts, intensified by physical maturation, are able now to take up the struggle again in which they were at first defeated by the defence. In the latter case it happens because the reactions and alterations of the ego brought about by the defence now prove a hindrance in dealing with the new tasks of life, so that severe conflicts come about between the demands of the real external world and the ego, which seeks to maintain the organization which it has painstakingly achieved in its defensive struggle. The phenomenon of a latency of the neurosis between the first reactions to the trauma and the later outbreak of the illness must be regarded as typical. This latter illness may also be looked upon as an attempt at cure - as an effort once more to reconcile with the rest those portions of the ego that have been split off by the influence of the trauma and to unite them into a powerful whole vis-à-vis the external world. An attempt of this kind seldom succeeds, however, unless the work of analysis comes to its help, and even then not always; it ends often enough in a complete devastation or fragmentation of the ego or in its being overwhelmed by the portion which was early split off and which is dominated by the trauma.

[1939a, 4902]

In the case of the individual we believe we can see clearly. The memory-trace of his early experience has been preserved in him, but in a special psychological condition. The individual may be said to have known it always, just as one knows about the repressed. Here we have formed ideas, which can be confirmed without difficulty through analysis, of how something can be forgotten and how it can then reappear after a while. What is forgotten is not extinguished but only ‘repressed’; its memory-traces are present in all their freshness, but isolated by 'anticathexes'. They cannot enter into communication with other intellectual processes; they are unconscious - inaccessible to consciousness. It may also be that certain portions of the repressed, having evaded the process, remain accessible to memory and occasionally emerge into consciousness; but even so they are isolated, like foreign bodies out of connection with the rest. It may be so, but it need not be so; repression may also be complete, and it is with that alternative that we shall deal in what follows.

[1939a, 4917]
We already know a number of things preliminary to such an undertaking. According to our hypothesis it is the ego's task to meet the demands raised by its three dependent relations to reality, to the id and to the super-ego - and nevertheless at the same time to preserve its own organization and maintain its own autonomy. The necessary precondition of the pathological states under discussion can only be a relative or absolute weakening of the ego which makes the fulfilment of its tasks impossible. The severest demand on the ego is probably the keeping down of the instinctual claims of the id, to accomplish which it is obliged to maintain large expenditures of energy on anticathexes. But the demands made by the super-ego too may become so powerful and so relentless that the ego may be paralysed, as it were, in the face of its other tasks. We may suspect that, in the economic conflicts which arise at this point, the id and the super-ego often make common cause against the hard-pressed ego which tries to cling to reality in order to retain its normal state. If the other two become too strong, they succeed in loosening and altering the ego's organization, so that its proper relation to reality is disturbed or even brought to an end. We have seen it happen in dreaming: when the ego is detached from the reality of the external world, it slips down, under the influence of the internal world, into psychosis.

[1940a [1938], 4982]

We can speak with a fair degree of certainty about the part played by the period of life. It seems that neuroses are acquired only in early childhood (up to the age of six), even though their symptoms may not make their appearance till much later. The childhood neurosis may become manifest for a short time or may even be overlooked. In every case the later neurotic illness links up with the prelude in childhood. It is possible that what are known as traumatic neuroses (due to excessive fright or severe somatic shocks, such as railway collisions, burial under falls of earth, and so on) are an exception to this: their relations to determinants in childhood have hitherto eluded investigation. There is no difficulty in accounting for this aetiological preference for the first period of childhood. The neuroses are, as we know, disorders of the ego; and it is not to be wondered at if the ego, so long as it is feeble, immature and incapable of resistance, fails to deal with tasks which it could cope with later on with the utmost ease. In these circumstances instinctual demands from within, no less than excitations from the external world, operate as 'traumas', particularly if they are met half way by certain innate dispositions. The helpless ego fends them off by means of attempts at flight (repression), which later turn out to be inefficient and which involve permanent restrictions on further development. The damage inflicted on the ego by its first experiences gives us the appearance of being disproportionately great; but we have only to take as an analogy the differences in the results produced by the prick of a needle into a mass of cells in the act of cell-division (as in Roux's experiments) and into the fully grown animal which eventually develops out of them. No human individual is spared such traumatic experiences; none escapes the repressions to which they give rise. These questionable reactions on the part of the ego may perhaps be indispensable for the attainment of another aim which is set for the same period of life: in the space of a few years the little primitive creature must turn into a civilized human being; he must pass through an immensely long stretch of human cultural development in an almost uncannily abbreviated form. This is made possible by hereditary disposition; but it can almost never be achieved without the additional help of upbringing, of parental influence, which, as a precursor of the super-ego, restricts the ego's activity by prohibitions and punishments, and encourages or compels the setting-up of repressions. We must therefore not forget to include the influence of civilization among the determinants of neurosis. It is easy, as we can see, for a barbarian to be healthy; for a civilized man the task is hard. The desire for a powerful, uninhibited ego may seem to us intelligible; but, as we are taught by the times we live in, it is in the profoundest sense hostile to civilization. And since the demands of civilization are represented by family upbringing, we must bear in mind the part played by this biological characteristic of the human species - the prolonged period of its childhood dependence - in the aetiology of the neuroses.

[1940a [1938], 4993]
The other agency of the mind, which we believe we know best and in which we recognize
ourselves most easily - what is known as the ego - has been developed out of the id's cortical
layer, which, through being adapted to the reception and exclusion of stimuli, is in direct contact
with the external world (reality). Starting from conscious perception it has subjected to its
influence ever larger regions and deeper strata of the id, and, in the persistence with which it
maintains its dependence on the external world, it bears the indelible stamp of its origin (as it
might be 'Made in Germany'). Its psychological function consists in raising the passage in the id
to a higher dynamic level (perhaps by transforming freely mobile energy into bound energy,
such as corresponds to the preconscious state); its constructive function consists in
interpolating, between the demand made by an instinct and the action that satisfies it, the
activity of thought which, after taking its bearings in the present and assessing earlier
experiences, endeavours by means of experimental actions to calculate the consequences of
the course of action proposed. In this way the ego comes to a decision on whether the attempt
to obtain satisfaction is to be carried out or postponed or whether it may not be necessary for
the demand by the instinct to be suppressed altogether as being dangerous. (Here we have the
reality principle.) Just as the id is directed exclusively to obtaining pleasure, so the ego is
governed by considerations of safety. The ego has set itself the task of self-preservation, which
the id appears to neglect. It makes use of the sensations of anxiety as a signal to give a warning
of dangers that threaten its integrity. Since memory traces can become conscious just as
perceptions do, especially through their association with residues of speech, the possibility
arises of a confusion which would lead to a mistaking of reality. The ego guards itself against
this possibility by the institution of reality-testing, which is allowed to fall into abeyance in
dreams on account of the conditions prevailing in the state of sleep. The ego, which seeks to
maintain itself in an environment of overwhelming mechanical forces, is threatened by dangers
which come in the first instance from external reality; but dangers do not threaten it from there
alone. Its own id is a source of similar dangers, and that for two different reasons. In the first
place, an excessive strength of instinct can damage the ego in a similar way to an excessive
'stimulus' from the external world. It is true that the former cannot destroy it; but it can destroy its
characteristic dynamic organization and change the ego back into a portion of the id. In the
second place, experience may have taught the ego that the satisfaction of some instinctual
demand which is not in itself intolerable would involve dangers in the external world, so that an
instinctual demand of that kind itself becomes a danger. Thus the ego is fighting on two fronts: it
has to defend its existence against an external world which threatens it with annihilation as well
as against an internal world that makes excessive demands. It adopts the same methods of
defence against both, but its defence against the internal enemy is particularly inadequate. As a
result of having originally been identical with this latter enemy and of having lived with it since
on the most intimate terms, it has great difficulty in escaping from the internal dangers. They
persist as threats, even if they can be temporarily held down.
[1940a [1938], 5005]
We have heard how the weak and immature ego of the first period of childhood is permanently damaged by the stresses put upon it in its efforts to fend off the dangers that are peculiar to that period of life. Children are protected against the dangers that threaten them from the external world by the solicitude of their parents; they pay for this security by a fear of loss of love which would deliver them over helpless to the dangers of the external world. This factor exerts a decisive influence on the outcome of the conflict when a boy finds himself in the situation of the Oedipus complex, in which the threat to his narcissism by the danger of castration, reinforced from primaeval sources, takes possession of him. Driven by the combined operation of these two influences, the contemporary real danger and the remembered one with its phylogenetic basis, the child embarks on his attempts at defence - repressions - which are effective for the moment but nevertheless turn out to be psychologically inadequate when the later re-animation of sexual life brings a reinforcement to the instinctual demands which have been repudiated in the past. If this is so, it would have to be said from a biological standpoint that the ego comes to grief over the task of mastering the excitations of the early sexual period, at a time when its immaturity makes it incompetent to do so. It is in this lagging of ego development behind libidinal development that we see the essential precondition of neurosis; and we cannot escape the conclusion that neuroses could be avoided if the childish ego were spared this task - if, that is to say, the child's sexual life were allowed free play, as happens among many primitive peoples. It may be that the aetiology of neurotic illnesses is more complicated than we have here described it; if so, we have at least brought out one essential part of the aetiological complex. Nor should we forget the phylogenetic influences, which are represented in some way in the id in forms that we are not yet able to grasp, and which must certainly act upon the ego more powerfully in that early period than later. On the other hand, the realization dawns on us that such an early attempt at damming up the sexual instinct, so decided a partisanship by the young ego in favour of the external as opposed to the internal world, brought about by the prohibition of infantile sexuality, cannot be without its effect on the individual's later readiness for culture. The instinctual demands forced away from direct satisfaction are compelled to enter on new paths leading to substitutive satisfaction, and in the course of these détours they may become desexualized and their connection with their original instinctual aims may become looser. And at this point we may anticipate the thesis that many of the highly valued assets of our civilization were acquired at the cost of sexuality and by the restriction of sexual motive forces.

[1940a [1938], 5006]
Before we decide on an answer to this question, however, we must consider an objection whose force lies in the fact that we are probably predisposed in its favour. Our arguments, it will be said, are all deduced from the processes which take place spontaneously between the ego and the instincts, and they presuppose that analytic therapy can accomplish nothing which does not, under favourable and normal conditions, occur of itself. But is this really so? Is it not precisely the claim of our theory that analysis produces a state which never does arise spontaneously in the ego and that this newly created state constitutes the essential difference between a person who has been analysed and a person who has not? Let us bear in mind what this claim is based on. All repressions take place in early childhood; they are primitive defensive measures taken by the immature, feeble ego. In later years no fresh repressions are carried out; but the old ones persist, and their services continue to be made use of by the ego for mastering the instincts. New conflicts are disposed of by what we call 'after-repression'. We may apply to these infantile repressions our general statement that repressions depend absolutely and entirely on the relative strength of the forces involved and that they cannot hold out against an increase in the strength of the instincts. Analysis, however, enables the ego, which has attained greater maturity and strength, to undertake a revision of these old repressions; a few are demolished, while others are recognized but constructed afresh out of more solid material. These new dams are of quite a different degree of firmness from the earlier ones; we may be confident that they will not give way so easily before a rising flood of instinctual strength. Thus the real achievement of analytic therapy would be the subsequent correction of the original process of repression, a correction which puts an end to the dominance of the quantitative factor.

If we ask what is the source of the great variety of kinds and degrees of alteration of the ego, we cannot escape the first obvious alternative, that such alterations are either congenital or acquired. Of these, the second sort will be the easier to treat. If they are acquired, it will certainly have been in the course of development, starting from the first years of life. For the ego has to try from the very outset to fulfil its task of mediating between its id and the external world in the service of the pleasure principle, and to protect the id from the dangers of the external world. If, in the course of these efforts, the ego learns to adopt a defensive attitude towards its own id as well and to treat the latter's instinctual demands as external dangers, this happens, at any rate in part, because it understands that a satisfaction of instinct would lead to conflicts with the external world. Thereafter, under the influence of education, the ego grows accustomed to removing the scene of the fight from outside to within and to mastering the internal danger before it has become an external one; and probably it is most often right in doing so. During this fight on two fronts - later there will be a third front as well - the ego makes use of various procedures for fulfilling its task, which, to put it in general terms, is to avoid danger, anxiety and unpleasure. We call these procedures 'mechanisms of defence'. Our knowledge of them is not yet sufficiently complete. Anna Freud's book (1936) has given us a first insight into their multiplicity and many-sided significance.
If the analogy is not pursued too strictly, we may say that repression has the same relation to the other methods of defence as omission has to distortion of the text, and we may discover in the different forms of this falsification parallels to the variety of ways in which the ego is altered. An attempt may be made to raise the objection that the analogy goes wrong in an essential point, for the distortion of a text is the work of a tendentious censorship, no counterpart to which is to be found in the development of the ego. But this is not so; for a tendentious purpose of this kind is to a great extent represented by the compelling force of the pleasure principle. The psychical apparatus is intolerant of unpleasure; it has to fend it off at all costs, and if the perception of reality entails unpleasure, that perception - that is, the truth - must be sacrificed. Where external dangers are concerned, the individual can help himself for some time by flight and by avoiding the situation of danger, until he is strong enough later on to remove the threat by actively altering reality. But one cannot flee from oneself; flight is no help against internal dangers. And for that reason the defensive mechanisms of the ego are condemned to falsify one's internal perception and to give one only an imperfect and distorted picture of one's id. In its relations to the id, therefore, the ego is paralysed by its restrictions or blinded by its errors; and the result of this in the sphere of psychical events can only be compared to being out walking in a country one does not know and without having a good pair of legs.

[1937c, 5033]

The mechanisms of defence serve the purpose of keeping off dangers. It cannot be disputed that they are successful in this; and it is doubtful whether the ego could do without them altogether during its development. But it is also certain that they may become dangers themselves. It sometimes turns out that the ego has paid too high a price for the services they render it. The dynamic expenditure necessary for maintaining them, and the restrictions of the ego which they almost invariably entail, prove a heavy burden on the psychical economy. Moreover, these mechanisms are not relinquished after they have assisted the ego during the difficult years of its development. No one individual, of course, makes use of all the possible mechanisms of defence. Each person uses no more than a selection of them. But these become fixated in his ego. They become regular modes of reaction of his character, which are repeated throughout his life whenever a situation occurs that is similar to the original one. This turns them into infantilisms, and they share the fate of so many institutions which attempt to keep themselves in existence after the time of their usefulness has passed. 'Vernunft wird Unsinn, Wohltat Plage'¹ as the poet complains. The adult's ego, with its increased strength, continues to defend itself against dangers which no longer exist in reality; indeed, it finds itself compelled to seek out those situations in reality which can serve as an approximate substitute for the original danger, so as to be able to justify, in relation to them, its maintaining its habitual modes of reaction. Thus we can easily understand how the defensive mechanisms, by bringing about an ever more extensive alienation from the external world and a permanent weakening of the ego, pave the way for, and encourage, the outbreak of neurosis.

[1937c, 5033]
At the moment, however, we are not concerned with the pathogenic role of the defensive mechanisms. What we are trying to discover is what influence the alteration of the ego which corresponds to them has upon our therapeutic efforts. The material for an answer to this question is given in the volume by Anna Freud to which I have already referred. The essential point is that the patient repeats these modes of reaction during the work of analysis as well, that he produces them before our eyes, as it were. In fact, it is only in this way that we get to know them. This does not mean that they make analysis impossible. On the contrary, they constitute half of our analytic task. The other half, the one which was first tackled by analysis in its early days, is the uncovering of what is hidden in the id. During the treatment our therapeutic work is constantly swinging backwards and forwards like a pendulum between a piece of id-analysis and a piece of ego-analysis. In the one case we want to make something from the id conscious, in the other we want to correct something in the ego. The crux of the matter is that the defensive mechanisms directed against former danger recur in the treatment as resistances against recovery. It follows from this that the ego treats recovery itself as a new danger.
[1937c, 5034]

The effect brought about in the ego by the defences can rightly be described as an 'alteration of the ego' if by that we understand a deviation from the fiction of a normal ego which would guarantee unshakable loyalty to the work of analysis. It is easy, then, to accept the fact, shown by daily experience, that the outcome of an analytic treatment depends essentially on the strength and on the depth of root of these resistances that bring about an alteration of the ego. Once again we are reminded that analysis can only draw upon definite and limited amounts of energy which have to be measured against the hostile forces. And it seems as if victory is in fact as a rule on the side of the big battalions.
[1937c, 5034]

The next question we come to is whether every alteration of the ego - in our sense of the term - is acquired during the defensive struggles of the earliest years. There can be no doubt about the answer. We have no reason to dispute the existence and importance of original, innate distinguishing characteristics of the ego. This is made certain by the single fact that each person makes a selection from the possible mechanisms of defence, that he always uses a few only of them and always the same ones. This would seem to indicate that each ego is endowed from the first with individual dispositions and trends, though it is true that we cannot specify their nature or what determines them. Moreover, we know that we must not exaggerate the difference between inherited and acquired characters into an antithesis; what was acquired by our forefathers certainly forms an important part of what we inherit. When we speak of an 'archaic heritage' we are usually thinking only of the id and we seem to assume that at the beginning of the individual's life no ego is as yet in existence. But we shall not overlook the fact that id and ego are originally one; nor does it imply any mystical overvaluation of heredity if we think it credible that, even before the ego has come into existence, the lines of development, trends and reactions which it will later exhibit are already laid down for it. The psychological peculiarities of families, races and nations, even in their attitude to analysis, allow of no other explanation. Indeed, more than this: analytic experience has forced on us a conviction that even particular psychical contents, such as symbolism, have no other sources than hereditary transmission, and researches in various fields of social anthropology, make it plausible to suppose that other, equally specialized precipitates left by early human development are also present in the archaic heritage.
[1937c, 5035]
A constitutional strength of instinct and an unfavourable alteration of the ego acquired in its
defensive struggle in the sense of its being dislocated and restricted - these are the factors
which are prejudicial to the effectiveness of analysis and which may make its duration
interminable. One is tempted to make the first factor - strength of instinct - responsible as well
for the emergence of the second - the alteration of the ego; but it seems that the latter too has
an aetiology of its own. And, indeed, it must be admitted that our knowledge of these matters is
as yet insufficient. They are only now becoming the subject of analytic study. In this field the
interest of analysts seems to me to be quite wrongly directed. Instead of an enquiry into how a
cure by analysis comes about (a matter which I think has been sufficiently elucidated) the
question should be asked of what are the obstacles that stand in the way of such a cure.
[1937c, 5019]
And now for the fact! In a whole number of nervous diseases - in hysteria, anxiety states, obsessional neurosis - our expectation is fulfilled. By searching for the repression in this way, by uncovering the resistances, by pointing out what is repressed, we really succeed in accomplishing our task - that is, in overcoming the resistances, lifting the repression and transforming the unconscious material into conscious. In doing so we gain the clearest impression of the way in which a violent struggle takes place in the patient's mind about the overcoming of each resistance - a normal mental struggle, on the same psychological ground, between the motives which seek to maintain the anticathexis and those which are prepared to give it up. The former are the old motives which in the past put the repression into effect; among the latter are the newly arrived ones which, we may hope, will decide the conflict in our favour. We have succeeded in reviving the old conflict which led to repression and in bringing up for revision the process that was then decided. The new material that we produce includes, first the reminder that the earlier decision led to illness and the promise that a different path will lead to recovery, and, second, the enormous change in all the circumstances that has take place since the time of the original rejection. Then the ego was feeble, infantile, and may perhaps have had grounds for banning the demands of the libido as a danger. To-day it has grown strong and experienced, and moreover has a helper at and in the shape of the doctor. Thus we may expect to lead the revived conflict to a better outcome than that which ended in repression, and, as I have said, in hysteria and in the anxiety and obsessional neuroses success proves us in general to be correct.

[1916-1917, 3480]

The existence of the second, phylogenetic, factor, is based only upon inference. We have been led to assume its existence by a remarkable feature in the development of the libido. We have found that the sexual life of man, unlike that of most of the animals nearly related to him, does not make a steady advance from birth to maturity, but that, after an early efflorescence up till the fifth year, it undergoes a very decided interruption; and that it then starts on its course once more at puberty, taking up again the beginnings broken off in early childhood. This has led us to suppose that something momentous must have occurred in the vicissitudes of the human species which has left behind this interruption in the sexual development of the individual as a historical precipitate. This factor owes its pathogenic significance to the fact that the majority of the instinctual demands of this infantile sexuality are treated by the ego as dangers and fended off as such, so that the later sexual impulses of puberty, which in the natural course of things would be ego-syntonic, run the risk of succumbing to the attraction of their infantile prototypes and following them into repression. It is here that we come upon the most direct aetiology of the neuroses. It is a curious thing that early contact with the demands of sexuality should have a similar effect on the ego to that produced by premature contact with the external world.

[1926d, 4309]
It is easy now to describe our therapeutic aim. We try to restore the ego, to free it from its restrictions, and to give it back the command over the id which it has lost owing to its early repressions. It is for this one purpose that we carry out analysis, our whole technique is directed to this aim. We have to seek out the repressions which have been set up and to urge the ego to correct them with our help and to deal with conflicts better than by an attempt at flight. Since these repressions belong to the very early years of childhood, the work of analysis leads us, too, back to that period. Our path to these situations of conflict, which have for the most part been forgotten and which we try to revive in the patient's memory, is pointed out to us by his symptoms, dreams and free associations. These must, however, first be interpreted - translated - for, under the influence of the psychology of the id, they have assumed forms of expression that are strange to our comprehension. We may assume that whatever associations, thoughts and memories the patient is unable to communicate to us without internal struggles are in some way connected with the repressed material or are its derivatives. By encouraging the patient to disregard his resistances to telling us these things, we are educating his ego to overcome its inclination towards attempts at flight and to tolerate an approach to what is repressed. In the end, if the situation of the repression can be successfully reproduced in his memory, his compliance will be brilliantly rewarded. The whole difference between his age then and now works in his favour; and the thing from which his childish ego fled in terror will often seem to his adult and strengthened ego no more than child's play.

