A comparison of the dreams of the two patients shows, however, that the question whether or not paranoia (or any other psychoneurosis) can penetrate into dreams is based on a false conception of dreams. Dreams are distinguished from waking thought by the fact that they can include material (belonging to the region of the repressed) which must not emerge in waking thought. Apart from this, dreams are merely a form of thinking, a transformation of preconscious material of thought by the dream-work and its conditions. Our terminology of the neuroses is not applicable to repressed material; this cannot be called hysterical, nor obsessional, nor paranoic. As against this, the other part of the material which is subjected to the process of dream-formation - the preconscious thoughts - may be normal or may bear the character of any neurosis; they may be the products of any of the pathogenic processes in which the essence of a neurosis lies There seems to be no reason why any such pathological idea should not be transformed into a dream. A dream may therefore quite simply represent a hysterical phantasy, an obsessional idea, or a delusion - that is, may reveal one or other of these upon interpretation. Observation of the two paranoics shows that the dreams of the one were quite normal while he was subject to his delusion, and that those of the other were paranoic in content while he was treating his delusional ideas with contempt. In both cases, therefore, the dream took up the material that was at the time forced into the background in waking life. This too, however, need not necessarily be an invariable rule.

[1922b, 3906]

It follows from this that it is on the whole a matter of indifference to the sleeping ego what may be dreamt during the night so long as the dream performs its task, and that those dreams best fulfil their function about which one knows nothing after waking. If it so often happens otherwise, if we remember dreams - even after years and decades - it always means that there has been an irruption of the repressed unconscious into the normal ego. Without this concession to it the repressed would not have consented to lend its help to the removal of the threat of disturbance to sleep. We know that it is the fact of this irruption that gives dreams their importance for psychopathology. If we can uncover a dream's motivating force, we shall obtain unsuspected information about the repressed impulses in the unconscious; and on the other hand, if we can undo its distortions, we shall overhear preconscious thought taking place in states of internal reflection which would not have attracted consciousness to themselves during the day-time.

[1925i, 4045]
In what follows I shall not be able to avoid a schematic method of exposition. Let us assume that in a particular case we have before us all the latent thoughts, charged with a greater or less amount of affect, by which the manifest dream has been replaced after its interpretation has been completed. We shall then be struck by one difference among these latent thoughts, and that difference will take us a long way. Almost all these dream-thoughts are recognized by the dreamer or acknowledged by him; he admits that he has thought this, now or at some other time, or that he might have thought it. There is only one single thought that he refuses to accept; it is strange to him or even perhaps repellent; he may possibly reject it with passionate feeling. It now becomes evident to us that the other thoughts are portions of a conscious, or, more accurately, a preconscious train of thinking. They might have been thought in waking life too, and indeed they were probably formed during the previous day. This one repudiated thought, however, or, properly speaking, this one impulse, is a child of night; it belongs to the dreamer's unconscious and on that account it is repudiated and rejected by him. It had to wait for the nightly relaxation of repression in order to arrive at any kind of expression. And in any case this expression is a weakened, distorted and disguised one; without our work of dream-interpretation we should not have found it. This unconscious impulse has to thank its link with the other, unobjectionable, dream-thoughts for the opportunity of slipping past the barrier of the censorship in an inconspicuous disguise. On the other hand, the preconscious dream-thoughts have to thank this same link for the power to occupy mental life during sleep as well. For there is no doubt about it: this unconscious impulse is the true creator of the dream; it is what produces the psychical energy for the dream's construction. Like any other instinctual impulse, it cannot strive for anything other than its own satisfaction; and our experience in interpreting dreams shows us too that that is the sense of all dreaming. In every dream an instinctual wish has to be represented as fulfilled. The shutting-off of mental life from reality at night and the regression to primitive mechanisms which this makes possible enable this wished-for instinctual satisfaction to be experienced in a hallucinatory manner as occurring in the present. As a result of this same regression, ideas are transformed in the dream into visual pictures: the latent dream-thoughts, that is to say, are dramatized and illustrated.

[1933a, 4631]

This piece of the dream-work gives us information about some of the most striking and peculiar features of dreams. I will repeat the course of events in dream-formation. As an introduction: the wish to sleep and intentional turning away from the external world. Next, two consequences of this for the mental apparatus: first, the possibility for older and more primitive methods of working to emerge in it - regression; secondly, the lowering of the resistance due to repression which weighs down upon the unconscious. As a result of this last factor the possibility arises for the formation of a dream and this is taken advantage of by the precipitating causes, the internal and external stimuli which have become active. The dream which originates in this way is already a compromise-structure. It has a double function; on the one hand it is ego-syntonic, since, by getting rid of the stimuli which are interfering with sleep, it serves the wish to sleep; on the other hand it allows a repressed instinctual impulse to obtain the satisfaction that is possible in these circumstances, in the form of the hallucinated fulfilment of a wish. The whole process of forming a dream which is permitted by the sleeping ego is, however, subject to the condition of the censorship, which is exercised by the residue of the repression still in operation. I cannot present the process more simply: it is not more simple. But I can proceed now with my description of the dream-work.
[1933a, 4632]
Let us go back once more to the latent dream-thoughts. Their most powerful element is the repressed instinctual impulse which has created in them an expression for itself on the basis of the presence of chance stimuli and by transference on to the day's residues - though an expression that is toned down and disguised. Like every instinctual impulse, it too presses for satisfaction by action; but its path to motility is blocked by the physiological regulations implied in the state of sleep; it is compelled to take the backwards course in the direction of perception and to be content with a hallucinated satisfaction. The latent dream-thoughts are thus transformed into a collection of sensory images and visual scenes. It is as they travel on this course that what seems to us so novel and so strange occurs to them. All the linguistic instruments by which we express the subtler relations of thought - the conjunctions and prepositions, the changes in declension and conjugation - are dropped, because there are no means of representing them; just as in a primitive language without any grammar, only the raw material of thought is expressed and abstract terms are taken back to the concrete ones that are at their basis. What is left over after this may well appear disconnected. The copious employment of symbols, which have become alien to conscious thinking, for representing certain objects and processes is in harmony alike with the archaic regression in the mental apparatus and with the demands of the censorship.

[1933a, 4632]
Dream-distortion was the profoundest and most difficult problem of dream life. And light was thrown on it by the following consideration, which placed dreams in a class along with other psychopathological formations and revealed them, as it were, as the normal psychoses of human beings. For our mind, that precious instrument by whose means we maintain ourselves in life, is no peacefully self-contained unity. It is rather to be compared with a modern State in which a mob, eager for enjoyment and destruction, has to be held down forcibly by a prudent superior class. The whole flux of our mental life and everything that finds expression in our thoughts are derivations and representatives of the multifarious instincts that are innate in our physical constitution. But these instincts are not all equally susceptible to direction and education, or equally ready to fall in with the demands of the external world and of human society. A number of them have retained their primitive, ungovernable nature; if we let them have their way, they would infallibly bring us to ruin. Consequently, learning by experience, we have developed organizations in our mind which, in the form of inhibitions, set themselves up against the direct manifestations of the instincts. Every impulse in the nature of a wish that arises from the sources of instinctual energy must submit itself to examination by the highest agencies of our mind, and, if it is not approved, is rejected and restrained from exercising any influence upon our movements - that is, from coming into execution. Often enough, indeed, such wishes are even forbidden to enter consciousness, which is habitually unaware even of the existence of these dangerous instinctual sources. We describe such impulses as being repressed from the point of view of consciousness, and as surviving only in the unconscious. If what is repressed contrives somehow to force its way into consciousness or into movement or into both, we are no longer normal: at that point the whole range of neurotic and psychotic symptoms arise. The maintenance of the necessary inhibitions and repressions imposes upon our mind a great expenditure of energy, from which it is glad to be relieved. A good opportunity for this seems to be offered at night by the state of sleep, since sleep involves a cessation of our motor functions. The situation seems safe, and the severity of our internal police-force may therefore be relaxed. It is not entirely withdrawn, since one cannot be certain: it may be that the unconscious never sleeps at all. And now the reduction of pressure upon the repressed unconscious produces its effect. Wishes arise from it which during sleep might find the entrance to consciousness open. If we were to know them we should be appalled, alike by their subject-matter, their unrestraint and indeed the mere possibility of their existence. This, however, occurs only seldom, and when it does we awake as speedily as possible, in a state of fear. But as a rule our consciousness does not experience the dream as it really was. It is true that the inhibitory forces (the dream censorship, as we may call them) are not completely awake, but neither are they wholly asleep. They have had an influence on the dream while it was struggling to find an expression in words and pictures, they have got rid of what was most objectionable, they have altered other parts of it till they are unrecognizable, they have severed real connections while introducing false ones, until the honest but brutal wishful phantasy which lay behind the dream has turned into the manifest dream as we remember it - more or less confused and almost always strange and incomprehensible. Thus the dream (or the distortion which characterizes it) is the expression of a compromise, the evidence of a conflict between the mutually incompatible impulses and strivings of our mental life. And do not let us forget that the same process, the same interplay of forces, which explains the dreams of a normal sleeper, gives us the key to understanding all the phenomena of neurosis and psychosis.

[1932c, 4809]
To provide a third opportunity for studying condensation in the formation of dreams, I will give part of the analysis of another dream, which I owe to an elderly lady undergoing psycho-analytic treatment. As was to be expected from the severe anxiety-states from which the patient suffered, her dreams contained a very large number of sexual thoughts, the first realization of which both surprised and alarmed her. Since I shall not be able to pursue the interpretation of the dream to the end, its material will appear to fall into several groups without any visible connection.

[1900a, 762]

It can scarcely be doubted that this dream had a sexual meaning. The silk cloths identified him with a homosexual whom he knew. The dreamer had never carried out coitus and had never aimed at having sexual intercourse with men in real life; and he pictured sexual intercourse on the model of the pubertal masturbation with which he had once been familiar.

[1900a, 843]

The more one is concerned with the solution of dreams, the more one is driven to recognize that the majority of the dreams of adults deal with sexual material and give expression to erotic wishes. A judgement on this point can be formed only by those who really analyse dreams, that is to say, who make their way through their manifest content to the latent dream-thoughts, and never by those who are satisfied with making a note of the manifest content alone (like Näcke, for instance, in his writings on sexual dreams). Let me say at once that this fact is not in the least surprising but is in complete harmony with the principles of my explanation of dreams. No other instinct has been subjected since childhood to so much suppression as the sexual instinct with its numerous components (cf. my *Three Essays on the Theory of Sexuality*, 1905d); from no other instinct are so many and such powerful unconscious wishes left over, ready to produce dreams in a state of sleep. In interpreting dreams we should never forget the significance of sexual complexes, though we should also, of course, avoid the exaggeration of attributing exclusive importance to them.

[1900a, 853]

¹ Here and elsewhere I have intentionally left gaps in the treatment of my theme because to fill them would on the one hand require too great an effort and on the other would involve my basing myself on material that is alien to the subject of dreams. For instance, I have omitted to state whether I attribute different meanings to the words ‘suppressed’ and ‘repressed.’ It should have been clear, however, that the latter lays more stress than the former upon the fact of attachment to the unconscious. Nor have I entered into the obvious problem of why the dream-thoughts are subjected to distortion by the censorship even in cases where they have abandoned the progressive path towards consciousness and have chosen the regressive one. And there are many similar omissions. What I was above all anxious to do was to create an impression of the problems to which a further analysis of the dream-work must lead and to give a hint of the other topics with which that further analysis would come into contact. It has not always been easy for me to decide the point at which to break off my pursuit of this line of exposition. There are special reasons, which may not be what my readers expect, why I have not given any exhaustive treatment to the part played in dreams by the world of sexual ideas and why I have avoided analysing dreams of obviously sexual content. Nothing could be further from my own views or from the theoretical opinions which I hold in neuropathology than to regard sexual life as something shameful, with which neither a physician nor a scientific research worker has any concern. Moreover, the moral indignation by which the translator of the *Oneirocritica* of Artemidorus of Daldis allowed himself to be led into withholding the chapter on sexual dreams from the knowledge of his readers strikes me as laughable. What governed my decision was simply my seeing that an explanation of sexual dreams would involve me deeply in the still unsolved problems of perversion and bisexuality; and I accordingly reserved this material for another occasion.

[1900a, 1033]
Now that the old antithesis between conscious life and dream life has been reduced to its proper proportions by the establishment of unconscious psychical reality, a number of dream-problems with which earlier writers were deeply concerned have lost their significance. Thus some of the activities whose successful performance in dreams excited astonishment are now no longer to be attributed to dreams but to unconscious thinking, which is active during the day no less than at night. If, as Scherner has said, dreams appear to engage in making symbolic representations of the body, we now know that those representations are the product of certain unconscious phantasies (deriving, probably, from sexual impulses) which find expression not only in dreams but also in hysterical phobias and other symptoms. If a dream carries on the activities of the day and completes them and even brings valuable fresh ideas to light, all we need do is to strip it of the dream disguise, which is the product of dream-work and the mark of assistance rendered by obscure forces from the depths of the mind (cf. the Devil in Tartini's sonata dream); the intellectual achievement is due to the same mental forces which produce every similar result during the daytime. We are probably inclined greatly to over-estimate the conscious character of intellectual and artistic production as well. Accounts given us by some of the most highly productive men, such as Goethe and Helmholtz, show rather that what is essential and new in their creations came to them without premeditation and as an almost ready-made whole. There is nothing strange if in other cases, where a concentration of every intellectual faculty was needed, conscious activity also contributed its share. But it is the much-abused privilege of conscious activity, wherever it plays a part, to conceal every other activity from our eyes.

³ I suspected, though I did not as yet say so to Dora, that she had seized upon this element on account of a symbolic meaning which it possessed. 'Zimmer' ['room'] in dreams stands very frequently for 'Frauenzimmer' [a slightly derogatory word for 'woman'; literally, 'women's apartments']. The question whether a woman is 'open' or 'shut' can naturally not be a matter of indifference. It is well known, too, what sort of 'key' effects the opening in such a case.

[1900a, 1038]

³ At this point a certain suspicion of mine became a certainty. The use of 'Bahnhof' ['station'; literally, 'railway-court'] and 'Friedhof' ['cemetery'; literally, 'peace-court'] to represent the female genitals was striking enough in itself, but it also served to direct my awakened curiosity to the similarly formed 'Vorhof' ['vestibulum'; literally, 'fore-court'] - an anatomical term for a particular region of the female genitals. This might have been no more than mistaken ingenuity. But now, with the addition of 'nymphs' visible in the background of a 'thick wood', no further doubts could be entertained. Here was a symbolic geography of sex! 'Nymphae', as is known to physicians though not to laymen (and even by the former the term is not very commonly used), is the name given to the labia minora, which lie in the background of a 'thick wood', no further doubts could be entertained. Here was a symbolic geography of sex! 'Nymphae', as is known to physicians though not to laymen (and even by the former the term is not very commonly used), is the name given to the labia minora, which lie in the background of the 'thick wood' of the pubic hair. But any one who employed such technical names as 'vestibulum' and 'nymphae' must have derived his knowledge from books, and not from popular ones either, but from anatomical text-books or from an encyclopaedia - the common refuge of youth when it is devoured by sexual curiosity. If this interpretation were correct, therefore, there lay concealed behind the first situation in the dream a phantasy of defloration, the phantasy of a man seeking to force an entrance into the female genitals.²

[1905e, 1435]
The phantasy of defloration formed the second component of the situation. The emphasis upon the
difficulty of getting forward and the anxiety felt in the dream indicated the stress which the dreamer was so
ready to lay upon her virginity - a point alluded to in another place by means of the Sistine Madonna.
These sexual thoughts gave an unconscious ground-colouring to the wishes (which were perhaps merely
kept secret ) concerned with the suitor who was waiting for her in Germany. We have already recognized
the phantasy of revenge as the first component of the same situation in the dream. The two components
do not coincide completely, but only in part. We shall subsequently come upon the traces of a third and still
more important train of thought.
[1905e, 1435]
I am aware that this explanation of anxiety in dreams sounds very strange and is not easy to credit; but I can only advise the reader to come to terms with it. Moreover it would be a very remarkable thing if Norbert Hanold's dream could be reconciled with this view of anxiety and could be explained in that way. On that basis, we should say that the dreamer's erotic longings were stirred up during the night and made a powerful effort to make conscious his memory of the girl he loved and so to tear him out of his delusion, but that those longings met with a fresh repudiation and were transformed into anxiety, which in its turn introduced into the content of the dream the terrifying pictures from the memories of his schooldays. In this manner the true unconscious content of the dream, his passionate longing for the Zoe he had once known, became transformed into its manifest content of the destruction of Pompeii and the loss of Gradiva.

[1907a, 1857]

So far, I think, it sounds plausible. But it might justly be insisted that, if erotic wishes constitute the undistorted content of the dream, it ought also to be possible to point at least to some recognizable residue of those wishes concealed somewhere in the transformed dream. Well, even that may be possible, with the help of a hint from a later part of the story. When Hanold had his first meeting with the supposed Gradiva, he recollected the dream and begged the apparition to lie down again as he had seen her do then.¹ Thereupon, however, the young lady rose indignantly and left her strange companion, for she had detected the improper erotic wish behind what he had said under the domination of his delusion. We must, I think, accept Gradiva's interpretation; even in a real dream we cannot always expect to find a more definite expression of an erotic wish.

[1907a, 1857]

Think of our first patient's obsessional action. The woman was without her husband, whom she loved intensely but with whom she could not share her life on account of his deficiencies and weaknesses. She had to remain faithful to him; she could not put anyone else in his place. Her obsessional symptom gave her what she longed for, set her husband on a pedestal, denied and corrected his weaknesses and above all his impotence. This symptom was fundamentally a wish-fulfilment, just like a dream - and moreover, what is not always true of a dream, an erotic wish-fulfilment. In the case of our second patient you could at least gather that her ceremonial sought to obstruct intercourse between her parents or prevent it from producing a new baby. You will also probably have guessed that it was at bottom endeavouring to put her herself in her mother's place. Once again, therefore, a setting-aside of interferences with sexual satisfaction and a fulfilment of the patient's own sexual wishes. I shall soon come to the complication I have hinted at.

[1916-1917, 3372]

As regards the melon, the dreamer has had the - original - idea of seeing in it 'the charms of solitude, but presented by purely human inducements'. This is certainly not correct, but it might provide an association of ideas which would lead to a correct explanation. If it is correlated with his state of sin, this association might stand for a sexual picture which occupied the lonely young man's imagination.

[1929b, 4574]
In the manifest content of dreams we very often find pictures and situations recalling familiar themes in fairy tales, legends and myths. The interpretation of such dreams thus throws a light on the original interests which created these themes, though we must at the same time not forget, of course, the change in meaning by which this material has been affected in the course of time. Our work of interpretation uncovers, so to say, the raw material, which must often enough be described as sexual in the widest sense, but has found the most varied application in later adaptations. Derivations of this kind are apt to bring down on us the wrath of all non-analytically schooled workers, as though we were seeking to deny or undervalue everything that was later erected on the original basis. Nevertheless, such discoveries are instructive and interesting. The same is true of tracing back the origin of particular themes in plastic art, as, for instance, when M. J. Eisler (1919), following indications in his patients’ dreams, gave an analytic interpretation of the youth playing with a little boy represented in the Hermes of Praxiteles. And lastly I cannot resist pointing out how often light is thrown by the interpretation of dreams on mythological themes in particular. Thus, for instance, the legend of the Labyrinth can be recognized as a representation of anal birth: the twisting paths are the bowels and Ariadne’s thread is the umbilical cord.

[1933a, 4638]
We can assert of many dreams, if they are carefully interpreted, that they are bisexual, since they unquestionably admit of an 'over-interpretation' in which the dreamer's homosexual impulses are realized - impulses, that is, which are contrary to his normal sexual activities. To maintain, however, as do Stekel (1911) and Adler (1910, etc.), that *all* dreams are to be interpreted bisexual appears to me to be a generalization which is equally undemonstrable and unpalatable and which I am not prepared to support. In particular, I cannot dismiss the obvious fact that there are numerous dreams which satisfy needs other than those which are erotic in the widest sense of the word: dreams of hunger and thirst, dreams of convenience, etc. So, too, such statements as that 'the spectre of death is to be found behind every dream' (Stekel), or that 'every dream shows an advance from the feminine to the masculine line' (Adler), appear to me to go far beyond anything that can be legitimately maintained in dream-interpretation.

[1900a, 853]
I have already shown elsewhere that strikingly innocent dreams may embody crudely erotic wishes, and I could confirm this by many new instances. But it is also true that many dreams which appear to be indifferent and which one would not regard as in any respect peculiar lead back on analysis to wishful impulses which are unmistakably sexual and often of an unexpected sort. Who, for instance, would have suspected the presence of a sexual wish in the following dream before it had been interpreted? The dreamer gave this account of it: Standing back a little behind two stately palaces was a little house with closed doors. My wife led me along the piece of street up to the little house and pushed the door open; I then slipped quickly and easily into the inside of a court which rose in an incline. Anyone, however, who has had a little experience in translating dreams will at once reflect that penetrating into narrow spaces and opening closed doors are among the commonest sexual symbols, and will easily perceive in this dream a representation of an attempt at *coitus a tergo* (between the two stately buttocks of the female body). The narrow passage rising in an incline stood, of course, for the vagina. The assistance attributed by the dreamer to his wife forces us to conclude that in reality it was only consideration for her that restrained the dreamer from making attempts of this kind. It turned out that on the dream-day a girl had come to live in the dreamer's household who had attracted him and had given him the impression that she would raise no great objections to an approach of that kind. The little house between the two palaces was a reminiscence of the Hradshin in Prague and was a further reference to the same girl, who came from that place.

No one who accepts the view that the censorship is the chief reason for dream-distortion will be surprised to learn from the results of dream-interpretation that most of the dreams of adults are traced back by analysis to *erotic wishes*. This assertion is not aimed at dreams with an undisguised sexual content, which are doubt familiar to all dreamers from their own experience and are as a rule the only ones to be described as 'sexual dreams.' Even dreams of this latter kind offer enough surprises in their choice of the people whom they make into sexual objects, in their disregard of all the limitations which the dreamer imposes in his waking life upon his sexual desires, and by their many strange details, hinting at what are commonly known as 'perversions.' A great many other dreams, however, which show no sign of being erotic in their manifest content, are revealed by the work of interpretation in analysis as sexual wish-fulfilments; and, on the other hand, analysis proves that a great many of the thoughts left over from the activity of waking life as 'residues of the previous day' only find their way to representation in dreams through the assistance of repressed erotic wishes.

So far, I think, it sounds plausible. But it might justly be insisted that, if erotic wishes constitute the undistorted content of the dream, it ought also to be possible to point at least to some recognizable residue of those wishes concealed somewhere in the transformed dream. Well, even that may be possible, with the help of a hint from a later part of the story. When Hanold had his first meeting with the supposed Gradiva, he recollected the dream and begged the apparition to lie down again as he had seen her do then.¹ Thereupon, however, the young lady rose indignantly and left her strange companion, for she had detected the improper erotic wish behind what he had said under the domination of his delusion. We must, I think, accept Gradiva's interpretation; even in a real dream we cannot always expect to find a more definite expression of an erotic wish.
The Theory of Repression. - These theoretical considerations, taken together with the immediate impressions derived from analytic work, lead to a view of the neuroses which may be described in the roughest outline as follows. The neuroses are the expression of conflicts between the ego and such of the sexual impulses as seem to the ego incompatible with its integrity or with its ethical standards. Since these impulses are not ego-syntonic, the ego has repressed them: that is to say, it has withdrawn its interest from them and has shut them off from becoming conscious as well as from obtaining satisfaction by motor discharge. If in the course of analytic work one attempts to make these repressed impulses conscious, one becomes aware of the repressive forces in the form of resistance. But the achievement of repression fails particularly readily in the case of the sexual instincts. Their dammed-up libido finds other ways out from the unconscious: for it regresses to earlier phases of development and earlier attitudes towards objects, and, at weak points in the libidinal development where there are infantile fixations, it breaks through into consciousness and obtains discharge. What results is a symptom and consequently in its essence a substitutive sexual satisfaction. Nevertheless the symptom cannot entirely escape from the repressive forces of the ego and must therefore submit to modifications and displacements exactly as happens with dreams - by means of which its characteristic of being a sexual satisfaction becomes unrecognizable. Consequently symptoms are in the nature of compromises between the repressed sexual instincts and the repressing ego-ininsticts; they represent a wish-fulfilment for both partners to the conflict simultaneously, but one which is incomplete for each of them. This is quite strictly true of the symptoms of hysteria, while in the symptoms of obsessional neurosis there is often a stronger emphasis upon the side of the repressing function owing to the erection of reaction- formations, which are assurances against sexual satisfaction.
[1923a, 3923]

But our interest in the genesis of these manifestly immoral dreams is greatly reduced when we find from analysis that the majority of dreams - innocent dreams, dreams without affect and anxiety-dreams - are revealed, when the distortions of the censorship have been undone, as the fulfilments of immoral - egoistic, sadistic, perverse or incestuous - wishful impulses. As in the world of waking life, these masked criminals are far commoner than those with their vizors raised. The straightforward dream of sexual relations with one's mother, which Jocasta alludes to in the Oedipus Rex, is a rarity in comparison with all the multiplicity of dreams which psycho-analysis must interpret in the same sense.
[1925i, 4049]

As regards the melon, the dreamer has had the - original - idea of seeing in it 'the charms of solitude, but presented by purely human inducements'. This is certainly not correct, but it might provide an association of ideas which would lead to a correct explanation. If it is correlated with his state of sin, this association might stand for a sexual picture which occupied the lonely young man's imagination.
[1929b, 4574]
'In this story the tree appears, upon which the wolves were sitting in the dream. But it also contains an unmistakable allusion to the castration complex. The old wolf was docked of his tail by the tailor. The fox-tails of the wolves in the dream were probably compensations for this taillessness.
[1918b, 3522]

There were several conclusions, too, to be drawn from the raw material which had been produced by the patient's first analysis of the dream, and these had to be fitted into the collocation of which we were in search. Behind the mention of the sheep-breeding, evidence was to be expected of his sexual researches, his interest in which he was able to gratify during his visits with his father; but there must also have been allusions to a fear of death, since the greater part of the sheep had died of the epidemic. The most obtrusive thing in the dream, the wolves on the tree, led straight to his grandfather's story; and what was fascinating about this story and capable of provoking the dream can scarcely have been anything but its connection with the theme of castration.
[1918b, 3525]

On another occasion an association which suddenly occurred to him carried us another step forward in our understanding of the dream: 'The tree was a Christmas-tree.' He now knew that he had dreamt the dream shortly before Christmas and in expectation of it. Since Christmas Day was also his birthday, it now became possible to establish with certainty the date of the dream and of the change in him which proceeded from it. It was immediately before his fourth birthday. He had gone to sleep, then, in tense expectation of the day which ought to bring him a double quantity of presents. We know that in such circumstances a child may easily anticipate the fulfilment of his wishes. So it was already Christmas in his dream; the content of the dream showed him his Christmas box, the presents which were to be his were hanging on the tree. But instead of presents they had turned into - wolves, and the dream ended by his being overcome by fear of being eaten by the wolf (probably his father), and by his flying for refuge to his nurse. Our knowledge of his sexual development before the dream makes it possible for us to fill in the gaps in the dream and to explain the transformation of his satisfaction into anxiety. Of the wishes concerned in the formation of the dream the most powerful must have been the wish for the sexual satisfaction which he was at that time longing to obtain from his father. The strength of this wish made it possible to revive a long-forgotten trace in his memory of a scene which was able to show him what sexual satisfaction from his father was like; and the result was terror, horror of the fulfilment of the wish, the repression of the impulse which had manifested itself by means of the wish, and consequently a flight from his father to his less dangerous nurse.
[1918b, 3526]

But what picture can the nightly workings of his sexual desire have conjured up that could frighten him away so violently from the fulfilment for which he longed? The material of the analysis shows that there is one condition which this picture must satisfy. It must have been calculated to create a conviction of the reality of the existence of castration. Fear of castration could then become the motive power for the transformation of the affect.
[1918b, 3527]
Let us now proceed with our discussion of the relations between his dream and the primal scene. We should so far have expected the dream to present the child (who was rejoicing at Christmas in the prospect of the fulfilment of his wishes) with this picture of sexual satisfaction afforded through his father’s agency, just as he had seen it in the primal scene, as a model of the satisfaction that he himself was longing to obtain from his father. Instead of this picture, however, there appeared the material of the story which he had been told by his grandfather shortly before: the tree, the wolves, and the taillessness (in the over-compensated form of the bushy tails of the putative wolves). At this point some connection is missing, some associative bridge to lead from the content of the primal scene to that of the wolf story. This connection is provided once again by the postures and only by them. In his grandfather’s story the tailless wolf asked the others to climb upon him. It was this detail that called up the recollection of the picture of the primal scene; and it was in this way that it became possible for the material of the primal scene to be represented by that of the wolf story, and at the same time for the two parents to be replaced, as was desirable, by several wolves. The content of the dream met with a further transformation, and the material of the wolf story was made to fit in with the content of the fairy tale of ‘The Seven Little Goats’, by borrowing from it the number seven.¹

The steps in the transformation of the material, ‘primal scene - wolf story - fairy tale of “The Seven Little Goats”’, are a reflection of the progress of the dreamer’s thoughts during the construction of the dream: ‘longing for sexual satisfaction from his father - realization that castration is a necessary condition of it - fear of his father’. It is only at this point, I think, that we can regard the anxiety-dream of this four-year-old boy as being exhaustively explained.²

They had tails like foxes. This must be the contradiction of a conclusion which was derived from the action of the primal scene on the wolf story, and which must be recognized as the most important result of the dreamer’s sexual researches: ‘So there really is such a thing as castration.’ The terror with which this conclusion was received finally broke out in the dream and brought it to an end.

The fear of being eaten up by the wolves. It seemed to the dreamer as though the motive force of this fear was not derived from the content of the dream. He said he need not have been afraid, for the wolves looked more like foxes or dogs, and they did not rush at him as though to bite him, but were very still and not at all terrible. We observe that the dream-work tries for some time to make the distressing content harmless by transforming it into its opposite. (‘They aren’t moving, and, only look, they have the loveliest tails!’) Until at last this expedient fails, and the fear breaks out. It expresses itself by the help of the fairy tale, in which the goat-children are eaten up by the wolf-father. This part of the fairy tale may perhaps have acted as a reminder of threats made by the child’s father in fun when he was playing with him; so that the fear of being eaten up by the wolf may be a reminiscence as well as a substitute by displacement.

The dream ended in a state of anxiety, from which he did not recover until he had his Nanya with him. He fled, therefore, from his father to her. His anxiety was a repudiation of the wish for sexual satisfaction from his father - the trend which had put the dream into his head. The form taken by the anxiety, the fear of ‘being eaten by the wolf’, was only the (as we shall hear, regressive) transposition of the wish to be copulated with by his father, that is, to be given sexual satisfaction in the same way as his mother. His last sexual aim, the passive attitude towards his father, succumbed to repression, and fear of his father appeared in its place in the shape of the wolf phobia.
We know from psycho-analytic experience, however, that the fear of damaging or losing one's eyes is a terrible one in children. Many adults retain their apprehensiveness in this respect, and no physical injury is so much dreaded by them as an injury to the eye. We are accustomed to say, too, that we will treasure a thing as the apple of our eye. A study of dreams, phantasies and myths has taught us that anxiety about one's eyes, the fear of going blind, is often enough a substitute for the dread of being castrated. The self-blinding of the mythical criminal, Oedipus, was simply a mitigated form of the punishment of castration - the only punishment that was adequate for him by the *lex talionis*. We may try on rationalistic grounds to deny that fears about the eye are derived from the fear of castration, and may argue that it is very natural that so precious an organ as the eye should be guarded by a proportionate dread. Indeed, we might go further and say that the fear of castration itself contains no other significance and no deeper secret than a justifiable dread of this rational kind. But this view does not account adequately for the substitutive relation between the eye and the male organ which is seen to exist in dreams and myths and phantasies; nor can it dispel the impression that the threat of being castrated in especial excites a peculiarly violent and obscure emotion, and that this emotion is what first gives the idea of losing other organs its intense colouring. All further doubts are removed when we learn the details of their 'castration complex' from the analysis of neurotic patients, and realize its immense importance in their mental life [1919h, 3684].
Footnote added 1911: Hypocritical dreams of this description are not uncommon events in my own case or in that of other people. While I was engaged in working out a certain scientific problem, I was troubled for several nights in close succession by a somewhat confusing dream which had as its subject a reconciliation with a friend whom I had dropped many years before. On the fourth or fifth occasion I at last succeeded in understanding the meaning of the dream. It was an incitement to abandon my last remnants of consideration for the person in question and to free myself from him completely, and it had been hypocritically disguised as its opposite. I have reported elsewhere a 'hypocritical Oedipus dream', dreamt by a man, in which the hostile impulses and death-wishes contained in the dream-thoughts were replaced by manifest affection. Another kind of hypocritical dream will be mentioned below in Chapter VI.

The ego, freed from all ethical bonds, also finds itself at one with all the demands of sexual desire, even those which have long been condemned by our aesthetic upbringing and those which contradict all the requirements of moral restraint. The desire for pleasure - the 'libido', as we call it - chooses its objects without inhibition, and by preference, indeed, the forbidden ones: not only other men's wives, but above all incestuous objects, objects sanctified by the common agreement of mankind, a man's mother and sister, a woman's father and brother. (The dream of our fifty-year-old lady, too, was incestuous; her libido was unmistakably directed to her son.) Lusts which we think of as remote from human nature show themselves strong enough to provoke dreams. Hatred, too, rages without restraint. Wishes for revenge and death directed against those who are nearest and dearest in waking life, against the dreamer's parents, brothers and sisters, husband or wife, and his own children are nothing unusual. These censored wishes appear to rise up out of a positive Hell; after they have been interpreted when we are awake, no censorship of them seems to us too severe.

The dreamer now began, without any further encouragement, to talk about his father's illness and death as well as about his own relations with him. His father was ill for a long time, and the nursing and treatment had cost him (the son) a lot of money. Yet it was never too much, he was never impatient, he never wished that after all it might soon come to an end. He was proud of his truly Jewish filial piety towards his father, of his strict obedience to Jewish Law. And here we are struck by a contradiction in the thoughts belonging to the dream. He had identified the tooth and his father. He wanted to proceed with the tooth in accordance with Jewish Law, which commanded him to pluck it out if it caused him pain or offence. He also wanted to proceed with his father, too, in accordance with the precepts of the Law, but in this case it commanded him to spare no expense or trouble, to take every burden on himself and to allow no hostile intention to emerge against the object that was causing him pain. Would not the two attitudes have agreed much more convincingly if he had really developed feelings towards his sick father similar to those towards his sick tooth - that is, if he had wished that an early death would put an end to his unnecessary, painful and costly existence?
I do not doubt that this was really his attitude towards his father during the tedious illness and that his boastful assurances of his filial piety were meant to distract him from these memories. Under such conditions the death-wish against a father is apt to become active and to hide itself under the mask of such sympathetic reflections as that ‘it would be a happy release for him’. But please observe that here we have passed a barrier in the latent dream-thoughts themselves. No doubt the first portion of them was unconscious only temporarily - that is, during the construction of the dream; but his hostile impulses against his father must have been permanently unconscious. They may have originated from scenes in his childhood and have occasionally slipped into consciousness, timidly and disguised, during his father's illness. We can assert this with greater certainty of other latent thoughts which have made unmistakable contributions to the content of the dream. Nothing, indeed, is to be discovered in the dream of his hostile impulses towards his father. But if we look for the roots of such hostility to a father in childhood, we shall recall that fear of a father is set up because, in the very earliest years, he opposes a boy's sexual activities, just as he is bound to do once more from social motives after the age of puberty. This relation to his father applies to our dreamer as well: his love for him included a fair admixture of awe and anxiety, which had their source in his having been early deterred by threats from sexual activity.

[1916-1917, 3280]

This same piece of information can be further applied to another of the riddles we have come up against. You recall the amazement which was caused by our discovery that what instigates dreams are actively evil and extravagantly sexual wishes, which have made the censorship and distortion of dreams necessary. When we have interpreted a dream of this sort to the dreamer and if, to take the most favourable case, he does not actually attack the interpretation, he nevertheless regularly raises the question of where these wishes come from, since they feel alien to him and their opposite is what he is conscious of. We need have no hesitation in pointing out their origin. These evil wishful impulses arise from the past, and often from a past that is not very remote. It can be shown that there was a time when they were familiar and conscious, even if they are no longer so to-day. A woman, whose dream meant that she would like to see her only daughter, now seventeen years old, dead before her eyes, found under our guidance that she had indeed at one time harboured this death wish. The child was the fruit of an unhappy marriage which was soon dissolved. Once, while she still bore her daughter in her womb, in a fit of rage after a violent scene with her husband she had beaten with her fists on her body in order to kill the child inside it. How many mothers, who love their children tenderly, perhaps over-tenderly, to-day, conceived them unwillingly and wished at that time that the living thing within them might not develop further! They may even have expressed that wish in various, fortunately harmless, actions. Thus their death-wish against someone they love, which is later so mysterious, originates from the earliest days of their relationship to that person.

[1916-1917, 3291]
In the same way, a father had a dream which justified the interpretation that he wished for the death of his favourite eldest child. He too was led to remember that there had been a time when this wish was not strange to him. When the child was still an infant in arms, the father, discontented with his choice of a wife, often thought that if the little creature, who meant nothing to him, were to die, he would be free once more and would make better use of his freedom. The same origin can be shown in the case of a great number of similar impulses of hatred; they are recollections of something belonging to the past, which was once conscious and played its part in mental life. You will be inclined to conclude from this that such wishes and such dreams ought not to arise in cases where transformations of this kind in one's relation to someone never occurred, where the relation was of the same kind from the first. I am prepared to admit this; but I must remind you that what you must take into consideration is not the wording of the dream but its sense after it has been interpreted. It is possible that a manifest dream of the death of someone loved has merely assumed a horrifying mask and may mean something quite different, or that the loved person is intended as a misleading substitute for someone else.

[1916-1917, 3291]

We will keep to wishes forgetting rid of someone, which may for the most part be attributed to the dreamer's unrestricted egoism. A wish of this kind can very often be pointed to as the constructor of a dream. Whenever anyone in the course of one's life gets in one's way - and how often this must happen in view of the complication of one's relationships in life! - a dream is promptly ready to kill that person, even if it be father or mother, brother or sister, husband or wife. This wickedness of human nature came as a great surprise to us and we were decidedly disinclined to accept this outcome of dream-interpretation without question. But as soon as we were led to look for the origin of these wishes in the past, we discovered the period of the individual's past in which there was no longer anything strange in such egoism and such wishful impulses, directed even against his closest relatives. It is children, and precisely in those earliest years which are later veiled by amnesia, who often exhibit this egoism to an extremely marked degree and who invariably show clear rudiments or, more correctly speaking, residues of it. Children love themselves first, and it is only later that they learn to love others and to sacrifice something of their own ego to others. Even those people whom a child seems to love from the beginning are loved by him at first because he needs them and cannot do without them - once again from egoistic motives. Not until later does the impulse to love make itself independent of egoism. It is literally true that his egoism has taught him to love.

[1916-1917, 3292]
In this connection it will be interesting to compare the child's attitude to his brothers and sisters with that towards his parents. A small child does not necessarily love his brothers and sisters; often he obviously does not. There is no doubt that he hates them as his competitors, and it is a familiar fact that this attitude often persists for long years, till maturity is reached or even later, without interruption. Quite often, it is true, it is succeeded, or let us rather say overlaid, by a more affectionate attitude; but the hostile one seems very generally to be the earlier. This hostile attitude can be observed most easily in children between two and a half and four or five, when a new baby brother or sister appears. It usually meets with a very unfriendly reception. Such remarks as 'I don't like him; the stork can take him away again!' are quite common. After this, every opportunity is taken of disparaging the new arrival and attempts to injure him and even murderous assaults are not unknown. If the difference in age is less, by the time the child's mental activity has awakened to some degree of intensity he finds his competitor already there and adjusts himself to him. If the difference is greater, the new baby may from the first arouse a certain sympathy as an interesting object, a sort of live doll; and where the difference in age is of eight or more years, solicitous, maternal impulses may already come into play, especially in girls. But, honestly speaking, if one comes upon a wish for the death of a brother or sister behind a dream, there is seldom need to find it puzzling and one can trace its prototype without any trouble in early childhood and often enough in later years of companionship as well.

There is no need to feel surprised, therefore, if, in a large number of people, dreams disclose their wish to get rid of their parents and especially of the parent of their own sex. We may assume that this wish is also present in waking life and is even conscious sometimes, if it can be masked by some other motive, as was the case with our dreamer in Example 3, where it was replaced by pity for his father's useless sufferings. It is rarely that the hostility alone dominates the relationship; far oftener it is in the background of more affectionate impulses by which it is suppressed, and it must wait until a dream isolates it, as it were. What seems to us of enormous size in a dream, on account of this isolation, shrinks up once more when our interpretation has given it its place in the context of real life (Hanns Sachs). But we come upon this dream-wish, too, where it has no relevance in real life, and where the adult need never confess to it in his waking life. The reason for this is that the deepest and most invariable motive for estrangement, especially between two people of the same sex, has already made itself felt in early childhood.

But there is something else that I cannot pass by. The reminder of dreams given to us by the mother and wife of Oedipus must not be allowed to remain fruitless. Do you recall the outcome of our dream-analyses - how the wishes that construct dreams are so often of a perverse or incestuous nature or reveal an unsuspected hostility to those who are nearest and dearest to the dreamer? At that time we gave no explanation of the origin of these evil impulses. Now you can find it for yourselves. They are allocations of the libido and object-cathexes which date from early infancy and have long since been abandoned as far as conscious life is concerned, but which prove still to be present at night-time and to be capable of functioning in a certain sense. Since, however, everyone, and not only neurotics, experiences these perverse, incestuous and murderous dreams, we may conclude that people who are normal to-day have passed along a path of development that has led through the perversions and object-cathexes of the Oedipus complex, that that is the path of normal development and that neurotics merely exhibit to us in a magnified and coarsened form what the analysis of dreams reveals to us in healthy people as well. And this is one of the reasons why I dealt with the study of dreams before that of neurotic symptoms.

[1916-1917, 3293]

[1916-1917, 3295]

[1916-1917, 3402]
The same extreme and unmeasured intensification of every emotion is also a feature of the affective life of children, and it is present as well in dream life. Thanks to the isolation of the single emotions in the unconscious, a slight annoyance during the day will express itself in a dream as a wish for the offending person's death, or a breath of temptation may give the impetus to the portrayal in the dream of a criminal action. Hanns Sachs has made an appropriate remark on this point: 'If we look in our consciousness at something that has been told us by a dream about a contemporary (real) situation, we ought not to be surprised to find that the monster which we saw under the magnifying glass of analysis turns out to be a tiny infusorian.'

We are led into quite another realm of explanation by the analysis of the attempt at suicide, which I must regard as seriously intended, and which, incidentally, considerably improved her position both with her parents and with the lady she loved. She went for a walk with her one day in a part of the town and at an hour at which she was not unlikely to meet her father on his way from his office. So it turned out. Her father passed them in the street and cast a furious look at her and her companion, about whom he had by that time come to know. A few moments later she flung herself into the railway cutting. The explanation she gave of the immediate reasons determining her decision sounded quite plausible. She had confessed to the lady that the man who had given them such an irate glance was her father, and that he had absolutely forbidden their friendship. The lady became incensed at this and ordered the girl to leave her then and there, and never again to wait for her or to address her - the affair must now come to an end. In her despair at having thus lost her loved one for ever, she wanted to put an end to herself. The analysis, however, was able to disclose another and deeper interpretation behind the one she gave, which was confirmed by the evidence of her own dreams. The attempted suicide was, as might have been expected, determined by two other motives besides the one she gave: it was the fulfilment of a punishment (self-punishment), and the fulfilment of a wish. As the latter it meant the attainment of the very wish which, when frustrated, had driven her into homosexuality - namely, the wish to have a child by her father, for now she 'fell' through her father's fault.¹ The fact that at that moment the lady had spoken in just the same terms as her father, and had uttered the same prohibition, forms the connecting link between this deep interpretation and the superficial one of which the girl herself was conscious. From the point of view of self-punishment the girl's action shows us that she had developed in her unconscious strong death-wishes against one or other of her parents - perhaps against her father, out of revenge for impeding her love, but more probably against her mother too, when she was pregnant with the little brother. For analysis has explained the enigma of suicide in the following way: probably no one finds the mental energy required to kill himself unless, in the first place, in doing so he is at the same time killing an object with whom he has identified himself, and, in the second place, is turning against himself a death-wish which had been directed against someone else. Nor need the regular discovery of these unconscious death-wishes in those who have attempted suicide surprise us (any more than it ought to make us think that it confirms our deductions), since the unconscious of all human beings is full enough of such death-wishes, even against those they love.² Since the girl identified herself with her mother, who should have died at the birth of the child denied to herself, this punishment-fulfilment itself was once again a wish-fulfilment. Finally, the discovery that several quite different motives, all of great strength, must have co-operated to make such a deed possible is only in accordance with what we should expect.

¹ [1921c, 3773]
² [1920a, 3851]
It is therefore with quite particular anticipations that we shall attempt to apply our technique of dream-interpretation to these typical dreams; and it is with great reluctance that we shall have to confess that our art disappoints our expectations precisely in relation to this material. If we attempt to interpret a typical dream, the dreamer fails as a rule to produce the associations which would in other cases have led us to understand it, or else his associations become obscure and insufficient so that we cannot solve our problem with their help. We shall learn in a later portion of this work why this is so and how we can make up for this defect in our technique. My readers will also discover why it is that at the present point I am able to deal only with a few members of the group of typical dreams and must postpone my consideration of the rest until this later point in my discussion.

Can we feel sure that none of the possible techniques of jokes has escaped our investigation? Of course not. But a continued examination of fresh material can convince us that we have got to know the commonest and most important technical methods of the joke-work - at all events as much as is required for forming a judgement on the nature of that psychical process. So far we have not arrived at any such judgement; but on the other hand we are now in possession of an important indication of the direction from which we may expect to receive further light upon the problem. The interesting processes of condensation accompanied by the formation of a substitute, which we have recognized as the core of the technique of verbal jokes, point towards the formation of dreams, in the mechanism of which the same psychical processes have been discovered. This is equally true, however, of the techniques of conceptual jokes - displacement, faulty reasoning, absurdity, indirect representation, representation by the opposite - which re-appear one and all in the technique of the dream-work. Displacement is responsible for the puzzling appearance of dreams, which prevents our recognizing that they are a continuation of our waking life. The use of absurdity and nonsense in dreams has cost them the dignity of being regarded as psychical products and has led the authorities to suppose that a disintegration of the mental activities and a cessation of criticism, morality and logic are necessary conditions of the formation of dreams. Representation by the opposite is so common in dreams that even the popular books of dream-interpretation, which are on a completely wrong tack, are in the habit of taking it into account. Indirect representation - the replacement of a dream-thought by an allusion, by something small, a symbolism akin to analogy - is precisely what distinguishes the mode of expression of dreams from that of our waking life.¹ So far-reaching an agreement between the methods of the joke-work and those of the dream-work can scarcely be a matter of chance. To demonstrate this agreement in detail and to examine its basis will be one of our later tasks.

Let me now touch upon one or two fields in which we have new things to learn and do in fact discover new things every day. Above all, there is the field of symbolism in dreams and in the unconscious - a fiercely contested subject, as you know. It is no small merit in our colleague, Wilhelm Stekel, that, untroubled by all the objections raised by our opponents, he has undertaken a study of dream-symbols. There is indeed still much to learn here; my Interpretation of Dreams, which was written in 1899, awaits important amplification from researches into symbolism.
I also ascribe to considerations of representability the fact which is insisted on and perhaps over-estimated by Silberer that some dreams admit of two simultaneous, and yet essentially different interpretations, one of which he calls the 'analytic' and the other the 'anagogic'. When this happens, we are invariably concerned with thoughts of a very abstract nature, which must have made their representation in the dream very difficult. We might compare it with the problem of representing in pictures a leading article from a political newspaper. In such cases, the dream-work must first replace the text that consists of abstract thoughts by one more concrete, connected with the former in some way - by comparison, symbolism, allegorical allusion, or best of all, genetically - so that the more concrete text then takes the place of the abstract one as material for the dream-work. The abstract thoughts yield the so-called anagogic interpretation, which, in our interpretative work, we discover more easily than the true analytic one. Otto Rank has justly remarked that certain dreams about their treatment, dreamt by patients in analysis, are the best models on which to form a view of these dreams which admit of more than one interpretation.
[1917d, 3033]
Nor can we leave the subject of regression in dreams without setting down in words a notion by which we have already repeatedly been struck and which will recur with fresh intensity when we have entered more deeply into the study of the psycho-neuroses: namely that dreaming is on the whole an example of regression to the dreamer's earliest condition, a revival of his childhood, of the instinctual impulses which dominated it and of the methods of expression which were then available to him. Behind this childhood of the individual we are promised a picture of a phylogenetic childhood - a picture of the development of the human race, of which the individual's development is in fact an abbreviated recapitulation influenced by the chance circumstances of life. We can guess how much to the point is Nietzsche's assertion that in dreams 'some primaeval relic of humanity is at work which we can now scarcely reach any longer by a direct path'; and we may expect that the analysis of dreams will lead us to a knowledge of man's archaic heritage, of what is psychically innate in him. Dreams and neuroses seem to have preserved more mental antiquities than we could have imagined possible; so that psycho-analysis may claim a high place among the sciences which are concerned with the reconstruction of the earliest and most obscure periods of the beginnings of the human race. [1900a, 981]

You may conclude from this that if we study the dream-work further we must succeed in gaining valuable light on the little known beginnings of our intellectual development. I hope it will be so; but this work has not so far been started upon. The prehistory into which the dream-work leads us back is of two kinds - on the one hand, into the individual's prehistory, his childhood, and on the other, in so far as each individual some how recapitulates in an abbreviated form the entire development of the human race, into phylogenetic prehistory too. Shall we succeed in distinguishing which portion of the latent mental processes is derived from the individual prehistoric period and which portion from the phylogenetic one? It is not, I believe, impossible that we shall. It seems to me, for instance, that symbolic connections, which the individual has never acquired by learning, may justly claim to be regarded as a phylogenetic heritage. [1916-1917, 3289]

A quite similar difficulty faces us in the theory of dreams. I could not deal with it in our earlier discussions on dreams. The manifest content of dreams is of the greatest diversity and individual variety, and we have shown in detail what one derives from this content by means of analysis. But alongside of these there are dreams which equally deserve to be called 'typical', which happen in everyone in the same way, dreams with a uniform content, which offer the same difficulties to interpretation. They are dreams of falling, flying, floating, swimming, of being inhibited, of being naked and certain other anxiety dreams - which lead, in different people, now to this and now to that interpretation, without any light being thrown on their monotony and typical occurrence. But in these dreams too we observe that this common background is enlivened by additions that vary individually; and it is probable that, with a widening of our knowledge, it will be possible, without constraint, to include these dreams too in the understanding of dream-life which we have acquired from other dreams. [1916-1917, 3350]
The evidence of the share taken by the unconscious id in the formation of dreams is abundant and convincing. (a) Memory is far more comprehensive in dreams than in waking life. Dreams bring up recollections which the dreamer has forgotten, which are inaccessible to him when he is awake. (b) Dreams make an unrestricted use of linguistic symbols, the meaning of which is for the most part unknown to the dreamer. Our experience, however, enables us to confirm their sense. They probably originate from earlier phases in the development of speech. (c) Memory very often reproduces in dreams impressions from the dreamer's early childhood of which we can definitely assert not only that they had been forgotten but that they had become unconscious owing to repression. That explains the help - usually indispensable - given us by dreams in the attempts we make during the analytic treatment of neuroses to reconstruct the dreamer's early life. (d) Furthermore, dreams bring to light material which cannot have originated either from the dreamer's adult life or from his forgotten childhood. We are obliged to regard it as part of the archaic heritage which a child brings with him into the world, before any experience of his own, influenced by the experiences of his ancestors. We find the counterpart of this phylogenetic material in the earliest human legends and in surviving customs. Thus dreams constitute a source of human prehistory which is not to be despised.

[1940a [1938], 4976]
When anything in a dream has the character of direct speech, that is to say, when it is said or heard and not merely thought (and it is easy as a rule to make the distinction with certainty), then it is derived from something actually spoken in waking life - though, to be sure, this something is merely treated as raw material and may be cut up and slightly altered and, more especially, divorced from its context.¹ In carrying out an interpretation, one method is to start from spoken phrases of this kind. What, then, was the origin of the butcher's remark 'That's not obtainable any longer'? The answer was that it came from me myself. A few days earlier I had explained to the patient that the earliest experiences of childhood were 'not obtainable any longer as such', but were replaced in analysis by 'transferences' and dreams. So I was the butcher and she was rejecting these transferences into the present of old habits of thinking and feeling. - What, again, was the origin of her own remark in the dream 'I don't recognize that; I won't take it'? For the purposes of the analysis this had to be divided up. 'I don't recognize that' was something she had said the day before to her cook, with whom she had had a dispute; but at the time she had gone on: 'Behave yourself properly!' At this point there had clearly been a displacement. Of the two phrases that she had used in the dispute with her cook, she had chosen the insignificant one for inclusion in the dream. But it was only the suppressed one, 'Behave yourself properly!' that fitted in with the rest of the content of the dream: those would have been the appropriate words to use if someone had ventured to make improper suggestions and had forgotten 'to close his meat-shop'. The allusions underlying the incident with the vegetable-seller were a further confirmation that our interpretation was on the right track. A vegetable that is sold tied up in bundles (lengthways, as the patient added afterwards) and is also black, could only be a dream-combination of asparagus and black (Spanish) radishes. No knowledgeable person of either sex will ask for an interpretation of asparagus. But the other vegetable - 'Schwarzer Retting' - can be taken as an exclamation - 'Schwarzer rett dich!' -, and accordingly it too seems to hint at the same sexual topic which we suspected at the very beginning, when we felt inclined to introduce the phrase about the meat-shop being closed into the original account of the dream. We need not enquire now into the full meaning of the dream. So much is quite clear: it had a meaning and that meaning was far from innocent.²

Where spoken sentences occur in dreams and are expressly distinguished as such from thoughts, it is an invariable rule that the words spoken in the dream are derived from spoken words remembered in the dream-material. The text of the speech is either retained unaltered or expressed with some slight displacement. A speech in a dream is often put together from various recollected speeches, the text remaining the same but being given, if possible, several meanings, or one different from the original one. A spoken remark in a dream is not infrequently no more than an allusion to an occasion on which the remark in question was made.¹

¹ [Footnote added 1909:] Not long ago I found a single exception to this rule in the case of a young man who suffered from obsessions while retaining intact his highly developed intellectual powers. The spoken words which occurred in his dreams were not derived from remarks which he had heard or made himself. They contained the undistorted text of his obsessional thoughts, which in his waking life only reached his consciousness in a modified form.

² [1900a, 671]
At this point an objection may perhaps be raised in dispute of the idea that dreams are unable to represent logical relations. For there are dreams in which the most complicated intellectual operations take place, statements are contradicted or confirmed, ridiculed or compared, just as they are in waking thought. But here again appearances are deceitful. If we go into the interpretation of dreams such as these, we find that the whole of this is part of the material of the dream-thoughts and is not a representation of intellectual work performed during the dream itself. What is reproduced by the ostensible thinking in the dream is the subject-matter of the dream-thoughts and not the mutual relations between them, the assertion of which constitutes thinking. I shall bring forward some instances of this. But the easiest point to establish in this connection is that all spoken sentences which occur in dreams and are specifically described as such are unmodified or slightly modified reproductions of speeches which are also to be found among the recollections in the material of the dream-thoughts. A speech of this kind is often no more than an allusion to some event included among the dream-thoughts, and the meaning of the dream may be a totally different one.

When we take together these and some other examples which I shall give later, we may safely say that the dream-work does not in fact carry out any calculations at all, whether correctly or incorrectly; it merely throws into the form of a calculation numbers which are present in the dream-thoughts and can serve as allusions to matter that cannot be represented in any other way. In this respect the dream-work is treating numbers as a medium for the expression of its purpose in precisely the same way as it treats any other idea, including proper names and speeches that occur recognizably as verbal presentations.

For the dream-work cannot actually create speeches. However much speeches and conversations, whether reasonable or unreasonable in themselves, may figure in dreams, analysis invariably proves that all that the dream has done is to extract from the dream-thoughts fragments of speeches which have really been made or heard. It deals with these fragments in the most arbitrary fashion. Not only does it drag them out of their context and cut them in pieces, incorporating some portions and rejecting others, but it often puts them together in a new order, so that a speech which appears in the dream to be a connected whole turns out in analysis to be composed of three or four detached fragments. In producing this new version, a dream will often abandon the meaning that the words originally had in the dream-thoughts and give them a fresh one.¹ If we look closely into a speech that occurs in a dream, we shall find that it consists on the one hand of relatively clear and compact portions and on the other hand of portions which serve as connecting matter and have probably been filled in at a later stage, just as, in reading, we fill in any letters or syllables that may have been accidentally omitted. Thus speeches in dreams have a structure similar to that of breccia, in which largish blocks of various kinds of stone are cemented together by a binding medium.

Strictly speaking, this description applies only to such speeches in dreams as possess something of the sensory quality of speech, and which are described by the dreamer himself as being speeches. Other sorts of speeches, which are not, as it were, felt by him as having been heard or spoken (that is, which have no acoustic or motor accompaniments in the dream), are merely thoughts such as occur in our waking thought-activity and are often carried over unmodified into our dreams. Another copious source of undifferentiated speeches of this kind, though one which it is difficult to follow up, seems to be provided by material that has been read. But whatever stands out markedly in dreams as a speech can be traced back to real speeches which have been spoken or heard by the dreamer.
Instances showing that speeches in dreams have this origin have already been given by me in the course of analysing dreams which I have quoted for quite other purposes. Thus, in the 'innocent' market dream reported on p. 670, the spoken words 'that's not obtainable any longer' served to identify me with the butcher, while one portion of the other speech, 'I don't recognize that; I won't take it', was actually responsible for making the dream an 'innocent' one. The dreamer, it will be remembered, having had some suggestion made to her on the previous day by her cook, had replied with the words: 'I don't recognize that; behave yourself properly!' The innocent-sounding first part of this speech was taken into the dream by way of allusion to its second part, which fitted excellently into the phantasy underlying the dream, but would at the same time have betrayed it.

[1900a, 873]

Here is another example, which will serve instead of many, all of them leading to the same conclusion.

[1900a, 873]

The dreamer was in a big courtyard in which some dead bodies were being burnt. 'I'm off', he said, 'I can't bear the sight of it.' (This was definitely a speech.) He then met two butcher's boys. 'Well', he asked, 'did it taste nice?' 'No', one of them answered, 'not a bit nice' - as though it had been human flesh.

[1900a, 873]

The innocent occasion of the dream was as follows. The dreamer and his wife had paid a visit after supper to their neighbours, who were excellent people but not precisely appetizing. The hospitable old lady was just having her supper and had tried to force him (there is a phrase with a sexual sense used jokingly among men to render this idea¹) to taste some of it. He had declined, saying he had no appetite left: 'Get along!' she had replied, 'you can manage it', or words to that effect. He had therefore been obliged to taste it and had complimented her on it saying: 'that was very nice.' When he was once more alone with his wife he had grumbled at his neighbour's insistence and also at the quality of the food. The thought, 'I can't bear the sight of it', which in the dream too failed to emerge as a speech in the strict sense, was an allusion to the physical charms of the lady from which the invitation had come, and it must be taken as meaning that he had no desire to look at them.

[1900a, 873]
The localities in the dream were brought together from several trips of mine to the Adriatic (to Miramare, Duino, Venice and Aquileia). A short but enjoyable Easter trip which I had made to Aquileia with my brother a few weeks before the dream was still fresh in my memory. The dream also contained allusions to the maritime war between America and Spain and to anxieties to which it had given rise about the fate of my relatives in America. At two points in the dream affects were in question. At one point an affect that was to be anticipated was absent: attention was expressly drawn to the fact that the Governor's death made no impression on me. At another point, when I thought I saw the warship, I was frightened and felt all the sensations of fright in my sleep. In this well-constructed dream the affects were distributed in such a way that any striking contradiction was avoided. There was no reason why I should be frightened at the death of the Governor and it was quite reasonable that as Commandant of the Castle I should be frightened at the sight of the warship. The analysis showed, however, that Herr P. was only a substitute for my own self. (In the dream I was the substitute for him.) I was the Governor who suddenly died. The dream-thoughts dealt with the future of my family after my premature death. This was the only distressing one among the dream-thoughts; and it must have been from it that the fright was detached and brought into connection in the dream with the sight of the warship. On the other hand, the analysis showed that the region of the dream-thoughts from which the warship was taken was filled with the most cheerful recollections. It was a year earlier, in Venice, and we were standing one magically beautiful day at the windows of our room on the Riva degli Schiavoni and were looking across the blue lagoon on which that day there was more movement than usual. English ships were expected and were to be given a ceremonial reception. Suddenly my wife cried out gaily as a child: 'Here comes the English warship!' In the dream I was frightened at these same words. (We see once again that speeches in a dream are derived from speeches in real life; I shall show shortly that the element 'English' in my wife's exclamation did not elude the dream-work either.) Here, then, in the process of changing the dream-thoughts into the manifest dream-content, I have transformed cheerfulness into fear, and I need only hint that this transformation was itself giving expression to a portion of the latent dream-content. This example proves, however, that the dream-work is at liberty to detach an affect from its connections in the dream-thoughts and introduce it at any other point it chooses in the manifest dream.

[1900a, 908]

Nor have I any changes to suggest in this interpretation except to add that the content of the dream must have been overdetermined and that the words spoken by the child must have been made up of words which he had actually spoken in his lifetime and which were connected with important events in the father's mind. For instance, 'I'm burning' may have been spoken during the fever of the child's last illness, and 'Father, don't you see?' may have been derived from some other highly emotional situation of which we are in ignorance.

[1900a, 946]

The content of dreams, however, does not consist entirely of situations, but also includes disconnected fragments of visual images, speeches and even bits of unmodified thoughts. It may therefore perhaps be of interest to enumerate very briefly the modes of representation available to the dream-work for reproducing the dream-thoughts in the peculiar form of expression necessary in dreams.

[1901a, 1075]
The dream-work exhibits no activities other than the four that have already been mentioned. If we keep to the definition of 'dream-work' as the process of transforming the dream-thoughts into the dream-content, it follows that the dream-work is not creative, that it develops no phantasies of its own, that it makes no judgements and draws no conclusions; it has no functions whatever other than condensation and displacement of the material and its modification into pictorial form, to which must be added as a variable factor the final bit of interpretative revision. It is true that we find various things in the dream-content which we should be inclined to regard as a product of some other and higher intellectual function; but in every case analysis shows convincingly that these intellectual operations have already been performed in the dream-thoughts and have only been TAKEN OVER by the dream-content. A conclusion drawn in a dream is nothing other than the repetition of a conclusion in the dream-thoughts; if the conclusion is taken over into the dream unmodified, it will appear impeccable; if the dream-work has displaced it on to some other material, it will appear nonsensical. A calculation in the dream-content signifies nothing more than that there is a calculation in the dream-thoughts; but while the latter is always rational, a dream-calculation may produce the wildest results if its factors are condensed or if its mathematical operations are displaced on to other material. Not even the speeches that occur in the dream-content are original compositions; they turn out to be a hotchpotch of speeches made, heard or read, which have been revived in the dream-thoughts and whose wording is exactly reproduced, while their origin is entirely disregarded and their meaning is violently changed.

[1901a, 1082]

The remark 'That's not obtainable any longer' originated from the treatment itself. A few days earlier I had explained to the patient in those very words that the earliest memories of childhood were 'not obtainable any longer as such', but were replaced in analysis by 'transferences' and dreams. So I was the butcher.

[1901a, 1082]

The second speech - 'I don't recognize that' - occurred in an entirely different connection. On the previous day she had reproved her cook, who incidentally also appeared in the dream, with the words: 'Behave yourself properly! I don't recognize that!' meaning, no doubt, that she did not understand such behaviour and would not put up with it. As the result of a displacement, it was the more innocent part of this speech which made its way into the content of the dream; but in the dream-thoughts it was only the other part of the speech that played a part. For the dream-work had reduced to complete unintelligibility and extreme innocence an imaginary situation in which I was behaving improperly to the lady in a particular way. But this situation which the patient was expecting in her imagination was itself only a new edition of something she had once actually experienced.

[1901a, 1082]

By inadvertence, I unfortunately left a gap in the analysis of the dream. Dora's father was made to say, 'I refuse to let my two children go to their destruction . . .' ('as a result of masturbation' should no doubt be added from the dream-thoughts). Such speeches in dreams are regularly constructed out of pieces of actual speeches which have either been made or heard. I ought to have made enquiries as to the actual source of this speech. The results of my enquiry would no doubt have shown that the structure of the dream was still more complicated, but would at the same time have made it easier to penetrate.

[1905e, 1428]
'Somewhere in the sun Gradiva was sitting, catching lizards and speaking.' What impression of the previous day finds an echo in this part of the dream? Undoubtedly the encounter with the elderly gentleman, the lizard-catcher, who was thus replaced in the dream by Gradiva. He sat or lay 'on a sun-bathed slope' and he, too, spoke to Hanold. Furthermore, Gradiva's remarks in the dream were copied from this man's remarks: viz. 'The method prescribed by our colleague Eimer is a really good one; I have made use of it many times already with excellent results. Please keep quite still.' Gradiva used much the same words in the dream, except that 'our colleague Eimer' was replaced by an unnamed 'lady colleague'; moreover, the 'many times' in the zoologist's speech was omitted in the dream and the order of the sentences was somewhat altered. It seems, therefore, that this experience of the previous day was transformed into the dream with the help of a few changes and distortions. Why this particular experience? And what is the meaning of the changes - the replacement of the elderly gentleman by Gradiva and the introduction of the enigmatic 'lady colleague'?

There is a rule in interpreting dreams which runs as follows: 'A speech heard in a dream is always derived from one that has been heard or made by the dreamer in waking life.' This rule seems to have been observed here: Gradiva's speech is only a modification of the old zoologist's speech which Hanold had heard the day before. Another rule in dream-interpretation would tell us that when one person is replaced by another or when two people are mixed up together (for instance, by one of them being shown in a situation that is characteristic of the other), it means that the two people are being equated, that there is a similarity between them. If we venture to apply this rule too to our dream, we should arrive at this translation: 'Gradiva catches lizards just like the old man; she is skilled in lizard-catching just as he is.' This result cannot exactly be said to be intelligible as yet; but we have yet another puzzle to solve. To what impression of the previous day are we to relate the 'lady colleague' who in the dream replaces the famous zoologist Eimer? Fortunately we have very little choice here. A 'lady colleague' can only mean another girl - that is to say, represent/represented the sympathetic young lady whom Hanold had taken for a sister travelling with her brother. 'She was wearing a red Sorrento rose in her dress, the sight of which reminded him of something as he looked across from his corner of the dining-room, but he could not think what.' This remark of the author's gives us a right to regard her as the 'lady colleague' in the dream. What Hanold could not recall were, it cannot be doubted, the words spoken by the supposed Gradiva, who had told him, as she asked him for the white flowers of the dead, that in the spring people give happier girls roses. But behind those words there had lain a hint of wooing. So what sort of lizard-catching was it that the happier 'lady colleague' had carried out so successfully?

I will only add that this dream obeys the rule I have given in *The Interpretation of Dreams*, to the effect that speeches occurring in dreams are derived from speeches heard or spoken by the dreamer during the preceding days.
There are, besides this, two special ways in which a more precise knowledge of obsessional structures can be gained. In the first place, experience shows that an obsessional command (or whatever it may be), which in waking life is known only in a truncated and distorted form, like a mutilated telegraph message, may have its actual text brought to light in a dream. Such texts appear in dreams in the shape of speeches, and are thus an exception to the rule that speeches in dreams are derived from speeches in real life.² Secondly, in the course of the analytic examination of a case history, one becomes convinced that if a number of obsessions succeed one another they are often - even though their wording is not identical - ultimately one and the same. The obsession may have been successfully shaken off on its first appearance, but it comes back a second time in a distorted form and without being recognized, and may then perhaps be able to hold its own in the defensive struggle more effectively, precisely because of its distortion. But the original form is the correct one, and often displays its meaning quite openly. When we have at great pains elucidated an unintelligible obsessional idea, it often happens that the patient informs us that just such a notion, wish, or temptation as the one we have constructed did in fact make its appearance on one occasion before the obsessional idea had arisen, but that it did not persist. It would unfortunately involve us in too lengthy a digression if we were to give instances of this from the history of our present patient.

[1909d, 2174]

We have already in The Interpretation of Dreams described the way in which the regression of the preconscious day's residues takes place in dream-formation. In this process thoughts are transformed into images, mainly of a visual sort; that is to say, word-presentations are taken back to the thing-presentations which correspond to them, as if, in general, the process were dominated by considerations of representability. When regression has been completed, a number of cathexes are left over in the system Ucs. - cathexes of memories of things. The primary psychical process is brought to bear on these memories, till, by condensation of them and displacement between their respective cathexes, it has shaped the manifest dream-content. Only where the word-presentations occurring in the day's residues are recent and current residues of perceptions, and not the expression of thoughts, are they themselves treated like thing-presentations, and subjected to the influence of condensation and displacement. Hence the rule laid down in The Interpretation of Dreams, and since confirmed beyond all doubt, that words and speeches in the dream-content are not freshly formed, but are modelled on speeches from the day preceding the dream (or on some other recent impressions, such as something that has been read). It is very noteworthy how little the dream-work keeps to the word-presentations; it is always ready to exchange one word for another till it finds the expression which is most handy for plastic representation.¹

[1917d, 3033]
On the other hand, we must not over-estimate the dream-work and attribute too much to it. The achievements I have enumerated exhaust its activity; it can do no more than condense, displace, represent in plastic form and subject the whole to a secondary revision. What appear in the dream as expressions of judgement, of criticism, of astonishment or of inference - none of these are achievements of the dream-work and they are very rarely expressions of afterthoughts about the dream; they are for the most part portions of the latent dream-thoughts which have passed over into the manifest dream with a greater or less amount of modification and adaptation to the context. Nor can the dream-work compose speeches. With a few assignable exceptions, speeches in dreams are copies and combinations of speeches which one has heard or spoken oneself on the day before the dream and which have been included in the latent thoughts either as material or as the instigator of the dream. The dream-work is equally unable to carry out calculations. Such of them as appear in the manifest dream are mostly combinations of numbers, sham calculations which are quite senseless quâ calculations and are once again only copies of calculations in the latent dream-thoughts. In these circumstances it is not to be wondered at that the interest which had turned to the dream-work soon tends to move away from it to the latent dream-thoughts, which are revealed, distorted to a greater or less degree, by the manifest dream. But there is no justification for carrying this shift of interest so far that, in looking at the matter theoretically, one replaces the dream entirely by the latent dream-thoughts and makes some assertion about the former which only applies to the latter. It is strange that the findings of psycho-analysis could be misused to bring about this confusion. One cannot give the name of ‘dream’ to anything other than the product of the dream-work - that is to say, the form into which the latent thoughts have been transmuted by the dream-work.

[1916-1917, 3273]

Or one can (b) start the work of interpretation from some one particular element of the dream which one picks out from the middle of it. For instance, one can choose the most striking piece of it, or the piece which shows the greatest clarity or sensory intensity; or, again, one can start off from some spoken words in the dream, in the expectation that they will lead to the recollection of some spoken words in waking life.

[1923c, 4030]
At this point an objection may perhaps be raised in dispute of the idea that dreams are unable to represent logical relations. For there are dreams in which the most complicated intellectual operations take place, statements are contradicted or confirmed, ridiculed or compared, just as they are in waking thought. But here again appearances are deceitful. If we go into the interpretation of dreams such as these, we find that the whole of this is part of the material of the dream-thoughts and is not a representation of intellectual work performed during the dream itself. What is reproduced by the ostensible thinking in the dream is the subject-matter of the dream-thoughts and not the mutual relations between them, the assertion of which constitutes thinking. I shall bring forward some instances of this. But the easiest point to establish in this connection is that all spoken sentences which occur in dreams and are specifically described as such are unmodified or slightly modified reproductions of speeches which are also to be found among the recollections in the material of the dream-thoughts. A speech of this kind is often no more than an allusion to some event included among the dream-thoughts, and the meaning of the dream may be a totally different one.

Nevertheless, I will not deny that critical thought-activity which is not a mere repetition of material in the dream-thoughts does have a share in the formation of dreams. I shall have to elucidate the part played by this factor at the end of the present discussion. It will then become apparent that this thought-activity is not produced by the dream-thoughts but by the dream itself after it has already, in a certain sense, been completed.

My next task is to show that the dream-work consists in nothing more than a combination of the three factors I have mentioned - and of a fourth which I have still to mention; that it carries out no other function than the translation of dream-thoughts in accordance with the four conditions to which it is subject; and that the question whether the mind operates in dreams with all its intellectual faculties or with only a part of them is wrongly framed and disregards the facts. Since, however, there are plenty of dreams in whose content judgements are passed, criticisms made, and appreciations expressed, in which surprise is felt at some particular element of the dream, in which explanations are attempted and argumentations embarked upon, I must now proceed to meet the objections arising from facts of this kind by producing some chosen examples.
The dream-work exhibits no activities other than the four that have already been mentioned. If we keep to the definition of 'dream-work' as the process of transforming the dream-thoughts into the dream-content, it follows that the dream-work is not creative, that it develops no phantasies of its own, that it makes no judgements and draws no conclusions; it has no functions whatever other than condensation and displacement of the material and its modification into pictorial form, to which must be added as a variable factor the final bit of interpretative revision. It is true that we find various things in the dream-content which we should be inclined to regard as a product of some other and higher intellectual function; but in every case analysis shows convincingly that these intellectual operations have already been performed in the dream-thoughts and have only been TAKEN OVER by the dream-content. A conclusion drawn in a dream is nothing other than the repetition of a conclusion in the dream-thoughts; if the conclusion is taken over into the dream unmodified, it will appear impeccable; if the dream-work has displaced it on to some other material, it will appear nonsensical. A calculation in the dream-content signifies nothing more than that there is a calculation in the dream-thoughts; but while the latter is always rational, a dream-calculation may produce the wildest results if its factors are condensed or if its mathematical operations are displaced on to other material. Not even the speeches that occur in the dream-content are original compositions; they turn out to be a hotchpotch of speeches made, heard or read, which have been revived in the dream-thoughts and whose wording is exactly reproduced, while their origin is entirely disregarded and their meaning is violently changed.

After these influences have been brought to bear upon the dream-thoughts the dream is almost complete. A further, somewhat variable, factor also comes into play - known as 'secondary revision' - after the dream has been presented before consciousness as an object of perception. At that point we treat it as we are in general accustomed to treat the contents of our perception: we fill in gaps and introduce connections, and in doing so are often guilty of gross misunderstandings. But this activity, which might be described as a rationalizing one and which at best provides the dream with a smooth façade that cannot fit its true content, may also be omitted or only be expressed to a very modest degree - in which case the dream will display all its rents and cracks openly. It must not be forgotten, on the other hand, that the dream-work does not always operate with equal energy either; it often restricts itself to certain portions of the dream-thoughts only and others of them are allowed to appear in the dream unaltered. In such cases an impression is given of the dream having carried out the most delicate and complex intellectual operations, of its having speculated, made jokes, arrived at decisions and solved problems, whereas all this is a product of our normal mental activity, may have been performed equally well during the day before the dream as during the night, has nothing to do with the dream-work and brings nothing to light that is characteristic of dreams. Nor is it superfluous to insist once more on the contrast within the dream-thoughts themselves between the unconscious instinctual impulse and the day's residues. While the latter exhibit all the multiplicity of our mental acts, the former, which becomes the motive force proper of the forming of the dream, finds its outlet invariably in the fulfilment of a wish.
The nature of the dream-work and the way in which it plays about with its material, the dream-thoughts, are instructively shown when we come to consider numbers and calculations that occur in dreams. Moreover, numbers in dreams are regarded superstitiously as being especially significant in regard to the future. I shall therefore select a few instances of this kind from my collection.

[1900a, 869]

Extract from a dream dreamt by a lady shortly before her treatment came to an end: She was going to pay for something. Her daughter took 3 florins and 65 kreuzers from her (the mother's) purse. The dreamer said to her: 'What are you doing? It only costs 21 kreuzers.' Owing to my knowledge of the dreamer's circumstances, this bit of dream was intelligible to me without any further explanation on her part. The lady came from abroad and her daughter was at school in Vienna. She was in a position to carry on her treatment with me as long as her daughter remained in Vienna. The girl's school year was due to end in three weeks and this also meant the end of the lady's treatment. The day before the dream, the headmistress had asked her whether she would not consider leaving her daughter at school for another year. From this suggestion she had evidently gone on to reflect that in that case she might also continue her treatment. This was what the dream referred to. One year is equal to 365 days. The three weeks which remained both of the school-year and of the treatment were equivalent to 21 days (though the hours of treatment would be less than this). The numbers, which in the dream-thoughts referred to periods of time, were attached in the dream itself to sums of money - not but what there was a deeper meaning involved, for 'time is money.' 365 kreuzers only amount to 3 florins and 65 kreuzers; and the smallness of the sums that occurred in the dream was obviously the result of wish-fulfilment. The dreamer's wish reduced the cost both of the treatment and of the year's school-fees.

[1900a, 869]

The numbers which occurred in another dream involved more complicated circumstances. A lady who, though she was still young, had been married for a number of years, received news that an acquaintance of hers, Elise L., who was almost exactly her contemporary, had just become engaged. Thereupon she had the following dream. She was at the theatre with her husband. One side of the stalls was completely empty. Her husband told her that Elise L. and her fiancé had wanted to go too; but had only been able to get bad seats - three for 1 florin 50 kreuzers - and of course they could not take those. She thought it would not really have done any harm if they had.

[1900a, 870]

It will be observed that the meaning and context of the numbers have been altered to a far greater extent in this dream than in the former one. The processes of modification and distortion have gone further here; and this is to be explained by the dream-thoughts in this case having to overcome a specially high degree of endopsychic resistance before they could obtain representation. Nor should we overlook the fact that there was an element of absurdity in the dream, namely the three seats being taken by two people. I will anticipate my discussion of absurdity in dreams by pointing out that this absurd detail in the content of the dream was intended to represent the most strongly emphasized of the dream-thoughts, viz., 'it was absurd to marry so early.' The absurdity which had to find a place in the dream was ingeniously supplied by the number 3, which was itself derived from a quite immaterial point of distinction between the two people under comparison - the 3 months' difference between their ages. The reduction of the actual 150 florins to 1 florin 50 corresponded to the low value assigned by the dreamer to her husband (or treasure), in her suppressed thoughts.

[1900a, 870]
Since the dream dates from 1898 this was evidently a miscalculation, and the dreamer's inability to do sums would deserve to be compared with that of a general paralytic unless it could be explained in some other way. My patient was one of those people who, whenever they happen to catch sight of a woman, cannot let her alone in their thoughts. The patient who for some months used regularly to come next after him in my consulting room, and whom he thus ran into, was a young lady; he used constantly to make enquiries about her and was most anxious to create a good impression with her. It was she whose age he estimated at 28 years. So much by way of explanation of the result of the ostensible calculation. 1882, incidentally, was the year in which the dreamer had married. - I may add that he was unable to resist entering into conversation with the two other members of the female sex whom he came across in my house - the two maids (neither of them by any means youthful), one or other of whom used to open the door to him; he explained their lack of response as being due to their regarding him as an elderly gentleman of settled habits.

Here is another dream dealing with figures, which is characterized by the clarity of the manner in which it was determined, or rather, overdetermined. I owe both the dream and its interpretation to Dr. B. Dattner. 'The landlord of my block of flats, who is a police-constable, dreamt that he was on street-duty. (This was a wish-fulfilment.) An inspector came up to him, who had the number 22 followed by 62 or 26, on his collar. At any rate there were several twos on it.'

'The mere fact that in reporting the dream the dreamer broke up the number 2262 showed that its components had separate meanings. He recalled that the day before there had been some talk at the police station about the men's length of service. The occasion for it was an inspector who had retired on his pension at the age of 62. The dreamer had only served for 22 years, and it would be 2 years and 2 months before he would be eligible for a 90 percent pension. The dream represented in the first place the fulfilment of a long-cherished wish of the dreamer's to reach the rank of inspector. The superior officer with "2262" on his collar was the dreamer himself. He was on street duty - another favourite wish of his - he had served his remaining 2 years and 2 months and now, like the 62-year-old inspector, he could retire on a full pension.'¹

¹ [Footnote added 1914:] For analyses of other dreams containing numbers, see Jung, Marcinowski and others. These often imply very complicated operations with numbers, which have been carried out by the dreamer with astonishing accuracy. See also Jones (1912a)

When we take together these and some other examples which I shall give later, we may safely say that the dream-work does not in fact carry out any calculations at all, whether correctly or incorrectly; it merely throws into the form of a calculation numbers which are present in the dream-thoughts and can serve as allusions to matter that cannot be represented in any other way. In this respect the dream-work is treating numbers as a medium for the expression of its purpose in precisely the same way as it treats any other idea, including proper names and speeches that occur recognizably as verbal presentations.
Once again it is impossible for me to present a complete analysis. I must restrict myself to bringing out a few salient points. Distressing anticipations from the previous day were what gave rise to the dream: we had once more been without news of our son at the front for over a week. It is easy to see that the content of the dream expressed a conviction that he had been wounded or killed. Energetic efforts were clearly being made at the beginning of the dream to replace the distressing thoughts by their contrary. I had some highly agreeable news to communicate - something about money being sent . . . distinction . . . distribution. (The sum of money was derived from an agreeable occurrence in my medical practice; it was an attempt at a complete diversion from the topic.) But these efforts failed. My wife suspected something dreadful and refused to listen to me. The disguises were too thin and references to what it was sought to repress pierced through them everywhere. If my son had been killed, his fellow-officers would send back his belongings and I should have to distribute what he left among his brothers and sisters and other people. A 'distinction' is often awarded to an officer who has fallen in battle. Thus the dream set about giving direct expression to what it had first sought to deny, though the inclination towards wish-fulfillment was still shown at work in the distortions. (The change of locality during the dream is no doubt to be understood as what Silberer has described as 'threshold symbolism'. We cannot tell, it is true, what it was that provided the dream with the motive force for thus giving expression to my distressing thoughts. My son did not appear as someone 'falling' but as someone 'climbing.' He had in fact been a keen mountaineer. He was not in uniform but in sports clothes; this meant that the place of the accident that I now feared had been taken by an earlier, sporting one; for he had had a fall during a skiing expedition and broken his thigh. The way in which he was dressed, on the other hand, which made him look like a seal, at once recalled someone younger - our funny little grandson; while the grey hair reminded me of the latter's father, our son-in-law, who had been hard hit by the war. What could this mean? . . . but I have said enough of it. - The locality in a store-closet and the cupboard from which he wanted to take something ('on which he wanted to put something' in the dream) - these allusions reminded me unmistakably of an accident of my own which I had brought on myself when I was between two and three years old. I had climbed up on to a stool in the store-closet to get something nice that was lying on a cupboard or table. The stool had tipped over and its corner had struck me behind my lower jaw; I might easily, I reflected, have knocked out all my teeth. The recollection was accompanied by an admonitory thought: 'that serves you right'; and this seemed as though it was a hostile impulse aimed at the gallant soldier. Deeper analysis at last enabled me to discover what the concealed impulse was which might have found satisfaction in the dreaded accident to my son: it was the envy which is felt for the young by those who have grown old, but which they believe they have completely stifled. And there can be no question that it was precisely the strength of the painful emotion which would have arisen if such a misfortune had really happened that caused that emotion to seek out a repressed wish-fulfilment of this kind in order to find some consolation. [1900a, 991]
The dream-work exhibits no activities other than the four that have already been mentioned. If we keep to the definition of 'dream-work' as the process of transforming the dream-thoughts into the dream-content, it follows that the dream-work is not creative, that it develops no phantasies of its own, that it makes no judgements and draws no conclusions; it has no functions whatever other than condensation and displacement of the material and its modification into pictorial form, to which must be added as a variable factor the final bit of interpretative revision. It is true that we find various things in the dream-content which we should be inclined to regard as a product of some other and higher intellectual function; but in every case analysis shows convincingly that these intellectual operations have already been performed in the dream-thoughts and have only been TAKEN OVER by the dream-content. A conclusion drawn in a dream is nothing other than the repetition of a conclusion in the dream-thoughts; if the conclusion is taken over into the dream unmodified, it will appear impeccable; if the dream-work has displaced it on to some other material, it will appear nonsensical. A calculation in the dream-content signifies nothing more than that there is a calculation in the dream-thoughts; but while the latter is always rational, a dream-calculation may produce the wildest results if its factors are condensed or if its mathematical operations are displaced on to other material. Not even the speeches that occur in the dream-content are original compositions; they turn out to be a hotchpotch of speeches made, heard or read, which have been revived in the dream-thoughts and whose wording is exactly reproduced, while their origin is entirely disregarded and their meaning is violently changed.

[1901a, 1082]

(II) Here is an apparently quite meaningless dream containing figures. She was going to pay for something. Her daughter took 3 florins and 65 kreuzers from her (the mother's) purse. The dreamer said to her: 'What are you about? It only costs 21 kreuzers.'

[1901a, 1083]

The dreamer came from abroad and her daughter was at school here. She was in a position to carry on her treatment with me as long as her daughter remained in Vienna. The day before the dream the head-mistress had suggested to her that she should leave her daughter at school for another year. In that case she could also have continued her treatment for a year. The figures in the dream become significant if we remember that 'time is money.' One year is equal to 365 days, or, expressed in money, 365 kreuzers or 3 florins 65 kreuzers. The 21 kreuzers corresponded to the 3 weeks which had still to run between the dream-day and the end of the school term and also to the end of the patient's treatment. It was clearly financial considerations which had induced the lady to refuse the head mistress's proposal, and which were responsible for the smallness of the sums mentioned in the dream.

[1901a, 1083]

What interests us here is the source of the figures in the material of the dream-thoughts and the transformations which they underwent. What was the origin of the 1 florin 50 kreuzers? It came from what was in fact an indifferent event of the previous day. Her sister-in-law had been given a present of 150 florins by her husband and had been in a hurry to get rid of them by buying a piece of jewellery. It is to be noticed that 150 florins is a hundred times as much as 1 florin 50 kreuzers. The only connection with the 'three', which was the number of the theatre tickets, was that her newly engaged friend was that number of months - three - her junior. The situation in the dream was a repetition of a small incident which her husband often teased her about. On one occasion she had been in a great hurry to buy tickets for a play in advance, and when she got to the theatre she had found that one side of the stalls was almost completely empty. There had been no need for her to be in such a hurry. Finally, we must not overlook the absurdity in the dream of two people taking three tickets for a play.

[1901a, 1083]
She asked quite a hundred times. . . . This led to another exciting cause of the dream, and this time to one that was less indifferent. On the previous evening they had had company, and afterwards her father had asked her to fetch him the brandy: he could not get to sleep unless he had taken some brandy. She had asked her mother for the key of the sideboard; but the latter had been deep in conversation, and had not answered her, until Dora had exclaimed with the exaggeration of impatience: 'I've asked you a hundred times already where the key is.' As a matter of fact, she had of course only repeated the question about five times.¹

¹ In the dream the number five occurs in the mention of the period of 'five minutes'. In my book on the interpretation of dreams I have given several examples of the way in which numbers occurring in the dream-thoughts are treated by dreams. We frequently find them torn out of their true context and inserted into a new one.

Since this dream ends in an act of sexual aggression carried out by the woman as a dream-action, this suggests that we should take the state of material need in the content of the dream as a substitute for a state of sexual need. Only the most extreme libidinal compulsion can at all justify such aggressiveness on the part of a woman. Other pieces of the dream-content point in a quite definite and different direction. The blame for the state of need is ascribed to the man. (He had drunk up all the money.)² The dream goes on to get rid of the man and the child and skilfully evades the sense of guilt attached to these wishes by causing the child to be killed by the man who then commits suicide out of remorse. Since this is the content of the dream we are led to conclude from many analogous instances that here is a woman who is not satisfied by her husband and who in her phantasies is longing for another marriage. It is all one for the interpretation whether we like to regard this dissatisfaction of the dreamer's as a permanent state of want or merely as the expression of a temporary one. The lottery, which in the dream brought about a short-lived state of happiness, could perhaps be understood as a symbolic reference to marriage. This symbol has not yet been identified with certainty in psycho-analytic work, but people are in the habit of saying that marriage is a game of chance, that in marriage one either draws the winning lot or a blank.³ The numbers, which have been enormously magnified⁴ by the dream-work, could well correspond in that case to the number of repetitions of the satisfying act that are wished for. We are thus made aware that the act of pulling the man's member not only has the meaning of libidinal provocation but also the additional meaning of contemptuous criticism, as though the woman wanted to pull the member off - as the man correctly assumed - because it was no good, did not fulfil its obligations.

² Psycho-analytic experience shows that noughts appended to numbers in dreams can be ignored in interpretation.

³ Many similar examples.

² This very often stands for the age of the dreamer at some particular period in his childhood. In one dream a quarter past five in the morning meant the age of five years and three months, which was significant, since that was the dreamer's age at the time of the birth of his younger brother.
On the other hand, we must not over-estimate the dream-work and attribute too much to it. The achievements I have enumerated exhaust its activity; it can do no more than condense, displace, represent in plastic form and subject the whole to a secondary revision. What appear in the dream as expressions of judgment, of criticism, of astonishment or of inference - none of these are achievements of the dream-work and they are very rarely expressions of afterthoughts about the dream; they are for the most part portions of the latent dream-thoughts which have passed over into the manifest dream with a greater or less amount of modification and adaptation to the context. Nor can the dream-work compose speeches. With a few assignable exceptions, speeches in dreams are copies and combinations of speeches which one has heard or spoken oneself on the day before the dream and which have been included in the latent thoughts either as material or as the instigator of the dream. The dream-work is equally unable to carry out calculations. Such of them as appear in the manifest dream are mostly combinations of numbers, sham calculations which are quite senseless qua calculations and are once again only copies of calculations in the latent dream-thoughts. In these circumstances it is not to be wondered at that the interest which had turned to the dream-work soon tends to move away from it to the latent dream-thoughts, which are revealed, distorted to a greater or less degree, by the manifest dream. But there is no justification for carrying this shift of interest so far that, in looking at the matter theoretically, one replaces the dream entirely by the latter. It is strange that the findings of psycho-analysis could be misused to bring about this confusion. One cannot give the name of ‘dream’ to anything other than the product of the dream-work - that is to say, the form into which the latent thoughts have been transmuted by the dream-work.

[1916-1917, 3273]

The number nine is well known to us from neurotic phantasies. It is the number of the months of pregnancy, and wherever it appears it directs our attention to a phantasy of pregnancy. In our painter’s case, to be sure, the number refers to years, not months; and it will be objected that nine is a significant number in other ways as well. But who knows whether it may not in general owe a good deal of its sanctity to the part it plays in pregnancy? Nor need we be disconcerted by the change from nine months to nine years. We know from dreams what liberties ‘unconscious mental activity’ takes with numbers. If, for instance, the number five occurs in a dream, this can invariably be traced back to a five that is important in waking life; but whereas in waking life the five was a five years’ difference in age or a company of five people, it appeared in the dream as five bank-notes or five fruits. That is to say, the number is kept, but its denominator is changed according to the requirements of condensation and displacement. Nine years in a dream could thus easily correspond to nine months in real life. The dream-work plays about with the numbers of waking life in another way, too, for it shows a sovereign disregard for noughts and does not treat them as numbers at all. Five dollars in a dream can stand for fifty or five hundred or five thousand dollars in reality.

[1923d, 4013]
What, then, was the meaning of this condition, of this attempted simulation of a perityphlitis? The remainder of the disorder, the dragging of one leg, was entirely out of keeping with perityphlitis. It must, no doubt, fit in better with the secret and possibly sexual meaning of the clinical picture; and if it were elucidated might in its turn throw light on the meaning which we were in search of. I looked about for a method of approaching the puzzle. Periods of time had been mentioned in the dream; and time is assuredly never a matter of indifference in any biological event. I therefore asked Dora when this attack of appendicitis had taken place; whether it had been before or after the scene by the lake. Every difficulty was resolved at a single blow by her prompt reply: 'Nine months later.' The period of time is sufficiently characteristic. Her supposed attack of appendicitis had thus enabled the patient with the modest means at her disposal (the pains and the menstrual flow) to realize a phantasy of childbirth.² Dora was naturally aware of the significance of this period of time, and could not dispute the probability of her having, on the occasion under discussion, read up in the encyclopaedia about pregnancy and childbirth. But what was all this about her dragging her leg? I could now hazard a guess. That is how people walk when they have twisted a foot. So she had made a 'false step': which was true indeed if she could give birth to a child nine months after the scene by the lake. But there was still another requirement upon the fulfilment of which I had to insist. I am convinced that a symptom of this kind can only arise where it has an infantile prototype. All my experience hitherto has led me to hold firmly to the view that recollections derived from the impressions of later years do not possess sufficient force to enable them to establish themselves as symptoms. I scarcely dared hope that Dora would provide me with the material that I wanted from her childhood, for the fact is that I am not yet in a position to assert the general validity of this rule, much as I should like to be able to do so. But in this case there came an immediate confirmation of it. Yes, said Dora, once when she was a child she had twisted the same foot; she had slipped on one of the steps as she was going downstairs. The foot - and it was actually the same one that she afterwards dragged - had swelled up and had to be bandaged and she had had to lie up for some weeks. This had been a short time before the attack of nervous asthma in her eighth year.

This very often stands for the age of the dreamer at some particular period in his childhood. In one dream a quarter past five in the morning meant the age of five years and three months, which was significant, since that was the dreamer's age at the time of the birth of his younger brother. - Many similar examples.

[1905e, 1438]

[1913h, 2830]
My next task is to show that the dream-work consists in nothing more than a combination of the three factors I have mentioned - and of a fourth which I have still to mention; that it carries out no other function than the translation of dream-thoughts in accordance with the four conditions to which it is subject; and that the question whether the mind operates in dreams with all its intellectual faculties or with only a part of them is wrongly framed and disregards the facts. Since, however, there are plenty of dreams in whose content judgements are passed, criticisms made, and appreciations expressed, in which surprise is felt at some particular element of the dream, in which explanations are attempted and argumentations embarked upon, I must now proceed to meet the objections arising from facts of this kind by producing some chosen examples.

[1900a, 891]

My reply is as follows: Everything that appears in dreams as the ostensible activity of the function of judgement is to be regarded not as an intellectual achievement of the dream-work but as belonging to the material of the dream-thoughts and as having been lifted from them into the manifest content of the dream as a ready-made structure. I can even carry this assertion further. Even the judgements made after waking upon a dream that has been remembered, and the feelings called up in us by the reproduction of such a dream, form part, to a great extent, of the latent content of the dream and are to be included in its interpretation.

[1900a, 891]

I now turn to consider expressions of judgement passed in the dream itself but not continued into waking life or transposed into it. In looking for examples of these, my task will be greatly assisted if I may make use of dreams which I have already recorded with other aims in view. The dream of Goethe's attack on Herr M. appears to contain a whole number of acts of judgement. 'I tried to throw a little light on the chronological data, which seemed to me improbable.' This has every appearance of being a criticism of the absurd idea that Goethe should have made a literary attack on a young man of my acquaintance. 'It seemed to be a plausible notion that he was eighteen.' This, again, sounds exactly like the outcome of a calculation, though, it is true, of a feeble-minded one. Lastly, 'I was not quite sure what year we were in' seems like an instance of uncertainty or doubt in a dream.

[1900a, 895]

Thus all of these seemed to be acts of judgement made for the first time in the dream. But analysis showed that their wording can be taken in another way, in the light of which they become indispensable for the dream's interpretation, while at the same time every trace of absurdity is removed. The sentence 'I tried to throw a little light on the chronological data' put me in the place of my friend who was in fact seeking to throw light on the chronological data of life. This deprives the sentence of its significance as a judgement protesting against the absurdity of the preceding sentences. The interpolated phrase, 'which seemed to me improbable', belonged with the subsequent one, 'It seemed to be a plausible notion'. I had used almost these precise words to the lady who had told her brother's case-history. 'It seems to me an improbable notion that his cries of "Nature! Nature!" had anything to do with Goethe; it seems to me far more plausible that the words had the sexual meaning you are familiar with.' It is true that here a judgement was passed - not in the dream, however, but in reality, and on an occasion which was recollected and exploited by the dream-thoughts. The content of the dream took over this judgement just like any other fragment of the dream-thoughts. The number '18' to which the judgement in the dream was senselessly attached, retains a trace of the real context from which the judgement was torn. Lastly, 'I was not quite sure what year we were in' was intended merely to carry further my identification with the paralytic patient in my examination of whom this point had really arisen.

[1900a, 895]
Here is a further instance of a process of judgement at work in a dream that I have already recorded. In the absurd dream of the communication from the town council I asked: 'Did you get married soon after that?' I calculated that, of course, I was born in 1856, which seemed to be the year which immediately followed the year in question. All of this was clothed in the form of a set of logical conclusions. My father had married in 1851, immediately after his attack; I, of course, was the eldest of the family and had been born in 1856; Q.E.D. As we know, this false conclusion was drawn in the interests of wish-fulfilment; and the predominant dream-thought ran: 'Four or five years; that's no time at all; it doesn't count.' Every step in this set of logical conclusions, however alike in their content and their form, could be explained in another way as having been determined by the dream-thoughts. It was the patient, of whose long analysis my colleague had fallen foul, who had decided to get married immediately the treatment was finished. The manner of my interview with my father in the dream was like an interrogation or examination, and reminded me too of a teacher at the University who used to take down exhaustive particulars from the students who were enrolling themselves for his lectures: 'Date of birth?' - '1856.' - 'Patre?' In reply to this, one gave one's father's first name with a Latin termination; and we students assumed that the Hofrat drew conclusions from the first name of the father which could not always be drawn from that of the student himself. Thus the drawing of the conclusion in the dream was no more than a repetition of the drawing of a conclusion which appeared as a piece of the material of the dream-thoughts. Something new emerges from this. If a conclusion appears in the content of the dream there is no question that it is derived from the dream-thoughts; but it may either be present in these as a piece of recollected material or it may link a series of dream-thoughts together in a logical chain. In any case, however, a conclusion in a dream represents a conclusion in the dream-thoughts.¹

It is unnecessary, I think, to accumulate further examples. They would merely serve to confirm what we have gathered from those I have already quoted - that an act of judgement in a dream is only a repetition of some prototype in the dream-thoughts. As a rule, the repetition is ill-applied and interpolated into an inappropriate context, but occasionally, as in our last instances, it is so neatly employed that it may give the impression of independent intellectual activity in the dream. From this point we might turn our attention to the psychical activity which, though it does not appear to accompany the construction of dreams invariably, yet, whenever it does so, is concerned to fuse together elements in a dream which are of disparate origin into a whole which shall make sense and be without contradiction. Before approaching that subject, however, we are under an urgent necessity to consider the expressions of affect which occur in dreams and to compare them with the affects which analysis uncovers in the dream-thoughts. [1900a, 903]

In some dreams the affect does at least remain in contact with the ideational material which has replaced that to which the affect was originally attached. In others, the dissolution of the complex has gone further. The affect makes its appearance completely detached from the idea which belongs to it and is introduced at some other point in the dream, where it fits in with the new arrangement of the dream-elements. The situation is then similar to the one we have found in the case of acts of judgement in dreams. If an important conclusion is drawn in the dream-thoughts, the dream also contains one; but the conclusion in the dream may be displaced on to quite different material. Such a displacement not infrequently follows the principle of antithesis. [1900a, 907]
In some dreams the affect does at least remain in contact with the ideational material which has replaced that to which the affect was originally attached. In others, the dissolution of the complex has gone further. The affect makes its appearance completely detached from the idea which belongs to it and is introduced at some other point in the dream, where it fits in with the new arrangement of the dream-elements. The situation is then similar to the one we have found in the case of acts of judgement in dreams. If an important conclusion is drawn in the dream-thoughts, the dream also contains one; but the conclusion in the dream may be displaced on to quite different material. Such a displacement not infrequently follows the principle of antithesis. [1900a, 907]

The dream-work exhibits no activities other than the four that have already been mentioned. If we keep to the definition of 'dream-work' as the process of transforming the dream-thoughts into the dream-content, it follows that the dream-work is not creative, that it develops no phantasies of its own, that it makes no judgements and draws no conclusions; it has no functions whatever other than condensation and displacement of the material and its modification into pictorial form, to which must be added as a variable factor the final bit of interpretative revision. It is true that we find various things in the dream-content which we should be inclined to regard as a product of some other and higher intellectual function; but in every case analysis shows convincingly that these intellectual operations have already been performed in the dream-thoughts and have only been TAKEN OVER by the dream-content. A conclusion drawn in a dream is nothing other than the repetition of a conclusion in the dream-thoughts; if the conclusion is taken over into the dream unmodified, it will appear impeccable; if the dream-work has displaced it on to some other material, it will appear nonsensical. A calculation in the dream-content signifies nothing more than that there is a calculation in the dream-thoughts; but while the latter is always rational, a dream-calculation may produce the wildest results if its factors are condensed or if its mathematical operations are displaced on to other material. Not even the speeches that occur in the dream-content are original compositions; they turn out to be a hotchpotch of speeches made, heard or read, which have been revived in the dream-thoughts and whose wording is exactly reproduced, while their origin is entirely disregarded and their meaning is violently changed. [1901a, 1082]
Anyone who has formed even the slightest idea of the extent of condensation in dreams will easily imagine what a number of pages would be filled by a full analysis of this dream. Fortunately, however, in the present context I need only take up one point in it, which provides an example of astonishment in dreams, as exhibited in the interpolation 'strangely enough'. The following was the occasion of the dream. Louise N., the lady who was assisting me in my job in the dream, had been calling on me. 'Lend me something to read', she had said. I offered her Rider Haggard's She. 'A strange book, but full of hidden meaning', I began to explain to her; 'the eternal feminine, the immortality of our emotions ...'. Here she interrupted me: 'I know it already. Have you nothing of your own?' - 'No, my own immortal works have not yet been written.' - 'Well, when are we to expect these so-called ultimate explanations of yours which you've promised even we shall find readable?' she asked, with a touch of sarcasm. At that point I saw that someone else was admonishing me through her mouth and I was silent. I reflected on the amount of self-discipline it was costing me to offer the public even my book upon dreams - I should have to give away so much of my own private character in it.

Included in yet another of my dreams there was an expression of surprise at something I had experienced in it; but the surprise was accompanied by such a striking, far-fetched and almost brilliant attempt at an explanation that, if only on its account, I cannot resist submitting the whole dream to analysis, quite apart from the dream's possessing two other points to attract our interest. I was travelling along the Südbahn railway line during the night of July 18-19th, and in my sleep I heard: 'Hollthurn, ten minutes' being called out. I at once thought of holothurians - of a natural history museum - that this was the spot at which valiant men had fought in vain against the superior power of the ruler of their country - yes, the Counter-Reformation in Austria - it was as though it were a place in Styria or the Tyrol. I then saw indistinctly a small museum, in which the relics or belongings of these men were preserved. I should have liked to get out, but hesitated to do so. There were women with fruit on the platform. They were crouching on the ground and holding up their baskets invitingly. - I hesitated because I was not sure whether there was time, but we were still not moving. - I was suddenly in another compartment, in which the upholstery and seats were so narrow that one's back pressed directly against the back of the carriage. I was surprised by this, but I reflected that I MIGHT HAVE CHANGED CARRIAGES WHILE I WAS IN A SLEEPING STATE. There were several people, including an English brother and sister; a row of books were distinctly visible on a shelf on the wall. I saw 'The Wealth of Nations' and 'Matter and Motion' (by Clerk-Maxwell), a thick volume and bound in brown cloth. The man asked his sister about a book by Schiller, whether she had forgotten it. It seemed as though the books were sometimes mine and sometimes theirs. I felt inclined at that point to intervene in the conversation in a confirmatory or substantiating sense. ... I woke up perspiring all over because all the windows were shut. The train was drawn up at Marburg.

[1900a, 900]
And now at last we can turn to the fourth of the factors concerned in the construction of dreams. If we pursue our investigation of the content of dreams in the manner in which we have begun it - that is, by comparing conspicuous events in the dream-content with their sources in the dream-thoughts, we shall come upon elements the explanation of which calls for an entirely new assumption. What I have in mind are cases in which the dreamer is surprised, annoyed or repelled in the dream, and, moreover, by a piece of the dream-content itself. As I have shown in a number of instances, the majority of these critical feelings in dreams are not in fact directed against the content of the dream, but turn out to be portions of the dream-thoughts which have been taken over and used to an appropriate end. But some material of this kind does not lend itself to this explanation; its correlate in the material of the dream-thoughts is nowhere to be found. What, for instance, is the meaning of a critical remark found so often in dreams: 'This is only a dream'? Here we have a genuine piece of criticism of the dream, such as might be made in waking life. Quite frequently, too, it is actually a prelude to waking up; and still more frequently it has been preceded by some distressing feeling which is set at rest by the recognition that the state is one of dreaming. When the thought 'this is only a dream' occurs during a dream, it has the same purpose in view as when the words are pronounced on the stage by la belle Hélène in Offenbach's comic opera of that name: it is aimed at reducing the importance of what has just been experienced and at making it possible to tolerate what is to follow. It serves to lull a particular agency to sleep which would have every reason at that moment to bestir itself and forbid the continuance of the dream - or the scene in the opera. It is more comfortable, however, to go on sleeping and tolerate the dream, because, after all, 'it is only a dream.' In my view the contemptuous critical judgement, 'it's only a dream', appears in a dream when the censorship, which is never quite asleep, feels that it has been taken unawares by a dream which has already been allowed through. It is too late to suppress it, and accordingly the censorship uses these words to meet the anxiety or the distressing feeling aroused by it. The phrase is an example of esprit d'escalier on the part of the psychical censorship.

[1900a, 928]
And now at last we can turn to the fourth of the factors concerned in the construction of dreams. If we pursue our investigation of the content of dreams in the manner in which we have begun it - that is, by comparing conspicuous events in the dream-content with their sources in the dream-thoughts, we shall come upon elements the explanation of which calls for an entirely new assumption. What I have in mind are cases in which the dreamer is surprised, annoyed or repelled in the dream, and, moreover, by a piece of the dream-content itself. As I have shown in a number of instances, the majority of these critical feelings in dreams are not in fact directed against the content of the dream, but turn out to be portions of the dream-thoughts which have been taken over and used to an appropriate end. But some material of this kind does not lend itself to this explanation; its correlate in the material of the dream-thoughts is nowhere to be found. What, for instance, is the meaning of a critical remark found so often in dreams: 'This is only a dream'? Here we have a genuine piece of criticism of the dream, such as might be made in waking life. Quite frequently, too, it is actually a prelude to waking up; and still more frequently it has been preceded by some distressing feeling which is set at rest by the recognition that the state is one of dreaming. When the thought 'this is only a dream' occurs during a dream, it has the same purpose in view as when the words are pronounced on the stage by la belle Hélène in Offenbach's comic opera of that name: it is aimed at reducing the importance of what has just been experienced and at making it possible to tolerate what is to follow. It serves to lull a particular agency to sleep which would have every reason at that moment to bestir itself and forbid the continuance of the dream - or the scene in the opera. It is more comfortable, however, to go on sleeping and tolerate the dream, because, after all, 'it is only a dream.' In my view the contemptuous critical judgement, 'it's only a dream', appears in a dream when the censorship, which is never quite asleep, feels that it has been taken unawares by a dream which has already been allowed through. It is too late to suppress it, and accordingly the censorship uses these words to meet the anxiety or the distressing feeling aroused by it. The phrase is an example of esprit d'escalier on the part of the psychical censorship.

[1900a, 928]
We can have no hesitation in deciding in favour of the second alternative. There can be no
doubt that the censoring agency, whose influence we have so far only recognized in limitations
and omissions in the dream-content, is also responsible for interpolations and additions in it.
The interpolations are easy to recognize. They are often reported with hesitation, and
introduced by an 'as though'; they are not in themselves particularly vivid and are always
introduced at points at which they can serve as links between two portions of the dream-content
or to bridge a gap between two parts of the dream. They are less easily retained in the memory
than genuine derivatives of the material of the dream-thoughts; if the dream is to be forgotten
they are the first part of it to disappear, and I have a strong suspicion that the common
complaint of having dreamt a lot, but of having forgotten most of it and of having only retained
fragments, is based upon the rapid disappearance precisely of these connecting thoughts. In a
complete analysis these interpolations are sometimes betrayed by the fact that no material
connected with them is to be found in the dream-thoughts. But careful examination leads me to
regard this as the less frequent case; as a rule the connecting thoughts lead back nevertheless
to material in the dream-thoughts, but to material which could have no claim to acceptance in
the dream either on its own account or owing to its being over-determined. Only in extreme
cases, it seems, does the psychical function in dream-formation which we are now considering
proceed to make new creations. So long as possible, it employs anything appropriate that it can
find in the material of the dream-thoughts.
[1900a, 929]

The psychical material of the dream-thoughts habitually includes recollections of impressive
experiences - not infrequently dating back to early childhood - which are thus themselves
perceived as a rule as situations having a visual subject matter. Wherever the possibility arises,
this portion of the dream-thoughts exercises a determining influence upon the form taken by the
content of the dream; it constitutes, as it were, a nucleus of crystallization, attracting the
material of the dream-thoughts to itself and thus affecting their distribution. The situation in a
dream is often nothing other than a modified repetition, complicated by interpolations, of an
impressive experience of this kind; on the other hand, faithful and straightforward reproductions
of real scenes only rarely appear in dreams.
[1901a, 1074]
It will be observed that the meaning and context of the numbers have been altered to a far greater extent in this dream than in the former one. The processes of modification and distortion have gone further here; and this is to be explained by the dream-thoughts in this case having to overcome a specially high degree of endopsychic resistance before they could obtain representation. Nor should we overlook the fact that there was an element of absurdity in the dream, namely the three seats being taken by two people. I will anticipate my discussion of absurdity in dreams by pointing out that this absurd detail in the content of the dream was intended to represent the most strongly emphasized of the dream-thoughts, viz., 'it was absurd to marry so early.' The absurdity which had to find a place in the dream was ingeniously supplied by the number 3, which was itself derived from a quite immaterial point of distinction between the two people under comparison - the 3 months' difference between their ages. The reduction of the actual 150 florins to 1 florin 50 corresponded to the low value assigned by the dreamer to her husband (or treasure), in her suppressed thoughts.

[1900a, 870]

In the course of our dream-interpretations we have so often come across the element of absurdity that we cannot postpone any longer the moment of investigating its source and significance, if it has any. For it will be remembered that the absurdity of dreams has provided those who deny the value of dreams with one of their principal arguments in favour of regarding them as the meaningless product of a reduced and fragmentary mental activity.

[1900a, 877]

There is another kind of absurdity, which occurs in dreams of dead relatives but which does not express ridicule and derision. It indicates an extreme degree of repudiation, and so makes it possible to represent a repressed thought which the dreamer would prefer to regard as utterly unthinkable. It seems impossible to elucidate dreams of this kind unless one bears in mind the fact that dreams do not differentiate between what is wished and what is real. For instance, a man who had nursed his father during his last illness and had been deeply grieved by his death, had the following senseless dream some time afterwards. *His father was alive once more and talking to him in his usual way, but (the remarkable thing was that) he had really died, only he did not know it.* This dream only becomes intelligible if, after the words 'but he had really died' we insert 'in consequence of the dreamer's wish', and if we explain that what 'he did not know' was that the dreamer had had this wish. While he was nursing his father he had repeatedly wished his father were dead; that is to say, he had had what was actually a merciful thought that death might put an end to his sufferings. During his mourning, after his father's death, even this sympathetic wish became a subject of unconscious self-reproach, as though by means of it he had really helped to shorten the sick man's life. A stirring up of the dreamer's earliest infantile impulses against his father made it possible for this self-reproach to find expression as a dream; but the fact that the instigator of the dream and the daytime thoughts were such worlds apart was precisely what necessitated the dream's absurdity.

[1900a, 880]
In the example which I shall next bring forward I have been able to catch the dream-work in
the very act of intentionally fabricating an absurdity for which there was absolutely no occasion
in the material. It is taken from the dream which arose from my meeting with Count Thun as I
was starting for my holidays. I was driving in a cab and ordered the driver to drive me to a
station. 'Of course I can't drive with you along the railway line itself', I said, after he had raised
some objection, as though I had overtired him. It was as if I had already driven with him for
some of the distance one normally travels by train. The analysis produced the following
explanations of this confused and senseless story. The day before, I had hired a cab to take me
to an out-of-the-way street in Dornbach. The driver, however, had not known where the street
was and, as these excellent people are apt to do, had driven on and on until at last I had noticed
what was happening and had told him the right way, adding a few sarcastic comments. A train
of thought, to which I was later in the analysis to return, led from this cab-driver to aristocrats.
For the moment it was merely the passing notion that what strikes us bourgeois plebs about the
aristocracy is the preference they have for taking the driver's seat. Count Thun, indeed, was the
driver of the State Coach of Austria. The next sentence in the dream, however, referred to my
brother, whom I was thus identifying with the cab-driver. That year I had called off a trip I was
going to make with him to Italy. ('I can't drive with you along the railway line itself.') And this
cancellation had been a kind of punishment for the complaints he used to make that I was in the
habit of overtiring him on such trips (this appeared in the dream unaltered) by insisting upon
moving too rapidly from place to place and seeing too many beautiful things in a single day. On
the evening of the dream my brother had accompanied me to the station; but he had jumped out
shortly before we got there, at the suburban railway station adjoining the main line terminus, in
order to travel to Purkersdorf by the suburban line. I had remarked to him that he might have
stayed with me a little longer by travelling to Purkersdorf by the main line instead of the
suburban one. This led to the passage in the dream in which I drove in the cab for some of the
distance one normally travels by train. This was an inversion of what had happened in reality - a
kind of 'tu quoque' argument. What I had said to my brother was: 'you can travel on the main
line in my company for the distance you would travel by the suburban line.' I brought about the
whole confusion in the dream by putting 'cab' instead of 'suburban line' (which, incidentally, was
of great help in bringing together the figures of the cab-driver and my brother). In this way I
succeeded in producing something senseless in the dream, which it seems scarcely possible to
disentangle and which was almost a direct contradiction of an earlier remark of mine in the
dream ('I can't drive with you along the railway line itself.') Since, however, there was no
necessity whatever for me to confuse the suburban railway and a cab, I must have arranged the
whole of this enigmatic business in the dream on purpose.
[1900a, 881]

But for what purpose? We are now to discover the significance of absurdity in dreams and
the motives which lead to its being admitted or even created. The solution of the mystery in the
present dream was as follows. It was necessary for me that there should be something absurd
and unintelligible in this dream in connection with the word 'fahren' because the dream-
thoughts included a particular judgement which called for representation. One evening, while I
was at the house of the hospitable and witty lady who appeared as the 'housekeeper' in one of
the other scenes in the same dream, I had heard two riddles which I had been unable to solve.
Since they were familiar to the rest of the company, I cut a rather ludicrous figure in my vain
attempts to find the answers. They depended upon puns on the words 'Nachkommen' and
'Vorfahren' and, I believe, ran as follows:
[1900a, 882]
When I saw Count Thun drive up so impressively and when I thereupon fell into the mood of Figaro, with his remarks on the goodness of great gentlemen in having taken the trouble to be born (to become progeny), these two riddles were adopted by the dream-work as intermediate thoughts. Since aristocrats could easily be confused with drivers and since there was a time in our part of the world when a driver was spoken of as 'Schwager' ['coachman' and 'brother-in-law'], the work of condensation was able to introduce my brother into the same picture. The dream-thought, however, which was operating behind all this ran as follows: 'It is absurd to be proud of one's ancestry; it is better to be an ancestor oneself.' This judgement, that something 'is absurd', was what produced the absurdity in the dream. And this also clears up the remaining enigma in this obscure region of the dream, namely why it was that I thought I had already driven with the driver before [vorangefahren ('driven before') - vorgefahren ('driven up') - Vorfahren ('ancestry')].

[1900a, 883]

Actually we have already come across a convincing example of an absurd dream with this kind of meaning: the dream - I interpreted it without any analysis - of the performance of a Wagner opera which lasted till a quarter to eight in the morning and in which the orchestra was conducted from a tower, and so on (see p. 811 f.). It evidently meant to say: 'This is a topsy-turvy world and a crazy society; the person who deserves something doesn't get it, and the person who doesn't care about something does get it' - and there the dreamer was comparing her fate with her cousin's. - Nor is it by any means a matter of chance that our first examples of absurdity in dreams related to a dead father. In such cases, the conditions for creating absurd dreams are found together in characteristic fashion. The authority wielded by a father provokes criticism from his children at an early age, and the severity of the demands he makes upon them leads them, for their own relief, to keep their eyes open to any weakness of their father's; but the filial piety called up in our minds by the figure of a father, particularly after his death, tightens the censorship which prohibits any such criticism from being consciously expressed.

[1900a, 883]

Dreams, then, are often most profound when they seem most crazy. In every epoch of history those who have had something to say but could not say it without peril have eagerly assumed a fool's cap. The audience at whom their forbidden speech was aimed tolerated it more easily if they could at the same time laugh and flatter themselves with the reflection that the unwelcome words were clearly nonsensical. The Prince in the play, who had to disguise himself as a madman, was behaving just as dreams do in reality; so that we can say of dreams what Hamlet said of himself, concealing the true circumstances under a cloak of wit and unintelligibility: 'I am but mad north-north-west: when the wind is southerly, I know a hawk from a hand-saw!'¹

[1900a, 890]

Thus I have solved the problem of absurdity in dreams by showing that the dream-thoughts are never absurd - never, at all events, in the dreams of sane people - and that the dream-work produces absurd dreams and dreams containing individual absurd elements if it is faced with the necessity of representing any criticism, ridicule or derision which may be present in the dream-thoughts.

[1900a, 890]
This short series of rough comments is of course inadequate to deal with the full extent of the formal means employed by dreams for the expression of logical relations in the dream-thoughts. Different dreams are more or less carefully constructed in this respect; they keep more or less closely to the text presented to them; they make more or less use of the expedients that are open to the dream-work. In the second case they appear obscure, confused and disconnected. If, however, a dream strikes one as obviously absurd, if its content includes a piece of palpable nonsense, this is intentionally so; its apparent disregard of all the requirements of logic is expressing a piece of the intellectual content of the dream-thoughts. Absurdity in a dream signifies the presence in the dream-thoughts of contradiction, ridicule and derision. Since this statement is in the most marked opposition to the view that dreams are the product of a dissociated and uncritical mental activity, I will emphasize it by means of an example. [1901a, 1077]

The nonsensical character of this dream will be even more glaringly obvious, if I explain that Herr M. is a youngish business man, who is far removed from any poetical and literary interests. I have no doubt, however, that when I have entered into the analysis of the dream I shall succeed in showing how much 'method' there is in its nonsense. [1901a, 1077]

If we pursue the dream-thoughts further, we shall keep on finding ridicule and derision as correlates of the absurdities of the manifest dream. It is well known that it was the discovery of the split skull of a sheep on the Lido of Venice that gave Goethe the idea of the so-called 'vertebral' theory of the skull. My friend boasts that, when he was a student, he released a storm which led to the resignation of an old Professor who, though he had once been distinguished (among other things in connection precisely with the same branch of comparative anatomy), had become incapable of teaching owing to senile dementia. Thus the agitation which my friend promoted served to combat the mischievous system according to which there is no age limit for academic workers in German universities - for age is proverbially no defence against folly. - In the hospital here I had the honour of serving for years under a chief who had long been a fossil and had for decades been notoriously feeble minded, but who was allowed to continue carrying on his responsible duties. At this point I thought of a descriptive term based upon the discovery on the Lido.¹ Some of my young contemporaries at the hospital concocted, in connection with this man, a version of what was then a popular song: 'Das hat kein Goethe g'schrieben, das hat kein Schiller g'dicht . . .'² [1901a, 1079]
Can we feel sure that none of the possible techniques of jokes has escaped our investigation? Of course not. But a continued examination of fresh material can convince us that we have got to know the commonest and most important technical methods of the joke-work - at all events as much as is required for forming a judgement on the nature of that psychical process. So far we have not arrived at any such judgement; but on the other hand we are now in possession of an important indication of the direction from which we may expect to receive further light upon the problem. The interesting processes of condensation accompanied by the formation of a substitute, which we have recognized as the core of the technique of verbal jokes, point towards the formation of dreams, in the mechanism of which the same psychical processes have been discovered. This is equally true, however, of the techniques of conceptual jokes - displacement, faulty reasoning, absurdity, indirect representation, representation by the opposite - which reappear one and all in the technique of the dream-work. Displacement is responsible for the puzzling appearance of dreams, which prevents our recognizing that they are a continuation of our waking life. The use of absurdity and nonsense in dreams has cost them the dignity of being regarded as psychical products and has led the authorities to suppose that a disintegration of the mental activities and a cessation of criticism, morality and logic are necessary conditions of the formation of dreams. Representation by the opposite is so common in dreams that even the popular books of dream-interpretation, which are on a completely wrong tack, are in the habit of taking it into account. Indirect representation - the replacement of a dream-thought by an allusion, by something small, a symbolism akin to analogy - is precisely what distinguishes the mode of expression of dreams from that of our waking life.¹ So far-reaching an agreement between the methods of the joke-work and those of the dream-work can scarcely be a matter of chance. To demonstrate this agreement in detail and to examine its basis will be one of our later tasks.

[1905c, 1686]
Let us recall, too, what we observed while we were investigating the technique of jokes: that in jokes nonsense often replaces ridicule and criticism in the thoughts lying behind the joke. (In this respect, incidentally, the joke-work is doing the same thing as the dream-work.) Here we find the fact confirmed once again. That the ridicule and criticism are not directed against the figure of the broker, who only appears in the examples we have quoted as a whipping-boy, is shown by another class of jokes in which the marriage-broker is represented, on the contrary, as a superior person, whose dialectical powers prove sufficient to meet any difficulty. They are anecdotes with a logical instead of a comic façade - sophistical conceptual jokes. In one of them (p. 1664 f.) the broker succeeds in arguing away the bride's defect of being lame. It is at least a 'fait accompli'; another wife, with straight limbs, would on the contrary be in constant danger of falling down and breaking her leg, and this would be followed by illness, pains, and the expenses of treatment, all of which would be spared in the case of the woman who is lame already. Or there is another anecdote, in which he succeeds in repelling a whole series of complaints made by the suitor against the bride, meeting each one with good arguments till he replies to the last, which cannot be countered: 'What do you want? Isn't she to have a single fault?', as though there were not necessarily something left over from the earlier objections. There is no difficulty in showing the weak spot in the argument in these two examples, and we did so in examining their technique. But what interests us now is something different. If the broker's speech is given such a marked appearance of logic which, on careful examination, is recognizable as being only an appearance, the truth behind it is that the joke declares the broker to be in the right; the thought does not venture to do so seriously but replaces the seriousness by the appearance which the joke presents. But here, as so often, a jest betrays something serious. We shall not be mistaken if we assume of all these anecdotes with a logical façade that they really mean what they assert for reasons that are intentionally faulty. It is only this employment of sophistry for the disguised representation of the truth that gives it the character of a joke, which is thus essentially dependent on its purpose. For what is hinted at in the two anecdotes is that it is really the suitor who is making himself ridiculous when he collects the bride's different advantages together with so much care, though all of them are weak, and when, in doing so, he forgets that he must be prepared to take as his wife a human being with her inevitable defects; while, on the other hand, the one characteristic that would make marriage with the woman's more or less imperfect personality tolerable - mutual attraction and readiness for affectionate adaptation - is quite left out of account in the whole transaction. [1905c, 1701]
Among the techniques common to jokes and dreams, representation by the opposite and the use of nonsense claim some amount of our interest. The former is one of the more effective methods employed in jokes, as may be seen among others by the examples of 'overstatement jokes' ([p. 1670 f.]). Incidentally, representation by the opposite is not able, like most other joke-techniques, to escape conscious attention. A person who tries to bring the joke-work into operation in himself as deliberately as possible - a professional wag - soon discovers as a rule that the easiest way of replying to an assertion by a joke is by asserting its contrary and by leaving it to the inspiration of the moment to get rid of the objection which his contradiction is likely to provoke, by giving what he has said a fresh interpretation. It may be that representation by the opposite owes the favour it enjoys to the fact that it forms the core of another pleasurable way of expressing a thought, which can be understood without any need for bringing in the unconscious. I am thinking of irony, which comes very close to joking and is counted among the sub-species of the comic. Its essence lies in saying the opposite of what one intends to convey to the other person, but in sparing him contradiction by making him understand - by one's tone of voice, by some accompanying gesture, or (where writing is concerned) by some small stylistic indications - that one means the opposite of what one says. Irony can only be employed when the other person is prepared to hear the opposite, so that he cannot fail to feel an inclination to contradict. As a result of this condition, irony is exposed particularly easily to the danger of being misunderstood. It brings the person who uses it the advantage of enabling him readily to evade the difficulties of direct expression, for instance in invectives. It produces comic pleasure in the hearer, probably because it stirs him into a contradictory expenditure of energy which is at once recognized as being unnecessary. A comparison like this between jokes and a closely related type of the comic may confirm our assumption that what is peculiar to jokes is their relation to the unconscious and that this may perhaps distinguish them from the comic as well.¹

Nonsense, absurdity, which appears so often in dreams and has brought them into so much undeserved contempt, never arises by chance through the ideational elements being jumbled together, but can always be shown to have been admitted by the dream-work intentionally and to be designed to represent embittered criticism and contemptuous contradiction in the dream-thoughts. Thus the absurdity in the content of the dream takes the place of the judgement 'this is a piece of nonsense' in the dream-thoughts. I laid great stress on the evidence of this in my Interpretation of Dreams because I thought that in this way I could make the most forcible attack on the error of believing that the dream is not a psychical phenomenon at all - an error which blocks the way to a knowledge of the unconscious. We have now learned, in the course of solving certain tendentious jokes ([p. 1660 ff.]), that nonsense in jokes is made to serve the same aims of representation. We know too that a senseless façade to a joke is particularly well suited to increase the hearer's psychical expenditure and so to raise the quota liberated for discharge by laughing. But besides this, it must not be forgotten that the nonsense in a joke is an end in itself, since the intention of recovering the old pleasure in nonsense is among the joke-work's motives. There are other ways of recovering the nonsense and of deriving pleasure from it: caricature, exaggeration, parody and travesty make use of them and so create 'comic nonsense'. If we submit these forms of expression to an analysis similar to the one we have applied to jokes, we shall find that in none of these cases is there any occasion for bringing in unconscious processes in our sense in order to explain them. We can now understand too how it is that the characteristic of being a joke can come as an extra addition to a caricature, exaggeration or parody; what makes this possible is a difference in the 'psychical scene of action'.²

[1905c, 1757]

[1905c, 1758]
Critical readers will now justly enquire about the origin of the interpolation (for which I have so far given no grounds) of the reference to being ridiculed by Gradiva. The answer to this is given in *The Interpretation of Dreams*, which explains that if ridicule, derision, or embittered contradiction occurs in the dream-thoughts, this is expressed by the manifest dream being given a senseless form, by absurdity in the dream. This absurdity does not mean, therefore, that there is any paralysis of psychical activity: it is a method of representation employed by the dream-work. As always happens at specially difficult points, the author once more comes to our help here. The senseless dream had a short epilogue, in which a bird uttered a laughing call and carried the lizard away in its beak. But Hanold had heard a similar laughing call after Gradiva's disappearance. It had in fact come from Zoe, who with this laugh was shaking off the gloomy seriousness of her underworld role. Gradiva had really laughed at him. But the dream-image of the bird carrying off the lizard may have been a recollection of the earlier dream, in which the Apollo Belvedere carried off the Capitoline Venus.

² Thus absurdity signifies derision in the language of obsessional thought, just as it does in dreams. See my *Interpretation of Dreams*.

We are perfectly familiar with the infantile attitude of boys towards their father; it is composed of the same mixture of reverent submission and mutinous insubordination that we have found in Schreber's relation to his God, and is the unmistakable prototype of that relation, which is faithfully copied from it. But the circumstance that Schreber's father was a physician, and a most eminent physician, and one who was no doubt highly respected by his patients, is what explains the most striking characteristics of his God and those upon which he dwells in such a critical fashion. Could more bitter scorn be shown for such a physician than by declaring that he understands nothing about living men and only knows how to deal with corpses? No doubt it is an essential attribute of God to perform miracles; but a physician performs miracles too; he effects miraculous cures, as his enthusiastic clients proclaim. So that when we see that these very miracles (the material for which was provided by the patient's hypochondria) turn out to be incredible, absurd, and to some extent positively silly, we are reminded of the assertion in my *Interpretation of Dreams* that absurdity in dreams expresses ridicule and derision.¹ Evidently, therefore, it is used for the same purposes in paranoia. As regards some of the other reproaches which he levelled against God, such, for instance, as that He learned nothing by experience, it is natural to suppose that they are examples of the *tu quoque* mechanism used by children,² which, when they receive a reproof, flings it back unchanged upon the person who originated it. Similarly, the voices give us grounds for suspecting that the accusation of soul-murder brought against Flechsig was in the first instance a self-accusation.³

¹ [1907a, 1876]
² [1909d, 2169]
³ [1911c, 2424]
In the first place, it is a remarkable thing that the main emphasis in the latent thoughts lies on
the element of being in too great a hurry; nothing of the sort is to be found in the manifest
dream. Without the analysis, we should have had no suspicion that that factor plays any part. It
seems, therefore, to be possible for what is in fact the main thing, the centre of the unconscious
thoughts, to be absent in the manifest dream. This means that the impression made by the
whole dream must be fundamentally altered. In the second place, there is an absurd
combination in the dream: three for 1 florin 50. We detected in the dream-thoughts the assertion
that 'it was absurd (to marry so early)'. Can it be doubted that this thought, 'it was absurd', is
represented by the inclusion of an absurd element in the manifest dream? And in the third
place, a glance of comparison shows us that the relation between the manifest and latent
elements is no simple one; it is far from being the case that one manifest element always takes
the place of one latent one. It is rather that there is a group-relation between the two layers,
within which one manifest element can replace several latent ones or one latent element can be
replaced by several manifest ones.
[1916-1917, 3220]

If we make a series of comparisons between the dream-thoughts and the manifest dreams
which replace them, we shall come upon all kinds of things for which we are unprepared: for
instance, that nonsense and absurdity in dreams have their meaning. At this point, indeed, the
contrast between the medical and the psycho-analytic view of dreams reaches a pitch of
acuteness not met with elsewhere. According to the former, dreams are senseless because
mental activity in dreams has abandoned all its powers of criticism; according to our view, on
the contrary, dreams become senseless when a piece of criticism included in the dream-
thoughts - a judgement that 'this is absurd' - has to be represented. The dream you are familiar
with of the visit to the theatre ('three tickets for 1 florin 50') is a good example of this. The
judgement it expressed was: 'it was absurd to marry so early.'
[1916-1917, 3269]
There is another kind of absurdity, which occurs in dreams of dead relatives but which does not express ridicule and derision. It indicates an extreme degree of repudiation, and so makes it possible to represent a repressed thought which the dreamer would prefer to regard as utterly unthinkable. It seems impossible to elucidate dreams of this kind unless one bears in mind the fact that dreams do not differentiate between what is wished and what is real. For instance, a man who had nursed his father during his last illness and had been deeply grieved by his death, had the following senseless dream some time afterwards. *His father was alive once more and talking to him in his usual way, but* (the remarkable thing was that) *he had really died, only he did not know it.* This dream only becomes intelligible if, after the words 'but he had really died' we insert 'in consequence of the dreamer's wish', and if we explain that what 'he did not know' was that the dreamer had had this wish. While he was nursing his father he had repeatedly wished his father were dead; that is to say, he had had what was actually a merciful thought that death might put an end to his sufferings. During his mourning, after his father's death, even this sympathetic wish became a subject of unconscious self-reproach, as though by means of it he had really helped to shorten the sick man's life. A stirring up of the dreamer's earliest infantile impulses against his father made it possible for this self-reproach to find expression as a dream; but the fact that the instigator of the dream and the daytime thoughts were such worlds apart was precisely what necessitated the dream's absurdity.¹

It is true that dreams of dead people whom the dreamer has loved raise difficult problems in dream-interpretation and that these cannot always be satisfactorily solved. The reason for this is to be found in the particularly strongly marked emotional ambivalence which dominates the dreamer's relation to the dead person. It very commonly happens that in dreams of this kind the dead person is treated to begin with as though he were alive, that he then suddenly turns out to be dead and that in a subsequent part of the dream he is alive once more. This has a confusing effect. It eventually occurred to me that this alternation between death and life is intended to represent *indifference* on the part of the dreamer. ('It's all the same to me whether he's alive or dead.') This indifference is, of course, not real but merely desired; it is intended to help the dreamer to repudiate his very intense and often contradictory emotional attitudes and it thus becomes a dream-representation of his *ambivalence*. - In other dreams in which the dreamer associates with dead people, the following rule often helps to give us our bearings. If there is no mention in the dream of the fact that the dead man is dead, the dreamer is equating himself with him: he is dreaming of his own death. If, in the course of the dream, the dreamer suddenly says to himself in astonishment, 'why, he died ever so long ago', he is repudiating this equation and is denying that the dream signifies his own death. - But I willingly confess to a feeling that dream-interpretation is far from having revealed all the secrets of dreams of this character. [1900a, 880]

(3) When anyone has lost someone near and dear to him, he produces dreams of a special sort for some time afterwards, in which knowledge of the death arrives at the strangest compromises with the need to bring the dead person to life again. In some of these dreams the person who has died is dead and at the same time still alive, because he does not know he is dead; only if he did know would he die completely. In others, he is half dead and half alive, and each of these states is indicated in a particular way. We must not describe these dreams as simply nonsensical; for being brought to life again is no more inconceivable in dreams than it is, for instance, in fairy tales, in which it occurs as a very usual event. So far as I have been able to analyse such dreams, it has turned out that they are capable of a reasonable solution, but that the pious wish to bring the dead person back to life has been able to operate by the strangest means. I will now put before you a dream of this kind which sounds sufficiently queer and senseless and the analysis of which will show you much for which our theoretical discussions will have prepared you. It is the dream of a man who had lost his father several years before: [1916-1917, 3278]
When we take together these and some other examples which I shall give later, we may safely say that the dream-work does not in fact carry out any calculations at all, whether correctly or incorrectly; it merely throws into the form of a calculation numbers which are present in the dream-thoughts and can serve as allusions to matter that cannot be represented in any other way. In this respect the dream-work is treating numbers as a medium for the expression of its purpose in precisely the same way as it treats any other idea, including proper names and speeches that occur recognizably as verbal presentations.
[1900a, 872]
Stricker (1879) writes: 'Dreams do not consist solely of illusions. If, for instance, one is afraid of robbers in a dream, the robbers, it is true, are imaginary - but the fear is real.' This calls our attention to the fact that affects in dreams cannot be judged in the same way as the remainder of their content; and we are faced by the problem of what part of the psychical processes occurring in dreams is to be regarded as real, that is to say, has a claim to be classed among the psychical processes of waking life.

[1900a, 581]

We need not consider the dreams of the first of these classes, for they have no claim to be regarded as 'typical'. If we analyse them, we find that they have some meaning other than their apparent one, and that they are intended to conceal some other wish. Such was the dream of the aunt who saw her sister's only son lying in his coffin. (See p. 647.) It did not mean that she wished her little nephew dead; as we have seen, it merely concealed a wish to see a particular person of whom she was fond and whom she had not met for a long time - a person whom she had once before met after a similarly long interval beside the coffin of another nephew. This wish, which was the true content of the dream, gave no occasion for grief, and no grief, therefore, was felt in the dream. It will be noticed that the affect felt in the dream belongs to its latent and not to its manifest content, and that the dream's affective content has remained untouched by the distortion which has overtaken its ideational content.

[1900a, 727]

The task which was imposed on me in the dream of carrying out a dissection of my own body was thus my self-analysis which was linked up with my giving an account of my dreams. Old Brücke came in here appropriately; even in the first years of my scientific work it happened that I allowed a discovery of mine to lie fallow until an energetic remonstrance on his part drove me into publishing it. The further thoughts which were started up by my conversation with Louise N. went too deep to become conscious. They were diverted in the direction of the material that had been stirred up in me by the mention of Rider Haggard's She. The judgement 'strangely enough' went back to that book and to another one, Heart of the World, by the same author; and numerous elements of the dream were derived from these two imaginative novels. The boggy ground over which people had to be carried, and the chasm which they had to cross by means of boards brought along with them, were taken from She; the Red Indians, the girl and the wooden house were taken from Heart of the World. In both novels the guide is a woman; both are concerned with perilous journeys; while She describes an adventurous road that had scarcely ever been trodden before, leading into an undiscovered region. The tired feeling in my legs, according to a note which I find I made upon the dream, had been a real sensation during the day-time. It probably went along with a tired mood and a doubting thought: 'How much longer will my legs carry me?' The end of the adventure in She is that the guide, instead of finding immortality for herself and the others, perishes in the mysterious subterranean fire. A fear of that kind was unmistakably active in the dream-thoughts. The 'wooden house' was also, no doubt, a coffin, that is to say, the grave. But the dream-work achieved a masterpiece in its representation of this most unwished-for of all thoughts by a wish-fulfilment. For I had already been in a grave once, but it was an excavated Etruscan grave near Orvieto, a narrow chamber with two stone benches along its walls, on which the skeletons of two grown-up men were lying. The inside of the wooden house in the dream looked exactly like it, except that the stone was replaced by wood. The dream seems to have been saying: 'If you must rest in a grave, let it be the Etruscan one.' And, by making this replacement, it transformed the gloomiest of expectations into one that was highly desirable. Unluckily, as we are soon to hear, a dream can turn into its opposite the idea accompanying an affect but not always the affect itself. Accordingly, I woke up in a 'mental fright', even after the successful emergence of the idea that children may perhaps achieve what their father has failed to - a fresh allusion to the strange novel in which a person's identity is retained through a series of generations for over two thousand years.

[1900a, 899]
It is unnecessary, I think, to accumulate further examples. They would merely serve to confirm what we have gathered from those I have already quoted - that an act of judgement in a dream is only a repetition of some prototype in the dream-thoughts. As a rule, the repetition is ill-applied and interpolated into an inappropriate context, but occasionally, as in our last instances, it is so neatly employed that to begin with it may give the impression of independent intellectual activity in the dream. From this point we might turn our attention to the psychical activity which, though it does not appear to accompany the construction of dreams invariably, yet, whenever it does so, is concerned to fuse together elements in a dream which are of disparate origin into a whole which shall make sense and be without contradiction. Before approaching that subject, however, we are under an urgent necessity to consider the expressions of affect which occur in dreams and to compare them with the affects which analysis uncovers in the dream-thoughts.

[1900a, 903]

A shrewd observation made by Stricker has drawn our attention to the fact that the expression of affect in dreams cannot be dealt with in the same contemptuous fashion in which, after waking, we are accustomed to dismiss their content. 'If I am afraid of robbers in a dream, the robbers, it is true, are imaginary - but the fear is real.' And this is equally true if I feel glad in a dream. Our feeling tells us that an affect experienced in a dream is in no way inferior to one of equal intensity experienced in waking life; and dreams insist with greater energy upon their right to be included among our real mental experiences in respect to their affective than in respect to their ideational content. In our waking state, however, we cannot in fact include them in this way, because we cannot make any psychical assessment of an affect unless it is linked to a piece of ideational material. If the affect and the idea are incompatible in their character and intensity, our waking judgement is at a loss.

[1900a, 904]

It has always been a matter for surprise that in dreams the ideational content is not accompanied by the affective consequences that we should regard as inevitable in waking thought. Strümpell declared that in dreams ideas are denuded of their psychical values. But there is no lack in dreams of instances of a contrary kind, where an intense expression of affect appears in connection with subject-matter which seems to provide no occasion for any such expression. In a dream I may be in a horrible, dangerous and disgusting situation without feeling any fear or repulsion; while another time, on the contrary, I may be terrified at something harmless and delighted at something childish.

[1900a, 904]

This particular enigma of dream-life vanishes more suddenly, perhaps, and more completely than any other, as soon as we pass over from the manifest to the latent content of the dream. We need not bother about the enigma, since it no longer exists. Analysis shows us that the ideational content has undergone displacements and substitutions, whereas the affects have remained unaltered. It is small wonder that the ideational material, which has been changed by dream-distortion, should no longer be compatible with the affect, which is retained unmodified; nor is there anything left to be surprised at after analysis has put the right material back into its former position.

[1900a, 905]
In the case of a psychical complex which has come under the influence of the censorship imposed by resistance, the affects are the constituent which is least influenced and which alone can give us a pointer as to how we should fill in the missing thoughts. This is seen even more clearly in the psychoneuroses than in dreams. Their affects are always appropriate, at least in their quality though we must allow for their intensity being increased owing to displacements of neurotic attention. If a hysteric is surprised at having to be so frightened of something trivial or if a man suffering from obsessions is surprised at such distressing self-reproaches arising out of a mere nothing, they have both gone astray, because they regard the ideational content - the triviality or the mere nothing - as what is essential; and they put up an unsuccessful fight because they take this ideational content as the starting-point of their thought-activity. Psycho-analysis can put them upon the right path by recognizing the affect as being, on the contrary, justified and by seeking out the idea which belongs to it but has been repressed and replaced by a substitute. A necessary premise to all this is that the release of affect and the ideational content do not constitute the indissoluble organic unity as which we are in the habit of treating them, but that these two separate entities may be merely soldered together and can thus be detached from each other by analysis. Dream-interpretation shows that this is in fact the case. [1900a, 905]

¹ [Footnote added 1919:] If I am not greatly mistaken, the first dream that I was able to pick up from my grandson, at the age of one year and eight months, revealed a state of affairs in which the dream-work had succeeded in transforming the material of the dream-thoughts into a wish-fulfilment, whereas the affect belonging to them persisted unchanged during the state of sleep. On the night before the day on which his father was due to leave for the front, the child cried out, sobbing violently: 'Daddy! Daddy! - baby!' This can only have meant that Daddy and baby were remaining together; whereas the tears recognized the approaching farewell. At that time the child was already quite well able to express the concept of separation. 'Fort' ['gone'] (replaced by a long-drawn-out and peculiarly stressed 'o-o-o') had been one of his first words, and several months before this first dream he had played at 'gone' with all his toys. This game went back to a successful piece of self-discipline which he had achieved at an early age in allowing his mother to leave him and be 'gone.' [1900a, 905]

As my second example I may quote the dream of the young girl who saw her sister's little son lying dead in his coffin, but who, as I may now add, felt neither pain nor grief. We know from the analysis why this was. The dream merely disguised her wish to see the man she was in love with once more; and her affect had to be in tune with her wish and not with its disguise. There was thus no occasion for grief. [1900a, 907]

In some dreams the affect does at least remain in contact with the ideational material which has replaced that to which the affect was originally attached. In others, the dissolution of the complex has gone further. The affect makes its appearance completely detached from the idea which belongs to it and is introduced at some other point in the dream, where it fits in with the new arrangement of the dream-elements. The situation is then similar to the one we have found in the case of acts of judgement in dreams. If an important conclusion is drawn in the dream-thoughts, the dream also contains one; but the conclusion in the dream may be displaced on to quite different material. Such a displacement not infrequently follows the principle of antithesis. [1900a, 907]
The detachment of affects from the ideational material which generated them is the most
striking thing which occurs to them during the formation of dreams; but it is neither the only nor
the most essential alteration undergone by them on their path from the dream-thoughts to the
manifest dream. If we compare the affects of the dream-thoughts with those in the dream, one
thing at once becomes clear. Whenever there is an affect in the dream, it is also to be found in
the dream-thoughts. But the reverse is not true. A dream is in general poorer in affect than the
psychical material from the manipulation of which it has proceeded. When I have reconstructed
the dream-thoughts, I habitually find the most intense psychical impulses in them striving to
make themselves felt and struggling as a rule against others that are sharply opposed to them.
If I then turn back to the dream, it not infrequently appears colourless, and without emotional
tone of any great intensity. The dream-work has reduced to a level of indifference not only the
content but often the emotional tone of my thoughts as well. It might be said that the dream-
work brings about a suppression of affects. Let us, for instance, take the dream of the botanical
monograph. The thoughts corresponding to it consisted of a passionately agitated plea on
behalf of my liberty to act as I chose to act and to govern my life as seemed right to me and me
alone. The dream that arose from them has an indifferent ring about it: 'I had written a
monograph; it lay before me; it contained coloured plates; dried plants accompanied each copy.'
This reminds one of the peace that has descended upon a battle field strewn with corpses; no
trace is left of the struggle which raged over it.
[1900a, 910]

Things can be otherwise: lively manifestations of affect can make their way into the dream
itself. For the moment, however, I will dwell upon the incontestable fact that large numbers of
dreams appear to be indifferent, whereas it is never possible to enter into the dream-thoughts
without being deeply moved.
[1900a, 910]

No complete theoretical explanation can here be given of this suppression of affect in the
course of the dream-work. It would require to be preceded by a most painstaking investigation
of the theory of affects and of the mechanism of repression. I will only permit myself a reference
to two points. I am compelled - for other reasons - to picture the release of affects as a
centrifugal process directed towards the interior of the body and analogous to the processes of
motor and secretory innervation. Now just as in the state of sleep the sending out of motor
impulses towards the external world appears to be suspended, so it may be that the centrifugal
calling-up of affects by unconscious thinking may become more difficult during sleep. In that
case the affective impulses occurring during the course of the dream-thoughts would from their
very nature be weak impulses, and consequently those which found their way into the dream
would be no less weak. On this view, then, the 'suppression of affect' would not in any way be
the consequence of the dream-work but would result from the state of sleep. This may be true,
but it cannot be the whole truth. We must also bear in mind that any relatively complex dream
turns out to be a compromise produced by a conflict between psychical forces. For one thing,
the thoughts constructing the wish are obliged to struggle against the opposition of a censoring
agency; and for another thing, we have often seen that in unconscious thinking itself every train
of thought is yoked with its contradictory opposite. Since all of these trains of thought are
capable of carrying an affect, we shall by and large scarcely be wrong if we regard the
suppression of affect as a consequence of the inhibition which these contraries exercise upon
each other and which the censorship exercises upon the impulsions suppressed by it. The
inhibition of affect, accordingly, must be considered as the second consequence of the
censorship of dreams, just as dream-distortion is its first consequence.
[1900a, 911]
There is yet another alternative way in which the dream-work can deal with affects in the dream-thoughts, in addition to allowing them through or reducing them to nothing. It can turn them into their opposite. We have already become acquainted with the interpretative rule according to which every element in a dream can, for purposes of interpretation, stand for its opposite just as easily as for itself. We can never tell beforehand whether it stands for the one or for the other; only the context can decide. A suspicion of this truth has evidently found its way into popular consciousness: ‘dream books’ very often adopt the principle of contraries in their interpretation of dreams. This turning of a thing into its opposite is made possible by the intimate associative chain which links the idea of a thing with its opposite in our thoughts. Like my other kind of displacement it can serve the ends of the censorship; but it is also frequently a product of wish-fulfilment, for wish-fulfilment consists in nothing else than a replacement of a disagreeable thing by its opposite. Just as ideas of things can make their appearance in dreams turned into their opposite, so too can the affects attaching to dream-thoughts; and it seems likely that this reversal of affect is brought about as a rule by the dream-censorship. In social life, which has provided us with our familiar analogy with the dream-censorship, we also make use of the suppression and reversal of affect, principally for purposes of dissimulation. If I am talking to someone whom I am obliged to treat with consideration while wishing to say something hostile to him, it is almost more important that I should conceal any expression of my affect from him than that I should mitigate the verbal form of my thoughts. If I were to address him in words that were not impolite, but accompanied them with a look or gesture of hatred and contempt, the effect which I should produce on him would not be very different from what it would have been if I had thrown my contempt openly in his face. Accordingly, the censorship bids me above all suppress my affects; and, if I am a master of dissimulation, I shall assume the opposite affect - smile when I am angry and seem affectionate when I wish to destroy.

We have already come across an excellent example of a reversal of affect of this kind carried out in a dream on behalf of the dream-censorship. In the dream of ‘my uncle with the yellow beard’ I felt the greatest affection for my friend R., whereas and because the dream-thoughts called him a simpleton. It was from this example of reversal of affect that we derived our first hint of the existence of a dream-censorship. Nor is it necessary to assume, in such cases either, that the dream-work creates contrary affects of this kind out of nothing; it finds them as a rule lying ready to hand in the material of the dream-thoughts, and merely intensifies them with the psychical force arising from a motive of defence, till they can predominate for the purposes of dream-formation. In the dream of my uncle which I have just mentioned, the antithetical, affectionate affect probably arose from an infantile source (as was suggested by the later part of the dream), for the uncle-nephew relationship, owing to the peculiar nature of the earliest experiences of my childhood (cf. the analysis on p. 876 f.) had become the source of all my friendships and all my hatreds.