[1926e, 4348]
We can speak with a fair degree of certainty about the part played by the period of life. It seems that neuroses are acquired only in early childhood (up to the age of six), even though their symptoms may not make their appearance till much later. The childhood neurosis may become manifest for a short time or may even be overlooked. In every case the later neurotic illness links up with the prelude in childhood. It is possible that what are known as traumatic neuroses (due to excessive fright or severe somatic shocks, such as railway collisions, burial under falls of earth, and so on) are an exception to this: their relations to determinants in childhood have hitherto eluded investigation. There is no difficulty in accounting for this aetiological preference for the first period of childhood. The neuroses are, as we know, disorders of the ego; and it is not to be wondered at if the ego, so long as it is feeble, immature and incapable of resistance, fails to deal with tasks which it could cope with later on with the utmost ease. In these circumstances instinctual demands from within, no less than excitations from the external world, operate as 'traumas', particularly if they are met half way by certain innate dispositions. The helpless ego fends them off by means of attempts at flight (repression), which later turn out to be inefficient and which involve permanent restrictions on further development. The damage inflicted on the ego by its first experiences gives us the appearance of being disproportionately great; but we have only to take as an analogy the differences in the results produced by the prick of a needle into a mass of cells in the act of cell-division (as in Roux's experiments) and into the fully grown animal which eventually develops out of them. No human individual is spared such traumatic experiences; none escapes the repressions to which they give rise. These questionable reactions on the part of the ego may perhaps be indispensable for the attainment of another aim which is set for the same period of life: in the space of a few years the little primitive creature must turn into a civilized human being; he must pass through an immensely long stretch of human cultural development in an almost uncannily abbreviated form. This is made possible by hereditary disposition; but it can almost never be achieved without the additional help of upbringing, of parental influence, which, as a precursor of the super-ego, restricts the ego's activity by prohibitions and punishments, and encourages or compels the setting-up of repressions. We must therefore not forget to include the influence of civilization among the determinants of neurosis. It is easy, as we can see, for a barbarian to be healthy; for a civilized man the task is hard. The desire for a powerful, uninhibited ego may seem to us intelligible; but, as we are taught by the times we live in, it is in the profoundest sense hostile to civilization. And since the demands of civilization are represented by family upbringing, we must bear in mind the part played by this biological characteristic of the human species - the prolonged period of its childhood dependence - in the aetiology of the neuroses.

[1940a [1938], 4993]
The mechanisms of defence serve the purpose of keeping off dangers. It cannot be disputed that they are successful in this; and it is doubtful whether the ego could do without them altogether during its development. But it is also certain that they may become dangers themselves. It sometimes turns out that the ego has paid too high a price for the services they render it. The dynamic expenditure necessary for maintaining them, and the restrictions of the ego which they almost invariably entail, prove a heavy burden on the psychical economy. Moreover, these mechanisms are not relinquished after they have assisted the ego during the difficult years of its development. No one individual, of course, makes use of all the possible mechanisms of defence. Each person uses no more than a selection of them. But these become fixated in his ego. They become regular modes of reaction of his character, which are repeated throughout his life whenever a situation occurs that is similar to the original one. This turns them into infantilisms, and they share the fate of so many institutions which attempt to keep themselves in existence after the time of their usefulness has passed. "Vernunft wird Unsinn, Wohltat Plage"¹ as the poet complains. The adult's ego, with its increased strength, continues to defend itself against dangers which no longer exist in reality; indeed, it finds itself compelled to seek out those situations in reality which can serve as an approximate substitute for the original danger, so as to be able to justify, in relation to them, its maintaining its habitual modes of reaction. Thus we can easily understand how the defensive mechanisms, by bringing about an ever more extensive alienation from the external world and a permanent weakening of the ego, pave the way for, and encourage, the outbreak of neurosis.

[1937c, 5033]

And since the demands of civilization are represented by family upbringing, we must bear in mind the part played by this biological characteristic of the human species - the prolonged period of its childhood dependence - in the aetiology of the neuroses. [1940a [1938], 4993]
The next question we come to is whether every alteration of the ego - in our sense of the term - is acquired during the defensive struggles of the earliest years. There can be no doubt about the answer. We have no reason to dispute the existence and importance of original, innate distinguishing characteristics of the ego. This is made certain by the single fact that each person makes a selection from the possible mechanisms of defence, that he always uses a few only of them and always the same ones. This would seem to indicate that each ego is endowed from the first with individual dispositions and trends, though it is true that we cannot specify their nature or what determines them. Moreover, we know that we must not exaggerate the difference between inherited and acquired characters into an antithesis; what was acquired by our forefathers certainly forms an important part of what we inherit. When we speak of an 'archaic heritage' we are usually thinking only of the id and we seem to assume that at the beginning of the individual's life no ego is as yet in existence. But we shall not overlook the fact that id and ego are originally one; nor does it imply any mystical overvaluation of heredity if we think it credible that, even before the ego has come into existence, the lines of development, trends and reactions which it will later exhibit are already laid down for it. The psychological peculiarities of families, races and nations, even in their attitude to analysis, allow of no other explanation. Indeed, more than this: analytic experience has forced on us a conviction that even particular psychical contents, such as symbolism, have no other sources than hereditary transmission, and researches in various fields of social anthropology, make it plausible to suppose that other, equally specialized precipitates left by early human development are also present in the archaic heritage.

With the recognition that the properties of the ego which we meet with in the form of resistances can equally well be determined by heredity as acquired in defensive struggles, the topographical distinction between what is ego and what is id loses much of its value for our investigation. If we advance a step further in our analytic experience, we come upon resistances of another kind, which we can no longer localize and which seem to depend on fundamental conditions in the mental apparatus. I can only give a few examples of this type of resistance; the whole field of enquiry is still bewilderingly strange and insufficiently explored. We come across people, for instance, to whom we should be inclined to attribute a special 'adhesiveness of the libido'. The processes which the treatment sets in motion in them are so much slower than in other people because, apparently, they cannot make up their minds to detach libidinal cathexes from one object and displace them on to another, although we can discover no special reason for this cathetic loyalty. One meets with the opposite type of person, too, in whom the libido seems particularly mobile; it enters readily upon the new cathexes suggested by analysis, abandoning its former ones in exchange for them. The difference between the two types is comparable to the one felt by a sculptor, according to whether he works in hard stone or soft clay. Unfortunately, in this second type the results of analysis often turn out to be very impermanent: the new cathexes are soon given up once more, and we have an impression, not of having worked in clay, but of having written on water. In the words of the proverb: "Soon got, soon gone."

[1937c, 5035]
But there is one thing which the severest and the mildest cases all have in common, and which is equally found in parapraxes and chance actions: the phenomena can be traced back to incompletely suppressed psychical material, which, although pushed away by consciousness, has nevertheless not been robbed of all capacity for expressing itself.

[1901b, 1347]

Now that the flood-waters of war have subsided, it is satisfactory to be able to record the fact that interest in psycho-analytic research remains unimpaired in the world at large. But the different parts of the theory have not all had the same history. The purely psychological theses and findings of psycho-analysis on the unconscious, repression, conflict as a cause of illness, the advantage accruing from illness, the mechanisms of the formation of symptoms, etc., have come to enjoy increasing recognition and have won notice even from those who are in general opposed to our views. That part of the theory, however, which lies on the frontiers of biology and the foundations of which are contained in this little work is still faced with undiminished contradiction. It has even led some who for a time took a very active interest in psycho-analysis to abandon it and to adopt fresh views which were intended to restrict once more the part played by the factor of sexuality in normal and pathological mental life.

[1905d, 1462]

Thus in the very first products of Hanold's delusional phantasies and actions we already find a double set of determinants, a derivation from two different sources. One of these is the one that was manifest to Hanold himself, the other is the one which is revealed to us when we examine his mental processes. One of them, looked at from Hanold's point of view, was conscious to him, the other was completely unconscious to him. One of them was derived wholly from the circle of ideas of the science of archaeology, the other arose from the repressed childhood memories that had become active in him and from the emotional instincts attached to them. One might be described as lying on the surface and covering the other, which was, as it were, concealed behind it. The scientific motivation might be said to serve as a pretext for the unconscious erotic one, and science had put itself completely at the service of the delusion. It should not be forgotten, however, that the unconscious determinants could not effect anything that did not simultaneously satisfy the conscious, scientific ones. The symptoms of a delusion - phantasies and actions alike - are in fact the products of compromise between the two mental currents, and in a compromise account is taken of the demands of each of the two parties to it; but each side must also renounce a part of what it wanted to achieve. Where a compromise comes about it must have been preceded by a struggle - in this case it was the conflict we have assumed between suppressed erotism and the forces that were keeping it in repression. In the formation of a delusion this struggle is in fact unending. Assault and resistance are renewed after the construction of each compromise, which is never, so to speak, entirely satisfying. Our author too is aware of this, and that is why he makes a peculiar unrest dominate this stage of his hero's disorder, as a precursor and guarantee of further developments.

[1907a, 1850]
Investigation of the childhood history of hysterical patients shows that the hysterical attack is designed to take the place of an auto-erotic satisfaction previously practised and since given up. In a great number of cases this satisfaction (masturbation by contact or by pressure of the thighs, or, again, by movements of the tongue, and so on) recurs during the attack itself, while the subject's consciousness is deflected. Moreover, the onset of an attack that is due to an increase of libido and is in the service of the primary purpose - as a consolation - exactly repeats the conditions under which, at the earlier time, the patient had intentionally sought this auto-erotic satisfaction. The anamnesis of the patient shows the following stages: (a) auto-erotic satisfaction, without ideational content; (b) the same satisfaction, connected with a phantasy which leads to the act of satisfaction; (c) renunciation of the act, with retention of the phantasy; (d) repression of the phantasy, which then comes into effect as a hysterical attack, either in an unchanged form, or in a modified one and adapted to new environmental impressions. Furthermore, (e) the phantasy may even reinstate the act of satisfaction belonging to it which had ostensibly been given up. This is a typical cycle of infantile sexual activity: repression, failure of repression, and return of the repressed.

[1909a, 1983]

Our most valuable lesson from Breuer's observation was what it proved concerning the relation between symptoms and pathogenic experiences or psychical traumas, and we must not omit now to consider these discoveries from the standpoint of the theory of repression. At first sight it really seems impossible to trace a path from repression to the formation of symptoms. Instead of giving a complicated theoretical account, I will return here to the analogy which I employed earlier for my explanation of repression. If you come to think of it, the removal of the interrupter and the posting of the guardians at the door may not mean the end of the story. It may very well be that the individual who has been expelled, and who has now become embittered and reckless, will cause us further trouble. It is true that he is no longer among us; we are free from his presence, from his insulting laughter and his sotto voce comments. But in some respects, nevertheless, the repression has been unsuccessful; for now he is making an intolerable exhibition of himself outside the room, and his shouting and banging on the door with his fists interfere with my lecture even more than his bad behaviour did before. In these circumstances we could not fail to be delighted if our respected president, Dr. Stanley Hall, should be willing to assume the role of mediator and peacemaker. He would have a talk with the unruly person outside and would then come to us with a request that he should be re-admitted after all: he himself would guarantee that the man would now behave better. On Dr. Hall's authority we decide to lift the repression, and peace and quiet are restored. This presents what is really no bad picture of the physician's task in the psycho-analytic treatment of the neuroses.

[1910a, 2214]

You must forgive me if I have not succeeded in giving you a more clearly intelligible account of these basic positions adopted by the method of treatment that is now described as 'psycho-analysis'. The difficulties have not lain only in the novelty of the subject. The nature of the incompatible wishes which, in spite of repression, succeed in making their existence in the unconscious perceptible, and the subjective and constitutional determinants which must be present in anyone before a failure of repression can occur and a substitute or symptom be formed - on all this I shall have more light to throw in some of my later observations.

[1910a, 2216]
You can also obtain a view, by a kind of synthetic work, of the process which has brought about
the distortion of the unconscious dream-thoughts into the manifest content of the dream. We call
this process the ‘dream-work’. It deserves our closest theoretical interest, since we are able to
study in it, as nowhere else, what unsuspected psychical processes can occur in the
unconscious, or rather, to put it more accurately, between two separate psychical systems like
the conscious and unconscious. Among these freshly discovered psychical processes those of
condensation and displacement are especially noticeable. The dream-work is a special case of
the effects produced by two different mental groupings on each other - that is, of the
consequences of mental splitting; and it seems identical in all essentials with the process of
distortion which transforms the repressed complexes into symptoms where there is unsuccessful
repression.
[1910a, 2223]

If you will now bring together the means we possess for uncovering what is concealed,
forgotten and repressed in the mind (the study of the ideas occurring to patients under free
association, of their dreams and of their faulty and symptomatic actions), and if you will add to
these the exploitation of certain other phenomena which occur during psycho-analytic treatment
and on which I shall have a few remarks to make later under the heading of ‘transference’ - if you
bear all these in mind, you will agree with me in concluding that our technique is already efficient
enough to fulfil its task, to bring the pathogenic psychical material into consciousness and so to
get rid of the ailments that have been brought about by the formation of substitutive symptoms.
And if, in the course of our therapeutic endeavours, we extend and deepen our knowledge of the
human mind both in health and sickness, that can, of course, only be regarded as a peculiar
attraction in our work.
[1910a, 2225]
If, then, as we have learnt, psychogenic disturbances of vision depend on certain ideas connected with seeing being cut off from consciousness, we must, on the psycho-analytic view, assume that these ideas have come into opposition to other, more powerful ones, for which we use the collective concept of the 'ego' - a compound which is made up variously at different times - and have for that reason come under repression. But what can be the origin of this opposition, which makes for repression, between the ego and various groups of ideas? You will no doubt notice that it was not possible to frame such a question before the advent of psycho-analysis, for nothing was known earlier of psychical conflict and repression. Our researches, however, have put us in a position to give us the desired answer. Our attention has been drawn to the importance of the instincts in ideational life. We have discovered that every instinct tries to make itself effective by activating ideas that are in keeping with its aims. These instincts are not always compatible with one another; their interests often come into conflict. Opposition between ideas is only an expression of struggles between the various instincts. From the point of view of our attempted explanation, a quite specially important part is played by the undeniable opposition between the instincts which subserve sexuality, the attainment of sexual pleasure, and those other instincts, which have as their aim the self-preservation of the individual - the ego-instincts. As the poet has said, all the organic instincts that operate in our mind may be classified as 'hunger' or 'love'. We have traced the 'sexual instinct' from its first manifestations in children to its final form, which is described as 'normal'. We have found that it is put together from numerous 'component instincts' which are attached to excitations of regions of the body; and we have come to see that these separate instincts have to pass through a complicated development before they can be brought effectively to serve the aims of reproduction. The light thrown by psychology on the evolution of our civilization has shown us that it originates mainly at the cost of the sexual component instincts, and that these must be suppressed, restricted, transformed and directed to higher aims, in order that the mental constructions of civilization may be established. We have been able to recognize as a valuable outcome of these researches something that our colleagues have not yet been willing to believe, namely that the human ailments known as 'neuroses' are derived from the many different ways in which these processes of transformation in the sexual component instincts may miscarry. The 'ego' feels threatened by the claims of the sexual instincts and fend them off by repressions; these, however, do not always have the desired result, but lead to the formation of dangerous substitutes for the repressed and to burdensome reactions on the part of the ego. From these two classes of phenomena taken together there emerge what we call the symptoms of neuroses.

It is true that psycho-analysis puts forward absence of sexual satisfaction as the cause of nervous disorders. But does it not say more than this? Is its teaching to be ignored as too complicated when it declares that nervous symptoms arise from a conflict between two forces - on the one hand, the libido (which has as a rule become excessive), and on the other, a rejection of sexuality, or a repression which is over-severe? No one who remembers this second factor, which is by no means secondary in importance, can ever believe that sexual satisfaction in itself constitutes a remedy of general reliability for the sufferings of neurotics. A good number of these people are, indeed, either in their actual circumstances or in general incapable of satisfaction. If they were capable of it, if they were without their inner resistances, the strength of the instinct itself would point the way to satisfaction for them even though no doctor advised it. What is the good, therefore, of medical advice such as that supposed to have been given to this lady?
In our clinical history of a case we have insisted that the imposition of the prohibition in very early childhood is the determining point; a similar importance attaches in the subsequent developments to the mechanism of repression at the same early age. As a result of the repression which has been enforced and which involves a loss of memory - an amnesia - the motives for the prohibition (which is conscious) remain unknown; and all attempts at disposing of it by intellectual processes must fail, since they cannot find any base of attack. The prohibition owes its strength and its obsessive character precisely to its unconscious opponent, the concealed and undiminished desire - that is to say, to an internal necessity inaccessible to conscious inspection. The ease with which the prohibition can be transferred and extended reflects a process which falls in with the unconscious desire and is greatly facilitated by the psychological conditions that prevail in the unconscious. The instinctual desire is constantly shifting in order to escape from the impasse and endeavours to find substitutes - substitute objects and substitute acts - in place of the prohibited ones. In consequence of this, the prohibition itself shifts about as well, and extends to any new aims which the forbidden impulse may adopt. Any fresh advance made by the repressed libido is answered by a fresh sharpening of the prohibition. The mutual inhibition of the two conflicting forces produces a need for discharge, for reducing the prevailing tension; and to this may be attributed the reason for the performance of obsessive acts. In the case of a neurosis these are clearly compromise actions: from one point of view they are evidences of remorse, efforts at expiation, and so on, while on the other hand they are at the same time substitutive acts to compensate the instinct for what has been prohibited. It is a law of neurotic illness that these obsessive acts fall more and more under the sway of the instinct and approach nearer and nearer to the activity which was originally prohibited.

[1912-1913, 2678]

We see that, if we follow up this line of thought, we come up against the problem not only of hypochondria, but of the other 'actual' neuroses - neurasthenia and anxiety neurosis. Let us therefore stop at this point. It is not within the scope of a purely psychological inquiry to penetrate so far behind the frontiers of physiological research. I will merely mention that from this point of view we may suspect that the relation of hypochondria to paraphrenia is similar to that of the other 'actual' neuroses to hysteria and obsessional neurosis: we may suspect, that is, that it is dependent on ego-libido just as the others are on object-libido, and that hypochondriacal anxiety is the counterpart, as coming from ego-libido, to neurotic anxiety. Further, since we are already familiar with the idea that the mechanism of falling ill and of the formation of symptoms in the transference neuroses - the path from introversion to regression - is to be linked to a damming-up of object-libido,¹ we may come to closer quarters with the idea of a damming-up of ego-libido as well and may bring this idea into relation with the phenomena of hypochondria and paraphrenia.

[1914c, 2940]
Among the derivatives of the *Ucs.* instinctual impulses, of the sort we have described, there are some which unite in themselves characters of an opposite kind. On the one hand, they are highly organized, free from self-contradiction, have made use of every acquisition of the system *Cs.* and would hardly be distinguished in our judgement from the formations of that system. On the other hand they are unconscious and are incapable of becoming conscious. Thus *qualitatively* they belong to the system *Pcs.*, but *factually* to the *Ucs*. Their origin is what decides their fate. We may compare them with individuals of mixed race who, taken all round, resemble white men, but who betray their coloured descent by some striking feature or other, and on that account are excluded from society and enjoy none of the privileges of white people. Of such a nature are those phantasies of normal people as well as of neurotics which we have recognized as preliminary stages in the formation both of dreams and of symptoms and which, in spite of their high degree of organization, remain repressed and therefore cannot become conscious. They draw near to consciousness and remain undisturbed so long as they do not have an intense cathexis, but as soon as they exceed a certain height of cathexis they are thrust back. Substitutive formations, too, are highly organized derivatives of the *Ucs.* of this kind; but these succeed in breaking through into consciousness, when circumstances are favourable - for example, if they happen to join forces with an anticathexis from the *Pcs.*

[1915e, 3013]

We must now form more definite ideas about this process of repression. It is the precondition for the construction of symptoms; but it is also something to which we know nothing similar. Let us take as our model an impulse, a mental process that endeavours to turn itself into an action. We know that it can be repelled by what we term a rejection or condemnation. When this happens, the energy at its disposal is withdrawn from it; it becomes powerless, though it can persist as a memory. The whole process of coming to a decision about it runs its course within the knowledge of the ego. It is a very different matter if we suppose that the same impulse is subjected to repression. In that case it would retain its energy and no memory of it would remain behind; moreover the process of repression would be accomplished unnoticed by the ego. This comparison, therefore, brings us no nearer to the essential nature of repression.

[1916-1917, 3368]
The Theory of Repression. - These theoretical considerations, taken together with the immediate impressions derived from analytic work, lead to a view of the neuroses which may be described in the roughest outline as follows. The neuroses are the expression of conflicts between the ego and such of the sexual impulses as seem to the ego incompatible with its integrity or with its ethical standards. Since these impulses are not *ego-syntonic*, the ego has repressed them: that is to say, it has withdrawn its interest from them and has shut them off from becoming conscious as well as from obtaining satisfaction by motor discharge. If in the course of analytic work one attempts to make these repressed impulses conscious, one becomes aware of the repressive forces in the form of *resistance*. But the achievement of repression fails particularly readily in the case of the sexual instincts. Their dammed-up libido finds other ways out from the unconscious: for it *regresses* to earlier phases of development and earlier attitudes towards objects, and, at weak points in the libidinal development where there are infantile fixations, it breaks through into consciousness and obtains discharge. What results is a *symptom* and consequently in its essence a substitutive sexual satisfaction. Nevertheless the symptom cannot entirely escape from the repressive forces of the ego and must therefore submit to modifications and displacements exactly as happens with dreams - by means of which its characteristic of being a sexual satisfaction becomes unrecognizable. Consequently symptoms are in the nature of compromises between the repressed sexual instincts and the repressing ego-instincts; they represent a wish-fulfilment for both partners to the conflict simultaneously, but one which is incomplete for each of them. This is quite strictly true of the symptoms of hysteria, while in the symptoms of obsessional neurosis there is often a stronger emphasis upon the side of the repressing function owing to the erection of reaction-formations, which are assurances against sexual satisfaction.

[1923a, 3923]

There are certainly good grounds for being suspicious of such simple solutions of a problem. Moreover, the most that we may expect is that this formula will turn out to be correct in the roughest outline. But even that would be something. One recalls at once, too, a whole number of discoveries and findings which seem to support our thesis. All our analyses go to show that the transference neuroses originate from the ego's refusing to accept a powerful instinctual impulse in the id or to help it to find a motor outlet, or from the ego's forbidding that impulse the object at which it is aiming. In such a case the ego defends itself against the instinctual impulse by the mechanism of repression. The repressed material struggles against this fate. It creates for itself, along paths over which the ego has no power, a substitutive representation (which forces itself upon the ego by way of a compromise) - the symptom. The ego finds its unity threatened and impaired by this intruder, and it continues to struggle against the symptom, just as it fended off the original instinctual impulse. All this produces the picture of a neurosis. It is no contradiction to this that, in undertaking the repression, the ego is at bottom following the commands of its super-ego - commands which, in their turn, originate from influences in the external world that have found representation in the super-ego. The fact remains that the ego has taken sides with those powers, that in it their demands have more strength than the instinctual demands of the id, and that the ego is the power which sets the repression in motion against the portion of the id concerned and which fortifies the repression by means of the anticathexis of resistance. The ego has come into conflict with the id in the service of the super-ego and of reality; and this is the state of affairs in every transference neurosis.