The complicated process of elimination, diminution and reversal, by means of which the affects in the dream-thoughts are eventually turned into those in the dream, can be satisfactorily followed in suitable syntheses of dreams that have been completely analysed. I will quote a few more examples of affects in dreams where some of the possibilities I have enumerated will be found realized.
Let us now apply these hints upon psychical mechanisms to an understanding of the expressions of affect in dreams. A satisfaction which is exhibited in a dream and can, of course, be immediately referred to its proper place in the dream-thoughts is not always completely elucidated by this reference alone. It is as a rule necessary to look for another source of it in the dream-thoughts, a source which is under the pressure of the censorship. As a result of that pressure, this source would normally have produced, not satisfaction, but the contrary affect. Owing to the presence of the first source of affect, however, the second source is enabled to withdraw its affect of satisfaction from repression and allow it to act as an intensification of the satisfaction from the first source. Thus it appears that affects in dreams are fed from a confluence of several sources and are over-determined in their reference to the material of the dream-thoughts. During the dream-work, sources of affect which are capable of producing the same affect come together in generating it.¹

[1900a, 921]

But what had become of the dream-censorship? Why had it not raised the most energetic objections against this blatantly egoistic train of thought? And why had it not transformed the satisfaction attached to that train of thought into severe unpleasure? The explanation was, I think, that other, unobjectionable, trains of thought in connection with the same people found simultaneous satisfaction and screened with their affect the affect which arose from the forbidden infantile source. In another stratum of my thoughts, during the ceremonial unveiling of the memorial, I had reflected thus: 'What a number of valued friends I have lost, some through death, some through a breach of our friendship! How fortunate that I have found a substitute for them and that I have gained one who means more to me than ever the others could, and that, at a time of life when new friendships cannot easily be formed, I shall never lose his! My satisfaction at having found a substitute for these lost friends could be allowed to enter the dream without interference; but there slipped in, along with it, the hostile satisfaction derived from the infantile source. It is no doubt true that infantile affection served to reinforce my contemporary and justified affection. But infantile hatred, too, succeeded in getting itself represented.

[1900a, 926]
I have only a few more remarks to add on the subject of affect in dreams from another point of view. A dominating element in a sleeper's mind may be constituted by what we call a 'mood' - or tendency to some affect - and this may then have a determining influence upon his dreams. A mood of this kind may arise from his experiences or thoughts during the preceding day, or its sources may be somatic. In either case it will be accompanied by the trains of thought appropriate to it. From the point of view of dream-construction it is a matter of indifference whether, as sometimes happens, these ideational contents of the dream-thoughts determine the mood in a primary fashion, or whether they are themselves aroused secondarily by the dreamer's emotional disposition which is in its turn to be explained on a somatic basis. In any case the construction of dreams is subject to the condition that it can only represent something which is the fulfilment of a wish and that it is only from wishes that it can derive its psychical motive force. A currently active mood is treated in the same way as a sensation arising and becoming currently active during sleep (cf. p. 714), which can be either disregarded or given a fresh interpretation in the sense of a wish-fulfilment. Distressing moods during sleep can become the motive force of a dream by arousing energetic wishes which the dream is supposed to fulfil. The material to which moods are attached is worked over until it can be used to express the fulfilment of a wish. The more intense and dominating a part is played in the dream-thoughts by the distressing mood, the more certain it becomes that the most strongly suppressed wishful impulses will make use of the opportunity in order to achieve representation. For, since the unpleasure which they would otherwise necessarily produce themselves is already present, they find the harder part of their task - the task of forcing their way through to representation - already accomplished for them. Here once more we are brought up against the problem of anxiety-dreams; and these, as we shall find, form a marginal case in the function of dreaming. [1900a, 927]
I will now try to sum up this lengthy disquisition on the dream-work. We were faced by the question whether the mind employs the whole of its faculties without reserve in constructing dreams or only a functionally restricted fragment of them. Our investigations led us to reject entirely the form in which the question was framed as being inadequate to the circumstances. If, however, we had to reply to the question on the basis of the terms in which it was stated, we should be obliged to reply in the affirmative to both the alternatives, mutually exclusive though they appear to be. Two separate functions may be distinguished in mental activity during the construction of a dream: the production of the dream-thoughts, and their transformation into the content of the dream. The dream-thoughts are entirely rational and are constructed with an expenditure of all the psychical energy of which we are capable. They have their place among thought-processes that have not become conscious - processes from which, after some modification, our conscious thoughts, too, arise. However many interesting and puzzling questions the dream-thoughts may involve, such questions have, after all, no special relation to dreams and do not call for treatment among the problems of dreams.¹ On the other hand, the second function of mental activity during dream-construction, the transformation of the unconscious thoughts into the content of the dream, is peculiar to dream-life and characteristic of it. This dream-work proper diverges further from our picture of waking thought than has been supposed even by the most determined depreciator of psychical functioning during the formation of dreams. The dream-work is not simply more careless, more irrational, more forgetful and more incomplete than waking thought; it is completely different from it qualitatively and for that reason not immediately comparable with it. It does not think, calculate or judge in any way at all; it restricts itself to giving things a new form. It is exhaustively described by an enumeration of the conditions which it has to satisfy in producing its result. That product, the dream, has above all to evade the censorship, and with that end in view the dream-work makes use of a displacement of psychical intensities to the point of a transvaluation of all psychical values. The thoughts have to be reproduced exclusively or predominantly in the material of visual and acoustic memory-traces, and this necessity imposes upon the dream-work considerations of representability which it meets by carrying out fresh displacements. Greater intensities have probably to be produced than are available in the dream-thoughts at night, and this purpose is served by the extensive condensation which is carried out with the constituents of the dream-thoughts. Little attention is paid to the logical relations between the thoughts; those relations are ultimately given a disguised representation in certain formal characteristics of dreams. Any affect attached to the dream-thoughts undergoes less modification than their ideational content. Such affects are as a rule suppressed; when they are retained, they are detached from the ideas that properly belong to them, affects of a similar character being brought together. Only a single portion of the dream-work and one which operates to an irregular degree, the working over of the material by partly aroused waking thought, tallies to some extent with the view which other writers have sought to apply to the entire activity of dream-construction.

[1900a, 944]
It may perhaps be useful to continue our examination of the same question by considering how a dream behaves when the dream-thoughts present it with material which is the complete reverse of a wish-fulfilment - well-justified worries, painful reflections, distressing realizations. The many possible outcomes can be classed under the two following groups. (A) The dream-work may succeed in replacing all the distressing ideas by contrary ones and in suppressing the unpleasurable affects attaching to them. The result will be a straightforward dream of satisfaction, a palpable 'wish-fulfilment', about which there seems no more to be said. (B) The distressing ideas may make their way, more or less modified but none the less quite recognizable, into the manifest content of the dream. This is the case which raises doubts as to the validity of the wish theory of dreams and needs further investigation. Dreams of this sort with a distressing content may either be experienced with indifference, or they may be accompanied by the whole of the distressing affect which their ideational content seems to justify, or they may even lead to the development of anxiety and to awakening.

Our discussion cannot be carried any further without examining the part played by the affects in these processes; but we can only do so imperfectly in the present connection. Let us assume, then, that the suppression of the Ucs. is necessary above all because, if the course of ideas in the Ucs. were left to itself, it would generate an affect which was originally of a pleasurable nature, but became unpleasurable after the process of 'repression' occurred. The purpose, and the result too, of suppression is to prevent this release of unpleasure. The suppression extends over the ideational content of the Ucs., since the release of unpleasure might start from that content. This presupposes a quite specific assumption as to the nature of the generation of affect. It is viewed as a motor or secretory function, the key to whose innervation lies in the ideas in the Ucs. Owing to the domination established by the Pcs. these ideas are, as it were, throttled, and inhibited from sending out impulses which would generate affect. If, therefore, the cathexis from the Pcs. ceases, the danger is that the unconscious excitations may release affect of a kind which (as a result of the repression which has already occurred) can only be experienced as unpleasure, as anxiety.

This was the whole of the dream, or at least all that I could remember of it. It seemed to me obscure and meaningless, but above all surprising. Frau E. L. is a person with whom I have hardly at any time been on friendly terms, nor, so far as I know, have I ever wished to have any closer relations with her. I have not seen her for a long time, and her name has not, I believe, been mentioned during the last few days. The dream-process was not accompanied by affects of any kind.

[1900a, 988]

[1900a, 1010]

[1901a, 1055]
I will pause here to survey the results I had so far reached in my dream-analysis. By following the associations which arose from the separate elements of the dream divorced from their context, I arrived at a number of thoughts and recollections, which I could not fail to recognize as important products of my mental life. This material revealed by the analysis of the dream was intimately connected with the dream's content, yet the connection was of such a kind that I could never have inferred the fresh material from that content. The dream was unemotional, disconnected and unintelligible; but while I was producing the thoughts behind the dream, I was aware of intense and well-founded affective impulses; the thoughts themselves fell at once into logical chains, in which certain central ideas made their appearance more than once. Thus, the contrast between 'selfish' and 'unselfish', and the elements 'being in debt' and 'without paying for it' were central ideas of this kind, not represented in the dream itself. I might draw closer together the threads in the material revealed by the analysis, and I might then show that they converge upon a single nodal point, but considerations of a personal and not of a scientific nature prevent my doing so in public. I should be obliged to betray many things which had better remain my secret, for on my way to discovering the solution of the dream all kinds of things were revealed which I was unwilling to admit even to myself. Why then, it will be asked, have I not chosen some other dream, whose analysis is better suited for reporting, so that I could produce more convincing evidence of the meaning and connectedness of the material uncovered by analysis? The answer is that every dream with which I might try to deal would lead to things equally hard to report and would impose an equal discretion upon me. Nor should I avoid this difficulty by bringing up someone else's dream for analysis, unless circumstances enabled me to drop all disguise without damage to the person who had confided in me.

[1901a, 1058]

We too, of course, feel the need to explain to ourselves why there are so many dreams with a distressing content and, especially why there are anxiety-dreams. Here for the first time we come upon the problem of affects in dreams; it would deserve a monograph of its own, but unfortunately we cannot enter into it. If dreams are the fulfilment of wishes, distressing feelings should be impossible in them: the lay critics would appear to be right there. But three kinds of complications must be taken into account which they have not thought of.

[1916-1917, 3302]

Firstly, it may be that the dream-work has not completely succeeded in creating a wish-fulfilment; so that a portion of the distressing affect in the dream-thoughts has been left over in the manifest dream. In that case analysis would have to show that these dream-thoughts were far more distressing than the dream-constructed out of them. That much can always be proved. If so, we must admit that the dream-work has not achieved its aim any more than the dream of drinking, formed in response to the stimulus of thirst, succeeded in quenching the thirst. The dreamer remains thirsty and has to wake up in order to drink. Nevertheless it was a genuine dream, and had lost nothing of a dream's essential nature. We can only say: 'Ut desint vires, tamen est laudanda voluntas.'¹ The intention, at least, which can clearly be recognized, remains praiseworthy. Such instances of failure are no rare event. This is helped by that fact that it is so much harder for the dream-work to alter the sense of a dream's affects than of its content; affects are some times highly resistant. What then happens is that the dream-work transforms the distressing content of the dream-thoughts into the fulfilment of a wish, while the distressing affect persists unaltered. In dreams of this kind the affect is quite inappropriate to the content, and our critics can say that dreams are so far from being wish-fulfillments that even one with a harmless content can be felt as distressing. We can answer this foolish remark by pointing out that it is precisely in dreams like this that the wish-fulfilling purpose of the dream-work appears most clearly, because in isolation. The error arises because those who are unfamiliar with the neuroses picture the link between content and affect as too intimate and therefore cannot imagine the content being altered without a simultaneous alteration of the expression of affect attached to it.

[1916-1917, 3303]
But what picture can the nightly workings of his sexual desire have conjured up that could frighten him away so violently from the fulfilment for which he longed? The material of the analysis shows that there is one condition which this picture must satisfy. It must have been calculated to create a conviction of the reality of the existence of castration. Fear of castration could then become the motive power for the transformation of the affect.

[1918b, 3527]

Well then, the patient has told us a dream, which we are to interpret. We have listened passively, without putting our powers of reflection into action. What do we do next? We decide to concern ourselves as little as possible with what we have heard, with the manifest dream. Of course this manifest dream exhibits all sorts of characteristics which are not entirely a matter of indifference to us. It may be coherent, smoothly constructed like a literary composition, or it may be confused to the point of unintelligibility, almost like a delirium; it may contain absurd elements or jokes and apparently witty conclusions; it may seem to the dreamer clear and sharp or obscure and hazy; its pictures may exhibit the complete sensory strength of perceptions or may be shadowy like an indistinct mist; the most diverse characteristics may be present in the same dream, distributed over various portions of it; the dream, finally, may show an indifferent emotional tone or be accompanied by feelings of the strongest joy or distress. You must not suppose that we think nothing of this endless diversity in manifest dreams. We shall come back to it later and we shall find a great deal in it that we can make use of in our interpretations. But for the moment we will disregard it and follow the main road that leads to the interpretation of dreams. That is to say, we ask the dreamer, too, to free himself from the impression of the manifest dream, to divert his attention from the dream as a whole on to the separate portions of its content and to report to us in succession everything that occurs to him in relation to each of these portions - what associations present themselves to him if he focuses on each of them separately.

[1933a, 4624]

Still more remarkable is the other process - displacement or shifting of accent - which in conscious thinking we come across only as faulty reasoning or as means for a joke. The different ideas in the dream-thoughts are, indeed, not all of equal value; they are cathected with quotas of affect of varying magnitude and are correspondingly judged to be important and deserving of interest to a greater or less degree. In the dream-work these ideas are separated from the affects attaching to them. The affects are dealt with independently; they may be displaced on to something else, they may be retained, they may undergo alterations, or they may not appear in the dream at all. The importance of the ideas that have been stripped of their affect returns in the dream as sensory strength in the dream-pictures; but we observe that this accent has passed over from important elements to indifferent ones. Thus something that played only a minor part in the dream-thoughts seems to be pushed into the foreground in the dream as the main thing, while, on the contrary, what was the essence of the dream-thoughts finds only passing and indistinct representation in the dream. No other part of the dream-work is so much responsible for making the dream strange and incomprehensible to the dreamer. Displacement is the principal means used in the dream-distortion to which the dream-thoughts must submit under the influence of the censorship.

[1933a, 4633]
I have only a few more remarks to add on the subject of affect in dreams from another point of view. A dominating element in a sleeper's mind may be constituted by what we call a 'mood' - or tendency to some affect - and this may then have a determining influence upon his dreams. A mood of this kind may arise from his experiences or thoughts during the preceding day, or its sources may be somatic. In either case it will be accompanied by the trains of thought appropriate to it. From the point of view of dream-construction it is a matter of indifference whether, as sometimes happens, these ideational contents of the dream-thoughts determine the mood in a primary fashion, or whether they are themselves aroused secondarily by the dreamer's emotional disposition which is in its turn to be explained on a somatic basis. In any case the construction of dreams is subject to the condition that it can only represent something which is the fulfilment of a wish and that it is only from wishes that it can derive its psychical motive force. A currently active mood is treated in the same way as a sensation arising and becoming currently active during sleep (cf. p. 714), which can be either disregarded or given a fresh interpretation in the sense of a wish-fulfilment. Distressing moods during sleep can become the motive force of a dream by arousing energetic wishes which the dream is supposed to fulfil. The material to which moods are attached is worked over until it can be used to express the fulfilment of a wish. The more intense and dominating a part is played in the dream-thoughts by the distressing mood, the more certain it becomes that the most strongly suppressed wishful impulses will make use of the opportunity in order to achieve representation. For, since the unpleasure which they would otherwise necessarily produce themselves is already present, they find the harder part of their task - the task of forcing their way through to representation - already accomplished for them. Here once more we are brought up against the problem of anxiety-dreams; and these, as we shall find, form a marginal case in the function of dreaming. [1900a, 927]
Just as the author of the novel, in choosing the name 'Sappho', had in mind an allusion to Lesbian practices, so too the pieces of the dream that spoke of people 'up above' and 'down below' alluded to phantasies of a sexual nature which occupied the patient's mind and, as suppressed desires, were not without a bearing on his neurosis. (The interpretation of the dream did not itself show us that what were thus represented in the dream were phantasies and not recollections of real events; an analysis only gives us the content of a thought and leaves it to us to determine its reality. Real and imaginary events appear in dreams at first sight as of equal validity; and that is so not only in dreams but in the production of more important psychical structures.)

[1900a, 761]

I do not wish to deny categorically that this fourth power in dream-construction - which we shall soon recognize as all old acquaintance, since in fact it is the only one of the four with which we are familiar in other connections - I do not wish to deny that this fourth factor has the capacity to create new contributions to dreams. It is certain, however, that, like the others, it exerts its influence principally by its preferences and selections from psychical material in the dream-thoughts that has already been formed. Now there is one case in which it is to a great extent spared the labour of, as it were, building up a façade for the dream - the case, namely, in which a formation of that kind already exists, available for use in the material of the dream-thoughts. I am in the habit of describing the element in the dream-thoughts which I have in mind as a ‘phantasy.’ I shall perhaps avoid misunderstanding if I mention the ‘day-dream’ as something analogous to it in waking life.¹ The part played in our mental life by these structures has not yet been fully recognized and elucidated by psychiatrists, though M. Benedikt has made what seems to me a very promising start in that direction. The importance of day-dreams has not escaped the unerring vision of imaginative writers; there is, for instance, a well-known account by Alphonse Daudet in *Le Nabab* of the day-dreams of one of the minor characters in that story. The study of the psychoneuroses leads to the surprising discovery that these phantasies or day-dreams are the immediate forerunners of hysterical symptoms, or at least of a whole number of them. Hysterical symptoms are not attached to actual memories, but to phantasies erected on the basis of the basis of memories. The frequent occurrence of conscious daytime phantasies brings these structures to our knowledge; but just as there are phantasies of this kind which are conscious, so, too, there are unconscious ones in great numbers, which have to remain unconscious on account of their content and of their origin from repressed material. Closer investigation of the characteristics of these day-time phantasies shows us how right it is that these formations should bear the same name as we give to the products of our thought during the night - the name, that is, of 'dreams.' They share a large number of their properties with night-dreams, and their investigation might, in fact, have served as the shortest and best approach to an understanding of night-dreams.

[1900a, 931]
The function of 'secondary revision', which we have attributed to the fourth of the factors concerned in shaping the content of dreams, shows us in operation once more the activity which is able to find free vent in the creation of day-dreams without being inhibited by any other influences. We might put it simply by saying that this fourth factor of ours seeks to mould the material offered to it into something like a day-dream. If, however, a day-dream of this kind has already been formed within the nexus of the dream-thoughts, this fourth factor in the dream-work will prefer to take possession of the ready-made day-dream and seek to introduce it into the content of the dream. There are some dreams which consist merely in the repetition of a day-time phantasy which may perhaps have remained unconscious: such, for instance, as the boy's dream of driving in a war-chariot with the heroes of the Trojan War. In my 'Autodidasker' dream the second part at all events was a faithful reproduction of a daytime phantasy, innocent in itself, of a conversation with Professor N. In view of the complicated conditions which a dream has to satisfy when it comes into existence, it happens more frequently that the ready-made phantasy forms only a portion of the dream, or that only a portion of the phantasy forces its way into the dream. Thereafter, the phantasy is treated in general like any other portion of the latent material, though it often remains recognizable as an entity in the dream. There are often parts of my dreams which stand out as producing a different impression from the rest. They strike me as being, as it were, more fluent, more connected and at the same time more fleeting than other parts of the same dream. These, I know, are unconscious phantasies which have found their way into the fabric of the dream, but I have never succeeded in pinning down a phantasy of this kind. Apart from this, these phantasies, like any other component of the dream-thoughts, are compressed, condensed, superimposed on one another, and so on. There are, however, transitional cases, between the case in which they constitute the content (or at least the façade) of the dream unaltered and the extreme opposite in which they are represented in the content of the dream only by one of their elements or by a distant allusion. What happens to phantasies present in the dream-thoughts is evidently also determined by any advantages they may have to offer the requirements of the censorship and of the urge towards condensation.

In selecting examples of dream-interpretation I have so far as possible avoided dreams in which unconscious phantasies play any considerable part, because the introduction of this particular psychical element would have necessitated lengthy discussions on the psychology of unconscious thinking. Nevertheless, I cannot completely escape a consideration of phantasies in this connection, since they often make their way complete into dreams and since still more often clear glimpses of them can be seen behind the dream. I will therefore quote one more dream, which seems to be composed of two different and opposing phantasies which coincide with each other at a few points and of which one is superficial while the second is, as it were, an interpretation of the first.¹

¹ [Footnote added 1909:] In my 'Fragment of an Analysis of a Case of Hysteria' (1905e), I have analysed a good specimen of a dream of this sort, made up of a number of superimposed phantasies. Incidentally, I underestimated the importance of the part played by these phantasies in the formation of dreams so long as I was principally working on my own dreams, which are usually based on discussions and conflict of thought and comparatively rarely on day-dreams. In the case of other people it is often much easier to demonstrate the complete analogy between night-dreams and day-dreams. With hysterical patients, a hysterical attack can often be replaced by a dream; and it is then easy to convince oneself that the immediate forerunner of both these psychical structures was a day-dream phantasy.
If we return for a moment to the point that the dream-work is glad to make use of a ready-
made phantasy instead of putting one together out of the material of the dream-thoughts, we
may perhaps find ourselves in a position to solve one of the most interesting puzzles connected
with dreams. On pp. 568 f. I told the well-known anecdote of how Maury, having been struck in
his sleep on the back of his neck by a piece of wood, woke up from a long dream which was like
a full-length story set in the days of the French Revolution. Since the dream, as reported, was a
coherent one and was planned entirely with an eye to providing an explanation of the stimulus
which woke him and whose occurrence he could not have anticipated, the only possible
hypothesis seems to be that the whole elaborate dream must have been composed and must
have taken place in the short period of time between the contact of the board with Maury's
cervical vertebrae and his consequent awakening. We should never dare to attribute such
rapidity to thought-activity in waking life, and we should therefore be driven to conclude that the
dream-work possesses the advantage of accelerating our thought-processes to a remarkable
degree.

Strong objections have been raised to what quickly became a popular conclusion by some
more recent writers (Le Lorrain, 1894 and 1895, Egger, 1895, and others). On the one hand
they throw doubts upon the accuracy of Maury's account of his dream; and on the other hand
they attempt to show that the rapidity of the operations of our waking thoughts is no less than in
this dream when exaggerations have been discounted. The discussion raised questions of
principle which do not seem to me immediately soluble. But I must confess that the arguments
brought forward (by Egger, for instance), particularly against Maury's guillotine dream, leave me
unconvinced. I myself would propose the following explanation of this dream. Is it so highly
improbable that Maury's dream represents a phantasy which had been stored up ready-made in
his memory for many years and which was aroused - or I would rather say 'alluded to' - at the
moment at which he became aware of the stimulus which woke him? If this were so, we should
have escaped the whole difficulty of understanding how such a long story with all its details
could have been composed in the extremely short period of time which was at the dreamer's
disposal - for the story would have been composed already. If the piece of wood had struck the
back of Maury's neck while he was awake, there would have been an opportunity for some such
thought as: 'That's just like being guillotined.' But since it was in his sleep that he was struck by
the board, the dream-work made use of the impinging stimulus in order rapidly to produce a
wish-fulfilment; it was as though it thought (this is to be taken purely figuratively): 'Here's a good
opportunity of realizing a wishful phantasy which was formed at such and such a time in the
course of reading.' It can hardly be disputed, I think, that the dream-story was precisely of a sort
likely to be constructed by a young man under the influence of powerfully exciting impressions.
Who - least of all what Frenchman or student of the history of civilization - could fail to be
gripped by narratives of the Reign of Terror, when the men and women of the aristocracy, the
flower of the nation, showed that they could die with a cheerful mind and could retain the
liveliness of their wit and the elegance of their manners till the very moment of the fatal
summons? How tempting for a young man to plunge into all this in his imagination - to picture
himself bidding a lady farewell - kissing her hand and mounting the scaffold unafraid! Or, if
ambition were the prime motive of the phantasy, how tempting for him to take the place of one
of those formidable figures who, by the power alone of their thoughts and flaming eloquence,
ruled the city in which the heart of humanity beat convulsively in those days - who were led by
their convictions to send thousands of men to their death and who prepared the way for the
transformation of Europe, while all the time their own heads were insecure and destined to fall
one day beneath the knife of the guillotine - how tempting to picture himself as one of the
Girondists, perhaps, or as the heroic Danton! There is one feature in Maury's recollection of the
dream, his being 'led to the place of execution, surrounded by an immense mob', which seems
to suggest that his phantasy was in fact of this ambitious type.

[1900a, 935]
Nor is it necessary that this long-prepared phantasy should have been gone through during sleep; it would have been sufficient for it to be merely touched on. What I mean is this. If a few bars of music are played and someone comments that it is from Mozart's *Figaro* (as happens in *Don Giovanni*) a number of recollections are roused in me all at once, none of which can enter my consciousness singly at the first moment. The key-phrase serves as a port of entry through which the whole network is simultaneously put in a state of excitation. It may well be the same in the case of unconscious thinking. The rousing stimulus excites the psychical port of entry which allows access to the whole guillotine phantasy. But the phantasy is not gone through during sleep but only in the recollection of the sleeper after his awakening. After waking he remembers in all its details the phantasy which was stirred up as a whole in his dream. One has no means of assuring oneself in such a case that one is really remembering something one has dreamt. This same explanation - that it is a question of ready-made phantasies which are brought into excitation as a whole by the rousing stimulus - can be applied to other dreams which are focused upon a rousing stimulus, such, for instance, as Napoleon's battle dream before the explosion of the infernal machine.

Among the dreams collected by Justine Tobowolska in her dissertation on the apparent passage of time in dreams, the most informative seems to me to be the one reported by Macario (1857) as having been dreamt by a dramatic author, Casimir Bonjour. One evening Bonjour wanted to attend the first performance of one of his pieces; but he was so fatigued that as he was sitting behind the scenes he dozed off just at the moment the curtain went up. During his sleep he went through the whole five acts of the play, and observed all the various signs of emotion shown by the audience during the different scenes. At the end of the performance he was delighted to hear his name being shouted with the liveliest demonstrations of applause. Suddenly he woke up. He could not believe either his eyes or his ears, for the performance had not gone beyond the first few lines of the first scene; he could not have been asleep for longer than two minutes. It is surely not too rash to suppose in the case of this dream that the dreamer's going through all five acts of the play and observing the attitude of the public to different passages in it need not have arisen from any fresh production of material during his sleep, but may have reproduced a piece of phantasy-activity (in the sense I have described) which had already been completed. Tobowolska, like other writers, emphasizes the fact that dreams with an accelerated passage of ideas have the common characteristic of seeming specially coherent, quite unlike other dreams, and that the recollection of them is summary far more than detailed. This would indeed be a characteristic which ready-made phantasies of this kind, touched upon by the dream-work, would be bound to possess, though this is a conclusion which the writers in question fail to draw. I do not assert, however, that all arousal dreams admit of this explanation, or that the problem of the accelerated passage of ideas in dreams can be entirely dismissed in this fashion.

If we now bear in mind how great a part is played in the dream-thoughts by infantile experiences or by phantasies based upon them, how frequently portions of them re-emerge in the dream-content and how often the dream-wishes themselves are derived from them, we cannot dismiss the probability that in dreams too the transformation of thoughts into visual images may be in part the result of the attraction which memories couched in visual form and eager for revival bring to bear upon thoughts cut off from consciousness and struggling to find expression. On this view a dream might be described as a *substitute for an infantile scene modified by being transferred on to a recent experience*. The infantile scene is unable to bring about its own revival and has to be content with returning as a dream.
This indication of the way in which infantile scenes (or their reproductions as phantasies) function in a sense as models for the content of dreams, removes the necessity for one of the hypotheses put forward by Scherner and his followers in regard to internal sources of stimulation. Scherner supposes that, when dreams exhibit particularly vivid or particularly copious visual elements, there is present a state of 'visual stimulation', that is, of internal excitation in the organ of vision. We need not dispute this hypothesis, but can content ourselves with assuming that this state of excitation applies merely to the *psychical* perceptual system of the visual organ; we may, however, further point out that the state of excitation has been set up by a memory, that it is a *revival* of a visual excitation which was originally an immediate one. I cannot produce any good example from my own experience of an *infantile* memory producing this kind of result. My dreams are in general less rich in sensory elements than I am led to suppose is the case in other people. But in the case of my most vivid and beautiful dream of the last few years I was easily able to trace back the hallucinatory clarity of the dream's content to the sensory qualities of recent or fairly recent impressions. On p. 907 ff. I recorded a dream in which the deep blue colour of the water, the brown of the smoke coming from the ship's funnels, and the dark brown and red of the buildings left behind a profound impression on me. This dream, if any, should be traceable, to a visual stimulus. What was it that had brought my visual organ into this state of stimulation? A recent impression, which attached itself to a number of earlier ones. The colours which I saw were in the first instance those of a box of toy bricks with which, on the day before the dream, my children had put up a fine building and shown it off for my admiration. The big bricks were of the same dark red and the small ones were of the same blue and brown. This was associated with colour impressions from my last travels in Italy: the beautiful blue of the Isonzo and the lagoons and the brown of the Carso. The beauty of the colours in the dream was only a repetition of something seen in my memory. [1900a, 979]

We have fully appreciated the importance of the part ascribed by Scherner to 'dream-imagination', as well as Scherner's own interpretations, but we have been obliged to transport them, as it were, to a different position in the problem. The point is not that dreams create the imagination, but rather that the unconscious activity of the imagination has a large share in the construction of the dream-thoughts. We remain in Scherner's debt for having indicated the source of the dream-thoughts; but nearly everything that he ascribes to the dream-work is really attributable to the activity of the unconscious during daytime, which is the instigating agent of dreams no less than of neurotic symptoms. We have been obliged to distinguish the 'dream-work' as something quite different and with a much narrower connotation. [1900a, 1018]
Now that the old antithesis between conscious life and dream life has been reduced to its proper proportions by the establishment of unconscious psychical reality, a number of dream-problems with which earlier writers were deeply concerned have lost their significance. Thus some of the activities whose successful performance in dreams excited astonishment are now no longer to be attributed to dreams but to unconscious thinking, which is active during the day no less than at night. If, as Scherner has said, dreams appear to engage in making symbolic representations of the body, we now know that those representations are the product of certain unconscious phantasies (deriving, probably, from sexual impulses) which find expression not only in dreams but also in hysterical phobias and other symptoms. If a dream carries on the activities of the day and completes them and even brings valuable fresh ideas to light, all we need do is to strip it of the dream disguise, which is the product of dream-work and the mark of assistance rendered by obscure forces from the depths of the mind (cf. the Devil in Tartini's sonata dream); the intellectual achievement is due to the same mental forces which produce every similar result during the daytime. We are probably inclined greatly to over-estimate the conscious character of intellectual and artistic production as well. Accounts given us by some of the most highly productive men, such as Goethe and Helmholtz, show rather that what is essential and new in their creations came to them without premeditation and as an almost ready-made whole. There is nothing strange if in other cases, where a concentration of every intellectual faculty was needed, conscious activity also contributed its share. But it is the much-abused privilege of conscious activity, wherever it plays a part, to conceal every other activity from our eyes.

It would be a mistake, however, to suppose that these dream-façades are nothing other than mistaken and somewhat arbitrary revisions of the dream-content by the conscious agency of our mental life. In the erection of a dream-façade use is not infrequently made of wishful phantasies which are present in the dream-thoughts in a pre-constructed form, and are of the same character as the appropriately named 'day-dreams' familiar to us in waking life. The wishful phantasies revealed by analysis in night-dreams often turn out to be repetitions or modified versions of scenes from infancy; thus in some cases the façade of the dream directly reveals the dream's actual nucleus, distorted by an admixture of other material.

This brings us to the contents of the letter in the dream. Her father was dead, and she had left home by her own choice. In connection with this letter I at once reminded Dora of the farewell letter which she had written to her parents or had at least composed for their benefit. This letter had been intended to give her father a fright, so that he should give up Frau K.; or at any rate to take revenge on him if he could not be induced to do that. We are here concerned with the subject of her death and of her father's death. (Cf. 'cemetery' later on in the dream.) Shall we be going astray if we suppose that the situation which formed the façade of the dream was a phantasy of revenge directed against her father? The feelings of pity for him which she remembered from the day before would be quite in keeping with this. According to the phantasy she had left home and gone among strangers, and her father's heart had broken with grief and with longing for her. Thus she would be revenged. She understood very clearly what it was that her father needed when he could not get to sleep without a drink of brandy.³ We will make a note of Dora's craving for revenge as a new element to be taken into account in any subsequent synthesis of her dream-thoughts.
At this point a certain suspicion of mine became a certainty. The use of 'Bahnhof' ['station'; literally, 'railway-court'] and 'Friedhof' ['cemetery'; literally, 'peace-court'] to represent the female genitals was striking enough in itself, but it also served to direct my awakened curiosity to the similarly formed 'Vorhof' ['vestibulum'; literally, 'fore-court'] - an anatomical term for a particular region of the female genitals. This might have been no more than mistaken ingenuity. But now, with the addition of 'nymphs' visible in the background of a 'thick wood', no further doubts could be entertained. Here was a symbolic geography of sex! 'Nymphae', as is known to physicians though not to laymen (and even by the former the term is not very commonly used), is the name given to the labia minora, which lie in the background of the 'thick wood' of the pubic hair. But any one who employed such technical names as 'vestibulum' and 'nymphae' must have derived his knowledge from books, and not from popular ones either, but from anatomical text-books or from an encyclopaedia - the common refuge of youth when it is devoured by sexual curiosity. If this interpretation were correct, therefore, there lay concealed behind the first situation in the dream a phantasy of defloration, the phantasy of a man seeking to force an entrance into the female genitals.²

² The phantasy of defloration formed the second component of the situation. The emphasis upon the difficulty of getting forward and the anxiety felt in the dream indicated the stress which the dreamer was so ready to lay upon her virginity - a point alluded to in another place by means of the Sistine Madonna. These sexual thoughts gave an unconscious ground-colouring to the wishes (which were perhaps merely kept secret) concerned with the suitor who was waiting for her in Germany. We have already recognized the phantasy of revenge as the first component of the same situation in the dream. The two components do not coincide completely, but only in part. We shall subsequently come upon the traces of a third and still more important train of thought.

¹ [Footnote added 1920:] The phantasies of the pubertal period have as their starting-point the infantile sexual researches that were abandoned in childhood. No doubt, too, they are also present before the end of the latency period. They may persist wholly, or to a great extent, unconsciously and for that reason it is often impossible to date them accurately. They are of great importance in the origin of many symptoms, since they precisely constitute preliminary stages of these symptoms and thus lay down the forms in which the repressed libidinal components find satisfaction. In the same way, they are the prototypes of the nocturnal phantasies which become conscious as dreams. Dreams are often nothing more than revivals of pubertal phantasies of this kind under the influence of, and in relation to, some stimulus left over from the waking life of the previous day (the 'day's residues'). Some among the sexual phantasies of the pubertal period are especially prominent, and are distinguished by their very general occurrence and by being to a great extent independent of individual experience. Such are the adolescent's phantasies of overhearing his parents in sexual intercourse, of having been seduced at an early age by someone he loves and of having been threatened with castration; such, too, are his phantasies of being in the womb, and even of experiences there, and the so-called 'Family Romance', in which he reacts to the difference between his attitude towards his parents now and in his childhood. The close relations existing between these phantasies and myths has been demonstrated in the case of the last instance by Otto Rank (1909).

There is a great deal more that could be said about phantasies; but I will only allude as briefly as possible to certain points. If phantasies become over-luxuriant and over-powerful, the conditions are laid for an onset of neurosis or psychosis. Phantasies, moreover, are the immediate mental precursors of the distressing symptoms complained of by our patients. Here a broad by-path branches off into pathology.
I cannot pass over the relation of phantasies to dreams. Our dreams at night are nothing else than phantasies like these, as we can demonstrate from the interpretation of dreams.¹ Language, in its unrivalled wisdom, long ago decided the question of the essential nature of dreams by giving the name of 'day-dreams' to the airy creations of phantasy. If the meaning of our dreams usually remains obscure to us in spite of this pointer, it is because of the circumstance that at night there also arise in us wishes of which we are ashamed; these we must conceal from ourselves, and they have consequently been repressed, pushed into the unconscious. Repressed wishes of this sort and their derivatives are only allowed to come to expression in a very distorted form. When scientific work had succeeded in elucidating this factor of dream-distortion, it was no longer difficult to recognize that night-dreams are wish-fulfilments in just the same way as day-dreams - the phantasies which we all know so well. [1908e, 1925]

A common source and normal prototype of all these creations of phantasy is to be found in what are called the day-dreams of youth. These have already received some, though as yet insufficient, notice in the literature of the subject.¹ They occur with perhaps equal frequency in both sexes, though it seems that while in girls and women they are invariably of an erotic nature, in men they may be either erotic or ambitious. Nevertheless the importance of the erotic factor in men, too, should not be given a secondary rating; a closer investigation of a man's day-dreams generally shows that all his heroic exploits are carried out and all his successes achieved only in order to please a woman and to be preferred by her to other men.² These phantasies are satisfactions of wishes proceeding from deprivation and longing. They are justly called 'day-dreams', for they give us the key to an understanding of night-dreams - in which the nucleus of the dream-formation consists of nothing else than complicated day-time phantasies of this kind that have been distorted and are misunderstood by the conscious psychical agency.³ [1908a, 1932]

When one carries out the psycho-analysis of a hysterical woman patient whose complaint is manifested in attacks, one soon becomes convinced that these attacks are nothing else but phantasies translated into the motor sphere, projected on to motility and portrayed in pantomime. It is true that the phantasies are unconscious; but apart from this they are of the same nature as the phantasies which can be observed directly in day-dreams or which can be elicited by interpretation from dreams at night. Often a dream takes the place of an attack, and still more often it explains it, since the same phantasy finds a different expression in a dream and in an attack. We might expect then that by observing an attack we should be able to get to know the phantasy represented in it; but this is seldom possible. As a rule, owing to the influence of the censorship, the pantomimic portrayal of the phantasy has undergone distortions which are completely analogous to the hallucinatory distortions of a dream, so that both of them have, in the first resort, become unintelligible to the subject's own consciousness as well as to the observer's comprehension. A hysterical attack, therefore, needs to be subjected to the same interpretative revision as we employ for night-dreams. But not only are the forces from which the distortion proceeds and the purpose of the distortion the same as those we have come to know through the interpretation of dreams; the technique employed in the distortion is the same too. [1909a, 1981]
The attack becomes unintelligible through the fact that it represents several phantasies in the same material simultaneously - that is to say through condensation. The elements common to the two (or more) phantasies constitute the nucleus of the representation, as they do in dreams. The phantasies which are thus made to coincide are often of quite a different nature. They may, for instance, be a recent wish and the re-activation of an infantile impression. The same innervations are in that case made to serve both purposes, often in a most ingenious way. Hysterical patients who make a very extensive use of condensation may find a single form of attack sufficient; others express their numerous pathogenic phantasies by a multiplication of the forms of attack.

[1909a, 1982]

Among the derivatives of the Ucs. instinctual impulses, of the sort we have described, there are some which unite in themselves characters of an opposite kind. On the one hand, they are highly organized, free from self-contradiction, have made use of every acquisition of the system Cs. and would hardly be distinguished in our judgement from the formations of that system. On the other hand they are unconscious and are incapable of becoming conscious. Thus qualitatively they belong to the system Pcs., but factually to the Ucs. Their origin is what decides their fate. We may compare them with individuals of mixed race who, taken all round, resemble white men, but who betray their coloured descent by some striking feature or other, and on that account are excluded from society and enjoy none of the privileges of white people. Of such a nature are those phantasies of normal people as well as of neurotics which we have recognized as preliminary stages in the formation both of dreams and of symptoms and which, in spite of their high degree of organization, remain repressed and therefore cannot become conscious. They draw near to consciousness and remain undisturbed so long as they do not have an intense cathexis, but as soon as they exceed a certain height of cathexis they are thrust back. Substitutive formations, too, are highly organized derivatives of the Ucs. of this kind; but these succeed in breaking through into consciousness, when circumstances are favourable - for example, if they happen to join forces with an anticathexis from the Pcs.

[1915e, 3013]
The manifestations of a compulsion to repeat (which we have described as occurring in the early activities of infantile mental life as well as among the events of psycho-analytic treatment) exhibit to a high degree an instinctual character and, when they act in opposition to the pleasure principle, give the appearance of some 'daemonic' force at work. In the case of children's play we seemed to see that children repeat unpleasurable experiences for the additional reason that they can master a powerful impression far more thoroughly by being active than they could by merely experiencing it passively. Each fresh repetition seems to strengthen the mastery they are in search of. Nor can children have their pleasurable experiences repeated often enough, and they are inexorable in their insistence that the repetition shall be an identical one. This character trait disappears later on. If a joke is heard for a second time it produces almost no effect; a theatrical production never creates so great an impression the second time as the first; indeed, it is hardly possible to persuade an adult who has very much enjoyed reading a book to re-read it immediately. Novelty is always the condition of enjoyment. But children will never tire of asking an adult to repeat a game that he has shown them or played with them, till he is too exhausted to go on. And if a child has been told a nice story, he will insist on hearing it over and over again rather than a new one; and he will remorselessly stipulate that the repetition shall be an identical one and will correct any alterations of which the narrator may be guilty - though they may actually have been made in the hope of gaining fresh approval. None of this contradicts the pleasure principle; repetition, the re-experiencing of something identical, is clearly in itself a source of pleasure. In the case of a person in analysis, on the contrary, the compulsion to repeat the events of his childhood in the transference evidently disregards the pleasure principle in every way. The patient behaves in a purely infantile fashion and thus shows us that the repressed memory-traces of his primaeval experiences are not present in him in a bound state and are indeed in a sense incapable of obeying the secondary process. It is to this fact of not being bound, moreover, that they owe their capacity for forming, in conjunction with the residues of the previous day, a wishful phantasy that emerges in a dream. This same compulsion to repeat frequently meets us as an obstacle to our treatment when at the end of an analysis we try to induce the patient to detach himself completely from his physician. It may be presumed, too, that when people unfamiliar with analysis feel an obscure fear - a dread of rousing something that, so they feel, is better left sleeping - what they are afraid of at bottom is the emergence of this compulsion with its hint of possession by some 'daemonic' power. [1920g, 3738]
Let us next consider the two dreams in which an expression of satisfaction was transposed to the moment after waking. In the one case the reason given for the satisfaction was an expectation that I should now discover what was meant by 'I've dreamt of that before', while the satisfaction really referred to the birth of my first children. In the other case the ostensible reason was my conviction that something that had been 'prognosticated' was now coming true, while the real reference was similar to that in the former dream: it was the satisfaction with which I greeted the birth of my second son. Here the affects which dominated the dream-thoughts persisted in the dreams; but it is safe to say that in no dream can things be as simple as all that. If we go a little more deeply into the two analyses we find that this satisfaction which had escaped censorship had received an accession from another source. This other source had grounds for fearing the censorship, and its affect would undoubtedly have aroused opposition if it had not covered itself by the similar, legitimate affect of satisfaction, arising from the permissible source, and slipped in, as it were, under its wing.

[1900a, 920]
A man who is now thirty-five years old reported a dream which he remembered clearly and claimed to have had at the age of four. The lawyer who had charge of his father's will - he had lost his father when he was three - brought two large pears. He was given one of them to eat; the other lay on the window-sill in the sitting-room. He awoke with a conviction of the reality of what he had dreamt and kept obstinately asking his mother for the second pear, and insisted that it was on the window-sill. His mother had laughed at this.

The failure of the dreamer's associations gave us a right to attempt an interpretation by symbolic substitution. The two pears - 'pommes ou poires' - were his mother's breasts which had given him nourishment; the window-sill was the projection formed by her bosom - like balconies in dreams of houses (see p. 821). His feeling of reality after waking was justified, for his mother had really suckled him, and had done so, in fact, for far longer than the usual time and his mother's breast was still available to him. The dream must be translated: 'Give (or show) me your breast again, Mother, that I used to drink from in the past.' 'In the past' was represented by his eating one of the pears; 'again' was represented by his longing for the other. The temporal repetition of an act is regularly shown in dreams by the numerical multiplication of an object.

Let us take this last remark as a starting-point. We know from our experience in interpreting dreams that this sense of reality carries a particular significance along with it. It assures us that some part of the latent material of the dream is claiming in the dreamer's memory to possess the quality of reality, that is, that the dream relates to an occurrence that really took place and was not merely imagined. It can naturally only be a question of the reality of something unknown; for instance, the conviction that his grandfather really told him the story of the tailor and the wolf, or that the stories of 'Little Red Riding-Hood' and of 'The Seven Little Goats' were really read aloud to him, would not be of a nature to be replaced by this sense of reality that outlasted the dream. The dream seemed to point to an occurrence the reality of which was very strongly emphasized as being in marked contrast to the unreality of the fairy tales.
¹ [Footnote added 1919:] I may quote the following dream from my Introductory Lectures as an example of the meaning of doubt and uncertainty in a dream and of its content being at the same time shrunk down to a single element; in spite of this the dream was successfully analysed after a short delay:
[1900a, 952]

Similarly, in the course of our work of interpretation we learn what it is that corresponds to the doubts and uncertainties which the dreamer so often expresses as to whether a particular element occurred in a dream, whether it was this or whether, on the contrary, it was something else. There is as a rule nothing in the latent dream-thoughts corresponding to these doubts and uncertainties; they are entirely due to the activity of the dream-censorship and are to be equated with an attempt at elimination which has not quite succeeded.
[1916-1917, 3269]

¹ In the interpretation of dreams, to which, indeed, we owe our best knowledge of unconscious mental life, we follow a technical rule of disregarding doubt and uncertainty in the narrative of the dream, and of treating every element of the manifest dream as being quite certain. We attribute doubt and uncertainty to the influence of the censorship to which the dream-work is subjected, and we assume that the primary dream-thoughts are not acquainted with doubt and uncertainty as critical processes. They may of course be present, like anything else, as part of the content of the day's residues which lead to the dream.
[1921c, 3773]
The alternative ‘either-or’ is never expressed in dreams, both of the alternatives being inserted in the text of the dream as though they were equally valid. I have already mentioned that an ‘either-or’ used in recording a dream is to be translated by ‘and’.
[1901a, 1076]
The failure of the dreamer's associations gave us a right to attempt an interpretation by symbolic substitution. The two pears - 'pommes ou poires' - were his mother's breasts which had given him nourishment; the window-sill was the projection formed by her bosom - like balconies in dreams of houses (see p. 821). His feeling of reality after waking was justified, for his mother had really suckled him, and had done so, in fact, for far longer than the usual time and his mother's breast was still available to him. The dream must be translated: 'Give (or show) me your breast again, Mother, that I used to drink from in the past.' 'In the past' was represented by his eating one of the pears; 'again' was represented by his longing for the other. The temporal repetition of an act is regularly shown in dreams by the numerical multiplication of an object.

[1900a, 832]
If we wish to pursue our study of the relations between dream-content and dream-thoughts further, the best plan will be to take dreams themselves as our point of departure and consider what certain formal characteristics of the method of representation in dreams signify in relation to the thoughts underlying them. Most prominent among these formal characteristics, which cannot fail to impress us in dreams, are the differences in sensory intensity between particular dream-images and in the distinctness of particular parts of dreams or of whole dreams as compared with one another.

We must begin by countering certain expectations which almost inevitably present themselves. Since the material of a dream may include real sensations experienced during sleep, it will probably be presumed that these, or the elements in the dream derived from them, are given prominence in the dream content by appearing with special intensity; or, conversely, that whatever is very specially vivid in a dream can be traced back to real sensations during sleep. In my experience, however, this has never been confirmed. It is not the case that the elements of a dream which are derivatives of real impressions during sleep (i.e. of nervous stimuli) are distinguished by their vividness from other elements which arise from memories. The factor of reality counts for nothing in determining the intensity of dream images.

Again, it might be expected that the sensory intensity (that is, the vividness) of particular dream-images would be related to the psychical intensity of the elements in the dream-thoughts corresponding to them. In the latter, psychical intensity coincides with psychical value: the most intense elements are also the most important ones - those which form the centre-point of the dream-thoughts. We know, it is true, that these are precisely elements which, on account of the censorship, cannot as a rule make their way into the content of the dream; nevertheless, it might well be that their immediate derivatives which represent them in the dream might bear a higher degree of intensity, without necessarily on that account forming the centre of the dream. But this expectation too is disappointed by a comparative study of dreams and the material from which they are derived. The intensity of the elements in the one has no relation to the intensity of the elements in the other: the fact is that a complete ‘transvaluation of all psychical values’ takes place between the material of the dream-thoughts and the dream. A direct derivative of what occupies a dominating position in the dream-thoughts can often only be discovered precisely in some transitory element of the dream which is quite overshadowed by more powerful images.

The intensity of the elements of a dream turns out to be determined otherwise - and by two independent factors. In the first place, it is easy to see that the elements by which the wish-fulfilment is expressed are represented with special intensity. And in the second place, analysis shows that the most vivid elements of a dream are the starting-point of the most numerous trains of thought - that the most vivid elements are also those with the most numerous determinants. We shall not be altering the sense of this empirically based assertion if we put it in these terms: the greatest intensity is shown by those elements of a dream on whose formation the greatest amount of condensation has been expended. We may expect that it will eventually turn out to be possible to express this determinant and the other (namely relation to the wish-fulfilment) in a single formula.
The problem with which I have just dealt - the causes of the greater or less intensity or clarity of particular elements of a dream - is not to be confounded with another problem, which relates to the varying clarity of whole dreams or sections of dreams. In the former case clarity is contrasted with vagueness, but in the latter case it is contrasted with confusion. Nevertheless it cannot be doubted that the increase and decrease of the qualities in the two scales run parallel. A section of a dream which strikes us as perspicuous usually contains intense elements; a dream which is obscure, on the other hand, is composed of elements of small intensity. Yet the problem presented by the scale which runs from what is apparently clear to what is obscure and confused is far more complicated than that of the varying degrees of vividness of dream-elements. Indeed, for reasons which will appear later, the former problem cannot yet be discussed.

In a few cases we find to our surprise that the impression of clarity or indistinctness given by a dream has no connection at all with the make-up of the dream itself but arises from the material of the dream-thoughts and is a constituent of it. Thus I remember a dream of mine which struck me when I woke up as being so particularly well-constructed, flawless and clear that, while I was still half-dazed with sleep, I thought of introducing a new category of dreams which were not subject to the mechanisms of condensation and displacement but were to be described as 'phantasies during sleep.' Closer examination proved that this rarity among dreams showed the same gaps and flaws in its structure as any other; and for that reason I dropped the category of 'dream-phantasies.'¹ The content of the dream, when it was arrived at, represented me as laying before my friend a difficult and long-sought theory of bisexuality; and the wish-fulfilling power of the dream was responsible for our regarding this theory (which, incidentally, was not given in the dream) as clear and flawless. Thus what I had taken to be a judgement on the completed dream was actually a part, and indeed the essential part, of the dream-content. The dream-work had in this case encroached, as it were, upon my first waking thoughts and had conveyed to me as a judgement upon the dream the part of the material of the dream-thoughts which it had not succeeded in representing accurately in the dream. I once came across a precise counterpart to this in a woman patient's dream during analysis. To begin with she refused altogether to tell it me, 'because it was so indistinct and muddled'. At length, protesting repeatedly that she felt no certainty that her account was correct, she informed me that several people had come into the dream - she herself, her husband and her father - and that it was as though she had not known whether her husband was her father, or who her father was, or something of that sort. This dream, taken in conjunction with her associations during the analytic session, showed beyond a doubt that it was a question of the somewhat commonplace story of a servant-girl who was obliged to confess that she was expecting a baby but was in doubts as to 'who the (baby's) father really was'.² Thus here again the lack of clarity shown by the dream was a part of the material which instigated the dream: part of this material, that is, was represented in the form of the dream. The form of a dream, or the form in which it is dreamt is used with quite surprising frequency for representing its concealed subject-matter.

Nevertheless in my experience it is only rarely that one is in a position to interpret the clarity or confusion of a dream by the presence of certainty or doubt in its material. Later on I shall have to disclose a factor in dream-formation which I have not yet mentioned and which exercises the determining influence upon the scale of these qualities in any particular dream.

¹ [1900a, 800]
² [1900a, 804]
I have already quoted a striking example of this. A woman patient refused to tell me a dream of hers because 'it was not clear enough.' She had seen someone in the dream but did not know whether it was her husband or her father. There then followed a second piece of dream in which a dust-bin [*Mistträger*] appeared, and this gave rise to the following recollection. When she had first set up house she had jokingly remarked on one occasion in the presence of a young relative who was visiting in the house that her next job was to get hold of a new dust-bin. The next morning one arrived for her, but it was filled with lilies of the valley. This piece of the dream served to represent a common phrase 'not grown on my own manure'.¹ When the analysis was completed, it turned out that the dream-thoughts were concerned with the after-effects of a story, which the dreamer had heard when she was young, of how a girl had had a baby and of how it was *not clear who the father really was*. Here, then, the dream-representation had overflowed into the waking thoughts: one of the elements of the dream-thoughts had found representation in a waking judgement passed upon the dream as a whole. [1900a, 892]

We now perceive, incidentally, on what it is that the range in the quality of dreams between confusion and clarity which was discussed on p. 779 f. depends. Those parts of a dream on which the secondary revision has been able to produce some effect are clear, while those parts on which its efforts have failed are confused. Since the confused parts of a dream are so often at the same time the less vivid parts, we may conclude that the secondary dream-work is also to be held responsible for a contribution to the plastic intensity of the different dream-elements. [1900a, 938]

This indication of the way in which infantile scenes (or their reproductions as phantasies) function in a sense as models for the content of dreams, removes the necessity for one of the hypotheses put forward by Scherner and his followers in regard to internal sources of stimulation. Scherner supposes that, when dreams exhibit particularly vivid or particularly copious visual elements, there is present a state of 'visual stimulation', that is, of internal excitation in the organ of vision. We need not dispute this hypothesis, but can content ourselves with assuming that this state of excitation applies merely to the *psychical* perceptual system of the visual organ; we may, however, further point out that the state of excitation has been set up by a *memory*, that it is a *revival* of a visual excitation which was originally an immediate one. I cannot produce any good example from my own experience of an *infantile* memory producing this kind of result. My dreams are in general less rich in sensory elements than I am led to suppose is the case in other people. But in the case of my most vivid and beautiful dream of the last few years I was easily able to trace back the hallucinatory clarity of the dream's content to the sensory qualities of recent or fairly recent impressions. On p. 907 ff., I recorded a dream in which the deep blue colour of the water, the brown of the smoke coming from the ship's funnels, and the dark brown and red of the buildings left behind a profound impression on me. This dream, if any, should be traceable, to a visual stimulus. What was it that had brought my visual organ into this state of stimulation? A recent impression, which attached itself to a number of earlier ones. The colours which I saw were in the first instance those of a box of toy bricks with which, on the day before the dream, my children had put up a fine building and shown it off for my admiration. The big bricks were of the same dark red and the small ones were of the same blue and brown. This was associated with colour impressions from my last travels in Italy: the beautiful blue of the Isonzo and the lagoons and the brown of the Carso. The beauty of the colours in the dream was only a repetition of something seen in my memory. [1900a, 979]
The tertium comparationis in the analogy that I have just used - the quantity put at the disposal of the entrepreneur in an appropriate amount - is capable of being applied in still greater detail to the purpose of elucidating the structure of dreams. In most dreams it is possible to detect a central point which is marked by peculiar sensory intensity, as I have shown on p. 778. This central point is as a rule the direct representation of the wish-fulfilment, for, if we undo the displacements brought about by the dream-work, we find that the psychical intensity of the elements in the dream-thoughts has been replaced by the sensory intensity of the elements in the content of the actual dream. The elements in the neighbourhood of the wish-fulfilment often have nothing to do with its meaning, but turn out to be derivatives of distressing thoughts that run contrary to the wish. But owing to their being in what is often an artificially established connection with the central element, they have acquired enough intensity to become capable of being represented in the dream. Thus the wish-fulfilment's power of bringing about representation is diffused over a certain sphere surrounding it, within which all the elements - including even those possessing no means of their own - become empowered to obtain representation. In the case of dreams that are actuated by several wishes, it is easy to delimit the spheres of the different wish-fulfilments, and gaps in the dream may often be understood as frontier zones between those spheres.

[1900a, 992]

The material in the dream-thoughts which is packed together for the purpose of constructing a dream-situation must of course in itself be adaptable for that purpose. There must be one or more common elements in all the components. The dream-work then proceeds just as Francis Galton did in constructing his family photographs. It superimposes, as it were, the different components upon one another. The common element in them then stands out clearly in the composite picture, while contradictory details more or less wipe one another out. This method of production also explains to some extent the varying degrees of characteristic vagueness shown by so many elements in the content of dreams. Basing itself on this discovery, dream-interpretation has laid down the following rule: In analysing a dream, if an uncertainty can be resolved into an 'either-or', we must replace it for purposes of interpretation by an 'and', and take each of the apparent alternatives as an independent starting-point for a series of associations.

[1901a, 1066]
Strümpell (1877, 40): 'The position is even more remarkable when we observe how dreams sometimes bring to light, as it were, from beneath the deepest piles of débris under which the earliest experiences of youth are buried in later times, pictures of particular localities, things or people, completely intact and with all their original freshness. This is not limited to experiences which created a lively impression when they occurred or enjoy a high degree of psychical importance and return later in a dream as genuine recollections at which waking consciousness will rejoice. On the contrary, the depths of memory in dreams also include pictures of people, things, localities and events dating from the earliest times, which either never possessed any psychical importance or more than a slight degree of vividness, or which have long since lost what they may have possessed of either, and which consequently seem completely alien and unknown alike to the dreaming and waking mind till their earlier origin has been discovered.' [1900a, 529]

Several writers who are anxious not to cast doubts on the intimate connection between the content of dreams and waking life have been struck by the fact that impressions with which waking thoughts are intensely occupied only appear in dreams after they have been pushed somewhat aside by the workings of daytime thought. Thus, after the death of someone dear to them, people do not as a rule dream of him to begin with, while they are overwhelmed by grief (Delage, 1891). On the other hand one of the most recent observers, Miss Hallam (Hallam and Weed, 1896, 410-11), has collected instances to the contrary, thus asserting the right of each of us to psychological individualism in this respect. [1900a, 532]

The third, most striking and least comprehensible characteristic of memory in dreams is shown in the choice of material reproduced. For what is found worth remembering is not, as in waking life, only what is most important, but on the contrary what is most indifferent and insignificant as well. On this point I will quote those writers who have given the strongest expression to their astonishment. [1900a, 532]

Hildebrandt (1875, 11): 'For the remarkable thing is that dreams derive their elements not from major and stirring events nor the powerful and compelling interests of the preceding day, but from incidental details, from the worthless fragments, one might say, of what has been recently experienced or of the remoter past. A family bereavement, which has moved us deeply and under whose immediate shadow we have fallen asleep late at night, is blotted out of our memory till with our first waking moment it returns to it again with disturbing violence. On the other hand, a wart on the forehead of a stranger whom we met in the street and to whom we owe no second thought after passing him has a part to play in our dream...'

[1900a, 532]

Strümpell (1877, 39): 'There are cases in which the analysis of a dream shows that some of its components are indeed derived from experiences of the previous day or its predecessor, but experiences so unimportant and trivial from the point of view of waking consciousness that they were forgotten soon after they occurred. Experiences of this kind include, for instance, remarks accidentally overheard, or another person's actions inattentively observed, or passing glimpses of people or things, or odd fragments of what one has read, and so on.' [1900a, 533]
Havelock Ellis (1899, 727): 'The profound emotions of waking life, the questions and problems on which we spread our chief voluntary mental energy, are not those which usually present themselves at once to dream consciousness. It is, so far as the immediate past is concerned, mostly the trifling, the incidental, the "forgotten" impressions of daily life which reappear in our dreams. The psychic activities that are awake most intensely are those that sleep most profoundly.'

[1900a, 533]

Binz (1878, 44-5) actually makes this particular peculiarity of memory in dreams the occasion for expressing his dissatisfaction with the explanations of dreams which he himself has supported: 'And the natural dream raises similar problems. Why do we not always dream of the mnemonic impressions of the day we have just lived through? Why do we often, without any apparent motive, plunge instead into the remote and almost extinct past? Why does consciousness so often in dreams receive the impression of indifferent mnemonic images, while the brain cells, just where they carry the most sensitive marks of what has been experienced, lie for the most part silent and still, unless they have been stirred into fresh activity shortly before, during waking life?'

[1900a, 533]

It is easy to see how the remarkable preference shown by the memory in dreams for indifferent, and consequently unnoticed, elements in waking experience is bound to lead people to overlook in general the dependence of dreams upon waking life and at all events to make it difficult in any particular instance to prove that dependence. Thus Miss Whiton Galkins (1893, 315), in her statistical study of her own and her collaborator's dreams, found that in eleven per cent of the total there was no visible connection with waking life. Hildebrandt (1875) is unquestionably right in asserting that we should be able to explain the genesis of every dream-image if we devoted enough time and trouble to tracing its origin. He speaks of this as 'an exceedingly laborious and thankless task. For as a rule it ends in hunting out every kind of utterly worthless psychical event from the remotest corners of the chambers of one's memory, and in dragging to light once again every kind of completely indifferent moment of the past from the oblivion in which it was buried in the very hour, perhaps, after it occurred.' I can only regret that this keen-sighted author allowed himself to be deterred from following the path which had this inauspicious beginning; if he had followed it, it would have led him to the very heart of the explanation of dreams.

[1900a, 533]

This ruling theory, which regards dreams as a somatic process, underlies a most interesting hypothesis put forward for the first time by Robert in 1886. It is particularly attractive since it is able to suggest a function, a utilitarian purpose, for dreaming. Robert takes as the groundwork of his theory two facts of observation which we have already considered in the course of our examination of the material of dreams (see above, p. 532 ff.), namely that we dream so frequently of the most trivial daily impressions and that we so rarely carry over into our dreams our important daily interests. Robert (1886, 10) asserts that it is universally true that things which we have thoroughly thought out never become instigators of dreams but only things which are in our minds in an uncompleted shape or which have merely been touched upon by our thoughts in passing: 'The reason why it is usually impossible to explain dreams is precisely because they are caused by sensory impressions of the preceding day which failed to attract enough of the dreamer's attention.' Thus the condition which determines whether an impression shall find its way into a dream is whether the process of working over the impression was interrupted or whether the impression was too unimportant to have a right to be worked over at all.

[1900a, 586]
Delage (1891, 41) tells us that he experienced in his own person, on the occasion of the death of someone of whom he was fond, the fact that we do not dream of what has occupied all our thoughts during the day, or not until it has begun to give place to other daytime concerns. His investigations among other people confirmed him in the general truth of this fact. He makes what would be an interesting observation of this kind, if it should prove to have general validity, on the dreams of young married couples: 'S'ils ont été fortement épris, presque jamais ils n'ont rêvé l'un de l'autre avant le mariage ou pendant la lune de miel; et s'ils ont rêvé d'amour c'est pour être infidèles avec quelque personne indifférente ou odieuse.' What, then, do we dream of? Delage identifies the material that occurs in our dreams as consisting of fragments and residues of the preceding days and of earlier times. Everything that appears in our dreams, even though we are inclined at first to regard it as a creation of our dream-life, turns out, when we have examined it more closely, to be unrecognized reproduction - 'souvenir inconscient'. But this ideational material possesses a common characteristic: it originates from impressions which probably affected our senses more strongly than our intelligence or from which our attention was diverted very soon after they emerged. The less conscious and at the same time the more powerful an impression has been, the more chance it has of playing a part in the next dream.

Here we have what are essentially the same two categories of impressions as are stressed by Robert: the trivial ones and those that have not been dealt with. Delage, however, gives the situation a different turn, for he holds that it is because these impressions have not been dealt with that they are capable of producing dreams, not because they are trivial. It is true in a certain sense that trivial impressions, too, have not been dealt with completely; being in the nature of fresh impressions, they are 'autant de ressorts tendus' which are released during sleep. A powerful impression which happens to have met with some check in the process of being worked over or which has been purposely held under restraint has more claim to play a part in dreams than an impression which is weak and almost unnoticed. The psychical energy which has been stored up during the daytime by being inhibited and suppressed becomes the motive force for dreams at night. Psychical material that has been suppressed comes to light in dreams.¹

Here is another dream in which once again the stimulus produced its effect during actual sleep. One of my women patients, who had been obliged to undergo an operation on her jaw which had taken an unfavourable course, was ordered by her doctors to wear a cooling apparatus on the side of her face day and night. But as soon as she fell asleep she used to throw it off. One day, after she had once more thrown the apparatus on the floor, I was asked to speak to her seriously about it. 'This time I really couldn't help it', she answered. 'It was because of a dream I had in the night. I dreamt I was in a box at the opera and very much enjoying the performance. But Herr Karl Meyer was in the nursing-home and complaining bitterly of pains in his jaw. So I told myself that as I hadn't any pain I didn't need the apparatus; and I threw it away.' The dream of this poor sufferer seems almost like a concrete representation of a phrase that sometimes forces its way on to people's lips in unpleasant situations: 'I must say I could think of something more agreeable than this.' The dream gives a picture of this more agreeable thing. The Herr Karl Meyer on to whom the dreamer transplanted her pains was the most indifferent young man of her acquaintance that she could call to mind.

(2) They make their selection upon different principles from our waking memory, since they do not recall what is essential and important but what is subsidiary and unnoticed.

¹ [1900a, 588]
They have at their disposal the earliest impressions of our childhood and even bring up
details from that period of our life which, once again, strike us as trivial and which in our waking
state we believe to have been long since forgotten.¹
[1900a, 655]

¹ The view adopted by Robert that the purpose of dreams is to unburden our memory of the useless
impressions of daytime is plainly no longer tenable if indifferent memory images from our childhood appear
at all frequently in dreams. Otherwise we could only conclude that dreams perform their function most
inadequately.
[1900a, 655]

We must now ask what was the relation of the two impressions of the dream-day to each
other and to the dream of the subsequent night. In the manifest content of the dream only the
indifferent impression was alluded to, which seems to confirm the notion that dreams have a
preference for taking up unimportant details of waking life. All the strands of the interpretation,
on the other hand, led to the important impression, to the one which had justifiably stirred my
feelings. If the sense of the dream is judged, as it can only rightly be, by its latent content as
revealed by the analysis, a new and significant fact is unexpectedly brought to light. The
conundrum of why dreams are concerned only with worthless fragments of waking life seems to
have lost all its meaning; nor can it any longer be maintained that waking life is not pursued
further in dreams and that dreams are thus psychical activity wasted upon foolish material. The
contrary is true: our dream-thoughts are dominated by the same material that has occupied us
during the day and we only bother to dream of things which have given us cause for reflection in
the daytime.
[1900a, 661]

Of the three characteristics of memory in dreams enumerated at the beginning of this chapter,
one - the preference for non-essential material in the content of dreams - has been satisfactorily
cleared up by being traced back to dream-distortion. We have been able to confirm the
existence of the other two - the emphasis upon recent and upon infantile material - but we have
not been able to account for them on the basis of the motives that lead to dreaming. These two
characteristics inclusion of both recent and infantile material, whose explanation and
appreciation remain to be discovered, must be kept in mind. Their proper place must be looked
for elsewhere - either in the psychology of the state of sleep or in the discussion of the structure
of the mental apparatus upon which we shall later embark, after we have learnt that the
interpretation of dreams is like a window through which we can get a glimpse of the interior of
that apparatus.
[1900a, 699]

In order to get some light on this question we must turn our attention to those elements of the
dream-content which must have fulfilled these conditions. And the most favourable material for
such an investigation will be a dream to the construction of which a particularly intense process
of condensation has contributed. I shall accordingly begin by choosing for the purpose the
dream which I have already recorded on p. 657 ff.
[1900a, 754]
The element in this dream which stood out most was the *botanical monograph*. This arose from the impressions of the dream day: I had in fact seen a monograph on the genus Cyclamen in the window of a book-shop. There was no mention of this genus in the content of the dream; all that was left in it was the monograph and its relation to botany. The 'botanical monograph' immediately revealed its connection with the *work upon cocaine* which I had once written. From 'cocaine' the chains of thought led on the one hand to the *Festschrift* and to certain events in a University laboratory, and on the other hand to my friend Dr. Königstein, the eye surgeon, who had had a share in the introduction of cocaine. The figure of Dr. Königstein further reminded me of the interrupted conversation which I had had with him the evening before and of my various reflections upon the payment for medical services among colleagues. This conversation was the actual currently active instigator of the dream; the monograph on the cyclamen was also a currently active impression, but one of an indifferent nature. As I perceived, the 'botanical monograph' in the dream turned out to be an 'intermediate common entity' between the two experiences of the previous day: it was taken over unaltered from the indifferent impression and was linked with the psychically significant event by copious associative connections.

[1900a, 755]

Not only the compound idea, 'botanical monograph', however, but each of its components, 'botanical' and 'monograph' separately, led by numerous connecting paths deeper and deeper into the tangle of dream-thoughts. 'Botanical' was related to the figure of Professor Gärtner [Gardener], the blooming looks of his wife, to my patient Flora and to the lady of whom I had told the story of the forgotten flowers. Gärtner led in turn to the laboratory and to my conversation with Königstein. My two patients had been mentioned in the course of this conversation. A train of thought joined the lady with the flowers to my wife's *favourite flowers* and thence to the title of the monograph which I had seen for a moment during the day. In addition to these, 'botanical' recalled an episode at my secondary school and an examination while I was at the University. A fresh topic touched upon in my conversation with Dr. Königstein - my *favourite* hobbies - was joined, through the intermediate link of what I jokingly called my *favourite flower*, the artichoke, with the train of thought proceeding from the forgotten flowers. Behind 'artichokes' lay, on the one hand, my thoughts about Italy and, on the other hand, a scene from my childhood which was the opening of what have since become my intimate relations with books. Thus 'botanical' was a regular nodal point in the dream. Numerous trains of thought converged upon it, which, as I can guarantee, had appropriately entered into the context of the conversation with Dr. Königstein. Here we find ourselves in a factory of thoughts where, as in the 'weaver's masterpiece' -

[1900a, 756]

This first investigation leads us to conclude that the elements 'botanical' and 'monograph' found their way into the content of the dream because they possessed copious contacts with the majority of the dream-thoughts, because, that is to say, they constituted 'nodal points' upon which a great number of the dream-thoughts converged, and because they had several meanings in connection with the interpretation of the dream. The explanation of this fundamental fact can also be put in another way: each of the elements of the dream's content turns out to have been 'overdetermined' - to have been represented in the dream-thoughts many times over.

[1900a, 756]
We discover still more when we come to examine the remaining constituents of the dream in relation to their appearance in the dream-thoughts. The coloured plate which I was unfolding led (see the analysis, p. 660 f.) to a new topic, my colleagues’ criticisms of my activities, and to one which was already represented in the dream, my favourite hobbies; and it led, in addition, to the childhood memory in which I was pulling to pieces a book with coloured plates. The dried specimen of the plant touched upon the episode of the herbarium at my secondary school and specially stressed that memory.

[1900a, 757]

The nature of the relation between dream-content and dream thoughts thus becomes visible. Not only are the elements of a dream determined by the dream-thoughts many times over, but the individual dream-thoughts are represented in the dream by several elements. Associative paths lead from one element of the dream to several dream-thoughts, and from one dream thought to several elements of the dream. Thus a dream is not constructed by each individual dream-thought, or group of dream-thoughts, finding (in abbreviated form) separate representation in the content of the dream - in the kind of way in which an electorate chooses parliamentary representatives; a dream is constructed, rather, by the whole mass of dream-thoughts being submitted to a sort of manipulative process in which those elements which have the most numerous and strongest supports acquire the right of entry into the dream-content - in a manner analogous to election by scrutin de liste. In the case of every dream which I have submitted to an analysis of this kind I have invariably found these same fundamental principles confirmed: the elements of the dream are constructed out of the whole mass of dream-thoughts and each one of those elements is shown to have been determined many times over in relation to the dream-thoughts.

[1900a, 757]

It will certainly not be out of place to illustrate the connection between dream-content and dream-thoughts by a further example, which is distinguished by the specially ingenious interweaving of their reciprocal relations. It is a dream produced by one of my patients - a man whom I was treating for claustrophobia. It will soon become clear why I have chosen to give this exceptionally clever dream-production the title of

[1900a, 758]

In all three of the dreams which I have just recorded, I have indicated by italics the points at which one of the elements of the dream-content reappears in the dream-thoughts, so as to show clearly the multiplicity of connections arising from the former. Since, however, the analysis of none of these dreams has been traced to its end, it will perhaps be worth while to consider a dream whose analysis has been recorded exhaustively, so as to show how its content is over-determined. For this purpose I will take the dream of Irma's injection. It will be easy to see from that example that the work of condensation makes use of more than one method in the construction of dreams.

[1900a, 765]

The occurrence of the idea of 'dysentery' in the dream of Irma's injection also had a multiple determination: first owing to its phonetic similarity to 'diphtheria', and secondly owing to its connection with the patient whom I had sent to the East and whose hysteria was not recognized.

[1900a, 766]
The recent exciting causes - the actual instigators of the dream - determined what was to attract my attention in the 'Otto' group; the amyl was among these selected elements, which were predestined to form part of the dream-content. The copious 'Wilhelm' group was stirred up precisely through being in contrast to 'Otto', and those elements in it were emphasized which echoed those which were already stirred up in 'Otto'. All though the dream, indeed, I kept on turning from someone who annoyed me to someone else who could be agreeably contrasted with him; point by point, I called up a friend against an opponent. Thus the amyl in the 'Otto' group produced memories from the field of chemistry in the other group; in this manner the trimethylamin, which was supported from several directions, found its way into the dream-content. 'Amyls' itself might have entered the dream-content unmodified; but it came under the influence of the 'Wilhelm' group. For the whole range of memories covered by that name was searched through in order to find some element which could provide a two-sided determination for 'amyls.' 'Propyls' was closely associated with 'amyls', and Munich from the 'Wilhelm' group with its 'propylaeae' came half-way to meet it. The two groups of ideas converged in 'propyls-propylaeae'; and, as though by an act of compromise, this intermediate element was what found its way into the dream-content. Here an intermediate common entity had been constructed which admitted of multiple determination. It is obvious, therefore, that multiple determination must make it easier for an element to force its way into the dream-content. In order to construct an intermediate link of this kind, attention is without hesitation displaced from what is actually intended on to some neighbouring association.

[1900a, 768]

Our study of the dream of Irma's injection has already enabled us to gain some insight into the processes of condensation during the formation of dreams. We have been able to observe certain of their details, such as how preference is given to elements that occur several times over in the dream-thoughts, how new unities are formed (in the shape of collective figures and composite structures), and how intermediate common entities are constructed. The further questions of the purpose of condensation and of the factors which tend to produce it will not be raised till we come to consider the whole question of the psychical processes at work in the formation of dreams. We will be content for the present with recognizing the fact that dream-condensation is a notable characteristic of the relation between dream-thoughts and dream-content.

[1900a, 768]
In making our collection of instances of condensation in dreams, the existence of another relation, probably of no less importance, had already become evident. It could be seen that the elements which stand out as the principal components of the manifest content of the dream are far from playing the same part in the dream-thoughts. And, as a corollary, the converse of this assertion can be affirmed: what is clearly the essence of the dream-thoughts need not be represented in the dream at all. The dream is, as it were, differently centred from the dream thoughts - its content has different elements as its central point. Thus in the dream of the botanical monograph, for instance, the central point of the dream-content was obviously the element 'botanical'; whereas the dream-thoughts were concerned with the complications and conflicts arising between colleagues from their professional obligations, and further with the charge that I was in the habit of sacrificing too much for the sake of my hobbies. The element 'botanical' had no place whatever in this core of the dream-thoughts, unless it was loosely connected with it by an antithesis - the fact that botany never had a place among my favourite studies. In my patient's Sappho dream the central position was occupied by climbing up and down and being up above and down below; the dream-thoughts, however, dealt with the dangers of sexual relations with people of an inferior social class. So that only a single element of the dream-thoughts seems to have found its way into the dream-content, though that element was expanded to a disproportionate extent. Similarly, in the dream of the may-beetles, the topic of which was the relations of sexuality to cruelty, it is true that the factor of cruelty emerged in the dream-content; but it did so in another connection and without any mention of sexuality, that is to say, divorced from its context and consequently transformed into something extraneous. Once again, in my dream about my uncle, the fair beard which formed its centre-point seems to have had no connection in its meaning with my ambitious wishes which, as we saw, were the core of the dream-thoughts. Dreams such as these give a justifiable impression of 'displacement.' In complete contrast to these examples, we can see that in the dream of Irma's injection the different elements were able to retain, during the process of constructing the dream, the approximate place which they occupied in the dream-thoughts. This further relation between the dream-thoughts and the dream-content, wholly variable as it is in its sense or direction, is calculated at first to create astonishment. If we are considering a psychical process in normal life and find that one out of its several component ideas has been picked out and has acquired a special degree of vividness in consciousness, we usually regard this effect as evidence that a specially high amount of psychical value - some particular degree of interest - attaches to this predominant idea. But we now discover that, in the case of the different elements of the dream-thoughts, a value of this kind does not persist or is disregarded in the process of dream-formation. There is never any doubt as to which of the elements of the dream-thoughts have the highest psychical value, we learn that by direct judgement. In the course of the formation of a dream these essential elements, charged, as they are, with intense interest, may be treated as though they were of small value, and their place may be taken in the dream by other elements, of whose small value in the dream-thoughts there can be no question. At first sight it looks as though no attention whatever is paid to the psychical intensity¹ of the various ideas in making the choice among them for the dream, and as though the only thing considered is the greater or less degree of multiplicity of their determination. What appears in dreams, we might suppose, is not what is important in the dream-thoughts but what occurs in them several times over. But this hypothesis does not greatly assist our understanding of dream-formation, since from the nature of things it seems clear that the two factors of multiple determination and inherent psychical value must necessarily operate in the same sense. The ideas which are most important among the dream-thoughts will almost certainly be those which occur most often in them, since the different dream-thoughts will, as it were, radiate out from them. Nevertheless a dream can reject elements which are thus both highly stressed in themselves and reinforced from many directions, and can select for its content other elements which possess only the second of these attributes.

[1900a, 778]
In order to solve this difficulty we shall make use of another impression derived from our enquiry into the overdetermination of the dream-content. Perhaps some of those who have read that enquiry may already have formed an independent conclusion that the overdetermination of the elements of dreams is no very important discovery, since it is a self-evident one. For in analysis we start out from the dream-elements and note down all the associations which lead off from them; so that there is nothing surprising in the fact that in the thought-material arrived at in this way we come across these same elements with peculiar frequency. I cannot accept this objection; but I will myself put into words something that sounds not unlike it. Among the thoughts that analysis brings to light are many which are relatively remote from the kernel of the dream and which look like artificial interpolations made for some particular purpose. That purpose is easy to divine. It is precisely they that constitute a connection, often a forced and far-fetched one, between the dream-content and the dream thoughts; and if these elements were weeded out of the analysis the result would often be that the component parts of the dream-content would be left not only without overdetermination but without any satisfactory determination at all. We shall be led to conclude that the multiple determination which decides what shall be included in a dream is not always a primary factor in dream-construction but is often the secondary product of a psychical force which is still unknown to us. Nevertheless multiple determination must be of importance in choosing what particular elements shall enter a dream, since we can see that a considerable expenditure of effort is used to bring it about in cases where it does not arise from the dream-material unassisted.

[1900a, 779]

It thus seems plausible to suppose that in the dream-work a psychical force is operating which on the one hand strips the elements which have a high psychical value of their intensity, and on the other hand, by means of overdetermination, creates from elements of low psychical value new values, which afterwards find their way into the dream-content. If that is so, a transference and displacement of psychical intensities occurs in the process of dream-formation, and it is as a result of these that the difference between the text of the dream-content and that of the dream thoughts comes about. The process which we are here presuming is nothing less than the essential portion of the dream-work; and it deserves to be described as 'dream-displacement.' Dream-displacement and dream-condensation are the two governing factors to whose activity we may in essence ascribe the form assumed by dreams.

[1900a, 779]

In the process of transforming the latent thoughts into the manifest content of a dream we have found two factors at work: dream-condensation and dream-displacement. As we continue our investigation we shall, in addition to these, come across two further determinants which exercise an undoubted influence on the choice of the material which is to find access to the dream.

[1900a, 781]

Here is another dream dealing with figures, which is characterized by the clarity of the manner in which it was determined, or rather, overdetermined. I owe both the dream and its interpretation to Dr. B. Dattner. "The landlord of my block of flats, who is a police-constable, dreamt that he was on street-duty. (This was a wish-fulfilment.) An inspector came up to him, who had the number 22 followed by 62 or 26, on his collar. At any rate there were several twos on it.

[1900a, 871]

² I may add as an example of over-determination that my excuse for arriving too late at the laboratory lay in the fact that after working far into the night I had in the morning to cover the long distance between the Kaiser Josef Strasse and the Währinger Strasse.

[1900a, 874]
We shall quickly find means of justifying the nonsense in this dream. Herr M., whom I had got to know among some company at table, had not long before asked me to examine his brother, who was showing signs of general paralysis. The suspicion was correct; on the occasion of his conversation the patient for no accountable reason gave his brother away by talking of his youthful follies. I had asked the patient the year of his birth and made him do several small sums so as to test the weakness of his memory - though, incidentally, he was still able to meet the tests quite well. I could already see that I myself behaved like a paralytic in the dream. (I was not quite sure what year we were in.) Another part of the material of the dream was derived from another recent source. The editor of a medical journal, with whom I was on friendly terms, had printed a highly unfavourable, a 'crushing' criticism of my Berlin friend Fl.'s last book. The criticism had been written by a very youthful reviewer who possessed small judgement. I thought I had a right to intervene and took the editor to task over it. He expressed lively regret at having published the criticism but would not undertake to offer any redress. I therefore severed my connection with the journal, but in my letter of resignation expressed a hope that our personal relations would not be affected by the event. The third source of the dream was an account I had just heard from a woman patient of her brother's mental illness, and of how he had broken out in a frenzy with cries of 'Nature! Nature!' The doctors believed that his exclamation came from his having read Goethe's striking essay on that subject and that it showed he had been overworking at his studies in natural philosophy. I myself preferred to think of the sexual sense in which the word is used even by the less educated people here. This idea of mine was at least not disproved by the fact that the unfortunate young man subsequently mutilated his own genitals. He was eighteen at the time of his outbreak.

The analysis brought up the following material. The indifferent precipitating cause of the dream was a sentence in her English composition: 'The mane is the ornament of the lion.' Her father wore a beard which framed his face like a mane. Her English mistress was called Miss Lyons. An acquaintance had sent her the ballads of Loewe. These, then, were the three lions; why should she be afraid of them? - She had read a story in which a negro, who had stirred up his companions to revolt, was hunted with blood hounds and climbed up a tree to save himself. She went on, in the highest spirits, to produce a number of fragmentary recollections, such as the advice on how to catch lions from Fliegende Blätter: 'Take a desert and put it through a sieve and the lions will be left over.' And again, the highly amusing but not very proper anecdote of an official who was asked why he did not take more trouble to ingratiate himself with the head of his department and replied that he had tried to make his way in, but his superior was up there already. The whole material became intelligible when it turned out that the lady had had a visit on the dream-day from her husband's superior. He had been very polite to her and had kissed her hand and she had not been in the least bit afraid of him, although he was a very 'big bug', and played the part of a 'social lion' in the capital of the country she came from. So this lion was like the lion in A Midsummer Night's Dream that concealed the figure of Snug the joiner; and the same is true of all dream-lions of which the dreamer is not afraid.

It is by no means inconceivable or improbable that this threshold symbolism might throw light upon some elements in the middle of the texture of dreams - in places, for instance, where there is a question of oscillations in the depth of sleep and of an inclination to break off the dream. Convincing instances of this, however, have not been produced. What seem to occur more frequently are cases of overdetermination, in which a part of a dream which has derived its material content from the nexus of dream-thoughts is employed to represent in addition some state of mental activity.
Nor have I any changes to suggest in this interpretation except to add that the content of the dream must have been overdetermined and that the words spoken by the child must have been made up of words which he had actually spoken in his lifetime and which were connected with important events in the father's mind. For instance, *'I'm burning'* may have been spoken during the fever of the child's last illness, and *'Father, don't you see?'* may have been derived from some other highly emotional situation of which we are in ignorance.

[1900a, 946]

Hitherto in interpreting dreams we have disregarded such warnings. On the contrary, we have accepted it as being just as important to interpret the smallest, least conspicuous and most uncertain constituents of the content of dreams as those that are most clearly and certainly preserved. The dream of Irma's injection contained the phrase *'I at once called in Dr. M.'*; and we assumed that even this detail would not have found its way into the dream unless it had had some particular origin. It was thus that we came upon the story of the unfortunate patient to whose bedside I had 'at once' called in my senior colleague. In the apparently absurd dream which treated the difference between 51 and 56 as a negligible quantity, the number 51 was mentioned several times. Instead of regarding this as a matter of course or as something indifferent, we inferred from it that there was a *second* line of thought in the latent content of the dream leading to the number 51; and along this track we arrived at my fears of 51 years being the limit of my life, in glaring contrast to the dream's dominant train of thought which was lavish in its boasts of a long life. In the *'Non vixit'* dream there was an inconspicuous interpolation which I overlooked at first: *'As P. failed to understand him, Fl. asked me'*, etc. When the interpretation was held up, I went back to these words and it was they that led me on to the childhood phantasy which turned out to be an intermediate nodal point in the dream-thoughts. This was arrived at by way of the lines:

[1900a, 949]
Though the preceding considerations have reduced the importance of the part played by the
day's residues in dreams, it is worth while devoting a little more attention to them. It must be that
they are essential ingredients in the formation of dreams, since experience has revealed the
surprising fact that in the content of every dream some link with a recent daytime impression -
often of the most insignificant sort - is to be detected. We have not hitherto been able to explain
the necessity for this addition to the mixture that constitutes a dream (see p. 669). And it is only
possible to do so if we bear firmly in mind the part played by the unconscious wish and then
seek for information from the psychology of the neuroses. We learn from the latter that an
unconscious idea is as such quite incapable of entering the preconscious and that it can only
exercise any effect there by establishing a connection with an idea which already belongs to the
preconscious, by transferring its intensity on to it and by getting itself 'covered' by it. Here we
have the fact of 'transference', which provides an explanation of so many striking phenomena in
the mental life of neurotics. The preconscious idea, which thus acquires an undeserved degree
of intensity may either be left unaltered by the transference, or it may have a modification forced
upon it, derived from the content of the idea which effects the transference. I hope I may be
forgiven for drawing analogies from everyday life, but I am tempted to say that the position of a
repressed idea resembles that of an American dentist in this country: he is not allowed to set up
in practice unless he can make use of a legally qualified medical practitioner to serve as a
stalking-horse and to act as a 'cover' in the eyes of the law. And just as it is not exactly the
physicians with the largest practices who form alliances of this kind with dentists, so in the same
way preconscious or conscious ideas which have already attracted a sufficient amount of the
attention that is operating in the preconscious will not be the ones to be chosen to act as covers
for a repressed idea. The unconscious prefers to weave its connections round preconscious
impressions and ideas which are either indifferent and have thus had no attention paid to them,
or have been rejected and have thus had attention promptly withdrawn from them. It is a familiar
article in the doctrine of association, and one that is entirely confirmed by experience, that an
idea which is bound by a very intimate tie in one direction, tends, as it were, to repel whole
groups of new ties. I once attempted to base a theory of hysterical paralyses on this proposition.
[1900a, 993]

If we assume that the same need for transference on the part of repressed ideas which we
have discovered in analysing the neuroses is also at work in dreams, two of the riddles of the
dream are solved at a blow: the fact, namely, that every analysis of a dream shows some recent
impression woven into its texture and that this recent element is often of the most trivial kind. I
may add that (as we have already found elsewhere) the reason why these recent and indifferent
elements so frequently find their way into dreams as substitutes for the most ancient of all the
dream-thoughts is that they have least to fear from the censorship imposed by resistance. But
while the fact that trivial elements are preferred is explained by their freedom from censorship,
the fact that recent elements occur with such regularity points to the existence of a need for
transference. Both groups of impressions satisfy the demand of the repressed for material that
is still clear of associations - the indifferent ones because they have given no occasion for the
formation of many ties, and the recent ones because they have not yet had time to form them.
[1900a, 994]
The view that dreams carry on the occupations and interests of waking life has been entirely confirmed by the discovery of the concealed dream-thoughts. These are only concerned with what seems important to us and interests us greatly. Dreams are never occupied with minor details. But we have also found reason for accepting the contrary view, that dreams pick up indifferent refuse left over from the previous day and that they cannot get control of any major day time interest until it has been to some extent withdrawn from waking activity. We have found that this holds good of the dream's content, which gives expression to the dream-thoughts in a form modified by distortion. For reasons connected with the mechanism of association, as we have seen, the dream-process finds it easier to get control of recent or indifferent ideational material which has not yet been requisitioned by waking thought-activity; and for reasons of censorship it transfers psychical intensity from what is important but objectionable on to what is indifferent.

[1900a, 1016]

It would indeed be a simple and satisfactory solution of the riddle of dreams if the work of analysis were to enable us to trace even the meaningless and confused dreams of adults back to the infantile type of fulfilment of an intensely felt wish of the previous day. There can be no doubt, however, that appearances do not speak in favour of such an expectation. Dreams are usually full of the most indifferent and strangest material, and there is no sign in their content of the fulfilment of any wish.

[1901a, 1064]

A good proportion of what we have learnt about condensation in dreams may be summarized in this formula: each element in the content of a dream is 'overdetermined' by material in the dream-thoughts; it is not derived from a single element in the dream-thoughts, but may be traced back to a whole number. These elements need not necessarily be closely related to each other in the dream-thoughts themselves; they may belong to the most widely separated regions of the fabric of those thoughts. A dream-element is, in the strictest sense of the word, the 'representative' of all this disparate material in the content of the dream. But analysis reveals yet another side of the complicated relation between the content of the dream and the dream-thoughts. Just as connections lead from each element of the dream to several dream-thoughts, so as a rule a single dream-thought is represented by more than one dream-element; the threads of association do not simply converge from the dream-thoughts to the dream-content, they cross and interweave with each other many times over in the course of their journey.

[1901a, 1069]
First and foremost, when by means of analysis we have arrived at a knowledge of the dream-thoughts, we observe that the manifest dream-content deals with quite different material from the latent thoughts. This, to be sure, is no more than an appearance, which evaporates under closer examination, for we find ultimately that the whole of the dream-content is derived from the dream-thoughts, and that almost all the dream-thoughts are represented in the dream-content. Nevertheless, something of the distinction still remains. What stands out boldly and clearly in the dream as its essential content must, after analysis, be satisfied with playing an extremely subordinate role among the dream-thoughts; and what, on the evidence of our feelings, can claim to be the most prominent among the dream-thoughts is either not present at all as ideational material in the content of the dream or is only remotely alluded to in some obscure region of it. We may put it in this way: in the course of the dream-work the psychical intensity passes over from the thoughts and ideas to which it properly belongs on to others which in our judgement have no claim to any such emphasis. No other process contributes so much to concealing the meaning of a dream and to making the connection between the dream-content and the dream-thoughts unrecognizable. In the course of this process, which I shall describe as 'dream-displacement', the psychical intensity, significance or affective potentiality of the thoughts is, as we further find, transformed into sensory vividness. We assume as a matter of course that the most distinct element in the manifest content of a dream is the most important one; but in fact it is often an indistinct element which turns out to be the most direct derivative of the essential dream-thought.

[1901a, 1070]

If we undo dream-displacement by means of analysis, we obtain what seems to be completely trustworthy information on two much-disputed problems concerning dreams: as to their instigators and as to their connection with waking life. There are dreams which immediately reveal their derivation from events of the day; there are others in which no trace of any such derivation is to be discovered. If we seek the help of analysis, we find that every dream without any possible exception goes back to an impression of the past few days, or, it is probably more correct to say, of the day immediately preceding the dream, of the 'dream-day.' The impression which plays the part of dream-instigator may be such an important one that we feel no surprise at being concerned with it in the daytime, and in that case we rightly speak of the dream as carrying on with the significant interests of our waking life. As a rule, however, if a connection is to be found in the content of the dream with any impression of the previous day, that impression is so trivial, insignificant and unmemorable, that it is only with difficulty that we ourselves can recall it. And in such cases the content of the dream itself, even if it is connected and intelligible, seems to be concerned with the most indifferent trivialities, which would be unworthy of our interest if we were awake. A good deal of the contempt in which dreams are held is due to the preference thus shown in their content for what is indifferent and trivial.

[1901a, 1071]
Analysis does away with the misleading appearance upon which this derogatory judgement is founded. If the content of a dream puts forward some indifferent impression as being its instigator, analysis invariably brings to light a significant experience, and one by which the dreamer has good reason to be stirred. This experience has been replaced by the indifferent one, with which it is connected by copious associative links. Where the content of the dream treats of insignificant and uninteresting ideational material, analysis uncovers the numerous associative paths connecting these trivialities with things that are of the highest psychical importance in the dreamer's estimation. If what makes their way into the content of dreams are impressions and material which are indifferent and trivial rather than justifiably stirring and interesting, that is only the effect of the process of displacement. If we answer our questions about dream-instigators and the connection between dreaming and daily affairs on the basis of the new insight we have gained from replacing the manifest by the latent content of dreams, we arrive at these conclusions: dreams are never concerned with things with which we should not think it worth while to be concerned during the day, and trivialities which do no affect us during the day are unable to pursue us in our sleep.

[1901a, 1072]

The opposite of 'wet' and 'water' can easily be 'fire' and 'burning'. The chance that, when they arrived at the place, her father had expressed his anxiety at the risk of fire, helped to decide that the danger from which her father was to rescue her should be a fire. The situation chosen for the dream-picture was based upon this chance, and upon the opposition to 'wet': 'There was a fire. Her father was standing beside her bed to wake her.' Her father's chance utterance would, no doubt, not have obtained such an important position in the dream if it had not fitted in so excellently with the dominating current of feeling, which was determined to regard him at any cost as a protector and saviour. 'He foresaw the danger from the very moment of our arrival! He was in the right!' (In actual fact, it was he who had brought the girl into danger.)

[1905e, 1425]

'Mother's jewel-case' was therefore introduced in two places in the dream; and this element replaced all mention of Dora's infantile jealousy, of the drops (that is, of the sexual wetness), of being dirtied by the discharge, and, on the other hand, of her present thoughts connected with the temptation - the thoughts which were urging her to reciprocate the man's love, and which depicted the sexual situation (alike desirable and menacing) that lay before her. The element of 'jewel-case' was more than any other a product of condensation and displacement, and a compromise between contrary mental currents. The multiplicity of its origin - both from infantile and contemporary sources - is no doubt pointed to by its double appearance in the content of the dream.

[1905e, 1427]

What is certain is that in Dora's case the dream which occurred during the treatment had gained a new significance connected with the present time, though perhaps its manifest content had not changed. The dream-thoughts behind it included a reference to my treatment, and it corresponded to a renewal of the old intention of withdrawing from a danger. If her memory was not deceiving her when she declared that even at L-- she had noticed the smoke after she woke up, it must be acknowledged that she had brought my proverb, 'There can be no smoke without fire', very ingeniously into the completed form of the dream, in which it seemed to serve as an overdetermination of the last element. It was undeniably a mere matter of chance that the most recent exciting cause - her mother's locking the dining-room door so that her brother was shut into his bedroom - had provided a connection with her persecution by Herr K. at L--, where her decision had been made when she found she could not lock her bedroom door. It is possible that her brother did not appear in the dream on the earlier occasions, so that the words 'my two children' did not form part of its content until after the occurrence of its latest exciting cause.

[1905e, 1429]
The wandering about in a strange town was overdetermined. It led back to one of the exciting causes from the day before. A young cousin of Dora's had come to stay with them for the holidays, and Dora had had to show him round Vienna. This cause was, it is true, a matter of complete indifference to her. But her cousin's visit reminded her of her own first brief visit to Dresden. On that occasion she had been a stranger and had wandered about, not failing, of course, to visit the famous picture gallery. Another cousin of hers, who was with them and knew Dresden, had wanted to act as a guide and take her round the gallery. But she declined and went alone, and stopped in front of the pictures that appealed to her. She remained two hours in front of the Sistine Madonna, rapt in silent admiration. When I asked her what had pleased her so much about the picture she could find no clear answer to make. At last she said: 'The Madonna.'

[1905e, 1432]

But the contents of the letter must be capable of further determination. What was the source of the words 'if you like'? It was at this point that the addendum of there having been a question-mark after the word 'like' occurred to Dora, and she then recognized these words as a quotation out of the letter from Frau K. which had contained the invitation to L--, the place by the lake. In that letter there had been a question-mark placed, in a most unusual fashion, in the very middle of a sentence, after the intercalated words 'if you would like to come'.

[1905e, 1434]

I naturally required a special determinant for this. Dora objected that she would anyhow have had to go upstairs if she had wanted to get to her flat, which was on an upper floor. It was easy to brush aside this objection (which was probably not very seriously intended) by pointing out that if she had been able to travel in her dream from the unknown town to Vienna without making a railway journey she ought also to have been able to leave out a flight of stairs. She then proceeded to relate that after the appendicitis she had not been able to walk properly and had dragged her right foot. This state of things had continued for a long time, and on that account she had been particularly glad to avoid stairs. Even now her foot sometimes dragged. The doctors whom she had consulted at her father's desire had been very much astonished at this most unusual after-effect of an appendicitis, especially as the abdominal pains had not recurred and did not in any way accompany the dragging of the foot.

[1905e, 1437]
Are processes similar to those which we have described here as the technique of jokes known already in any other field of mental events? They are - in a single field, and an apparently very remote one. In 1900 I published a book which, as its title (The Interpretation of Dreams) indicates, attempted to throw light on what is puzzling in dreams and to establish them as derivatives of our normal mental functioning. I found occasion there to contrast the manifest, and often strange, content of the dream with the latent, but perfectly logical, dream-thoughts from which the dream is derived; and I entered into an investigation of the processes which make the dream out of the latent dream-thoughts, as well as of the psychical forces which are involved in that transformation. To the totality of these transforming processes I gave the name of the ‘dream-work’; and I have described as a part of this dream-work a process of condensation which shows the greatest similarity to the one found in the technique of jokes - which, like it, leads to abbreviation, and creates substitute-formations of the same character. Everyone will be familiar, from a recollection of his own dreams, with the composite structures both of people and of things which emerge in dreams. Indeed, dreams even construct them out of words, and they can then be dissected in analysis. (For instance, ‘Autodidasker’ = ‘Autodidakt’ + ‘Lasker’.) On other occasions - much more often, in fact - what the work of condensation in dreams produces is not composite structures but pictures which exactly resemble one thing or one person except for an addition or alteration derived from another source - modifications, that is, just like those in Herr N.’s jokes. We cannot doubt that in both cases we are faced by the same psychical process, which we may recognize from its identical results. Such a far-reaching analogy between the technique of jokes and the dream-work will undoubtedly increase our interest in the former and raise an expectation in us that a comparison between jokes and dreams may help to throw light on jokes. But we will refrain from entering upon this task, for we must reflect that so far we have investigated the technique of only a very small number of jokes, so that we cannot tell whether the analogy by which we are proposing to be guided will in fact hold good. We will therefore turn away from the comparison with dreams and go back to the technique of jokes, though at this point we shall, as it were, be leaving a loose end to our enquiry, which at some later stage we may perhaps pick up once more.

Thus a great number of the jokes in circulation have a certain length of life: their life runs a course made up of a period of flowering and a period of decay and it ends in complete oblivion. The need which men feel for deriving pleasure from their processes of thought is therefore constantly creating new jokes based on the new interests of the day. The vital force of topical jokes is not their own; it is borrowed, by the method of allusion, from those other interests, the expiry of which determines the fate of the joke as well. The factor of topicality is a source of pleasure, ephemeral it is true but particularly abundant, which supplements the sources inherent in the joke itself. It cannot be simply equated with the rediscovery of what is familiar. It is concerned rather with a particular category of what is familiar, which must in addition possess the characteristic of being fresh, recent and untouched by forgetting. In the formation of dreams, too, we come across a special preference for what is recent and we cannot escape a suspicion that association with what is recent is rewarded, and so facilitated, by a peculiar bonus of pleasure.
The replacement of the lizard-catcher by Gradiva in the content of the dream is accordingly a representation of the relation between the two figures which was known to Hanold in his unconscious; the introduction of the 'lady colleague' instead of 'our colleague Eimer' allowed the dream to express Hanold's realization that she was wooing a man. So far the dream welded together ('condensed', as we say) two experiences of the previous day into one situation, in order to bring to expression (in a very obscure way, it is true) two discoveries which were not allotted to become conscious. But we can go further, we can diminish the strangeness of the dream still more and we can demonstrate the influence of his other experiences of the previous day on the form taken by the manifest dream.

[1907a, 1870]

But all the same, she had given us so much material in these few associations that it was possible to guess the latent dream-thoughts from them. We cannot help being struck by the fact that periods of time occur at several points in the information she gave us about the dream, and these provide a common factor between the different parts of the material. She took the theatre tickets too early, bought them over-hurriedly so that she had to pay more than was necessary; so too her sister-in-law had been in a hurry to take her money to the jewellers and buy some jewellery with it, as though otherwise she would miss it. If, in addition to the 'too early' and 'in a hurry' which we have stressed, we take into account the precipitating cause of the dream - the news that her friend, though only three months her junior, had nevertheless got an excellent husband - and the criticism of her sister-in-law expressed in the idea that it was absurd of her to be in such a hurry, then we find ourselves presented almost spontaneously with the following construction of the latent dream-thoughts, for which the manifest dream is a severely distorted substitute:

[1916-1917, 3219]

In the first place, it is a remarkable thing that the main emphasis in the latent thoughts lies on the element of being in too great a hurry; nothing of the sort is to be found in the manifest dream. Without the analysis, we should have had no suspicion that that factor plays any part. It seems, therefore, to be possible for what is in fact the main thing, the centre of the unconscious thoughts, to be absent in the manifest dream. This means that the impression made by the whole dream must be fundamentally altered. In the second place, there is an absurd combination in the dream: three for 1 florin 50. We detected in the dream-thoughts the assertion that 'it was absurd (to marry so early)'. Can it be doubted that this thought, 'it was absurd', is represented by the inclusion of an absurd element in the manifest dream? And in the third place, a glance of comparison shows us that the relation between the manifest and latent elements is no simple one; it is far from being the case that one manifest element always takes the place of one latent one. It is rather that there is a group-relation between the two layers, within which one manifest element can replace several latent ones or one latent element can be replaced by several manifest ones.

[1916-1917, 3220]
I know of no parallel in the operations of the press-censorship to a third manner of working by
the dream-censorship; but I am able to demonstrate it from precisely the one example of a
dream which we have analysed so far. You will recall the dream of the ‘three bad theatre-tickets
for 1 florin 50’. In the latent thoughts of that dream the element ‘over-hurriedly, too early’ stood
in the foreground. Thus: it was absurd to marry so early - it was also absurd to take the theatre-
tickets so early - it was ridiculous of the sister-in-law to part with her money in such a hurry to
buy jewellery with it. Nothing of this central element of the dream-thoughts passed over into the
manifest dream; in it the central position is taken by the ‘going to the theatre’ and ‘taking the
tickets’. As a result of this displacement of accent, this fresh grouping of the elements of the
content, the manifest dream has become so unlike the latent dream-thoughts that no-one would
suspect the presence of the latter behind the former. This displacement of accent is one of the
chief instruments of dream-distortion and it is what gives the dream the strangeness on account
of which the dreamer himself is not inclined to recognize it as his own production.
[1916-1917, 3235]

For that is in fact the case. You will recall that when we began to make use of our technique of
free association we made a surprising discovery. We became aware that our efforts at
proceeding from the dream-element to the unconscious element for which it is a substitute were
being met by a resistance. This resistance, we said, could be of different magnitudes,
sometimes enormous and sometimes quite insignificant. In the latter case we need to pass
through only a small number of intermediate links in our work of interpretation; but when the
resistance is large we have to traverse long chains of associations from the dream-element, we
are led far away from it and on our path we have to overcome all the difficulties which represent
themselves as critical objections to the ideas that occur. What we met with as resistance in our
work of interpretation must now be introduced into the dream-work in the form of the dream-
censorship. The resistance to interpretation is only a putting into effect of the dream-censorship.
It also proves to us that the force of the censorship is not exhausted in bringing about the
distortion of dreams and thereafter extinguished, but that the censorship persists as a
permanent institution which has as its aim the maintenance of the distortion. Moreover, just as
the strength of the resistance varies in the interpretation of each element in a dream, so too the
magnitude of the distortion introduced by the censorship varies for each element in the same
dream. If we compare the manifest and the latent dream, we shall find that some particular
latent elements have been completely eliminated, others modified to a greater or less extent,
while yet others have been carried over into the manifest content of the dream unaltered or
even perhaps strengthened.
[1916-1917, 3236]

In regard to the connection between the latent and the manifest dream, condensation results
also in no simple relation being left between the elements in the one and the other. A manifest
element may correspond simultaneously to several latent ones, and, contrariwise, a latent
element may play a part in several manifest ones - there is, as it were, a criss-cross
relationship. In interpreting a dream, moreover, we find that the associations to a single
manifest element need not emerge in succession: we must often wait till the whole dream has
been interpreted.
[1916-1917, 3265]
A sceptical woman patient had a longish dream in the course of which some people told her about my book on jokes and praised it highly. Something came in then about a "channel", perhaps it was another book that mentioned a channel, or something else about a channel . . . she didn't know . . . it was all so indistinct.

Convincing evidence of the fact that the forgetting of dreams is tendentious and serves the purpose of resistance¹ is afforded when it is possible to observe in analyses a preliminary stage of forgetting. It not infrequently happens that in the middle of the work of interpretation an omitted portion of the dream comes to light and is described as having been forgotten till that moment. Now a part of a dream that has been rescued from oblivion in this way is invariably the most important part; it always lies on the shortest road to the dream's solution and has for that reason been exposed to resistance more than any other part. Among the specimen dreams scattered through this volume, there is one in which a part of its content was added like this as an after-thought. It is the travel dream in which I revenged myself on two disagreeable fellow-travellers and which I had to leave almost uninterpreted on account of its gross indecency. The omitted portion ran as follows: 'I said, referring to one of Schiller's works: "It is from . . ." but, noticing the mistake, I corrected myself: "It is by . . ." "Yes", the man commented to his sister, "he said that right."²
Moreover I am in a position to offer an ocular demonstration of the fact that the forgetting of dreams is to a great extent a product of resistance. One of my patients will tell me he has had a dream but has forgotten every trace of it: it is therefore just as though it had never happened. We proceed with our work. I come up against a resistance; I therefore explain something to the patient and help him by encouragement and pressure to come to terms with some disagreeable thought. Hardly have I succeeded in this than he exclaims: 'Now I remember what it was I dreamt.' The same resistance which interfered with our work that day also made him forget the dream. By overcoming this resistance I have recalled the dream to his memory.

¹ [Footnote added 1914:] Ernest Jones has described an analogous case which often occurs: while a dream is being analysed the patient may recollect a second one which was dreamt during the same night but whose very existence had not been suspected.

An observation which I have been able to make in the course of preparing this manuscript has shown me that dreams are no more forgotten than other mental acts and can be compared, by no means to their disadvantage, with other mental functions in respect of their retention in the memory. I had kept records of a large number of my own dreams which for one reason or another I had not been able to interpret completely at the time or had left entirely uninterpreted. And now, between one and two years later, I have attempted to interpret some of them for the purpose of obtaining more material in illustration of my views. These attempts have been successful in every instance; indeed the interpretation may be said to have proceeded more easily after this long interval than it did at the time when the dream was a recent experience. A possible explanation of this is that in the meantime I have overcome some of the internal resistances which previously obstructed me. When making these subsequent interpretations I have compared the dream-thoughts that I elicited at the time of the dream with the present, usually far more copious, yield, and I have always found that the old ones are included among the new. My astonishment at this was quickly halted by the reflection that I had long been in the habit of getting my patients, who sometimes tell me dreams dating from earlier years, to interpret them - by the same procedure and with the same success - as though they had dreamt them the night before. When I come to discuss anxiety-dreams I shall give two examples of postponed interpretations like these. I was led into making my first experiment of this kind by the justifiable expectation that in this as in other respects dreams would behave like neurotic symptoms. When I treat a psychoneurotic - a hysteric, let us say - by psycho-analysis, I am obliged to arrive at an explanation for the earliest and long since vanished symptoms of his illness no less than for the contemporary ones which brought him to me for treatment; and I actually find the earlier problem easier to solve than the immediate one. As long ago as in 1895 I was able to give an explanation in Studies on Hysteria of the first hysterical attack which a woman of over forty had had in her fifteenth year.

¹ [1900a, 956]
When we speak of the relation of dreams to mental disorders we may have three things in mind: (1) aetiological and clinical connections, as when a dream represents a psychotic state, or introduces it, or is left over from it; (2) modifications to which dream-life is subject in cases of mental disease; and (3) intrinsic connections between dreams and psychoses, analogies pointing to their being essentially akin. These numerous relations between the two groups of phenomena were a favourite topic among medical writers in earlier times and have become so once again to-day, as is shown by the bibliographies of the subject collected by Spitza, Radestock, Maury and Tissié. Quite recently Sante de Sanctis has turned his attention to this subject.¹ It will be enough for the purpose of my thesis if I do no more than touch upon this important question.

A comparison of the dreams of the two patients shows, however, that the question whether or not paranoia (or any other psychoneurosis) can penetrate into dreams is based on a false conception of dreams. Dreams are distinguished from waking thought by the fact that they can include material (belonging to the region of the repressed) which must not emerge in waking thought. Apart from this, dreams are merely a form of thinking, a transformation of preconscious material of thought by the dream-work and its conditions. Our terminology of the neuroses is not applicable to repressed material; this cannot be called hysterical, nor obsessional, nor paranoic. As against this, the other part of the material which is subjected to the process of dream-formation - the preconscious thoughts - may be normal or may bear the character of any neurosis; they may be the products of any of the pathogenic processes in which the essence of a neurosis lies. There seems to be no reason why any such pathological idea should not be transformed into a dream. A dream may therefore quite simply represent a hysterical phantasy, an obsessional idea, or a delusion - that is, may reveal one or other of these upon interpretation. Observation of the two paranoics shows that the dreams of the one were quite normal while he was subject to his delusion, and that those of the other were paranoic in content while he was treating his delusional ideas with contempt. In both cases, therefore, the dream took up the material that was at the time forced into the background in waking life. This too, however, need not necessarily be an invariable rule.

[1900a, 594]

[1922b, 3906]
The foregoing discussion has led us at last to the discovery of a third factor whose share in the transformation of the dream thoughts into the dream-content is not to be underrated: namely, considerations of representability in the peculiar psychical material of which dreams make use - for the most part, that is, representability in visual images. Of the various subsidiary thoughts attached to the essential dream-thoughts, those will be preferred which admit of visual representation; and the dream-work does not shrink from the effort of recasting unadaptable thoughts into a new verbal form - even into a less usual one - provided that that process facilitates representation and so relieves the psychological pressure caused by constricted thinking. This pouring of the content of a thought into another mould may at the same time serve the purposes of the activity of condensation and may create connections, which might not otherwise have been present, with some other thought; while this second thought itself may already have had its original form of expression changed, with a view to meeting the first one half-way.

[1900a, 813]

The dream-work can often succeed in representing very refractory material, such as proper names, by a far-fetched use of out-of-the-way associations. In one of my dreams old Brücke had set me the task of making a dissection; . . . I fished something out that looked like a piece of crumpled silver-paper. (I shall return to this dream later.) The association to this (at which I arrived with some difficulty) was 'stanniol.' I then perceived that I was thinking of the name of Stannius, the author of a dissertation on the nervous system of fish, which I had greatly admired in my youth. The first scientific task which my teacher set me was in fact concerned with the nervous system of a fish, Ammocoetes. It was clearly impossible to make use of the name of this fish in a picture puzzle.

[1900a, 868]
The situation is this. Either residues of the previous day have been left over from the activity of waking life and it has not been possible to withdraw the whole cathexis of energy from them; or the activity of waking life during the course of the day has led to the stirring up of an unconscious wish; or these two events have happened to coincide. (We have already discussed the various possibilities in this connection.) The unconscious wish links itself up with the day's residues and effects a transference on to them; this may happen either in the course of the day or not until a state of sleep has been established. A wish now arises which has been transferred on to the recent material; or a recent wish, having been suppressed, gains fresh life by being reinforced from the unconscious. This wish seeks to force its way along the normal path taken by thought processes, though the Pcs. (to which, indeed, it in part belongs) to consciousness. But it comes up against the censorship, which is still functioning and to the influence of which it now submits. At this point it takes on the distortion for which the way has already been paved by the transference of the wish on to recent material. So far it is on the way to becoming an obsessive idea or a delusion or something of the kind - that is, a thought which has been intensified by transference and distorted in its expression by censorship. Its further advance is halted, however, by the sleeping state of the preconscious. (The probability is that that system has protected itself against the invasion by diminishing its own excitations.) The dream-process consequently enters on a regressive path, which lies open to it precisely owing to the peculiar nature of the state of sleep, and it is led along that path by the attraction exercised on it by groups of memories; some of these memories themselves exist only in the form of visual cathexes and not as translations into the terminology of the later systems. In the course of its regressive path the dream-process acquires the attribute of representability. (I shall deal later with the question of compression.) It has now completed the second portion of its zigzag journey. The first portion was a progressive one, leading from the unconscious scenes or phantasies to the preconscious; the second portion led from the frontier of the censorship back again to perceptions. But when the content of the dream process has become perceptual, by that fact it has, as it were, found a way of evading the obstacle put in its way by the censorship and the state of sleep in the Pcs. It succeeds in drawing attention to itself and in being noticed by consciousness.

[1900a, 1002]

It is the process of displacement which is chiefly responsible for our being unable to discover or recognize the dream-thoughts in the dream-content, unless we understand the reason for their distortion. Nevertheless, the dream-thoughts are also submitted to another and milder sort of transformation, which leads to our discovering a new achievement on the part of the dream-work - one, however, which is easily intelligible. The dream-thoughts which we first come across as we proceed with our analysis often strike us by the unusual form in which they are expressed; they are not clothed in the prosaic language usually employed by our thoughts, but are on the contrary represented symbolically by means of similes and metaphors, in images resembling those of poetic speech. There is no difficulty in accounting for the constraint imposed upon the form in which the dream-thoughts are expressed. The manifest content of dreams consists for the most part in pictorial situations; and the dream-thoughts must accordingly be submitted in the first place to a treatment which will make them suitable for a representation of this kind. If we imagine ourselves faced by the problem of representing the arguments in a political leading article or the speeches of counsel before a court of law in a series of pictures, we shall easily understand the modifications which must necessarily be carried out by the dream-work owing to considerations of representability in the content of the dream.

[1901a, 1074]
The content of dreams, however, does not consist entirely of situations, but also includes disconnected fragments of visual images, speeches and even bits of unmodified thoughts. It may therefore perhaps be of interest to enumerate very briefly the modes of representation available to the dream-work for reproducing the dream-thoughts in the peculiar form of expression necessary in dreams.

[1901a, 1075]

It is only rarely that a dream represents, or, as we might say, 'stages', a single thought: there are usually a number of them, a tissue of thoughts. Another component of the content of Hanold's dream can be detached, the distortion of which can easily be got rid of, so that the latent idea represented by it can be detected. This is a piece of the dream to which once again it is possible to extend the assurance of reality with which the dream ended. In the dream Gradiva as she steps along is transformed into a marble sculpture. This is no more than an ingenious and poetical representation of the real event. Hanold had in fact transferred his interest from the living girl to the sculpture: the girl he loved had been transformed for him into a marble relief. The latent dream-thoughts, which were bound to remain unconscious, sought to change the sculpture back into the living girl; what they were saying to him accordingly was something like: 'After all, you're only interested in the statue of Gradiva because it reminds you of Zoe, who is living here and now.' But if this discovery could have become conscious, it would have meant the end of the delusion.

[1907a, 1856]

We have already in *The Interpretation of Dreams* described the way in which the regression of the preconscious day's residues takes place in dream-formation. In this process thoughts are transformed into images, mainly of a visual sort; that is to say, word-presentations are taken back to the thing-presentations which correspond to them, as if, in general, the process were dominated by considerations of *representability*. When regression has been completed, a number of cathexes are left over in the system *Ucs*. - cathexes of memories of *things*. The primary psychical process is brought to bear on these memories, till, by condensation of them and displacement between their respective cathexes, it has shaped the manifest dream-content. Only where the word-presentations occurring in the day's residues are recent and current residues of *perceptions*, and not the expression of *thoughts*, are they themselves treated like thing-presentations, and subjected to the influence of condensation and displacement. Hence the rule laid down in *The Interpretation of Dreams*, and since confirmed beyond all doubt, that words and speeches in the dream-content are not freshly formed, but are modelled on speeches from the day preceding the dream (or on some other recent impressions, such as something that has been read). It is very noteworthy how little the dream-work keeps to the word-presentations; it is always ready to exchange one word for another till it finds the expression which is most handy for plastic representation.¹

[1917d, 3033]

Here we have a new type of relation between the manifest and latent dream-elements. The former is not so much a distortion of the latter as a representation of it, a plastic, concrete, portrayal of it, taking its start from the wording. But precisely on that account it is once more a distortion, for we have long since forgotten from what concrete image the word originated and consequently fail to recognize it when it is replaced by the image. When you consider that the manifest dream is made up predominantly of visual images and more rarely of thoughts and words, you can imagine what importance attaches to this kind of relation in the construction of dreams. You will see, too, that in this way it becomes possible in regard to a large number of abstract thoughts to create pictures to act as substitutes for them in the manifest dream while at the same time serving the purpose of concealment. This is the technique of the familiar picture-puzzles. Why it is that these representations have an appearance of being jokes is a special problem into which we need not enter here.

[1916-1917, 3217]
The methods of representation employed by the dream-work - fascinating material, scarcely capable of exhaustion - have been made more and more familiar to us by closer study. I will give you a few examples of them. Thus, for instance, dreams represent the relation of frequency by a multiplication of similar things. Here is a young girl's remarkable dream. She dreamt she came into a great hall and found some one in it sitting on a chair; this was repeated six or eight times or more, but each time it was her father. This is easy to understand when we discover, from accessory details in the interpretation, that this room stood for the womb. The dream then becomes equivalent to the phantasy, familiarly found in girls, of having met their rather already during their intra-uterine life when he visited the womb while their mother was pregnant. You should not be confused by the fact that something is reversed in the dream - that her father's 'coming-in' is displaced on to herself; incidentally, this has a special meaning of its own as well. The multiplication of the figure of the father can only express the fact that the event in question occurred repeatedly. After all, it must be allowed that the dream is not taking very much on itself in expressing frequency by multiplicity. It has only needed to go back to the original significance of the former word; to-day it means to us a repetition in time, but it is derived from an accumulation in space. In general, indeed, where it is possible, the dream-work changes temporal relations into spatial ones and represents them as such. In a dream, for instance, one may see a scene between two people who look very small and a long way off, as though one were seeing them through the wrong end of a pair of opera-glasses. Here, both the smallness and the remoteness in space have the same significance: what is meant is remoteness in time and we are to understand that the scene is from the remote past.

[1933a, 4638]
We have been occupied so far with investigating the means by which dreams represent the relations between the dream-thoughts. In the course of this investigation, however, we have more than once touched upon the further topic of the general nature of the modifications which the material of the dream-thoughts undergoes for the purpose of the formation of a dream. We have learnt that that material, stripped to a large extent of its relations, is submitted to a process of compression, while at the same time displacements of intensity between its elements necessarily bring about a psychical transvaluation of the material. The displacements we have hitherto considered turned out to consist in the replacing of some one particular idea by another in some way closely associated with it, and they were used to facilitate condensation in so far as, by their means, instead of two elements, a single common element intermediate between them found its way into the dream. We have not yet referred to any other sort of displacement. Analyses show us, however, that another sort exists and that it reveals itself in a change in the verbal expression of the thoughts concerned. In both cases there is a displacement along a chain of associations; but a process of such a kind can occur in various psychical spheres, and the outcome of the displacement may in one case be that one element is replaced by another, while the outcome in another case may be that a single element has its verbal form replaced by another.

[1900a, 808]

This second species of displacement which occurs in dream-formation is not only of great theoretical interest but is also specially well calculated to explain the appearance of fantastic absurdity in which dreams are disguised. The direction taken by the displacement usually results in a colourless and abstract expression in the dream-thought being exchanged for a pictorial and concrete one. The advantage, and accordingly the purpose, of such a change jumps to the eyes. A thing that is pictorial is, from the point of view of a dream, a thing that is capable of being represented: it can be introduced into a situation in which abstract expressions offer the same kind of difficulties to representation in dreams as a political leading article in a newspaper would offer to an illustrator. But not only representability, but the interests of condensation and the censorship as well can be the gainers from this exchange. A dream-thought is unusable so long as it is expressed in an abstract form; but when once it has been transformed into pictorial language, contrasts and identifications of the kind which the dream-work requires, and which it creates if they are not already present, can be established more easily than before between the new form of expression and the remainder of the material underlying the dream. This is so because in every language concrete terms, in consequence of the history of their development, are richer in associations than conceptual ones. We may suppose that a good part of the intermediate work done during the formation of a dream, which seeks to reduce the dispersed dream-thoughts to the most succinct and unified expression possible, proceeds along the line of finding appropriate verbal transformations for the individual thoughts. Any one thought, whose form of expression may happen to be fixed for other reasons, will operate in a determinant and selective manner on the possible forms of expression allotted to the other thoughts, and it may do so, perhaps, from the very start - as is the case in writing a poem. If a poem is to be written in rhymes, the second line of a couplet is limited by two conditions: it must express an appropriate meaning, and the expression of that meaning must rhyme with the first line. No doubt the best poem will be one in which we fail to notice the intention of finding a rhyme, and in which the two thoughts have, by mutual influence, chosen from the very start a verbal expression which will allow a rhyme to emerge with only slight subsequent adjustment.

[1900a, 809]
In a few instances a change of expression of this kind assists dream-condensation even more directly, by finding a form of words which owing to its ambiguity is able to give expression to more than one of the dream-thoughts. In this way the whole domain of verbal wit is put at the disposal of the dream-work. There is no need to be astonished at the part played by words in dream-formation. Words, since they are the nodal point of numerous ideas, may be regarded as predestined to ambiguity; and the neuroses (e.g. in framing obsessions and phobias), no less than dreams, make unashamed use of the advantages thus offered by words for purposes of condensation and disguise.¹ It is easy to show that dream-distortion too profits from displacement of expression. If one ambiguous word is used instead of two unambiguous ones the result is misleading; and if our everyday, sober method of expression is replaced by a pictorial one, our understanding is brought to a halt, particularly since a dream never tells us whether its elements are to be interpreted literally or in a figurative sense or whether they are to be connected with the material of the dream-thoughts directly or through the intermediary of some interpolated phraseology. In interpreting any dream-element it is in general doubtful

I have already given several examples of representations in dreams which are only held together by the ambiguity of their wording. (For instance, 'She opened her mouth properly' in the dream of Irma's injection and 'I could not go after all' in the dream which I last quoted.) I will now record a dream in which a considerable part was played by the turning of abstract thought into pictures. The distinction between dream-interpretation of this kind and interpretation by means of symbolism can still be drawn quite sharply. In the case of symbolic dream-interpretation the key to the symbolization is arbitrarily chosen by the interpreter; whereas in our cases of verbal disguise the keys are generally known and laid down by firmly established linguistic usage. If one has the right idea at one's disposal at the right moment, one can solve dreams of this kind wholly or in part even independently of information from the dreamer.

Herbert Silberer (1909) has pointed out a good way of directly observing the transformation of thoughts into pictures in the process of forming dreams and so of studying this one factor of the dream-work in isolation. If, when he was in a fatigued and sleepy condition, he set himself some intellectual task, he found that it often happened that the thought escaped him and that in its place a picture appeared, which he was then able to recognize as a substitute for the thought. Silberer describes these substitutes by the not very appropriate term of 'auto-symbolic.' I will here quote a few examples from Silberer's paper, and I shall have occasion, on account of certain characteristics of the phenomena concerned, to return to them later.

We can go so far as to say that the dream-work makes use, for the purpose of giving a visual representation of the dream-thoughts, of any methods within its reach, whether waking criticism regards them as legitimate or illegitimate. This lays the dream-work open to doubt and derision on the part of everyone who has only heard of dream-interpretation but never practised it. Stekel's book, Die Sprache des Traumes (1911), is particularly rich in examples of this kind. I have, however, avoided quoting instances from it, on account of the author's lack of critical judgement and of the arbitrariness of his technique, which give rise to doubts even if unprejudiced minds.
From this discussion of secondary revision I will go on to consider a further factor in the
dream-work which has recently been brought to light by some finely perceptive observations
carried out by Herbert Silberer. As I have mentioned earlier (p. 814 ff.), Silberer has, as it were,
captured in the very act the process of transforming thoughts into images, by forcing himself into
intellectual activity while he was in a state of fatigue and drowsiness. At such moments the
thought with which he was dealing vanished and was replaced by a vision which turned out to
be a substitute for what were as a rule abstract thoughts, (Cf. the examples in the passage just
referred to.) Now it happened during these experiments that the image which arose, and which
might be compared to an element of a dream, sometimes represented something other than the
thought that was being dealt with - namely, the fatigue itself, the difficulty and unpleasure
involved in the work. It represented, that is to say, the subjective state and mode of functioning
of the person making the effort instead of the object of his efforts. Silberer described
occurrences of this kind, which were very frequent in his case, as a 'functional phenomenon' in
contrast to the 'material phenomenon' which would have been expected.
[1900a, 941]

Having now repelled the objections that have been raised against us, or having at least
indicated where our defensive weapons lie, we must no longer postpone the task of setting
about the psychological investigations for which we have so long been arming ourselves. Let us
summarize the principal findings of our enquiry so far as it has gone. Dreams are psychical acts
of as much significance as any others; their motive force is in every instance a wish seeking
fulfilment; the fact of their not being recognizable as wishes and their many peculiarities and
absurdities are due to the influence of the psychical censorship to which they have been
subjected during the process of their formation; apart from the necessity of evading this
censorship, other factors which have contributed to their formation are a necessity for the
condensation of their psychical material, a regard for the possibility of its being represented in
sensory images and - though not invariably - a demand that the structure of the dream shall
have a rational and intelligible exterior. Each of these propositions opens a way to fresh
psychological postulates and speculations; the mutual relations between the wish which is the
dream's motive force and the four conditions to which the dream's formation is subject, as well as
the interrelations between the latter, require to be investigated; and the place of dreams in the
nexus of mental life has to be assigned.
[1900a, 966]

If we look into the matter more closely we shall observe that two almost independent features
stand out as characteristic of the form taken by this dream. One is the fact that the thought is
represented as an immediate situation with the 'perhaps' omitted, and the other is the fact that
the thought is transformed into visual images and speech.
[1900a, 967]
But dreams differ from day-dreams in their second characteristic: namely, in the fact of their ideational content being transformed from thoughts into sensory images, to which belief is attached and which appear to be experienced. I must add at once that not every dream exhibits this transformation from idea into sensory image. There are dreams which consist only of thoughts but which cannot on that account be denied the essential nature of dreams. My 'Autodidasker' dream was of that kind; it included scarcely more sensory elements than if I had thought its content in the daytime. And in every dream of any considerable length there are elements which have not, like the rest, been given a sensory form, but which are simply thought or known, in the kind of way in which we are accustomed to think or know things in waking life. It should also be remembered here that it is not only in dreams that such transformations of ideas into sensory images occur: they are also found in hallucinations and visions, which may appear as independent entities, so to say, in health or as symptoms in the psychoneuroses. In short, the relation which we are examining now is not in any respect an exclusive one. Nevertheless it remains true that it would be impossible for us to imagine the dream-world without it. But in order to arrive at an understanding of it we must embark upon a discussion that will take us far afield.

[1900a, 968]

Let us bring together what we have found out about the peculiar propensity of dreams to recast their ideational content into sensory images. We have not explained this feature of the dream-work, we have not traced it back to any known psychological laws; but we have rather picked it out as something that suggests unknown implications and we have characterized it with the word 'regressive.' We have put forward the view that in all probability this regression, wherever it may occur, is an effect of a resistance opposing the progress of a thought into consciousness along the normal path, and of a simultaneous attraction exercised upon the thought by the presence of memories possessing great sensory force.¹ In the case of dreams, regression may perhaps be further facilitated by the cessation of the progressive current - which streams in during the daytime from the sense organs; in other forms of regression, the absence of this accessory factor must be made up for by a greater intensity of the other motives for regression. Nor must we forget to observe that in these pathological cases of regression as well as in dreams the process of transference of energy must differ from what it is in regressions occurring in normal mental life, since in the former cases that process makes possible a complete hallucinatory cathexis of the perceptual systems. What we have described, in our analysis of the dream-work, as 'regard for representability' might be brought into connection with the selective attraction exercised by the visually recollected scenes touched upon by the dream-thoughts.

[1900a, 980]
The situation is this. Either residues of the previous day have been left over from the activity of waking life and it has not been possible to withdraw the whole cathexis of energy from them; or the activity of waking life during the course of the day has led to the stirring up of an unconscious wish; or these two events have happened to coincide. (We have already discussed the various possibilities in this connection.) The unconscious wish links itself up with the day’s residues and effects a transference on to them; this may happen either in the course of the day or not until a state of sleep has been established. A wish now arises which has been transferred on to the recent material; or a recent wish, having been suppressed, gains fresh life by being reinforced from the unconscious. This wish seeks to force its way along the normal path taken by thought processes, though the Pcs. (to which, indeed, it in part belongs) to consciousness. But it comes up against the censorship, which is still functioning and to the influence of which it now submits. At this point it takes on the distortion for which the way has already been paved by the transference of the wish on to recent material. So far it is on the way to becoming an obsessive idea or a delusion or something of the kind - that is, a thought which has been intensified by transference and distorted in its expression by censorship. Its further advance is halted, however, by the sleeping state of the preconscious. (The probability is that that system has protected itself against the invasion by diminishing its own excitations.) The dream-process consequently enters on a regressive path, which lies open to it precisely owing to the peculiar nature of the state of sleep, and it is led along that path by the attraction exercised on it by groups of memories; some of these memories themselves exist only in the form of visual cathexes and not as translations into the terminology of the later systems. In the course of its regressive path the dream-process acquires the attribute of representability. (I shall deal later with the question of compression.) It has now completed the second portion of its zigzag journey. The first portion was a progressive one, leading from the unconscious scenes or phantasies to the preconscious; the second portion led from the frontier of the censorship back again to perceptions. But when the content of the dream process has become perceptual, by that fact it has, as it were, found a way of evading the obstacle put in its way by the censorship and the state of sleep in the Pcs. It succeeds in drawing attention to itself and in being noticed by consciousness.

[1900a, 1002]

As regards the embittered and apparently irreconcilable dispute as to whether the mind sleeps at night or is as much in command of all its faculties as it is by day, we have found that both parties are right but that neither is wholly right. We have found evidence in the dream-thoughts of a highly complex intellectual function, operating with almost the whole resources of the mental apparatus. Nevertheless it cannot be disputed that these dream-thoughts originated during the day, and it is imperative to assume that there is such a thing as a sleeping state of the mind. Thus even the theory of partial sleep has shown its value, though we have found that what characterizes the state of sleep is not the disintegration of mental bonds but the concentration of the psychical system which is in command during the day upon the wish to sleep. The factor of withdrawal from the external world retains its significance in our scheme; it helps, though not as the sole determinant, to make possible the regressive character of representation in dreams. The renunciation of voluntary direction of the flow of ideas cannot be disputed; but this does not deprive mental life of all purpose, for we have seen how, after voluntary purposive ideas have been abandoned, involuntary ones assume command. We have not merely accepted the fact of the looseness of associative connections in dreams, but we have shown that it extends far further than had been suspected; we have found, however, that these loose connections are merely obligatory substitutes for others which are valid and significant. It is quite true that we have described dreams as absurd; but examples have taught us how sensible a dream can be even when it appears to be absurd.

[1900a, 1017]
These are some of the most striking of the abnormal processes to which the dream-thoughts, previously constructed on rational lines, are subjected in the course of the dream-work. It will be seen that the chief characteristic of these processes is that the whole stress is laid upon making the cathecting energy mobile and capable of discharge; the content and the proper meaning of the psychical elements to which the cathexes are attached are treated as of little consequence. It might have been supposed that condensation and the formation of compromises is only carried out for the sake of facilitating regression, that is, when it is a question of transforming thoughts into images. But the analysis - and still more the synthesis - of dreams which include no such regression to images, e.g. the dream of 'Autodidasker', exhibits the same processes of displacement and condensation as the rest.

[1900a, 1023]

But before taking leave of infantile dreams with their undisguised wish-fulfilments, I must not omit to mention one principal feature of dreams, which has long been evident and which emerges particularly clearly precisely in this group. Every one of these dreams can be replaced by an optative clause: 'Oh, if only the trip on the lake had lasted longer!' - 'If only I were already washed and dressed!' - 'If only I could have kept the cherries instead of giving them to Uncle!' But dreams give us more than such optative clauses. They show us the wish as already fulfilled; they represent its fulfilment as real and present; and the material employed in dream-representation consists principally, though not exclusively, of situations and of sensory images, mostly of a visual character. Thus, even in this infantile group, a species of transformation, which deserves to be described as dream-work, is not completely absent: a thought expressed in the optative has been replaced by a representation in the present tense.

[1901a, 1065]

Condensation, together with the transformation of thoughts into situations ('dramatization'), is the most important and peculiar characteristic of the dream-work. So far, however, nothing has transpired as to any motive necessitating this compression of the material.

[1901a, 1069]

In the case of the complicated and confused dreams with which we are now concerned, condensation and dramatization alone are not enough to account for the whole of the impression that we gain of the dissimilarity between the content of the dream and the dream-thoughts. We have evidence of the operation of a third factor, and this evidence deserves careful sifting.

[1901a, 1070]
It is the process of displacement which is chiefly responsible for our being unable to discover or recognize the dream-thoughts in the dream-content, unless we understand the reason for their distortion. Nevertheless, the dream-thoughts are also submitted to another and milder sort of transformation, which leads to our discovering a new achievement on the part of the dream-work - one, however, which is easily intelligible. The dream-thoughts which we first come across as we proceed with our analysis often strike us by the unusual form in which they are expressed; they are not clothed in the prosaic language usually employed by our thoughts, but are on the contrary represented symbolically by means of similes and metaphors, in images resembling those of poetic speech. There is no difficulty in accounting for the constraint imposed upon the form in which the dream-thoughts are expressed. The manifest content of dreams consists for the most part in pictorial situations; and the dream-thoughts must accordingly be submitted in the first place to a treatment which will make them suitable for a representation of this kind. If we imagine ourselves faced by the problem of representing the arguments in a political leading article or the speeches of counsel before a court of law in a series of pictures, we shall easily understand the modifications which must necessarily be carried out by the dream-work owing to considerations of representability in the content of the dream. [1901a, 1074]

The content of dreams, however, does not consist entirely of situations, but also includes disconnected fragments of visual images, speeches and even bits of unmodified thoughts. It may therefore perhaps be of interest to enumerate very briefly the modes of representation available to the dream-work for reproducing the dream-thoughts in the peculiar form of expression necessary in dreams. [1901a, 1075]

The modes of expression open to a dream may therefore be qualified as meagre by comparison with those of our intellectual speech; nevertheless a dream need not wholly abandon the possibility of reproducing the logical relations present in the dream-thoughts. On the contrary, it succeeds often enough in replacing them by formal characteristics in its own texture. [1901a, 1075]

Having been made acquainted with the dream-work by the foregoing discussion, we shall no doubt be inclined to pronounce it a quite peculiar psychical process, the like of which, so far as we are aware, does not exist elsewhere. It is as though we were carrying over on to the dream-work all the astonishment which used formerly to be aroused in us by its product, the dream. In fact, however, the dream-work is only the first to be discovered of a whole series of psychical processes, responsible for of hysterical symptoms, of phobias, obsessions and delusions. Condensation and, above all, displacement are invariable characteristics of these other processes as well. Modification into a pictorial form, on the other hand, remains a peculiarity of the dream-work. If this explanation places dreams in a single series alongside the structures produced by psychical illness, this makes it all the more important for us to discover the essential determining conditions of such processes as those of dream-formation. We shall probably be surprised to hear that neither the state of sleep nor illness is among these indispensable conditions. A whole number of the phenomena of the everyday life of healthy people - such as forgetting, slips of the tongue, bungled actions and a particular class of errors - owe their origin to a psychical mechanism analogous to that of dreams and of the other members of the series. [1901a, 1084]
In the case of children's dreams there should be no difficulty in accepting this statement. The state of sleep or the psychical modification involved in sleep, whatever that may be, is brought about by a resolve to sleep which is either imposed upon the child or is reached on the basis of sensations of fatigue; and it is only made possible by the withholding of stimuli which might suggest to the psychical apparatus aims other than that of sleeping. The means by which external stimuli can be kept off are familiar to us; but what are the means available for controlling internal mental stimuli which set themselves against falling asleep? Let us observe a mother putting her child to sleep. The child gives vent to an unceasing stream of desires: he wants one more kiss, he wants to go on playing. His mother satisfies some of these desires, but uses her authority to postpone others of them to the next day. It is clear that any wishes or needs that may arise have an inhibiting effect upon falling asleep. We all know the amusing story told by Balduin Groller of the bad little boy who woke up in the middle of the night and shouted across the night nursery: 'I want the rhino!' A better behaved child, instead of shouting, would have dreamt that he was playing with the rhino. Since a dream that shows a wish as fulfilled is believed during sleep, it does away with the wish and makes sleep possible. It cannot be disputed that dream-images are believed in this way, for they are clothed in the psychical appearance of perceptions, and children have not yet acquired the later faculty of distinguishing hallucinations or phantasies from reality.

Remembering in adults, as is well known, makes use of a variety of psychical material. Some people remember in visual images; their memories have a visual character. Other people can scarcely reproduce in their memory even the scantiest outlines of what they have experienced. Following Charcot's proposal, such people are called auditifs and moteurs in contrast to the visuels. In dreams these distinctions disappear: we all dream predominantly in visual images. But this development is similarly reversed in the case of childhood memories: they are plastically visual even in people whose later function of memory has to do without any visual element. Visual memory accordingly preserves the type of infantile memory. In my own case the earliest childhood memories are the only ones of a visual character: they are regular scenes worked out in plastic form, comparable only to representations on the stage. In these scenes of childhood, whether in fact they prove to be true or falsified, what one sees invariably includes oneself as a child, with a child's shape and clothes. This circumstance must cause surprise: in their recollections of later experiences adult visuels no longer see themselves. Furthermore it contradicts all that we have learnt to suppose that in his experiences a child's attention is directed to himself instead of exclusively to impressions from outside. One is thus forced by various considerations to suspect that in the so-called earliest childhood memories we possess not the genuine memory-trace but a later revision of it, a revision which may have been subjected to the influences of a variety of later psychical forces. Thus the 'childhood memories' of individuals come in general to acquire the significance of 'screen memories' and in doing so offer a remarkable analogy with the childhood memories that a nation preserves in its store of legends and myths.
Let us recall all that we have heard about the nature and origin of the phantasies which are the precursors of delusions. They are substitutes for and derivatives of repressed memories which a resistance will not allow to enter consciousness unaltered, but which can purchase the possibility of becoming conscious by taking account, by means of changes and distortions, of the resistance's censorship. When this compromise has been accomplished, the memories have turned into the phantasies, which can easily be misunderstood by the conscious personality - that is, understood so as to fit in with the dominant psychical current. Now let us suppose that dream-images are what might be described as the creations of people's physiological delusions - the products of the compromise in the struggle between what is repressed and what is dominant which is probably present in every human being, including those who in the day-time are perfectly sound in mind. We shall then understand that dream-images have to be regarded as something distorted, behind which something else must be looked for, something not distorted, but in some sense objectionable, like Hanold's repressed memories behind his phantasies. We can give expression to the contrast which we have thus recognized, by distinguishing what the dreamer remembers when he wakes up as the manifest content of the dream from what constituted the basis of the dream before the distortion imposed by the censorship - namely, the latent dream-thoughts. Thus, interpreting a dream consists in translating the manifest content of the dream into the latent dream-thoughts, in undoing the distortion which the dream-thoughts have had to submit to from the censorship of the resistance. If we apply these notions to the dream we are concerned with, we shall find that its latent dream-thoughts can only have been: 'the girl you are looking for with the graceful gait is really living in this town with you.' But in that form the thought could not become conscious. It was obstructed by the fact that a phantasy had laid it down, as the result of an earlier compromise, that Gradiva was a Pompeian; consequently, if the real fact that she was living in the same place and at the same time was to be affirmed, there was no choice but to adopt the distortion: 'You are living at Pompeii at the time of Gradiva.' This then was the idea which was realized by the manifest content of the dream, and was represented as a present event actually being experienced.

[1907a, 1855]

It is only rarely that a dream represents, or, as we might say, 'stages', a single thought: there are usually a number of them, a tissue of thoughts. Another component of the content of Hanold's dream can be detached, the distortion of which can easily be got rid of, so that the latent idea represented by it can be detected. This is a piece of the dream to which once again it is possible to extend the assurance of reality with which the dream ended. In the dream Gradiva as she steps along is transformed into a marble sculpture. This is no more than an ingenious and poetical representation of the real event. Hanold had in fact transferred his interest from the living girl to the sculpture: the girl he loved had been transformed for him into a marble relief. The latent dream-thoughts, which were bound to remain unconscious, sought to change the sculpture back into the living girl; what they were saying to him accordingly was something like: 'After all, you're only interested in the statue of Gradiva because it reminds you of Zoe, who is living here and now.' But if this discovery could have become conscious, it would have meant the end of the delusion.

[1907a, 1856]
If we reflect that the means of representation in dreams are principally visual images and not words, we shall see that it is even more appropriate to compare dreams with a system of writing than with a language. In fact the interpretation of dreams is completely analogous to the decipherment of an ancient pictographic script such as Egyptian hieroglyphs. In both cases there are certain elements which are not intended to be interpreted (or read, as the case may be) but are only designed to serve as 'determinatives', that is to establish the meaning of some other element. The ambiguity of various elements of dreams finds a parallel in these ancient systems of writing; and so too does the omission of various relations, which have in both cases to be supplied from the context. If this conception of the method of representation in dreams has not yet been followed up, this, as will be readily understood, must be ascribed to the fact that psycho-analysts are entirely ignorant of the attitude and knowledge with which a philologist would approach such a problem as that presented by dreams.

It will certainly be of importance to us if evidence of the activity of this critically observing agency - which becomes heightened into conscience and philosophic introspection - can be found in other fields as well. I will mention here what Herbert Silberer has called the 'functional phenomenon', one of the few indisputably valuable additions to the theory of dreams. Silberer, as we know, has shown that in states between sleeping and waking we can directly observe the translation of thoughts into visual images, but that in these circumstances we frequently have a representation, not of a thought-content, but of the actual state (willingness, fatigue, etc.) of the person who is struggling against sleep. Similarly, he has shown that the conclusions of some dreams or some divisions in their content merely signify the dreamer's own perception of his sleeping and waking. Silberer has thus demonstrated the part played by observation - in the sense of the paranoic's delusions of being watched - in the formation of dreams. This part is not a constant one. Probably the reason why I overlooked it is because it does not play any great part in my own dreams; in persons who are gifted philosophically and accustomed to introspection it may become very evident.

We have already in _The Interpretation of Dreams_ described the way in which the regression of the preconscious day's residues takes place in dream-formation. In this process thoughts are transformed into images, mainly of a visual sort; that is to say, word-presentations are taken back to the thing-presentations which correspond to them, as if, in general, the process were dominated by considerations of representability. When regression has been completed, a number of cathexes are left over in the system _Ucs._ - cathexes of memories of things. The primary psychical process is brought to bear on these memories, till, by condensation of them and displacement between their respective cathexes, it has shaped the manifest dream-content. Only where the word-presentations occurring in the day's residues are recent and current residues of _perceptions_, and not the expression of _thoughts_, are they themselves treated like thing-presentations, and subjected to the influence of condensation and displacement. Hence the rule laid down in _The Interpretation of Dreams_, and since confirmed beyond all doubt, that words and speeches in the dream-content are not freshly formed, but are modelled on speeches from the day preceding the dream (or on some other recent impressions, such as something that has been read). It is very noteworthy how little the dream-work keeps to the word-presentations; it is always ready to exchange one word for another till it finds the expression which is most handy for plastic representation.¹

[1913j, 2814]

[1914c, 2950]

[1917d, 3033]
Here we have a new type of relation between the manifest and latent dream-elements. The former is not so much a distortion of the latter as a representation of it, a plastic, concrete, portrayal of it, taking its start from the wording. But precisely on that account it is once more a distortion, for we have long since forgotten from what concrete image the word originated and consequently fail to recognize it when it is replaced by the image. When you consider that the manifest dream is made up predominantly of visual images and more rarely of thoughts and words, you can imagine what importance attaches to this kind of relation in the construction of dreams. You will see, too, that in this way it becomes possible in regard to a large number of abstract thoughts to create pictures to act as substitutes for them in the manifest dream while at the same time serving the purpose of concealment. This is the technique of the familiar picture-puzzles. Why it is that these representations have an appearance of being jokes is a special problem into which we need not enter here.

The third achievement of the dream-work is psychologically the most interesting. It consists in transforming thoughts into visual images. Let us keep it clear that this transformation does not affect everything in the dream-thoughts; some of them retain their form and appear as thoughts or knowledge in the manifest dream as well; nor are visual images the only form into which thoughts are transformed. Nevertheless they comprise the essence of the formation of dreams; this part of the dream-work is, as we already know, the second most regular one, and we have already made the acquaintance of the 'plastic' representation of words in the case of individual dream-elements.

It is clear that this achievement is not an easy one. To form some idea of its difficulties, let us suppose that you have under taken the task of replacing a political leading article in a newspaper by a series of illustrations. You will thus have been thrown back from alphabetic writing to picture writing. In so far as the article mentioned people and concrete objects you will replace them easily and perhaps even advantageously by pictures; but your difficulties will begin when you come to the representation of abstract words and of all those parts of speech which indicate relations between thoughts - such as particles, conjunctions and so on. In the case of abstract words you will be able to help yourselves out by means of a variety of devices. For instance, you will endeavour to give the text of the article a different wording, which may perhaps sound less usual but which will contain more components that are concrete and capable of being represented. You will then recall that most abstract words are 'watered-down' concrete ones, and you will for that reason hark back as often as possible to the original concrete meaning of such words. Thus you will be pleased to find that you can represent the 'possession' of an object by a real, physical sitting down on it.¹ And the dream-work does just the same thing. In such circumstances you will scarcely be able to expect very great accuracy from your representation: similarly, you will forgive the dream-work for replacing an element so hard to put into pictures as, for example, 'adultery' ['Ehebruch', literally, 'breach of marriage'], by another breach - a broken leg ['Beinbruch'].² And in this way you will succeed to some extent in compensating for the clumsiness of the picture writing that is supposed to take the place of the alphabetic script.
For representing the parts of speech which indicate relations between thoughts - 'because', 'therefore', 'however', etc. - you will have no similar aids at your disposal; those constituents of the text will be lost so far as translation into pictures goes. In the same way, the dream-work reduces the content of the dream-thoughts to its raw material of objects and activities. You will feel pleased if there is a possibility of in some way hinting, through the subtler details of the pictures, at certain relations not in themselves capable of being represented. And just so does the dream-work succeed in expressing some of the content of the latent dream-thoughts by peculiarities in the form of the manifest dream-by its clarity or obscurity, by its division into several pieces, and so on. The number of part dreams into which a dream is divided usually corresponds to the number of main topics or groups of thoughts in the latent dream. A short introductory dream will often stand in the relation of a prelude to a following, more detailed, main dream or may give the motive for it; a subordinate clause in the dream-thoughts will be replaced by the interpolation of a change of scene into the manifest dream, and so on. Thus the form of dreams is far from being without significance and itself calls for interpretation. When several dreams occur during the same night, they often have the same meaning and indicate that an attempt is being made to deal more and more efficiently with a stimulus of increasing insistence. In individual dreams a particularly difficult element may be represented by several symbols - by 'doublets'.