[1924b, 4066]
The sexual function, as I found, is in existence from the very beginning of the individual's life, though at first it is attached to the other vital functions and does not become independent of them until later; it has to pass through a long and complicated process of development before it becomes what we are familiar with as the normal sexual life of the adult. It begins by manifesting itself in the activity of a whole number of component instincts. These are dependent upon erotogenic zones in the body; some of them make their appearance in pairs of opposite impulses (such as sadism and masochism or the impulses to look and to be looked at); they operate independently of one another in a search for pleasure, and they find their object for the most part in the subject's own body. Thus at first the sexual function is non-centralized and predominantly auto-erotic. Later, syntheses begin to appear in it; a first stage of organization is reached under the dominance of the oral components, an anal-sadistic stage follows, and it is only after the third stage has at last been reached that the primacy of the genitals is established and that the sexual function begins to serve the ends of reproduction. In the course of this process of development a number of elements of the various component instincts turn out to be unserviceable for this last end and are therefore left on one side or turned to other uses, while others are diverted from their aims and carried over into the genital organization. I gave the name of libido to the energy of the sexual instincts and to that form of energy alone. I was next driven to suppose that the libido does not always pass through its prescribed course of development smoothly. As a result either of the excessive strength of certain of the components or of experiences involving premature satisfaction, fixations of the libido may occur at various points in the course of its development. If subsequently a repression takes place, the libido flows back to these points (a process described as regression), and it is from them that the energy breaks through in the form of a symptom. Later on it further became clear that the localization of the point of fixation is what determines the choice of neurosis, that is, the form in which the subsequent illness makes its appearance.

The main characteristics of the formation of symptoms have long since been studied and, I hope, established beyond dispute. A symptom is a sign of, and a substitute for, an instinctual satisfaction which has remained in abeyance; it is a consequence of the process of repression. Repression proceeds from the ego when the latter - it may be at the behest of the super-ego - refuses to associate itself with an instinctual cathexis which has been aroused in the id. The ego is able by means of repression to keep the idea which is the vehicle of the reprehensible impulse from becoming conscious. Analysis shows that the idea often persists as an unconscious formation.

So long as we direct our attention to the ego's attempt at flight we shall get no nearer to the subject of symptom-formation. A symptom arises from an instinctual impulse which has been detrimentally affected by repression. If the ego, by making use of the signal of unpleasure, attains its object of completely suppressing the instinctual impulse, we learn nothing of how this has happened. We can only find out about it from those cases in which repression must be described as having to a greater or less extent failed. In this event the position, generally speaking, is that the instinctual impulse has found a substitute in spite of repression, but a substitute which is very much reduced, displaced and inhibited and which is no longer recognizable as a satisfaction. And when the substitutive impulse is carried out there is no sensation of pleasure; its carrying out has, instead, the quality of a compulsion.
These are unwelcome complications, considering that we only set out to study simple cases of symptom-formation due to repression, and with that intention selected the earliest and to all appearances, most transparent neuroses of childhood. Instead of a single repression we have found a collection of them and have become involved with regression into the bargain. Perhaps we have added to the confusion by treating the two cases of animal phobia at our disposal - 'Little Hans' and the 'Wolf Man' - as though they were cast in the same mould. As a matter of fact, certain differences between them stand out. It is only with regard to 'Little Hans' that we can say with certainty that what his phobia disposed of were the two main impulses of the Oedipus complex - his aggressiveness towards his father and his over-fondness for his mother. A tender feeling for his father was undoubtedly there too and played a part in repressing the opposite feeling; but we can prove neither that it was strong enough to draw repression upon itself nor that it disappeared afterwards. 'Hans' seems, in fact, to have been a normal boy with what is called a 'positive' Oedipus complex. It is possible that the factors which we do not find were actually at work in him, but we cannot demonstrate their existence. Even the most exhaustive analysis has gaps in its data and is insufficiently documented. In the case of the Russian the deficiency lies elsewhere. His attitude to female objects had been disturbed by an early seduction and his passive, feminine side was strongly developed. The analysis of his wolf-dream revealed very little intentional aggressiveness towards his father, but it brought forward unmistakable proof that what repression overtook was his passive tender attitude to his father. In his case, too, the other factors may have been operative as well; but they were not in evidence. How is it that, in spite of these differences in the two cases, almost amounting to an antithesis, the final outcome - a phobia - was approximately the same? The answer must be sought in another quarter. I think it will be found in the second fact which emerges from our brief comparative examination. It seems to me that in both cases we can detect what the motive force of the repression was and can substantiate our view of its nature from the line of development which the two children subsequently pursued. This motive force was the same in both of them. It was the fear of impending castration. 'Little Hans' gave up his aggressiveness towards his father from fear of being castrated. His fear that a horse would bite him can, without any forcing, be given the full sense of a fear that a horse would bite off his genitals, would castrate him. But it was from fear of being castrated, too, that the little Russian relinquished his wish to be loved by his father, for he thought that a relation of that sort presupposed a sacrifice of his genitals - of the organ which distinguished him from a female. As we see, both forms of the Oedipus complex, the normal, active form and the inverted one, came to grief through the castration complex. The Russian boy's anxiety-idea of being devoured by a wolf contained, it is true, no suggestion of castration, for the oral regression it had undergone had removed it too far from the phallic stage. But the analysis of his dream rendered further proof superfluous. It was a triumph of repression that the form in which his phobia was expressed should no longer have contained any allusion to castration.

[1926d, 4267]
¹ Since the differentiation of the ego and the id, our interest in the problems of repression, too, was bound to receive a fresh impetus. Up till then we had been content to confine our interest to those aspects of repression which concerned the ego - the keeping away from consciousness and from motility, and the formation of substitutes (symptoms). With regard to the repressed instinctual impulses themselves, we assumed that they remained unaltered in the unconscious for an indefinite length of time. But now our interest is turned to the vicissitudes of the repressed and we begin to suspect that it is not self-evident, perhaps not even usual, that those impulses should remain unaltered and unalterable in this way. There is no doubt that the original impulses have been inhibited and deflected from their aim through repression. But has the portion of them in the unconscious maintained itself and been proof against the influences of life that tend to alter and depreciate them? In other words, do the old wishes, about whose former existence analysis tells us, still exist? The answer seems ready to hand and certain. It is that the old, repressed wishes must still be present in the unconscious since we still find their derivatives, the symptoms, in operation. But this answer is not sufficient. It does not enable us to decide between two possibilities: either that the old wish is now operating only through its derivatives, having transferred the whole of its cathectic energy to them, or that it is itself still in existence too. If its fate has been to exhaust itself in cathecting its derivatives, there is yet a third possibility. In the course of the neurosis it may have become re-animated by regression, anachronistic though it may now be. These are no idle speculations. There are many things about mental life, both normal and pathological, which seem to call for the raising of such questions. In my paper, 'The Dissolution of the Oedipus Complex' (1924d), I had occasion to notice the difference between the mere repression and the real removal of an old wishful impulse.

[1926d, 4297]

Psycho-analysis leads to less simple and satisfactory conclusions. What I have to say in this connection has long been familiar and I have nothing new to add. If the ego succeeds in protecting itself from a dangerous instinctual impulse, through, for instance, the process of repression, it has certainly inhibited and damaged the particular part of the id concerned; but it has at the same time given it some independence and has renounced some of its own sovereignty. This is inevitable from the nature of repression, which is, fundamentally, an attempt at flight. The repressed is now, as it were, an outlaw; it is excluded from the great organization of the ego and is subject only to the laws which govern the realm of the unconscious. If, now, the danger-situation changes so that the ego has no reason for fending off a new instinctual impulse analogous to the repressed one, the consequence of the restriction of the ego which has taken place will become manifest. The new impulse will run its course under an automatic influence - or, as I should prefer to say, under the influence of the compulsion to repeat. It will follow the same path as the earlier, repressed impulse, as though the danger-situation that had been overcome still existed. The fixating factor in repression, then, is the unconscious id's compulsion to repeat - a compulsion which in normal circumstances is only done away with by the freely mobile function of the ego. The ego may occasionally manage to break down the barriers of repression which it has itself put up and to recover its influence over the instinctual impulse and direct the course of the new impulse in accordance with the changed danger-situation. But in point of fact the ego very seldom succeeds in doing this: it cannot undo its repressions. It is possible that the way the struggle will go depends upon quantitative relations. In some cases one has the impression that the outcome is an enforced one: the regressive attraction exerted by the repressed impulse and the strength of the repression are so great that the new impulse has no choice but to obey the compulsion to repeat. In other cases we perceive a contribution from another play of forces: the attraction exerted by the repressed prototype is reinforced by a repulsion coming from the direction of difficulties in real life which stand in the way of any different course that might be taken by the new instinctual impulse.

[1926d, 4307]
(1) There is a force in the mind which exercises the functions of a censorship, and which excludes from consciousness and from any influence upon action all tendencies which displease it. Such tendencies are described as 'repressed'. They remain unconscious; and if one attempts to bring them into the patient's consciousness one provokes a 'resistance'. These repressed instinctual impulses, however, have not always become powerless. In many cases they succeed in making their influence felt in the mind by circuitous paths, and the indirect or substitutive satisfactions of repressed impulses thus achieved are what constitute neurotic symptoms. [1926f, 4405]
There is no longer anything contradictory to us in the notion that a psychical process which develops anxiety can nevertheless be the fulfilment of a wish. We know that it can be explained by the fact that the wish belongs to one system, the \( Ucs \), while it has been repudiated and suppressed by the other system, the \( Pcs \).¹ Even where psychical health is perfect, the subjugation of the \( Ucs \) by the \( Pcs \) is not complete; the measure of suppression indicates the degree of our psychical normality. Neurotic symptoms show that the two systems are in conflict with each other; they are the products of a compromise which brings the conflict to an end for the time being. On the one hand, they allow the \( Ucs \) an outlet for the discharge of its excitation, and provide it with a kind of sally-port, while, on the other hand they make it possible for the \( Pcs \) to control the \( Ucs \) to some extent. It is instructive to consider, for instance, the significance of a hysterical phobia or an agoraphobia. Let us suppose that a neurotic patient is unable to cross the street alone - a condition which we rightly regard as a 'symptom.' If we remove this symptom by compelling him to carry out the act of which he believes himself incapable, the consequence will be an attack of anxiety; and indeed the occurrence of an anxiety-attack in the street is often the precipitating cause of the onset of an agoraphobia. We see, therefore, that the symptom has been constructed in order to avoid an outbreak of anxiety; the phobia is erected like a frontier fortification against the anxiety.

[1900a, 1009]

¹ [Footnote added 1920:] It implies no qualification of the above assertion, but rather an amplification of it, if I restate it as follows: neurotic symptoms are based on the one hand on the demands of the libidinal instincts and on the other hand on those made by the ego by way of reaction to them.

[1905d, 1488]

Where the sexual instinct is fairly intense, but perverse, there are two possible outcomes. The first, which we shall not discuss further, is that the person affected remains a pervert and has to put up with the consequences of his deviation from the standard of civilization. The second is far more interesting. It is that, under the influence of education and social demands, a suppression of the perverse instincts is indeed achieved, but it is a kind of suppression which is really no suppression at all. It can better be described as a suppression that has failed. The inhibited sexual instincts are, it is true, no longer expressed as such - and this constitutes the success of the process - but they find expression in other ways, which are quite as injurious to the subject and make him quite as useless for society as satisfaction of the suppressed instincts in an unmodified form would have done. This constitutes the failure of the process, which in the long run more than counterbalances its success. The substitutive phenomena which emerge in consequence of the suppression of the instinct amount to what we call nervous illness, or, more precisely, the psychoneuroses.¹ Neurotics are the class of people who, since they possess a recalcitrant organization, only succeed, under the influence of cultural requirements, in achieving a suppression of their instincts which is \textit{apparent} and which becomes increasingly unsuccessful. They therefore only carry on their collaboration with cultural activities by a great expenditure of force and at the cost of an internal impoverishment, or are obliged at times to interrupt it and fall ill. I have described the neuroses as the 'negative' of the perversions because in the neuroses the perverse impulses, after being repressed, manifest themselves from the unconscious part of the mind - because the neuroses contain the same tendencies, though in a state of 'repression', as do the positive perversions.

[1908d, 1954]
Symptoms - and of course we are dealing now with psychical (or psychogenic) symptoms and psychical illness - are acts detrimental, or at least useless, to the subject's life as a whole, often complained of by him as unwelcome and bringing unpleasure or suffering to him. The main damage they do resides in the mental expenditure which they themselves involve and in the further expenditure that becomes necessary for fighting against them. Where there is an extensive formation of symptoms, these two sorts of expenditure can result in an extraordinary impoverishment of the subject in regard to the mental energy available to him and so in paralysing him for all the important tasks of life. Since this outcome depends mainly on the quantity of the energy which is thus absorbed, you will easily see that 'being ill' is in its essence a practical concept. But if you take up a theoretical point of view and disregard this matter of quantity, you may quite well say that we are all ill - that is, neurotic - since the preconditions for the formation of symptoms can also be observed in normal people.

[1916-1917, 3417]

The main characteristics of the formation of symptoms have long since been studied and, I hope, established beyond dispute. A symptom is a sign of, and a substitute for, an instinctual satisfaction which has remained in abeyance; it is a consequence of the process of repression. Repression proceeds from the ego when the latter - it may be at the behest of the super-ego - refuses to associate itself with an instinctual cathexis which has been aroused in the id. The ego is able by means of repression to keep the idea which is the vehicle of the reprehensible impulse from becoming conscious. Analysis shows that the idea often persists as an unconscious formation.

[1926d, 4252]

So long as we direct our attention to the ego's attempt at flight we shall get no nearer to the subject of symptom-formation. A symptom arises from an instinctual impulse which has been detrimentally affected by repression. If the ego, by making use of the signal of unpleasure, attains its object of completely suppressing the instinctual impulse, we learn nothing of how this has happened. We can only find out about it from those cases in which repression must be described as having to a greater or less extent failed. In this event the position, generally speaking, is that the instinctual impulse has found a substitute in spite of repression, but a substitute which is very much reduced, displaced and inhibited and which is no longer recognizable as a satisfaction. And when the substitutive impulse is carried out there is no sensation of pleasure; its carrying out has, instead, the quality of a compulsion.

[1926d, 4255]

Psycho-analytic work has shown us that it is precisely these frustrations of sexual life which people known as neurotics cannot tolerate. The neurotic creates substitutive satisfactions for himself in his symptoms, and these either cause him suffering in themselves or become sources of suffering for him by raising difficulties in his relations with his environment and the society he belongs to. The latter fact is easy to understand; the former presents us with a new problem. But civilization demands other sacrifices besides that of sexual satisfaction.

[1930a, 4500]
Now I already knew from the analysis of similar cases that before hysteria can be acquired for the first time one essential condition must be fulfilled: an idea must be intentionally repressed from consciousness and excluded from associative modification. In my view this intentional repression is also the basis for the conversion, whether total or partial, of the sum of excitation. The sum of excitation, being cut off from psychical association, finds its way all the more easily along the wrong path to a somatic innervation. The basis for repression itself can only be a feeling of unpleasure, the incompatibility between the single idea that is to be repressed and the dominant mass of ideas constituting the ego. The repressed idea takes its revenge, however, by becoming pathogenic.

[1895d, 102]

In order to describe clearly and with probable accuracy the processes of repression, the return of the repressed and the formation of pathological compromise-ideas, one would have to make up one's mind to quite definite assumptions about the substratum of psychical events and of consciousness. So long as one seeks to avoid this, one must be content with the following remarks which are intended more or less figuratively. There are two forms of obsessional neurosis, according to whether what forces an entrance into consciousness is solely the mnemonic content of the act involving self-reproach, or whether the self-reproachful affect connected with the act does so as well.

[1896b, 390]

Besides these compromise symptoms, which signify the return of the repressed and consequently a collapse of the defence that had been originally achieved, the obsessional neurosis constructs a set of further symptoms, whose origin is quite different. For the ego seeks to fend off the derivatives of the initially repressed memory, and in this defensive struggle it creates symptoms which might be classed together as 'secondary defence'. These are all of them 'protective measures', which have already done good service in the fight against obsessional ideas and obsessional affects. If these aids in the defensive struggle genuinely succeed in once more repressing the symptoms of the return which have forced themselves on the ego, then the obsession is transferred to the protective measures themselves and creates a third form of 'obsessional neurosis'- obsessive actions. These actions are never primary; they never contain anything but a defence - never an aggression. A psychical analysis of them shows that, in spite of their peculiarity, they can always be fully explained by being traced back to the obsessional memories which they are fighting against.'

[1896b, 392]

Further investigation of these indifferent childhood memories has taught me that they can originate in other ways as well and that an unsuspected wealth of meaning lies concealed behind their apparent innocence. But on this point I shall not content myself with a mere assertion but shall give a detailed report of one particular instance which seems to me the most instructive out of a considerable number of similar ones. Its value is certainly increased by the fact that it relates to someone who is not at all or only very slightly neurotic.

[1899a, 492]
In the most favourable cases the generation of unpleasure ceases along with the withdrawal of cathexis from the transference thoughts in the $Pcs$; and this outcome signifies that the intervention of the unpleasure principle has served a useful purpose. But it is another matter when the repressed unconscious wish receives an organic reinforcement, which it passes on to its transference thoughts; in that way it may place them in a position to make an attempt at forcing their way through with their excitation, even if they have lost their cathexis from the $Pcs$. There then follows a defensive struggle - for the $Pcs$ in turn reinforces its opposition to the repressed thoughts (i.e. produces an 'anticathexis') - and thereafter the transference thoughts, which are the vehicles of the unconscious wish, force their way through in some form of compromise which is reached by the production of a symptom. But from the moment at which the repressed thoughts are strongly cathecated by the unconscious wishful impulse and, on the other hand, abandoned by the preconscious cathexis, they become subject to the primary psychical process and their one aim is motor discharge or, if the path is open, hallucinatory revival of the desired perceptual identity. We have already found empirically that the irrational processes we have described are only carried out with thoughts that are under repression. We can now see our way a little further into the whole position. The irrational processes which occur in the psychical apparatus are the primary ones. They appear wherever ideas are abandoned by the preconscious cathexis, are left to themselves and can become charged with the uninhibited energy from the unconscious which is striving to find an outlet. Some other observations lend support to the view that these processes which are described as irrational are not in fact falsifications of normal processes - intellectual errors - but are modes of activity of the psychical apparatus that have been freed from an inhibition. Thus we find that the transition from preconscious excitation to movement is governed by the same processes, and that the linking of preconscious ideas to words may easily exhibit the same displacements and confusions, which are then attributed to inattention. Evidence, finally, of the increase in activity which becomes necessary when these primary modes of functioning are inhibited is to be found in the fact that we produce a comic effect, that is, a surplus of energy which has to be discharged in laughter, if we allow these modes of thinking to force their way through into consciousness.

[1900a, 1032]
Hitherto philosophers have had no occasion to concern themselves with a psychology of repression. We may therefore be permitted to make a first approach to this hitherto unknown topic by constructing a pictorial image of the course of events in dream-formation. It is true that the schematic picture we have arrived at - not only from the study of dreams - is a fairly complicated one; but we cannot manage with anything simpler. Our hypothesis is that in our mental apparatus there are two thought-constructing agencies, of which the second enjoys the privilege of having free access to consciousness for its products whereas the activity of the first is in itself unconscious and can only reach consciousness by way of the second. On the frontier between the two agencies, where the first passes over to the second, there is a censorship, which only allows what is agreeable to it to pass through and holds back everything else. According to our definition, then, what is rejected by the censorship is in a state of repression. Under certain conditions, of which the state of sleep is one, the relation between the strength of the two agencies is modified in such a way that what is repressed can no longer be held back. In the state of sleep this probably occurs owing to a relaxation of the censorship; when this happens it becomes possible for what has hitherto been repressed to make a path for itself to consciousness. Since, however, the censorship is never completely eliminated but merely reduced, the repressed material must submit to certain alterations which mitigate its offensive features. What becomes conscious in such cases is a compromise between the intentions of one agency and the demands of the other. Repression - relaxation of the censorship - the formation of a compromise, this is the fundamental pattern for the generation not only of dreams but of many other psychopathological structures; and in the latter cases too we may observe that the formation of compromises is accompanied by processes of condensation and displacement and by the employment of superficial associations, which we have become familiar with in the dream-work.

[1901a, 1089]

But there is one thing which the severest and the mildest cases all have in common, and which is equally found in parapraxes and chance actions: the phenomena can be traced back to incompletely suppressed psychical material, which, although pushed away by consciousness, has nevertheless not been robbed of all capacity for expressing itself.

[1901b, 1347]

As a further corollary to my modified view of 'sexual traumas in childhood', my theory now developed further in a direction which had already been indicated in my publications between 1894 and 1896. At that time, and even before sexuality had been given its rightful place as an aetiological factor, I had maintained that no experience could have a pathogenic effect unless it appeared intolerable to the subject's ego and gave rise to efforts at defence (Freud, 1894a). It was to this defence that I traced back the split in the psyche (or, as we said in those days, in consciousness) which occurs in hysteria. If the defence was successful, the intolerable experience with its affective consequences was expelled from consciousness and from the ego's memory. In certain circumstances, however, what had been expelled pursued its activities in what was now an unconscious state, and found its way back into consciousness by means of symptoms and the affects attaching to them, so that the illness corresponded to a failure in defence. This view had the merit of entering into the interplay of the psychical forces and of thus bringing the mental processes in hysteria nearer to normal ones, instead of characterizing the neurosis as nothing more than a mysterious disorder insusceptible to further analysis.

[1906a, 1580]
Further information now became available relating to people who had remained normal; and this led to the unexpected finding that the sexual history of their childhood did not necessarily differ in essentials from that of neurotics, and, in particular, that the part played by seduction was the same in both cases. As a consequence, accidental influences receded still further into the background as compared with 'repression' (as I now began to say instead of 'defence'). Thus it was no longer a question of what sexual experiences a particular individual had had in his childhood, but rather of his reaction to those experiences - of whether he had reacted to them by 'repression' or not. It could be shown how in the course of development a spontaneous infantile sexual activity was often broken off by an act of repression. Thus a mature neurotic individual was invariably pursued by a certain amount of 'sexual repression' from his childhood; this found expression when he was faced by the demands of real life, and the psycho-analyses of hysterics showed that they fell ill as a result of the conflict between their libido and their sexual repression and that their symptoms were in the nature of compromises between the two mental currents.