[1916-1917, 3268]

And now a few more considerations. In the case of the dream-work it is clearly a matter of transforming the latent thoughts which are expressed in words into sensory images, mostly of a visual sort. Now our thoughts originally arose from sensory images of that kind: their first material and their preliminary stages were sense impressions, or, more properly, mnemic images of such impressions. Only later were words attached to them and the words in turn linked up into thoughts. The dream-work thus submits thoughts to a regressive treatment and undoes their development; and in the course of the regression everything has to be dropped that had been added as a new acquisition in the course of the development of the mnemonic images into thoughts.

[1916-1917, 3271]
We may, I think, tentatively venture to regard the common traumatic neurosis as a consequence of an extensive breach being made in the protective shield against stimuli. This would seem to reinstate the old, naïve theory of shock, in apparent contrast to the later and psychologically more ambitious theory which attributes aetiological importance not to the effects of mechanical violence but to fright and the threat to life. These opposing views are not, however, irreconcilable; nor is the psycho-analytic view of the traumatic neurosis identical with the shock theory in its crudest form. The latter regards the essence of the shock as being the direct damage to the molecular structure or even to the histological structure of the elements of the nervous system; whereas what we seek to understand are the effects produced on the organ of the mind by the breach in the shield against stimuli and by the problems that follow in its train. And we still attribute importance to the element of fright. It is caused by lack of any preparedness for anxiety, including lack of hypercathexis of the systems that would be the first to receive the stimulus. Owing to their low cathexis those systems are not in a good position for binding the inflowing amounts of excitation and the consequences of the breach in the protective shield follow all the more easily. It will be seen, then, that preparedness for anxiety and the hypercathexis of the receptive systems constitute the last line of defence of the shield against stimuli. In the case of quite a number of traumas, the difference between systems that are unprepared and systems that are well prepared through being hypercathected may be a decisive factor in determining the outcome; though where the strength of a trauma exceeds a certain limit this factor will no doubt cease to carry weight. The fulfilment of wishes is, as we know, brought about in a hallucinatory manner by dreams, and under the dominance of the pleasure principle this has become their function. But it is not in the service of that principle that the dreams of patients suffering from traumatic neuroses lead them back with such regularity to the situation in which the trauma occurred. We may assume, rather, that dreams are here helping to carry out another task, which must be accomplished before the dominance of the pleasure principle can ever begin. These dreams are endeavouring to master the stimulus retrospectively, by developing the anxiety whose omission was the cause of the traumatic neurosis. They thus afford us a view of a function of the mental apparatus which, though it does not contradict the pleasure principle, is nevertheless independent of it and seems to be more primitive than the purpose of gaining pleasure and avoiding unpleasure.
[1920g, 3734]
I am hoping that you will grant this, but that you will raise the objection that there are, nevertheless, other telepathic dreams in which there is no difference between the event and the dream, and in which there is nothing else to be found but an undistorted reproduction of the event. I have no knowledge of such dreams from my own experience, but I know they have often been reported. If we assume that we have such an undisguised and unadulterated telepathic dream to deal with, another question arises. Ought we to call such a telepathic experience a 'dream' at all? You will certainly do so as long as you keep to popular usage, in which everything that takes place in mental life during sleep is called a dream. You, too, perhaps say, 'I tossed about in my dream', and still less are you conscious of anything incorrect when you say, 'I shed tears in my dream' or 'I felt apprehensive in my dream'. But you will no doubt notice that in all these cases you are using 'dream' and 'sleep' and 'state of being asleep' interchangeably, as if there were no distinction between them. I think it would be in the interests of scientific accuracy to keep 'dream' and 'state of sleep' more distinctly separate. Why should we provide a counterpart to the confusion evoked by Maeder who, by refusing to distinguish between the dream-work and the latent dream-thoughts, has discovered a new function for dreams? Supposing, then, that we are brought face to face with a pure telepathic 'dream', let us rather call it instead a telepathic experience in a state of sleep. A dream without condensation, distortion, dramatization, above all, without wish-fulfilment, surely does not deserve the name.

You will remind me that, if so, there are other mental products in sleep to which the right to be called 'dreams' would have to be refused. Actual experiences of the day are sometimes simply repeated in sleep; reproductions of traumatic scenes in 'dreams' have led us only lately to revise the theory of dreams. There are dreams which are to be distinguished from the usual type by certain special qualities, which are, properly speaking, nothing but night-phantasies, not having undergone additions or alterations of any kind and being in all other ways similar to the familiar day-dreams. It would be awkward, no doubt, to exclude these structures from the domain of 'dreams'. But still they all come from within, are products of our mental life, whereas the very conception of the purely 'telepathic dream' lies in its being a perception of something external, in relation to which the mind remains passive and receptive.

[1922a, 3887]

With the help of the method of free association and of the related art of interpretation, psycho-analysis succeeded in achieving one thing which appeared to be of no practical importance but which in fact necessarily led to a totally fresh attitude and a fresh scale of values in scientific thought. It became possible to prove that dreams have a meaning, and to discover it. In classical antiquity great importance was attached to dreams as foretelling the future; but modern science would have nothing to do with them, it handed them over to superstition, declaring them to be purely 'somatic' processes - a kind of twitching of a mind that is otherwise asleep. It seemed quite inconceivable that anyone who had done serious scientific work could make his appearance as an 'interpreter of dreams'. But by disregarding the excommunication pronounced upon dreams, by treating them as unexplained neurotic symptoms, as delusional or obsessional ideas, by neglecting their apparent content and by making their separate component images into subjects for free association, psycho-analysis arrived at a different conclusion. The numerous associations produced by the dreamer led to the discovery of a thought-structure which could no longer be described as absurd or confused, which ranked as a completely valid psychical product, and of which the manifest dream was no more than a distorted, abbreviated, and misunderstood translation, and for the most part a translation into visual images. These latent dream-thoughts contained the meaning of the dream, while its manifest content was simply a make-believe, a façade, which could serve as a starting-point for the associations but not for the interpretation.

[1925d, 4218]
There is no difficulty in discovering the general function of dreaming. It serves the purpose of fending off, by a kind of soothing action, external or internal stimuli which would tend to arouse the sleeper, and thus of securing sleep against interruption. External stimuli are fended off by being given a new interpretation and by being woven into some harmless situation; internal stimuli, caused by instinctual demands, are given free play by the sleeper and allowed to find satisfaction in the formation of dreams, so long as the latent dream-thoughts submit to the control of the censorship. But if they threaten to break free and the meaning of the dream becomes too plain, the sleeper cuts short the dream and wakes in a fright. (Dreams of this class are known as anxiety-dreams.) A similar failure in the function of dreaming occurs if an external stimulus becomes too strong to be fended off. (This is the class of arousal-dreams.) I have given the name of dream-work to the process which, with the co-operation of the censorship, converts the latent thoughts into the manifest content of the dream. It consists of a peculiar way of treating the preconscious material of thought, so that its component parts become condensed, its psychical emphasis becomes displaced, and the whole of it is translated into visual images or dramatized, and completed by a deceptive secondary revision. The dream-work is an excellent example of the processes occurring in the deeper, unconscious layers of the mind, which differ considerably from the familiar normal processes of thought. It also displays a number of archaic characteristics, such as the use of a symbolism (in this case of a predominantly sexual kind) which it has since also been possible to discover in other spheres of mental activity.

[1925d, 4220]

In what follows I shall not be able to avoid a schematic method of exposition. Let us assume that in a particular case we have before us all the latent thoughts, charged with a greater or less amount of affect, by which the manifest dream has been replaced after its interpretation has been completed. We shall then be struck by one difference among these latent thoughts, and that difference will take us a long way. Almost all these dream-thoughts are recognized by the dreamer or acknowledged by him; he admits that he has thought this, now or at some other time, or that he might have thought it. There is only one single thought that he refuses to accept; it is strange to him or even perhaps repellent; he may possibly reject it with passionate feeling. It now becomes evident to us that the other thoughts are portions of a conscious, or, more accurately, a preconscious train of thinking. They might have been thought in waking life too, and indeed they were probably formed during the previous day. This one repudiated thought, however, or, properly speaking, this one impulse, is a child of night; it belongs to the dreamer's unconscious and on that account it is repudiated and rejected by him. It had to wait for the nightly relaxation of repression in order to arrive at any kind of expression. And in any case this expression is a weakened, distorted and disguised one; without our work of dream-interpretation we should not have found it. This unconscious impulse has to thank its link with the other, unobjectionable, dream-thoughts for the opportunity of slipping past the barrier of the censorship in an inconspicuous disguise. On the other hand, the preconscious dream-thoughts have to thank this same link for the power to occupy mental life during sleep as well. For there is no doubt about it: this unconscious impulse is the true creator of the dream; it is what produces the psychical energy for the dream's construction. Like any other instinctual impulse, it cannot strive for anything other than its own satisfaction; and our experience in interpreting dreams shows us too that that is the sense of all dreaming. In every dream an instinctual wish has to be represented as fulfilled. The shutting-off of mental life from reality at night and the regression to primitive mechanisms which this makes possible enable this wished-for instinctual satisfaction to be experienced in a hallucinatory manner as occurring in the present. As a result of this same regression, ideas are transformed in the dream into visual pictures: the latent dream-thoughts, that is to say, are dramatized and illustrated.

[1933a, 4631]
This piece of the dream-work gives us information about some of the most striking and peculiar features of dreams. I will repeat the course of events in dream-formation. As an introduction: the wish to sleep and intentional turning away from the external world. Next, two consequences of this for the mental apparatus: first, the possibility for older and more primitive methods of working to emerge in it - regression; secondly, the lowering of the resistance due to repression which weighs down upon the unconscious. As a result of this last factor the possibility arises for the formation of a dream and this is taken advantage of by the precipitating causes, the internal and external stimuli which have become active. The dream which originates in this way is already a compromise-structure. It has a double function; on the one hand it is ego-syntonic, since, by getting rid of the stimuli which are interfering with sleep, it serves the wish to sleep; on the other hand it allows a repressed instinctual impulse to obtain the satisfaction that is possible in these circumstances, in the form of the hallucinated fulfilment of a wish. The whole process of forming a dream which is permitted by the sleeping ego is, however, subject to the condition of the censorship, which is exercised by the residue of the repression still in operation. I cannot present the process more simply: it is not more simple. But I can proceed now with my description of the dream-work.

Let us go back once more to the latent dream-thoughts. Their most powerful element is the repressed instinctual impulse which has created in them an expression for itself on the basis of the presence of chance stimuli and by transference on to the day's residues - though an expression that is toned down and disguised. Like every instinctual impulse, it too presses for satisfaction by action; but its path to motility is blocked by the physiological regulations implied in the state of sleep; it is compelled to take the backwards course in the direction of perception and to be content with a hallucinated satisfaction. The latent dream-thoughts are thus transformed into a collection of sensory images and visual scenes. It is as they travel on this course that what seems to us so novel and so strange occurs to them. All the linguistic instruments by which we express the subtler relations of thought - the conjunctions and prepositions, the changes in declension and conjugation - are dropped, because there are no means of representing them; just as in a primitive language without any grammar, only the raw material of thought is expressed and abstract terms are taken back to the concrete ones that are at their basis. What is left over after this may well appear disconnected. The copious employment of symbols, which have become alien to conscious thinking, for representing certain objects and processes is in harmony alike with the archaic regression in the mental apparatus and with the demands of the censorship.

In a very interesting series of experiments, Herbert Silberer has shown that one can catch the dream-work red-handed, as it were, in the act of turning abstract thoughts into visual pictures. If he tried to force himself to do intellectual work while he was in a state of fatigue and drowsiness, the thought would often vanish and be replaced by a vision, which was obviously a substitute for it.
The methods of representation employed by the dream-work - fascinating material, scarcely capable of exhaustion - have been made more and more familiar to us by closer study. I will give you a few examples of them. Thus, for instance, dreams represent the relation of frequency by a multiplication of similar things. Here is a young girl's remarkable dream. She dreamt she came into a great hall and found some one in it sitting on a chair; this was repeated six or eight times or more, but each time it was her father. This is easy to understand when we discover, from accessory details in the interpretation, that this room stood for the womb. The dream then becomes equivalent to the phantasy, familiarly found in girls, of having met their rather already during their intra-uterine life when he visited the womb while their mother was pregnant. You should not be confused by the fact that something is reversed in the dream - that her father's 'coming-in' is displaced on to herself; incidentally, this has a special meaning of its own as well. The multiplication of the figure of the father can only express the fact that the event in question occurred repeatedly. After all, it must be allowed that the dream is not taking very much on itself in expressing frequency by multiplicity. It has only needed to go back to the original significance of the former word; to-day it means to us a repetition in time, but it is derived from an accumulation in space. In general, indeed, where it is possible, the dream-work changes temporal relations into spatial ones and represents them as such. In a dream, for instance, one may see a scene between two people who look very small and a long way off, as though one were seeing them through the wrong end of a pair of opera-glasses. Here, both the smallness and the remoteness in space have the same significance: what is meant is remoteness in *time* and we are to understand that the scene is from the remote past.

[1933a, 4638]
Even the *Interpretation of Dreams* has not been left untouched by the advance of scientific knowledge. When I wrote it in 1899, my theory of sexuality was not yet in existence and the analysis of the more complicated forms of psycho-neurosis was only just beginning. It was my hope that dream-interpretation would help to make possible the psychological analysis of the neuroses; since then a deeper understanding of neuroses has reacted in turn upon our view of dreams. The theory of dream-interpretation has itself developed further in a direction on which insufficient stress had been laid in the first edition of this book. My own experience, as well as the works of Wilhelm Stekel and others, have since taught me to form a truer estimate of the extent and importance of symbolism in dreams (or rather in unconscious thinking). Thus in the course of these years much has accumulated which demands attention. I have endeavoured to take these innovations into account by making numerous interpolations in the text and by additional footnotes. If these additions threaten at times to burst the whole framework of the book or if I have not everywhere succeeded in bringing the original text up to the level of our present knowledge, I must ask the reader's indulgence for these deficiencies: they are the results and signs of the present increasingly rapid development of our science. I may even venture to prophesy in what other directions later editions of this book - if any should be needed - will differ from the present one. They will have on the one hand to afford a closer contact with the copious material presented in imaginative writing, in myths, in linguistic usage and in folklore; while on the other hand they will have to deal in greater detail than has here been possible with the relations of dreams to neuroses and mental diseases.

Scherner is not one of those who believe that the capacities of the mind continue undiminished in dream-life. He himself shows how the centralized core of the ego - its spontaneous energy - is deprived of its nervous force in dreams, how as a result of this decentralization the processes of cognition, feeling, willing and ideation are modified, and how the remnants of these psychical functions no longer possess a truly mental character but become nothing more than mechanisms. But by way of contrast, the mental activity which may be described as 'imagination', liberated from the domination of reason and from any moderating control, leaps into a position of unlimited sovereignty. Though dream-imagery makes use of recent waking memories for its building material, it erects them into structures bearing not the remotest resemblance to those of waking life; it reveals itself in dreams as possessing not merely reproductive but productive powers. Its characteristics are what lend their peculiar features to dreams. It shows a preference for what is immoderate, exaggerated and monstrous. But at the same time, being freed from the hindrances of the categories of thought, it gains in pliancy, agility and versatility. It is susceptible in the subtlest manner to the shades of the tender feelings and to passionate emotions, and promptly incorporates our inner life into external plastic pictures. Imagination in dreams is without the power of conceptual speech. It is obliged to paint what it has to say pictorially, and, since there are no concepts to exercise an attenuating influence, it makes full and powerful use of the pictorial form. Thus, however clear its speech may be, it is diffuse, clumsy and awkward. The clarity of its speech suffers particularly from the fact that it has a dislike of representing an object by its proper image, and prefers some extraneous image which will express only that particular one of the object's attributes which it is seeking to represent. Here we have the 'symbolizing activity' of the imagination. . . . Another very important point is that dream-imagery never depicts things completely, but only in outline and even so only in the roughest fashion. For this reason its paintings seem like inspired sketches. It does not halt, however, at the mere representation of an object; it is under an internal necessity to involve the dream-ego to a greater or less extent with the object and thus produce an event. For instance, a dream caused by a visual stimulus may represent gold coins in the street; the dreamer will pick them up delightedly and carry them off.

[1900a, 510]

[1900a, 590]
What dream-imagination does to the somatic stimuli cannot, of course, be regarded as serving any useful purpose. It plays about with them and pictures the organic sources, from which the stimuli of the dream in question have arisen, in some kind of plastic symbolism. Scherner is of the opinion - though here Volkelt and others refuse to follow him - that dream imagination has one particular favourite way of representing the organism as a whole: namely as a house. Fortunately, however, it does not seem to be restricted to this one method of representation. On the other hand, it may make use of a whole row of houses to indicate a single organ; for instance, a very long street of houses may represent a stimulus from the intestines. Again, separate portions of a house may stand for separate portions of the body; thus, in a dream caused by a headache, the head may be represented by the ceiling of a room covered with disgusting, toad-like spiders.

Leaving this house-symbolism on one side, any number of other kinds of things may be used to represent the parts of the body from which the stimulus to the dream has arisen. Thus the breathing lung will be symbolically represented by a blazing furnace, with flames roaring with a sound like the passage of air; the heart will be represented by hollow boxes or baskets, the bladder by round, bag-shaped objects or, more generally, by hollow ones. A dream caused by stimuli arising from the male sexual organs may cause the dreamer to find the top part of a clarinet in the street or the mouth-piece of a tobacco-pipe, or again, a piece of fur. Here the clarinet and the tobacco-pipe represent the approximate shape of the male organ, while the fur stands for the pubic hair. In the case of a sexual dream in a woman, the narrow space where the thighs come together may be represented by a narrow courtyard surrounded by houses, while the vagina may be symbolized by a soft, slippery and very narrow foot-path leading across the yard, along which the dreamer has to pass, in order, perhaps, to take a gentleman a letter.

Dream-imagination may, however, not merely direct its attention to the form of the stimulating organ; it may equally well symbolize the substance contained in that organ. In this way, a dream with an intestinal stimulus may lead the dreamer along muddy streets, or one with a urinary stimulus may lead him to a foaming stream. Or the stimulus as such, the nature of the excitement it produces, or the object it desires, may be symbolically represented. Or the dream-ego may enter into concrete relations with the symbols of its own state; for instance, in the case of painful stimuli the dreamer may engage in a desperate struggle with fierce dogs or savage bulls, or a woman in a sexual dream may find herself pursued by a naked man. Quite apart from the wealth of the means that it employs, the symbolizing activity of the imagination remains the central force in every dream. The task of penetrating more deeply into the nature of this imagination and of finding a place for it in a system of philosophical thought is attempted by Volkelt in the pages of his book. But, though it is well and feelingly written, it remains excessively hard to understand for anyone whose early education has not prepared him for a sympathetic grasp of the conceptual constructions of philosophy.
A similar dream of another woman patient had a different explanation. When she was young she had been remarkable for her ready wit and cheerful disposition; and these characteristics were still to be seen, at all events in the ideas that occurred to her during the treatment. In the course of a longish dream, this lady imagined that she saw her only fifteen-year-old daughter lying dead 'in a case.' She had half a mind to use the scene as an objection to the wish-fulfilment theory, though she herself suspected that the detail of the 'case' must point the way to another view of the dream.¹ In the course of the analysis she recalled that at a party the evening before there had been some talk about the English word 'box' and the various ways in which it could be translated into German - such as 'Schachtel', 'Loge', 'Kasten', 'Ohrfeige', and so on. Other portions of the same dream enabled us to discover further that she had guessed that the English 'box' was related to the German 'Büchse', and that she had then been plagued by a recollection that 'Büchse' is used as a vulgar term for the female genitals. If some allowance was made for the limits of her knowledge of topographical anatomy, it might be presumed, therefore, that the child lying in the case meant an embryo in the womb. After being enlightened up to this point, she no longer denied that the dream-picture corresponded to a wish of hers. Like so many young married women, she had been far from pleased when she became pregnant; and more than once she had allowed herself to wish that the child in her womb might die. Indeed, in a fit of rage after a violent scene with her husband, she had beaten with her fists on her body so as to hit the child inside it. Thus the dead child was in fact the fulfilment of a wish, but of a wish that had been put aside fifteen years earlier. It is scarcely to be wondered at if a wish that was fulfilled after such a long delay was not recognized. Too much had changed in the interval.

[1900a, 649]

Yet again the occasion for the dream was a real event. The day before she had actually put a candle into a candlestick, though it did not break. Some transparent symbolism was being used in this dream. A candle is an object which can excite the female genitals; and, if it is broken, so that it cannot stand up properly, it means that the man is impotent. ('It was not her fault.') But could a carefully brought-up young woman, who had been screened from the impact of anything ugly, have known that a candle might be put to such a use? As it happened, she was able to indicate how it was that she obtained this piece of knowledge. Once when they were in a rowing boat on the Rhine, another boat had passed them with some students in it. They were in high spirits and were singing, or rather shouting, a song:

[1900a, 673]

In order that we may not be tempted to draw conclusions too easily from dreams as to the dreamer's actual life, I will add one more dream of the same patient's, which once more has an innocent appearance. 'I dreamt,' she said, 'of what I really did yesterday: I filled a small trunk so full of books that I really had difficulty in shutting it and I dreamt what really happened.' In this instance the narrator herself laid the chief emphasis on the agreement between the dream and reality. All such judgements on a dream and comments upon it, though they have made themselves a place in waking thought, invariably form in fact part of the latent content of the dream, as we shall find confirmed by other examples later on. What we were being told, then, was that what the dream described had really happened the day before. It would take up too much space to explain how it was that the idea occurred to me of making use of the English language in the interpretation. It is enough to say that once again what was in question was a little 'box' (cf. the dream of the dead child in the 'case', p. 649 f.) which was so full that nothing more could get into it. Anyhow, nothing bad this time.

[1900a, 674]
Turning now to the second episode of the dream, I am unable to deal with it in such detail - out of consideration for the censorship. For I was putting myself in the place of an exalted personage of those revolutionary times, who also had an adventure with an eagle [Adler] and is said to have suffered from incontinence of the bowels, and so on. I thought to myself that I should not be justified in passing the censorship at this point, even though the greater part of the story was told me by a Hofrat (a consiliarius aulicus [court councillor] - cf. Aula). The series of public rooms in the dream were derived from His Excellency's saloon carriage, of which I had succeeded in getting a glimpse. But the 'rooms' [Zimmer] also meant 'women' [Frauenzimmer], as is often the case in dreams - in this instance 'public women'. In the figure of the housekeeper I was showing my lack of gratitude towards a witty elderly lady and ill repaying her hospitality and the many good stories that I heard while I was stopping in her house. -The allusion to the lamp went back to Grillparzer, who introduced a charming episode of a similar kind, which he had actually experienced, into his tragedy about Hero and Leander, Des Meeres und der Liebe Wellen ['The Waves of the Sea and of Love'] - the Armada and the storm.¹

Here is the material relating to the two childhood scenes which I have promised my readers. I had bought a new trunk for the journey, of a brownish violet colour. This colour appears more than once in the dream: the violet-brown violets made of a stiffish material and beside them a thing known as a 'Mädchenfänger' ['girl-catcher'] - and the furniture in the ministerial apartments. It is commonly believed by children that people are struck by anything new. The following scene from my childhood has been described to me, and my memory of the description has taken the place of my memory of the scene itself. It appears that when I was two years old I still occasionally wetted the bed, and when I was reproached for this I consoled my father by promising to buy him a nice new red bed in N., the nearest town of any size. This was the origin of the parenthetical phrase in the dream to the effect that we bought or had to buy the urinal in town: one must keep one's promises. (Notice, too, the juxtaposition in symbolism of the male urinal and the female trunk or box.) This promise of mine exhibited all the megalomania of childhood. We have already come across the significant part played in dreams by children's difficulties in connection with micturition (cf. the dream reported on p. 685). We have also learned from the psycho-analysis of neurotic subjects the intimate connection between bed-wetting and the character trait of ambition. [1900a, 697]

The value of the views put forward by Scherner and Volkelt lies in the fact that they draw attention to a number of characteristics of the content of dreams which call for explanation and seem to promise fresh discoveries. It is perfectly true that dreams contain symbolizations of bodily organs and functions, that water in a dream often points to a urinary stimulus, and that the male genitals can be represented by an upright stick or a pillar, and so on. In the case of dreams in which the field of vision is full of movement and bright colours, in contrast to the drabness of other dreams, it is scarcely possible not to interpret them as 'dreams with a visual stimulus'; nor can one dispute the part played by illusions in the case of dreams characterized by noise and a confusion of voices. Scherner reports a dream of two rows of pretty, fair-haired boys standing opposite each other on a bridge, and of their attacking each other and then going back to their original position, till at last the dreamer saw himself sitting down on a bridge and pulling a long tooth out of his jaw. Similarly Volkelt reports a dream in which two rows of drawers in a cupboard played a part and which once more ended with the dreamer pulling out a tooth. Dream-formations such as these, which are recorded in great numbers by the two authors, forbid our dismissing Scherner's theory as an idle invention without looking for its kernel of truth. The task, then, that faces us is to find an explanation of another kind for the supposed symbolization of what is alleged to be a dental stimulus. [1900a, 706]
It is therefore with quite particular anticipations that we shall attempt to apply our technique of dream-interpretation to these typical dreams; and it is with great reluctance that we shall have to confess that our art disappoints our expectations precisely in relation to this material. If we attempt to interpret a typical dream, the dreamer fails as a rule to produce the associations which would in other cases have led us to understand it, or else his associations become obscure and insufficient so that we cannot solve our problem with their help. We shall learn in a later portion of this work why this is so and how we can make up for this defect in our technique. My readers will also discover why it is that at the present point I am able to deal only with a few members of the group of typical dreams and must postpone my consideration of the rest until this later point in my discussion.

¹ [Footnote added 1925:] This assertion that our method of interpreting dreams cannot be applied unless we have access to the dreamer’s associative material requires supplementing: our interpretative activity is in one instance independent of these associations - if, namely, the dreamer has employed symbolic elements in the content of the dream. In such case we make use of what is, strictly speaking, a second and auxiliary method of dream-interpretation. (See below.)

A 'large party' meant, as we already know, a secret. His brother was simply the representative (introduced into the childhood scene by a 'retrospective phantasy') of all his later rivals for a woman's affection. The episode of the gentleman who abused the King of Italy related once again, via the medium of a recent and in itself indifferent experience, to people of lower rank pushing their way into higher society. It was just as though the child at the breast was being given a warning parallel to the one which Daudet had given to young men.¹

In view of the part played by jokes, quotations, songs and proverbs in the mental life of educated people, it would fully agree with our expectations if disguises of such kinds were used with extreme frequency for representing dream-thoughts. What, for instance, is the meaning in a dream of a number of carts, each filled with a different sort of vegetable? They stand for a wishful contrast to 'Kraut und Rüben', that is to say to 'higgledy-piggledy', and accordingly signify 'disorder.' I am surprised that this dream has only been reported to me once.¹ A dream-symbolism of universal validity has only emerged in the case of a few subjects, on the basis of generally familiar allusions and verbal substitutes. Moreover a good part of this symbolism is shared by dreams with psychoneuroses, legends and popular customs.

¹ [Footnote added 1925:]
Indeed, when we look into the matter more closely, we must recognize the fact that the
dream-work is doing nothing original in making substitutions of this kind. In order to gain its
ends - in this case the possibility of a representation hampered by censorship - it merely follows
the paths which it finds already laid down in the unconscious; and it gives preference to those
transformations of the repressed material which can also become conscious in the form of jokes
or allusions and of which the phantasies of neurotic patients are so full. At this point we
suddenly reach an understanding of Scherner's dream interpretations, whose essential
correctness I have defended elsewhere. The imagination's pre-occupation with the subject's
own body is by no means peculiar to dreams or characteristic only of them. My analyses have
shown me that it is habitually present in the unconscious thoughts of neurotics, and that it is
derived from sexual curiosity, which, in growing youths or girls, is directed to the genitals of the
other sex, and to those of their own as well. Nor, as Scherner and Volkelt have rightly insisted,
is a house the only circle of ideas employed for symbolizing the body; and this is equally true of
dreams and of the unconscious phantasies of neurosis. It is true that I know patients who have
retained an architectural symbolism for the body and the genitals. (Sexual interest ranges far
beyond the sphere of the external genitalia.) For these patients pillars and columns represent
the legs (as they do in the Song of Solomon), every gateway stands for one of the bodily orifices
(a 'hole'), every water-pipe is a reminder of the urinary apparatus, and so on. But the circle of
ideas centring round plant-life or the kitchen may just as readily be chosen to conceal sexual
images.¹ In the former case the way has been well prepared by linguistic usage, itself the
precipitate of imaginative similes reaching back to remote antiquity: e.g. the Lord's vineyard, the
seed, and the maiden's garden in the Song of Solomon. The ugliest as well as the most intimate
details of sexual life may be thought and dreamt of in seemingly innocent allusions to activities
in the kitchen; and the symptoms of hysteria could never be interpreted if we forgot that sexual
symbolism can find its best hiding-place behind what is commonplace and inconspicuous.
There is a valid sexual meaning behind the neurotic child's intolerance of blood or raw meat, or
his nausea at the sight of eggs or macaroni, and behind the enormous exaggeration in neurotics
of the natural human dread of snakes. Wherever neuroses make use of such disguises they are
following paths along which all humanity passed in the earliest periods of civilization - paths of
whose continued existence today, under the thinnest of veils, evidence is to be found in
linguistic usages, superstitions and customs.
[1900a, 815]

I will now append the 'flowery' dream dreamt by one of my women patients which I have
already promised to record. I have indicated in small capitals those elements in it that are to be
given a sexual interpretation. The dreamer quite lost her liking for this pretty dream after it had
been interpreted.
[1900a, 816]

This dream, which I have brought forward on account of its symbolic elements, may be
described as a 'biographical' one. Dreams of this kind occur frequently during psycho-analysis,
but perhaps only rarely outside it.¹
[1900a, 817]

I naturally have at my disposal a superfluity of material of this kind, but to report it would
involve us too deeply in a consideration of neurotic conditions. It all leads to the same
conclusion, namely that there is no necessity to assume that any peculiar symbolizing activity of
the mind is operating in the dream-work, but that dreams make use of any symbolizations which
are already present in unconscious thinking, because they fit in better with the requirements of
dream-construction on account of their representability and also because as a rule they escape
censorship.
[1900a, 817]
The analysis of this last, biographical, dream is clear evidence that I recognized the presence of symbolism in dreams from the very beginning. But it was only by degrees and as my experience increased that I arrived at a full appreciation of its extent and significance, and I did so under the influence of the contributions of Wilhelm Stekel (1911), about whom a few words will not be out of place here.

When we have become familiar with the abundant use made of symbolism for representing sexual material in dreams, the question is bound to arise of whether many of these symbols do not occur with a permanently fixed meaning, like the 'grammalogues' in shorthand; and we shall feel tempted to draw up a new 'dream-book' on the decoding principle. On that point there is this to be said: this symbolism is not peculiar to dreams, but is characteristic of unconscious ideation, in particular among the people, and it is to be found in folklore, and in popular myths, legends, linguistic idioms, proverbial wisdom and current jokes, to a more complete extent than in dreams.

It would therefore carry us far beyond the sphere of dream-interpretation if we were to do justice to the significance of symbols and discuss the numerous, and to a large extent still unsolved, problems attaching to the concept of a symbol.¹ We must restrict ourselves here to remarking that representation by a symbol is among the indirect methods of representation, but that all kinds of indications warn us against lumping it in with other forms of indirect representation without being able to form any clear conceptual picture of their distinguishing features. In a number of cases the element in common between a symbol and what it represents is obvious; in others it is concealed and the choice of the symbol seems puzzling. It is precisely these latter cases which must be able to throw light upon the ultimate meaning of the symbolic relation, and they indicate that it is of a genetic character. Things that are symbolically connected to-day were probably united in prehistoric times by conceptual and linguistic identity.² The symbolic relation seems to be a relic and a mark of former identity. In this connection we may observe how in a number of cases the use of a common symbol extends further than the use of a common language, as was already pointed out by Schubert (1814).³ A number of symbols are as old as language itself, while others (e.g. 'airship', 'Zeppelin') are being coined continuously down to the present time.

² [Footnote added 1925:] This view would be powerfully supported by a theory put forward by Dr. Hans Sperber (1912). He is of the opinion that all primal words referred to sexual things but afterwards lost their sexual meaning though being applied to other things and activities which were compared with the sexual ones.

³ [Added 1914:] For instance, according to Ferenczi, a ship moving on the water occurs in dreams of micturition in Hungarian dreamers, though the term 'schiffen' is unknown in that language. (See also p. 829 f., below.) In dreams of speakers of French and other Romance languages a room is used to symbolize a woman, though these languages have nothing akin to the German expression 'Frauenzimmer.'
Dreams make use of this symbolism for the disguised representation of their latent thoughts. Incidentally, many of the symbols are habitually or almost habitually employed to express the same thing. Nevertheless, the peculiar plasticity of the psychical material must never be forgotten. Often enough a symbol has to be interpreted in its proper meaning and not symbolically; while on other occasions a dreamer may derive from his private memories the power to employ as sexual symbols all kinds of things which are not ordinarily employed as such. If a dreamer has a choice open to him between a number of symbols, he will decide in favour of the one which is connected in its subject-matter with the rest of the material of his thoughts - which, that is to say, has individual grounds for its acceptance in addition to the typical ones.

[1900a, 820]

Though the later investigations since the time of Scherner have made it impossible to dispute the existence of dream symbolism - even Havelock Ellis admits that there can be no doubt that our dreams are full of symbolism - yet it must be confessed that the presence of symbols in dreams not only facilitates their interpretation but also makes it more difficult. As a rule the technique of interpreting according to the dreamer's free associations leaves us in the lurch when we come to the symbolic elements in the dream-content. Regard for scientific criticism forbids our returning to the arbitrary judgement of the dream-interpreter, as it was employed in ancient times and seems to have been revived in the reckless interpretations of Stekel. We are thus obliged, in dealing with those elements of the dream-content which must be recognized as symbolic, to adopt a combined technique, which on the one hand rests on the dreamer's associations and on the other hand fills the gaps from the interpreter's knowledge of symbols. We must combine a critical caution in resolving symbols with a careful study of them in dreams which afford particularly clear instances of their use, in order to disarm any charge of arbitrariness in dream-interpretation. The uncertainties which still attach to our activities as interpreters of dreams spring in part from our incomplete knowledge, which can be progressively improved as we advance further, but in part from certain characteristics of dream symbols themselves. They frequently have more than one or even several meanings, and, as with Chinese script, the correct interpretation can only be arrived at on each occasion from the context. This ambiguity of the symbols links up with the characteristic of dreams for admitting of 'over-interpretation' - for representing in a single piece of content thoughts and wishes which are often widely divergent in their nature.

[1900a, 820]
Subject to these qualifications and reservations I will now proceed. The Emperor and Empress (or the King and Queen) as a rule really represent the dreamer's parents; and a Prince or Princess represents the dreamer himself or herself. But the same high authority is attributed to great men as to the Emperor; and for that reason Goethe, for instance, appears as a father-symbol in some dreams (Hitschmann, 1913.) - All elongated objects, such as sticks, tree-trunks and umbrellas (the opening of these last being comparable to an erection) may stand for the male organ - as well as all long, sharp weapons, such as knives, daggers and pikes. Another frequent though not entirely intelligible symbol of the same thing is a nail-file - possibly on account of the rubbing up and down. - Boxes, cases, chests, cupboards and ovens represent the uterus, and also hollow objects, ships, and vessels of all kinds. - Rooms in dreams are usually women ('Frauenzimmer'); if the various ways in and out of them are represented, this interpretation is scarcely open to doubt.¹ In this connection interest in whether the room is open or locked is easily intelligible. (Cf. Dora's first dream in my 'Fragment of an Analysis of a Case of Hysteria', 1905e.) There is no need to name explicitly the key that unlocks the room; in his ballad of Count Eberstein, Uhland has used the symbolism of locks and keys to construct a charming piece of bawdry. - A dream of going through a suite of rooms is a brothel or harem dream. But, as Sachs has shown by some neat examples, it can also be used (by antithesis) to represent marriage. - We find an interesting link with the sexual researches of childhood when a dreamer dreams of two rooms which were originally one, or when he sees a familiar room divided into two in the dream, or vice versa. In childhood the female genitals and the anus are regarded as a single area - the 'bottom' (in accordance with the infantile 'cloaca theory'); and it is not until later that the discovery is made that this region of the body comprises two separate cavities and orifices. - Steps, ladders or staircases, or, as the case may be, walking up or down them, are representations of the sexual act.² - Smooth walls over which the dreamer climbs, the façades of houses, down which he lowers himself - often in great anxiety - correspond to erect human bodies, and are probably repeating in the dream recollections of a baby's climbing up his parents or nurse. The 'smooth' walls are men; in his fear the dreamer often clutches hold of 'projections' in the façades of houses. Tables, tables laid for a meal, and boards also stand for women - no doubt by antithesis, since the contours of their bodies are eliminated in the symbols. 'Wood' seems, from its linguistic connections, to stand in general for female 'material.' The name of the Island of 'Madeira' means 'wood' in Portuguese. Since 'bed and board' constitute marriage, the latter often takes the place of the former in dreams and the sexual complex of ideas is, so far as may be, transposed on to the eating complex. - As regards articles of clothing, a woman's hat can very often be interpreted with certainty as a genital organ, and, moreover, as a man's. The same is true of an overcoat [German 'Mantel'], though in this case it is not clear to what extent the use of the symbol is due to a verbal assonance. In men's dreams a necktie often appears as a symbol for the penis. No doubt this is not only because neckties are long, dependent objects and peculiar to men, but also because they can be chosen according to taste - a liberty which, in the case of the object symbolized, is forbidden by Nature.³ Men who make use of this symbol in dreams are often very extravagant in ties in real life and own whole collections of them. - It is highly probable that all complicated machinery and apparatus occurring in dreams stand for the genitals (and as a rule male ones - in describing which dream-symbolism is as indefatigable as the 'joke-work.' Nor is there any doubt that all weapons and tools are used as symbols for the male organ: e.g. ploughs, hammers, rifles, revolvers, daggers, sabres, etc.

[1900a, 821]
- In the same way many landscapes in dreams, especially any containing bridges or wooded
  hills, may clearly be recognized as descriptions of the genitals. Marcinowski has published a
  collection of dreams illustrated by their dreamers with drawings that ostensibly represent
  landscapes and other localities occurring in the dreams. These drawings bring out very clearly
  the distinction between a dream's manifest and latent meaning. Whereas to the innocent eye
  they appear as plans, maps, and so on, closer inspection shows that they represent the human
  body, the genitals, etc., and only then do the dreams become intelligible. (See in this connection
  Pfister's papers on cryptograms and puzzle-pictures.) In the case of unintelligible neologisms,
  too, it is worth considering whether they may not be put together from components with a sexual
  meaning.- Children in dreams often stand for the genitals; and, indeed, both men and women
  are in the habit of referring to their genitals affectionately as their 'little ones.' Stekel is right in
  recognizing a 'little brother' as the penis. Playing with a little child, beating it, etc., often
  represent masturbation in dreams. - To represent castration symbolically, the dream-work
  makes use of baldness, hair-cutting, falling out of teeth and decapitation. If one of the ordinary
  symbols for a penis occurs in a dream doubled or multiplied, it is to be regarded as a warding-
  off of castration. The appearance in dreams of lizards - animals whose tails grow again if they
  are pulled off - has the same significance. (Cf. the lizard-dream on p. 525 f.) - Many of the
  beasts which are used as genital symbols in mythology and folklore play the same part in
  dreams: e.g. fishes, snails, cats, mice (on account of the pubic hair), and above all those most
  important symbols of the male organ - snakes. Small animals and vermin represent small
  children - for instance, undesired brothers and sisters. Being plagued with vermin is often a sign
  of pregnancy. - A quite recent symbol of the male organ in dreams deserves mention: the
  airship, whose use in this sense is justified by its connection with flying as well as sometimes by
  its shape.

[1900a, 821]

² [Footnote added 1911:] I will repeat here what I have written on this subject elsewhere (Freud, 1910d):
'A little time ago I heard that a psychologist whose views are somewhat different from ours had remarked
 to one of us that, when all was said and done, we did undoubtedly exaggerate the hidden sexual
 significance of dreams: his own commonest dream was of going upstairs, and surely there could not be
 anything sexual in that. We were put on the alert by this objection, and began to turn our attention to the
 appearance of steps, staircases and ladders in dreams, and were soon in a position to show that
 staircases (and analogous things) were unquestionably symbols of copulation. It is not hard to discover the
 basis of the comparison: we come to the top in a series of rhythmical movements and with increasing
 breathlessness and then, with a few rapid leaps, we can get to the bottom again. Thus the rhythmical
 pattern of copulation is reproduced in going upstairs. Nor must we omit to bring in the evidence of linguistic
 usage. It shows us that "mounting" [German "steigen"] is used as a direct equivalent for the sexual act. We
 speak of a man as a "Steiger" [a "mounter"] and of "nachsteigen" ["to run after", literally "to climb after"]. In
 French the steps on a staircase are called "marches" and "un vieux marcheur" has the same meaning as
 our "ein alter Steiger" ["an old rake"].

[1900a, 821]
According to Stekel, 'right' and 'left' in dreams have an ethical sense. 'The right-hand path always means the path of righteousness and the left-hand one that of crime. Thus "left" may represent homosexuality, incest or perversion, and "right" may represent marriage, intercourse with a prostitute and so on, always looked at from the subject's individual moral stand point.' (Stekel, 1909, 466 ff.) - Relatives in dreams usually play the part of genitals (ibid., 473). I can only confirm this in the case of sons, daughters and younger sisters - that is only so far as they fall into the category of 'little ones.' On the other hand I have come across undoubted cases in which 'sisters' symbolized the breasts and 'brothers' the larger hemispheres. - Stekel explains failing to catch up with a carriage as regret at a difference in age which cannot be caught up with (ibid., 479). - Luggage that one travels with is a load of sin, he says, that weighs one down (loc. cit.). But precisely luggage often turns out to be an unmistakable symbol of the dreamer's own genitals. - Stekel also assigns fixed symbolic meanings to numbers, such as often appear in dreams. But these explanations seem neither sufficiently verified nor generally valid, though his interpretations usually appear plausible in the individual cases. In any case the number three has been confirmed from many sides as a symbol of the male genitals.

One of the generalizations put forward by Stekel concerns the double significance of genital symbols. 'Where', he asks, 'is there a symbol which - provided that the imagination by any means admits of it - cannot be employed both in a male and in a female sense?' In any case the clause in parenthesis removes much of the certainty from this assertion, since in fact the imagination does not always admit of it. But I think it is worth while remarking that in my experience Stekel's generalization cannot be maintained in the face of the greater complexity of the facts. In addition to symbols which can stand with equal frequency for the male and for the female genitals, there are some which designate one of the sexes predominately or almost exclusively, and yet others which are known only with a male or a female meaning. For it is a fact that the imagination does not admit of long, stiff objects and weapons being used as symbols of the female genitals, or of hollow objects, such as chests, cases, boxes, etc., being used as symbols for the male ones. It is true that the tendency of dreams and of unconscious phantasies to employ sexual symbols bisexually betrays an archaic characteristic; for in childhood the distinction between the genitals of the two sexes is unknown and the same kind of genitals are attributed to both of them. But it is possible, too, to be misled into wrongly supposing that a sexual symbol is bisexual, if one forgets that in some dreams there is a general inversion of sex, so that what is male is represented as female and vice versa. Dreams of this kind may, for instance, express a woman's wish to be a man.

The genitals can also be represented in dreams by other parts of the body: the male organ by a hand or a foot and the female genital orifice by the mouth or an ear or even an eye. The secretions of the human body - mucus, tears, urine, semen, etc. - can replace one another in dreams. This last assertion of Stekel's, which is on the whole correct, has been justifiably criticized by Reitler (1913b) as requiring some qualification: what in fact happens is that significant secretions, such as semen, are replaced by indifferent ones.
I shall now append a few examples of the use of these symbols in dreams, with the idea of showing how impossible it becomes to arrive at the interpretation of a dream if one excludes dream-symbolism, and how irresistibly one is driven to accept it in many cases. At the same time, however, I should like to utter an express warning against over-estimating the importance of symbols in dream-interpretation, against restricting the work of translating dreams merely to translating symbols and against abandoning the technique of making use of the dreamer's associations. The two techniques of dream-interpretation must be complementary to each other; but both in practice and in theory the first place continues to be held by the procedure which I began by describing and which attributes a decisive significance to the comments made by the dreamer, while the translation of symbols, as I have explained it, is also at our disposal as an auxiliary method.

Since nothing occurred to her in connection with the hat in the dream, I said: 'No doubt the hat was a male genital organ, with its middle-piece sticking up and its two side-pieces hanging down. It may seem strange, perhaps, that a hat should be a man, but you will remember the phrase "Unter die Haube kommen" ["to find a husband" (literally "to come under the cap").] I intentionally gave her no interpretation of the detail about the two side-pieces hanging down unevenly; though it is precisely details of this kind that must point the way in determining an interpretation. I went on to say that as she had a husband with such fine genitals there was no need for her to be afraid of the officers - no need, that is, for her to wish for anything from them, since as a rule she was prevented from going for a walk unprotected and unaccompanied owing to her phantasies of being seduced. I had already been able to give her this last explanation of her anxiety on several occasions upon the basis of other material.

Her mother sent her little daughter away, so that she had to go by herself. Then she went in a train with her mother and saw her little one walk straight on to the rails so that she was bound to be run over. She heard the cracking of her bones. (This produced an uncomfortable feeling in her but no real horror.) Then she looked round out of the window of the railway-carriage to see whether the parts could no be seen behind. Then she reproached her mother for having made the little one go by herself.
ANALYSIS. - It is no easy matter to give a complete interpretation of the dream. It formed part of a cycle of dreams and can only be fully understood if it is taken in connection with the others. There is difficulty in obtaining in sufficient isolation the material necessary for establishing the symbolism. - In the first place, the patient declared that the train journey was to be interpreted historically, as an allusion to a journey she had taken when she was leaving a sanatorium for nervous diseases, with whose director, needless to say, she had been in love. Her mother had fetched her away, and the doctor had appeared at the station and handed her a bouquet of flowers as a parting present. It had been very awkward that her mother should have witnessed this tribute. At this point, then, her mother figured as interfering with her attempts at a love affair; and this had in fact been the part played by that severe lady during the patient's girlhood. - Her next association related to the sentence: 'she looked round to see whether the parts could not be seen from behind.' - - The façade of the dream would of course lead one to think of the parts of her little daughter who had been run over and mangled. But her association led in quite another direction. She recollected having once seen her father naked in the bath room from behind; - she went on to talk of the distinctions between the sexes, and laid stress on the fact that a man's genitals can be seen even from behind but a woman's cannot. In this connection she herself interpreted 'the little one' as meaning the genitals and 'her little one' - she had a four-year-old daughter - as her own genitals. She reproached her mother with having expected her to live as though she had no genitals, and pointed out that the same reproach was expressed in the opening sentence of the dream: 'her mother sent her little one away, so that she had to go by herself.' In her imagination 'going by herself in the streets' meant not having a man, not having any sexual relations ('coire' in Latin means literally 'to go with') - - and she disliked that. Her accounts all went to show that when she was a girl she had in fact suffered from her mother's jealousy owing to the preference shown her by her father.

The deeper interpretation of this dream was shown by another dream of the same night, in which the dreamer identified herself with her brother. She had actually been a boyish girl, and had often been told that she should have been a boy. This identification with her brother made it particularly clear that 'the little one' meant a genital organ. Her mother was threatening him (or her) with castration, which could only have been a punishment for playing with her penis; thus the identification also proved that she herself had masturbated as a child - a memory which till then she had only had as applied to her brother. The information supplied by the second dream showed that she must have come to know about the male organ at an early age and have afterwards forgotten it. Further, the second dream alluded to the infantile sexual theory according to which girls are boys who have been castrated. When I suggested to her that she had had this childish belief, she at once confirmed the fact by telling me that she had heard the anecdote of the little boy's saying to the little girl: 'Cut off?' and of the little girl's replying: 'No, always been like that.'

The fact that 'being run over' symbolizes sexual intercourse would not be obvious from this dream, though it has been confirmed from many other sources.
He was going for a walk with his father in a place which must certainly have been the Prater, since he saw the ROTUNDA, with a SMALL ANNEX IN FRONT OF IT to which A CAPTIVE BALLOON was attached, though it looked rather LIMP. His father asked him what all this was for; he was surprised at his asking, but explained it to him. Then they came into a courtyard which had a large sheet laid out in it. His father wanted to PULL OFF a large piece of it, but first looked around to see if anyone was watching. He told him that he need only tell the foreman and he could take some without any bother. A STAIRCASE led down from this yard into A SHAFT, whose walls were cushioned in some soft material, rather like a leather armchair. The end of the shaft was a longish platform and then another SHAFT started . . .

[1900a, 826]

The courtyard in which the sheet of tin was spread out is not to be taken symbolically in the first instance. It was derived from the business premises of the dreamer's father. For reasons of discretion I have substituted 'tin' for another material in which his father actually dealt: but I have made no other change in the wording of the dream. The dreamer had entered his father's business and had taken violent objection to the somewhat dubious practices on which the firm's earnings in part depended. Consequently the dream-thought I have just interpreted may have continued in this way: 'If I had asked him, he would have deceived me just as he deceives his customers.' As regards the 'pulling off' which served to represent his father's dishonesty in business, the dreamer himself produced a second explanation - namely that it stood for masturbating. Not only was I already familiar with this interpretation (see p. 817 n. above), but there was something to confirm it in the fact that the secret nature of masturbation was represented by its reverse: it might be done openly. Just as we should expect, the masturbatory activity was once again displaced on to the dreamer's father, like the questioning in the first scene of the dream. He promptly interpreted the shaft as a vagina, having regard to the soft cushioning of its walls. I added from my own knowledge derived elsewhere that climbing down, like climbing up in other cases, described sexual intercourse in the vagina. (See my remarks, quoted above, p. 821 n.)

[1900a, 827]

(The dream of an uneducated woman whose husband was a policeman, reported by B. Dattner.)

[1900a, 828]

Then someone broke into the house and she was frightened and called out for a policeman. But he had quietly gone into a church ¹, to which a number of steps ² led up, accompanied by two tramps. Behind the church there was a hill ³ and above it a thick wood. The policeman was dressed in a helmet, brass collar and cloak.⁵ He had a brown beard. The two tramps, who went along peaceably with the policeman, had sack-like aprons tied around their middles. In front of the church a path led up to the hill; on both sides of it there grew grass and brushwood, which became thicker and thicker and, at the top of the hill, turned into a regular wood.'

[1900a, 828]

It is fair to say that there is no group of ideas that is incapable of representing sexual facts and wishes.

[1900a, 832]
The failure of the dreamer's associations gave us a right to attempt an interpretation by symbolic substitution. The two pears - *pommes ou poires* - were his mother's breasts which had given him nourishment; the window-sill was the projection formed by her bosom - like balconies in dreams of houses (see p. 821). His feeling of reality after waking was justified, for his mother had really suckled him, and had done so, in fact, for far longer than the usual time and his mother's breast was still available to him. The dream must be translated: 'Give (or show) me your breast again, Mother, that I used to drink from in the past.' 'In the past' was represented by his eating one of the pears; 'again' was represented by his longing for the other. The temporal repetition of an act is regularly shown in dreams by the numerical multiplication of an object.

It is most remarkable, of course, that symbolism should already be playing a part in the dream of a four-year-old child. But this is the rule and not the exception. It may safely be asserted that dreamers have symbolism at their disposal from the very first.

The following uninfluenced recollection by a lady who is now twenty-seven shows at what an early age symbolism is employed outside dream-life as well as inside it. She was between three and four years old. Her nurse-maid took her to the lavatory along with a brother eleven months her junior and a girl cousin of an age between the other two, to do their small business before going out for a walk. Being the eldest, she sat on the seat, while the other two sat on chambers. She asked her cousin: 'Have you got a purse too? Walter's got a little sausage; I've got a purse.' Her cousin replied: 'Yes, I've got a purse too.' The nurse-maid heard what they said with much amusement and reported the conversation to the children's mother, who reacted with a sharp reprimand.

I will here interpolate a dream (recorded in a paper by Alfred Robitsek, 1912) in which the beautifully chosen symbolism made an interpretation possible with only slight assistance from the dreamer.

'One objection which is frequently brought forward by opponents of psycho-analysis, and which has lately been voiced by Havelock Ellis (1911, 168), argues that though dream-symbolism may perhaps occur as a product of the neurotic mind, it is not to be found in normal persons. Now psycho-analytic research finds no fundamental, but only quantitative, distinctions between normal and neurotic life; and indeed the analysis of dreams, in which repressed complexes are operative alike in the healthy and the sick, shows a complete identity both in their mechanisms and in their symbolism. The naive dreams of healthy people actually often contain a much simpler, more perspicuous and more characteristic symbolism than those of neurotics; for in the latter, as a result of the more powerful workings of the censorship and of the consequently more far-reaching dream-distortion, the symbolism may be obscure and hard to interpret. The dream recorded below will serve to illustrate this fact. It was dreamt by a girl who is not neurotic but is of a somewhat prudish and reserved character. In the course of conversation with her I learnt that she was engaged, but that there were some difficulties in the way of her marriage which were likely to lead to its postponement. Of her own accord she told me the following dream.
At this point I shall interpose a dream dreamt by a contemporary historical figure. I am doing so because in it an object that would in any case appropriately represent a male organ has a further attribute which established it in the clearest fashion as a phallic symbol. The fact of a riding whip growing to an endless length could scarcely be taken to mean anything but an erection. Apart from this, too, the dream is an excellent instance of the way in which thoughts of a serious kind, far removed from anything sexual, can come to be represented by infantile sexual material.

It would seem that the occurrence of sexual symbolism in dreams has already been experimentally confirmed by some work carried out by K. Schröter, on lines proposed by H. Swoboda. Subjects under deep hypnosis were given suggestions by Schröter, and these led to the production of dreams a large part of whose content was determined by the suggestions. If he gave a suggestion that the subject should dream of normal or abnormal sexual intercourse, the dream, in obeying the suggestion, would make use of symbols familiar to us from psychoanalysis in place of the sexual material. For instance, when a suggestion was made to a female subject that she should dream of having homosexual intercourse with a friend, the friend appeared in the dream carrying a shabby hand-bag with a label stuck on to it bearing the words "Ladies only." The woman who dreamt this was said never to have had any knowledge of symbolism in dreams or of their interpretation. Difficulties are, however, thrown in the way of our forming an opinion of the value of these interesting experiments by the unfortunate circumstance that Dr. Schröter committed suicide soon after making them. The only record of them is to be found in a preliminary communication published in the Zentralblatt für Psychoanalyse (Schrötter, 1912).

Similar findings were published by Roffenstein in 1923. Some experiments made by Betlheim and Hartmann (1924) were of particular interest, since they made no use of hypnosis. These experimenters related anecdotes of a coarsely sexual character to patients suffering from Korsakoff's syndrome and observed the distortions which occurred when the anecdotes were reproduced by the patients in these confusional states. They found that the symbols familiar to us from the interpretation of dreams made their appearance (e.g. going upstairs, stabbing and shooting as symbols of copulation, and knives and cigarettes as symbols of the penis). The authors attached special importance to the appearance of the symbol of a staircase, for, as they justly observed, 'no conscious desire to distort could have arrived at a symbol of such a kind.'

It is only now, after we have properly assessed the importance of symbolism in dreams, that it becomes possible for us to take up the theme of typical dreams, which was broken off on p. 541 above. I think we are justified in dividing such dreams roughly into two classes: those which really always have the same meaning, and those which, in spite of having the same or a similar content, must nevertheless be interpreted in the greatest variety of ways. Among typical dreams of the first class I have already dealt in some detail with examination dreams.

Dreams of missing a train deserve to be put alongside examination dreams on account of the similarity of their affect, and their explanation shows that we shall be right in doing so. They are dreams of consolation for another kind of anxiety felt in sleep - the fear of dying. 'Departing' on a journey is one of the commonest and best authenticated symbols of death. These dreams say in a consoling way: 'Don't worry, you won't die (depart)'; just as examination dreams say soothingly: 'Don't be afraid, no harm will come to you this time either.' The difficulty of understanding both these kinds of dreams is due to the fact that the feeling of anxiety is attached precisely to the expression of consolation.
I have already shown elsewhere that strikingly innocent dreams may embody crudely erotic
wishes, and I could confirm this by many new instances. But it is also true that many dreams
which appear to be indifferent and which one would not regard as in any respect peculiar lead
back on analysis to wishful impulses which are unmistakably sexual and often of an unexpected
sort. Who, for instance, would have suspected the presence of a sexual wish in the following
dream before it had been interpreted? The dreamer gave this account of it: Standing back a
little behind two stately palaces was a little house with closed doors. My wife led me along the
piece of street up to the little house and pushed the door open; I then slipped quickly and easily
into the inside of a court which rose in an incline. Anyone, however, who has had a little
experience in translating dreams will at once reflect that penetrating into narrow spaces and
opening closed doors are among the commonest sexual symbols, and will easily perceive in this
dream a representation of an attempt at coitus a tergo (between the two stately buttocks of the
female body). The narrow passage rising in an incline stood, of course, for the vagina. The
assistance attributed by the dreamer to his wife forces us to conclude that in reality it was only
consideration for her that restrained the dreamer from making attempts of this kind. It turned out
that on the dream-day a girl had come to live in the dreamer's household who had attracted him
and had given him the impression that she would raise no great objections to an approach of
that kind. The little house between the two palaces was a reminiscence of the Hradshin in
Prague and was a further reference to the same girl, who came from that place.
[1900a, 854]

¹ [Footnote added 1911:] I have published elsewhere a typical example of a disguised Oedipus dream of
this kind. [Reprinted below.] Another example, with a detailed analysis, has been published by Otto Rank
(1911a). - [Added 1914:] For some other disguised Oedipus dreams, in which eye-symbolism is prominent,
see Rank (1913). Other papers on eye-dreams and eye-symbolism, by Eder, Ferenczi and Reitler will be
found in the same place. The blinding in the legend of Oedipus, as well as elsewhere, stands for
castation. - [Added 1911:] Incidentally, the symbolic interpretation of undisguised Oedipus dreams was
not unknown to the ancients. Rank (1910, 534) writes: 'Thus Julius Caesar is reported to have had a
dream of sexual intercourse with his mother which was explained by the dream-interpreters as a
favourable augury for his taking possession of the earth (Mother Earth). The oracle given to the Tarquins is
equally well known, which prophesied that the conquest of Rome would fall to that one of them who should
first kiss his mother ("osculum matri tulerit"). This was interpreted by Brutus as referring to Mother Earth.
("Terram osculo contigit, scilicet quod ea communis mater omnium mortalium esset" Livy, I, 56.)' - [Added
1914:] Compare in this connection the dream of Hippias reported by Herodotus (VI, 107): 'As for the
Persians, they were guided to Marathon by Hippias son of Pisistratus. Hippias in the past night had seen a
vision in his sleep wherein he thought that he lay with his own mother; he interpreted this dream to signify
that he should return to Athens and recover his power, and so die an old man in his own mother-country.'
- [Added 1911:] These myths and interpretations reveal a true psychological insight. I have found that
people who know that they are preferred or favoured by the mother give evidence in their lives of a
peculiar self-reliance and an unshakeable optimism which often seem like heroic attributes and bring
actual success to their possessors.
[1900a, 855]

In some dreams of landscapes or other localities emphasis is laid in the dream itself on a
convinced feeling of having been there once before. (Occurrences of 'déjà vu' in dreams have a
special meaning.) These places are invariably the genitals of the dreamer's mother; there is
indeed no other place about which one can assert with such conviction that one has been there
once before.
[1900a, 856]
This is an appropriate point at which to return to a topic that was broken off in an earlier chapter (p. 716): the problem of the part played in the formation of dreams by organic stimuli which disturb sleep. Dreams which come about under their influence openly exhibit not only the usual tendency to wish-fulfilment and to serving the end of convenience, but very often a perfectly transparent symbolism as well; for it not infrequently happens that a stimulus awakens a dreamer after a vain attempt has been made to deal with it in a dream under a symbolic disguise. This applies to dreams of emission or orgasm as well as to those provoked by a need to micturate or defaecate. 'The peculiar nature of emission dreams not only puts us in a position to reveal directly certain sexual symbols which are already known as being typical, but which have nevertheless been violently disputed; it also enables us to convince ourselves that some apparently innocent situations in dreams are no more than a symbolic prelude to crudely sexual scenes. The latter are as a rule represented undisguisedly in the relatively rare emission dreams, whereas they culminate often enough in anxiety dreams, which have the same result of awakening the sleeper.'

The symbolism of dreams with a urinary stimulus is especially transparent and has been recognized from the earliest times. The view was already expressed by Hippocrates that dreams of fountains and springs indicate a disorder of the bladder (Havelock Ellis). Scherner studied the multiplicity of the symbolism of urinary stimuli and asserted that 'any urinary stimulus of considerable strength invariably passes over into stimulation of the sexual regions and symbolic representations of them. . . . Dreams with a urinary stimulus are often at the same time representatives of sexual dreams.'

Dreams with an intestinal stimulus throw light in an analogous fashion on the symbolism involved in them, and at the same time confirm the connection between gold and faeces which is also supported by copious evidence from social anthropology. (See Freud, 1908b; Rank, 1912a; Dattner, 1913; and Reik, 1915.) 'Thus, for instance, a woman who was receiving medical treatment for an intestinal disorder dreamt of someone who was burying a treasure in the neighbourhood of a little wooden hut which looked like a rustic out-door closet. There was a second part to the dream in which she was wiping the behind of her little girl who had dirtied herself.'

(6) A man dreamt that he was an officer sitting at a table opposite the Emperor. This meant that he was putting himself in opposition to his father.

[1900a, 858]

[1900a, 859]

[1900a, 864]
It is not surprising that a person undergoing psycho-analytic treatment should often dream of it and be led to give expression in his dreams to the many thoughts and expectations to which the treatment gives rise. The imagery most frequently chosen to represent it is that of a journey, usually by motor-car, as being a modern and complicated vehicle. The speed of the car will then be used by the patient as an opportunity for giving vent to ironical comments. -If 'the unconscious', as an element in the subject's waking thoughts, has to be represented in a dream, it may be replaced very appropriately by subterranean regions. -These, where they occur without any reference to analytic treatment, stand for the female body or the womb. -'Down below' in dreams often relates to the genitals, 'up above', on the contrary, to the face, mouth or breast. -Wild beasts are as a rule employed by the dream-work to represent passionate impulses of which the dreamer is afraid, whether they are his own or those of other people. (It then needs only a slight displacement for the wild beasts to come to represent the people who are possessed by these passions. We have not far to go from here to cases in which a dreaded father is represented by a beast of prey or a dog or wild horse - a form of representation recalling totemism.) It might be said that the wild beasts are used to represent the libido, a force dreaded by the ego and combated by means of repression. It often happens, too, that the dreamer separates off his neurosis, his 'sick personality', from himself and depicts it as an independent person.

Without any assistance he interpreted tearing down the strip ['Leiste'] as a great achievement ['Leistung']. He was escaping from his uncomfortable situation (in the treatment) by tearing himself out of his feminine attitude . . . . The absurd detail of the strip of wood not simply breaking but splitting lengthways was explained thus: the dreamer recalled that this combination of doubling and destroying was an allusion to castration. Dreams very often represent castration by the presence of two penis symbols as the defiant expression of an antithetical wish. Incidentally, the 'Leiste' ['groin'] is a part of the body in the neighbourhood of the genitals. The dreamer summed up the interpretation of the dream as meaning that he had got the better of the threat of castration which had led to his adopting a feminine attitude.

Now that the old antithesis between conscious life and dream life has been reduced to its proper proportions by the establishment of unconscious psychical reality, a number of dream-problems with which earlier writers were deeply concerned have lost their significance. Thus some of the activities whose successful performance in dreams excited astonishment are now no longer to be attributed to dreams but to unconscious thinking, which is active during the day no less than at night. If, as Scherner has said, dreams appear to engage in making symbolic representations of the body, we now know that those representations are the product of certain unconscious phantasies (deriving, probably, from sexual impulses) which find expression not only in dreams but also in hysterical phobias and other symptoms. If a dream carries on the activities of the day and completes them and even brings valuable fresh ideas to light, all we need do is to strip it of the dream disguise, which is the product of dream-work and the mark of assistance rendered by obscure forces from the depths of the mind (cf. the Devil in Tartini's sonata dream); the intellectual achievement is due to the same mental forces which produce every similar result during the daytime. We are probably inclined greatly to over-estimate the conscious character of intellectual and artistic production as well. Accounts given us by some of the most highly productive men, such as Goethe and Helmholtz, show rather that what is essential and new in their creations came to them without premeditation and as an almost ready-made whole. There is nothing strange if in other cases, where a concentration of every intellectual faculty was needed, conscious activity also contributed its share. But it is the much-abused privilege of conscious activity, wherever it plays a part, to conceal every other activity from our eyes.
There is only one method by which a dream which expresses erotic wishes can succeed in appearing innocently non-sexual in its manifest content. The material of the sexual ideas must not be represented as such, but must be replaced in the content of the dream by hints, allusions and similar forms of indirect representation. But, unlike other forms of indirect representation, that which is employed in dreams must not be immediately intelligible. The modes of representation which fulfil these conditions are usually described as 'symbols' of the things which they represent. Particular interest has been directed to them since it has been noticed that dreamers speaking the same language make use of the same symbols, and that in some cases, indeed, the use of the same symbols extends beyond the use of the same language. Since dreamers themselves are unaware of the meaning of the symbols they use, it is difficult at first sight to discover the source of the connection between the symbols and what they replace and represent. The fact itself, however, is beyond doubt, and it is important for the technique of dream-interpretation. For, with the help of a knowledge of dream-symbolism, it is possible to understand the meaning of separate elements of the content of a dream or separate pieces of a dream or in some cases even whole dreams, without having to ask the dreamer for his associations. Here we are approaching the popular ideal of translating dreams and on the other hand are returning to the technique of interpretation used by the ancients, to whom dream-interpretation was identical with interpretation by means of symbols.

Although the study of dream-symbols is far from being complete, we are in a position to lay down with certainty a number of general statements and a quantity of special information on the subject. There are some symbols which bear a single meaning almost universally: thus the Emperor and Empress (or the King and Queen) stand for the parents, rooms represent women¹ and their entrances and exits the openings of the body. The majority of dream-symbols serve to represent persons, parts of the body and activities invested with erotic interest; in particular, the genitals are represented by a number of often very surprising symbols, and the greatest variety of objects are employed to denote them symbolically. Sharp weapons, long and stiff objects, such as tree-trunks and sticks, stand for the male genital; while cupboards, boxes, carriages or ovens may represent the uterus. In such cases as these the tertium comparationis, the common element in these substitutions, is immediately intelligible; but there are other symbols in which it is not so easy to grasp the connection. Symbols such as a staircase or going upstairs to represent sexual intercourse, a tie or cravat for the male organ, or wood for the female one, provoke our unbelief until we can arrive at an understanding of the symbolic relation underlying them by some other means. Moreover a whole number of dream-symbols are bisexual and can relate to the male or female genitals according to the context.

Some symbols are universally disseminated and can be met with in all dreamers belonging to a single linguistic or cultural group; there are others which occur only within the most restricted and individual limits, symbols constructed by an individual out of his own ideational material. Of the former class we can distinguish some whose claim to represent sexual ideas is immediately justified by linguistic usage (such, for instance, as those derived from agriculture, e.g. 'fertilization' or 'seed') and others whose relation to sexual ideas appears to reach back into the very earliest ages and to the most obscure depths of our conceptual functioning. The power of constructing symbols has not been exhausted in our own days in the case of either of the two sorts of symbols which I have distinguished at the beginning of this paragraph. Newly discovered objects (such as airships) are, as we may observe, at once adopted as universally available sexual symbols.
It would, incidentally, be a mistake to expect that if we had a still profounder knowledge of dream-symbolism (of the 'language of dreams') we could do without asking the dreamer for his associations to the dream and go back entirely to the technique of dream-interpretation of antiquity. Quite apart from individual symbols and oscillations in the use of universal ones, one can never tell whether any particular element in the content of a dream is to be interpreted symbolically or in its proper sense, and one can be certain that the whole content of a dream is not to be interpreted symbolically. A knowledge of dream-symbolism will never do more than enable us to translate certain constituents of the dream-content, and will not relieve us of the necessity for applying the technical rules which I gave earlier. It will, however, afford the most valuable assistance to interpretation precisely at points at which the dreamer's associations are insufficient or fail altogether. [1901a, 1096]

Dream-symbolism is also indispensable to an understanding of what are known as 'typical' dreams, which are common to everyone, and of 'recurrent' dreams in individuals. [1901a, 1097]

If the account I have given in this short discussion of the symbolic mode of expression in dreams appears incomplete, I can justify my neglect by drawing attention to one of the most important pieces of knowledge that we possess on this subject. Dream-symbolism extends far beyond dreams: it is not peculiar to dreams, but exercises a similar dominating influence on representation in fairy-tales, myths and legends, in jokes and in folk-lore. It enables us to trace the intimate connections between dreams and these latter productions. We must not suppose that dream-symbolism is a creation of the dream-work; it is in all probability a characteristic of the unconscious thinking which provides the dream-work with the material for condensation, displacement and dramatization.¹ [1901a, 1097]

¹ [Footnote added 1924:] Anyone who is interested in the mental life of these years of childhood will find it easy to guess the deeper determinant of the demand made on the big brother. The child of not yet three had understood that the little sister who had recently arrived had grown inside his mother. He was very far from approving of this addition to the family, and was full of mistrust and anxiety that his mother's inside might conceal still more children. The wardrobe or cupboard was a symbol for him of his mother's inside. So he insisted on looking into this cupboard, and turned for this to his big brother, who (as is clear from other material) had taken his father's place as the child's rival. Besides the well-founded suspicion that this brother had had the lost nurse 'boxed up', there was a further suspicion against him - namely that he had in some way introduced the recently born baby into his mother's inside. The affect of disappointment when the cupboard was found to be empty derived, therefore, from the superficial motivation for the child's demand. As regards the deeper trend of thought, the affect was in the wrong place. On the other hand, his great satisfaction over his mother's slimness on her return can only be fully understood in the light of this deeper layer. [1901b, 1143]

We shall not be surprised if an object of such rich symbolic meaning as a ring should be made to play a part in some significant parapraxes, even where it does not, in the form of a wedding ring or an engagement ring, mark an erotic tie. The following example of an occurrence of this sort has been put at my disposal by Dr. M. Kardos: [1901b, 1282]

³ I suspected, though I did not as yet say so to Dora, that she had seized upon this element on account of a symbolic meaning which it possessed. 'Zimmer' ['room'] in dreams stands very frequently for 'Frauenzimmer' [a slightly derogatory word for 'woman'; literally, 'women's apartments']. The question whether a woman is 'open' or 'shut' can naturally not be a matter of indifference. It is well known, too, what sort of 'key' effects the opening in such a case. [1905e, 1403]
'Then a return-present would have been very appropriate. Perhaps you do not know that "jewel-case" ["Schmuckkästchen"] is a favourite expression for the same thing that you alluded to not long ago by means of the reticule you were wearing³ - for the female genitals, I mean.'

[1905e, 1406]

But a still further displacement had to be effected before this material appeared in the dream. Though 'drops' is nearer to the original 'wet', it was the more distant 'jewellery' that found a place in the dream. When, therefore, this element had been inserted into the dream-situation which had already been established, the account might have run: 'Mother wanted to stop and save her jewellery.' But a subsequent influence now made itself felt, and led to the further alteration of 'jewellery' into 'jewel-case'. This influence came from elements in the underlying group relating to the temptation offered by Herr K. He had never given her jewellery, but he had given her a 'case' for it, which meant for her all the marks of preference and all the tenderness for which she felt she ought now to have been grateful. And the composite word thus formed, 'jewel-case', had beyond this a special claim to be used as a representative element in the dream. Is not 'jewel-case' ['Schmuckkästen'] a term commonly used to describe female genitals that are immaculate and intact? And is it not, on the other hand, an innocent word? Is it not, in short, admirably calculated both to betray and to conceal the sexual thoughts that lie behind the dream?

[1905e, 1427]

There could be no doubt that these associations really belonged to the material concerned in forming the dream. They included portions which reappeared in the dream unchanged ('she declined and went alone' and 'two hours'). I may remark at once that 'pictures' was a nodal point in the network of her dream-thoughts (the pictures in the album, the pictures at Dresden). I should also like to single out, with a view to subsequent investigation, the theme of the 'Madonna', of the virgin mother. But what was most evident was that in this first part of the dream she was identifying herself with a young man. This young man was wandering about in a strange place, he was striving to reach a goal, but he was being kept back, he needed patience and must wait. If in all this she had been thinking of the engineer, it would have been appropriate for the goal to have been the possession of a woman, of herself. But instead of this it was - a station. Nevertheless, the relation of the question in the dream to the question which had been put in real life allows us to substitute 'box' for 'station'. A box and a woman: the notions begin to agree better.

[1905e, 1432]

'Where is the key?' seems to me to be the masculine counterpart to the question 'Where is the box?'³ They are therefore questions referring to - the genitals.

[1905e, 1433]
At this point a certain suspicion of mine became a certainty. The use of 'Bahnhof' ['station'; literally, 'railway-court'] and 'Friedhof' ['cemetery'; literally, 'peace-court'] to represent the female genitals was striking enough in itself, but it also served to direct my awakened curiosity to the similarly formed 'Vorhof' ['vestibulum'; literally, 'fore-court'] - an anatomical term for a particular region of the female genitals. This might have been no more than mistaken ingenuity. But now, with the addition of 'nymphs' visible in the background of a 'thick wood', no further doubts could be entertained. Here was a symbolic geography of sex! 'Nymphae', as is known to physicians though not to laymen (and even by the former the term is not very commonly used), is the name given to the labia minora, which lie in the background of the 'thick wood' of the pubic hair. But any one who employed such technical names as 'vestibulum' and 'nymphae' must have derived his knowledge from books, and not from popular ones either, but from anatomical text-books or from an encyclopaedia - the common refuge of youth when it is devoured by sexual curiosity. If this interpretation were correct, therefore, there lay concealed behind the first situation in the dream a phantasy of defloration, the phantasy of a man seeking to force an entrance into the female genitals.²

Moreover, a 'station' is used for purposes of 'Verkehr' ['traffic', intercourse', 'sexual intercourse']: this fact determines the psychical coating in a number of cases of railway phobia.

It was not really possible to regard this state as a purely hysterical one. Although hysterical fever does undoubtedly occur, yet it seemed too arbitrary to put down the fever accompanying this questionable illness to hysteria instead of to some organic cause operative at the time. I was on the point of abandoning the track, when she herself helped me along it by producing her last addendum to the dream: she saw herself particularly distinctly going up the stairs.