[1906a, 1580]

The answer to the first question touches on a problem which has often been discussed and cannot be exhaustively treated here - that of sexual abstinence. Our third stage of civilization demands of individuals of both sexes that they shall practise abstinence until they are married and that all who do not contract a legal marriage shall remain abstinent throughout their lives. The position, agreeable to all the authorities, that sexual abstinence is not harmful and not difficult to maintain, has also been widely supported by the medical profession. It may be asserted, however, that the task of mastering such a powerful impulse as that of the sexual instinct by any other means than satisfying it is one which can call for the whole of a man's forces. Mastering it by sublimation, by deflecting the sexual instinctual forces away from their sexual aim to higher cultural aims, can be achieved by a minority and then only intermittently, and least easily during the period of ardent and vigorous youth. Most of the rest become neurotic or are harmed in one way or another. Experience shows that the majority of the people who make up our society are constitutionally unfit to face the task of abstinence. Those who would have fallen ill under milder sexual restrictions fall ill all the more readily and more severely before the demands of our cultural sexual morality of to-day; for we know no better safe-guard against the threat to normal sexual life offered by defective innate dispositions or disturbances of development than sexual satisfaction itself. The more a person is disposed to neurosis, the less can he tolerate abstinence; instincts which have been withdrawn from normal development, in the sense in which it has been described above, become at the same time all the more uninhibitable. But even those people who would have retained their health under the requirements of the second stage of civilization will now succumb to neurosis in great numbers. For the psychical value of sexual satisfaction increases with its frustration. The dammed-up libido is now put in a position to detect one or other of the weaker spots which are seldom absent in the structure of sexual life, and there to break through and obtain substitutive satisfaction of a neurotic kind in the form of pathological symptoms. Anyone who is able to penetrate the determinants of nervous illness will soon become convinced that its increase in our society arises from the intensification of sexual restrictions.

[1908d, 1956]
If, then, as we have learnt, psychogenic disturbances of vision depend on certain ideas connected with seeing being cut off from consciousness, we must, on the psycho-analytic view, assume that these ideas have come into opposition to other, more powerful ones, for which we use the collective concept of the ‘ego’ - a compound which is made up variously at different times - and have for that reason come under repression. But what can be the origin of this opposition, which makes for repression, between the ego and various groups of ideas? You will no doubt notice that it was not possible to frame such a question before the advent of psycho-analysis, for nothing was known earlier of psychical conflict and repression. Our researches, however, have put us in a position to give us the desired answer. Our attention has been drawn to the importance of the instincts in ideational life. We have discovered that every instinct tries to make itself effective by activating ideas that are in keeping with its aims. These instincts are not always compatible with one another; their interests often come into conflict. Opposition between ideas is only an expression of struggles between the various instincts. From the point of view of our attempted explanation, a quite specially important part is played by the undeniable opposition between the instincts which subserve sexuality, the attainment of sexual pleasure, and those other instincts, which have as their aim the self-preservation of the individual - the ego-instincts. As the poet has said, all the organic instincts that operate in our mind may be classified as ‘hunger’ or ‘love’. We have traced the ‘sexual instinct’ from its first manifestations in children to its final form, which is described as ‘normal’. We have found that it is put together from numerous ‘component instincts’ which are attached to excitations of regions of the body; and we have come to see that these separate instincts have to pass through a complicated development before they can be brought effectively to serve the aims of reproduction. The light thrown by psychology on the evolution of our civilization has shown us that it originates mainly at the cost of the sexual component instincts, and that these must be suppressed, restricted, transformed and directed to higher aims, in order that the mental constructions of civilization may be established. We have been able to recognize as a valuable outcome of these researches something that our colleagues have not yet been willing to believe, namely that the human ailments known as ‘neuroses’ are derived from the many different ways in which these processes of transformation in the sexual component instincts may miscarry. The ‘ego’ feels threatened by the claims of the sexual instincts and fends them off by repressions; these, however, do not always have the desired result, but lead to the formation of dangerous substitutes for the repressed and to burdensome reactions on the part of the ego. From these two classes of phenomena taken together there emerge what we call the symptoms of neuroses.

[1910i, 2368]

We must now form more definite ideas about this process of repression. It is the precondition for the construction of symptoms; but it is also something to which we know nothing similar. Let us take as our model an impulse, a mental process that endeavours to turn itself into an action. We know that it can be repelled by what we term a rejection or condemnation. When this happens, the energy at its disposal is withdrawn from it; it becomes powerless, though it can persist as a memory. The whole process of coming to a decision about it runs its course within the knowledge of the ego. It is a very different matter if we suppose that the same impulse is subjected to repression. In that case it would retain its energy and no memory of it would remain behind; moreover the process of repression would be accomplished unnoticed by the ego. This comparison, therefore, brings us no nearer to the essential nature of repression.

[1916-1917, 3368]
I hope to be able to give you adequate replies to these questions, even though the replies may be reduced to schematic dimensions. The conflict is conjured up by frustration, as a result of which the libido, deprived of satisfaction, is driven to look for other objects and paths. The necessary precondition of the conflict is that these other paths and objects arouse displeasure in one part of the personality, so that a veto is imposed which makes the new method of satisfaction impossible as it stands. From this point the construction of symptoms pursues its course, which we shall follow later. The repudiated libidinal trends nevertheless succeed in getting their way by certain roundabout paths, though not, it is true, without taking the objection into account by submitting to some distortions and mitigations. The roundabout paths are those taken by the construction of symptoms; the symptoms are the fresh or substitute satisfaction which has become necessary owing to the fact of frustration.

[1916-1917, 3411]

The meaning of psychical conflict can be adequately expressed in another way by saying that for an external frustration to become pathogenic an internal frustration must be added to it. In that case, of course, the external and internal frustration relate to different paths and objects. The external frustration removes one possibility of satisfaction and the internal frustration seeks to exclude another possibility, about which the conflict then breaks out. I prefer this way of representing the matter because it has a secret content. For it hints at the probability that the internal impediments arose from real external obstacles during the prehistoric periods of human development.

[1916-1917, 3411]

But, Ladies and Gentlemen, who has so seriously misinformed you? A recommendation to the patient to 'live a full life' sexually could not possibly play a part in analytic therapy - if only because we ourselves have declared that an obstinate conflict is taking place in him between a libidinal impulse and sexual repression, between a sensual and an ascetic trend. This conflict would not be solved by our helping one of these trends to victory over its opponent. We see, indeed, that in neurotics asceticism has the upper hand; and the consequence of this is precisely that the suppressed sexual tendency finds a way out in symptoms. If, on the contrary, we were to secure victory for sensuality, then the sexual repression that had been put on one side would necessarily be replaced by symptom. Neither of these two alternative decisions could end the internal conflict; in either case one party to it would remain unsatisfied. There are only a few cases in which the conflict is so unstable that a factor such as the doctor's taking sides could decide it; and such cases do not in fact stand in need of analytic treatment. Anyone on whom the doctor could have so much influence would have found the same way out without the doctor. You must be aware that if an abstinent young man decides in favour of illicit sexual intercourse or if an unsatisfied wife seeks relief with another man, they have not as a rule waited for permission from a doctor or even from their analyst.

[1916-1917, 3476]
There are certainly good grounds for being suspicious of such simple solutions of a problem. Moreover, the most that we may expect is that this formula will turn out to be correct in the roughest outline. But even that would be something. One recalls at once, too, a whole number of discoveries and findings which seem to support our thesis. All our analyses go to show that the transference neuroses originate from the ego's refusing to accept a powerful instinctual impulse in the id or to help it to find a motor outlet, or from the ego's forbidding that impulse the object at which it is aiming. In such a case the ego defends itself against the instinctual impulse by the mechanism of repression. The repressed material struggles against this fate. It creates for itself, along paths over which the ego has no power, a substitutive representation (which forces itself upon the ego by way of a compromise) - the symptom. The ego finds its unity threatened and impaired by this intruder, and it continues to struggle against the symptom, just as it fended off the original instinctual impulse. All this produces the picture of a neurosis. It is no contradiction to this that, in undertaking the repression, the ego is at bottom following the commands of its super-ego - commands which, in their turn, originate from influences in the external world that have found representation in the super-ego. The fact remains that the ego has taken sides with those powers, that in it their demands have more strength than the instinctual demands of the id, and that the ego is the power which sets the repression in motion against the portion of the id concerned and which fortifies the repression by means of the anticathexis of resistance. The ego has come into conflict with the id in the service of the super-ego and of reality; and this is the state of affairs in every transference neurosis.

[1924b, 4066]

It looked as though our work had been made much more difficult and complicated; but the inestimable gain was that an insight was now obtained into an interplay of forces which had been concealed from the observer by the hypnotic state. It became evident that the work of uncovering what had been pathogenically forgotten had to struggle against a constant and very intense resistance. The critical objections which the patient raised in order to avoid communicating the ideas which occurred to him, and against which the fundamental rule of psycho-analysis was directed, had themselves already been manifestations of this resistance. A consideration of the phenomena of resistance led to one of the corner-stones of the psychoanalytic theory of the neuroses - the theory of repression. It was plausible to suppose that the same forces which were now struggling against the pathogenic material being made conscious had at an earlier time made the same efforts with success. A gap in the aetiology of neurotic symptoms was thus filled. The impressions and mental impulses, for which the symptoms were now serving as substitutes, had not been forgotten without reason or on account of a constitutional incapacity for synthesis (as Janet supposed); they had, though the influence of other mental forces, met with a repression the success and evidence of which was precisely their being debarred from consciousness and excluded from memory. It was only in consequence of this repression that they had become pathogenic - that is, had succeeded in manifesting themselves along unusual paths as symptoms.

[1924f, 4106]
It was now easy to reconstruct the pathogenic process. Let us keep to a simple example, in which a particular impulsion had arisen in the subject's mind but was opposed by other powerful impulsions. We should have expected the mental conflict which now arose to take the following course. The two dynamic quantities - for our present purposes let us call them 'the instinct' and 'the resistance' - would struggle with each other for some time in the fullest light of consciousness, until the instinct was repudiated and the cathexis of energy withdrawn from its impulsion. This would have been the normal solution. In a neurosis, however (for reasons which were still unknown), the conflict found a different outcome. The ego drew back, as it were, on its first collision with the objectionable instinctual impulse; it debarred the impulse from access to consciousness and to direct motor discharge, but at the same time the impulse retained its full cathexis of energy. I named this process repression; it was a novelty, and nothing like it had ever before been recognized in mental life. It was obviously a primary mechanism of defence, comparable to an attempt at flight, and was only a forerunner of the later-developed normal condemning judgement. The first act of repression involved further consequences. In the first place the ego was obliged to protect itself against the constant threat of a renewed advance on the part of the repressed impulse by making a permanent expenditure of energy, an ant cathexis, and it thus impoverished itself. On the other hand, the repressed impulse, which was now unconscious, was able to find means of discharge and of substitutive satisfaction by circuitous routes and thus to bring the whole purpose of the repression to nothing. In the case of conversion hysteria the circuitous route led to the somatic innervation; the repressed impulse broke its way through at some point or other and produced symptoms. The symptoms were thus results of a compromise, for although they were substitutive satisfactions they were nevertheless distorted and deflected from their aim owing to the resistance of the ego.

The sexual function, as I found, is in existence from the very beginning of the individual's life, though at first it is attached to the other vital functions and does not become independent of them until later; it has to pass through a long and complicated process of development before it becomes what we are familiar with as the normal sexual life of the adult. It begins by manifesting itself in the activity of a whole number of component instincts. These are dependent upon erogenous zones in the body; some of them make their appearance in pairs of opposite impulses (such as sadism and masochism or the impulses to look and to be looked at); they operate independently of one another in a search for pleasure, and they find their object for the most part in the subject's own body. Thus at first the sexual function is non-centralized and predominantly auto-erotic. Later, syntheses begin to appear in it; a first stage of organization is reached under the dominance of the oral components, an anal-sadistic stage follows, and it is only after the third stage has at last been reached that the primacy of the genitals is established and that the sexual function begins to serve the ends of reproduction. In the course of this process of development a number of elements of the various component instincts turn out to be unserviceable for this last end and are therefore left on one side or turned to other uses, while others are diverted from their aims and carried over into the genital organization. I gave the name of libido to the energy of the sexual instincts and to that form of energy alone. I was next driven to suppose that the libido does not always pass through its prescribed course of development smoothly. As a result either of the excessive strength of certain of the components or of experiences involving premature satisfaction, fixations of the libido may occur at various points in the course of its development. If subsequently a repression takes place, the libido flows back to these points (a process described as regression), and it is from them that the energy breaks through in the form of a symptom. Later on it further became clear that the localization of the point of fixation is what determines the choice of neurosis, that is, the form in which the subsequent illness makes its appearance.
In the same way that psycho-analysis makes use of dream-interpretation, it also profits by the study of the numerous little slips and mistakes which people make - symptomatic actions, as they are called. I investigated this subject in a series of papers which were published for the first time in book form in 1904 under the title of *The Psychopathology of Everyday Life*. In this widely circulated work I have pointed out that these phenomena are not accidental, that they require more than physiological explanations, that they have a meaning and can be interpreted, and that one is justified in inferring from them the presence of restrained or repressed impulses and intentions. But what constitutes the enormous importance of dream-interpretation, as well as of this latter study, is not the assistance they give to the work of analysis but another of their attributes. Previously psycho-analysis had only been concerned with solving pathological phenomena and in order to explain them it had often been driven into making assumptions whose comprehensiveness was out of all proportion to the importance of the actual material under consideration. But when it came to dreams, it was no longer dealing with a pathological symptom, but with a phenomenon of normal mental life which might occur in any healthy person. If dreams turned out to be constructed like symptoms, if their explanation required the same assumptions - the repression of impulses, substitutive formation, compromise-formation, the dividing of the conscious and the unconscious into various psychical systems - then psycho-analysis was no longer an auxiliary science in the field of psychopathology, it was rather the starting-point of a new and deeper science of the mind which would be equally indispensable for the understanding of the normal. Its postulates and findings could be carried over to other regions of mental happening; a path lay open to it that led far afield, into spheres of universal interest.

[1925d, 4222]

The main characteristics of the formation of symptoms have long since been studied and, I hope, established beyond dispute. A symptom is a sign of, and a substitute for, an instinctual satisfaction which has remained in abeyance; it is a consequence of the process of repression. Repression proceeds from the ego when the latter - it may be at the behest of the super-ego - refuses to associate itself with an instinctual cathexis which has been aroused in the id. The ego is able by means of repression to keep the idea which is the vehicle of the reprehensible impulse from becoming conscious. Analysis shows that the idea often persists as an unconscious formation.

[1926d, 4252]

In thus degrading a process of satisfaction to a symptom, repression displays its power in a further respect. The substitutive process is prevented, if possible, from finding discharge though motility; and even if this cannot be done, the process is forced to expend itself in making alterations in the subject's own body and is not permitted to impinge upon the external world. It must not be transformed into action. For, as we know, in repression the ego is operating under the influence of external reality and therefore it debars the substitutive process from having any effect upon that reality.

[1926d, 4256]
To return to the problem of the ego. The apparent contradiction is due to our having taken abstractions too rigidly and attended exclusively now to the one side and now to the other of what is in fact a complicated state of affairs. We were justified, I think, in dividing the ego from the id, for there are certain considerations which necessitate that step. On the other hand the ego is identical with the id, and is merely a specially differentiated part of it. If we think of this part by itself in contradistinction to the whole, or if a real split has occurred between the two, the weakness of the ego becomes apparent. But if the ego remains bound up with the id and indistinguishable from it, then it displays its strength. The same is true of the relation between the ego and the super-ego. In many situations the two are merged; and as a rule we can only distinguish one from the other when there is a tension or conflict between them. In repression the decisive fact is that the ego is an organization and the id is not. The ego is, indeed, the organized portion of the id. We should be quite wrong if we pictured the ego and the id as two opposing camps and if we supposed that, when the ego tries to suppress a part of the id by means of repression, the remainder of the id comes to the rescue of the endangered part and measures its strength with the ego. This may often be what happens, but it is certainly not the initial situation in repression. As a rule the instinctual impulse which is to be repressed remains isolated. Although the act of repression demonstrates the strength of the ego, in one particular it reveals the ego’s powerlessness and how impervious to influence are the separate instinctual impulses of the id. For the mental process which has been turned into a symptom owing to repression now maintains its existence outside the organization of the ego and independently of it. Indeed, it is not that process alone but all its derivatives which enjoy, as it were, this same privilege of extra-territoriality; and whenever they come into associative contact with a part of the ego-organization, it is not at all certain that they will not draw that part over to themselves and thus enlarge themselves at the expense of the ego. An analogy with which we have long been familiar compared a symptom to a foreign body which was keeping up a constant succession of stimuli and reactions in the tissue in which it was embedded. It does sometimes happen that the defensive struggle against an unwelcome instinctual impulse is brought to an end with the formation of a symptom. As far as can be seen, this is most often possible in hysterical conversion. But usually the outcome is different. The initial act of repression is followed by a tedious or interminable sequel in which the struggle against the instinctual impulse is prolonged into a struggle against the symptom.

[1926d, 4258]
In this secondary defensive struggle the ego presents two faces with contradictory expressions. The one line of behaviour it adopts springs from the fact that its very nature obliges it to make what must be regarded as an attempt at restoration or reconciliation. The ego is an organization. It is based on the maintenance of free intercourse and of the possibility of reciprocal influence between all its parts. Its desexualized energy still shows traces of its origin in its impulse to bind together and unify, and this necessity to synthesize grows stronger in proportion as the strength of the ego increases. It is therefore only natural that the ego should try to prevent symptoms from remaining isolated and alien by using every possible method to bind them to itself in one way or another, and to incorporate them into its organization by means of those bonds. As we know, a tendency of this kind is already operative in the very act of forming a symptom. A classical instance of this are those hysterical symptoms which have been shown to be a compromise between the need for satisfaction and the need for punishment. Such symptoms participate in the ego from the very beginning, since they fulfil a requirement of the super-ego, while on the other hand they represent positions occupied by the repressed and points at which an irruption has been made by it into the ego-organization. They are a kind of frontier-station with a mixed garrison. (Whether all primary hysterical symptoms are constructed on these lines would be worth enquiring into very carefully.) The ego now proceeds to behave as though it recognized that the symptom had come to stay and that the only thing to do was to accept the situation in good part and draw as much advantage from it as possible. It makes an adaptation to the symptom - to this piece of the internal world which is alien to it - just as it normally does to the real external world. It can always find plenty of opportunities for doing so. The presence of a symptom may entail a certain impairment of capacity, and this can be exploited to appease some demand on the part of the super-ego or to refuse some claim from the external world. In this way the symptom gradually comes to be the representative of important interests; it is found to be useful in asserting the position of the self and becomes more and more closely merged with the ego and more and more indispensable to it. It is only very rarely that the physical process of 'healing' round a foreign body follows such a course as this. There is a danger, too, of exaggerating the importance of a secondary adaptation of this kind to a symptom, and of saying that the ego has created the symptom merely in order to enjoy its advantages. It would be equally true to say that a man who had lost his leg in the war had got it shot away so that he might thenceforward live on his pension without having to do any more work.

Let us start with an infantile hysterical phobia of animals - for instance, the case of 'Little Hans', whose phobia of horses was undoubtedly typical in all its main features. The first thing that becomes apparent is that in a concrete case of neurotic illness the state of affairs is much more complex than one would suppose so long as one was dealing with abstractions. It takes a little time to find one's bearings and to decide which the repressed impulse is, what substitutive symptom it has found and where the motive for repression lies.
These are unwelcome complications, considering that we only set out to study simple cases of symptom-formation due to repression, and with that intention selected the earliest and to all appearances, most transparent neuroses of childhood. Instead of a single repression we have found a collection of them and have become involved with regression into the bargain. Perhaps we have added to the confusion by treating the two cases of animal phobia at our disposal - 'Little Hans' and the 'Wolf Man' - as though they were cast in the same mould. As a matter of fact, certain differences between them stand out. It is only with regard to 'Little Hans' that we can say with certainty that what his phobia disposed of were the two main impulses of the Oedipus complex - his aggressiveness towards his father and his over-fondness for his mother. A tender feeling for his father was undoubtedly there too and played a part in repressing the opposite feeling; but we can prove neither that it was strong enough to draw repression upon itself nor that it disappeared afterwards. 'Hans' seems, in fact, to have been a normal boy with what is called a 'positive' Oedipus complex. It is possible that the factors which we do not find were actually at work in him, but we cannot demonstrate their existence. Even the most exhaustive analysis has gaps in its data and is insufficiently documented. In the case of the Russian the deficiency lies elsewhere. His attitude to female objects had been disturbed by an early seduction and his passive, feminine side was strongly developed. The analysis of his wolf-dream revealed very little intentional aggressiveness towards his father, but it brought forward unmistakable proof that what repression overtook was his passive tender attitude to his father. In his case, too, the other factors may have been operative as well; but they were not in evidence. How is it that, in spite of these differences in the two cases, almost amounting to an antithesis, the final outcome - a phobia - was approximately the same? The answer must be sought in another quarter. I think it will be found in the second fact which emerges from our brief comparative examination. It seems to me that in both cases we can detect what the motive force of the repression was and can substantiate our view of its nature from the line of development which the two children subsequently pursued. This motive force was the same in both of them. It was the fear of impending castration. 'Little Hans' gave up his aggressiveness towards his father from fear of being castrated. His fear that a horse would bite him can, without any forcing, be given the full sense of a fear that a horse would bite off his genitals, would castrate him. But it was from fear of being castrated, too, that the little Russian relinquished his wish to be loved by his father, for he thought that a relation of that sort presupposed a sacrifice of his genitals - of the organ which distinguished him from a female. As we see, both forms of the Oedipus complex, the normal, active form and the inverted one, came to grief through the castration complex. The Russian boy's anxiety-idea of being devoured by a wolf contained, it is true, no suggestion of castration, for the oral regression it had undergone had removed it too far from the phallic stage. But the analysis of his dream rendered further proof superfluous. It was a triumph of repression that the form in which his phobia was expressed should no longer have contained any allusion to castration.

[1926d, 4267]

The third, psychological, factor resides in a defect of our mental apparatus which has to do precisely with its differentiation into an id and an ego, and which is therefore also attributable ultimately to the influence of the external world. In view of the dangers of reality, the ego is obliged to guard against certain instinctual impulses in the id and to treat them as dangers. But it cannot protect itself from internal instinctual dangers as effectively as it can from some piece of reality that is not part of itself. Intimately bound up with the id as it is, it can only fend off an instinctual danger by restricting its own organization and by acquiescing in the formation of symptoms in exchange for having impaired the instinct. If the rejected instinct renews its attack, the ego is overtaken by all those difficulties which are known to us as neurotic ailments.