In other cases the replacement of the object by a fetish is determined by a symbolic connection of thought, of which the person concerned is usually not conscious. It is not always possible to trace the course of these connections with certainty (The foot, for instance, is an age-old sexual symbol which occurs even in mythology;¹ no doubt the part played by fur as a fetish owes its origin to an association with the hair of the mons Veneris.) None the less even symbolism such as this is not always unrelated to sexual experiences in childhood.²

¹ [Footnote added 1910:] The shoe or slipper is a corresponding symbol of the female genitals.

² [Footnote added 1910:] When the account which I have given above of infantile sexuality was first published in 1905, it was founded for the most part on the results of psycho-analytic research upon adults. At that time it was impossible to make full use of direct observation on children: only isolated hints and some valuable pieces of confirmation came from that source. Since then it has become possible to gain direct insight into infantile psycho-sexuality by the analysis of some cases of neurotic illness during the early years of childhood. It is gratifying to be able to report that direct observation has fully confirmed the conclusions arrived at by psycho-analysis - which is incidentally good evidence of the trustworthiness of that method of research. In addition to this, the 'Analysis of a Phobia in a Five-Year-Old Boy' (1909b) has taught us much that is new for which we have not been prepared by psycho-analysis: for instance, the fact that sexual symbolism - the representation of what is sexual by non-sexual objects and relations - extends back into the first years of possession of the power of speech.
MECHANICAL EXCITATIONS  At this point we must also mention the production of sexual excitement by rhythmic mechanical agitation of the body. Stimuli of this kind operate in three different ways: on the sensory apparatus of the vestibular nerves, on the skin, and on the deeper parts (e.g. the muscles and articular structures). The existence of these pleasurable sensations - and it is worth emphasizing the fact that in this connection the concepts of 'sexual excitation' and 'satisfaction' can to a great extent be used without distinction, a circumstance which we must later endeavour to explain - the existence, then, of these pleasurable sensations, caused by forms of mechanical agitation of the body, is confirmed by the fact that children are so fond of games of passive movement, such as swinging and being thrown up into the air, and insist on such games being incessantly repeated.¹ It is well known that rocking is habitually used to induce sleep in restless children. The shaking produced by driving in carriages and later by railway-travel exercises such a fascinating effect upon older children that every boy, at any rate, has at one time or other in his life wanted to be an engine driver or a coachman. It is a puzzling fact that boys take such an extraordinarily intense interest in things connected with railways, and, at the age at which the production of phantasies is most active (shortly before puberty), use those things as the nucleus of a symbolism that is peculiarly sexual. A compulsive link of this kind between railway-travel and sexuality is clearly derived from the pleasurable character of the sensations of movement. In the event of repression, which turns so many childish preferences into their opposite, these same individuals, when they are adolescents or adults, will react to rocking or swinging with a feeling of nausea, will be terribly exhausted by a railway journey, or will be subject to attacks of anxiety on the journey and will protect themselves against a repetition of the painful experience by a dread of railway-travel.

[1905d, 1520]

If anyone is inclined to turn away in horror from this depravity of the childish heart or feels tempted, indeed, to dispute the possibility of such things, he should observe that these works of fiction, which seem so full of hostility, are none of them really so badly intended, and that they still preserve, under a slight disguise, the child's original affection for his parents. The faithlessness and ingratitude are only apparent. If we examine in detail the commonest of these imaginative romances, the replacement of both parents or of the father alone by grander people, we find that these new and aristocratic parents are equipped with attributes that are derived entirely from real recollections of the actual and humble ones; so that in fact the child is not getting rid of his father but exalting him. Indeed the whole effort at replacing the real father by a superior one is only an expression of the child's longing for the happy, vanished days when his father seemed to him the noblest and strongest of men and his mother the dearest and loveliest of women. He is turning away from the father whom he knows to-day to the father in whom he believed in the earlier years of his childhood; and his phantasy is no more than the expression of a regret that those happy days have gone. Thus in these phantasies the overvaluation that characterizes a child's earliest years comes into its own again. An interesting contribution to this subject is afforded by the study of dreams. We learn from their interpretation that even in later years, if the Emperor and Empress appear in dreams, those exalted personages stand for the dreamer's father and mother.¹ So that the child's overvaluation of his parents survives as well in the dreams of normal adults.

[1909c, 1990]
In elucidating the effects produced by the captain's rat story we must follow the course of the analysis more closely. The patient began by producing an enormous mass of associative material, which at first, however, threw no light upon the circumstances in which the formation of his obsession had taken place. The idea of the punishment carried out by means of rats had acted as a stimulus to a number of his instincts and had called up a whole quantity of recollections; so that, in the short interval between the captain's story and his request to him to pay back the money, rats had acquired a series of symbolic meanings, to which, during the period which followed, fresh ones were continually being added. I must confess that I can only give a very incomplete account of the whole business. What the rat punishment stirred up more than anything else was his anal erotism, which had played an important part in his childhood and had been kept in activity for many years by a constant irritation due to worms. In this way rats came to have the meaning of 'money'.¹ The patient gave an indication of this connection by reacting to the word 'Ratten' ['rats'] with the association 'Raten' ['instalments']. In his obsessional deliria he coined himself a regular rat currency. When, for instance, in reply to a question, I told him the amount of my fee for an hour's treatment, he said to himself (as I learned six months later): 'So many florins, so many rats'. Little by little he translated into this language the whole complex of money interests which centred round his father's legacy to him, that is to say, all his ideas connected with that subject were, by way of the verbal bridge 'Raten - Ratten', carried over into his obsessional life and brought under the dominion of his unconscious. Moreover, the captain's request to him to pay back the charges due upon the packet served to strengthen the money significance of rats, by way of another verbal bridge 'Spielratte', which led back to his father's gambling debt. [1909d, 2166]

But the patient was also familiar with the fact that rats are carriers of dangerous infectious diseases; he could therefore employ them as symbols of his dread (justifiable enough in the army) of syphilitic infection. This dread concealed all sorts of doubts as to the kind of life his father had led during his term of military service. Again, in another sense, the penis itself is a carrier of syphilitic infection; and in this way he could consider the rat as a male organ of sex. It had a further title to be so regarded; for a penis (especially a child's penis) can easily be compared to a worm, and the captain's story had been about rats burrowing in some one's anus, just as the large round-worms had in his when he was a child. Thus the penis significance of rats was based, once more, upon anal erotism. And apart from this, the rat is a dirty animal, feeding upon excrement and living in sewers.¹ It is perhaps unnecessary to point out how great an extension of the rat delirium became possible owing to this new meaning. For instance, 'So many rats, so many florins' could serve as an excellent characterization of a certain female profession which he particularly detested. On the other hand, it is certainly not a matter of indifference that the substitution of a penis for a rat in the captain's story resulted in a situation of intercourse per anum, which could not fail to be especially revolting to him when brought into connection with his father and the woman he loved. And when we consider that the same situation was reproduced in the compulsive threat which had formed in his mind after the captain had made his request, we shall be forcibly reminded of certain curses in use among the Southern Slavs.² Moreover, all of this material, and more besides, was woven into the fabric of the rat discussions behind the screen-association 'heiraten' ['to marry']. [1909d, 2167]
The story of the rat punishment, as was shown by the patient's own account of the matter and by his facial expression as he repeated the story to me, had fanned into a flame all his prematurely suppressed impulses of cruelty, egoistic and sexual alike. Yet, in spite of all this wealth of material, no light was thrown upon the meaning of his obsessional idea until one day the Rat-Wife in Ibsen's *Little Eyolf* came up in the analysis, and it became impossible to escape the inference that in many of the shapes assumed by his obsessional deliria rats had another meaning still - namely, that of children.¹ Enquiry into the origin of this new meaning at once brought me up against some of the earliest and most important roots. Once when the patient was visiting his father's grave he had seen a big beast, which he had taken to be a rat, gliding along over the grave.² He assumed that it had actually come out of his father's grave, and had just been having a meal off his corpse. The notion of a rat is inseparably bound up with the fact that it has sharp teeth with which it gnaws and bites.³ But rats cannot be sharp-toothed, greedy and dirty with impunity: they are cruelly persecuted and mercilessly put to death by man, as the patient had often observed with horror. He had often pitied the poor creatures. But he himself had been just such a nasty, dirty little wretch, who was apt to bite people when he was in a rage, and had been fearfully punished for doing so (p. 2162). He could truly be said to find 'a living likeness of himself' in the rat. It was almost as though Fate, when the captain told him his story, had been putting him through an association test: she had called out a 'complex stimulus-word', and he had reacted to it with his obsessional idea.

¹ Ibsen's Rat-Wife must certainly be derived from the legendary Pied Piper of Hamelin, who first enticed away the rats into the water, and then, by the same means, lured the children out of the town, never to return. So too, Little Eyolf threw himself into the water under the spell of the Rat-Wife. In legends generally the rat appears not so much as a disgusting creature but as something uncanny - as a chthonic animal, one might almost say; and it is used to represent the souls of the dead.

² It was only then that it became possible to understand the inexplicable process by which his obsessional idea had been formed. With the assistance of our knowledge of infantile sexual theories and of symbolism (as learnt from the interpretation of dreams) the whole thing could be translated and given a meaning. When, at the afternoon halt (during which he had lost his pince-nez), the captain had told him about the rat punishment, the patient had only been struck away the rats into the water, and then, by the same means, lured the children out of the town, never to return. So too, Little Eyolf threw himself into the water under the spell of the Rat-Wife. In legends generally the rat appears not so much as a disgusting creature but as something uncanny - as a chthonic animal, one might almost say; and it is used to represent the souls of the dead.

³ When the captain had handed him the packet upon which the charges were due and had requested him to pay back the 3.80 kronen to Lieutenant A., he had already been aware that his 'cruel superior' was making a mistake, and that the only person he owed anything to was the young lady at the post office. It might easily, therefore, have occurred to him to think of some derisive reply, such as, 'Will I, though?' or 'Pay your grandmother!' or 'Yes! You bet I'll pay him back the money!' - answers which would have been subject to no compulsive force. But instead, out of the stirrings of his father-complex and out of his memory of the scene from his childhood, there formed in his mind some such answer as: 'Yes! I'll pay back the money to A. when my father and the lady have children!' or 'As sure as my father and the lady can have children, I'll pay him back the money!' In short, a derisive affirmation attached to an absurd condition which could never be fulfilled.
I should like you to notice, too, that the analysis of dreams has shown us that the unconscious makes use of a particular symbolism, especially for representing sexual complexes. This symbolism varies partly from individual to individual; but partly it is laid down in a typical form and seems to coincide with the symbolism which, as we suspect, underlies our myths and fairy tales. It seems not impossible that these creations of the popular mind might find an explanation through the help of dreams.

If we examine with the eyes of a psycho-analyst Leonardo's phantasy of the vulture, it does not appear strange for long. We seem to recall having come across the same sort of thing in many places, for example in dreams; so that we may venture to translate the phantasy from its own special language into words that are generally understood. The translation is then seen to point to an erotic content. A tail, 'coda', is one of the most familiar symbols and substitutive expressions for the male organ, in Italian no less than in other languages; the situation in the phantasy, of a vulture opening the child's mouth and beating about inside it vigorously with its tail, corresponds to the idea of an act of fellatio, a sexual act in which the penis is put into the mouth of the person involved. It is strange that this phantasy is so completely passive in character; moreover it resembles certain dreams and phantasies found in women or passive homosexuals (who play the part of the woman in sexual relations).

Our interest is next claimed by another unintelligible feature of Leonardo's childhood phantasy. We interpret the phantasy as one of being suckled by his mother, and we find his mother replaced by - a vulture. Where does this vulture come from and how does it happen to be found in its present place?

At this point a thought comes to the mind from such a remote quarter that it would be tempting to set it aside. In the hieroglyphics of the ancient Egyptians the mother is represented by a picture of a vulture.¹ The Egyptians also worshipped a Mother Goddess, who was represented as having a vulture's head, or else several heads, of which at least one was a vulture's.² This goddess's name was pronounced Mut. Can the similarity to the sound of our word Mutter ['mother'] be merely a coincidence? There is, then, some real connection between vulture and mother - but what help is that to us? For have we any right to expect Leonardo to know of it, seeing that the first man who succeeded in reading hieroglyphics was François Champollion (1790-1832)?³

In Leonardo's childhood phantasy we have taken the element of the vulture to represent the real content of his memory, while the context in which Leonardo himself placed his phantasy has thrown a bright light on the importance which that content had for his later life. In proceeding with our work of interpretation we now come up against the strange problem of why this content has been recast into a homosexual situation. The mother who suckles her child - or to put it better, at whose breast the child sucks - has been turned into a vulture that puts its tail into the child's mouth. We have asserted that, according to the usual way in which language makes use of substitutes, the vulture's 'coda' cannot possibly signify anything other than a male genital, a penis. But we do not understand how imaginative activity can have succeeded in endowing precisely this bird which is a mother with the distinguishing mark of masculinity; and in view of this absurdity we are at a loss how to reduce this creation of Leonardo's phantasy to any rational meaning.
Let me now touch upon one or two fields in which we have new things to learn and do in fact discover new things every day. Above all, there is the field of symbolism in dreams and in the unconscious - a fiercely contested subject, as you know. It is no small merit in our colleague, Wilhelm Stekel, that, untroubled by all the objections raised by our opponents, he has undertaken a study of dream-symbols. There is indeed still much to learn here; my Interpretation of Dreams, which was written in 1899, awaits important amplification from researches into symbolism.

[1910d, 2308]

I will say a few words about one of the symbols that has newly been recognized. A little time ago I heard that a psychologist whose views are somewhat different from ours had remarked to one of us that, when all was said and done, we did undoubtedly exaggerate the hidden sexual significance of dreams: his own commonest dream was of going upstairs, and surely there could not be anything sexual in that. We were put on the alert by this objection, and began to turn our attention to the appearance of steps, staircases and ladders in dreams and were soon in a position to show that staircases (and analogous things) were unquestionably symbols of copulation. It is not hard to discover the basis of the comparison: we come to the top in a series of rhythmical movements and with increasing breathlessness and then, with a few rapid leaps, we can get to the bottom again. Thus the rhythmical pattern of copulation is reproduced in going upstairs. Nor must we omit to bring in the evidence of linguistic usage. It shows us that 'mounting' [German 'steigen'] is used as a direct equivalent for the sexual act. We speak of a man as a 'Steiger' [a 'mounter'] and of 'nachsteigen' ['to run after', literally 'to climb after']. In French the steps on a staircase are called 'marches' and 'un vieux marcheur' has the same meaning as our 'ein alter Steiger' ['an old rake']. The dream-material from which these newly recognized symbols are derived will in due time be put before you by the committee we are about to form for a collective study of symbolism. You will find some remarks on another interesting symbol, on 'rescue' and its changes in significance, in the second volume of our Jahrbuch. But I must break off here or I shall not get to my other points.

[1910d, 2308]

The taboo of virginity and something of its motivation has been depicted most powerfully of all in a well-known dramatic character, that of Judith in Hebbel's tragedy Judith und Holofernes. Judith is one of those women whose virginity is protected by a taboo. Her first husband was paralysed on the bridal night by a mysterious anxiety, and never again dared to touch her, 'My beauty is like belladonna,' she says. 'Enjoyment of it brings madness and death.' When the Assyrian general is besieging her city, she conceives the plan of seducing him by her beauty and of destroying him, thus employing a patriotic motive to conceal a sexual one. After she has been deflowered by this powerful man, who boasts of his strength and ruthlessness, she finds the strength in her fury to strike off his head, and thus becomes the liberator of her people. Beheading is well known to us as a symbolic substitute for castrating; Judith is accordingly the woman who castrates the man who has deflowered her, which was just the wish of the newly-married woman expressed in the dream I reported. It is clear that Hebbel has intentionally sexualized the patriotic narrative from the Apocrypha of the Old Testament, for there Judith is able to boast after her return that she has not been defiled, nor is there in the Biblical text any mention of her uncanny wedding night. But probably, with the fine perception of a poet, he sensed the ancient motive, which had been lost in the tendentious narrative, and has merely restored its earlier content to the material.

[1918a, 2362]
The sun, therefore, is nothing but another sublimated symbol for the father; and in pointing this out I must disclaim all responsibility for the monotony of the solutions provided by psycho-analysis. In this instance symbolism overrides grammatical gender - at least so far as German goes,¹ for in most other languages the sun is masculine. Its counterpart in this picture of the two parents is 'Mother Earth' as she is generally called. We frequently come upon confirmations of this assertion in resolving the pathogenic phantasies of neurotics by psycho-analysis. I can make no more than the barest allusion to the relation of all this to cosmic myths. One of my patients, who had lost his father at a very early age, was always seeking to rediscover him in what was grand and sublime in Nature. Since I have known this, it has seemed to me probable that Nietzsche's hymn 'Vor Sonnenaufgang' ['Before Sunrise'] is an expression of the same longing.² Another patient, who became neurotic after his father's death, was seized with his first attack of anxiety and giddiness while the sun shone upon him as he was working in the garden with a spade. He spontaneously put forward as an interpretation that he had become frightened because his father had looked at him while he was at work upon his mother with a sharp instrument. When I ventured upon a mild remonstrance, he gave an air of greater plausibility to his view by telling me that even in his father's lifetime he had compared him with the sun, though then it had been in a satirical sense. Whenever he had been asked where his father was going to spend the summer he had replied in these sonorous words from the 'Prologue in Heaven':

6 'For this reason attempts were made to pump out my spinal cord. This was done by means of so-called "little men" who were placed in my feet. I shall have more to say presently on the subject of these "little men", who showed some resemblance to the phenomena of the same name which I have already discussed in Chapter VI. There used as a rule to be two of them - a "little Flechsig" and a "little von W." - And I used to hear their voices, too, in my feet.' (154.) Von W. was the man who was supposed to have accused Schreber of masturbation. The 'little men' are described by Schreber himself as being among the most remarkable and, in some respects, the most puzzling phenomena of his illness (157). It looks as though they were the product of a condensation of children and - spermatozoa.

Since I published my work upon Schreber, a chance acquisition of knowledge has put me in a position to appreciate one of his delusional beliefs more adequately, and to recognize the wealth of its bearing upon mythology. I mentioned on p. 2425 the patient's peculiar relation to the sun, and I was led to explain the sun as a sublimated 'father-symbol'. The sun used to speak to him in human language and thus revealed itself to him as a living being. Schreber was in the habit of abusing it and shouting threats at it; he declares, moreover, that when he stood facing it and spoke aloud, its rays would turn pale before him. After his 'recovery' he boasts that he can gaze at it without any difficulty and without being more than slightly dazzled by it, a thing which would naturally have been impossible for him formerly.²

The eagle, then, who makes his young look into the sun and requires of them that they shall not be dazzled by its light, is behaving as though he were himself a descendant of the sun and were submitting his children to a test of their ancestry. And when Schreber boasts that he can look into the sun unscathed and undazzled, he has rediscovered the mythological method of expressing his filial relation to the sun, and has confirmed us once again in our view that the sun is a symbol of the father. It will be remembered that during his illness Schreber gave free expression to his family pride,² and that we discovered in the fact of his childlessness a human motive for his having fallen ill with a feminine wishful phantasy. Thus the connection between his delusional privilege and the basis of his illness becomes evident.
I submit, therefore, that dream-interpretation should not be pursued in analytic treatment as an art for its own sake, but that its handling should be subject to those technical rules that govern the conduct of the treatment as a whole. Occasionally, of course, one can act otherwise and allow a little free play to one's theoretical interest; but one should always be aware of what one is doing. Another situation to be considered is one which has arisen since we have acquired more confidence in our understanding of dream-symbolism, and know ourselves to be more independent of the patient's associations. An unusually skilful dream-interpreter will sometimes find himself in the position of being able to see through every one of a patient's dreams without requiring him to go through the tedious and time-absorbing process of working over them. Such an analyst is thus exempt from any conflict between the demands of dream-interpretation and those of the treatment. Moreover he will be tempted to make full use of dream-interpretation on every occasion, by telling the patient everything he has detected in his dreams. In doing so, however, he will have adopted a method of treatment which departs considerably from the established one, as I shall point out in another connection. Beginners in psycho-analytic practice, at any rate, are advised not to take this exceptional case as a model. [1911e, 2452]

In the following quatrain the penis appears as a sceptre:
[1957a [1911], 2524]

In the Silesian folksong that follows, the dream is only invented in order to hide a different occurrence. The penis appears here as a worm ('fat earthworm'), which has crawled into the girl, and at the right time crawls out again as a little worm (baby).¹
[1957a [1911], 2525]

The dream which now follows symbolizes the penis by a dagger: the woman who dreams it is pulling at a dagger in order to stab herself, when she is awakened by her husband and exhorted not to tear his member off.
[1957a [1911], 2526]
A woman dreamt that things had got to such a pitch that they had nothing to eat before the holiday and could not buy anything either. Her husband had drunk up all the money. There was only a lottery ticket left and even this they really ought to pawn. But the man was still keeping it back, for the draw was to be on the second of January. He said: ‘Wife, now tomorrow is the draw, let the ticket wait a while longer. If we don’t win, then we must sell the ticket or pawn it.’ ‘Well, the devil take it, all you’ve bought is worry, and you’ve got about as much out of it as there is milk in a billy-goat.’ So the next day arrived. See, along came the newspaper man. He stopped him, took a copy and began to look down the list. He ran his eyes over the figures, he looked through every column, his number was not among them. He did not trust his eyes, looked through once again and this time sure enough he came upon the number of his ticket. The number was the same, but the number of the series did not fit. Once again he did not trust himself and thought to himself: ‘This must be a mistake. Wait a bit, I will go to the bank and make certain one way or the other.’

So he went there with his head hanging. On the way he met a second newspaper man. He bought another copy of a second paper, scanned the list and found the number of his ticket straight away. The number of the series, too, was the same as the one which included his ticket. The prize of 5,000 roubles fell to his lot. He burst into the bank, rushed up and asked them to pay out on the winning ticket at once. The banker said that they could not pay out yet, only in a week or two. He began to beg and pray: ‘Please be kind, give me one thousand at least, I can get the rest later!’ The banker refused, but advised him to apply to the private individual who had procured the winning lottery ticket for him. What was to be done now? Just then a little Jew appeared as though he had sprung up from the ground. He smelt a bargain and made him an offer to pay over the money at once, though instead of 5,000 only 4,000. The fifth thousand would be his own share. The man was delighted at this good fortune and decided to give the Jew the thousand, just so that he could get the money on the spot. He took the money from the Jew and handed over the ticket to him. Then he went home. On the way he went into an inn, swallowed a quick glass and from there went straight home. He walked along grinning and humming a little song. His wife saw him through the window and thought: ‘Now he’s certainly sold the lottery ticket; you can see he’s cheerful, he’s probably paid a visit to the inn and got himself drunk because he was feeling miserable.’ Then he came indoors, put the money on the kitchen table and went to his wife to bring her the good news that he had won and had got the money. While they were hugging and kissing one another to their heart’s content because they were so happy, their little three-year-old daughter grabbed the money and threw it into the stove. Then they came along to count the money and it was no longer there. The last bundle of notes was already on fire. In a rage the man seized hold of the little girl by the legs and dashed her against the stove. She dropped dead. Disaster stared him in the face, there was no escaping Siberia now. He seized his revolver and bang! he shot himself in the chest and dropped dead. Horrified by such a disaster, the woman snatched up a dagger and was going to stab herself. She tried to pull it out of the sheath but could not manage it however she tried. Then she heard a voice as though from Heaven: ‘Enough, let go! What are you doing?’ She woke up and saw that she was not pulling at a dagger but at her husband’s tool, and he was saying: ‘Enough, let go or you’ll tear it off!’

The representation of the penis as a weapon, cutting knife, dagger, etc., is familiar to us from the anxiety dreams of abstinent women in particular and also lies at the root of numerous phobias in neurotic people. The complicated disguise of this present dream, however, demands that we should make an attempt to clarify our understanding of it by a psycho-analytic interpretation based on interpretations already carried out. In doing so we are not overlooking the fact that we shall be going beyond the material presented in the folk tale itself and that consequently our conclusions will lose in certainty.

In dreams in folklore gold is seen in the most unambiguous way to be a symbol of faeces. If the sleeper feels a need to defaecate, he dreams of gold, of treasure. The disguise in the dream, which is designed to mislead him into satisfying his need in bed, usually makes the pile of faeces serve as a sign to mark the place where the treasure is to be found; that is to say, the dream - as though by means of endopsychic perception - states outright, even if in a reversed form, that gold is a sign or a symbol for faeces.
At this point, however, psycho-analysis forces on our attention an interpretation which changes our whole view of this class of dreams. Extensible objects, so the experience of interpreting dreams tells us, are ordinarily symbols of erection.¹ In both these anecdotes of dreams the emphasis lies on the element of the thread's refusing to get long enough, and the anxiety in the dream is also attached to this same element. Thread moreover, like all things analogous to it (cord, rope, twine etc.), is a symbol of semen.² The peasant, then, is striving to produce an erection and only when this is unsuccessful does he resort to defaecation. All at once a sexual need comes to view in these dreams behind the excremental one.

Nevertheless, our knowledge of dream-symbolism enables us to understand uninterpreted portions of this dream and to discover a deeper significance behind the interpretations already given. We cannot but notice that some of the material employed by the nurse came from the complex of giving birth, of having children. The expanse of water (the Rhine, the Channel where the whale was seen) was certainly the water out of which children come. And then, too, she came to the water in search of a child. The Jonah legend, which was a factor lying behind the determination of this water, the question how Jonah (the child) could get through such a narrow passage, belongs to the same complex. And the nurse who threw herself into the Rhine out of mortification found a sexual-symbolic consolation for her despair of life in the mode of her death - by going into water. The narrow footbridge on which the apparition met her was in all probability also a genital symbol, although I must admit that here we lack as yet more precise knowledge.

Behind this first interpretation we have a glimpse of deeper and purely sexual material. Here the room was the vagina. (The room was in her - this was reversed in the dream.) The little man who made grimaces and behaved so funnily was the penis. The narrow door and the steep stairs confirmed the view that the situation was a representation of intercourse. As a rule we are accustomed to find the penis symbolized by a child; but we shall find there was good reason for a father being introduced to represent the penis in this instance.

The solution of the remaining portion of the dream will entirely confirm us in this interpretation. The dreamer herself explained the transparent grey garment as a condom. We may gather that considerations of preventing conception and worries whether this visit of her husband's might not have sown the seed of a second child were among the instigating causes of the dream.

¹ Wood, as is well known, is frequently a female or maternal symbol: e.g. materia, Madeira, etc.
² For bed and board stand for marriage.
Let us look once more at our material. In the Estonian epic, just as in the tale from the *Gesta Romanorum*, the subject is a girl choosing between three suitors; in the scene from *The Merchant of Venice* the subject is apparently the same, but at the same time something appears in it that is in the nature of an inversion of the theme: a *man* chooses between three - caskets. If what we were concerned with were a dream, it would occur to us at once that caskets are also women, symbols of what is essential in woman, and therefore of a woman herself - like coffers, boxes, cases, baskets, and so on. If we boldly assume that there are symbolic substitutions of the same kind in myths as well, then the casket scene in *The Merchant of Venice* really becomes the inversion we suspected. With a wave of the wand, as though we were in a fairy tale, we have stripped the astral garment from our theme; and now we see that the theme is a human one, a *man's choice between three women*.

But who are these three sisters and why must the choice fall on the third? If we could answer this question, we should be in possession of the interpretation we are seeking. We have once already made use of an application of psycho-analytic technique, when we explained the three caskets symbolically as three women. If we have the courage to proceed in the same way, we shall be setting foot on a path which will lead us first to something unexpected and incomprehensible, but which will perhaps, by a devious route, bring us to a goal.

If we decide to regard the peculiarities of our 'third one' as concentrated in her 'dumbness', then psycho-analysis will tell us that in dreams dumbness is a common representation of death.¹

More than ten years ago a highly intelligent man told me a dream which he wanted to use as evidence of the telepathic nature of dreams. In it he saw an absent friend from whom he had received no news for a very long time, and reproached him energetically for his silence. The friend made no reply. It afterwards turned out that he had met his death by suicide at about the time of the dream. Let us leave the problem of telepathy on one side: there seems, however, not to be any doubt that here the dumbness in the dream represented death. Hiding and being unfindable - a thing which confronts the prince in the fairy tale of Cinderella three times, is another unmistakable symbol of death in dreams; so, too, is a marked pallor, of which the 'paleness' of the lead in one reading of Shakespeare's text is a reminder.² It would be very much easier for us to transpose these interpretations from the language of dreams to the mode of expression used in the myth that is now under consideration if we could make it seem probable that dumbness must be interpreted as a sign of being dead in productions other than dreams.

It would certainly be possible to collect further evidence from fairy tales that dumbness is to be understood as representing death. These indications would lead us to conclude that the third one of the sisters between whom the choice is made is a dead woman. But she may be something else as well - namely, Death itself, the Goddess of Death. Thanks to a displacement that is far from infrequent, the qualities that a deity imparts to men are ascribed to the deity himself. Such a displacement will surprise us least of all in relation to the Goddess of Death, since in modern versions and representations, which these stories would thus be forestalling, Death itself is nothing other than a dead man.
I shall no doubt be overstepping common linguistic usage in postulating an interest in psycho-analysis on the part of philologists, that is of experts in speech. For in what follows 'speech' must be understood not merely to mean the expression of thought in words but to include the speech of gesture and every other method, such, for instance, as writing, by which mental activity can be expressed. That being so, it may be pointed out that the interpretations made by psycho-analysis are first and foremost translations from an alien method of expression into the one which is familiar to us. When we interpret a dream we are simply translating a particular thought-content (the latent dream-thoughts) from the 'language of dreams' into our waking speech. In the course of doing so we learn the peculiarities of this dream language and it is borne in upon us that it forms part of a highly archaic system of expression. Thus, to take an instance, there is no special indication for the negative in the language of dreams. Contraries may stand for each other in the dream's content and may be represented by the same element. Or we may put it like this: concepts are still ambivalent in dream-language, and unite within themselves contrary meanings - as is the case, according to the hypotheses of philologists, in the oldest roots of historical languages. Another striking feature of our dream-language is its extremely frequent use of symbols, which make us able to some extent to translate the content of dreams without reference to the associations of the individual dreamer. Our researches have not yet sufficiently elucidated the essential nature of these symbols. They are in part substitutes and analogies based upon obvious similarities; but in some of these symbols the tertium comparationis which is presumably present escapes our conscious knowledge. It is precisely this latter class of symbols which must probably originate from the earliest phases of linguistic development and conceptual construction. In dreams it is above all the sexual organs and sexual activities which are represented symbolically instead of directly. A philologist, Hans Sperber, of Uppsala, has only recently (1912) attempted to prove that words which originally represented sexual activities have, on the basis of analogies of this kind, undergone an extraordinarily far-reaching change in their meaning.

He had a dream in which he saw two familiar rooms which had been made into one.

In women's dreams an overcoat [German 'Mantel'] is unquestionably shown to be a symbol for a man. Linguistic assonance may perhaps play some part in this.

These often contain only the symbols relating to the subject of the dream. For instance, here is a dream that occurred in a context of homosexual impulses: he was going for a walk somewhere with a friend . . . (indistinct) . . . balloons.
I am quite sure, however, that this opposition between our views had nothing to do with the breach in our relations which followed shortly after. This had deeper causes, but it came about in such a way that at first I did not understand it; it was only later that I learnt from many clear indications how to interpret it. It will be remembered that Breuer said of his famous first patient that the element of sexuality was astonishingly undeveloped in her and had contributed nothing to the very rich clinical picture of the case. I have always wondered why the critics did not more often cite this assertion of Breuer’s as an argument against my contention of a sexual aetiology in the neuroses, and even to-day I do not know whether I ought to regard the omission as evidence of tact or of carelessness on their part. Anyone who reads the history of Breuer’s case now in the light of the knowledge gained in the last twenty years will at once perceive the symbolism in it - the snakes, the stiffening, the paralysis of the arm - and, on taking into account the situation at the bedside of the young woman’s sick father, will easily guess the real interpretation of her symptoms; his opinion of the part played by sexuality in her mental life will therefore be very different from that of her doctor. In his treatment of her case, Breuer was able to make use of a very intense suggestive rapport with the patient, which may serve us as a complete prototype of what we call ‘transference’-today. Now I have strong reasons for suspecting that after all her symptoms had been relieved Breuer must have discovered from further indications the sexual motivation of this transference, but that the universal nature of this unexpected phenomenon escaped him, with the result that, as though confronted by an ‘untoward event’,¹ he broke off all further investigation. He never said this to me in so many words, but he told me enough at different times to justify this reconstruction of what happened. When I later began more and more resolutely to put forward the significance of sexuality in the aetiology of neuroses, he was the first to show the reaction of distaste and repudiation which was later to become so familiar to me, but which at that time I had not yet learnt to recognize as my inevitable fate.

I need say little about the interpretation of dreams. It came as the first fruits of the technical innovation I had adopted when, following a dim presentiment, I decided to replace hypnosis by free association. My desire for knowledge had not at the start been directed towards understanding dreams. I do not know of any outside influence which drew my interest to them or inspired me with any helpful expectations. Before Breuer and I ceased to meet I only just had time to tell him in a single sentence that I now understood how to translate dreams. Since this was how the discovery came about, it followed that the symbolism in the language of dreams was almost the last thing to become accessible to me, for the dreamer’s associations help very little towards understanding symbols. I have held fast to the habit of always studying things themselves before looking for information about them in books, and therefore I was able to establish the symbolism of dreams for myself before I was led to it by Scherner’s work on the subject. It was only later that I came to appreciate to its full extent this mode of expression of dreams. This was partly through the influence of the works of Stekel, who at first did such very creditable work but afterwards went totally astray. The close connection between psycho-analytic dream-interpretation and the art of interpreting dreams as practised and held in such high esteem in antiquity only became clear to me much later. Later on I found the essential characteristic and most important part of my dream theory - the derivation of dream-distortion from an internal conflict, a kind of inner dishonesty - in a writer who was ignorant, it is true, of medicine, though not of philosophy, the famous engineer J. Popper, who published his Phantasien eines Realisten under the name of Lynkeus.

¹[1914d, 2881]
Experience in the analysis of dreams has sufficiently well established the hat as a symbol of the genital organ, most frequently of the male organ. It cannot be said, however, that the symbol is an intelligible one. In phantasies and in numerous symptoms the head too appears as a symbol of the male genitals, or, if one prefers to put it so, as something standing for them. It will sometimes have been noticed that patients suffering from obsessions express an amount of abhorrence of and indignation against punishment by beheading far greater than they do in the case of any other form of death; and in such cases the analyst may be led to explain to them that they are treating being beheaded as a substitute for being castrated. Instances have often been analysed and published of dreams dreamt by young people or reported as having occurred in youth, which concerned the subject of castration, and in which a round ball was mentioned which could only be interpreted as the head of the dreamer’s father. I was recently able to solve a ceremonial performed by a woman patient before going to sleep, in which she had to lay her small top pillow diamond-wise on the other ones and to rest her head exactly in the long diameter of the diamond-shape. The diamond had the meaning that is familiar to us from drawings on walls [graffiti]; the head was supposed to represent a male organ.

It may be that the symbolic meaning of the hat is derived from that of the head, in so far as a hat can be regarded as a prolonged, though detachable head. In this connection I am reminded of a symptom by means of which obsessive neurotics succeed in causing themselves continual torments. When they are in the street they are constantly on the look-out to see whether some acquaintance will greet them first by taking off his hat, or whether he seems to be waiting for their salutation; and they give up a number of their acquaintances after discovering that they no longer greet them or do not return their own salutation properly. There is no end to their difficulties in this connection; they find them everywhere as their mood and fancy dictate. It makes no difference to their behaviour when we tell them, what they all know already, that a salutation by taking off the hat has the meaning of an abasement before the person saluted - that a Spanish grandee, for example, enjoyed the privilege of remaining covered in the king’s presence - and that their own sensitiveness on the subject of greeting therefore means that they are unwilling to show themselves less important than the other person thinks he is. The resistance of their sensitiveness to explanations such as this suggests that a motive less familiar to consciousness is at work; and the source of this excess of feeling might easily be found in its relation to the castration complex.

'Really it was absurd of me to be in such a hurry to get married! I can see from Elise’s example that I could have got a husband later too.' (Being in too great a hurry was represented by her own behaviour in buying the tickets and by her sister-in-laws in buying the jewellery. Going to the play appeared as a substitute forgetting married.) This would seem to be the main thought. We may perhaps proceed further, though with less certainty, since the analysis ought not to have been without the dreamer’s comments at these points: ‘And I could have got one a hundred times better with the money!’ (150 florins is a hundred times more than 1 florin 50.) If we were to put her dowry in place of the money, it would mean that her husband was bought with her dowry: the jewellery, and the bad tickets as well, would be substitutes for her husband. It would be still more satisfactory if the actual element ‘three tickets’ had something to do with a husband. But we have not got so far as that in our understanding of the dream. We have only discovered that the dream expresses the low value assigned by her to her own husband and her regret at having married so early.
We come upon this other factor which prevents dreams from being lucid, this new contribution to dream-distortion, by noticing a gap in our technique. I have already admitted to you that it does sometimes really happen that nothing occurs to a person under analysis in response to particular elements of his dreams. It is true that this does not happen as often as he asserts; in a great many cases, with perseverance, an idea is extracted from him. But nevertheless there remain cases in which an association fails to emerge or, if it is extracted, does not give us what we expected from it. If this happens during a psycho-analytic treatment, it has a peculiar significance with which we are not here concerned. But it also happens in the interpretation of normal people's dreams or in that of our own. If we convince ourselves that in such case no amount of pressure is of any use, we eventually discover that this unwished-for event regularly occurs in connection with particular dream-elements, and we begin to recognize that a fresh general principle is at work where we had begun by thinking we were only faced by an exceptional failure of technique.

In this way we are tempted to interpret these 'mute' dream-elements ourselves, to set about translating them with our own resources. We are then forced to recognize that whenever we venture on making a replacement of this sort we arrive at a satisfactory sense for the dream, whereas it remains senseless and the chain of thought is interrupted so long as we refrain from intervening in this way. An accumulation of many similar cases eventually gives the necessary certainty to what began as a timid experiment.

In this way we obtain constant translations for a number of dream-elements - just as popular 'dream-books' provide them for everything that appears in dreams. You will not have forgotten, of course, that when we use our associative technique constant replacements of dream-elements never come to light.

You will object at once that this method of interpretation strikes you as far more insecure and open to attack than the earlier one by means of free association. There is, however, something further. For when, with experience, we have collected enough of these constant renderings, the time comes when we realize that we should in fact have been able to deal with these portions of dream-interpretation from our own knowledge, and that they could really be understood without the dreamer's associations. How it is that we must necessarily have known their meaning will become clear in the second half of our present discussion.

A constant relation of this kind between a dream-element and its translation is described by us as a 'symbolic' one, and the dream-element itself as a 'symbol' of the unconscious dream-thought. You will recall that earlier, when we were investigating the relations between dream-elements and the 'genuine' thing behind them, I distinguished three such relations - those of a part to a whole, of allusion and of plastic portrayal. I warned you at the time that there was a fourth, but I did not name it. This fourth relation is the symbolic one which I am now introducing. It gives occasion for some most interesting discussions, and I will turn to them before laying before you the detailed results of our observations of symbolism.
Symbolism is perhaps the most remarkable chapter of the theory of dreams. In the first place, since symbols are stable translations, they realize to some extent the ideal of the ancient as well as of the popular interpretation of dreams, from which, with our technique, we had departed widely. They allow us in certain circumstances to interpret a dream without questioning the dreamer, who indeed would in any case have nothing to tell, us about the symbol. If we are acquainted with the ordinary dream-symbols, and in addition with the dreamer's personality, the circumstances in which he lives and the impressions which preceded the occurrence of the dream, we are often in a position to interpret a dream straightaway - to translate it at sight, as it were. A piece of virtuosity of this kind flatters the dream-interpreter and impresses the dreamer; it forms an agreeable contrast to the laborious work of questioning the dreamer. But do not allow yourselves to be led astray by this. It is not our business to perform acts of virtuosity. Interpretation based on a knowledge of symbols is not a technique which can replace or compete with the associative one. It forms a supplement to the latter and yields results which are only of use when introduced into it. And as regards acquaintance with the dreamer's psychical situation, you must bear in mind that the dreams of people you know well are not the only ones you have to analyse, that you are not as a rule familiar with the events of the previous day, which were the instigators of the dream, but that the associations of the person you are analysing will provide you precisely with a knowledge of what we call the psychical situation. [1916-1917, 3245]

Moreover it is quite specially remarkable - having regard, too, to some considerations which we shall mention later - that the most violent resistances have been expressed once again to the existence of a symbolic relation between dreams and the unconscious. Even people of judgement and reputation, who, apart from this, have gone a long way in agreeing with psycho-analysis, have at this point withheld their support. This behaviour is all the stranger in view, first, of the fact that symbolism is not peculiar to dreams alone and is not characteristic of them, and, secondly, that symbolism in dreams is by no means a discovery of psycho-analysis, however many other surprising discoveries it has made. The philosopher K. A. Scherner (1861) must be described as the discoverer of dream-symbolism, if its beginning is to be placed in modern times at all. Psycho-analysis has confirmed Scherner's findings, though it has made material modifications in them. [1916-1917, 3246]

The essence of this symbolic relation is that it is a comparison, though not a comparison of any sort. Special limitations seem to be attached to the comparison, but it is hard to say what these are. Not everything with which we can compare an object or a process appears in dreams as a symbol for it. And on the other hand a dream does not symbolize every possible element of the latent dream-thoughts but only certain definite ones. So there are restrictions here in both directions. We must admit, too, that the concept of a symbol cannot at present be sharply delimited: it shades off into such notions as those of a replacement or representation, and even approaches that of an allusion. With a number of symbols the comparison which underlies them is obvious. But again there are other symbols in regard to which we must ask ourselves where we are to look for the common element, the tertium comparationis, of the supposed comparison. On further reflection we may afterwards discover it or it may definitely remain concealed. It is strange, moreover, that if a symbol is a comparison it should not be brought to light by an association, and that the dreamer should not be acquainted with it but should make use of it without knowing about it: more than that, indeed, that the dreamer feels no inclination to acknowledge the comparison even after it has been pointed out to him. You see, then, that a symbolic relation is a comparison of a quite special kind, of which we do not as yet clearly grasp the basis, though perhaps we may later arrive at some indication of it. [1916-1917, 3246]
The range of things which are given symbolic representation in dreams is not wide: the human body as a whole, parents, children, brothers and sisters, birth, death, nakedness - and something else besides. The one typical - that is regular - representation of the human figure as a whole is a house, as was recognized by Scherner, who even wanted to give this symbol a transcendant importance which it does not possess. It may happen in a dream that one finds oneself climbing down the façade of a house, enjoying it at one moment, frightened at another. The houses with smooth walls are men, the ones with projections and balconies that one can hold on to are women. One's parents appear in dreams as the Emperor and Empress, the King and Queen or other honoured personages; so here dreams are displaying much filial piety. They treat children and brothers and sisters less tenderly: these are symbolized as small animals or vermin. Birth is almost invariably represented by something which has a connection with water: one either falls into the water or climbs out of it, one rescues someone from the water or is rescued by someone - that is to say, the relation is one of mother to child. Dying is replaced in dreams by departure, by a train journey, being dead by various obscure and, as it were, timid hints, nakedness by clothes and uniforms. You see how indistinct the boundaries are here between symbolic and allusive representation.

It is a striking fact that, compared with this scanty enumeration, there is another field in which the objects and topics are represented with an extraordinarily rich symbolism. This field is that of sexual life - the genitals, sexual processes, sexual intercourse. The very great majority of symbols in dreams are sexual symbols. And here a strange disproportion is revealed. The topics I have mentioned are few, but the symbols for them are extremely numerous, so that each of these things can be expressed by numbers of almost equivalent symbols. The outcome, when they are interpreted, gives rise to general objection. For, in contrast to the multiplicity of the representations in the dream, the interpretations of the symbols are very monotonous, and this displeases everyone who hears of it; but what is there that we can do about it?

The male genitals, then, are represented in dreams in a number of ways that must be called symbolic, where the common element in the comparison is mostly very obvious. To begin with, for the male genitals as a whole the sacred number 3 is of symbolic significance. The more striking and for both sexes the more interesting component of the genitals, the male organ, finds symbolic substitutes in the first instance in things that resemble it in shape - things, accordingly, that are long and up-standing, such as sticks, umbrellas, posts, trees and so on; further, in objects which share with the thing they represent the characteristic of penetrating into the body and injuring - thus, sharp weapons of every kind, knives, daggers, spears, sabres, but also firearms, rifles, pistols and revolvers (particularly suitable owing to their shape). In the anxiety dreams of girls, being followed by a man with a knife or a fire-arm plays a large part. This is perhaps the commonest instance of dream symbolism and you will now be able to translate it easily. Nor is there any difficulty in understanding how it is that the male organ can be replaced by objects from which water flows - water-taps, watering-cans, or fountains - or again by other objects which are capable of being lengthened, such as hanging-lamps, extensible pencils, etc. A no less obvious aspect of the organ explains the fact that pencils, pen-holders, nail-files, hammers, and other instruments are undoubted male sexual symbols.
The remarkable characteristic of the male organ which enables it to rise up in defiance of the laws of gravity, one of the phenomena of erection, leads to its being represented symbolically by balloons, flying-machines and most recently by Zeppelin airships. But dreams can symbolize erection in yet another, far more expressive manner. They can treat the sexual organ as the essence of the dreamer's whole person and make him himself fly. Do not take it to heart if dreams of flying, so familiar and often so delightful, have to be interpreted as dreams of general sexual excitement, as erection-dreams. Among students of psycho-analysis, Paul Federn has placed this interpretation beyond any doubt; but the same conclusion was reached from his investigations by Mourly Vold, who has been so much praised for his sobriety, who carried out the dream-experiments I have referred to with artificially arranged positions of the arms and legs and who was far removed from psycho-analysis and may have known nothing about it. And do not make an objection out of the fact that women can have the same flying dreams as men. Remember, rather, that our dreams aim at being the fulfilments of wishes and that the wish to be a man is found so frequently, consciously or unconsciously, in women. Nor will anyone with a knowledge of anatomy be bewildered by the fact that it is possible for women to realize this wish through the same sensations as men. Women possess as part of their genitals a small organ similar to the male one; and this small organ, the clitoris, actually plays the same part in childhood and during the years before sexual intercourse as the large organ in men.

Among the less easily understandable male sexual symbols are certain reptiles and fishes, and above all the famous symbol of the snake. It is certainly not easy to guess why hats and overcoats or cloaks are employed in the same way, but their symbolic significance is quite unquestionable. And finally we can ask ourselves whether the replacement of the male limb by another limb, the foot or the hand, should be described as symbolic. We are, I think, compelled to do so by the context and by counterparts in the case of women.

The female genitals are symbolically represented by all such objects as share their characteristic of enclosing a hollow space which can take something into itself: by pits, cavities and hollows, for instance, by vessels and bottles, by receptacles, boxes, trunks, cases, chests, pockets, and so on. Ships, too, fall into this category. Some symbols have more connection with the uterus than with the female genitals: thus, cupboard, stoves and, more especially, rooms. Here room-symbolism touches on house-symbolism. Doors and gates, again, are symbols of the genital orifice. Materials, too, are symbols for women: wood, papery and objects made of them, like tables and books. Among animals, snails and mussels at least are undeniably female symbols; among parts of the body, the mouth (as a substitute for the genital orifice); among buildings, churches and chapels. Not every symbol, as you will observe, is equally intelligible.

The breasts must be reckoned with the genitals, and these, like the larger hemispheres of the female body, are represented by apples, peaches, and fruit in general. The pubic hair of both sexes is depicted in dreams as woods and bushes. The complicated topography of the female genital parts makes one understand how it is that they are often represented as landscapes, with rocks, woods and water, while the imposing mechanism of the male sexual apparatus explains why all kinds of complicated machinery which is hard to describe serve as symbols for it.
Another symbol of the female genitals which deserves mention is a jewel-case. Jewel and treasure are used in dreams as well as in waking life to describe someone who is loved. Sweets frequently represent sexual enjoyment. Satisfaction obtained from a person's own genitals is indicated by all kinds of playing, including piano-playing. Symbolic representations par excellence of masturbation are gliding or sliding and pulling off a branch. The falling out of a tooth or the pulling out of a tooth is a particularly notable dream-symbol. Its first meaning is undoubtedly castration as a punishment for masturbating. We come across special representations of sexual intercourse less often than might be expected from what has been said so far. Rhythmic activities such as dancing, riding and climbing must be mentioned here, as well as violent experiences such as being run over; so, too, certain manual crafts, and, of course, threatening with weapons.

You must not picture the use or the translation of these symbols as something quite simple. In the course of them all kinds of things happen which are contrary to our expectations. It seems almost incredible, for instance, that in these symbolic representations the differences between the sexes are often not clearly observed. Some symbols signify genitals in general, irrespective of whether they are male or female: for instance, a small child, a small son or a small daughter. Or again, a predominantly male symbol may be used for the female genitals or vice versa. We cannot understand this till we have obtained some insight into the development of sexual ideas in human beings. In some instances the ambiguity of the symbols may only be an apparent one; and the most marked symbols, such as weapons, pockets and chests are excluded from this bisexual use.

I will now go on to make a survey, starting not from the thing represented but from the symbol, of the fields from which sexual symbols are mostly derived, and I will make a few additional remarks, with special reference to the symbols where the common element in the comparison is not understood. The hat is an obscure symbol of this kind - perhaps, too, head-coverings in general - with a male significance as a rule, but also capable of a female one. In the same way an overcoat or cloak means a man, perhaps not always with a genital reference; it is open to you to ask why. Neckties, which hang down and are not worn by women, are a definitely male symbol. Underclothing and linen in general are female. Clothes and uniforms, as we have already seen, are a substitute for nakedness or bodily shapes. Shoes and slippers are female genitals. Tables and wood have already been mentioned as puzzling but certainly female symbols. Ladders, steps, and staircases, or, more precisely, walking on them, are clear symbols of sexual intercourse. On reflection, it will occur to us that the common element here is the rhythm of walking up them - perhaps, too, the increasing excitement and breathlessness the higher one climbs.

We have earlier referred to landscapes as representing the female genitals. Hills and rocks are symbols of the male organ. Gardens are common symbols of the female genitals. Fruit stands, not for children, but for the breasts. Wild animals mean people in an excited sensual state, and further, evil instincts or passions. Blossoms and flowers indicate women's genitals, or, in particular, virginity. Do not forget that blossoms are actually the genitals of plants.

We are acquainted already with rooms as a symbol. The representation can be carried further, for windows, and doors in and out of rooms, take over the meaning of orifices in the body. And the question of the room being open or locked fits in with this symbolism, and the key that opens it is a decidedly male symbol.
Here, then, is material used for symbolism in dreams. It is not complete and could be carried deeper as well as further. But I fancy it will seem to you more than enough and may even have exasperated you. ‘Do I really live in the thick of sexual symbols?’ you may ask. ‘Are all the objects around me, all the clothes I put on, all the things I pick up, all of them sexual symbols and nothing else?’ There is really sound enough for raising astonished questions, and, as a first one, we may enquire how we in fact come to know the meaning of these dream symbols, upon which the dreamer himself gives us insufficient information or none at all.

[1916-1917, 3252]

My reply is that we learn it from very different sources from fairy tales and myths, from buffoonery and jokes, from folklore (that is, from knowledge about popular manners and customs, sayings and songs) and from poetic and colloquial linguistic usage. In all these directions we come upon the same symbolism, and in some of them we can understand it without further instruction. If we go into these sources in detail, we shall find so many parallels to dream-symbolism that we cannot fail to be convinced of our interpretations.

[1916-1917, 3252]

According to Scherner, as we have said, the human body is often represented in dreams by the symbol of a house. Carrying this representation further, we found that windows, doors and gates stood for openings in the body and that façades of houses were either smooth or provided with balconies and projections to hold on to. But the same symbolism is found in our linguistic usage - when we greet an acquaintance familiarly as an ‘altes haus’ ['old house'], when we speak of giving someone ‘eins aufs Dach’ [a knock on the head, literally, ‘one on the roof’], or when we say of someone else that ‘he’s not quite right in the upper storey’. In anatomy the orifices of the body are in so many words termed ‘Leibespforten’ [literally, ‘portals of the body’].

[1916-1917, 3253]

It seems surprising at first to find one’s parents in dreams as an imperial or royal couple. But it has its parallel in fairy tales. It begins to dawn on us that the many fairy tales which begin ‘Once upon a time there were a King and Queen’ only mean to say that there were once a father and mother. In a family the children are jokingly called ‘princes’ and the eldest ‘crown prince’. The King himself calls himself the father of his country. We speak of small children jokingly as ‘Würmer’ ['worms'] and speak sympathetically of a child as ‘der arme Wurm’ ['the poor worm’].

[1916-1917, 3253]

Let us go back to house-symbolism. When in a dream we make use of the projections on houses for catching hold of, we may be reminded of a common vulgar expression for well developed breasts: ‘She’s got something to catch hold of.’ There is another popular expression in such cases: ‘She’s got plenty of wood in front of the house’, which seems to confirm our interpretation of wood as a female, maternal symbol.

[1916-1917, 3253]
And, speaking of wood, it is hard to understand how that material came to represent what is maternal and female. But here comparative philology may come to our help. Our German word - 'Holz' seems to come from the same root as the Greek 'ἱός' [hule], meaning 'stuff' 'raw material'. This seems to be an instance of the not uncommon event of the general name of a material eventually coming to be reserved for some particular material. Now there is an island in the Atlantic named 'Madeira'. This name was given to it by the Portuguese when they discovered it, because at that time it was covered all over with woods. For in the Portuguese language 'madeira' means 'wood'. You will notice, however, that 'madeira' is only a slightly modified form of the Latin word 'materia', which once more means 'material' in general. But 'mater' is derived from 'mater', 'mother': the material out of which anything is made is, as it were, a mother to it. This ancient view of the thing survives, therefore, in the symbolic use of wood for 'woman' or 'mother'.

Birth is regularly expressed in dreams by some connection with water: one falls into the water or one comes out of the water - one gives birth or one is born. We must not forget that this symbol is able to appeal in two ways to evolutionary truth. Not only are all terrestrial mammals, including man's ancestors, descended from aquatic creatures (this is the more remote of the two facts), but every individual mammal, every human being, spent the first phase of its existence in water - namely as an embryo in the amniotic fluid in its mother's uterus, and came out of that water when it was born. I do not say that the dreamer knows this; on the other hand, I maintain that he need not know it. There is something else that the dreamer probably knows from having been told it in his childhood; and I even maintain of that too that his knowledge of it contributed nothing to the construction of the symbol. He was told in his nursery that the stork brings the babies. But where does it fetch them from? From the pond, or from the stream - once again, then, from the water. One of my patients after he had been given this information - he was a little Count at the time - disappeared for a whole afternoon. He was found at last lying by the edge of the castle pool, with his little face bending over the surface of the water eagerly peering down to try and see the babies at the bottom.

In myths about the birth of heroes - to which Otto Rank has devoted a comparative study, the oldest being that of King Sargon of Agade (about 2800 B.C.) - a predominant part is played by exposure in the water and rescue from the water. Rank has perceived that these are representations of birth, analogous to those that are usual in dreams. If one rescues someone from the water in a dream, one is making one self into his mother, or simply into a mother. In myths a person who rescues a baby from the water is admitting that she is the baby's true mother. There is a well-known comic anecdote according to which an intelligent Jewish boy was asked who the mother of Moses was. He replied without hesitation: 'The Princess.' 'No', he was told, 'she only took him out of the water.' 'That's what she says', he replied, and so proved that he had found the correct interpretation of the myth.

Departure in dreams means dying. So, too, if a child asks where someone is who has died and whom he misses, it is common nursery usage to reply that he has gone on a journey. Once more I should like to contradict the belief that the dream symbol is derived from this evasion. The dramatist is using the same symbolic connection when he speaks of the after-life as 'the undiscovered country from whose bourn no traveller returns'. Even in ordinary life it is common to speak of 'the last journey'. Every one acquainted with ancient rituals is aware of how seriously (in the religion of Ancient Egypt, for instance) the idea is taken of a journey to the land of the dead. Many copies have survived of The Book of the Dead, which was supplied to the mummy like a Baedeker to take with him on the journey. Ever since burial-places have been separated from dwelling-places the dead person's last journey has indeed become a reality.
It is just as little the case that genital symbolism is something that is found only in dreams. Every one of you has probably at one time or another spoken impolitely of a woman as an 'alte Schachtel' ['old box'], perhaps without knowing that you were using a genital symbol. In the New Testament we find woman referred to as 'the weaker vessel'. The Hebrew scriptures, written in a style that comes close to poetry, are full of sexually symbolic expressions, which have not always been correctly understood and whose exegesis (for instance, in the case of the Song of Solomon) has led to some misunderstandings. In later Hebrew literature it is very common to find a woman represented by a house, whose door stands for the sexual orifice. A man complains, for instance, in a case of lost virginity, that he has 'found the door open'. So, too, the symbol of a table for a woman in these writings. Thus, a woman says of her husband: 'I laid the table for him, but he turned it round.' Lame children are said to come about through the man's 'turning the table round'. I take these examples from a paper by Dr. L. Levy of Brünn.

[1916-1917, 3255]

The fact that ships, too, in dreams stand for women is made credible by the etymologists, who tell us that 'Schiff [ship]' was originally the name of an earthenware vessel and is the same word as 'Schaff' [a dialect word meaning 'tub']. That ovens represent women and the uterus is confirmed by the Greek legend of Periander of Corinth and his wife Melissa. The tyrant, according to Herodotus, conjured up the shade of his wife, whom he had loved passionately but had murdered out of jealousy, to obtain some information from her. The dead woman proved her identity by saying that he (Periander) had pushed his bread into a cold oven', as a disguise for an event which no one else could know of. In the periodical Anthropophyteia, edited by F. S. Krauss, an invaluable source of knowledge of sexual anthropology, we learn that in a particular part of Germany they say of a woman who has given birth to a child that 'her oven has come to pieces'. Kindling fire, and everything to do with it, is intimately interwoven with sexual symbolism. Flame is always a male genital, and the fireplace, the hearth is its female counterpart.

[1916-1917, 3256]

If you may have felt surprised at the frequency with which landscapes are used in dreams to represent the female genitals, you can learn from mythology the part played by Mother Earth in the concepts and cults of the peoples of antiquity and how their view of agriculture was determined by this symbolism. You will perhaps be inclined to trace the fact that in dreams a room represents a woman to the common usage in our language by which 'Frau' is replaced by 'Frauenzimmer'¹ - the human being is replaced by the apartment allotted to her. Similarly we speak of the 'Sublime Porte', meaning the Sultan and his government. So too the title of the Ancient Egyptian ruler, 'Pharaoh', means simply 'Great Courtyard'. (In the Ancient East the courts between the double gateways of a city were public meeting-places like the market-places of the classical world.) This derivation, however, appears to be too superficial. It seems to me more likely that a room became the symbol of a woman as being the space which encloses human beings. We have already found 'house' used in a similar sense; and mythology and poetical language enable us to add 'city', 'citadel', 'castle' and 'fortress' as further symbols for 'woman'. The question could be easily settled from the dreams of people who do not speak or understand German. During the last few years I have mainly treated foreign-speaking patients, and I seem to remember that in their dreams too 'Zimmer' ['room'] meant 'Frauenzimmer', though they had no similar usage in their languages. There are other indications that the symbolic relation can go beyond the limits of language - which, incidentally was asserted long ago by an old investigator of dreams, Schubert. However, none of my dreamers were completely ignorant of German, so the decision must be left to psycho-analysts who can collect data from unilingual people in other countries.

[1916-1917, 3256]
There is scarcely one of the symbolic representations of the male genitals which does not recur in joking, vulgar or poetic usage, especially in the ancient classical dramatists. But here we meet not only the symbols which appear in dreams, but others besides - for instance tools employed in various operations, and particularly the plough. Moreover, the symbolic representation of masculinity leads us to a very extensive and much disputed region, which, on grounds of economy, we shall avoid. I should like, however, to devote a few words to one symbol, which, as it were, falls outside this class - the number 3. Whether this number owes its sacred character to this symbolic connection remains undecided. But what seems certain is that a number of tripartite things that occur in nature - the clover leaf, for instance - owe their use for coats of arms and emblems to this symbolic meaning. Similarly, the tripartite lily - the so-called fleur-de-lis - and the remarkable heraldic device of two islands so far apart as Sicily and the Isle of Man - the triskeles (three bent legs radiating from a centre) - seem to be stylized versions of the male genitals. Likenesses of the male organ were regarded in antiquity as the most powerful apotropaic (means of defence) against evil influences, and, in conformity with this, the lucky charms of our own day can all be easily recognized as genital or sexual symbols. Let us consider a collection of such things - as they are worn, for instance, in the form of small silver hanging trinkets: a four-leaved clover, a pig, a mushroom, a horse-shoe, a ladder, a chimney-sweep. The four-leaved clover has taken the place of the three-leaved one which is really suited to be a symbol. The pig is an ancient fertility symbol. The mushroom is an undoubted penis-symbol: there are mushrooms which owe their systematic name (Phallus impudicus) to their unmistakable resemblance to the male organ. The horseshoe copies the outline of the female genital orifice, while the chimney-sweep, who carries the ladder, appears in this company on account of his activities, with which sexual intercourse is vulgarly compared. (Cf. Anthropophyteia.) We have made the acquaintance of his ladder in dreams as a sexual symbol; here German linguistic usage comes to our help and shows us how the word 'steigen' ['to climb', or 'to mount'] is used in what is par excellence a sexual sense. We say 'den Frauen nachsteigen ['to run' (literally 'climb') 'after women'], and 'eine Steiger' ['an old rake' (literally 'climber')]. In French, in which the word for steps on a staircase is 'marches', we find a precisely analogous term 'un vieux marcheur'. The fact that in many large animals climbing or 'mounting' on the female is a necessary preliminary to sexual intercourse probably fits into this context.

'Pulling off a branch' as a symbolic representation of masturbation is not merely in harmony with vulgar descriptions of the act but has far-reaching mythological parallels. But that masturbation, or rather the punishment for it - castration -, should be represented by the falling out or pulling out of teeth is especially remarkable, since there is a counterpart to it in anthropology which can be known to only a very small number of dreamers. There seems to me no doubt that the circumcision practised by so many peoples is an equivalent and substitute for castration. And we now learn that certain primitive tribes in Australia carry out circumcision as a puberty rite (at the festival to celebrate a boy's attaining sexual maturity), while other tribes, their near neighbours, have replaced this act by the knocking out of a tooth.

[1916-1917, 3257]

[1916-1917, 3258]
In the first place we are faced by the fact that the dreamer has a symbolic mode of expression at his disposal which he does not know in waking life and does not recognize. This is as extraordinary as if you were to discover that your housemaid understood Sanskrit, though you know that she was born in a Bohemian village and never learnt it. It is not easy to account for this fact by the help of our psychological views. We can only say that the knowledge of symbolism is unconscious to the dreamer, that it belongs to his unconscious mental life. But even with this assumption we do not meet the point. Hitherto it has only been necessary for us to assume the existence of unconscious endeavours - endeavours, that is, of which, temporarily or permanently, we know nothing. Now, however, it is a question of more than this, of unconscious pieces of knowledge, of connections of thought, of comparisons between different objects which result in its being possible for one of them to be regularly put in place of the other. These comparisons are not freshly made on each occasion; they lie ready to hand and are complete, once and for all. This is implied by the fact of their agreeing in the case of different individuals - possibly, indeed, agreeing in spite of differences of language. What can be the origin of these symbolic relations? Linguistic usage covers only a small part of them. The multiplicity of parallels in other spheres of knowledge are mostly unknown to the dreamer; we ourselves have been obliged to collect them laboriously.

Secondly, these symbolic relations are not something peculiar to dreamers or to the dream-work through which they come to expression. This same symbolism, as we have seen, is employed by myths and fairy tales, by the people in their sayings and songs, by colloquial linguistic usage and by the poetic imagination. The field of symbolism is immensely wide, and dream symbolism is only a small part of it: indeed, it serves no useful purpose to attack the whole problem from the direction of dreams. Many symbols which are commonly used elsewhere appear in dreams very seldom or not at all. Some dream symbols are not to be found in all other fields but only, as you have seen, here and there. One gets an impression that what we are faced with here is an ancient but extinct mode of expression, of which different pieces have survived indifferent fields, one piece only here, another only there, a third, perhaps, in slightly modified forms in several fields. And here I recall the phantasy of an interesting psychotic patient, who imagined a 'basic language' of which all these symbolic relations would be residues.

Thirdly, it must strike you that the symbolism in the other fields I have mentioned is by no means solely sexual symbolism, whereas in dreams symbols are used almost exclusively for the expression of sexual objects and relations. This is not easily explained either. Are we to suppose that symbols which originally had a sexual significance later acquired another application and that, furthermore, the toning-down of representation by symbols into other kinds of representation may be connected with this? These questions can evidently not be answered so long as we have considered dream-symbolism alone. We can only hold firmly to the suspicion that there is a specially intimate relation between true symbols and sexuality.
In this connection we have been given an important hint during the last few years. A philologist, Hans Sperber, of Uppsala, who works independently of psycho-analysis, has put forward the argument that sexual needs have played the biggest part in the origin and development of speech. According to him, the original sounds of speech served for communication, and summoned the speaker's sexual partner; the further development of linguistic roots accompanied the working activities of primal man. These activities, he goes on, were performed in common and were accompanied by rhythmically repeated utterances. In this way a sexual interest became attached to work. Primal man made work acceptable, as it were, by treating it as an equivalent and substitute for sexual activity. The words enunciated during work in common thus had two meanings; they denoted sexual acts as well as the working activity equated with them. As time went on, the words became detached from the sexual meaning and fixed to the work. In later generations the same thing happened with new words, which had a sexual meaning and were applied to new forms of work. In this way a number of verbal roots would have been formed, all of which were of sexual origin and had subsequently lost their sexual meaning. If the hypothesis I have here sketched out is correct, it would give us a possibility of understanding dream symbolism. We should understand why dreams, which preserve something of the earliest conditions, have such an extraordinarily large number of sexual symbols, and why, in general, weapons and tools always stand for what is male, while materials and things that are worked upon stand for what is female. The symbolic relation would be the residue of an ancient verbal identity; things which were once called by the same name as the genitals could now serve as symbols for them in dreams.

[1916-1917, 3260]

The fourth of my reflections takes us back to the beginning and directs us along our prescribed path. I have said that even if there were no dream-censorship dreams would still not be easily intelligible to us, for we should still be faced with the task of translating the symbolic language of dreams into that of our waking thought. Thus symbolism is a second and independent factor in the distortion of dreams, alongside of the dream-censorship. It is plausible to suppose, however, that the dream-censorship finds it convenient to make use of symbolism, since it leads towards the same end - the strangeness and incomprehensibility of dreams.

[1916-1917, 3261]

LADIES AND GENTLEMEN, - When you have thoroughly grasped the dream-censorship and representation by symbols, you will not yet, it is true, have completely mastered the distortion in, dreams, but you will nevertheless be in a position to understand most dreams. In doing so you will make use of both of the two complementary techniques: calling up ideas that occur to the dreamer till you have penetrated from the substitute to the genuine thing and, on the ground of your own knowledge, replacing the symbols by what they mean. Later on we shall discuss some uncertainties that arise in this connection.

[1916-1917, 3262]
Reversals like this, which occur here with individual words, take place in various ways in the dream-work. We already know reversal of meaning, replacement of something by its opposite. Besides this we find in dreams reversals of situation, of the relation between two people - a 'topsy-turvy' world. Quite often in dreams it is the hare that shoots the sportsman. Or again we find a reversal in the order of events, so that what precedes an event causally comes after it in the dream - like a theatrical production by a third-rate touring company, in which the hero falls down dead and the shot that killed him is not fired in the wings till afterwards. Or there are dreams where the whole order of the elements is reversed, so that to make sense in interpreting it we must take the last one first and the first one last. You will remember too from our study of dream symbolism that going or falling into the water means the same as coming out of it - that is, giving birth or being born, and that climbing up a staircase or a ladder is the same thing as coming down it. It is not hard to see the advantage that dream-distortion can derive from this freedom of representation.

You will no doubt recognize the pursuit by the officer in the red cap and the breathless climbing upstairs as representing the sexual act. The fact that it was the dreamer who locked herself up against her pursuer will serve as an example of the reversals that are used so commonly in dreams, for it was the man who had avoided the consummation of the sexual act. In the same way, her grief was displaced on to the man, for it was he who wept in the dream - and this was simultaneously a representation of the emission of semen.

(6) I have a particular reason for piling up instances of the use of symbols in dreams. At our first meeting I lamented the difficulty of providing demonstrations and so of carrying conviction in giving instruction in psycho-analysis. And I have no doubt that you have since come to agree with me. But the different theses of psycho-analysis are so intimately connected that conviction can easily be carried over from a single point to a larger part of the whole. It might be said of psycho-analysis that if anyone holds out a little finger to it it quickly grasps his whole hand. No one, even, who has accepted the explanation of parapraxes can logically withhold his belief in all the rest. A second, equally accessible position is offered by dream-symbolism. Here is the dream of an uneducated woman whose husband was a policeman and who had certainly never heard anything about dream-symbolism or psycho-analysis. Then judge for yourselves whether its explanation by the help of sexual symbols can be called arbitrary and forced:

You will have no trouble in recognizing the symbols used. The male genitals are represented by a triad of figures, and the female ones by a landscape with a chapel, hill and wood. Once again you find steps as a symbol for the sexual act. What is called a hill in the dream is also called one in anatomy - the Mons Veneris.

(7) And here is yet another dream that must be solved by the insertion of symbols. It is notable and convincing from the fact that the dreamer himself translated all the symbols, though he had no sort of previous theoretical knowledge of dream-interpretation. Such an attitude is quite unusual and its determinants are not precisely understood:
The courtyard in which the sheet of tin was spread out is not to be taken symbolically in the first instance. It was derived from the business premises of the dreamer's father. For reasons of discretion I have substituted 'tin' for another material in which his father actually dealt: but I have made no other change in the wording of the dream. The dreamer had entered his father's business and had taken violent objection to the somewhat dubious practices on which the firm's earnings in part depended. Consequently the dream-thought I have just interpreted may have continued in this way: 'If I had asked him), he would have deceived me just as he deceives his customers.' As regards the 'pulling off' which served to represent his father's dishonesty in business, the dreamer himself produced a second explanation - namely that it stood for masturbating. Not only have we long been familiar with this interpretation, but there was something to confirm it in the fact that the secret nature of masturbation was represented by its reverse: it might be done openly. Just as we should expect, the masturbatory activity was once again displaced on to the dreamer's father, like the questioning in the first scene of the dream. He promptly interpreted the shaft as a vagina, having regard to the soft cushioning of its walls. I added on my own authority that climbing down, like climbing up in other cases, described sexual intercourse in the vagina.

[1916-1917, 3285]

In connection with this he thought of a story told him by a friend. A lunatic was being conveyed in a compartment on an Italian line, but through carelessness a traveller was allowed in with him. The madman killed the other traveller. Thus he was identifying himself with the madman, and based his right to do so on an obsession by which he was tormented from time to time that he must 'get rid of all accessory witnesses'. But then he himself found a better reason, and this led to the precipitating cause of the dream. At the theatre the night before he had once more seen the girl whom he had wanted to marry but had withdrawn from because she had given him ground for being jealous. In view of the intensity reached by his jealousy he would, he thought, really be mad to want to marry her. This meant that he regarded her as so untrustworthy that, in his jealousy, he would have to kill everyone who came his way. We have already come across walking through a series of rooms (here, railway coaches) as a symbol of marriage (a reversal of 'monogamy').

[1916-1917, 3288]

You may conclude from this that if we study the dream-work further we must succeed in gaining valuable light on the little known beginnings of our intellectual development. I hope it will be so; but this work has not so far been started upon. The prehistory into which the dream-work leads us back is of two kinds - on the one hand, into the individual's prehistory, his childhood, and on the other, in so far as each individual some how recapitulates in an abbreviated form the entire development of the human race, into phylogenetic prehistory too. Shall we succeed in distinguishing which portion of the latent mental processes is derived from the individual prehistoric period and which portion from the phylogenetic one? It is not, I believe, impossible that we shall. It seems to me, for instance, that symbolic connections, which the individual has never acquired by learning, may justly claim to be regarded as a phylogenetic heritage.

[1916-1917, 3289]
You may have formed an impression that, even though the technique is correctly carried out, the findings of our interpretative work on dreams admit of so many uncertainties as to defeat any secure translation of the manifest dream into the latent dream-thoughts. You will argue in support of this that in the first place one never knows whether a particular element of the dream is to be understood in its actual sense or as a symbol, since the things employed as symbols do not cease on that account to be themselves. If, however, one has no objective clue for deciding this, the interpretation must at that point be left to the arbitrary choice of the interpreter. Furthermore, as a result of the fact that in the dream-work contraries coalesce, it is always left undetermined whether a particular element is to be understood in a positive or negative sense - as itself or as its contrary. Here is a fresh opportunity for the interpreter to exercise an arbitrary choice. Thirdly, in consequence of the reversals of every kind of which dreams are so fond, it is open to the interpreter to carry out a reversal like this in connection with any passage in the dream he chooses. And lastly, you will mention having heard that one is never certain whether the interpretation one has found for a dream is the only possible one. We run the risk of overlooking a perfectly admissible 'over-interpretation' of the same dream. In these circumstances, you will conclude, so much room is left to the interpreter's arbitrary decision as to be incompatible with objective certainty in the findings. Or alternatively you may suppose that the fault does not lie with dreams but that the inadequacies of our dream-interpretation are to be attributed to errors in our views and premisses.

All your material is unimpeachable, but it does not, I think, justify your conclusions, and in two respects: namely that the interpretation of dreams is, as you insist, at the mercy of arbitrary choice and that the lack of results throws doubts on the correctness of our procedure. If instead of the interpreter's arbitrary choice you would speak of his skill, his experience and his understanding, I should agree with you. We cannot, of course, do without a personal factor of that kind, especially in the more difficult problems of dream-interpretation. But the position is no different in other scientific occupations. There is no means of preventing one person from handling a particular technique worse than another, or one person from making better use of it than another. What in other ways gives an impression of arbitrariness - in, for instance, the interpretation of symbols - is done away with by the fact that as a rule the interconnection between the dream-thoughts, or the connection between the dream and the dreamer's life, or the whole psychical situation in which the dream occurs, selects a single one from among the possible determinations presented and dismisses the rest as unserviceable. The conclusion that because of the imperfections of dream-interpretation our hypotheses are incorrect is invalidated by pointing out that on the contrary ambiguity or indefiniteness is a characteristic of dreams which was necessarily to be anticipated.