[1926d, 4309]
You have no notion how close I am to fulfilling my promise. Even in organisms which later develop an efficient ego-organization, their ego is feeble and little differentiated from their id to begin with, during their first years of childhood. Imagine now what will happen if this powerless ego experiences an instinctual demand from the id which it would already like to resist (because it senses that to satisfy it is dangerous and would conjure up a traumatic situation, a collision with the external world) but which it cannot control, because it does not yet possess enough strength to do so. In such a case the ego treats the instinctual danger as if it was an external one; it makes an attempt at flight, draws back from this portion of the id and leaves it to its fate, after withholding from it all the contributions which it usually makes to instinctual impulses. The ego, as we put it, institutes a repression of these instinctual impulses. For the moment this has the effect of fending off the danger; but one cannot confuse the inside and the outside with impunity. One cannot run away from oneself. In repression the ego is following the pleasure principle, which it is usually in the habit of correcting; and it is bound to suffer damage in revenge. This lies in the ego's having permanently narrowed its sphere of influence. The repressed instinctual impulse is now isolated, left to itself, inaccessible, but also uninfluenceable. It goes its own way. Even later, as a rule, when the ego has grown stronger, it still cannot lift the repression; its synthesis is impaired, a part of the id remains forbidden ground to the ego. Nor does the isolated instinctual impulse remain idle; it understands how to make up for being denied normal satisfaction; it produces psychical derivatives which take its place; it links itself to other processes which by its influence it likewise tears away from the ego; and finally it breaks through into the ego and into consciousness in the form of an unrecognizably distorted substitute, and creates what we call a symptom. All at once the nature of a neurotic disorder becomes clear to us: on the one hand an ego which is inhibited in its synthesis, which has no influence on parts of the id, which must renounce some of its activities in order to avoid a fresh collision with what has been repressed, and which exhausts itself in what are for the most part vain acts of defence against the symptoms, the derivatives of the repressed impulses; and on the other hand an id in which individual instincts have made themselves independent, pursue their aims regardless of the interests of the person as a whole and henceforth obey the laws only of the primitive psychology that rules in the depths of the id. If we survey the whole situation we arrive at a simple formula for the origin of a neurosis: the ego has made an attempt to suppress certain portions of the id in an inappropriate manner, this attempt has failed and the id has taken its revenge. A neurosis is thus the result of a conflict between the ego and the id, upon which the ego has embarked because, as careful investigation shows, it wishes at all costs to retain its adaptability in relation to the real external world. The disagreement is between the external world and the id; and it is because the ego, loyal to its inmost nature, takes sides with the external world that it becomes involved in a conflict with its id. But please observe that what creates the determinant for the illness is not the fact of this conflict - for disagreements of this kind between reality and the id are unavoidable and it is one of the ego's standing tasks to mediate in them - but the circumstance that the ego has made use of the inefficient instrument of repression for dealing with the conflict. But this in turn is due to the fact that the ego, at the time at which it was set the task, was undeveloped and powerless. The decisive repressions all take place in early childhood.

[1926e, 4346]

(1) There is a force in the mind which exercises the functions of a censorship, and which excludes from consciousness and from any influence upon action all tendencies which displease it. Such tendencies are described as 'repressed'. They remain unconscious; and if one attempts to bring them into the patient's consciousness one provokes a 'resistance'. These repressed instinctual impulses, however, have not always become powerless. In many cases they succeed in making their influence felt in the mind by circuitous paths, and the indirect or substitutive satisfactions of repressed impulses thus achieved are what constitute neurotic symptoms.

[1926f, 4405]
Psycho-analytic work has shown us that it is precisely these frustrations of sexual life which people known as neurotics cannot tolerate. The neurotic creates substitutive satisfactions for himself in his symptoms, and these either cause him suffering in themselves or become sources of suffering for him by raising difficulties in his relations with his environment and the society he belongs to. The latter fact is easy to understand; the former presents us with a new problem. But civilization demands other sacrifices besides that of sexual satisfaction.

[1930a, 4500]

Regular contributions are made to the phenomena we are in search of by the mechanisms which lead to the formation of neuroses. Here again the determining events occur in early childhood times, but here the stress is not upon the time but upon the process by which the event is met, the reaction to it. We can describe it schematically thus. As a result of the experience, an instinctual demand arises which calls for satisfaction. The ego refuses that satisfaction, either because it is paralysed by the magnitude of the demand or because it recognizes it as a danger. The former of these grounds is the more primary one; both of them amount to the avoidance of a situation of danger. The ego fends off the danger by the process of repression. The instinctual impulse is in some way inhibited, its precipitating cause, with its attendant perceptions and ideas, is forgotten. This, however, is not the end of the process: the instinct has either retained its forces, or collects them again, or it is reawakened by some new precipitating cause. Thereupon it renews its demand, and, since the path to normal satisfaction remains closed to it by what we may call the scar of repression, somewhere, at a weak spot, it opens another path for itself to what is known as a substitutive satisfaction, which comes to light as a symptom, without the acquiescence of the ego, but also without its understanding. All the phenomena of the formation of symptoms may justly be described as the 'return of the repressed'. Their distinguishing characteristic, however, is the far-reaching distortion to which the returning material has been subjected as compared with the original. It will perhaps be thought that this last group of facts has carried us too far away from the similarity with tradition. But we ought not to regret it if it has brought us close to the problems of the renunciation of instinct.

[1939a, 4945]
I hope to be able to give you adequate replies to these questions, even though the replies may be reduced to schematic dimensions. The conflict is conjured up by frustration, as a result of which the libido, deprived of satisfaction, is driven to look for other objects and paths. The necessary precondition of the conflict is that these other paths and objects arouse displeasure in one part of the personality, so that a veto is imposed which makes the new method of satisfaction impossible as it stands. From this point the construction of symptoms pursues its course, which we shall follow later. The repudiated libidinal trends nevertheless succeed in getting their way by certain roundabout paths, though not, it is true, without taking the objection into account by submitting to some distortions and mitigations. The roundabout paths are those taken by the construction of symptoms; the symptoms are the fresh or substitute satisfaction which has become necessary owing to the fact of frustration.

[1916-1917, 3411]

There are certainly good grounds for being suspicious of such simple solutions of a problem. Moreover, the most that we may expect is that this formula will turn out to be correct in the roughest outline. But even that would be something. One recalls at once, too, a whole number of discoveries and findings which seem to support our thesis. All our analyses go to show that the transference neuroses originate from the ego's refusing to accept a powerful instinctual impulse in the id or to help it to find a motor outlet, or from the ego's forbidding that impulse the object at which it is aiming. In such a case the ego defends itself against the instinctual impulse by the mechanism of repression. The repressed material struggles against this fate. It creates for itself, along paths over which the ego has no power, a substitutive representation (which forces itself upon the ego by way of a compromise) - the symptom. The ego finds its unity threatened and impaired by this intruder, and it continues to struggle against the symptom, just as it fended off the original instinctual impulse. All this produces the picture of a neurosis. It is no contradiction to this that, in undertaking the repression, the ego is at bottom following the commands of its super-ego - commands which, in their turn, originate from influences in the external world that have found representation in the super-ego. The fact remains that the ego has taken sides with those powers, that in it their demands have more strength than the instinctual demands of the id, and that the ego is the power which sets the repression in motion against the portion of the id concerned and which fortifies the repression by means of the anticathexis of resistance. The ego has come into conflict with the id in the service of the super-ego and of reality; and this is the state of affairs in every transference neurosis.

[1924b, 4066]
To return to the problem of the ego. The apparent contradiction is due to our having taken
abstractions too rigidly and attended exclusively now to the one side and now to the other of
what is in fact a complicated state of affairs. We were justified, I think, in dividing the ego from
the id, for there are certain considerations which necessitate that step. On the other hand the
ego is identical with the id, and is merely a specially differentiated part of it. If we think of this
part by itself in contradistinction to the whole, or if a real split has occurred between the two, the
weakness of the ego becomes apparent. But if the ego remains bound up with the id and
indistinguishable from it, then it displays its strength. The same is true of the relation between
the ego and the super-ego. In many situations the two are merged; and as a rule we can only
distinguish one from the other when there is a tension or conflict between them. In repression
the decisive fact is that the ego is an organization and the id is not. The ego is, indeed, the
organized portion of the id. We should be quite wrong if we pictured the ego and the id as two
opposing camps and if we supposed that, when the ego tries to suppress a part of the id by
means of repression, the remainder of the id comes to the rescue of the endangered part and
measures its strength with the ego. This may often be what happens, but it is certainly not the
initial situation in repression. As a rule the instinctual impulse which is to be repressed remains
isolated. Although the act of repression demonstrates the strength of the ego, in one particular it
reveals the ego’s powerlessness and how impervious to influence are the separate instinctual
impulses of the id. For the mental process which has been turned into a symptom owing to
repression now maintains its existence outside the organization of the ego and independently of
it. Indeed, it is not that process alone but all its derivatives which enjoy, as it were, this same
privilege of extra-territoriality; and whenever they come into associative contact with a part of
the ego-organization, it is not at all certain that they will not draw that part over to themselves
and thus enlarge themselves at the expense of the ego. An analogy with which we have long
been familiar compared a symptom to a foreign body which was keeping up a constant
succession of stimuli and reactions in the tissue in which it was embedded. It does sometimes
happen that the defensive struggle against an unwelcome instinctual impulse is brought to an
end with the formation of a symptom. As far as can be seen, this is most often possible in
hysterical conversion. But usually the outcome is different. The initial act of repression is
followed by a tedious or interminable sequel in which the struggle against the instinctual impulse
is prolonged into a struggle against the symptom.
[1926d, 4258]
Regular contributions are made to the phenomena we are in search of by the mechanisms which lead to the formation of neuroses. Here again the determining events occur in early childhood times, but here the stress is not upon the time but upon the process by which the event is met, the reaction to it. We can describe it schematically thus. As a result of the experience, an instinctual demand arises which calls for satisfaction. The ego refuses that satisfaction, either because it is paralysed by the magnitude of the demand or because it recognizes it as a danger. The former of these grounds is the more primary one; both of them amount to the avoidance of a situation of danger. The ego fends off the danger by the process of repression. The instinctual impulse is in some way inhibited, its precipitating cause, with its attendant perceptions and ideas, is forgotten. This, however, is not the end of the process: the instinct has either retained its forces, or collects them again, or it is reawakened by some new precipitating cause. Thereupon it renews its demand, and, since the path to normal satisfaction remains closed to it by what we may call the scar of repression, somewhere, at a weak spot, it opens another path for itself to what is known as a substitutive satisfaction, which comes to light as a symptom, without the acquiescence of the ego, but also without its understanding. All the phenomena of the formation of symptoms may justly be described as the 'return of the repressed'. Their distinguishing characteristic, however, is the far-reaching distortion to which the returning material has been subjected as compared with the original. It will perhaps be thought that this last group of facts has carried us too far away from the similarity with tradition. But we ought not to regret it if it has brought us close to the problems of the renunciation of instinct.

[1939a, 4945]
As you will recall, we have dealt with repression at great length, but in doing so we have always followed the vicissitudes only of the idea that is to be repressed - naturally, since this was easier to recognize and describe. We have always left on one side the question of what happens to the affect that was attached to the repressed idea; and it is only now that we learn that the immediate vicissitude of that affect is to be transformed into anxiety, whatever quality it may have exhibited apart from this in the normal course of events. This transformation of affect is, however, by far the most important part of the process of repression. It is not so easy to speak of this, since we cannot assert the existence of unconscious affects in the same sense as that of unconscious ideas. An idea remains the same, except for the one difference, whether it is conscious or unconscious; we can state what it is that corresponds to an unconscious idea. But an affect is a process of discharge and must be judged quite differently from an idea; what corresponds to it in the unconscious cannot be declared without deeper reflection and a clarification of our hypotheses about psychical processes. And that we cannot undertake here. We will, however, emphasize the impression we have now gained that the generation of anxiety is intimately linked to the system of the unconscious.

[1916-1917, 3455]

For we consider that what is responsible for the anxiety in hysteria and other neuroses is the process of repression. We believe it is possible to give a more complete account of this than before, if we separate what happens to the idea that has to be repressed from what happens to the quota of libido attaching to it. It is the idea which is subjected to repression and which may be distorted to the point of being unrecognizable; but its quota of affect is regularly transformed into anxiety - and this is so whatever the nature of the affect may be, whether it is aggressiveness or love. It makes no essential difference, then, for what reason a quota of libido has become unemployable: whether it is on account of the infantile weakness of the ego, as in children's phobias, or on account of somatic processes in sexual life, as in anxiety neurosis, or owing to repression, as in hysteria. Thus in reality the two mechanisms that bring about neurotic anxiety coincide.

[1933a, 4690]
I hope to be able to give you adequate replies to these questions, even though the replies may be reduced to schematic dimensions. The conflict is conjured up by frustration, as a result of which the libido, deprived of satisfaction, is driven to look for other objects and paths. The necessary precondition of the conflict is that these other paths and objects arouse displeasure in one part of the personality, so that a veto is imposed which makes the new method of satisfaction impossible as it stands. From this point the construction of symptoms pursues its course, which we shall follow later. The repudiated libidinal trends nevertheless succeed in getting their way by certain roundabout paths, though not, it is true, without taking the objection into account by submitting to some distortions and mitigations. The roundabout paths are those taken by the construction of symptoms; the symptoms are the fresh or substitute satisfaction which has become necessary owing to the fact of frustration.

I have said that transformation into anxiety - it would be better to say discharge in the form of anxiety - is the immediate vicissitude of libido which is subjected to repression. I must add that that vicissitude is not the only or the definitive one. In the neuroses processes are in action which endeavour to bind this generating of anxiety and which even succeed in doing so in various ways. In phobias, for instance, two phases of the neurotic process can be clearly distinguished. The first is concerned with repression and the changing of libido into anxiety, which is then bound to an external danger. The second consists in the erection of all the precautions and guarantees by means of which any contact can be avoided with this danger, treated as it is like an external thing. Repression corresponds to an attempt at flight by the ego from libido which is felt as a danger. A phobia may be compared to an entrenchment against an external danger which now represents the dreaded libido. The weakness of the defensive system in phobias lies, of course, in the fact that the fortress which has been so greatly strengthened towards the outside remains assailable from within. A projection outwards of the danger of libido can never succeed thoroughly. For that reason, in other neuroses other systems of defence are in use against the possible generation of anxiety. That is a most interesting part of the psychology of the neuroses; but unluckily it would lead us too far and it presupposes a deeper specialized knowledge. I will only add one thing more. I have already spoken to you of the 'anticathexis' which is employed by the ego in the process of repression and which must be permanently maintained in order that the repression may have stability. This anticathexis has the task of carrying through the various forms of defence against the generating of anxiety after repression.
There are certainly good grounds for being suspicious of such simple solutions of a problem. Moreover, the most that we may expect is that this formula will turn out to be correct in the roughest outline. But even that would be something. One recalls at once, too, a whole number of discoveries and findings which seem to support our thesis. All our analyses go to show that the transference neuroses originate from the ego's refusing to accept a powerful instinctual impulse in the id or to help it to find a motor outlet, or from the ego's forbidding that impulse the object at which it is aiming. In such a case the ego defends itself against the instinctual impulse by the mechanism of repression. The repressed material struggles against this fate. It creates for itself, along paths over which the ego has no power, a substitutive representation (which forces itself upon the ego by way of a compromise) - the symptom. The ego finds its unity threatened and impaired by this intruder, and it continues to struggle against the symptom, just as it fended off the original instinctual impulse. All this produces the picture of a neurosis. It is no contradiction to this that, in undertaking the repression, the ego is at bottom following the commands of its super-ego - commands which, in their turn, originate from influences in the external world that have found representation in the super-ego. The fact remains that the ego has taken sides with those powers, that in it their demands have more strength than the instinctual demands of the id, and that the ego is the power which sets the repression in motion against the portion of the id concerned and which fortifies the repression by means of the antithesis of resistance. The ego has come into conflict with the id in the service of the super-ego and of reality; and this is the state of affairs in every transference neurosis.

[1924b, 4066]

It looked as though our work had been made much more difficult and complicated; but the inestimable gain was that an insight was now obtained into an interplay of forces which had been concealed from the observer by the hypnotic state. It became evident that the work of uncovering what had been pathogenically forgotten had to struggle against a constant and very intense resistance. The critical objections which the patient raised in order to avoid communicating the ideas which occurred to him, and against which the fundamental rule of psycho-analysis was directed, had themselves already been manifestations of this resistance. A consideration of the phenomena of resistance led to one of the corner-stones of the psychoanalytic theory of the neuroses - the theory of repression. It was plausible to suppose that the same forces which were now struggling against the pathogenic material being made conscious had at an earlier time made the same efforts with success. A gap in the aetiology of neurotic symptoms was thus filled. The impressions and mental impulses, for which the symptoms were now serving as substitutes, had not been forgotten without reason or on account of a constitutional incapacity for synthesis (as Janet supposed); they had, though the influence of other mental forces, met with a repression the success and evidence of which was precisely their being debarred from consciousness and excluded from memory. It was only in consequence of this repression that they had become pathogenic - that is, had succeeded in manifesting themselves along unusual paths as symptoms.

[1924f, 4106]
How had it come about that the patients had forgotten so many of the facts of their external and internal lives but could nevertheless recollect them if a particular technique was applied? Observation supplied an exhaustive answer to these questions. Everything that had been forgotten had in some way or other been distressing; it had been either alarming or painful or shameful by the standards of the subject's personality. It was impossible not to conclude that that was precisely why it had been forgotten - that is, why it had not remained conscious. In order to make it conscious again in spite of this, it was necessary to overcome something that fought against one in the patient; it was necessary to make efforts on one's own part so as to urge and compel him to remember. The amount of effort required of the physician varied in different cases; it increased in direct proportion to the difficulty of what had to be remembered. The expenditure of force on the part of the physician was evidently the measure of a resistance on the part of the patient. It was only necessary to translate into words what I myself had observed, and I was in possession of the theory of repression.

[1925d, 4206]

It was now easy to reconstruct the pathogenic process. Let us keep to a simple example, in which a particular impulsion had arisen in the subject's mind but was opposed by other powerful impulsions. We should have expected the mental conflict which now arose to take the following course. The two dynamic quantities - for our present purposes let us call them 'the instinct' and 'the resistance' - would struggle with each other for some time in the fullest light of consciousness, until the instinct was repudiated and the cathexis of energy withdrawn from its impulsion. This would have been the normal solution. In a neurosis, however (for reasons which were still unknown), the conflict found a different outcome. The ego drew back, as it were, on its first collision with the objectionable instinctual impulse; it debared the impulse from access to consciousness and to direct motor discharge, but at the same time the impulse retained its full cathexis of energy. I named this process repression; it was a novelty, and nothing like it had ever before been recognized in mental life. It was obviously a primary mechanism of defence, comparable to an attempt at flight, and was only a forerunner of the later-developed normal condemning judgement. The first act of repression involved further consequences. In the first place the ego was obliged to protect itself against the constant threat of a renewed advance on the part of the repressed impulse by making a permanent expenditure of energy, an anticathexis, and it thus impoverished itself. On the other hand, the repressed impulse, which was now unconscious, was able to find means of discharge and of substitutive satisfaction by circuitous routes and thus to bring the whole purpose of the repression to nothing. In the case of conversion hysteria the circuitous route led to the somatic innervation; the repressed impulse broke its way through at some point or other and produced symptoms. The symptoms were thus results of a compromise, for although they were substitutive satisfactions they were nevertheless distorted and deflected from their aim owing to the resistance of the ego.

[1925d, 4206]
To return to the problem of the ego. The apparent contradiction is due to our having taken abstractions too rigidly and attended exclusively now to the one side and now to the other of what is in fact a complicated state of affairs. We were justified, I think, in dividing the ego from the id, for there are certain considerations which necessitate that step. On the other hand the ego is identical with the id, and is merely a specially differentiated part of it. If we think of this part by itself in contradistinction to the whole, or if a real split has occurred between the two, the weakness of the ego becomes apparent. But if the ego remains bound up with the id and indistinguishable from it, then it displays its strength. The same is true of the relation between the ego and the super-ego. In many situations the two are merged; and as a rule we can only distinguish one from the other when there is a tension or conflict between them. In repression the decisive fact is that the ego is an organization and the id is not. The ego is, indeed, the organized portion of the id. We should be quite wrong if we pictured the ego and the id as two opposing camps and if we supposed that, when the ego tries to suppress a part of the id by means of repression, the remainder of the id comes to the rescue of the endangered part and measures its strength with the ego. This may often be what happens, but it is certainly not the initial situation in repression. As a rule the instinctual impulse which is to be repressed remains isolated. Although the act of repression demonstrates the strength of the ego, in one particular it reveals the ego's powerlessness and how impervious to influence are the separate instinctual impulses of the id. For the mental process which has been turned into a symptom owing to repression now maintains its existence outside the organization of the ego and independently of it. Indeed, it is not that process alone but all its derivatives which enjoy, as it were, this same privilege of extra-territoriality; and whenever they come into associative contact with a part of the ego-organization, it is not at all certain that they will not draw that part over to themselves and thus enlarge themselves at the expense of the ego. An analogy with which we have long been familiar compared a symptom to a foreign body which was keeping up a constant succession of stimuli and reactions in the tissue in which it was embedded. It does sometimes happen that the defensive struggle against an unwelcome instinctual impulse is brought to an end with the formation of a symptom. As far as can be seen, this is most often possible in hysterical conversion. But usually the outcome is different. The initial act of repression is followed by a tedious or interminable sequel in which the struggle against the instinctual impulse is prolonged into a struggle against the symptom.

[1926d, 4258]
Psycho-analysis leads to less simple and satisfactory conclusions. What I have to say in this connection has long been familiar and I have nothing new to add. If the ego succeeds in protecting itself from a dangerous instinctual impulse, through, for instance, the process of repression, it has certainly inhibited and damaged the particular part of the id concerned; but it has at the same time given it some independence and has renounced some of its own sovereignty. This is inevitable from the nature of repression, which is, fundamentally, an attempt at flight. The repressed is now, as it were, an outlaw; it is excluded from the great organization of the ego and is subject only to the laws which govern the realm of the unconscious. If, now, the danger-situation changes so that the ego has no reason for fending off a new instinctual impulse analogous to the repressed one, the consequence of the restriction of the ego which has taken place will become manifest. The new impulse will run its course under an automatic influence - or, as I should prefer to say, under the influence of the compulsion to repeat. It will follow the same path as the earlier, repressed impulse, as though the danger-situation that had been overcome still existed. The fixating factor in repression, then, is the unconscious id's compulsion to repeat - a compulsion which in normal circumstances is only done away with by the freely mobile function of the ego. The ego may occasionally manage to break down the barriers of repression which it has itself put up and to recover its influence over the instinctual impulse and direct the course of the new impulse in accordance with the changed danger-situation. But in point of fact the ego very seldom succeeds in doing this: it cannot undo its repressions. It is possible that the way the struggle will go depends upon quantitative relations. In some cases one has the impression that the outcome is an enforced one: the regressive attraction exerted by the repressed impulse and the strength of the repression are so great that the new impulse has no choice but to obey the compulsion to repeat. In other cases we perceive a contribution from another play of forces: the attraction exerted by the repressed prototype is reinforced by a repulsion coming from the direction of difficulties in real life which stand in the way of any different course that might be taken by the new instinctual impulse.

The third, psychological, factor resides in a defect of our mental apparatus which has to do precisely with its differentiation into an id and an ego, and which is therefore also attributable ultimately to the influence of the external world. In view of the dangers of reality, the ego is obliged to guard against certain instinctual impulses in the id and to treat them as dangers. But it cannot protect itself from internal instinctual dangers as effectively as it can from some piece of reality that is not part of itself. Intimately bound up with the id as it is, it can only fend off an instinctual danger by restricting its own organization and by acquiescing in the formation of symptoms in exchange for having impaired the instinct. If the rejected instinct renews its attack, the ego is overtaken by all those difficulties which are known to us as neurotic ailments.
Regular contributions are made to the phenomena we are in search of by the mechanisms which lead to the formation of neuroses. Here again the determining events occur in early childhood times, but here the stress is not upon the time but upon the process by which the event is met, the reaction to it. We can describe it schematically thus. As a result of the experience, an instinctual demand arises which calls for satisfaction. The ego refuses that satisfaction, either because it is paralysed by the magnitude of the demand or because it recognizes it as a danger. The former of these grounds is the more primary one; both of them amount to the avoidance of a situation of danger. The ego fends off the danger by the process of repression. The instinctual impulse is in some way inhibited, its precipitating cause, with its attendant perceptions and ideas, is forgotten. This, however, is not the end of the process: the instinct has either retained its forces, or collects them again, or it is reawakened by some new precipitating cause. Thereupon it renews its demand, and, since the path to normal satisfaction remains closed to it by what we may call the scar of repression, somewhere, at a weak spot, it opens another path for itself to what is known as a substitutive satisfaction, which comes to light as a symptom, without the acquiescence of the ego, but also without its understanding. All the phenomena of the formation of symptoms may justly be described as the 'return of the repressed'. Their distinguishing characteristic, however, is the far-reaching distortion to which the returning material has been subjected as compared with the original. It will perhaps be thought that this last group of facts has carried us too far away from the similarity with tradition. But we ought not to regret it if it has brought us close to the problems of the renunciation of instinct.

[1939a, 4945]
I hope to be able to give you adequate replies to these questions, even though the replies may be reduced to schematic dimensions. The conflict is conjured up by frustration, as a result of which the libido, deprived of satisfaction, is driven to look for other objects and paths. The necessary precondition of the conflict is that these other paths and objects arouse displeasure in one part of the personality, so that a veto is imposed which makes the new method of satisfaction impossible as it stands. From this point the construction of symptoms pursues its course, which we shall follow later. The repudiated libidinal trends nevertheless succeed in getting their way by certain roundabout paths, though not, it is true, without taking the objection into account by submitting to some distortions and mitigations. The roundabout paths are those taken by the construction of symptoms; the symptoms are the fresh or substitute satisfaction which has become necessary owing to the fact of frustration.

[1916-1917, 3411]

It was now easy to reconstruct the pathogenic process. Let us keep to a simple example, in which a particular impulsion had arisen in the subject's mind but was opposed by other powerful impulsions. We should have expected the mental conflict which now arose to take the following course. The two dynamic quantities - for our present purposes let us call them 'the instinct' and 'the resistance' - would struggle with each other for some time in the fullest light of consciousness, until the instinct was repudiated and the cathexis of energy withdrawn from its impulsion. This would have been the normal solution. In a neurosis, however (for reasons which were still unknown), the conflict found a different outcome. The ego drew back, as it were, on its first collision with the objectionable instinctual impulse; it debarred the impulse from access to consciousness and to direct motor discharge, but at the same time the impulse retained its full cathexis of energy. I named this process repression; it was a novelty, and nothing like it had ever before been recognized in mental life. It was obviously a primary mechanism of defence, comparable to an attempt at flight, and was only a forerunner of the later-developed normal condemning judgement. The first act of repression involved further consequences. In the first place the ego was obliged to protect itself against the constant threat of a renewed advance on the part of the repressed impulse by making a permanent expenditure of energy, an anticathexis, and it thus impoverished itself. On the other hand, the repressed impulse, which was now unconscious, was able to find means of discharge and of substitutive satisfaction by circuitous routes and thus to bring the whole purpose of the repression to nothing. In the case of conversion hysteria the circuitous route led to the somatic innervation; the repressed impulse broke its way through at some point or other and produced symptoms. The symptoms were thus results of a compromise, for although they were substitutive satisfactions they were nevertheless distorted and deflected from their aim owing to the resistance of the ego.

[1925d, 4206]
Regular contributions are made to the phenomena we are in search of by the mechanisms which lead to the formation of neuroses. Here again the determining events occur in early childhood times, but here the stress is not upon the time but upon the process by which the event is met, the reaction to it. We can describe it schematically thus. As a result of the experience, an instinctual demand arises which calls for satisfaction. The ego refuses that satisfaction, either because it is paralysed by the magnitude of the demand or because it recognizes it as a danger. The former of these grounds is the more primary one; both of them amount to the avoidance of a situation of danger. The ego fends off the danger by the process of repression. The instinctual impulse is in some way inhibited, its precipitating cause, with its attendant perceptions and ideas, is forgotten. This, however, is not the end of the process: the instinct has either retained its forces, or collects them again, or it is reawakened by some new precipitating cause. Thereupon it renews its demand, and, since the path to normal satisfaction remains closed to it by what we may call the scar of repression, somewhere, at a weak spot, it opens another path for itself to what is known as a substitutive satisfaction, which comes to light as a symptom, without the acquiescence of the ego, but also without its understanding. All the phenomena of the formation of symptoms may justly be described as the 'return of the repressed'. Their distinguishing characteristic, however, is the far-reaching distortion to which the returning material has been subjected as compared with the original. It will perhaps be thought that this last group of facts has carried us too far away from the similarity with tradition. But we ought not to regret it if it has brought us close to the problems of the renunciation of instinct.

[1939a, 4945]
In the most favourable cases the generation of unpleasure ceases along with the withdrawal of cathexis from the transference thoughts in the \( Pcs \); and this outcome signifies that the intervention of the unpleasure principle has served a useful purpose. But it is another matter when the repressed unconscious wish receives an organic reinforcement, which it passes on to its transference thoughts; in that way it may place them in a position to make an attempt at forcing their way through with their excitation, even if they have lost their cathexis from the \( Pcs \). There then follows a defensive struggle - for the \( Pcs \) in turn reinforces its opposition to the repressed thoughts (i.e. produces an 'anticathexis') - and thereafter the transference thoughts, which are the vehicles of the unconscious wish, force their way through in some form of compromise which is reached by the production of a symptom. But from the moment at which the repressed thoughts are strongly cathected by the unconscious wishful impulse and, on the other hand, abandoned by the preconscious cathexis, they become subject to the primary psychic process and their one aim is motor discharge or, if the path is open, hallucinatory revival of the desired perceptual identity. We have already found empirically that the irrational processes we have described are only carried out with thoughts that are under repression. We can now see our way a little further into the whole position. The irrational processes which occur in the psychic apparatus are the primary ones. They appear wherever ideas are abandoned by the preconscious cathexis, are left to themselves and can become charged with the uninhibited energy from the unconscious which is striving to find an outlet. Some other observations lend support to the view that these processes which are described as irrational are not in fact falsifications of normal processes - intellectual errors - but are modes of activity of the psychic apparatus that have been freed from an inhibition. Thus we find that the transition from preconscious excitation to movement is governed by the same processes, and that the linking of preconscious ideas to words may easily exhibit the same displacements and confusions, which are then attributed to inattention. Evidence, finally, of the increase in activity which becomes necessary when these primary modes of functioning are inhibited is to be found in the fact that we produce a comic effect, that is, a surplus of energy which has to be discharged in laughter, if we allow these modes of thinking to force their way through into consciousness.

[1900a, 1032]

There are certainly good grounds for being suspicious of such simple solutions of a problem. Moreover, the most that we may expect is that this formula will turn out to be correct in the roughest outline. But even that would be something. One recalls at once, too, a whole number of discoveries and findings which seem to support our thesis. All our analyses go to show that the transference neuroses originate from the ego's refusing to accept a powerful instinctual impulse in the id or to help it to find a motor outlet, or from the ego's forbidding that impulse the object at which it is aiming. In such a case the ego defends itself against the instinctual impulse by the mechanism of repression. The repressed material struggles against this fate. It creates for itself, along paths over which the ego has no power, a substitutive representation (which forces itself upon the ego by way of a compromise) - the symptom. The ego finds its unity threatened and impaired by this intruder, and it continues to struggle against the symptom, just as it fended off the original instinctual impulse. All this produces the picture of a neurosis. It is no contradiction to this that, in undertaking the repression, the ego is at bottom following the commands of its super-ego - commands which, in their turn, originate from influences in the external world that have found representation in the super-ego. The fact remains that the ego has taken sides with those powers, that in it their demands have more strength than the instinctual demands of the id, and that the ego is the power which sets the repression in motion against the portion of the id concerned and which fortifies the repression by means of the anticathexis of resistance. The ego has come into conflict with the id in the service of the super-ego and of reality; and this is the state of affairs in every transference neurosis.

[1924b, 4066]
To return to the problem of the ego. The apparent contradiction is due to our having taken abstractions too rigidly and attended exclusively now to the one side and now to the other of what is in fact a complicated state of affairs. We were justified, I think, in dividing the ego from the id, for there are certain considerations which necessitate that step. On the other hand the ego is identical with the id, and is merely a specially differentiated part of it. If we think of this part by itself in contradistinction to the whole, or if a real split has occurred between the two, the weakness of the ego becomes apparent. But if the ego remains bound up with the id and indistinguishable from it, then it displays its strength. The same is true of the relation between the ego and the super-ego. In many situations the two are merged; and as a rule we can only distinguish one from the other when there is a tension or conflict between them. In repression the decisive fact is that the ego is an organization and the id is not. The ego is, indeed, the organized portion of the id. We should be quite wrong if we pictured the ego and the id as two opposing camps and if we supposed that, when the ego tries to suppress a part of the id by means of repression, the remainder of the id comes to the rescue of the endangered part and measures its strength with the ego. This may often be what happens, but it is certainly not the initial situation in repression. As a rule the instinctual impulse which is to be repressed remains isolated. Although the act of repression demonstrates the strength of the ego, in one particular it reveals the ego’s powerlessness and how impervious to influence are the separate instinctual impulses of the id. For the mental process which has been turned into a symptom owing to repression now maintains its existence outside the organization of the ego and independently of it. Indeed, it is not that process alone but all its derivatives which enjoy, as it were, this same privilege of extra-territoriality; and whenever they come into associative contact with a part of the ego-organization, it is not at all certain that they will not draw that part over to themselves and thus enlarge themselves at the expense of the ego. An analogy with which we have long been familiar compared a symptom to a foreign body which was keeping up a constant succession of stimuli and reactions in the tissue in which it was embedded. It does sometimes happen that the defensive struggle against an unwelcome instinctual impulse is brought to an end with the formation of a symptom. As far as can be seen, this is most often possible in hysterical conversion. But usually the outcome is different. The initial act of repression is followed by a tedious or interminable sequel in which the struggle against the instinctual impulse is prolonged into a struggle against the symptom.
[1926d, 4258]
In this secondary defensive struggle the ego presents two faces with contradictory expressions. The one line of behaviour it adopts springs from the fact that its very nature obliges it to make what must be regarded as an attempt at restoration or reconciliation. The ego is an organization. It is based on the maintenance of free intercourse and of the possibility of reciprocal influence between all its parts. Its desexualized energy still shows traces of its origin in its impulsion to bind together and unify, and this necessity to synthesize grows stronger in proportion as the strength of the ego increases. It is therefore only natural that the ego should try to prevent symptoms from remaining isolated and alien by using every possible method to bind them to itself in one way or another, and to incorporate them into its organization by means of those bonds. As we know, a tendency of this kind is already operative in the very act of forming a symptom. A classical instance of this are those hysterical symptoms which have been shown to be a compromise between the need for satisfaction and the need for punishment. Such symptoms participate in the ego from the very beginning, since they fulfil a requirement of the super-ego, while on the other hand they represent positions occupied by the repressed and points at which an irruption has been made by it into the ego-organization. They are a kind of frontier-station with a mixed garrison. (Whether all primary hysterical symptoms are constructed on these lines would be worth enquiring into very carefully.) The ego now proceeds to behave as though it recognized that the symptom had come to stay and that the only thing to do was to accept the situation in good part and draw as much advantage from it as possible. It makes an adaptation to the symptom - to this piece of the internal world which is alien to it - just as it normally does to the real external world. It can always find plenty of opportunities for doing so. The presence of a symptom may entail a certain impairment of capacity, and this can be exploited to appease some demand on the part of the super-ego or to refuse some claim from the external world. In this way the symptom gradually comes to be the representative of important interests; it is found to be useful in asserting the position of the self and becomes more and more closely merged with the ego and more and more indispensable to it. It is only very rarely that the physical process of 'healing' round a foreign body follows such a course as this. There is a danger, too, of exaggerating the importance of a secondary adaptation of this kind to a symptom, and of saying that the ego has created the symptom merely in order to enjoy its advantages. It would be equally true to say that a man who had lost his leg in the war had got it shot away so that he might thenceforward live on his pension without having to do any more work.

[1926d, 4259]

The secondary defensive struggle against the symptom takes many shapes. It is fought out on different fields and makes use of a variety of methods. We shall not be able to say much about it until we have made an enquiry into the various different instances of symptom-formation. In doing this we shall have an opportunity of going into the problem of anxiety - a problem which has long been looming in the background. The wisest plan will be to start from the symptoms produced by the hysterical neurosis; for we are not as yet in a position to consider the conditions in which the symptoms of obsessional neurosis, paranoia and other neuroses are formed.

[1926d, 4260]
We set out to study the formation of symptoms and the secondary struggle waged by the ego against symptoms. But in picking on the phobias for this purpose we have clearly made an unlucky choice. The anxiety which predominates in the picture of these disorders is now seen as a complication which obscures the situation. There are plenty of neuroses which exhibit no anxiety whatever. True conversion hysteria is one of these. Even in its most severe symptoms no admixture of anxiety is found. This fact alone ought to warn us against making too close a connection between anxiety and symptom-formation. The phobias are so closely akin to conversion hysteria in every other respect that I have felt justified in classing them alongside of it under the name of ‘anxiety hysteria’. But no one has as yet been able to say what it is that determines whether any given case shall take the form of a conversion hysteria or a phobia - has been able, that is to say, to establish what determines the generating of anxiety in hysteria. [1926d, 4270]

In enforcing regression, the ego scores its first success in its defensive struggle against the demands of the libido. (In this connection it is of advantage to distinguish the more general notion of ‘defence’ from ‘repression’. Repression is only one of the mechanisms which defence makes use of.) It is perhaps in obsessional cases more than in normal or hysterical ones that we can most clearly recognize that the motive force of defence is the castration complex and that what is being fended off are the trends of the Oedipus complex. We are at present dealing with the beginning of the latency period, a period which is characterized by the dissolution of the Oedipus complex, the creation or consolidation of the super-ego and the erection of ethical and aesthetic barriers in the ego. In obsessional neuroses these processes are carried further than is normal. In addition to the destruction of the Oedipus complex a regressive degradation of the libido takes place, the super-ego becomes exceptionally severe and unkind, and the ego, in obedience to the super-ego, produces strong reaction-formations in the shape of conscientiousness, pity and cleanliness. Implacable, though not always on that account successful, severity is shown in condemning the temptation to continue early infantile masturbation, which now attaches itself to regressive (sadistic-anal) ideas but which nevertheless represents the unsubjugated part of the phallic organization. There is an inherent contradiction about this state of affairs, in which, precisely in the interests of masculinity (that is to say, from fear of castration), every activity belonging to masculinity is stopped. But here, too, obsessional neurosis is only overdoing the normal method of getting rid of the Oedipus complex. We once more find here an illustration of the truth that every exaggeration contains the seed of its own undoing. For, under the guise of obsessional acts, the masturbation that has been suppressed approaches ever more closely to satisfaction. [1926d, 4273]
We shall see, however, that this is not so and that it is merely a matter of bringing into sharper focus a turn of thought arrived at long ago and of following out its consequences. Of all the slowly developed parts of analytic theory, the theory of the instincts is the one that has felt its way the most painfully forward. And yet that theory was so indispensable to the whole structure that something had to be put in its place. In what was at first my utter perplexity, I took as my starting-point a saying of the poet-philosopher, Schiller, that ‘hunger and love are what moves the world’. Hunger could be taken to represent the instincts which aim at preserving the individual; while love strives after objects, and its chief function, favoured in every way by nature, is the preservation of the species. Thus, to begin with, ego-instincts and object-instincts confronted each other. It was to denote the energy of the latter and only the latter instinct that I introduced the term ‘libido’. Thus the antithesis was between the ego-instincts and the ‘libidinal’ instincts of love (in its widest sense) which were directed to an object. One of these object-instincts, the sadistic instinct, stood out from the rest, it is true, in that its aim was so very far from being loving. Moreover it was obviously in some respects attached to the ego-instincts: it could not hide its close affinity with instincts of mastery which have no libidinal purpose. But these discrepancies were got over; after all, sadism was clearly a part of sexual life, in the activities of which affection could be replaced by cruelty. Neurosis was regarded as the outcome of a struggle between the interest of self-preservation and the demands of the libido, a struggle in which the ego had been victorious but at the price of severe sufferings and renunciations. [1930a, 4508]
The obsessional neurosis (Zwangsneurose) arises from a specific cause very analogous to that of hysteria. Here too we find a precocious sexual event, occurring before puberty, the memory of which becomes active during or after that period; and the same remarks and arguments which I put forward in connection with hysteria will apply to my observations of the other neurosis (six cases, three of which were pure ones). There is only one difference which seems capital. At the basis of the aetiology of hysteria we found an event of passive sexuality, an experience submitted to with indifference or with a small degree of annoyance or fright. In obsessional neurosis it is a question on the other hand, of an event which has given pleasure, of an act of aggression inspired by desire (in the case of a boy) or of a participation in sexual relations accompanied by enjoyment (in the case of a little girl). The obsessional ideas, when their intimate meaning has been recognized by analysis, when they have been reduced, as it were, to their simplest expression, are nothing other than reproaches addressed by the subject himself on account of this anticipated sexual enjoyment, but reproaches distorted by an unconscious psychical work of transformation and substitution.

The next period, that of the illness, is characterized by return of the repressed memories - that is, therefore, by the failure of the defence. It is not certain whether the awakening of those memories occurs more often accidentally and spontaneously or as a result of current sexual disturbances, as a kind of by-product of them. The re-activated memories, however, and the self reproaches formed from them never re-emerge into consciousness unchanged: what become conscious as obsessional ideas and affects, and take the place of the pathogenic memories so far as conscious life is concerned, are structures in the nature of a compromise between the repressed ideas and the repressing ones.

The first form includes the typical obsessional ideas, in which the content engages the patient's attention and, as an affect, he merely feels an indefinite unpleasure, whereas the only affect which would be suitable to the obsessional idea would be one of self-reproach. The content of the obsessional idea is distorted in two ways in relation to the obsessional act of childhood. First, something contemporary is put in the place of something past; and secondly, something sexual is replaced by something analogous to it that is not sexual. These two alterations are the effect of the inclination to repress, still in force, which we will ascribe to the 'ego'. The influence of the re-activated pathogenic memory is shown by the fact that the content of the obsessional idea is still in part identical with what has been repressed or follows from it by a logical train of thought. If, with the help of the psycho-analytic method, we reconstruct the origin of an individual obsessional idea, we find that from a single current impression two different trains of thought have been set going. The one which has passed by way of the repressed memory proves to be as correctly logical in its structure as the other, although it is incapable of being conscious and insusceptible to correction. If the products of the two psychical operations do not tally, what takes place is not some sort of logical adjustment of the contradiction between them; instead, alongside of the normal intellectual outcome, there comes into consciousness, as a compromise between the resistance and the pathological intellectual product, an obsessional idea which appears absurd. If the two trains of thought lead to the same conclusion, they reinforce each other, so that an intellectual product that has been arrived at normally now behaves, psychologically, like an obsessional idea. Wherever a neurotic obsession emerges in the psychological sphere, it comes from repression. Obsessional ideas have, as it were, a compulsive psychical currency, not on account of their intrinsic value, but on account of the source from which they derive or which has added a contribution to their value.
Nor do I think we shall have any difficulty in recognizing the psychical force which manifests itself in the facts of dream-displacement. The consequence of the displacement is that the dream-content no longer resembles the core of the dream-thoughts and that the dream gives no more than a distortion of the dream-wish which exists in the unconscious. But we are already familiar with dream-distortion. We traced it back to the censorship which is exercised by one psychical agency in the mind over another. Dream-displacement is one of the chief methods by which that distortion is achieved. Is fecit cui profuit. We may assume, then, that dream-displacement comes about through the influence of the same censorship - that is, the censorship of endopsychic defence.¹

I have already asserted that obsessional thoughts have undergone a distortion similar to that undergone by dream-thoughts before they become the manifest content of a dream. The technique of this distortion may therefore be of interest to us, and there should be nothing to prevent our exhibiting its various modes by means of a series of obsessions which have been translated and made clear. But here again the conditions governing the publication of this case make it impossible for me to give more than a few specimens. Not all of the patient's obsessions were so complicated in their structure and so difficult to solve as the great rat idea. In some of the others a very simple technique was employed - namely, that of distortion by omission or ellipsis. This technique is pre-eminently applicable to jokes, but in our present case, too, it did useful work as a means of protecting things from being understood.

The technique of distortion by ellipsis seems to be typical of obsessional neuroses; I have come across it in the obsessional thoughts of other patients as well. One example, a particularly transparent one, is of especial interest on account of a certain structural similarity with the rat idea. It was a case of doubting, and occurred in a lady who suffers principally from obsessional acts. This lady was going for a walk with her husband in Nuremberg, and made him take her into a shop, where she purchased various objects for her child and amongst them a comb. Her husband, finding that the shopping was too long a business for his taste, said that he had noticed some coins in an antique shop on the way which he was anxious to secure, adding that after he had made his purchase he would come and fetch her in the shop in which they at present were. But he stayed away, as she thought, far too long. When he came back she accordingly asked him where he had been. 'Why,' he replied, 'at the antique shop I told you about.' At the same instant she was seized by a tormenting doubt whether she had not as a matter of fact always possessed the comb which she had just bought for her child. She was naturally quite unable to discover the simple mental link that was involved. There is nothing for it but to regard the doubt as having become displaced, and to reconstruct the complete chain of unconscious thoughts as follows: 'If it is true that you were only at the antique shop, if I am really to believe that, then I may just as well believe that this comb that I bought a moment ago has been in my possession for years.' Here, therefore, the lady was drawing a derisive and ironical parallel, just as when our patient thought: 'Oh yes, as sure as those two' (his father and the lady) 'will have children, I shall pay back the money to A.' In the lady's case the doubt was dependent upon her unconscious jealousy, which led her to suppose that her husband had spent the interval of his absence in paying a visit of gallantry.
The obsessive thought which has forced its way into consciousness with such excessive violence has next to be secured against the efforts made by conscious thought to resolve it. As we already know, this protection is afforded by the distortion which the obsessive thought has undergone before becoming conscious. But this is not the only means employed. In addition, each separate obsessional idea is almost invariably removed from the situation in which it originated and in which, in spite of its distortion, it would be most easily comprehensible. With this end in view, in the first place an interval of time is inserted between the pathogenic situation and the obsession that arises from it, so as to lead astray any conscious investigation of its causal connections, and in the second place the content of the obsession is taken out of its particular setting by being generalized. Our patient's 'obsession for understanding' is an example of this (p. 2150). But perhaps a better one is afforded by another patient. This was a woman who prohibited herself from wearing any sort of personal adornment, though the exciting cause of the prohibition related only to one particular piece of jewellery: she had envied her mother the possession of it and had had hopes that one day she would inherit it. Finally, if we care to distinguish verbal distortion from distortion of content, there is yet another means by which the obsession is protected against conscious attempts at solution. And that is the choice of an indefinite or ambiguous wording. After being misunderstood, the wording may find its way into the patient's 'deliria', and whatever further processes of development or substitution his obsession undergoes will then be based upon the misunderstanding and not upon the proper sense of the text. Observation will show, however, that the deliria constantly tend to form new connections with that part of the matter and wording of the obsession which is not present in consciousness.