It was clear, in the first place, that the patient was identifying herself with her husband; she was playing his part by imitating his running from one room into the other. Further, to carry on the analogy, we must agree that the bed and the sheet were replaced by the table and the tablecloth. This might seem arbitrary, but surely we have not studied dream-symbolism to no purpose. In dreams too we often find a table which has to be interpreted as a bed. Table and bed together stand for marriage, so that the one can easily take the place of the other.
Our patient gradually came to learn that it was as symbols of the female genitals that clocks were banished from her equipment for the night. Clocks and watches - though elsewhere we have found other symbolic interpretations for them - have arrived at a genital role owing to their relation to periodic processes and equal intervals of time. A woman may boast that her menstruation behaves with the regularity of clockwork. Our patient's anxiety, however, was directed in particular against being disturbed in her sleep by the ticking of a clock. The ticking of a clock may be compared with the knocking or throbbing in the clitoris during sexual excitement. She had in fact been repeatedly woken from her sleep by this sensation, which had now become distressing to her; and she gave expression to this fear of an erection in the rule that all clocks and watches that were going should be removed from her neighbourhood at night.

Flower-pots and vases, like all vessels, are also female symbols. Taking precautions against their falling and being broken at night was thus not without its good sense. We know the widespread custom of breaking a vessel or plate at betrothal ceremonies. Each man present gets hold of a fragment, and we may regard this as a sign of his resigning the claims he had upon the bride in virtue of a marriage-regulation dating from before the establishment of monogamy. In connection with this part of her ceremonial the girl produced a recollection and several associations. Once when she was a child she had fallen down while she was carrying a glass or china vase and had cut her finger and bled profusely. When she grew up and came to know the facts about sexual intercourse she formed an anxious idea that on her wedding-night she would not bleed and would thus fail to show that she was a virgin. Her precautions against vases being broken thus meant a repudiation of the whole complex concerned with virginity and bleeding at the first intercourse - a repudiation equally of the fear of bleeding and of the contrary fear of not bleeding. These precautions, which she subsumed under her avoidance of noise, had only a remote connection with it.

A quite similar difficulty faces us in the theory of dreams. I could not deal with it in our earlier discussions on dreams. The manifest content of dreams is of the greatest diversity and individual variety, and we have shown in detail what one derives from this content by means of analysis. But alongside of these there are dreams which equally deserve to be called 'typical', which happen in everyone in the same way, dreams with a uniform content, which offer the same difficulties to interpretation. They are dreams of falling, flying, floating, swimming, of being inhibited, of being naked and certain other anxiety dreams - which lead, in different people, now to this and now to that interpretation, without any light being thrown on their monotony and typical occurrence. But in these dreams too we observe that this common background is enlivened by additions that vary individually; and it is probable that, with a widening of our knowledge, it will be possible, without constraint, to include these dreams too in the understanding of dream-life which we have acquired from other dreams.

We also concluded from the first incomplete analysis of the dream that the wolf may have been a father-surrogate; so that, in that case, this first anxiety-dream would have brought to light the fear of his father which from that time forward was to dominate his life. This conclusion, indeed, was in itself not yet binding. But if we put together as the result of the provisional analysis what can be derived from the material produced by the dreamer, we then find before us for reconstruction some such fragments as these:

The big walnut tree. The representative of the Christmas tree, and therefore belonging to the current situation. But also the tree out of the wolf story, on which the tailor took refuge from pursuit, and under which the wolves were on the watch. Moreover, as I have often been able to satisfy myself, a high tree is a symbol of observing, of scopophilia. A person sitting on a tree can see everything that is going on below him and cannot himself be seen. Compare Boccaccio's well-known story, and similar facetiae.

Just as vermin often stands for babies in dreams and phobias.
[1918b, 3564]

Permanent marks have been left by this oral phase of sexuality upon the usages of language. People commonly speak for instance, of an 'appetizing' love-object, and describe persons they are fond of as 'sweet'. It will be remembered, too, that our little patient would only eat sweet things. In dreams sweet things and sweetmeats stand regularly for caresses or sexual gratifications.
[1918b, 3583]

This is most easily seen in the relation between 'baby' and 'penis'. It cannot be without significance that in the symbolic language of dreams, as well as of everyday life, both may be replaced by the same symbol; both baby and penis are called a 'little one'. It is a well-known fact that symbolic speech often ignores difference of sex. The 'little one', which originally meant the male genital organ, may thus have acquired a secondary application to the female genitals.
[1917c, 3600]

We know from psycho-analytic experience, however, that the fear of damaging or losing one's eyes is a terrible one in children. Many adults retain their apprehensiveness in this respect, and no physical injury is so much dreaded by them as an injury to the eye. We are accustomed to say, too, that we will treasure a thing as the apple of our eye. A study of dreams, phantasies and myths has taught us that anxiety about one's eyes, the fear of going blind, is often enough a substitute for the dread of being castrated. The self-blinding of the mythical criminal, Oedipus, was simply a mitigated form of the punishment of castration - the only punishment that was adequate for him by the lex talionis. We may try on rationalistic grounds to deny that fears about the eye are derived from the fear of castration, and may argue that it is very natural that so precious an organ as the eye should be guarded by a proportionate dread. Indeed, we might go further and say that the fear of castration itself contains no other significance and no deeper secret than a justifiable dread of this rational kind. But this view does not account adequately for the substitutive relation between the eye and the male organ which is seen to exist in dreams and myths and phantasies; nor can it dispel the impression that the threat of being castrated in especial excites a peculiarly violent and obscure emotion, and that this emotion is what first gives the idea of losing other organs its intense colouring. All further doubts are removed when we learn the details of their 'castration complex' from the analysis of neurotic patients, and realize its immense importance in their mental life.
[1919h, 3684]

The theme of the 'double' has been very thoroughly treated by Otto Rank (1914). He has gone into the connections which the 'double' has with reflections in mirrors, with shadows, with guardian spirits, with the belief in the soul and with the fear of death; but he also lets in a flood of light on the surprising evolution of the idea. For the 'double' was originally an insurance against the destruction of the ego, an 'energetic denial of the power of death', as Rank says; and probably the 'immortal' soul was the first 'double' of the body. This invention of doubling as a preservation against extinction has its counterpart in the language of dreams, which is fond of representing castration by a doubling or multiplication of a genital symbol. The same desire led the Ancient Egyptians to develop the art of making images of the dead in lasting materials. Such ideas, however, have sprung from the soil of unbounded self-love, from the primary narcissism which dominates the mind of the child and of primitive man. But when this stage has been surmounted, the 'double' reverses its aspect. From having been an assurance of immortality, it becomes the uncanny harbinger of death.
[1919h, 3687]
The hero claims to have acted alone in accomplishing the deed, which certainly only the horde as a whole would have ventured upon. But, as Rank has observed, fairy tales have preserved clear traces of the facts which were disavowed. For we often find in them that the hero who has to carry out some difficult task (usually the youngest son, and not infrequently one who has represented himself to the father-substitute as being stupid, that is to say, harmless) - we often find, then, that this hero can carry out his task only by the help of a crowd of small animals, such as bees or ants. These would be the brothers in the primal horde, just as in the same way in dream symbolism insects or vermin signify brothers and sisters (contemptuously, considered as babies). Moreover every one of the tasks in myths and fairy tales is easily recognizable as a substitute for the heroic deed.

[1921c, 3827]

The dream which the writer of the letter asks us to interpret is not hard to understand. It is a dream of rescuing from water, a typical birth-dream. The language of symbolism, as you are aware, knows no grammar; it is an extreme case of a language of infinitives, and even the active and passive are represented by one and the same image. If in a dream a woman pulls (or tries to pull) a man out of the water, that may mean that she wants to be his mother (takes him for her son as Pharaoh's daughter did with Moses). Or it may mean that she wants him to make her into a mother: she wants to have a son by him, who, as a likeness of him, can be his equivalent. The tree-trunk to which the woman was clinging is easily recognized as a phallic symbol, even though it is not standing straight up, but inclined towards the surface of the water - in the dream the word is 'bent'. The onrush and recoil of the breakers brought to the mind of another dreamer who was relating a similar dream a comparison with the intermittent pains of labour; and when, knowing that she had not yet borne a child, I asked her how she knew of this characteristic of labour, she said that she imagined labour as a kind of colic - a quite unimpeachable description physiologically. She gave the association 'The Waves of the Sea and of Love'. How our present dreamer at so early as age can have arrived at the finer details of symbolism - tongue of land, palm-tree - I am naturally unable to say. We must not, moreover, overlook the fact that, when people assert that they have for years been pursued by the same dream, it often turns out that the manifest content is not quite the same. Only the kernel of the dream has recurred each time; the details of the content are changed or additions are made to them.

[1922a, 3892]

Our dreamer quite correctly supposed that her first memories of childhood would be of value in the interpretation of her early and recurrent dream. In the first scene, before she was one year old, as she was sitting in her perambulator she saw two horses beside her, one looking at her. This she described as her most vivid experience; she had the feeling that it was a human being. This was a feeling which we can understand only if we assume that the two horses represented, in this case as so often, a married couple, father and mother. It was, as it were, a flash of infantile totemism. If we could, we should ask the writer whether the brown horse who looked at her so humanly could not be recognized by its colouring as her father. The second recollection was associatively connected with the first through the same 'understanding' gaze. Taking the little bird in her hand, however, reminds the analyst, who has prejudices of his own, of a feature in the dream in which the woman's hand was in contact with another phallic symbol.

[1922a, 3893]
The little series of reminiscences must engage our attention for a while longer. I have stated elsewhere that such scenes of childhood are 'screen memories' selected at a later period, put together, and not infrequently falsified in the process. This subsequent remodelling serves a purpose that is sometimes easy to guess. In our case one can almost hear the writer's ego glorifying or soothing itself by means of this series of recollections. 'I was from infancy a particularly noble and compassionate creature. I learnt quite early that animals have souls as we have, and could not endure cruelty to animals. The sins of the flesh were far from me and I preserved my chastity till late in life.' With declarations such as these she was loudly contradicting the inferences that we have to make about her early childhood on the basis of our analytical experience, namely, that she had an abundance of premature sexual impulses and violent feelings of hatred for her mother and her younger brothers and sisters. (Besides the genital significance I have just assigned to it, the little bird may also be a symbol of a child, like all small animals; her recollection thus accentuated very insistently the fact that this small creature had the same right to exist as she herself.) Hence the short series of recollections furnishes a very nice example of a mental structure with a twofold aspect. Viewed superficially, we may find in it the expression of an abstract idea, here, as usually, with an ethical reference. In Silberer's nomenclature the structure has an anagogic content. On deeper investigation it reveals itself as a chain of phenomena belonging to the region of the repressed life of the instincts - it displays its psycho-analytic content. As you know, Silberer, who was among the first to issue a warning to us not to lose sight of the nobler side of the human soul, has put forward the view that all or nearly all dreams permit such a twofold interpretation, a purer, anagogic one beside the ignoble, psycho-analytic one. This is, however, unfortunately not so. On the contrary, an over-interpretation of this kind is rarely possible. To my knowledge no valid example of such a dream-analysis with a double meaning has been published up to the present time. But observations of this kind can often be made upon the series of associations that our patients produce during analytic treatment. On the one hand the successive ideas are linked by a line of association which is plain to the eye, while on the other hand you become aware of an underlying theme which is kept secret but which at the same time plays a part in all these ideas. The contrast between the two themes that dominate the same series of ideas is not always one between the lofty anagogic and the low psycho-analytic, but one rather between offensive and respectable or indifferent ideas - a fact that easily explains why such a chain of associations with a twofold determination arises. In our present example it is of course not accidental that the anagogic and the psycho-analytic interpretations stood in such a sharp contrast to each other; both related to the same material, and the later trend was no other than that of the reaction-formations which had been erected against the disowned instinctual impulses.

Symbolism. - In the course of investigating the form of expression brought about by the dream-work, the surprising fact emerged that certain objects, arrangements and relations are represented, in a sense indirectly, by 'symbols', which are used by the dreamer without his understanding them and to which as a rule he offers no associations. Their translation has to be provided by the analyst, who can himself only discover it empirically by experimentally fitting it into the context. It was later found that linguistic usage, mythology and folklore afford the most ample analogies to dream-symbols. Symbols, which raise the most interesting and hitherto unsolved problems, seem to be a fragment of extremely ancient inherited mental equipment. The use of a common symbolism extends far beyond the use of a common language.
The hair upon Medusa's head is frequently represented in works of art in the form of snakes, and these once again are derived from the castration complex. It is a remarkable fact that, however frightening they may be in themselves, they nevertheless serve actually as a mitigation of the horror, for they replace the penis, the absence of which is the cause of the horror. This is a confirmation of the technical rule according to which a multiplication of penis symbols signifies castration.

[1940c [1922], 3943]

The sight of Medusa's head makes the spectator stiff with terror, turns him to stone. Observe that we have here once again the same origin from the castration complex and the same transformation of affect! For becoming stiff means an erection. Thus in the original situation it offers consolation to the spectator: he is still in possession of a penis, and the stiffening reassures him of the fact.

[1940c [1922], 3943]

What is of far greater importance is the question of whether the work of interpretation proceeds under a pressure of resistance which is high or low - a point on which the analyst never remains long in doubt. If the pressure is high, one may perhaps succeed in discovering what the things are with which the dream is concerned, but one cannot make out what it says about these things. It is as though one were trying to listen to a conversation taking place at a distance or in a very low voice. In that case, one can feel confident that there is not much prospect of collaborating with the dreamer, one decides not to bother too much about it and not to give him much help, and one is content to put before him a few translations of symbols that seem probable.

[1923c, 4031]

There seems to be no end to the problems of dream-life. But this can only be surprising if we forget that all the problems of mental life recur in dreams with the addition of a few new ones arising from the special nature of dreams. Many of the things that we study in dreams, because we meet with them there, have nevertheless little or nothing to do with the psychological peculiarity of dreams. Thus, for instance, symbolism is not a dream-problem, but a topic connected with our archaic thinking - our 'basic language', as it was aptly called by the paranoic Schreber. It dominates myths and religious ritual no less than dreams, and dream-symbolism can scarcely even claim that it is peculiar in that it conceals more particularly things that are important sexually. Again, it is not to be expected that the explanation of anxiety-dreams will be found in the theory of dreams. Anxiety is a problem rather of neurosis, and all that remains to be discussed is how it comes about that anxiety can arise under dream-conditions.

[1925i, 4052]
There is no difficulty in discovering the general function of dreaming. It serves the purpose of fending off, by a kind of soothing action, external or internal stimuli which would tend to arouse the sleeper, and thus of securing sleep against interruption. External stimuli are fended off by being given a new interpretation and by being woven into some harmless situation; internal stimuli, caused by instinctual demands, are given free play by the sleeper and allowed to find satisfaction in the formation of dreams, so long as the latent dream-thoughts submit to the control of the censorship. But if they threaten to break free and the meaning of the dream becomes too plain, the sleeper cuts short the dream and wakes in a fright. (Dreams of this class are known as anxiety-dreams.) A similar failure in the function of dreaming occurs if an external stimulus becomes too strong to be fended off. (This is the class of arousal-dreams.) I have given the name of dream-work to the process which, with the co-operation of the censorship, converts the latent thoughts into the manifest content of the dream. It consists of a peculiar way of treating the preconscious material of thought, so that its component parts become condensed, its psychical emphasis becomes displaced, and the whole of it is translated into visual images or dramatized, and completed by a deceptive secondary revision. The dream-work is an excellent example of the processes occurring in the deeper, unconscious layers of the mind, which differ considerably from the familiar normal processes of thought. It also displays a number of archaic characteristics, such as the use of a symbolism (in this case of a predominantly sexual kind) which it has since also been possible to discover in other spheres of mental activity.

[1925d, 4220]

I have taken but little direct part in certain other applications of psycho-analysis, though they are none the less of general interest. It is only a step from the phantasies of individual neurotics to the imaginative creations of groups and peoples as we find them in myths, legends, and fairy tales. Mythology became the special province of Otto Rank; the interpretation of myths, the tracing of them back to the familiar unconscious complexes of early childhood, the replacing of astral explanations by a discovery of human motives, all of this is to a large extent due to his analytic efforts. The subject of symbolism, too, has found many students among my followers. Symbolism has brought psycho-analysis many enemies; many enquirers with unduly prosaic minds have never been able to forgive it the recognition of symbolism, which followed from the interpretation of dreams. But analysis is guiltless of the discovery of symbolism, for it had long been known in other regions of thought (such as folklore, legends, and myths) and plays an even larger part in them than in the 'language of dreams'.

[1925d, 4242]
Just a moment! Things are not quite as bad as that. Why do you choose to except your own mental processes from the rule of law which you recognize in other people's? When you have attained some degree of self-discipline and have certain knowledge at your disposal, your interpretations will be independent of your personal characteristics and will hit the mark. I am not saying that the analyst's personality is a matter of indifference for this portion of his task. A kind of sharpness of hearing for what is unconscious and repressed, which is not possessed equally by everyone, has a part to play. And here, above all, we are brought to the analyst's obligation to make himself capable, by a deep-going analysis of his own, of the unprejudiced reception of the analytic material. Something, it is true, still remains over: something comparable to the 'personal equation' in astronomical observations. This individual factor will always play a larger part in psycho-analysis than elsewhere. An abnormal person can become an accurate physicist; as an analyst he will be hampered by his own abnormality from seeing the pictures of mental life undistorted. Since it is impossible to demonstrate to anyone his own abnormality, general agreement in matters of depth-psychology will be particularly hard to reach. Some psychologists, indeed, think it is quite impossible and that every fool has an equal right to give out his folly as wisdom. I confess that I am more of an optimist about this. After all, our experiences show that fairly satisfactory agreements can be reached even in psychology. Every field of research has its particular difficulty which we must try to eliminate. And, moreover, even in the interpretative art of analysis there is much that can be learnt like any other material of study: for instance, in connection with the peculiar method of indirect representation through symbols.

Within this narrow compass it has been impossible to mention many matters of the greatest interest, such as the 'sublimation' of instincts, the part played by symbolism, the problem of ambivalence, etc. Nor has there been space to allude to the applications of psycho-analysis, which originated, as we have seen, in the sphere of medicine, to other departments of knowledge (such as Social Anthropology, the Study of Religion, Literary History and Education) where its influence is constantly increasing. It is enough to say that psycho-analysis, in its character of the psychology of the deepest, unconscious mental acts, promises to become the link between psychiatry and all of these other branches of mental science.

Our knowledge of the historical worth of certain religious doctrines increases our respect for them, but does not invalidate our proposal that they should cease to be put forward as the reasons for the precepts of civilization. On the contrary! Those historical residues have helped us to view religious teachings, as it were, as neurotic relics, and we may now argue that the time has probably come, as it does in an analytic treatment, for replacing the effects of repression by the results of the rational operation of the intellect. We may foresee, but hardly regret, that such a process of remoulding will not stop at renouncing the solemn transfiguration of cultural precepts, but that a general revision of them will result in many of them being done away with. In this way our appointed task of reconciling men to civilization will to a great extent be achieved. We need not deplore the renunciation of historical truth when we put forward rational grounds for the precepts of civilization. The truths contained in religious doctrines are after all so distorted and systematically disguised that the mass of humanity cannot recognize them as truth. The case is similar to what happens when we tell a child that new-born babies are brought by the stork. Here, too, we are telling the truth in symbolic clothing, for we know what the large bird signifies. But the child does not know it. He hears only the distorted part of what we say, and feels that he has been deceived; and we know how often his distrust of the grown-ups and his refractoriness actually take their start from this impression. We have become convinced that it is better to avoid such symbolic disguisings of the truth in what we tell children and not to withhold from them a knowledge of the true state of affairs commensurate with their intellectual level.

[1926e, 4362]

[1926f, 4406]

[1927c, 4453]
As regards the melon, the dreamer has had the - original - idea of seeing in it 'the charms of solitude, but presented by purely human inducements'. This is certainly not correct, but it might provide an association of ideas which would lead to a correct explanation. If it is correlated with his state of sin, this association might stand for a sexual picture which occupied the lonely young man's imagination.
[1929b, 4574]

If in general and primarily we are dependent, in interpreting dreams, on the dreamer's associations, yet in relation to certain elements of the dream's content we adopt a quite independent attitude, chiefly because we have to, because as a rule associations fail to materialize in their case. We noticed at an early stage that it is always in connection with the same elements that this happens; they are not very numerous, and repeated experience has taught us that they are to be regarded and interpreted as symbols of something else. As contrasted with the other dream-elements, a fixed meaning may be attributed to them, which, however, need not be unambiguous and whose range is determined by special rules with which we are unfamiliar. Since we know how to translate these symbols and the dreamer does not, in spite of having used them himself, it may happen that the sense of a dream may at once become clear to us as soon as we have heard the text of the dream, even before we have made any efforts at interpreting it, while it still remains an enigma to the dreamer himself. But I have said so much to you in my earlier lectures about symbolism, our knowledge of it and the problems it poses us, that I need not repeat it to-day.
[1933a, 4627]

Let us go back once more to the latent dream-thoughts. Their most powerful element is the repressed instinctual impulse which has created in them an expression for itself on the basis of the presence of chance stimuli and by transference on to the day's residues - though an expression that is toned down and disguised. Like every instinctual impulse, it too presses for satisfaction by action; but its path to motility is blocked by the physiological regulations implied in the state of sleep; it is compelled to take the backwards course in the direction of perception and to be content with a hallucinated satisfaction. The latent dream-thoughts are thus transformed into a collection of sensory images and visual scenes. It is as they travel on this course that what seems to us so novel and so strange occurs to them. All the linguistic instruments by which we express the subtler relations of thought - the conjunctions and prepositions, the changes in declension and conjugation - are dropped, because there are no means of representing them; just as in a primitive language without any grammar, only the raw material of thought is expressed and abstract terms are taken back to the concrete ones that are at their basis. What is left over after this may well appear disconnected. The copious employment of symbols, which have become alien to conscious thinking, for representing certain objects and processes is in harmony alike with the archaic regression in the mental apparatus and with the demands of the censorship.
[1933a, 4632]
In the literature of this period you will of course find a large quantity of confirmatory material and of presentation of details, of which I intend only to give you samples. I shall also, incidentally, be able to tell you a few things that were in fact already known earlier. What is in question is principally the symbolism in dreams and the other methods of representation in them. Now listen to this. Only quite a short while ago the medical faculty in an American University refused to allow psycho-analysis the status of a science, on the ground that it did not admit of any experimental proof. They might have raised the same objection to astronomy; indeed, experimentation with the heavenly bodies is particularly difficult. There one has to fall back on observation. Nevertheless, some Viennese investigators have actually made a beginning with experimental confirmation of our dream symbolism. As long ago as in 1912 a Dr. Schrötter found that if instructions to dream of sexual matters are given to deeply hypnotized subjects, then in the dream that is thus provoked the sexual material emerges with its place taken by the symbols that are familiar to us. For instance, a woman was told to dream of sexual intercourse with a female friend. In her dream this friend appeared with a travelling-bag on which was pasted the label 'Ladies Only'. Still more impressive experiments were carried out by Betheim and Hartmann in 1924. They worked with patients suffering from what is known as the Korsakoff confusional psychosis. They told these patients stories of a grossly sexual kind and observed the distortions which appeared when the patients were instructed to reproduce what they had been told. Once more there emerged the symbols for sexual organs and sexual intercourse that are familiar to us - among them the symbol of the staircase which, as the writers justly remark, could never have been reached by a conscious wish to distort.

We have not yet finished with symbols. There are some which we believed we recognized but which nevertheless worried us because we could not explain how this particular symbol had come to have that particular meaning. In such cases confirmations from elsewhere - from philology, folklore, mythology or ritual - were bound to be especially welcome. An instance of this sort is the symbol of an overcoat or cloak. We have said that in a woman's dreams this stands for a man. I hope it will impress you when you hear that Theodor Reik (1920) gives us this information: 'During the extremely ancient bridal ceremonial of the Bedouins, the bridgroom covers the bride with a special cloak known as "Aba" and speaks the following ritual words: "Henceforth none save I shall cover thee!" (Quoted from Robert Eisler). We have also found several fresh symbols, at least two of which I will tell you of. According to Abraham (1922) a spider in dreams is a symbol of the mother, but of the phallic mother, of whom we are afraid; so that the fear of spiders expresses dread of mother-incest and horror of the female genitals. You know, perhaps, that the mythological creation, Medusa's head, can be traced back to the same motif of fright at castration. The other symbol I want to talk to you about is that of the bridge, which has been explained by Ferenczi (1921 and 1922). First it means the male organ, which unites the two parents in sexual intercourse; but afterwards it develops further meanings which are derived from this first one. In so far as it is thanks to the male organ that we are able to come into the world at all, out of the amniotic fluid, a bridge becomes the crossing from the other world (the unborn state, the womb) to this world (life); and, since men also picture death as a return to the womb (to the water), a bridge also acquires the meaning of something that leads to death, and finally, at a further remove from its original sense, it stands for transitions or changes in condition generally. It tallies with this, accordingly, if a woman who has not overcome her wish to be a man has frequent dreams of bridges that are too short to reach the further shore.
The methods of representation employed by the dream-work - fascinating material, scarcely capable of exhaustion - have been made more and more familiar to us by closer study. I will give you a few examples of them. Thus, for instance, dreams represent the relation of frequency by a multiplication of similar things. Here is a young girl's remarkable dream. She dreamt she came into a great hall and found some one in it sitting on a chair; this was repeated six or eight times or more, but each time it was her father. This is easy to understand when we discover, from accessory details in the interpretation, that this room stood for the womb. The dream then becomes equivalent to the phantasy, familiarly found in girls, of having met their rather already during their intra-uterine life when he visited the womb while their mother was pregnant. You should not be confused by the fact that something is reversed in the dream - that her father's 'coming-in' is displaced on to herself; incidentally, this has a special meaning of its own as well. The multiplication of the figure of the father can only express the fact that the event in question occurred repeatedly. After all, it must be allowed that the dream is not taking very much on itself in expressing frequency by multiplicity. It has only needed to go back to the original significance of the former word; to-day it means to us a repetition in time, but it is derived from an accumulation in space. In general, indeed, where it is possible, the dream-work changes temporal relations into spatial ones and represents them as such. In a dream, for instance, one may see a scene between two people who look very small and a long way off, as though one were seeing them through the wrong end of a pair of opera-glasses. Here, both the smallness and the remoteress in space have the same significance: what is meant is remoteress in time and we are to understand that the scene is from the remote past.

[1933a, 4638]

If one is not aware of these profound connections, it is impossible to find one's way about in the phantasies of human beings, in their associations, influenced as they are by the unconscious, and in their symptomatic language. Faeces - money - gift - baby - penis are treated there as though they meant the same thing, and they are represented too by the same symbols. Nor must you forget that I have only been able to give you very incomplete information. I may hurriedly add, perhaps, that interest in the vagina, which awakens later, is also essentially of anal-erotic origin. This is not to be wondered at, for the vagina itself, to borrow an apt phrase from Lou Andreas-Salomé, is 'taken on lease' from the rectum later; in the life of homosexuals, who have failed to accomplish some part of normal sexual development, the vagina is once more represented by it. In dreams a locality often appears which was earlier a simple room but is now divided into two by a wall, or the other way round. This always means the relation of the vagina to the bowel. It is also easy to follow the way in which in girls what is an entirely unfeminine wish to possess a penis is normally transformed into a wish for a baby, and then for a man as the bearer of the penis and giver of the baby; so that here we can see too how a portion of what was originally anal-erotic interest obtains admission into the later genital organization.

[1933a, 4706]
For I think my hypothesis - that, in order to gain control over fire, men had to renounce the homosexually-tinged desire to put it out with a stream of urine - can be confirmed by an interpretation of the Greek myth of Prometheus, provided that we bear in mind the distortions which must be expected to occur in the transition from facts to the contents of a myth. These distortions are of the same sort as, and no worse than, those which we acknowledge every day, when we reconstruct from patients' dreams the repressed but extremely important experiences of their childhood. The mechanisms employed in the distortions I have in mind are symbolic representation and turning into the opposite. I should not venture to explain all the features of our myth in this fashion; apart from the original set of facts, other and later occurrences may have contributed to its content. But the elements which admit of analytic interpretation are, after all, the most striking and important - viz. the manner in which Prometheus transported the fire, the character of his act (an outrage, a theft, a defrauding of the gods) and the meaning of his punishment.

The myth tells us that Prometheus the Titan, a culture-hero who was still a god¹ and who was perhaps originally himself a demiurge and a creator of men, brought fire to men, having stolen it from the gods, hidden in a hollow stick, a fennel-stalk. If we were interpreting a dream we should be inclined to regard such an object as a penis symbol, although the unusual stress laid on its hollowness might make us hesitate. But how can we bring this penis-tube into connection with the preservation of fire? There seems little chance of doing this, till we remember the procedure of reversal, of turning into the opposite, of inverting relationships, which is so common in dreams and which so often conceals their meaning from us. What a man harbours in his penis-tube is not fire. On the contrary, it is the means of quenching fire; it is the water of his stream of urine. This relationship between fire and water then connects up with a wealth of familiar analytic material.

The obscurity of the Prometheus legend, as of other fire myths, is increased by the fact that primitive man was bound to regard fire as something analogous to the passion of love - or, as we should say, as a symbol of the libido. The warmth that is radiated by fire calls up the same sensation that accompanies a state of sexual excitation, and the shape and movements of a flame suggest a phallus in activity. There can be no doubt about the mythological significance of flame as a phallus; we have further evidence of it in the legend of the parentage of Servius Tullius, the Roman king. When we ourselves speak of the 'devouring fire' of love and of 'licking' flames - thus comparing the flame to a tongue - we have not moved so very far away from the mode of thinking of our primitive ancestors. One of the presuppositions on which we based our account of the myth of the acquisition of fire was, indeed, that to primal man the attempt to quench fire with his own water had the meaning of a pleasurable struggle with another phallus.

It may thus well be that, by way of this symbolic analogy, other elements, of a purely imaginative sort, have made their way into the myth and become interwoven with its historical elements. It is difficult to resist the notion that, if the liver is the seat of passion, its significance, symbolically, is the same as that of fire itself; and that, if this is so, its being daily consumed and renewed gives an apt picture of the behaviour of the erotic desires, which, though daily satisfied, are daily revived. The bird which sates itself on the liver would then have the meaning of a penis - a meaning which is not strange to it in other connections, as we know from legends, dreams, linguistic usage and plastic representations in ancient times. A short step further brings us to the phoenix, the bird which, as often as it is consumed by fire, emerges rejuvenated once more, and which probably bore the significance of a penis revivified after its collapse rather than, and earlier than, that of the sun setting in the glow of evening and afterwards rising once again.

[1932a, 4781]

[1932a, 4782]

[1932a, 4784]
Ten years ago, when the *Internationale Zeitschrift* dedicated a special number to Ferenczi on his fiftieth birthday, he had already published most of the works which have made all analysts into his pupils. But he was holding back his most brilliant and most fertile achievement. I knew of it, and in the closing sentence of my contribution I urged him to give it to us. Then, in 1924, his *Versuch einer Genitaltheorie* appeared. This little book is a biological rather than a psycho-analytic study; it is an application of the attitudes and insights associated with psycho-analysis to the biology of the sexual processes and, beyond them, to organic life in general. It was perhaps the boldest application of psycho-analysis that was ever attempted. As its governing thought it lays stress on the conservative nature of the instincts, which seek to re-establish every state of things that has been abandoned owing to an external interference. Symbols are recognized as evidence of ancient connections. Impressive instances are adduced to show how the characteristics of what is psychical preserve traces of primaeval changes in the bodily substance. When one has read this work, one seems to understand many peculiarities of sexual life of which one had never previously been able to obtain a comprehensive view, and one finds oneself the richer for hints that promise a deep insight into wide fields of biology. It is a vain task to attempt already to-day to distinguish what can be accepted as an authentic discovery from what seeks, in the fashion of a scientific phantasy, to guess at future knowledge. We lay the little book aside with a feeling: 'This is almost too much to take in at a first reading; I will read it again after a while.' But it is not only I who feel like this. It is probable that some time in the future there will really be a 'bio-analysis', as Ferenczi has prophesied, and it will have to cast back to the *Versuch einer Genitaltheorie*.

[1933c, 4815]

Rank's researches have made us acquainted with the source and purpose of this myth. I need only refer to them with some brief indications. A hero is someone who has had the courage to rebel against his father and has in the end victoriously overcome him. Our myth traces this struggle back as far as the individual's prehistory, for it represents him as being born against his father's will and rescued despite his father's evil intention. The exposure in a casket is an unmistakable symbolic representation of birth: the casket is the womb and the water is the amniotic fluid. The parent-child relationship is represented in countless dreams by pulling out of the water or rescuing from the water. When a people's imagination attaches the myth of birth which we are discussing to an outstanding figure, it is intending in that way to recognize him as a hero and to announce that he has fulfilled the regular pattern of a hero's life. In fact, however, the source of the whole poetic fiction is what is known as a child's 'family romance', in which the son reacts to a change in his emotional relation to his parents and in particular to his father. A child's earliest years are dominated by an enormous overvaluation of his father; in accordance with this a king and queen in dreams and fairy tales invariably stand for parents. Later, under the influence of rivalry and of disappointment in real life, the child begins to detach himself from his parents and to adopt a critical attitude towards his father. Thus the two families in the myth - the aristocratic one and the humble one - are both of them reflections of the child's own family as they appeared to him in successive periods of his life.

[1939a, 4843]
Nevertheless, analytic research has brought us a few results which give us cause for thought. There is, in the first place, the universality of symbolism in language. The symbolic representation of one object by another - the same thing applies to actions - is familiar to all our children and comes to them, as it were, as a matter of course. We cannot show in regard to them how they have learnt it and must admit that in many cases learning it is impossible. It is a question of an original knowledge which adults afterwards forget. It is true that an adult makes use of the same symbols in his dreams, but he does not understand them unless an analyst interprets them to him, and even then he is reluctant to believe the translation. If he makes use of one of the very common figures of speech in which this symbolism is recorded, he is obliged to admit that its true sense has completely escaped him. Moreover, symbolism disregards differences of language; investigations would probably show that it is ubiquitous - the same for all peoples. Here, then, we seem to have an assured instance of an archaic heritage dating from the period at which language developed. But another explanation might still be attempted. It might be said that we are dealing with thought-connections between ideas - connections which had been established during the historical development of speech and which have to be repeated now every time the development of speech has to be gone through in an individual. It would thus be a case of the inheritance of an intellectual disposition similar to the ordinary inheritance of an instinctual disposition - and once again it would be no contribution to our problem.

I cannot here repeat the contents of *Totem and Taboo* in greater detail. But I must undertake to fill up the long stretch between that hypothetical primaeval period and the victory of monotheism in historical times. After the institution of the combination of brother-clan, matriarchy, exogamy and totemism, a development began which must be described as a slow 'return if the repressed'. Here I am not using the term 'the repressed' in its proper sense. What is in question is something in a people's life which is past, lost to view, superseded and which we venture to compare with what is repressed in the mental life of an individual. We cannot at first sight say in what form this past existed during the time of its eclipse. It is not easy for us to carry over the concepts of individual psychology into group psychology; and I do not think we gain anything by introducing the concept of a 'collective' unconscious. The content of the unconscious, indeed, is in any case a collective, universal property of mankind. For the moment, then, we will make shift with the use of analogies. The processes in the life of peoples which we are studying here are very similar to those familiar to us in psychopathology, but nevertheless not quite the same. We must finally make up our minds to adopt the hypothesis that the psychical precipitates of the primaeval period became inherited property which, in each fresh generation, called not for acquisition but only for awakening. In this we have in mind the example of what is certainly the 'innate' symbolism which derives from the period of the development of speech, which is familiar to all children without their being instructed, and which is the same among all peoples despite their different languages. What we may perhaps still lack in certainty here is made good by other products of psycho-analytic research. We find that in a number of important relations our children react, not in a manner corresponding to their own experience, but instinctively, like the animals, in a manner that is only explicable as phylogenetic acquisition.

[1939a, 4920]

[1939a, 4949]
The evidence of the share taken by the unconscious id in the formation of dreams is abundant and convincing. (a) Memory is far more comprehensive in dreams than in waking life. Dreams bring up recollections which the dreamer has forgotten, which are inaccessible to him when he is awake. (b) Dreams make an unrestricted use of linguistic symbols, the meaning of which is for the most part unknown to the dreamer. Our experience, however, enables us to confirm their sense. They probably originate from earlier phases in the development of speech. (c) Memory very often reproduces in dreams impressions from the dreamer's early childhood of which we can definitely assert not only that they had been forgotten but that they had become unconscious owing to repression. That explains the help - usually indispensable - given us by dreams in the attempts we make during the analytic treatment of neuroses to reconstruct the dreamer's early life. (d) Furthermore, dreams bring to light material which cannot have originated either from the dreamer's adult life or from his forgotten childhood. We are obliged to regard it as part of the archaic heritage which a child brings with him into the world, before any experience of his own, influenced by the experiences of his ancestors. We find the counterpart of this phylogenetic material in the earliest human legends and in surviving customs. Thus dreams constitute a source of human prehistory which is not to be despised.

[1940a [1938], 4976]

In view of the complication and ambiguity of the relations between the manifest dream and the latent content lying behind it, it is of course justifiable to ask how it is at all possible to deduce the one from the other and whether all we have to go on is a lucky guess, assisted perhaps by a translation of the symbols that occur in the manifest dream. It may be said in reply that in the great majority of cases the problem can be satisfactorily solved, but only with the help of the associations provided by the dreamer himself to the elements of the manifest content. Any other procedure is arbitrary and can yield no certain result. But the dreamer's associations bring to light intermediate links which we can insert in the gap between the two and by aid of which we can reinstate the latent content of the dream and 'interpret' it. It is not to be wondered at if this work of interpretation (acting in a direction opposite to the dream-work) fails occasionally to arrive at complete certainty.

[1940a [1938], 4979]

¹ Castration has a place too in the Oedipus legend, for the blinding with which Oedipus punishes himself after the discovery of his crime is, by the evidence of dreams, a symbolic substitute for castration. The possibility cannot be excluded that a phylogenetic memory-trace may contribute to the extraordinarily terrifying effect of the threat - a memory-trace from the prehistory of the primal family, where the jealous father actually robbed his son of his genitals if the latter became troublesome to him as a rival with a woman. The primaeval custom of circumcision, another symbolic substitute for castration, can only be understood as an expression of submission to the father's will. (Cf. the puberty rites of primitive peoples.) No investigation has yet been made of the form taken by the events described above among peoples and in civilizations which do not suppress masturbation in children.

[1940a [1938], 4997]
The male genitals, then, are represented in dreams in a number of ways that must be called symbolic, where the common element in the comparison is mostly very obvious. To begin with, for the male genitals as a whole the sacred number 3 is of symbolic significance. The more striking and for both sexes the more interesting component of the genitals, the male organ, finds symbolic substitutes in the first instance in things that resemble it in shape - things, accordingly, that are long and up-standing, such as sticks, umbrellas, posts, trees and so on; further, in objects which share with the thing they represent the characteristic of penetrating into the body and injuring - thus, sharp weapons of every kind, knives, daggers, spears, sabres, but also firearms, rifles, pistols and revolvers (particularly suitable owing to their shape). In the anxiety dreams of girls, being followed by a man with a knife or a fire-arm plays a large part. This is perhaps the commonest instance of dream symbolism and you will now be able to translate it easily. Nor is there any difficulty in understanding how it is that the male organ can be replaced by objects from which water flows - water-taps, watering-cans, or fountains - or again by other objects which are capable of being lengthened, such as hanging-lamps, extensible pencils, etc. A no less obvious aspect of the organ explains the fact that pencils, pen-holders, nail-files, hammers, and other instruments are undoubted male sexual symbols.

The remarkable characteristic of the male organ which enables it to rise up in defiance of the laws of gravity, one of the phenomena of erection, leads to its being represented symbolically by balloons, flying-machines and most recently by Zeppelin airships. But dreams can symbolize erection in yet another, far more expressive manner. They can treat the sexual organ as the essence of the dreamer's whole person and make him himself fly. Do not take it to heart if dreams of flying, so familiar and often so delightful, have to be interpreted as dreams of general sexual excitement, as erection-dreams. Among students of psycho-analysis, Paul Federn has placed this interpretation beyond any doubt; but the same conclusion was reached from his investigations by Mourly Vold, who has been so much praised for his sobriety, who carried out the dream-experiments I have referred to with artificially arranged positions of the arms and legs and who was far removed from psycho-analysis and may have known nothing about it. And do not make an objection out of the fact that women can have the same flying dreams as men. Remember, rather, that our dreams aim at being the fulfilments of wishes and that the wish to be a man is found so frequently, consciously or unconsciously, in women. Nor will anyone with a knowledge of anatomy be bewildered by the fact that it is possible for women to realize this wish through the same sensations as men. Women possess as part of their genitals a small organ similar to the male one; and this small organ, the clitoris, actually plays the same part in childhood and during the years before sexual intercourse as the large organ in men.

Among the less easily understandable male sexual symbols are certain reptiles and fishes, and above all the famous symbol of the snake. It is certainly not easy to guess why hats and overcoats or cloaks are employed in the same way, but their symbolic significance is quite unquestionable. And finally we can ask ourselves whether the replacement of the male limb by another limb, the foot or the hand, should be described as symbolic. We are, I think, compelled to do so by the context and by counterparts in the case of women.

The breasts must be reckoned with the genitals, and these, like the larger hemispheres of the female body, are represented by apples, peaches, and fruit in general. The pubic hair of both sexes is depicted in dreams as woods and bushes. The complicated topography of the female genital parts makes one understand how it is that they are often represented as landscapes, with rocks, woods and water, while the imposing mechanism of the male sexual apparatus explains why all kinds of complicated machinery which is hard to describe serve as symbols for it.
You must not picture the use or the translation of these symbols as something quite simple. In the course of them all kinds of things happen which are contrary to our expectations. It seems almost incredible, for instance, that in these symbolic representations the differences between the sexes are often not clearly observed. Some symbols signify genitals in general, irrespective of whether they are male or female: for instance, a small child, a small son or a small daughter. Or again, a predominantly male symbol may be used for the female genitals or vice versa. We cannot understand this till we have obtained some insight into the development of sexual ideas in human beings. In some instances the ambiguity of the symbols may only be an apparent one; and the most marked symbols, such as weapons, pockets and chests are excluded from this bisexual use.

I will now go on to make a survey, starting not from the thing represented but from the symbol, of the fields from which sexual symbols are mostly derived, and I will make a few additional remarks, with special reference to the symbols where the common element in the comparison is not understood. The hat is an obscure symbol of this kind - perhaps, too, head-coverings in general - with a male significance as a rule, but also capable of a female one. In the same way an overcoat or cloak means a man, perhaps not always with a genital reference; it is open to you to ask why. Neckties, which hang down and are not worn by women, are a definitely male symbol. Underclothing and linen in general are female. Clothes and uniforms, as we have already seen, are a substitute for nakedness or bodily shapes. Shoes and slippers are female genitals. Tables and wood have already been mentioned as puzzling but certainly female symbols. Ladders, steps, and staircases, or, more precisely, walking on them, are clear symbols of sexual intercourse. On reflection, it will occur to us that the common element here is the rhythm of walking up them - perhaps, too, the increasing excitement and breathlessness the higher one climbs.

We have earlier referred to landscapes as representing the female genitals. Hills and rocks are symbols of the male organ. Gardens are common symbols of the female genitals. Fruit stands, not for children, but for the breasts. Wild animals mean people in an excited sensual state, and further, evil instincts or passions. Blossoms and flowers indicate women's genitals, or, in particular, virginity. Do not forget that blossoms are actually the genitals of plants.

We are acquainted already with rooms as a symbol. The representation can be carried further, for windows, and doors in and out of rooms, take over the meaning of orifices in the body. And the question of the room being open or locked fits in with this symbolism, and the key that opens it is a decidedly male symbol.
The fact that ships, too, in dreams stand for women is made credible by the etymologists, who tell us that 'Schiff [ship]' was originally the name of an earthenware vessel and is the same word as 'Schaff' [a dialect word meaning 'tub']. That ovens represent women and the uterus is confirmed by the Greek legend of Periander of Corinth and his wife Melissa. The tyrant, according to Herodotus, conjured up the shade of his wife, whom he had loved passionately but had murdered out of jealousy, to obtain some information from her. The dead woman proved her identity by saying that he (Periander) had pushed his bread into a cold oven', as a disguise for an event which no one else could know of. In the periodical Anthropophyleia, edited by F. S. Krauss, an invaluable source of knowledge of sexual anthropology, we learn that in a particular part of Germany they say of a woman who has given birth to a child that 'her oven has come to pieces'. Kindling fire, and everything to do with it, is intimately interwoven with sexual symbolism. Flame is always a male genital, and the fireplace, the hearth is its female counterpart.

[1916-1917, 3256]

There is scarcely one of the symbolic representations of the male genitals which does not recur in joking, vulgar or poetic usage, especially in the ancient classical dramatists. But here we meet not only the symbols which appear in dreams, but others besides - for instance tools employed in various operations, and particularly the plough. Moreover, the symbolic representation of masculinity leads us to a very extensive and much disputed region, which, on grounds of economy, we shall avoid. I should like, however, to devote a few words to one symbol, which, as it were, falls outside this class - the number 3. Whether this number owes its sacred character to this symbolic connection remains undecided. But what seems certain is that a number of tripartite things that occur in nature - the clover leaf, for instance - owe their use for coats of arms and emblems to this symbolic meaning. Similarly, the tripartite lily - the so-called fleur-de-lis - and the remarkable heraldic device of two islands so far apart as Sicily and the Isle of Man - the triskeles (three bent legs radiating from a centre) - seem to be stylized versions of the male genitals. Likenesses of the male organ were regarded in antiquity as the most powerful apotropaic (means of defence) against evil influences, and, in conformity with this, the lucky charms of our own day can all be easily recognized as genital or sexual symbols. Let us consider a collection of such things - as they are worn, for instance, in the form of small silver hanging trinkets: a four-leaved clover, a pig, a mushroom, a horse-shoe, a ladder, a chimney-sweep. The four-leaved clover has taken the place of the three-leaved one which is really suited to be a symbol. The pig is an ancient fertility symbol. The mushroom is an undoubted penis-symbol: there are mushrooms which owe their systematic name (Phallus impudicus) to their unmistakable resemblance to the male organ. The horseshoe copies the outline of the female genital orifice, while the chimney-sweep, who carries the ladder, appears in this company on account of his activities, with which sexual intercourse is vulgarly compared. (Cf. Anthropophyleia.) We have made the acquaintance of his ladder in dreams as a sexual symbol; here German linguistic usage comes to our help and shows us how the word 'steigen' ['to climb', or 'to mount'] is used in what is par excellence a sexual sense. We say 'den Frauen nachsteigen' ['to run' (literally 'climb') 'after women'], and 'ein alter Steiger' ['an old rake' (literally 'climber')]. In French, in which the word for steps on a staircase is 'marches', we find a precisely analogous term 'un vieux marcheur'. The fact that in many large animals climbing or 'mounting' on the female is a necessary preliminary to sexual intercourse probably fits into this context.

[1916-1917, 3257]
In this connection we have been given an important hint during the last few years. A philologist, Hans Sperber, of Uppsala, who works independently of psycho-analysis, has put forward the argument that sexual needs have played the biggest part in the origin and development of speech. According to him, the original sounds of speech served for communication, and summoned the speaker's sexual partner; the further development of linguistic roots accompanied the working activities of primal man. These activities, he goes on, were performed in common and were accompanied by rhythmically repeated utterances. In this way a sexual interest became attached to work. Primal man made work acceptable, as it were, by treating it as an equivalent and substitute for sexual activity. The words enunciated during work in common thus had two meanings; they denoted sexual acts as well as the working activity equated with them. As time went on, the words became detached from the sexual meaning and fixed to the work. In later generations the same thing happened with new words, which had a sexual meaning and were applied to new forms of work. In this way a number of verbal roots would have been formed, all of which were of sexual origin and had subsequently lost their sexual meaning. If the hypothesis I have here sketched out is correct, it would give us a possibility of understanding dream symbolism. We should understand why dreams, which preserve something of the earliest conditions, have such an extraordinarily large number of sexual symbols, and why, in general, weapons and tools always stand for what is male, while materials and things that are worked upon stand for what is female. The symbolic relation would be the residue of an ancient verbal identity; things which were once called by the same name as the genitals could now serve as symbols for them in dreams.

[1916-1917, 3260]

No reminiscence, nothing that had really happened. The information she produced in response to it led in quite other directions. "You know how badly my hair's falling out. "My child," my mother said to me yesterday, "if this goes any further you'll have a head as smooth as a bottom." So here the head stands for the other end of the body. We can understand the chandelier, without any help, as a symbol: all objects capable of being lengthened are symbols of the male organ. It was therefore a matter of bleeding at the lower end of the body, which had arisen from contact with a penis. This might still be ambiguous. Her further associations showed that what was in question concerned a belief that menstrual bleeding arises from sexual intercourse with a man - a piece of sexual theory which counts many faithful believers among immature girls.

[1916-1917, 3282]

You will have no trouble in recognizing the symbols used. The male genitals are represented by a triad of figures, and the female ones by a landscape with a chapel, hill and wood. Once again you find steps as a symbol for the sexual act. What is called a hill in the dream is also called one in anatomy - the Mons Veneris.

[1916-1917, 3284]
On the whole, therefore, I have made no concession to your objection to the theory of wish-fulfilment. It is our duty, however, to be able to indicate the wish-fulfilment in any distorted dream we may come across, and we shall certainly not evade the task. Let us go back to the dream we have already interpreted of the three bad theatre-tickets for 1 florin 50, from which we have already learnt so much. I hope you still recollect it. A lady, whose husband had told her during the day that her friend Elise, who was only three months her junior, had become engaged, dreamt that she was at the theatre with her husband. One side of the stalls was almost empty. Her husband said to her that Elise and her fiancé had wanted to go to the theatre too but had not been able to, since they had only got bad seats - three for 1 florin 50. She thought it would not really have done any harm if they had. We found that the dream-thoughts related to her anger at having married so early and to her dissatisfaction with her husband. We may be curious to discover how these gloomy thoughts were transformed into the fulfilment of a wish and where any trace of it is to be found in the manifest content of the dream. We already know that the element 'too early, in a hurry' was eliminated from the dream by the censorship. The empty stalls were an allusion to it. The mysterious 'three for 1 florin 50' now becomes more intelligible to us with the help of the symbolism with which we have meanwhile become acquainted. The '3' really means a man and the manifest element is easy to translate: buying a husband with her dowry. ('I could have got one ten times better with my dowry.') 'Marrying' is clearly replaced by 'going to the theatre'. 'Taking the theatre tickets too early' is, indeed, an immediate substitute for 'marrying too early'. This substitution is, however, the work of a wish-fulfilment. Our dreamer was not always so dissatisfied with her early marriage as she was on the day when she received the news of her friend's engagement. She had been proud of it at one time and regarded herself as at an advantage over her friend. Simple-minded girls, after becoming engaged, are reputed often to express their joy that they will soon be able to go to the theatre, to all the plays which have hitherto been prohibited, and will be allowed to see everything. The pleasure in looking, or curiosity, which is revealed in this was no doubt originally a sexual desire to look, directed towards sexual happenings and especially on to the girls’ parents, and hence it became a powerful motive for urging them to an early marriage. In this way a visit to the theatre became an obvious substitute, by way of allusion, for being married. Thus the dreamer, in her present anger at her early marriage, harked back to the time at which early marriage was the fulfilment of a wish because it satisfied her scopophilia, and, under the lead of this old wishful impulse, she replaced marriage by going to the theatre.

[1916-1917, 3308]
The dream which the writer of the letter asks us to interpret is not hard to understand. It is a dream of rescuing from water, a typical birth-dream. The language of symbolism, as you are aware, knows no grammar; it is an extreme case of a language of infinitives, and even the active and passive are represented by one and the same image. If in a dream a woman pulls (or tries to pull) a man out of the water, that may mean that she wants to be his mother (takes him for her son as Pharaoh's daughter did with Moses). Or it may mean that she wants him to make her into a mother: she wants to have a son by him, who, as a likeness of him, can be his equivalent. The tree-trunk to which the woman was clinging is easily recognized as a phallic symbol, even though it is not standing straight up, but inclined towards the surface of the water - in the dream the word is 'bent'. The onrush and recoil of the breakers brought to the mind of another dreamer who was relating a similar dream a comparison with the intermittent pains of labour; and when, knowing that she had not yet borne a child, I asked her how she knew of this characteristic of labour, she said that she imagined labour as a kind of colic - a quite unimpeachable description physiologically. She gave the association 'The Waves of the Sea and of Love'. How our present dreamer at so early an age can have arrived at the finer details of symbolism - tongue of land, palm-tree - I am naturally unable to say. We must not, moreover, overlook the fact that, when people assert that they have for years been pursued by the same dream, it often turns out that the manifest content is not quite the same. Only the kernel of the dream has recurred each time; the details of the content are changed or additions are made to them.
[1922a, 3892]

My two cases of paranoia showed an instructive contrast in the behaviour of their dreams. Whereas those of the first case were free from delusion, as has already been said, the other patient produced great numbers of persecutory dreams, which may be regarded as forerunners of or substitutes for the delusional ideas. The pursuer, whom he only managed to escape with great fear, was usually a powerful bull or some other male symbol which even in the dream itself he sometimes recognized as representing his father. One day he produced a very characteristic paranoid transference-dream. He saw me shaving in front of him, and from the scent he realized that I was using the same soap as his father had used. I was doing this in order to oblige him to make a father-transference on to me. The choice of this incident for his dream quite unmistakably betrays the patient's depreciatory attitude to his paranoid phantasies and his disbelief in them; for his own eyes could tell him every day that I was never in a position to make use of shaving-soap and that therefore there was in this respect nothing to which a father-transference could attach itself.
[1922b, 3906]
We have not yet finished with symbols. There are some which we believed we recognized but which nevertheless worried us because we could not explain how this particular symbol had come to have that particular meaning. In such cases confirmations from elsewhere - from philology, folklore, mythology or ritual - were bound to be especially welcome. An instance of this sort is the symbol of an overcoat or cloak. We have said that in a woman's dreams this stands for a man. I hope it will impress you when you hear that Theodor Reik (1920) gives us this information: 'During the extremely ancient bridal ceremonial of the Bedouins, the bridgetrom covers the bride with a special cloak known as "Aba" and speaks the following ritual words: "Henceforth none save I shall cover thee!" (Quoted from Robert Eisler). We have also found several fresh symbols, at least two of which I will tell you of. According to Abraham (1922) a spider in dreams is a symbol of the mother, but of the phallic mother, of whom we are afraid; so that the fear of spiders expresses dread of mother-incest and horror of the female genitals. You know, perhaps, that the mythological creation, Medusa's head, can be traced back to the same motif of fright at castration. The other symbol I want to talk to you about is that of the bridge, which has been explained by Ferenczi (1921 and 1922). First it means the male organ, which unites the two parents in sexual intercourse; but afterwards it develops further meanings which are derived from this first one. In so far as it is thanks to the male organ that we are able to come into the world at all, out of the amniotic fluid, a bridge becomes the crossing from the other world (the unborn state, the womb) to this world (life); and, since men also picture death as a return to the womb (to the water), a bridge also acquires the meaning of something that leads to death, and finally, at a further remove from its original sense, it stands for transitions or changes in condition generally. It tallies with this, accordingly, if a woman who has not overcome her wish to be a man has frequent dreams of bridges that are too short to reach the further shore. [1933a, 4637]

The myth tells us that Prometheus the Titan, a culture-hero who was still a god¹ and who was perhaps originally himself a demiurge and a creator of men, brought fire to men, having stolen it from the gods, hidden in a hollow stick, a fennel-stalk. If we were interpreting a dream we should be inclined to regard such an object as a penis symbol, although the unusual stress laid on its hollowness might make us hesitate. But how can we bring this penis-tube into connection with the preservation of fire? There seems little chance of doing this, till we remember the procedure of reversal, of turning into the opposite, of inverting relationships, which is so common in dreams and which so often conceals their meaning from us. What a man harbours in his penis-tube is not fire. On the contrary, it is the means of quenching fire; it is the water of his stream of urine. This relationship between fire and water then connects up with a wealth of familiar analytic material. [1932a, 4782]

The obscurity of the Prometheus legend, as of other fire myths, is increased by the fact that primitive man was bound to regard fire as something analogous to the passion of love - or, as we should say, as a symbol of the libido. The warmth that is radiated by fire calls up the same sensation that accompanies a state of sexual excitation, and the shape and movements of a flame suggest a phallus in activity. There can be no doubt about the mythological significance of flame as a phallus; we have further evidence of it in the legend of the parentage of Servius Tullius, the Roman king. When we ourselves speak of the 'devouring fire' of love and of 'licking' flames - thus comparing the flame to a tongue - we have not moved so very far away from the mode of thinking of our primitive ancestors. One of the presuppositions on which we based our account of the myth of the acquisition of fire was, indeed, that to primal man the attempt to quench fire with his own water had the meaning of a pleasurable struggle with another phallus. [1932a, 4784]
It may thus well be that, by way of this symbolic analogy, other elements, of a purely imaginative sort, have made their way into the myth and become interwoven with its historical elements. It is difficult to resist the notion that, if the liver is the seat of passion, its significance, symbolically, is the same as that of fire itself; and that, if this is so, its being daily consumed and renewed gives an apt picture of the behaviour of the erotic desires, which, though daily satisfied, are daily revived. The bird which sates itself on the liver would then have the meaning of a penis - a meaning which is not strange to it in other connections, as we know from legends, dreams, linguistic usage and plastic representations in ancient times. A short step further brings us to the phoenix, the bird which, as often as it is consumed by fire, emerges rejuvenated once more, and which probably bore the significance of a penis revived after its collapse rather than, and earlier than, that of the sun setting in the glow of evening and afterwards rising once again.

[1932a, 4784]

A reversal into the opposite is unexpectedly found in another myth which in appearance has very little to do with the fire myth. The Lernaean hydra with its countless flickering serpent's heads - one of which was immortal - was, as its name tells us, a water-dragon. Heracles, the culture-hero, fought it by cutting off its heads; but they always grew again, and it was only after he had burnt up the immortal head with fire that he overcame the monster. A water-dragon subdued by fire - that surely makes no sense. But, as in so many dreams, sense emerges if we reverse the manifest content. In that case the hydra is a brand of fire and the flickering serpent's heads are the flames; and these, in proof of their libidinal nature, once more display, like Prometheus's liver, the phenomenon of re-growth, of renewal after attempted destruction. Heracles, then, extinguishes this brand of fire with - water. (The immortal head is no doubt the phallus itself, and its destruction signifies castration.) But Heracles was also the deliverer of Prometheus and slew the bird which devoured his liver. Should we not suspect a deeper connection between the two myths? It is as though the deed of the one hero was made up for by the other. Prometheus (like the Mongolian law) had forbidden the quenching of fire; Heracles permitted it in the case in which the brand of fire threatened disaster. The second myth seems to correspond to the reaction of a later epoch of civilization to the events of the acquisition of power over fire. It looks as though this line of approach might take us quite a distance into the secrets of the myth; but admittedly we should carry a feeling of certainty with us only a short way.

[1932a, 4785]

The sexual organ of the male has two functions; and there are those to whom this association is an annoyance. It serves for the evacuation of the bladder, and it carries out the act of love which sets the craving of the genital libido at rest. The child still believes that he can unite the two functions. According to a theory of his, babies are made by the man urinating into the woman's body. But the adult knows that in reality the acts are mutually incompatible - as incompatible as fire and water. When the penis is in the state of excitation which led to its comparison with a bird, and while the sensations are being experienced which suggest the warmth of fire, urination is impossible; and conversely, when the organ is serving to evacuate urine (the water of the body) all its connections with the genital function seem to be quenched. The antithesis between the two functions might lead us to say that man quenches his own fire with his own water. And primal man, who had to understand the external world by the help of his own bodily sensations and states, would surely not have failed to notice and utilize the analogies pointed out to him by the behaviour of fire.

[1932a, 4786]
The female genitals are symbolically represented by all such objects as share their characteristic of enclosing a hollow space which can take something into itself: by pits, cavities and hollows, for instance, by vessels and bottles, by receptacles, boxes, trunks, cases, chests, pockets, and so on. Ships, too, fall into this category. Some symbols have more connection with the uterus than with the female genitals: thus, cupboard, stoves and, more especially, rooms. Here room-symbolism touches on house-symbolism. Doors and gates, again, are symbols of the genital orifice. Materials, too, are symbols for women: wood, papery and objects made of them, like tables and books. Among animals, snails and mussels at least are undeniably female symbols; among parts of the body, the mouth (as a substitute for the genital orifice); among buildings, churches and chapels. Not every symbol, as you will observe, is equally intelligible.

The breasts must be reckoned with the genitals, and these, like the larger hemispheres of the female body, are represented by apples, peaches, and fruit in general. The pubic hair of both sexes is depicted in dreams as woods and bushes. The complicated topography of the female genital parts makes one understand how it is that they are often represented as landscapes, with rocks, woods and water, while the imposing mechanism of the male sexual apparatus explains why all kinds of complicated machinery which is hard to describe serve as symbols for it.

Another symbol of the female genitals which deserves mention is a jewel-case. Jewel and treasure are used in dreams as well as in waking life to describe someone who is loved. Sweets frequently represent sexual enjoyment. Satisfaction obtained from a person's own genitals is indicated by all kinds of playing, including piano-playing. Symbolic representations par excellence of masturbation are gliding or sliding and pulling off a branch. The falling out of a tooth or the pulling out of a tooth is a particularly notable dream-symbol. Its first meaning is undoubtedly castration as a punishment for masturbating. We come across special representations of sexual intercourse less often than might be expected from what has been said so far. Rhythmical activities such as dancing, riding and climbing must be mentioned here, as well as violent experiences such as being run over; so, too, certain manual crafts, and, of course, threatening with weapons.

You must not picture the use or the translation of these symbols as something quite simple. In the course of them all kinds of things happen which are contrary to our expectations. It seems almost incredible, for instance, that in these symbolic representations the differences between the sexes are often not clearly observed. Some symbols signify genitals in general, irrespective of whether they are male or female: for instance, a small child, a small son or a small daughter. Or again, a predominantly male symbol may be used for the female genitals or vice versa. We cannot understand this till we have obtained some insight into the development of sexual ideas in human beings. In some instances the ambiguity of the symbols may only be an apparent one; and the most marked symbols, such as weapons, pockets and chests are excluded from this bisexual use.
I will now go on to make a survey, starting not from the thing represented but from the symbol, of the fields from which sexual symbols are mostly derived, and I will make a few additional remarks, with special reference to the symbols where the common element in the comparison is not understood. The hat is an obscure symbol of this kind - perhaps, too, head-coverings in general - with a male significance as a rule, but also capable of a female one. In the same way an overcoat or cloak means a man, perhaps not always with a genital reference; it is open to you to ask why. Neckties, which hang down and are not worn by women, are a definitely male symbol. Underclothing and linen in general are female. Clothes and uniforms, as we have already seen, are a substitute for nakedness or bodily shapes. Shoes and slippers are female genitals. Tables and wood have already been mentioned as puzzling but certainly female symbols. Ladders, steps, and staircases, or, more precisely, walking on them, are clear symbols of sexual intercourse. On reflection, it will occur to us that the common element here is the rhythm of walking up them - perhaps, too, the increasing excitement and breathlessness the higher one climbs.

We have earlier referred to landscapes as representing the female genitals. Hills and rocks are symbols of the male organ. Gardens are common symbols of the female genitals. Fruit stands, not for children, but for the breasts. Wild animals mean people in an excited sensual state, and further, evil instincts or passions. Blossoms and flowers indicate women's genitals, or, in particular, virginity. Do not forget that blossoms are actually the genitals of plants.

We are acquainted already with rooms as a symbol. The representation can be carried further, for windows, and doors in and out of rooms, take over the meaning of orifices in the body. And the question of the room being open or locked fits in with this symbolism, and the key that opens it is a decidedly male symbol.

Let us go back to house-symbolism. When in a dream we make use of the projections on houses for catching hold of, we may be reminded of a common vulgar expression for well developed breasts: 'She's got something to catch hold of.' There is another popular expression in such cases: 'She's got plenty of wood in front of the house', which seems to confirm our interpretation of wood as a female, maternal symbol.

And, speaking of wood, it is hard to understand how that material came to represent what is maternal and female. But here comparative philology may come to our help. Our German word - 'Holz' seems to come from the same root as the Greek 'ιύλη [hule]', meaning 'stuff' 'raw material'. This seems to be an instance of the not uncommon event of the general name of a material eventually coming to be reserved for some particular material. Now there is an island in the Atlantic named 'Madeira'. This name was given to it by the Portuguese when they discovered it, because at that time it was covered all over with woods. For in the Portuguese language 'madeira' means 'wood'. You will notice, however, that 'madeira' is only a slightly modified form of the Latin word 'materia', which once more means 'material' in general. But 'mater' is derived from 'mater', 'mother': the material out of which anything is made is, as it were, a mother to it. This ancient view of the thing survives, therefore, in the symbolic use of wood for 'woman' or 'mother'.
The fact that ships, too, in dreams stand for women is made credible by the etymologists, who tell us that 'Schiff [ship]' was originally the name of an earthenware vessel and is the same word as 'Schaff' [a dialect word meaning 'tub']. That ovens represent women and the uterus is confirmed by the Greek legend of Periander of Corinth and his wife Melissa. The tyrant, according to Herodotus, conjured up the shade of his wife, whom he had loved passionately but had murdered out of jealousy, to obtain some information from her. The dead woman proved her identity by saying that he (Periander) had pushed his bread into a cold oven', as a disguise for an event which no one else could know of. In the periodical Anthropophyteia, edited by F. S. Krauss, an invaluable source of knowledge of sexual anthropology, we learn that in a particular part of Germany they say of a woman who has given birth to a child that 'her oven has come to pieces'. Kindling fire, and everything to do with it, is intimately interwoven with sexual symbolism. Flame is always a male genital, and the fireplace, the hearth is its female counterpart.

[1916-1917, 3256]

If you may have felt surprised at the frequency with which landscapes are used in dreams to represent the female genitals, you can learn from mythology the part played by Mother Earth in the concepts and cults of the peoples of antiquity and how their view of agriculture was determined by this symbolism. You will perhaps be inclined to trace the fact that in dreams a room represents a woman to the common usage in our language by which 'Frau' is replaced by 'Frauenzimmer'¹ - the human being is replaced by the apartment allotted to her. Similarly we speak of the 'Sublime Porte', meaning the Sultan and his government. So too the title of the Ancient Egyptian ruler, 'Pharaoh', means simply 'Great Courtyard'. (In the Ancient East the courts between the double gateways of a city were public meeting-places like the market-places of the classical world.) This derivation, however, appears to be too superficial. It seems to me more likely that a room became the symbol of a woman as being the space which encloses human beings. We have already found 'house' used in a similar sense; and mythology and poetical language enable us to add 'city', 'citadel', 'castle' and 'fortress' as further symbols for 'woman'. The question could be easily settled from the dreams of people who do not speak or understand German. During the last few years I have mainly treated foreign-speaking patients, and I seem to remember that in their dreams too 'Zimmer' ['room'] meant 'Frauenzimmer', though they had no similar usage in their languages. There are other indications that the symbolic relation can go beyond the limits of language - which, incidentally was asserted long ago by an old investigator of dreams, Schubert. However, none of my dreamers were completely ignorant of German, so the decision must be left to psycho-analysts who can collect data from unilingual people in other countries.

[1916-1917, 3256]
In this connection we have been given an important hint during the last few years. A philologist, Hans Sperber, of Uppsala, who works independently of psycho-analysis, has put forward the argument that sexual needs have played the biggest part in the origin and development of speech. According to him, the original sounds of speech served for communication, and summoned the speaker's sexual partner; the further development of linguistic roots accompanied the working activities of primal man. These activities, he goes on, were performed in common and were accompanied by rhythmically repeated utterances. In this way a sexual interest became attached to work. Primal man made work acceptable, as it were, by treating it as an equivalent and substitute for sexual activity. The words enunciated during work in common thus had two meanings; they denoted sexual acts as well as the working activity equated with them. As time went on, the words became detached from the sexual meaning and fixed to the work. In later generations the same thing happened with new words, which had a sexual meaning and were applied to new forms of work. In this way a number of verbal roots would have been formed, all of which were of sexual origin and had subsequently lost their sexual meaning. If the hypothesis I have here sketched out is correct, it would give us a possibility of understanding dream symbolism. We should understand why dreams, which preserve something of the earliest conditions, have such an extraordinarily large number of sexual symbols, and why, in general, weapons and tools always stand for what is male, while materials and things that are worked upon stand for what is female. The symbolic relation would be the residue of an ancient verbal identity; things which were once called by the same name as the genitals could now serve as symbols for them in dreams.

[1916-1917, 3260]

(c) She was standing in front of the drawer of her writing-table which she was so familiar with that she could tell at once if anyone had been into it. Like all drawers, chests and cases, the writing-table drawer stood for the female genitals. She knew that indications of sexual intercourse (and, as she thought, of touching) could be observed on the genitals and had long feared such a discovery. In all these three dreams, I think, the accent is to be placed on knowledge. She was recalling the period of her sexual researches when she was a child, of whose outcome she had been quite proud at the time.

[1916-1917, 3282]

You will have no trouble in recognizing the symbols used. The male genitals are represented by a triad of figures, and the female ones by a landscape with a chapel, hill and wood. Once again you find steps as a symbol for the sexual act. What is called a hill in the dream is also called one in anatomy - the Mons Veneris.

[1916-1917, 3284]
The courtyard in which the sheet of tin was spread out is not to be taken symbolically in the first instance. It was derived from the business premises of the dreamer's father. For reasons of discretion I have substituted 'tin' for another material in which his father actually dealt: but I have made no other change in the wording of the dream. The dreamer had entered his father's business and had taken violent objection to the somewhat dubious practices on which the firm's earnings in part depended. Consequently the dream-thought I have just interpreted may have continued in this way: '(If I had asked him), he would have deceived me just as he deceives his customers.' As regards the 'pulling off' which served to represent his father's dishonesty in business, the dreamer himself produced a second explanation - namely that it stood for masturbating. Not only have we long been familiar with this interpretation, but there was something to confirm it in the fact that the secret nature of masturbation was represented by its reverse: it might be done openly. Just as we should expect, the masturbatory activity was once again displaced on to the dreamer's father, like the questioning in the first scene of the dream. He promptly interpreted the shaft as a vagina, having regard to the soft cushioning of its walls. I added on my own authority that climbing down, like climbing up in other cases, described sexual intercourse in the vagina.

(8) The two following dreams were dreamt by a foreigner of a highly polygamous disposition. I repeat them to you as evidence for my assertion that the dreamer's own ego appears in every dream even if it is concealed in the manifest content. The trunks in the dreams were symbols of women:

He did in fact travel with a great deal of luggage; but he also brought a great many stories about women into the treatment. The two black trunks corresponded to two dark women who were at the time playing the main part in his life. One of them had wanted to follow him to Vienna; and on my advice he had telegraphed to put her off.

No connection with any real occurrence. But his thoughts took him back, rather, to a period in which his observations led him to reflect on how late girls' breasts developed. So the two sisters were breasts; he would have liked to take hold of them with his hand - if only it were not his sister.
Our patient gradually came to learn that it was as symbols of the female genitals that clocks were banished from her equipment for the night. Clocks and watches - though elsewhere we have found other symbolic interpretations for them - have arrived at a genital role owing to their relation to periodic processes and equal intervals of time. A woman may boast that her menstruation behaves with the regularity of clockwork. Our patient's anxiety, however, was directed in particular against being disturbed in her sleep by the ticking of a clock. The ticking of a clock may be compared with the knocking or throbbing in the clitoris during sexual excitement. She had in fact been repeatedly woken from her sleep by this sensation, which had now become distressing to her; and she gave expression to this fear of an erection in the rule that all clocks and watches that were going should be removed from her neighbourhood at night.

Flower-pots and vases, like all vessels, are also female symbols. Taking precautions against their falling and being broken at night was thus not without its good sense. We know the widespread custom of breaking a vessel or plate at betrothal ceremonies. Each man present gets hold of a fragment, and we may regard this as a sign of his resigning the claims he had upon the bride in virtue of a marriage-regulation dating from before the establishment of monogamy. In connection with this part of her ceremonial the girl produced a recollection and several associations. Once when she was a child she had fallen down while she was carrying a glass or china vase and had cut her finger and bled profusely. When she grew up and came to know the facts about sexual intercourse she formed an anxious idea that on her wedding-night she would not bleed and would thus fail to show that she was a virgin. Her precautions against vases being broken thus meant a repudiation of the whole complex concerned with virginity and bleeding at the first intercourse - a repudiation equally of the fear of bleeding and of the contrary fear of not bleeding. These precautions, which she subsumed under her avoidance of noise, had only a remote connection with it.

There was another dream, which belongs to the period before his emancipation by the tutor, and which I mention because it was forgotten until its appearance during the treatment. He saw himself riding on a horse and pursued by a gigantic caterpillar. He recognized in this dream an allusion to an earlier one from the period before the tutor, which we had interpreted long before. In this earlier dream he saw the Devil dressed in black and in the upright posture with which the wolf and the lion had terrified him so much in their day. He was pointing with his out-stretched finger at a gigantic snail. The patient had soon guessed that this Devil was the Demon out of a well-known poem, and that the dream itself was a version of a very popular picture representing the Demon in a love-scene with a girl. The snail was in the woman's place, as being a perfect female sexual symbol. Guided by the Demon's pointing gesture, we were soon able to give as the dream's meaning that the patient was longing for some one who should give him the last pieces of information that were still missing upon the riddle of sexual intercourse, just as his father had given him the first in the primal scene long before.
It would seem that the occurrence of sexual symbolism in dreams has already been experimentally confirmed by some work carried out by K. Schröter, on lines proposed by H. Swoboda. Subjects under deep hypnosis were given suggestions by Schröter, and these led to the production of dreams a large part of whose content was determined by the suggestions. If he gave a suggestion that the subject should dream of normal or abnormal sexual intercourse, the dream, in obeying the suggestion, would make use of symbols familiar to us from psychoanalysis in place of the sexual material. For instance, when a suggestion was made to a female subject that she should dream of having homosexual intercourse with a friend, the friend appeared in the dream carrying a shabby hand-bag with a label stuck on to it bearing the words 'Ladies only.' The woman who dreamt this was said never to have had any knowledge of symbolism in dreams or of their interpretation. Difficulties are, however, thrown in the way of our forming an opinion of the value of these interesting experiments by the unfortunate circumstance that Dr. Schröter committed suicide soon after making them. The only record of them is to be found in a preliminary communication published in the *Zentralblatt für Psychoanalyse* (Schröter, 1912).