When the period of infantile sexual researches has been terminated by a wave of energetic sexual repression, the instinct for research has three distinct possible vicissitudes open to it owing to its early connection with sexual interests. In the first of these, research shares the fate of sexuality; thenceforward curiosity remains inhibited and the free activity of intelligence may be limited for the whole of the subject's lifetime, especially as shortly after this the powerful religious inhibition of thought is brought into play by education. This is the type characterized by neurotic inhibition. We know very well that the intellectual weakness which has been acquired in this way gives an effective impetus to the outbreak of a neurotic illness. In a second type the intellectual development is sufficiently strong to resist the sexual repression which has hold of it. Some time after the infantile sexual researches have come to an end, the intelligence, having grown stronger, recalls the old association and offers its help in evading sexual repression, and the suppressed sexual activities of research return from the unconscious in the form of compulsive brooding, naturally in a distorted and unfree form, but sufficiently powerful to sexualize thinking itself and to colour intellectual operations with the pleasure and anxiety that belong to sexual processes proper. Here investigation becomes a sexual activity, often the exclusive one, and the feeling that comes from settling things in one's mind and explaining them replaces sexual satisfaction; but the interminable character of the child's researches is also repeated in the fact that this brooding never ends and that the intellectual feeling, so much desired, of having found a solution recedes more and more into the distance.

[1909d, 2192]

[1910c, 2256]
This interpretation by the psychological novelist cannot be put to the proof, but it can claim so much inner probability, and is so much in harmony with all that we otherwise know of Leonardo's emotional activity, that I cannot refrain from accepting it as correct. He had succeeded in subjecting his feelings to the yoke of research and in inhibiting their free utterance; but even for him there were occasions when what had been suppressed obtained expression forcibly. The death of the mother he had once loved so dearly was one of these. What we have before us in the account of the costs of the funeral is the expression - distorted out of all recognition - of his mourning for his mother. We wonder how such distortion could come about, and indeed we cannot understand it if we treat it as a normal mental process. But similar processes are well known to us in the abnormal conditions of neurosis and especially of what is known as 'obsessional neurosis'. There we can see how the expression of intense feelings, which have however become unconscious through repression, is displaced on to trivial and even foolish actions. The expression of these repressed feelings has been lowered by the forces opposed to them to such a degree that one would have had to form a most insignificant estimate of their intensity; but the imperative compulsiveness with which this trivial expressive act is performed betrays the real force of the impulses - a force which is rooted in the unconscious and which consciousness would like to deny. Only a comparison such as this with what happens in obsessional neurosis can explain Leonardo's account of the expenses of his mother's funeral. In his unconscious he was still tied to her by erotically coloured feelings, as he had been in childhood. The opposition that came from the subsequent repression of this childhood love did not allow him to set up a different and worthier memorial to her in his diary. But what emerged as a compromise from this neurotic conflict had to be carried out; and thus it was that the account was entered in the diary, and has come to the knowledge of posterity as something unintelligible.

(3) Finally, I have to explain to you what I mean by the 'general effect' of our work, and how I come to set hopes on it. What we have here is a very remarkable therapeutic constellation, the like of which is perhaps not to be found anywhere else and which will appear strange to you too at first, until you recognize in it something you have long been familiar with. You know, of course, that the psychoneuroses are substitutive satisfactions of some instinct the presence of which one is obliged to deny to oneself and others. Their capacity to exist depends on this distortion and lack of recognition. When the riddle they present is solved and the solution is accepted by the patients these diseases cease to be able to exist. There is hardly anything like this in medicine, though in fairy tales you hear of evil spirits whose power is broken as soon as you can tell them their name - the name which they have kept secret.

The dream-work is a psychological process the like of which has hitherto been unknown to psychology. It has claims upon our interest in two main directions. In the first place, it brings to our notice novel processes such as 'condensation' (of ideas) and 'displacement' (of psychical emphasis from one idea to another), processes which we have never come across at all in our waking life, or only as the basis of what are known as 'errors in thought'. In the second place, it enables us to detect the operation in the mind of a play of forces which was concealed from our conscious perception. We find that there is a 'censorship', a testing agency, at work in us, which decides whether an idea cropping up in the mind shall be allowed to reach consciousness, and which, so far as lies within its power, ruthlessly excludes anything that might produce or revive unpleasure. And it will be recalled at this point that in our analysis of parapraxes we found traces of this same intention to avoid unpleasure in remembering things and of similar conflicts between mental impulses.
I hope to be able to give you adequate replies to these questions, even though the replies may be reduced to schematic dimensions. The conflict is conjured up by frustration, as a result of which the libido, deprived of satisfaction, is driven to look for other objects and paths. The necessary precondition of the conflict is that these other paths and objects arouse displeasure in one part of the personality, so that a veto is imposed which makes the new method of satisfaction impossible as it stands. From this point the construction of symptoms pursues its course, which we shall follow later. The repudiated libidinal trends nevertheless succeed in getting their way by certain roundabout paths, though not, it is true, without taking the objection into account by submitting to some distortions and mitigations. The roundabout paths are those taken by the construction of symptoms; the symptoms are the fresh or substitute satisfaction which has become necessary owing to the fact of frustration.

[1916-1917, 3411]

The path to perversion branches off sharply from that to neurosis. If these regressions rouse no objection from the ego, no neurosis will come about either; and the libido will arrive at some real, even though no longer normal, satisfaction. But if the ego, which has under its control not only consciousness but also the approaches to motor innervation and accordingly to the realization of mental desires, does not agree with these regressions, conflict will follow. The libido is, as it were, cut off and must try to escape in some direction where, in accordance with the requirements of the pleasure principle, it can find a discharge for its cathexis of energy. It must withdraw from the ego. An escape of this kind is offered it by the fixations on the path of its development which it has now entered on regressively - fixations from which the ego had protected itself in the past by repressions. By cathecting these repressed positions as it flows backward, the libido has withdrawn from the ego and its laws, and has at the same time renounced all the education it has acquired under the ego's influence. It was docile so long as satisfaction beckoned to it; but under the double pressure of external and internal frustration it becomes refractory, and recalls earlier and better times. Such is the libido's fundamentally unchangeable character. The ideas to which it now transfers its energy as a cathexis belong to the system of the unconscious and are subject to the processes which are possible there, particularly to condensation and displacement. In this way conditions are established which completely resemble those in dream-construction. The dream proper, which has been completed in the unconscious and is the fulfilment of an unconscious wishful phantasy, is brought up against a portion of (pre)conscious activity which exercises the office of censorship and which, when it has been indemnified, permits the formation of the manifest dream as a compromise. In the same way, what represents the libido in the unconscious has to reckon with the power of the preconscious ego. The opposition which had been raised against it in the ego pursues it as an 'anticathexis' and compels it to choose a form of expression which can at the same time become an expression of the opposition itself. Thus the symptom emerges as a many-times-distorted derivative of the unconscious libidinal wish-fulfilment, an ingeniously chosen piece of ambiguity with two meanings in complete mutual contradiction. In this last respect, however, there is a distinction between the construction of a dream and of a symptom. For in dream-formation the preconscious purpose is merely concerned to preserve sleep, to allow nothing that would disturb it to make its way into consciousness; it does not insist upon calling out sharply 'No! on the contrary!' to the unconscious wishful impulse. It can afford to be more tolerant because the situation of someone sleeping is less perilous. The state of sleep in itself bars any outlet into reality.

[1916-1917, 3418]
The Theory of Repression. - These theoretical considerations, taken together with the immediate impressions derived from analytic work, lead to a view of the neuroses which may be described in the roughest outline as follows. The neuroses are the expression of conflicts between the ego and such of the sexual impulses as seem to the ego incompatible with its integrity or with its ethical standards. Since these impulses are not ego-syntonic, the ego has repressed them: that is to say, it has withdrawn its interest from them and has shut them off from becoming conscious as well as from obtaining satisfaction by motor discharge. If in the course of analytic work one attempts to make these repressed impulses conscious, one becomes aware of the repressive forces in the form of resistance. But the achievement of repression fails particularly readily in the case of the sexual instincts. Their dammed-up libido finds other ways out from the unconscious: for it regresses to earlier phases of development and earlier attitudes towards objects, and, at weak points in the libidinal development where there are infantile fixations, it breaks through into consciousness and obtains discharge. What results is a symptom and consequently in its essence a substitutive sexual satisfaction. Nevertheless the symptom cannot entirely escape from the repressive forces of the ego and must therefore submit to modifications and displacements exactly as happens with dreams - by means of which its characteristic of being a sexual satisfaction becomes unrecognizable. Consequently symptoms are in the nature of compromises between the repressed sexual instincts and the repressing ego-instances; they represent a wish-fulfilment for both partners to the conflict simultaneously, but one which is incomplete for each of them. This is quite strictly true of the symptoms of hysteria, while in the symptoms of obsessional neurosis there is often a stronger emphasis upon the side of the repressing function owing to the erection of reaction-formations, which are assurances against sexual satisfaction.

[1923a, 3923]

The repressed retains its upward urge, its effort to force its way to consciousness. It achieves its aim under three conditions: (1) if the strength of the anticathexis is diminished by pathological processes which overtake the other part, what we call the ego, or by a different distribution of the cathetic energies in that ego, as happens regularly in the state of sleep; (2) if the instinctual elements attaching to the repressed receive a special reinforcement (of which the best example is the processes during puberty); and (3) if at any time in recent experience impressions or experiences occur which resemble the repressed so closely that they are able to awaken it. In the last case the recent experience is reinforced by the latent energy of the repressed, and the repressed comes into operation behind the recent experience and with its help. In none of these three alternatives does what has hitherto been repressed enter consciousness smoothly and unaltered; it must always put up with distortions which testify to the influence of the resistance (not entirely overcome) arising from the anticathexis, or to the modifying influence of the recent experience or to both.

[1939a, 4918]
Owing, probably, to the difficulties which the unconscious phantasies meet with in their endeavour to find expression, the relationship of the phantasies to the symptoms is not simple, but on the contrary, complicated in many ways.¹ As a rule - when, that is, the neurosis is fully developed and has persisted for some time - a particular symptom corresponds, not to a single unconscious phantasy, but to several such phantasies; and it does so not in an arbitrary manner but in accordance with a regular pattern. At the beginning of the illness these complications are, no doubt, not all fully developed.

[1908a, 1936]

I hope to be able to give you adequate replies to these questions, even though the replies may be reduced to schematic dimensions. The conflict is conjured up by frustration, as a result of which the libido, deprived of satisfaction, is driven to look for other objects and paths. The necessary precondition of the conflict is that these other paths and objects arouse displeasure in one part of the personality, so that a veto is imposed which makes the new method of satisfaction impossible as it stands. From this point the construction of symptoms pursues its course, which we shall follow later. The repudiated libidinal trends nevertheless succeed in getting their way by certain roundabout paths, though not, it is true, without taking the objection into account by submitting to some distortions and mitigations. The roundabout paths are those taken by the construction of symptoms; the symptoms are the fresh or substitute satisfaction which has become necessary owing to the fact of frustration.

[1916-1917, 3411]

We already know that neurotic symptoms are the outcome of a conflict which arises over a new method of satisfying the libido. The two forces which have fallen out meet once again in the symptom and are reconciled, as it were, by the compromise of the symptom that has been constructed. It is for that reason, too, that the symptom is so resistant: it is supported from both sides. We also know that one of the two partners to the conflict is the unsatisfied libido which has been repulsed by reality and must now seek for other paths to its satisfaction. If reality remains relentless even though the libido is ready to take another object in place of the one that has been refused to it, then it will finally be compelled to take the path of regression and strive to find satisfaction either in one of the organizations which it has already outgrown or from one of the objects which it has earlier abandoned. The libido is lured into the path of regression by the fixation which it has left behind it at these points in its development.

[1916-1917, 3417]
The path to perversion branches off sharply from that to neurosis. If these regressions rouse no objection from the ego, no neurosis will come about either; and the libido will arrive at some real, even though no longer normal, satisfaction. But if the ego, which has under its control not only consciousness but also the approaches to motor innervation and accordingly to the realization of mental desires, does not agree with these regressions, conflict will follow. The libido is, as it were, cut off and must try to escape in some direction where, in accordance with the requirements of the pleasure principle, it can find a discharge for its cathexis of energy. It must withdraw from the ego. An escape of this kind is offered it by the fixations on the path of its development which it has now entered on regressively - fixations from which the ego had protected itself in the past by repressions. By cathecting these repressed positions as it flows backward, the libido has withdrawn from the ego and its laws, and has at the same time renounced all the education it has acquired under the ego's influence. It was docile so long as satisfaction beckoned to it; but under the double pressure of external and internal frustration it becomes refractory, and recalls earlier and better times. Such is the libido's fundamentally unchangeable character. The ideas to which it now transfers its energy as a cathexis belong to the system of the unconscious and are subject to the processes which are possible there, particularly to condensation and displacement. In this way conditions are established which completely resemble those in dream-construction. The dream proper, which has been completed in the unconscious and is the fulfilment of an unconscious wishful phantasy, is brought up against a portion of (pre)conscious activity which exercises the office of censorship and which, when it has been indemnified, permits the formation of the manifest dream as a compromise. In the same way, what represents the libido in the unconscious has to reckon with the power of the preconscious ego. The opposition which had been raised against it in the ego pursues it as an 'anticathexis' and compels it to choose a form of expression which can at the same time become an expression of the opposition itself. Thus the symptom emerges as a many-times-distorted derivative of the unconscious libidinal wish-fulfilment, an ingeniously chosen piece of ambiguity with two meanings in complete mutual contradiction. In this last respect, however, there is a distinction between the construction of a dream and of a symptom. For in dream-formation the preconscious purpose is merely concerned to preserve sleep, to allow nothing that would disturb it to make its way into consciousness; it does not insist upon calling out sharply 'No! on the contrary!' to the unconscious wishful impulse. It can afford to be more tolerant because the situation of someone sleeping is less perilous. The state of sleep in itself bars any outlet into reality.

LADIES AND GENTLEMEN, - We have repeatedly (and only recently once again) had to deal with the distinction between the ego-instincts and the sexual instincts. In the first place, repression showed us that the two can come into opposition to each other, that the sexual instincts are then ostensibly subdued and are obliged to find satisfaction for themselves along regressive and roundabout paths, and that in doing so they are able to find compensation for their defeat in their indomitability. We next learnt that the two kinds of instincts are from the first differently related to Necessity the educator, so that their course of development is not the same and they do not enter into the same connection with the reality principle. Lastly, we seem to have found that the sexual instincts are linked by much closer bonds than the ego-instincts to the affective state of anxiety - a conclusion which seems incomplete in only one important respect. In order to establish it more firmly, therefore, I will bring forward the further noteworthy fact that if hunger and thirst (the two most elementary self-preservative instincts) are unsatisfied, the result is never their transformation into anxiety, whereas the changing of unsatisfied libido into anxiety is, as we have seen, among the best known and most frequently observed of phenomena.
"Nothing has entered into you from without; a part of the activity of your own mind has been withdrawn from your knowledge and from the command of your will. That, too, is why you are so weak in your defence; you are using one part of your force to fight the other part and you cannot concentrate the whole of your force as you would against an external enemy. And it is not even the worst or least important part of your mental forces that has thus become antagonistic to you and independent of you. The blame, I am bound to say, lies with yourself. You over-estimated your strength when you thought you could treat your sexual instincts as you liked and could utterly ignore their intentions. The result is that they have rebelled and have taken their own obscure paths to escape this suppression; they have established their rights in a manner you cannot approve. How they have achieved this, and the paths which they have taken, have not come to your knowledge. All you have learned is the outcome of their work - the symptom which you experience as suffering. Thus you do not recognize it as a derivative of your own rejected instincts and do not know that it is a substitutive satisfaction of them. [1917a, 3613]

There can be no doubt, however, that the replacement of the pleasure principle by the reality principle can only be made responsible for a small number, and by no means the most intense, of unpleasurable experiences. Another occasion of the release of unpleasure, which occurs with no less regularity, is to be found in the conflicts and dissensions that take place in the mental apparatus while the ego is passing through its development into more highly composite organizations. Almost all the energy with which the apparatus is filled arises from its innate instinctual impulses. But these are not all allowed to reach the same phases of development. In the course of things it happens again and again that individual instincts or parts of instincts turn out to be incompatible in their aims or demands with the remaining ones, which are able to combine into the inclusive unity of the ego. The former are then split off from this unity by the process of repression, held back at lower levels of psychical development and cut off, to begin with, from the possibility of satisfaction. If they succeed subsequently, as can so easily happen with repressed sexual instincts, in struggling through, by roundabout paths, to a direct or to a substitutive satisfaction, that event, which would in other cases have been an opportunity for pleasure, is felt by the ego as unpleasure. As a consequence of the old conflict which ended in repression, a new breach has occurred in the pleasure principle at the very time when certain instincts were endeavouring, in accordance with the principle, to obtain fresh pleasure. The details of the process by which repression turns a possibility of pleasure into a source of unpleasure are not yet clearly understood or cannot be clearly represented; but there is no doubt that all neurotic unpleasure is of that kind - pleasure that cannot be felt as such.¹ [1920g, 3717]
The Theory of Repression. - These theoretical considerations, taken together with the immediate impressions derived from analytic work, lead to a view of the neuroses which may be described in the roughest outline as follows. The neuroses are the expression of conflicts between the ego and such of the sexual impulses as seem to the ego incompatible with its integrity or with its ethical standards. Since these impulses are not ego-syntonic, the ego has repressed them: that is to say, it has withdrawn its interest from them and has shut them off from becoming conscious as well as from obtaining satisfaction by motor discharge. If in the course of analytic work one attempts to make these repressed impulses conscious, one becomes aware of the repressive forces in the form of resistance. But the achievement of repression fails particularly readily in the case of the sexual instincts. Their dammed-up libido finds other ways out from the unconscious: for it regresses to earlier phases of development and earlier attitudes towards objects, and, at weak points in the libido development where there are infantile fixations, it breaks through into consciousness and obtains discharge. What results is a symptom and consequently in its essence a substitutive sexual satisfaction. Nevertheless the symptom cannot entirely escape from the repressive forces of the ego and must therefore submit to modifications and displacements exactly as happens with dreams - by means of which its characteristic of being a sexual satisfaction becomes unrecognizable. Consequently symptoms are in the nature of compromises between the repressed sexual instincts and the repressing ego-instances; they represent a wish-fulfilment for both partners to the conflict simultaneously, but one which is incomplete for each of them. This is quite strictly true of the symptoms of hysteria, while in the symptoms of obsessional neurosis there is often a stronger emphasis upon the side of the repressing function owing to the erection of reaction-formations, which are assurances against sexual satisfaction.

Contrast between Sexual and Ego Instincts. - Psycho-analysis early became aware that all mental occurrences must be regarded as built on the basis of an interplay of the forces of the elementary instincts. This, however, led to a difficult predicament, since psychology included no theory of the instincts. No one could say what an instinct really was, the question was left entirely to individual caprice, and every psychologist was in the habit of postulating any instincts in any number that he chose. The first sphere of phenomena to be studied by psycho-analysis comprised what are known as the transference neuroses (hysteria and obsessional neurosis). It was found that their symptoms came about by sexual instinctual impulses being rejected (repressed) by the subject's personality (his ego) and then finding expression by circuitous paths through the unconscious. These facts could be met by drawing a contrast between the sexual instincts and ego instincts (instincts of self-preservation), which was in line with the popular saying that hunger and love are what make the world go round: libido was the manifestation of the force of love in the same sense as was hunger of the self-preservation instinct. The nature of the ego instincts remained for the time being undefined and, like all the other characteristics of the ego, inaccessible to analysis. There was no means of deciding whether, and if so what, qualitative differences were to be assumed to exist between the two classes of instincts.
There are certainly good grounds for being suspicious of such simple solutions of a problem. Moreover, the most that we may expect is that this formula will turn out to be correct in the roughest outline. But even that would be something. One recalls at once, too, a whole number of discoveries and findings which seem to support our thesis. All our analyses go to show that the transference neuroses originate from the ego's refusing to accept a powerful instinctual impulse in the id or to help it to find a motor outlet, or from the ego's forbidding that impulse the object at which it is aiming. In such a case the ego defends itself against the instinctual impulse by the mechanism of repression. The repressed material struggles against this fate. It creates for itself, along paths over which the ego has no power, a substitutive representation (which forces itself upon the ego by way of a compromise) - the symptom. The ego finds its unity threatened and impaired by this intruder, and it continues to struggle against the symptom, just as it fended off the original instinctual impulse. All this produces the picture of a neurosis. It is no contradiction to this that, in undertaking the repression, the ego is at bottom following the commands of its super-ego - commands which, in their turn, originate from influences in the external world that have found representation in the super-ego. The fact remains that the ego has taken sides with those powers, that in it their demands have more strength than the instinctual demands of the id, and that the ego is the power which sets the repression in motion against the portion of the id concerned and which fortifies the repression by means of the anticathexis of resistance. The ego has come into conflict with the id in the service of the super-ego and of reality; and this is the state of affairs in every transference neurosis.

[1924b, 4066]

It looked as though our work had been made much more difficult and complicated; but the inestimable gain was that an insight was now obtained into an interplay of forces which had been concealed from the observer by the hypnotic state. It became evident that the work of uncovering what had been pathogenically forgotten had to struggle against a constant and very intense resistance. The critical objections which the patient raised in order to avoid communicating the ideas which occurred to him, and against which the fundamental rule of psycho-analysis was directed, had themselves already been manifestations of this resistance. A consideration of the phenomena of resistance led to one of the corner-stones of the psychoanalytic theory of the neuroses - the theory of repression. It was plausible to suppose that the same forces which were now struggling against the pathogenic material being made conscious had at an earlier time made the same efforts with success. A gap in the aetiology of neurotic symptoms was thus filled. The impressions and mental impulses, for which the symptoms were now serving as substitutes, had not been forgotten without reason or on account of a constitutional incapacity for synthesis (as Janet supposed); they had, though the influence of other mental forces, met with a repression the success and evidence of which was precisely their being debarred from consciousness and excluded from memory. It was only in consequence of this repression that they had become pathogenic - that is, had succeeded in manifesting themselves along unusual paths as symptoms.

[1924f, 4106]
It was now easy to reconstruct the pathogenic process. Let us keep to a simple example, in which a particular impulsion had arisen in the subject's mind but was opposed by other powerful impulsions. We should have expected the mental conflict which now arose to take the following course. The two dynamic quantities - for our present purposes let us call them 'the instinct' and 'the resistance' - would struggle with each other for some time in the fullest light of consciousness, until the instinct was repudiated and the cathexis of energy withdrawn from its impulsion. This would have been the normal solution. In a neurosis, however (for reasons which were still unknown), the conflict found a different outcome. The ego drew back, as it were, on its first collision with the objectionable instinctual impulse; it debarred the impulse from access to consciousness and to direct motor discharge, but at the same time the impulse retained its full cathexis of energy. I named this process repression; it was a novelty, and nothing like it had ever before been recognized in mental life. It was obviously a primary mechanism of defence, comparable to an attempt at flight, and was only a forerunner of the later-developed normal condemning judgement. The first act of repression involved further consequences. In the first place the ego was obliged to protect itself against the constant threat of a renewed advance on the part of the repressed impulse by making a permanent expenditure of energy, an anticathexis, and it thus impoverished itself. On the other hand, the repressed impulse, which was now unconscious, was able to find means of discharge and of substitutive satisfaction by circuitous routes and thus to bring the whole purpose of the repression to nothing. In the case of conversion hysteria the circuitous route led to the somatic innervation; the repressed impulse broke its way through at some point or other and produced symptoms. The symptoms were thus results of a compromise, for although they were substitutive satisfactions they were nevertheless distorted and deflected from their aim owing to the resistance of the ego.

[1925d, 4206]

(1) There is a force in the mind which exercises the functions of a censorship, and which excludes from consciousness and from any influence upon action all tendencies which displease it. Such tendencies are described as 'repressed'. They remain unconscious; and if one attempts to bring them into the patient's consciousness one provokes a 'resistance'. These repressed instinctual impulses, however, have not always become powerless. In many cases they succeed in making their influence felt in the mind by circuitous paths, and the indirect or substitutive satisfactions of repressed impulses thus achieved are what constitute neurotic symptoms.

[1926f, 4405]

Psycho-analytic work has shown us that it is precisely these frustrations of sexual life which people known as neurotics cannot tolerate. The neurotic creates substitutive satisfactions for himself in his symptoms, and these either cause him suffering in themselves or become sources of suffering for him by raising difficulties in his relations with his environment and the society he belongs to. The latter fact is easy to understand; the former presents us with a new problem. But civilization demands other sacrifices besides that of sexual satisfaction.

[1930a, 4500]
Regular contributions are made to the phenomena we are in search of by the mechanisms which lead to the formation of neuroses. Here again the determining events occur in early childhood times, but here the stress is not upon the time but upon the process by which the event is met, the reaction to it. We can describe it schematically thus. As a result of the experience, an instinctual demand arises which calls for satisfaction. The ego refuses that satisfaction, either because it is paralysed by the magnitude of the demand or because it recognizes it as a danger. The former of these grounds is the more primary one; both of them amount to the avoidance of a situation of danger. The ego fends off the danger by the process of repression. The instinctual impulse is in some way inhibited, its precipitating cause, with its attendant perceptions and ideas, is forgotten. This, however, is not the end of the process: the instinct has either retained its forces, or collects them again, or it is reawakened by some new precipitating cause. Thereupon it renews its demand, and, since the path to normal satisfaction remains closed to it by what we may call the scar of repression, somewhere, at a weak spot, it opens another path for itself to what is known as a substitutive satisfaction, which comes to light as a symptom, without the acquiescence of the ego, but also without its understanding. All the phenomena of the formation of symptoms may justly be described as the 'return of the repressed'. Their distinguishing characteristic, however, is the far-reaching distortion to which the returning material has been subjected as compared with the original. It will perhaps be thought that this last group of facts has carried us too far away from the similarity with tradition. But we ought not to regret it if it has brought us close to the problems of the renunciation of instinct.

[1939a, 4945]
We have heard how the weak and immature ego of the first period of childhood is permanently damaged by the stresses put upon it in its efforts to fend off the dangers that are peculiar to that period of life. Children are protected against the dangers that threaten them from the external world by the solicitude of their parents; they pay for this security by a fear of loss of love which would deliver them over helpless to the dangers of the external world. This factor exerts a decisive influence on the outcome of the conflict when a boy finds himself in the situation of the Oedipus complex, in which the threat to his narcissism by the danger of castration, reinforced from primaeval sources, takes possession of him. Driven by the combined operation of these two influences, the contemporary real danger and the remembered one with its phylogenetic basis, the child embarks on his attempts at defence - repressions - which are effective for the moment but nevertheless turn out to be psychologically inadequate when the later re-animation of sexual life brings a reinforcement to the instinctual demands which have been repudiated in the past. If this is so, it would have to be said from a biological standpoint that the ego comes to grief over the task of mastering the excitations of the early sexual period, at a time when its immaturity makes it incompetent to do so. It is in this lagging of ego development behind libidinal development that we see the essential precondition of neurosis; and we cannot escape the conclusion that neuroses could be avoided if the childish ego were spared this task - if, that is to say, the child's sexual life were allowed free play, as happens among many primitive peoples. It may be that the aetiology of neurotic illnesses is more complicated than we have here described it; if so, we have at least brought out one essential part of the aetiological complex. Nor should we forget the phylogenetic influences, which are represented in some way in the id in forms that we are not yet able to grasp, and which must certainly act upon the ego more powerfully in that early period than later. On the other hand, the realization dawns on us that such an early attempt at damming up the sexual instinct, so decided a partisanship by the young ego in favour of the external as opposed to the internal world, brought about by the prohibition of infantile sexuality, cannot be without its effect on the individual's later readiness for culture. The instinctual demands forced away from direct satisfaction are compelled to enter on new paths leading to substitutive satisfaction, and in the course of these détours they may become desexualized and their connection with their original instinctual aims may become looser. And at this point we may anticipate the thesis that many of the highly valued assets of our civilization were acquired at the cost of sexuality and by the restriction of sexual motive forces.

[1940a [1938], 5006]
If, then, as we have learnt, psychogenic disturbances of vision depend on certain ideas connected with seeing being cut off from consciousness, we must, on the psycho-analytic view, assume that these ideas have come into opposition to other, more powerful ones, for which we use the collective concept of the 'ego'- a compound which is made up variously at different times - and have for that reason come under repression. But what can be the origin of this opposition, which makes for repression, between the ego and various groups of ideas? You will no doubt notice that it was not possible to frame such a question before the advent of psychoanalysis, for nothing was known earlier of psychical conflict and repression. Our researches, however, have put us in a position to give us the desired answer. Our attention has been drawn to the importance of the instincts in ideational life. We have discovered that every instinct tries to make itself effective by activating ideas that are in keeping with its aims. These instincts are not always compatible with one another; their interests often come into conflict. Opposition between ideas is only an expression of struggles between the various instincts. From the point of view of our attempted explanation, a quite specially important part is played by the undeniable opposition between the instincts which subserve sexuality, the attainment of sexual pleasure, and those other instincts, which have as their aim the self-preservation of the individual - the ego-instincts. As the poet has said, all the organic instincts that operate in our mind may be classified as 'hunger' or 'love'. We have traced the 'sexual instinct' from its first manifestations in children to its final form, which is described as 'normal'. We have found that it is put together from numerous 'component instincts' which are attached to excitations of regions of the body; and we have come to see that these separate instincts have to pass through a complicated development before they can be brought effectively to serve the aims of reproduction. The light thrown by psychology on the evolution of our civilization has shown us that it originates mainly at the cost of the sexual component instincts, and that these must be suppressed, restricted, transformed and directed to higher aims, in order that the mental constructions of civilization may be established. We have been able to recognize as a valuable outcome of these researches something that our colleagues have not yet been willing to believe, namely that the human ailments known as 'neuroses' are derived from the many different ways in which these processes of transformation in the sexual component instincts may miscarry. The 'ego' feels threatened by the claims of the sexual instincts and fends them off by repressions; these, however, do not always have the desired result, but lead to the formation of dangerous substitutes for the repressed and to burdensome reactions on the part of the ego. From these two classes of phenomena taken together there emerge what we call the symptoms of neuroses.

[1910i, 2368]

I hope to be able to give you adequate replies to these questions, even though the replies may be reduced to schematic dimensions. The conflict is conjured up by frustration, as a result of which the libido, deprived of satisfaction, is driven to look for other objects and paths. The necessary precondition of the conflict is that these other paths and objects arouse displeasure in one part of the personality, so that a veto is imposed which makes the new method of satisfaction impossible as it stands. From this point the construction of symptoms pursues its course, which we shall follow later. The repudiated libidinal trends nevertheless succeed in getting their way by certain roundabout paths, though not, it is true, without taking the objection into account by submitting to some distortions and mitigations. The roundabout paths are those taken by the construction of symptoms; the symptoms are the fresh or substitute satisfaction which has become necessary owing to the fact of frustration.

[1916-1917, 3411]
But, Ladies and Gentlemen, who has so seriously misinformed you? A recommendation to the patient to 'live a full life' sexually could not possibly play a part in analytic therapy - if only because we ourselves have declared that an obstinate conflict is taking place in him between a libidinal impulse and sexual repression, between a sensual and an ascetic trend. This conflict would not be solved by our helping one of these trends to victory over its opponent. We see, indeed, that in neurotics asceticism has the upper hand; and the consequence of this is precisely that the suppressed sexual tendency finds a way out in symptoms. If, on the contrary, we were to secure victory for sensuality, then the sexual repression that had been put on one side would necessarily be replaced by symptom. Neither of these two alternative decisions could end the internal conflict; in either case one party to it would remain unsatisfied. There are only a few cases in which the conflict is so unstable that a factor such as the doctor's taking sides could decide it; and such cases do not in fact stand in need of analytic treatment. Anyone on whom the doctor could have so much influence would have found the same way out without the doctor. You must be aware that if an abstinent young man decides in favour of illicit sexual intercourse or if an unsatisfied wife seeks relief with another man, they have not as a rule waited for permission from a doctor or even from their analyst.

[1916-1917, 3476]

'Nothing has entered into you from without; a part of the activity of your own mind has been withdrawn from your knowledge and from the command of your will. That, too, is why you are so weak in your defence; you are using one part of your force to fight the other part and you cannot concentrate the whole of your force as you would against an external enemy. And it is not even the worst or least important part of your mental forces that has thus become antagonistic to you and independent of you. The blame, I am bound to say, lies with yourself. You over-estimated your strength when you thought you could treat your sexual instincts as you liked and could utterly ignore their intentions. The result is that they have rebelled and have taken their own obscure paths to escape this suppression; they have established their rights in a manner you cannot approve. How they have achieved this, and the paths which they have taken, have not come to your knowledge. All you have learned is the outcome of their work - the symptom which you experience as suffering. Thus you do not recognize it as a derivative of your own rejected instincts and do not know that it is a substitutive satisfaction of them.

[1917a, 3613]

The second theory is of more recent origin. It is in agreement with the first one in so far as it too represents the struggle between the two sexes as being the decisive cause of repression. In other respects it comes into conflict with the former theory; moreover, it looks for support to sociological rather than biological sources. According to this theory of the 'masculine protest', formulated by Alfred Adler, every individual makes efforts not to remain on the inferior 'feminine line' and struggles towards the 'masculine line', from which satisfaction can alone be derived. Adler makes the masculine protest responsible for the whole formation both of character and of neuroses. Unfortunately he makes so little distinction between the two processes, which certainly have to be kept separate, and sets altogether so little store in general by the fact of repression, that to attempt to apply the doctrine of the masculine protest to repression brings with it the risk of misunderstanding. In my opinion such an attempt could only lead us to infer that the masculine protest, the desire to break away from the feminine line, was in every case the motive force of repression. The repressing agency, therefore, would always be a masculine instinctual impulse, and the repressed would be a feminine one. But symptoms would also be the result of a feminine impulse, for we cannot discard the characteristic feature of symptoms - that they are substitutes for the repressed, substitutes that have made their way out in spite of repression.

[1919e, 3660]
The theory of psycho-analysis (a theory based on observation) holds firmly to the view that the motive forces of repression must not be sexualized. Man's archaic heritage forms the nucleus of the unconscious mind; and whatever part of that heritage has to be left behind in the advance to later phases of development, because it is unserviceable or incompatible with what is new and harmful to it, falls a victim to the process of repression. This selection is made more successfully with one group of instincts than with the other. In virtue of special circumstances which have often been pointed out already, the latter group, that of the sexual instincts, are able to defeat the intentions of repression, and to enforce their representation by substitutive formations of a disturbing kind. For this reason infantile sexuality, which is held under repression, acts as the chief motive force in the formation of symptoms; and the essential part of its content, the Oedipus complex, is the nuclear complex of neuroses. I hope that in this paper I have raised an expectation that the sexual aberrations of childhood, as well as those of mature life, are ramifications of the same complex.

There can be no doubt, however, that the replacement of the pleasure principle by the reality principle can only be made responsible for a small number, and by no means the most intense, of unpleasurable experiences. Another occasion of the release of unpleasure, which occurs with no less regularity, is to be found in the conflicts and dissensions that take place in the mental apparatus while the ego is passing through its development into more highly composite organizations. Almost all the energy with which the apparatus is filled arises from its innate instinctual impulses. But these are not all allowed to reach the same phases of development. In the course of things it happens again and again that individual instincts or parts of instincts turn out to be incompatible in their aims or demands with the remaining ones, which are able to combine into the inclusive unity of the ego. The former are then split off from this unity by the process of repression, held back at lower levels of psychical development and cut off, to begin with, from the possibility of satisfaction. If they succeed subsequently, as can so easily happen with repressed sexual instincts, in struggling through, by roundabout paths, to a direct or to a substitutive satisfaction, that event, which would in other cases have been an opportunity for pleasure, is felt by the ego as unpleasure. As a consequence of the old conflict which ended in repression, a new breach has occurred in the pleasure principle at the very time when certain instincts were endeavouring, in accordance with the principle, to obtain fresh pleasure. The details of the process by which repression turns a possibility of pleasure into a source of unpleasure are not yet clearly understood or cannot be clearly represented; but there is no doubt that all neurotic unpleasure is of that kind - pleasure that cannot be felt as such.¹

[1919e, 3662] [1920g, 3717]
The Theory of Repression. - These theoretical considerations, taken together with the immediate impressions derived from analytic work, lead to a view of the neuroses which may be described in the roughest outline as follows. The neuroses are the expression of conflicts between the ego and such of the sexual impulses as seem to the ego incompatible with its integrity or with its ethical standards. Since these impulses are not ego-syntonic, the ego has repressed them: that is to say, it has withdrawn its interest from them and has shut them off from becoming conscious as well as from obtaining satisfaction by motor discharge. If in the course of analytic work one attempts to make these repressed impulses conscious, one becomes aware of the repressive forces in the form of resistance. But the achievement of repression fails particularly readily in the case of the sexual instincts. Their dammed-up libido finds other ways out from the unconscious: for it regresses to earlier phases of development and earlier attitudes towards objects, and, at weak points in the libidinal development where there are infantile fixations, it breaks through into consciousness and obtains discharge. What results is a symptom and consequently in its essence a substitutive sexual satisfaction. Nevertheless the symptom cannot entirely escape from the repressive forces of the ego and must therefore submit to modifications and displacements exactly as happens with dreams - by means of which its characteristic of being a sexual satisfaction becomes unrecognizable. Consequently symptoms are in the nature of compromises between the repressed sexual instincts and the repressing ego-instincts; they represent a wish-fulfilment for both partners to the conflict simultaneously, but one which is incomplete for each of them. This is quite strictly true of the symptoms of hysteria, while in the symptoms of obsessional neurosis there is often a stronger emphasis upon the side of the repressing function owing to the erection of reaction-formations, which are assurances against sexual satisfaction. [1923a, 3923]

There are certainly good grounds for being suspicious of such simple solutions of a problem. Moreover, the most that we may expect is that this formula will turn out to be correct in the roughest outline. But even that would be something. One recalls at once, too, a whole number of discoveries and findings which seem to support our thesis. All our analyses go to show that the transference neuroses originate from the ego's refusing to accept a powerful instinctual impulse in the id or to help it to find a motor outlet, or from the ego's forbidding that impulse the object at which it is aiming. In such a case the ego defends itself against the instinctual impulse by the mechanism of repression. The repressed material struggles against this fate. It creates for itself, along paths over which the ego has no power, a substitutive representation (which forces itself upon the ego by way of a compromise) - the symptom. The ego finds its unity threatened and impaired by this intruder, and it continues to struggle against the symptom, just as it fended off the original instinctual impulse. All this produces the picture of a neurosis. It is no contradiction to this that, in undertaking the repression, the ego is at bottom following the commands of its super-ego - commands which, in their turn, originate from influences in the external world that have found representation in the super-ego. The fact remains that the ego has taken sides with those powers, that in it their demands have more strength than the instinctual demands of the id, and that the ego is the power which sets the repression in motion against the portion of the id concerned and which fortifies the repression by means of the anticathexis of resistance. The ego has come into conflict with the id in the service of the super-ego and of reality; and this is the state of affairs in every transference neurosis. [1924b, 4066]
It looked as though our work had been made much more difficult and complicated; but the inestimable gain was that an insight was now obtained into an interplay of forces which had been concealed from the observer by the hypnotic state. It became evident that the work of uncovering what had been pathogenically forgotten had to struggle against a constant and very intense resistance. The critical objections which the patient raised in order to avoid communicating the ideas which occurred to him, and against which the fundamental rule of psycho-analysis was directed, had themselves already been manifestations of this resistance. A consideration of the phenomena of resistance led to one of the corner-stones of the psycho-analytic theory of the neuroses - the theory of repression. It was plausible to suppose that the same forces which were now struggling against the pathogenic material being made conscious had at an earlier time made the same efforts with success. A gap in the aetiology of neurotic symptoms was thus filled. The impressions and mental impulses, for which the symptoms were now serving as substitutes, had not been forgotten without reason or on account of a constitutional incapacity for synthesis (as Janet supposed); they had, though the influence of other mental forces, met with a repression the success and evidence of which was precisely their being debarred from consciousness and excluded from memory. It was only in consequence of this repression that they had become pathogenic - that is, had succeeded in manifesting themselves along unusual paths as symptoms.

[1924f, 4106]

It was now easy to reconstruct the pathogenic process. Let us keep to a simple example, in which a particular impulsion had arisen in the subject's mind but was opposed by other powerful impulsions. We should have expected the mental conflict which now arose to take the following course. The two dynamic quantities - for our present purposes let us call them 'the instinct' and 'the resistance' - would struggle with each other for some time in the fullest light of consciousness, until the instinct was repudiated and the cathexis of energy withdrawn from its impulsion. This would have been the normal solution. In a neurosis, however (for reasons which were still unknown), the conflict found a different outcome. The ego drew back, as it were, on its first collision with the objectionable instinctual impulse; it debarred the impulse from access to consciousness and to direct motor discharge, but at the same time the impulse retained its full cathexis of energy. I named this process repression; it was a novelty, and nothing like it had ever before been recognized in mental life. It was obviously a primary mechanism of defence, comparable to an attempt at flight, and was only a forerunner of the later-developed normal condemning judgement. The first act of repression involved further consequences. In the first place the ego was obliged to protect itself against the constant threat of a renewed advance on the part of the repressed impulse by making a permanent expenditure of energy, an anticathexis, and it thus impoverished itself. On the other hand, the repressed impulse, which was now unconscious, was able to find means of discharge and of substitutive satisfaction by circuitous routes and thus to bring the whole purpose of the repression to nothing. In the case of conversion hysteria the circuitous route led to the somatic innervation; the repressed impulse broke its way through at some point or other and produced symptoms. The symptoms were thus results of a compromise, for although they were substitutive satisfactions they were nevertheless distorted and deflected from their aim owing to the resistance of the ego.

[1925d, 4206]
You have no notion how close I am to fulfilling my promise. Even in organisms which later
develop an efficient ego-organization, their ego is feeble and little differentiated from their id to
begin with, during their first years of childhood. Imagine now what will happen if this powerless
ego experiences an instinctual demand from the id which it would already like to resist (because
it senses that to satisfy it is dangerous and would conjure up a traumatic situation, a collision
with the external world) but which it cannot control, because it does not yet possess enough
strength to do so. In such a case the ego treats the instinctual danger as if it was an external
one; it makes an attempt at flight, draws back from this portion of the id and leaves it to its fate,
after withholding from it all the contributions which it usually makes to instinctual impulses. The
ego, as we put it, institutes a repression of these instinctual impulses. For the moment this has
the effect of fending off the danger; but one cannot confuse the inside and the outside with
impunity. One cannot run away from oneself. In repression the ego is following the pleasure
principle, which it is usually in the habit of correcting; and it is bound to suffer damage in
revenge. This lies in the ego's having permanently narrowed its sphere of influence. The
repressed instinctual impulse is now isolated, left to itself, inaccessible, but also
uninfluenceable. It goes its own way. Even later, as a rule, when the ego has grown stronger, it
still cannot lift the repression; its synthesis is impaired, a part of the id remains forbidden ground
to the ego. Nor does the isolated instinctual impulse remain idle; it understands how to make up
for being denied normal satisfaction; it produces psychical derivatives which take its place; it
links itself to other processes which by its influence it likewise tears away from the ego; and
finally it breaks through into the ego and into consciousness in the form of an unrecognizably
distorted substitute, and creates what we call a symptom. All at once the nature of a neurotic
disorder becomes clear to us: on the one hand an ego which is inhibited in its synthesis, which
has no influence on parts of the id, which must renounce some of its activities in order to avoid
a fresh collision with what has been repressed, and which exhausts itself in what are for the
most part vain acts of defence against the symptoms, the derivatives of the repressed impulses;
and on the other hand an id in which individual instincts have made themselves independent,
pursue their aims regardless of the interests of the person as a whole and henceforth obey the
laws only of the primitive psychology that rules in the depths of the id. If we survey the whole
situation we arrive at a simple formula for the origin of a neurosis: the ego has made an attempt
to suppress certain portions of the id in an inappropriate manner, this attempt has failed and the
id has taken its revenge. A neurosis is thus the result of a conflict between the ego and the id,