Similar findings were published by Roffenstein in 1923. Some experiments made by Betlheim and Hartmann (1924) were of particular interest, since they made no use of hypnosis. These experimenters related anecdotes of a coarsely sexual character to patients suffering from Korsakoff's syndrome and observed the distortions which occurred when the anecdotes were reproduced by the patients in these confusional states. They found that the symbols familiar to us from the interpretation of dreams made their appearance (e.g. going upstairs, stabbing and shooting as symbols of copulation, and knives and cigarettes as symbols of the penis). The authors attached special importance to the appearance of the symbol of a staircase, for, as they justly observed, 'no conscious desire to distort could have arrived at a symbol of such a kind.'

In the literature of this period you will of course find a large quantity of confirmatory material and of presentation of details, of which I intend only to give you samples. I shall also, incidentally, be able to tell you a few things that were in fact already known earlier. What is in question is principally the symbolism in dreams and the other methods of representation in them. Now listen to this. Only quite a short while ago the medical faculty in an American University refused to allow psycho-analysis the status of a science, on the ground that it did not admit of any experimental proof. They might have raised the same objection to astronomy; indeed, experimentation with the heavenly bodies is particularly difficult. There one has to fall back on observation. Nevertheless, some Viennese investigators have actually made a beginning with experimental confirmation of our dream symbolism. As long ago as in 1912 a Dr. Schröter found that if instructions to dream of sexual matters are given to deeply hypnotized subjects, then in the dream that is thus provoked the sexual material emerges with its place taken by the symbols that are familiar to us. For instance, a woman was told to dream of sexual intercourse with a female friend. In her dream this friend appeared with a travelling-bag on which was pasted the label 'Ladies Only'. Still more impressive experiments were carried out by Betlheim and Hartmann in 1924. They worked with patients suffering from what is known as the Korsakoff confusional psychosis. They told these patients stories of a grossly sexual kind and observed the distortions which appeared when the patients were instructed to reproduce what they had been told. Once more there emerged the symbols for sexual organs and sexual intercourse that are familiar to us - among them the symbol of the staircase which, as the writers justly remark, could never have been reached by a conscious wish to distort.
As regards my share of the book, too, the only possible decision has been that the text of the first edition shall be reprinted without alteration. The developments and changes in my views during the course of thirteen years of work have been too far-reaching for it to be possible to attach them to my earlier exposition without entirely destroying its essential character. Nor have I any reason for wishing to eliminate this evidence of my initial views. Even to-day I regard them not as errors but as valuable first approximations to knowledge which could only be fully acquired after long and continuous efforts. The attentive reader will be able to detect in the present book the germs of all that has since been added to the theory of catharsis: for instance, the part played by psychosexual factors and infantilism, the importance of dreams and of unconscious symbolism. And I can give no better advice to any one interested in the development of catharsis into psycho-analysis than to begin with *Studies on Hysteria* and thus follow the path which I myself have trodden.

[1895d, 4]

Even the *Interpretation of Dreams* has not been left untouched by the advance of scientific knowledge. When I wrote it in 1899, my theory of sexuality was not yet in existence and the analysis of the more complicated forms of psycho-neurosis was only just beginning. It was my hope that dream-interpretation would help to make possible the psychological analysis of the neuroses; since then a deeper understanding of neuroses has reacted in turn upon our view of dreams. The theory of dream-interpretation has itself developed further in a direction on which insufficient stress had been laid in the first edition of this book. My own experience, as well as the works of Wilhelm Stekel and others, have since taught me to form a truer estimate of the extent and importance of symbolism in dreams (or rather in unconscious thinking). Thus in the course of these years much has accumulated which demands attention. I have endeavoured to take these innovations into account by making numerous interpolations in the text and by additional footnotes. If these additions threaten at times to burst the whole framework of the book or if I have not everywhere succeeded in bringing the original text up to the level of our present knowledge, I must ask the reader's indulgence for these deficiencies: they are the results and signs of the present increasingly rapid development of our science. I may even venture to prophesy in what other directions later editions of this book - if any should be needed - will differ from the present one. They will have on the one hand to afford a closer contact with the copious material presented in imaginative writing, in myths, in linguistic usage and in folklore; while on the other hand they will have to deal in greater detail than has here been possible with the relations of dreams to neuroses and mental diseases.

[1900a, 510]

In view of the part played by jokes, quotations, songs and proverbs in the mental life of educated people, it would fully agree with our expectations if disguises of such kinds were used with extreme frequency for representing dream-thoughts. What, for instance, is the meaning in a dream of a number of carts, each filled with a different sort of vegetable? They stand for a wishful contrast to 'Kraut und Rüben', that is to say to 'higgledy-piggledy', and accordingly signify 'disorder.' I am surprised that this dream has only been reported to me once.¹ A dream-symbolism of universal validity has only emerged in the case of a few subjects, on the basis of generally familiar allusions and verbal substitutes. Moreover a good part of this symbolism is shared by dreams with psychoneuroses, legends and popular customs.

[1900a, 814]
I naturally have at my disposal a superfluity of material of this kind, but to report it would involve us too deeply in a consideration of neurotic conditions. It all leads to the same conclusion, namely that there is no necessity to assume that any peculiar symbolizing activity of the mind is operating in the dream-work, but that dreams make use of any symbolizations which are already present in unconscious thinking, because they fit in better with the requirements of dream-construction on account of their representability and also because as a rule they escape censorship.

[1900a, 817]

When we have become familiar with the abundant use made of symbolism for representing sexual material in dreams, the question is bound to arise of whether many of these symbols do not occur with a permanently fixed meaning, like the 'grammalogues' in shorthand; and we shall feel tempted to draw up a new 'dream-book' on the decoding principle. On that point there is this to be said: this symbolism is not peculiar to dreams, but is characteristic of unconscious ideation, in particular among the people, and it is to be found in folklore, and in popular myths, legends, linguistic idioms, proverbial wisdom and current jokes, to a more complete extent than in dreams.

[1900a, 819]

The following uninfluenced recollection by a lady who is now twenty-seven shows at what an early age symbolism is employed outside dream-life as well as inside it. *She was between three and four years old. Her nurse-maid took her to the lavatory along with a brother eleven months her junior and a girl cousin of an age between the other two, to do their small business before going out for a walk. Being the eldest, she sat on the seat, while the other two sat on chambers. She asked her cousin: 'Have you got a purse too? Walter's got a little sausage; I've got a purse.' Her cousin replied: 'Yes, I've got a purse too.' The nurse-maid heard what they said with much amusement and reported the conversation to the children's mother, who reacted with a sharp reprimand.*

[1900a, 832]

If the account I have given in this short discussion of the symbolic mode of expression in dreams appears incomplete, I can justify my neglect by drawing attention to one of the most important pieces of knowledge that we possess on this subject. Dream-symbolism extends far beyond dreams: it is not peculiar to dreams, but exercises a similar dominating influence on representation in fairy-tales, myths and legends, in jokes and in folk-lore. It enables us to trace the intimate connections between dreams and these latter productions. We must not suppose that dream-symbolism is a creation of the dream-work; it is in all probability a characteristic of the unconscious thinking which provides the dream-work with the material for condensation, displacement and dramatization.¹

[1901a, 1097]

¹ [Footnote added 1924:] Anyone who is interested in the mental life of these years of childhood will find it easy to guess the deeper determinant of the demand made on the big brother. The child of not yet three had understood that the little sister who had recently arrived had grown inside his mother. He was very far from approving of this addition to the family, and was full of mistrust and anxiety that his mother's inside might conceal still more children. The wardrobe or cupboard was a symbol for him of his mother's inside. So he insisted on looking into this cupboard, and turned for this to his big brother, who (as is clear from other material) had taken his father's place as the child's rival. Besides the well-founded suspicion that this brother had had the lost nurse 'boxed up', there was a further suspicion against him - namely that he had in some way introduced the recently born baby into his mother's inside. The affect of disappointment when the cupboard was found to be empty derived, therefore, from the superficial motivation for the child's demand. As regards the deeper trend of thought, the affect was in the wrong place. On the other hand, his great satisfaction over his mother's slimness on her return can only be fully understood in the light of this deeper layer.

[1901b, 1143]
We shall not be surprised if an object of such rich symbolic meaning as a ring should be made
to play a part in some significant parapraxes, even where it does not, in the form of a wedding
ring or an engagement ring, mark an erotic tie. The following example of an occurrence of this
sort has been put at my disposal by Dr. M. Kardos:
[1901b, 1282]

There is a great deal of symbolism of this kind in life, but as a rule we pass it by without
heeding it. When I set myself the task of bringing to light what human beings keep hidden within
them, not by the compelling power of hypnosis, but by observing what they say and what they
show, I thought the task was a harder one than it really is. He that has eyes to see and ears to
hear may convince himself that no mortal can keep a secret. If his lips are silent, he chatters
with his finger-tips; betrayal oozes out of him at every pore. And thus the task of making
conscious the most hidden recesses of the mind is one which it is quite possible to accomplish.
[1905e, 1414]

'I have long grown used to being dead.' (90.) 'To me it is right that you should give the flower
of forgetfulness.' [Ibid.] In these sentences there was a faint foretaste of the reproaches which
broke out clearly enough later on in her final lecture to him, in which she compared him to an
archaeopteryx. 'The fact of someone having to die so as to come alive; but no doubt that must
be so for archaeologists.' She made this last remark after the delusion had been cleared up, as
though to give a key to her ambiguous speeches. But she made her neatest use of her
symbolism when she asked: 'I feel as though we had shared a meal like this once before, two
thousand years ago; can't you remember?' (118.) Here the substitution of the historical past for
childhood and the effort to awaken the memory of the latter are quite unmistakable.
[1907a, 1879]

¹ Hans only confirmed the interpretation of the two giraffes as his father and mother, and not the sexual
symbolism, according to which the giraffe itself represented the penis. This symbolism was probably
correct, but we really cannot ask more of Hans.
[1909b, 2030]

¹ Hans was now going off into a phantasy. As we can see, a box and a bath have the same meaning for
him: they both represent the space which contains the babies. We must bear in mind Hans's repeated
assurances on this point.
[1909b, 2056]

What can be the meaning of the boy's obstinate persistence in all this nonsense? Oh no, it
was no nonsense: it was parody, it was Hans's revenge upon his father. It was as much as to
say: 'If you really expect me to believe that the stork brought Hanna in October, when even in
the summer, while we were travelling to Gmunden, I'd noticed how big Mother's stomach was, -
then I expect you to believe my lies.' What can be the meaning of the assertion that even the
summer before the last Hanna had travelled with them to Gmunden 'in the box', except that he
knew about his mother's pregnancy? His holding out the prospect of a repetition of this journey
in the box in each successive year exemplifies a common way in which unconscious thoughts
from the past emerge into consciousness; or it may have special reasons and express his dread
of seeing a similar pregnancy repeated on their next summer holiday. We now see, moreover,
what the circumstances were that had made him take a dislike to the journey to Gmunden, as
his second phantasy had indicated.
[1909b, 2057]

¹ The box was of course the womb. (Hans's father was trying to let him know that he understood this.)
And the same is true of the caskets in which so many of the heroes of mythology were exposed, from the
time of King Sargon of Agade onwards. - [Added 1923:] Cf. Rank's study, Der Mythus von der Geburt des
Helden, 1909.
[1909b, 2057]
'In the light of this, we may review the interpretation of Hans's earlier phantasy to the effect that the plumber had come and unscrewed the bath and had stuck a borer into his stomach. The big bath meant a "behind", the borer or screwdriver was (as was explained at the time) a widdler.¹ The two phantasies are identical. Moreover, a new light is thrown upon Hans's fear of the big bath. (This, by the way, has already diminished.) He dislikes his "behind" being too small for the big bath.'

[1909b, 2084]

But the patient was also familiar with the fact that rats are carriers of dangerous infectious diseases; he could therefore employ them as symbols of his dread (justifiable enough in the army) of syphilitic infection. This dread concealed all sorts of doubts as to the kind of life his father had led during his term of military service. Again, in another sense, the penis itself is a carrier of syphilitic infection; and in this way he could consider the rat as a male organ of sex. It had a further title to be so regarded; for a penis (especially a child's penis) can easily be compared to a worm, and the captain's story had been about rats burrowing in some one's anus, just as the large round-worms had in his when he was a child. Thus the penis significance of rats was based, once more, upon anal erotism. And apart from this, the rat is a dirty animal, feeding upon excrement and living in sewers.¹ It is perhaps unnecessary to point out how great an extension of the rat delirium became possible owing to this new meaning. For instance, 'So many rats, so many florins' could serve as an excellent characterization of a certain female profession which he particularly detested. On the other hand, it is certainly not a matter of indifference that the substitution of a penis for a rat in the captain's story resulted in a situation of intercourse per anum, which could not fail to be especially revolting to him when brought into connection with his father and the woman he loved. And when we consider that the same situation was reproduced in the compulsive threat which had formed in his mind after the captain had made his request, we shall be forcibly reminded of certain curses in use among the Southern Slavs.² Moreover, all of this material, and more besides, was woven into the fabric of the rat discussions behind the screen-association 'heiraten' ['to marry'].

[1909d, 2167]

¹ Ibsen's Rat-Wife must certainly be derived from the legendary Pied Piper of Hamelin, who first enticed away the rats into the water, and then, by the same means, lured the children out of the town, never to return. So too, Little Eyolf threw himself into the water under the spell of the Rat-Wife. In legends generally the rat appears not so much as a disgusting creature but as something uncanny - as a chthonic animal, one might almost say; and it is used to represent the souls of the dead.

[1909d, 2168]
It was only then that it became possible to understand the inexplicable process by which his obsessional idea had been formed. With the assistance of our knowledge of infantile sexual theories and of symbolism (as learnt from the interpretation of dreams) the whole thing could be translated and given a meaning. When, at the afternoon halt (during which he had lost his pince-nez), the captain had told him about the rat punishment, the patient had only been struck at first by the combined cruelty and lasciviousness of the situation depicted. But immediately afterwards a connection had been set up with the scene from his childhood in which he himself had bitten some one. The captain - a man who could defend such punishments - had become a substitute for his father, and had thus drawn down upon himself a part of the reviving animosity which had burst out, on the original occasion, against his cruel father. The idea which came into his consciousness for a moment, to the effect that something of the sort might happen to some one he was fond of, is probably to be translated into a wish such as 'You ought to have the same thing done to you!' aimed at the teller of the story, but through him at his father. A day and a half later,¹ when the captain had handed him the packet upon which the charges were due and had requested him to pay back the 3.80 kronen to Lieutenant A., he had already been aware that his 'cruel superior' was making a mistake, and that the only person he owed anything to was the young lady at the post office. It might easily, therefore, have occurred to him to think of some derisive reply, such as, 'Will I, though?' or 'Pay your grandmother!' or 'Yes! You bet I'll pay him back the money!' - answers which would have been subject to no compulsive force. But instead, out of the stirrings of his father-complex and out of his memory of the scene from his childhood, there formed in his mind some such answer as: 'Yes! I'll pay back the money to A. when my father and the lady have children!' or 'As sure as my father and the lady can have children, I'll pay him back the money!' In short, a derisive affirmation attached to an absurd condition which could never be fulfilled.²

[1909d, 2169]

Before the child comes under the dominance of the castration-complex - at a time when he still holds women at full value - he begins to display an intense desire to look, as an erotic instinctual activity. He wants to see other people's genitals, at first in all probability to compare them with his own. The erotic attraction that comes from his mother soon culminates in a longing for her genital organ, which he takes to be a penis. With the discovery, which is not made till later, that women do not have a penis, this longing often turns into its opposite and gives place to a feeling of disgust which in the years of puberty can become the cause of psychical impotence, misogyny and permanent homosexuality. But the fixation on the object that was once strongly desired, the woman's penis, leaves indelible traces on the mental life of the child, who has pursued that portion of his infantile sexual researches with particular thoroughness. Fetishistic reverence for a woman's foot and shoe appears to take the foot merely as a substitutive symbol for the woman's penis which was once revered and later missed; without knowing it, 'coupeurs de nattes'¹ play the part of people who carry out an act of castration on the female genital organ.

[1910c, 2271]

Let me now touch upon one or two fields in which we have new things to learn and do in fact discover new things every day. Above all, there is the field of symbolism in dreams and in the unconscious - a fiercely contested subject, as you know. It is no small merit in our colleague, Wilhelm Stekel, that, untroubled by all the objections raised by our opponents, he has undertaken a study of dream-symbols. There is indeed still much to learn here; my Interpretation of Dreams, which was written in 1899, awaits important amplification from researches into symbolism.

[1910d, 2308]
The taboo of virginity and something of its motivation has been depicted most powerfully of all in a well-known dramatic character, that of Judith in Hebbel's tragedy *Judith und Holofernes*. Judith is one of those women whose virginity is protected by a taboo. Her first husband was paralysed on the bridal night by a mysterious anxiety, and never again dared to touch her, 'My beauty is like belladonna,' she says. 'Enjoyment of it brings madness and death.' When the Assyrian general is besieging her city, she conceives the plan of seducing him by her beauty and of destroying him, thus employing a patriotic motive to conceal a sexual one. After she has been deflowered by this powerful man, who boasts of his strength and ruthlessness, she finds the strength in her fury to strike off his head, and thus becomes the liberator of her people. Beheading is well known to us as a symbolic substitute for castrating; Judith is accordingly the woman who castrates the man who has deflowered her, which was just the wish of the newly-married woman expressed in the dream I reported. It is clear that Hebbel has intentionally sexualized the patriotic narrative from the Apocrypha of the Old Testament, for there Judith is able to boast after her return that she has not been defiled, nor is there in the Biblical text any mention of her uncanny wedding night. But probably, with the fine perception of a poet, he sensed the ancient motive, which had been lost in the tendentious narrative, and has merely restored its earlier content to the material.

[1918a, 2362]

The sun, therefore, is nothing but another sublimated symbol for the father; and in pointing this out I must disclaim all responsibility for the monotony of the solutions provided by psycho-analysis. In this instance symbolism overrides grammatical gender - at least so far as German goes,¹ for in most other languages the sun is masculine. Its counterpart in this picture of the two parents is 'Mother Earth' as she is generally called. We frequently come upon confirmations of this assertion in resolving the pathogenic phantasies of neurotics by psycho-analysis. I can make no more than the barest allusion to the relation of all this to cosmic myths. One of my patients, who had lost his father at a very early age, was always seeking to rediscover him in what was grand and sublime in Nature. Since I have known this, it has seemed to me probable that Nietzsche's hymn "Vor Sonnenaufgang" ['Before Sunrise'] is an expression of the same longing.² Another patient, who became neurotic after his father's death, was seized with his first attack of anxiety and giddiness while the sun shone upon him as he was working in the garden with a spade. He spontaneously put forward as an interpretation that he had become frightened because his father had looked at him while he was at work upon his mother with a sharp instrument. When I ventured upon a mild remonstrance, he gave an air of greater plausibility to his view by telling me that even in his father's lifetime he had compared him with the sun, though then it had been in a satirical sense. Whenever he had been asked where his father was going to spend the summer he had replied in these sonorous words from the 'Prologue in Heaven':

[1911c, 2426]

6 'For this reason attempts were made to pump out my spinal cord. This was done by means of so-called "little men" who were placed in my feet. I shall have more to say presently on the subject of these "little men", who showed some resemblance to the phenomena of the same name which I have already discussed in Chapter VI. There used as a rule to be two of them - a "little Flechsig" and a "little von W." - And I used to hear their voices, too, in my feet.' (154.) Von W. was the man who was supposed to have accused Schreber of masturbation. The 'little men' are described by Schreber himself as being among the most remarkable and, in some respects, the most puzzling phenomena of his illness (157). It looks as though they were the product of a condensation of children and - spermatozoa.

[1911c, 2427]
In dealing with the case history of Senatspräsident Schreber I purposely restricted myself to a minimum of interpretation and I feel confident that every reader with a knowledge of psychoanalysis will have learned from the material which I presented more than was explicitly stated by me, and that he will have found no difficulty in drawing the threads closer and in reaching conclusions at which I no more than hinted. By a happy chance the same issue of this periodical as that in which my own paper appeared showed that the attention of some other contributors had been directed to Schreber's autobiography, and made it easy to guess how much more material remains to be gathered from the symbolic content of the phantasies and delusions of this gifted paranoic.¹

Since I published my work upon Schreber, a chance acquisition of knowledge has put me in a position to appreciate one of his delusional beliefs more adequately, and to recognize the wealth of its bearing upon mythology. I mentioned on p. 2425 the patient's peculiar relation to the sun, and I was led to explain the sun as a sublimated 'father-symbol'. The sun used to speak to him in human language and thus revealed itself to him as a living being. Schreber was in the habit of abusing it and shouting threats at it; he declares, moreover, that when he stood facing it and spoke aloud, its rays would turn pale before him. After his 'recovery' he boasts that he can gaze at it without any difficulty and without being more than slightly dazzled by it, a thing which would naturally have been impossible for him formerly.²

It is to this delusional privilege of being able to gaze at the sun without being dazzled that the mythological interest attaches. We read in Reinach³ that the natural historians of antiquity attributed this power to the eagle alone, who, as a dweller in the highest regions of the air, was brought into especially intimate relation with the heavens, with the sun, and with lightning.⁴ We learn from the same sources, moreover, that the eagle puts his young to a test before recognizing them as his legitimate offspring. Unless they can succeed in looking into the sun without blinking they are thrown out of the eyrie.

One of us (O.) in his studies of folklore has made two observations with regard to the dreams narrated there which seem to him worth communicating. Firstly, that the symbolism employed in these dreams coincides completely with that accepted by psycho-analysis, and secondly, that a number of these dreams are understood by the common people in the same way as they would be interpreted by psycho-analysis - that is, not as premonitions about a still unrevealed future, but as the fulfilment of wishes, the satisfaction of needs which arise during the state of sleep. Certain peculiarities of these, usually indecent, dreams, which are told as comic anecdotes, have encouraged the second of us (Fr.) to attempt an interpretation of them which has made them seem more serious and more deserving of attention.

Now compare with this the following examples in which the same symbolism is employed outside a dream.

A different variant of this symbolic exaltation of the genitals is favoured in the imagination of artists. A fine etching by Félicien Rops,⁴ bearing the title 'Tout est grand chez les rois' ['Everything about kings is great'], shows the naked figure of a king with the features of the Roi Soleil, whose gigantic penis, which rises to arm level, itself wears a crown. The right hand balances a sceptre, while the left clasps a large orb, which by reason of a central cleft achieves an unmistakable resemblance to another part of the body which is the object of erotic desires.⁵ The index finger of the left hand is inserted into this groove.
The same symbolization of the penis by a worm is familiar from numerous obscene jokes.
[1957a [1911], 2525]

Our intention in putting together this short paper was twofold. On the one hand we wanted to suggest that one should not be deterred by the often repulsively dirty and indecent nature of this popular material from seeking in it valuable confirmation of psycho-analytic views. Thus on this occasion we have been able to establish the fact that folklore interprets dream-symbols in the same way as psycho-analysis, and that, contrary to loudly proclaimed popular opinion, it derives a group of dreams from needs and wishes which have become immediate. On the other hand, we should like to express the view that it is doing the common people an injustice to assume that they employ this form of entertainment merely to satisfy the coarsest desires. It seems rather that behind these ugly façades are concealed mental reactions to impressions of life which are to be taken seriously, which even strike a sad note - reactions to which common people are ready to surrender, but only if they are accompanied by a yield of coarse pleasure.
[1957a [1911], 2542]

Let us look once more at our material. In the Estonian epic, just as in the tale from the Gesta Romanorum, the subject is a girl choosing between three suitors; in the scene from The Merchant of Venice the subject is apparently the same, but at the same time something appears in it that is in the nature of an inversion of the theme: a man chooses between three - caskets. If what we were concerned with were a dream, it would occur to us at once that caskets are also women, symbols of what is essential in woman, and therefore of a woman herself - like coffers, boxes, cases, baskets, and so on. If we boldly assume that there are symbolic substitutions of the same kind in myths as well, then the casket scene in The Merchant of Venice really becomes the inversion we suspected. With a wave of the wand, as though we were in a fairy tale, we have stripped the astral garment from our theme; and now we see that the theme is a human one, a man's choice between three women.
[1913f, 2605]

But who are these three sisters and why must the choice fall on the third? If we could answer this question, we should be in possession of the interpretation we are seeking. We have once already made use of an application of psycho-analytic technique, when we explained the three caskets symbolically as three women. If we have the courage to proceed in the same way, we shall be setting foot on a path which will lead us first to something unexpected and incomprehensible, but which will perhaps, by a devious route, bring us to a goal.
[1913f, 2606]

The son's efforts to put himself in the place of the father-god became ever more obvious. The introduction of agriculture increased the son's importance in the patriarchal family. He ventured upon new demonstrations of his incestuous libido, which found symbolic satisfaction in his cultivation of Mother Earth. Divine figures such as Attis, Adonis and Tammuz emerged, spirits of vegetation and at the same time youthful divinities enjoying the favours of mother goddesses and committing incest with their mother in defiance of their father. But the sense of guilt, which was not allayed by these creations, found expression in myths which granted only short lives to these youthful favourites of the mother-goddesses and decreed their punishment by emasculation or by the wrath of the father in the form of an animal. Adonis was killed by a wild boar, the sacred animal of Aphrodite; Attis, beloved of Cybele, perished by castration.¹ The mourning for these gods and the rejoicings over their resurrection passed over into the ritual of another son-deity who was destined to lasting success.
[1912-1913, 2792]
Moreover it is quite specially remarkable - having regard, too, to some considerations which we shall mention later - that the most violent resistances have been expressed once again to the existence of a symbolic relation between dreams and the unconscious. Even people of judgement and reputation, who, apart from this, have gone a long way in agreeing with psycho-analysis, have at this point withheld their support. This behaviour is all the stranger in view, first, of the fact that symbolism is not peculiar to dreams alone and is not characteristic of them, and, secondly, that symbolism in dreams is by no means a discovery of psycho-analysis, however many other surprising discoveries it has made. The philosopher K. A. Scherner (1861) must be described as the discoverer of dream-symbolism, if its beginning is to be placed in modern times at all. Psycho-analysis has confirmed Scherner's findings, though it has made material modifications in them.

[1916-1917, 3246]

My reply is that we learn it from very different sources from fairy tales and myths, from buffoonery and jokes, from folklore (that is, from knowledge about popular manners and customs, sayings and songs) and from poetic and colloquial linguistic usage. In all these directions we come upon the same symbolism, and in some of them we can understand it without further instruction. If we go into these sources in detail, we shall find so many parallels to dream-symbolism that we cannot fail to be convinced of our interpretations.

[1916-1917, 3252]

According to Scherner, as we have said, the human body is often represented in dreams by the symbol of a house. Carrying this representation further, we found that windows, doors and gates stood for openings in the body and that façades of houses were either smooth or provided with balconies and projections to hold on to. But the same symbolism is found in our linguistic usage - when we greet an acquaintance familiarly as an 'altes haus' ['old house'], when we speak of giving someone 'eins aufs Dachl' [a knock on the head, literally, 'one on the roof'], or when we say of someone else that 'he's not quite right in the upper storey'. In anatomy the orifices of the body are in so many words termed 'Leibespforten' [literally, 'portals of the body'].

[1916-1917, 3253]

It seems surprising at first to find one's parents in dreams as an imperial or royal couple. But it has its parallel in fairy tales. It begins to dawn on us that the many fairy tales which begin 'Once upon a time there were a King and Queen' only mean to say that there were once a father and mother. In a family the children are jokingly called 'princes' and the eldest 'crown prince'. The King himself calls himself the father of his country. We speak of small children jokingly as 'Würmer' ['worms'] and speak sympathetically of a child as 'der areme Wurm' ['the poor worm'].

[1916-1917, 3253]
Birth is regularly expressed in dreams by some connection with water: one falls into the water or one comes out of the water - one gives birth or one is born. We must not forget that this symbol is able to appeal in two ways to evolutionary truth. Not only are all terrestrial mammals, including man's ancestors, descended from aquatic creatures (this is the more remote of the two facts), but every individual mammal, every human being, spent the first phase of its existence in water - namely as an embryo in the amniotic fluid in its mother's uterus, and came out of that water when it was born. I do not say that the dreamer knows this; on the other hand, I maintain that he need not know it. There is something else that the dreamer probably knows from having been told it in his childhood; and I even maintain of that too that his knowledge of it contributed nothing to the construction of the symbol. He was told in his nursery that the stork brings the babies. But where does it fetch them from? From the pond, or from the stream - once again, then, from the water. One of my patients after he had been given this information - he was a little Count at the time - disappeared for a whole afternoon. He was found at last lying by the edge of the castle pool, with his little face bending over the surface of the water eagerly peering down to try and see the babies at the bottom.

In myths about the birth of heroes - to which Otto Rank has devoted a comparative study, the oldest being that of King Sargon of Agade (about 2800 B.C.) - a predominant part is played by exposure in the water and rescue from the water. Rank has perceived that these are representations of birth, analogous to those that are usual in dreams. If one rescues someone from the water in a dream, one is making one self into his mother, or simply into a mother. In myths a person who rescues a baby from the water is admitting that she is the baby's true mother. There is a well-known comic anecdote according to which an intelligent Jewish boy was asked who the mother of Moses was. He replied without hesitation: 'The Princess.' 'No', he was told, 'she only took him out of the water.' 'That's what she says', he replied, and so proved that he had found the correct interpretation of the myth.

Departure in dreams means dying. So, too, if a child asks where someone is who has died and whom he misses, it is common nursery usage to reply that he has gone on a journey. Once more I should like to contradict the belief that the dream symbol is derived from this evasion. The dramatist is using the same symbolic connection when he speaks of the after-life as 'the undiscovered country from whose bourn no traveller returns'. Even in ordinary life it is common to speak of 'the last journey'. Every one acquainted with ancient rituals is aware of how seriously (in the religion of Ancient Egypt, for instance) the idea is taken of a journey to the land of the dead. Many copies have survived of The Book of the Dead, which was supplied to the mummy like a Baedeker to take with him on the journey. Ever since burial-places have been separated from dwelling-places the dead person's last journey has indeed become a reality.

It is just as little the case that genital symbolism is something that is found only in dreams. Every one of you has probably at one time or another spoken impolitely of a woman as an 'alte Schachtel' ['old box'], perhaps without knowing that you were using a genital symbol. In the New Testament we find woman referred to as 'the weaker vessel'. The Hebrew scriptures, written in a style that comes close to poetry, are full of sexually symbolic expressions, which have not always been correctly understood and whose exegesis (for instance, in the case of the Song of Solomon) has led to some misunderstandings. In later Hebrew literature it is very common to find a woman represented by a house, whose door stands for the sexual orifice. A man complains, for instance, in a case of lost virginity, that he has 'found the door open'. So, too, the symbol of a table for a woman in these writings. Thus, a woman says of her husband: 'I laid the table for him, but he turned it round.' Lame children are said to come about through the man's 'turning the table round'. I take these examples from a paper by Dr. L. Levy of Brünn.
The fact that ships, too, in dreams stand for women is made credible by the etymologists, who tell us that 'Schiff [ship]' was originally the name of an earthenware vessel and is the same word as 'Schaff' [a dialect word meaning 'tub']. That ovens represent women and the uterus is confirmed by the Greek legend of Periander of Corinth and his wife Melissa. The tyrant, according to Herodotus, conjured up the shade of his wife, whom he had loved passionately but had murdered out of jealousy, to obtain some information from her. The dead woman proved her identity by saying that he (Periander) had pushed his bread into a cold oven', as a disguise for an event which no one else could know of. In the periodical Anthropophyteleia, edited by F. S. Krauss, an invaluable source of knowledge of sexual anthropology, we learn that in a particular part of Germany they say of a woman who has given birth to a child that 'her oven has come to pieces'. Kindling fire, and everything to do with it, is intimately interwoven with sexual symbolism. Flame is always a male genital, and the fireplace, the hearth is its female counterpart.

[1916-1917, 3256]

If you may have felt surprised at the frequency with which landscapes are used in dreams to represent the female genitals, you can learn from mythology the part played by Mother Earth in the concepts and cults of the peoples of antiquity and how their view of agriculture was determined by this symbolism. You will perhaps be inclined to trace the fact that in dreams a room represents a woman to the common usage in our language by which 'Frau' is replaced by 'Frauenzimmer'¹ - the human being is replaced by the apartment allotted to her. Similarly we speak of the 'Sublime Porte', meaning the Sultan and his government. So too the title of the Ancient Egyptian ruler, 'Pharaoh', means simply 'Great Courtyard'. (In the Ancient East the courts between the double gateways of a city were public meeting-places like the market-places of the classical world.) This derivation, however, appears to be too superficial. It seems to me more likely that a room became the symbol of a woman as being the space which encloses human beings. We have already found 'house' used in a similar sense; and mythology and poetical language enable us to add 'city', 'citadel', 'castle' and 'fortress' as further symbols for 'woman'. The question could be easily settled from the dreams of people who do not speak or understand German. During the last few years I have mainly treated foreign-speaking patients, and I seem to remember that in their dreams too 'Zimmer' ["room"] meant 'Frauenzimmer', though they had no similar usage in their languages. There are other indications that the symbolic relation can go beyond the limits of language - which, incidentally was asserted long ago by an old investigator of dreams, Schubert. However, none of my dreamers were completely ignorant of German, so the decision must be left to psycho-analysts who can collect data from unilingual people in other countries.

[1916-1917, 3256]
There is scarcely one of the symbolic representations of the male genitals which does not recur in joking, vulgar or poetic usage, especially in the ancient classical dramatists. But here we meet not only the symbols which appear in dreams, but others besides - for instance tools employed in various operations, and particularly the plough. Moreover, the symbolic representation of masculinity leads us to a very extensive and much disputed region, which, on grounds of economy, we shall avoid. I should like, however, to devote a few words to one symbol, which, as it were, falls outside this class - the number 3. Whether this number owes its sacred character to this symbolic connection remains undecided. But what seems certain is that a number of tripartite things that occur in nature - the clover leaf, for instance - owe their use for coats of arms and emblems to this symbolic meaning. Similarly, the tripartite lily - the so-called *fleur-de-lis* - and the remarkable heraldic device of two islands so far apart as Sicily and the Isle of Man - the *triskeles* (three bent legs radiating from a centre) - seem to be stylized versions of the male genitals. Likenesses of the male organ were regarded in antiquity as the most powerful *apotropaic* (means of defence) against evil influences, and, in conformity with this, the lucky charms of our own day can all be easily recognized as genital or sexual symbols. Let us consider a collection of such things - as they are worn, for instance, in the form of small silver hanging trinkets: a four-leaved clover, a pig, a mushroom, a horse-shoe, a ladder, a chimney-sweep. The four-leaved clover has taken the place of the three-leaved one which is really suited to be a symbol. The pig is an ancient fertility symbol. The mushroom is an undoubted penis-symbol: there are mushrooms which owe their systematic name (*Phallus impudicus*) to their unmistakable resemblance to the male organ. The horseshoe copies the outline of the female genital orifice, while the chimney-sweep, who carries the ladder, appears in this company on account of his activities, with which sexual intercourse is vulgarly compared. (Cf. *Anthropophyteia*.) We have made the acquaintance of his ladder in dreams as a sexual symbol; here German linguistic usage comes to our help and shows us how the word 'steigen' ['to climb', or 'to mount'] is used in what is *par excellence* a sexual sense. We say 'den Frauen nachsteigen' ['to run' (literally 'climb') 'after women'], and 'ein alter Steiger' ['an old rake' (literally 'climber')]. In French, in which the word for steps on a staircase is 'marches', we find a precisely analogous term 'un vieux marcheur'. The fact that in many large animals climbing or 'mounting' on the female is a necessary preliminary to sexual intercourse probably fits into this context.

[1916-1917, 3257]

'Pulling off a branch' as a symbolic representation of masturbation is not merely in harmony with vulgar descriptions of the act but has far-reaching mythological parallels. But that masturbation, or rather the punishment for it - castration - should be represented by the falling out or pulling out of teeth is especially remarkable, since there is a counterpart to it in anthropology which can be known to only a very small number of dreamers. There seems to me no doubt that the circumcision practised by so many peoples is an equivalent and substitute for castration. And we now learn that certain primitive tribes in Australia carry out circumcision as a puberty rite (at the festival to celebrate a boy's attaining sexual maturity), while other tribes, their near neighbours, have replaced this act by the knocking out of a tooth.

[1916-1917, 3258]
In the first place we are faced by the fact that the dreamer has a symbolic mode of expression at his disposal which he does not know in waking life and does not recognize. This is as extraordinary as if you were to discover that your housemaid understood Sanskrit, though you know that she was born in a Bohemian village and never learnt it. It is not easy to account for this fact by the help of our psychological views. We can only say that the knowledge of symbolism is unconscious to the dreamer, that it belongs to his unconscious mental life. But even with this assumption we do not meet the point. Hitherto it has only been necessary for us to assume the existence of unconscious endeavours - endeavours, that is, of which, temporarily or permanently, we know nothing. Now, however, it is a question of more than this, of unconscious pieces of knowledge, of connections of thought, of comparisons between different objects which result in its being possible for one of them to be regularly put in place of the other. These comparisons are not freshly made on each occasion; they lie ready to hand and are complete, once and for all. This is implied by the fact of their agreeing in the case of different individuals - possibly, indeed, agreeing in spite of differences of language. What can be the origin of these symbolic relations? Linguistic usage covers only a small part of them. The multiplicity of parallels in other spheres of knowledge are mostly unknown to the dreamer; we ourselves have been obliged to collect them laboriously.

Secondly, these symbolic relations are not something peculiar to dreamers or to the dream-work through which they come to expression. This same symbolism, as we have seen, is employed by myths and fairy tales, by the people in their sayings and songs, by colloquial linguistic usage and by the poetic imagination. The field of symbolism is immensely wide, and dream symbolism is only a small part of it: indeed, it serves no useful purpose to attack the whole problem from the direction of dreams. Many symbols which are commonly used elsewhere appear in dreams very seldom or not at all. Some dream symbols are not to be found in all other fields but only, as you have seen, here and there. One gets an impression that what we are faced with here is an ancient but extinct mode of expression, of which different pieces have survived indifferent fields, one piece only here, another only there, a third, perhaps, in slightly modified forms in several fields. And here I recall the phantasy of an interesting psychotic patient, who imagined a 'basic language' of which all these symbolic relations would be residues.

Thirdly, it must strike you that the symbolism in the other fields I have mentioned is by no means solely sexual symbolism, whereas in dreams symbols are used almost exclusively for the expression of sexual objects and relations. This is not easily explained either. Are we to suppose that symbols which originally had a sexual significance later acquired another application and that, furthermore, the toning-down of representation by symbols into other kinds of representation may be connected with this? These questions can evidently not be answered so long as we have considered dream-symbolism alone. We can only hold firmly to the suspicion that there is a specially intimate relation between true symbols and sexuality.
The parallels we have found to dream-symbolism also allow us to form an estimate of the characteristic of psycho-analysis which enables it to attract general interest in a way in which neither psychology nor psychiatry has succeeded in doing. In the work of psycho-analysis links are formed with numbers of other mental sciences, the investigation of which promises results of the greatest value: links with mythology and philology, with folklore, with social psychology and the theory of religion. You will not be surprised to hear that a periodical has grown up on psycho-analytic soil whose sole aim is to foster these links. This periodical is known as *Imago*, founded in 1912 and edited by Hanns Sachs and Otto Rank. In all these links the share of psycho-analysis is in the first instance that of giver and only to a less extent that of receiver. It is true that this brings it an advantage in the fact that its strange findings become more familiar when they are met with again in other fields; but on the whole it is psycho-analysis which provides the technical methods and the points of view whose application in these other fields should prove fruitful. The mental life of human individuals, when subjected to psycho-analytic investigation, offers us the explanations with the help of which we are able to solve a number of riddles in the life of human communities or at least to set them in a true light.

[1916-1917, 3261]

It will shortly become clear whether a further study of dreams may not bring us up against yet another factor that contributes to the distortion of dreams. But I should not like to leave the subject of dream-symbolism without once more touching on the problem of how it can meet with such violent resistance in educated people when the wide diffusion of symbolism in myths, religion, art and language is so unquestionable. May it not be that what is responsible is once again its connection with sexuality?

[1916-1917, 3261]

Our patient gradually came to learn that it was as symbols of the female genitals that clocks were banished from her equipment for the night. Clocks and watches - though elsewhere we have found other symbolic interpretations for them - have arrived at a genital role owing to their relation to periodic processes and equal intervals of time. A woman may boast that her menstruation behaves with the regularity of clockwork. Our patient's anxiety, however, was directed in particular against being disturbed in her sleep by the ticking of a clock. The ticking of a clock may be compared with the knocking or throbbing in the clitoris during sexual excitement. She had in fact been repeatedly woken from her sleep by this sensation, which had now become distressing to her; and she gave expression to this fear of an erection in the rule that all clocks and watches that were going should be removed from her neighbourhood at night. Flower-pots and vases, like all vessels, are also female symbols. Taking precautions against their falling and being broken at night was thus not without its good sense. We know the widespread custom of breaking a vessel or plate at betrothal ceremonies. Each man present gets hold of a fragment, and we may regard this as a sign of his resigning the claims he had upon the bride in virtue of a marriage-regulation dating from before the establishment of monogamy. In connection with this part of her ceremonial the girl produced a recollection and several associations. Once when she was a child she had fallen down while she was carrying a glass or china vase and had cut her finger and bled profusely. When she grew up and came to know the facts about sexual intercourse she formed an anxious idea that on her wedding-night she would not bleed and would thus fail to show that she was a virgin. Her precautions against vases being broken thus meant a repudiation of the whole complex concerned with virginity and bleeding at the first intercourse - a repudiation equally of the fear of bleeding and of the contrary fear of not bleeding. These precautions, which she subsumed under her avoidance of noise, had only a remote connection with it.

[1916-1917, 3346]
"If in my patient's case the wolf was merely a first father surrogate, the question arises whether the hidden content in the fairy tales of the wolf that ate up the little goats and of "Little Red Riding-Hood" may not simply be infantile fear of the father.¹ Moreover, my patient's father had the characteristic, shown by so many people in relation to their children, of indulging in "affectionate abuse"; and it is possible that during the patient's earlier years his father (though he grew severe later on) may more than once, as he caressed the little boy or played with him, have threatened in fun to "gobble him up". One of my patients told me that her two children could never get to be fond of their grandfather, because in the course of his affectionate romping with them he used to frighten them by saying he would cut open their tummies.' [1918b, 3523]

This is most easily seen in the relation between 'baby' and 'penis'. It cannot be without significance that in the symbolic language of dreams, as well as of everyday life, both may be replaced by the same symbol; both baby and penis are called a 'little one'. It is a well-known fact that symbolic speech often ignores difference of sex. The 'little one', which originally meant the male genital organ, may thus have acquired a secondary application to the female genitals. [1917c, 3600]

We know from psycho-analytic experience, however, that the fear of damaging or losing one's eyes is a terrible one in children. Many adults retain their apprehensiveness in this respect, and no physical injury is so much dreaded by them as an injury to the eye. We are accustomed to say, too, that we will treasure a thing as the apple of our eye. A study of dreams, phantasies and myths has taught us that anxiety about one's eyes, the fear of going blind, is often enough a substitute for the dread of being castrated. The self-blinding of the mythical criminal, Oedipus, was simply a mitigated form of the punishment of castration - the only punishment that was adequate for him by the lex talionis. We may try on rationalistic grounds to deny that fears about the eye are derived from the fear of castration, and may argue that it is very natural that so precious an organ as the eye should be guarded by a proportionate dread. Indeed, we might go further and say that the fear of castration itself contains no other significance and no deeper secret than a justifiable dread of this rational kind. But this view does not account adequately for the substitutive relation between the eye and the male organ which is seen to exist in dreams and myths and phantasies; nor can it dispel the impression that the threat of being castrated in especial excites a peculiarly violent and obscure emotion, and that this emotion is what first gives the idea of losing other organs its intense colouring. All further doubts are removed when we learn the details of their 'castration complex' from the analysis of neurotic patients, and realize its immense importance in their mental life. [1919h, 3684]

Moreover, I would not recommend any opponent of the psycho-analytic view to select this particular story of the Sand-Man with which to support his argument that anxiety about the eyes has nothing to do with the castration complex. For why does Hoffmann bring the anxiety about eyes into such intimate connection with the father's death? And why does the Sand-Man always appear as a disturber of love? He separates the unfortunate Nathaniel from his betrothed and from her brother, his best friend; he destroys the second object of his love, Olympia, the lovely doll; and he drives him into suicide at the moment when he has won back his Clara and is about to be happily united to her. Elements in the story like these, and many others, seem arbitrary and meaningless so long as we deny all connection between fears about the eye and castration; but they become intelligible as soon as we replace the Sand-Man by the dreaded father at whose hands castration is expected.' [1919h, 3684]
Symbolism. - In the course of investigating the form of expression brought about by the dream-work, the surprising fact emerged that certain objects, arrangements and relations are represented, in a sense indirectly, by 'symbols', which are used by the dreamer without his understanding them and to which as a rule he offers no associations. Their translation has to be provided by the analyst, who can himself only discover it empirically by experimentally fitting it into the context. It was later found that linguistic usage, mythology and folklore afford the most ample analogies to dream-symbols. Symbols, which raise the most interesting and hitherto unsolved problems, seem to be a fragment of extremely ancient inherited mental equipment. The use of a common symbolism extends far beyond the use of a common language.
[1923a, 3919]

The mother herself seems to have understood the transition from the child's first remark to her second one. What she was trying to say was: 'I know that babies grow inside their mother.' She was not expressing this knowledge directly, but symbolically, by replacing the mother by Mother Earth. We have already learnt from numerous incontestable observations the early age at which children know how to make use of symbols. But the little girl's third remark carries on the same context. We can only suppose that she was trying to convey a further piece of her knowledge about the origin of babies: 'I know that it's all the work of the father.' But this time she was replacing the direct thought by the appropriate sublimation - that God makes the world.
[1920d, 3938]

The hair upon Medusa's head is frequently represented in works of art in the form of snakes, and these once again are derived from the castration complex. It is a remarkable fact that, however frightening they may be in themselves, they nevertheless serve actually as a mitigation of the horror, for they replace the penis, the absence of which is the cause of the horror. This is a confirmation of the technical rule according to which a multiplication of penis symbols signifies castration.
[1940c [1922], 3943]

The sight of Medusa's head makes the spectator stiff with terror, turns him to stone. Observe that we have here once again the same origin from the castration complex and the same transformation of affect! For becoming stiff means an erection. Thus in the original situation it offers consolation to the spectator: he is still in possession of a penis, and the stiffening reassures him of the fact.
[1940c [1922], 3943]

This symbol of horror is worn upon her dress by the virgin goddess Athene. And rightly so, for thus she becomes a woman who is unapproachable and repels all sexual desires - since she displays the terrifying genitals of the Mother. Since the Greeks were in the main strongly homosexual, it was inevitable that we should find among them a representation of woman as a being who frightens and repels because she is castrated.
[1940c [1922], 3943]

The erect male organ also has an apotropaic effect, but thanks to another mechanism. To display the penis (or any of its surrogates) is to say: 'I am not afraid of you. I defy you. I have a penis.' Here, then, is another way of intimidating the Evil Spirit.
[1940c [1922], 3943]
It is true that it is by no means easy to demonstrate the traces of this satanic view of the father in the mental life of the individual. When a boy draws grotesque faces and caricatures, we may no doubt be able to show that he is jeering at his father in them; and when a person of either sex is afraid of robbers and burglars at night, it is not hard to recognize these as split off portions of the father.¹ The animals, too, which appear in children's animal phobias are most often father-substitutes, as were the totem animals of primaeval times. But that the Devil is a duplicate of the father and can act as a substitute for him has not been shown so clearly elsewhere as in the demonological neurosis of this seventeenth-century painter. That is why, at the beginning of this paper, I foretold that a demonological case history of this kind would yield in the form of pure metal material which, in the neuroses of a later epoch (no longer superstitious but hypochondriacal instead) has to be laboriously extracted by analytic work from the ore of free associations and symptoms.² A deeper penetration into the analysis of our painter's illness will probably bring stronger conviction. It is no unusual thing for a man to acquire a melancholic depression and an inhibition in his work as a result of his father's death. When this happens, we conclude that the man had been attached to his father with an especially strong love, and we remember how often a severe melancholia appears as a neurotic form of mourning.

¹ In the familiar fairy tale of 'The Seven Little Goats', the Father Wolf appears as a burglar.

² The number nine is well known to us from neurotic phantasies. It is the number of the months of pregnancy, and wherever it appears it directs our attention to a phantasy of pregnancy. In our painter's case, to be sure, the number refers to years, not months; and it will be objected that nine is a significant number in other ways as well. But who knows whether it may not in general owe a good deal of its sanctity to the part it plays in pregnancy? Nor need we be disconcerted by the change from nine months to nine years. We know from dreams what liberties 'unconscious mental activity' takes with numbers. If, for instance, the number five occurs in a dream, this can invariably be traced back to a five that is important in waking life; but whereas in waking life the five was a five years' difference in age or a company of five people, it appeared in the dream as five bank-notes or five fruits. That is to say, the number is kept, but its denominator is changed according to the requirements of condensation and displacement. Nine years in a dream could thus easily correspond to nine months in real life. The dream-work plays about with the numbers of waking life in another way, too, for it shows a sovereign disregard for noughts and does not treat them as numbers at all. Five dollars in a dream can stand for fifty or five hundred or five thousand dollars in reality.

There seems to be no end to the problems of dream-life. But this can only be surprising if we forget that all the problems of mental life recur in dreams with the addition of a few new ones arising from the special nature of dreams. Many of the things that we study in dreams, because we meet with them there, have nevertheless little or nothing to do with the psychological peculiarity of dreams. Thus, for instance, symbolism is not a dream-problem, but a topic connected with our archaic thinking - our 'basic language', as it was aptly called by the paranoic Schreber. It dominates myths and religious ritual no less than dreams, and dream-symbolism can scarcely even claim that it is peculiar in that it conceals more particularly things that are important sexually. Again, it is not to be expected that the explanation of anxiety-dreams will be found in the theory of dreams. Anxiety is a problem rather of neurosis, and all that remains to be discussed is how it comes about that anxiety can arise under dream-conditions.
There is no difficulty in discovering the general function of dreaming. It serves the purpose of fending off, by a kind of soothing action, external or internal stimuli which would tend to arouse the sleeper, and thus of securing sleep against interruption. External stimuli are fended off by being given a new interpretation and by being woven into some harmless situation; internal stimuli, caused by instinctual demands, are given free play by the sleeper and allowed to find satisfaction in the formation of dreams, so long as the latent dream-thoughts submit to the control of the censorship. But if they threaten to break free and the meaning of the dream becomes too plain, the sleeper cuts short the dream and wakes in a fright. (Dreams of this class are known as anxiety-dreams.) A similar failure in the function of dreaming occurs if an external stimulus becomes too strong to be fended off. (This is the class of arousal-dreams.) I have given the name of dream-work to the process which, with the co-operation of the censorship, converts the latent thoughts into the manifest content of the dream. It consists of a peculiar way of treating the preconscious material of thought, so that its component parts become condensed, its psychical emphasis becomes displaced, and the whole of it is translated into visual images or dramatized, and completed by a deceptive secondary revision. The dream-work is an excellent example of the processes occurring in the deeper, unconscious layers of the mind, which differ considerably from the familiar normal processes of thought. It also displays a number of archaic characteristics, such as the use of a symbolism (in this case of a predominantly sexual kind) which it has since also been possible to discover in other spheres of mental activity. [1925d, 4220]

I have taken but little direct part in certain other applications of psycho-analysis, though they are none the less of general interest. It is only a step from the phantasies of individual neurotics to the imaginative creations of groups and peoples as we find them in myths, legends, and fairy tales. Mythology became the special province of Otto Rank; the interpretation of myths, the tracing of them back to the familiar unconscious complexes of early childhood, the replacing of astral explanations by a discovery of human motives, all of this is to a large extent due to his analytic efforts. The subject of symbolism, too, has found many students among my followers. Symbolism has brought psycho-analysis many enemies; many enquirers with unduly prosaic minds have never been able to forgive it the recognition of symbolism, which followed from the interpretation of dreams. But analysis is guiltless of the discovery of symbolism, for it had long been known in other regions of thought (such as folklore, legends, and myths) and plays an even larger part in them than in the 'language of dreams'. [1925d, 4242]

Within this narrow compass it has been impossible to mention many matters of the greatest interest, such as the 'sublimation' of instincts, the part played by symbolism, the problem of 'ambivalence', etc. Nor has there been space to allude to the applications of psycho-analysis, which originated, as we have seen, in the sphere of medicine, to other departments of knowledge (such as Social Anthropology, the Study of Religion, Literary History and Education) where its influence is constantly increasing. It is enough to say that psycho-analysis, in its character of the psychology of the deepest, unconscious mental acts, promises to become the link between psychiatry and all of these other branches of mental science. [1926f, 4406]
Our knowledge of the historical worth of certain religious doctrines increases our respect for them, but does not invalidate our proposal that they should cease to be put forward as the reasons for the precepts of civilization. On the contrary! Those historical residues have helped us to view religious teachings, as it were, as neurotic relics, and we may now argue that the time has probably come, as it does in an analytic treatment, for replacing the effects of repression by the results of the rational operation of the intellect. We may foresee, but hardly regret, that such a process of remoulding will not stop at renouncing the solemn transfiguration of cultural precepts, but that a general revision of them will result in many of them being done away with. In this way our appointed task of reconciling men to civilization will to a great extent be achieved. We need not deplore the renunciation of historical truth when we put forward rational grounds for the precepts of civilization. The truths contained in religious doctrines are after all so distorted and systematically disguised that the mass of humanity cannot recognize them as truth. The case is similar to what happens when we tell a child that new-born babies are brought by the stork. Here, too, we are telling the truth in symbolic clothing, for we know what the large bird signifies. But the child does not know it. He hears only the distorted part of what we say, and feels that he has been deceived; and we know how often his distrust of the grown-ups and his refractoriness actually take their start from this impression. We have become convinced that it is better to avoid such symbolic disguisings of the truth in what we tell children and not to withhold from them a knowledge of the true state of affairs commensurate with their intellectual level.

[1927c, 4453]

We have not yet finished with symbols. There are some which we believed we recognized but which nevertheless worried us because we could not explain how this particular symbol had come to have that particular meaning. In such cases confirmations from elsewhere - from philology, folklore, mythology or ritual - were bound to be especially welcome. An instance of this sort is the symbol of an overcoat or cloak. We have said that in a woman's dreams this stands for a man. I hope it will impress you when you hear that Theodor Reik (1920) gives us this information: "During the extremely ancient bridal ceremonial of the Bedouins, the bridgroom covers the bride with a special cloak known as "Aba" and speaks the following ritual words: "Henceforth none save I shall cover thee!" (Quoted from Robert Eisler). We have also found several fresh symbols, at least two of which I will tell you of. According to Abraham (1922) a spider in dreams is a symbol of the mother, but of the phallic mother, of whom we are afraid; so that the fear of spiders expresses dread of mother-incest and horror of the female genitals. You know, perhaps, that the mythological creation, Medusa's head, can be traced back to the same motif of fright at castration. The other symbol I want to talk to you about is that of the bridge, which has been explained by Ferenczi (1921 and 1922). First it means the male organ, which unites the two parents in sexual intercourse; but afterwards it develops further meanings which are derived from this first one. In so far as it is thanks to the male organ that we are able to come into the world at all, out of the amniotic fluid, a bridge becomes the crossing from the other world (the unborn state, the womb) to this world (life); and, since men also picture death as a return to the womb (to the water), a bridge also acquires the meaning of something that leads to death, and finally, at a further remove from its original sense, it stands for transitions or changes in condition generally. It tallies with this, accordingly, if a woman who has not overcome her wish to be a man has frequent dreams of bridges that are too short to reach the further shore.

[1933a, 4637]
In the manifest content of dreams we very often find pictures and situations recalling familiar themes in fairy tales, legends and myths. The interpretation of such dreams thus throws a light on the original interests which created these themes, though we must at the same time not forget, of course, the change in meaning by which this material has been affected in the course of time. Our work of interpretation uncovers, so to say, the raw material, which must often enough be described as sexual in the widest sense, but has found the most varied application in later adaptations. Derivations of this kind are apt to bring down on us the wrath of all non-analytically schooled workers, as though we were seeking to deny or undervalue everything that was later erected on the original basis. Nevertheless, such discoveries are instructive and interesting. The same is true of tracing back the origin of particular themes in plastic art, as, for instance, when M. J. Eisler (1919), following indications in his patients’ dreams, gave an analytic interpretation of the youth playing with a little boy represented in the Hermes of Praxiteles. And lastly I cannot resist pointing out how often light is thrown by the interpretation of dreams on mythological themes in particular. Thus, for instance, the legend of the Labyrinth can be recognized as a representation of anal birth: the twisting paths are the bowels and Ariadne’s thread is the umbilical cord.

I need not say much about other schools which have branched off from our psycho-analysis. The fact that they have done so cannot be used either for or against the validity of psycho-analytic theories. You have only to think of the strong emotional factors that make it hard for many people to fit themselves in with others or to subordinate themselves, and of the still greater difficulty justly insisted on by the dictum 'Quot capita tot sensus'. When the differences of opinion had gone beyond a certain point, the most sensible thing was to part and thereafter to proceed along our different ways - especially when the theoretical divergence involved a change in practical procedure. Suppose, for instance, that an analyst attaches little value to the influence of the patient’s personal past and looks for the causation of neuroses exclusively in present-day motives and in expectations of the future. In that case he will also neglect the analysis of childhood; he will have to adopt an entirely different technique and will have to make up for the omission of the events from the analysis of childhood by increasing his didactic influence and by directly indicating certain particular aims in life. We for our part will then say: 'This may be a school of wisdom; but it is no longer analysis.' Or someone else may arrive at the view that the experience of anxiety at birth sows the seed of all later neurotic disturbances. It may thereupon seem to him legitimate to restrict analysis to the consequences of this single impression and to promise therapeutic success from a treatment lasting from three to four months. As you will observe, I have chosen two examples which start from diametrically opposite premisses. It is an almost universal characteristic of these ‘secessionist movements' that each of them takes hold of one fragment out of the wealth of themes in psycho-analysis and makes itself independent on the basis of this seizure - selecting the instinct for mastery, for instance, or ethical conflict, or the mother, or genitality, and so on. If it appears to you that secessions of this sort are already more numerous to-day in the history of psycho-analysis than in other intellectual movements, I am not sure that I should agree with you. If it is the case, the responsibility must be laid on the intimate relations which exist in psycho-analysis between theoretical views and therapeutic treatment. Mere differences of opinion would be tolerable for far longer. People like accusing us psycho-analysts of intolerance. The only manifestation of this ugly characteristic has been precisely our parting from those who think differently from us. No other harm has been done to them. On the contrary, they have fallen on their feet, and are better off than they were before. For by their separation they have usually freed themselves of one of the burdens which weigh us down - the odium of infantile sexuality, perhaps, or the absurdity of symbolism - and are regarded by their environment as passably respectable, which is still not true of those of us who are left behind. Moreover, apart from one notable exception, it was they who excluded themselves.

[1933a, 4638]

[1933a, 4744]
For I think my hypothesis - that, in order to gain control over fire, men had to renounce the homosexually-tinged desire to put it out with a stream of urine - can be confirmed by an interpretation of the Greek myth of Prometheus, provided that we bear in mind the distortions which must be expected to occur in the transition from facts to the contents of a myth. These distortions are of the same sort as, and no worse than, those which we acknowledge every day, when we reconstruct from patients' dreams the repressed but extremely important experiences of their childhood. The mechanisms employed in the distortions I have in mind are symbolic representation and turning into the opposite. I should not venture to explain all the features of our myth in this fashion; apart from the original set of facts, other and later occurrences may have contributed to its content. But the elements which admit of analytic interpretation are, after all, the most striking and important - viz. the manner in which Prometheus transported the fire, the character of his act (an outrage, a theft, a defrauding of the gods) and the meaning of his punishment.

[1932a, 4781]

The obscurity of the Prometheus legend, as of other fire myths, is increased by the fact that primitive man was bound to regard fire as something analogous to the passion of love - or, as we should say, as a symbol of the libido. The warmth that is radiated by fire calls up the same sensation that accompanies a state of sexual excitation, and the shape and movements of a flame suggest a phallus in activity. There can be no doubt about the mythological significance of flame as a phallus; we have further evidence of it in the legend of the parentage of Servius Tullius, the Roman king. When we ourselves speak of the 'devouring fire' of love and of 'licking' flames - thus comparing the flame to a tongue - we have not moved so very far away from the mode of thinking of our primitive ancestors. One of the presuppositions on which we based our account of the myth of the acquisition of fire was, indeed, that to primal man the attempt to quench fire with his own water had the meaning of a pleasurable struggle with another phallus.

[1932a, 4784]

It may thus well be that, by way of this symbolic analogy, other elements, of a purely imaginative sort, have made their way into the myth and become interwoven with its historical elements. It is difficult to resist the notion that, if the liver is the seat of passion, its significance, symbolically, is the same as that of fire itself; and that, if this is so, its being daily consumed and renewed gives an apt picture of the behaviour of the erotic desires, which, though daily satisfied, are daily revived. The bird which sates itself on the liver would then have the meaning of a penis - a meaning which is not strange to it in other connections, as we know from legends, dreams, linguistic usage and plastic representations in ancient times. A short step further brings us to the phoenix, the bird which, as often as it is consumed by fire, emerges rejuvenated once more, and which probably bore the significance of a penis revivified after its collapse rather than, and earlier than, that of the sun setting in the glow of evening and afterwards rising once again.

[1932a, 4784]
A reversal into the opposite is unexpectedly found in another myth which in appearance has very little to do with the fire myth. The Lernaean hydra with its countless flickering serpent's heads - one of which was immortal - was, as its name tells us, a water-dragon. Heracles, the culture-hero, fought it by cutting off its heads; but they always grew again, and it was only after he had burnt up the immortal head with fire that he overcame the monster. A water-dragon subdued by fire - that surely makes no sense. But, as in so many dreams, sense emerges if we reverse the manifest content. In that case the hydra is a brand of fire and the flickering serpent's heads are the flames; and these, in proof of their libidinal nature, once more display, like Prometheus's liver, the phenomenon of re-growth, of renewal after attempted destruction. Heracles, then, extinguishes this brand of fire with - water. (The immortal head is no doubt the phallus itself, and its destruction signifies castration.) But Heracles was also the deliverer of Prometheus and slew the bird which devoured his liver. Should we not suspect a deeper connection between the two myths? It is as though the deed of the one hero was made up for by the other. Prometheus (like the Mongolian law) had forbidden the quenching of fire; Heracles permitted it in the case in which the brand of fire threatened disaster. The second myth seems to correspond to the reaction of a later epoch of civilization to the events of the acquisition of power over fire. It looks as though this line of approach might take us quite a distance into the secrets of the myth; but admittedly we should carry a feeling of certainty with us only a short way.

Nevertheless, analytic research has brought us a few results which give us cause for thought. There is, in the first place, the universality of symbolism in language. The symbolic representation of one object by another - the same thing applies to actions - is familiar to all our children and comes to them, as it were, as a matter of course. We cannot show in regard to them how they have learnt it and must admit that in many cases learning it is impossible. It is a question of an original knowledge which adults afterwards forget. It is true that an adult makes use of the same symbols in his dreams, but he does not understand them unless an analyst interprets them to him, and even then he is reluctant to believe the translation. If he makes use of one of the very common figures of speech in which this symbolism is recorded, he is obliged to admit that its true sense has completely escaped him. Moreover, symbolism disregards differences of language; investigations would probably show that it is ubiquitous - the same for all peoples. Here, then, we seem to have an assured instance of an archaic heritage dating from the period at which language developed. But another explanation might still be attempted. It might be said that we are dealing with thought-connections between ideas - connections which had been established during the historical development of speech and which have to be repeated now every time the development of speech has to be gone through in an individual. It would thus be a case of the inheritance of an intellectual disposition similar to the ordinary inheritance of an instinctual disposition - and once again it would be no contribution to our problem.

¹ Castration has a place too in the Oedipus legend, for the blinding with which Oedipus punishes himself after the discovery of his crime is, by the evidence of dreams, a symbolic substitute for castration. The possibility cannot be excluded that a phylogenetic memory-trace may contribute to the extraordinarily terrifying effect of the threat - a memory-trace from the prehistory of the primal family, where the jealous father actually robbed his son of his genitals if the latter became troublesome to him as a rival with a woman. The primaeval custom of circumcision, another symbolic substitute for castration, can only be understood as an expression of submission to the father's will. (Cf. the puberty rites of primitive peoples.) No investigation has yet been made of the form taken by the events described above among peoples and in civilizations which do not suppress masturbation in children.
The connections between the complexes of interest in money and of defaecation, which seem so dissimilar, appear to be the most extensive of all. Every doctor who has practised psycho-analysis knows that the most refractory and long-standing cases of what is described as habitual constipation in neurotics can be cured by that form of treatment. This is less surprising if we remember that that function has shown itself similarly amenable to hypnotic suggestion. But in psycho-analysis one only achieves this result if one deals with the patients' money complex and induces them to bring it into consciousness with all its connections. It might be supposed that the neurosis is here only following as indication of common usage in speech, which calls a person who keeps too careful a hold on his money 'dirty' or 'filthy'. But this explanation would be far too superficial. In reality, wherever archaic modes of thought have predominated or persist - in the ancient civilizations, in myths, fairy tales and superstitions, in unconscious thinking, in dreams and in neuroses - money is brought into the most intimate relationship with dirt. We know that the gold which the devil gives his paramours turns into excrement after his departure, and the devil is certainly nothing else than the personification of the repressed unconscious instinctual life. We also know about the superstition which connects the finding of treasure with defaecation, and everyone is familiar with the figure of the 'shitter of ducats' [Dukatenscheisser]. Indeed, even according to ancient Babylonian doctrine gold is 'the faeces of Hell' (Mammon = ilu manmans). Thus in following the usage of language, neurosis, here as elsewhere, is taking words in their original, significant sense, and where it appears to be using a word figuratively it is usually simply restoring its old meaning.

In the correspondence between the peculiarity of the dream-work mentioned at the beginning of the paper and the practice discovered by philology in the oldest languages, we may see a confirmation of the view we have formed about the regressive, archaic character of the expression of thoughts in dreams. And we psychiatrists cannot escape the suspicion that we should be better at understanding and translating the language of dreams if we knew more about the development of language.

This short postscript to my analysis of a paranoid patient may serve to show that Jung had excellent grounds for his assertion that the mythopoeic forces of mankind are not extinct, but that to this very day they give rise in the neuroses to the same psychical products as in the remotest past ages. I should like to take up a suggestion that I myself made some time ago, and add that the same holds good of the forces that construct religions. And I am of opinion that the time will soon be ripe for us to make an extension of a thesis which has long been asserted by psycho-analysts, and to complete what has hitherto had only an individual and ontogenetic application by the addition of its anthropological counterpart, which is to be conceived phylogenetically. 'In dreams and in neuroses', so our thesis has run, 'we come once more upon the child and the peculiarities which characterize his modes of thought and his emotional life.' 'And we come upon the savage too,' we may now add, 'upon the primitive man, as he stands revealed to us in the light of the researches of archaeology and of ethnology.'
If we follow the changing relations between survivors and the dead through the course of ages, it becomes obvious that there has been an extraordinary diminution in ambivalence. It is now quite easy to keep down the unconscious hostility to the dead (though its existence can still be traced) without any particular expenditure of psychical energy. Where, in earlier times, satisfied hatred and pained affection fought each other, we now find that a kind of scar has been formed in the shape of piety, which declares ‘de mortuis nil nisi bonum’. It is only neurotics whose mourning for the loss of those dear to them is still troubled by obsessive self-reproaches - the secret of which is revealed by psycho-analysis as the old emotional ambivalence. We need not discuss here how this alteration came about or how much share in it is due to a constitutional modification and how much to a real improvement in family relations. But this example suggests the probability that the psychical impulses of primitive peoples were characterized by a higher amount of ambivalence than is to be found in modern civilized man. It is to be supposed that as this ambivalence diminished, taboo (a symptom of the ambivalence and a compromise between two conflicting impulses) slowly disappeared. Neurotics, who are obliged to reproduce the struggle and the taboo resulting from it, may be said to have inherited an archaic constitution as an atavistic vestige; the need to compensate for this at the behest of civilization is what drives them to their immense expenditure of mental energy.

[1912-1913, 2710]

These features of the dream-work may be described as archaic. They are equally characteristic of ancient systems of expression by speech and writing and they involve the same difficulties, which we shall have to discuss again later in a critical sense.

[1916-1917, 3271]

LADIES AND GENTLEMEN, - Let us start out once more from the conclusion we arrived at that the dream-work, under the influence of the dream-censorship, transposes the latent dream-thoughts into a different mode of expression. The latent thoughts do not differ from our familiar conscious thoughts of waking life. The new mode of expression is incomprehensible to us owing to many of its features. We have said that it harks back to states of our intellectual development which have long since been superseded - to picture-language, to symbolic connections, to conditions, perhaps, which existed before our thought-language had developed. We have on that account described the mode of expression of the dream-work as archaic or regressive.

[1916-1917, 3289]

In psycho-analytic treatments we are invariably faced by the task of filling up these gaps in the memory of childhood; and in so far as the treatment is to any extent successful - that is to say, extremely frequently - we also succeed in bringing to light the content of these forgotten years of childhood. Those impressions had never been really forgotten, they were only inaccessible, latent, and had formed part of the unconscious. But it can come about that they emerge from the unconscious spontaneously, and this happens in connection with dreams. It appears that dream-life knows how to find access to these latent, infantile experiences. Excellent examples of this have been reported in the literature and I myself have been able to provide a contribution of the kind. I once dreamt in a certain connection of a person who must have done me a service and whom I saw clearly before me. He was a one-eyed man of small stature, stout, and with his head sunk deep in his shoulders. I concluded from the context that he was a doctor. Luckily I was able to enquire from my mother, who was still alive, what the doctor at my birth-place (which I had left when I was three) had looked like; and I learned from her that he was one-eyed, short, stout and with his head sunk deep in his shoulders; and I also learned what the accident was for which he had come to my help and which I myself had forgotten. This fact of dreams having at their disposal the forgotten material of the first years of childhood is thus a further archaic feature.

[1916-1917, 3290]
Let us now bring together what our researches into child psychology have contributed to our understanding of dreams. We have not only found that the material of the forgotten experiences of childhood is accessible to dreams, but we have also seen that the mental life of children with all its characteristics, its egoism, its incestuous choice of love-objects, and so on, still persists in dreams - that is, in the unconscious, and that dreams carry us back every night to this infantile level. The fact is thus confirmed that what is unconscious in mental life is also what is infantile. The strange impression of there being so much evil in people begins to diminish. This frightful evil is simply the initial, primitive, infantile part of mental life, which we can find in actual operation in children, but which, in part, we overlook in them on account of their small size, and which in part we do not take seriously since we do not expect any high ethical standard from children. Since dreams regress to this level, they give the appearance of having brought to light the evil in us. But this is a deceptive appearance, by which we have allowed ourselves to be scared. We are not so evil as we were inclined to suppose from the interpretation of dreams.

As the outcome of our whole enquiry, let us grasp two discoveries, though they only signify the beginning of fresh enigmas and fresh doubts. First, the regression of the dream-work is not only a formal but also a material one. It not only translates our thoughts into a primitive form of expression; but it also revives the characteristics of our primitive mental life - the old dominance of the ego, the initial impulses of our sexual life, and even, indeed, our old intellectual endowment, if symbolic connections may be regarded as such. And secondly, all this, which is old and infantile and was once dominant and alone dominant, must to-day be ascribed to the unconscious, our ideas of which are now becoming altered and extended. 'Unconscious' is no longer the name of what is latent at the moment; the unconscious is a particular realm of the mind with its own wishful impulses, its own mode of expression and its peculiar mental mechanisms which are not in force elsewhere. But the latent dream-thoughts which we have discovered by interpreting dreams do not belong to this realm; they are on the contrary thoughts just as we might have thought them in waking life. Nevertheless, they are unconscious. How, then, is this contradiction to be solved? We begin to suspect that a distinction is to be drawn here. Something which is derived from our conscious life and shares its characteristics - we call it 'the day's residues' - combines with something else coming from the realm of the unconscious in order to construct a dream. The dream-work is accomplished between these two components. The influence exercised upon the day's residues by the addition of the unconscious is no doubt among the determinants of regression. This is the deepest insight that we can reach here into the essential nature of dreams - until we have investigated further regions of the mind. But the time will soon have come to provide another name for the unconscious character of the latent dream-thoughts in order to distinguish it from the unconscious which comes from the realm of the infantile.
The Dynamic Theory of Dream-Formation. The motive power for the formation of dreams is not provided by the latent dream-thoughts or day's residues, but by an unconscious impulse, repressed during the day, with which the day's residues have been able to establish contact and which contrives to make a wish-fulfilment for itself out of the material of the latent thoughts. Thus every dream is on the one hand the fulfilment of a wish on the part of the unconscious and on the other hand (in so far as it succeeds in guarding the state of sleep against being disturbed) the fulfilment of the normal wish to sleep which set the sleep going. If we disregard the unconscious contribution to the formation of the dream and limit the dream to its latent thoughts, it can represent anything with which waking life has been concerned - a reflection, a warning, an intention, a preparation for the immediate future or, once again, the satisfaction of an unfulfilled wish. The recognizability, strangeness and absurdity of the manifest dream are partly the result of the translation of the thoughts into a different, so to say archaic, method of expression, but partly the effect of a restrictive, critically disapproving agency in the mind which does not entirely cease to function during sleep. It is plausible to suppose that the 'dream-censorship', which we regard as being responsible in the first instance for the distortion of the dream-thoughts into the manifest dream, is an expression of the same mental forces which during the day-time had held back or repressed the unconscious wishful impulse.

There is no difficulty in discovering the general function of dreaming. It serves the purpose of fending off, by a kind of soothing action, external or internal stimuli which would tend to arouse the sleeper, and thus of securing sleep against interruption. External stimuli are fended off by being given a new interpretation and by being woven into some harmless situation; internal stimuli, caused by instinctual demands, are given free play by the sleeper and allowed to find satisfaction in the formation of dreams, so long as the latent dream-thoughts submit to the control of the censorship. But if they threaten to break free and the meaning of the dream becomes too plain, the sleeper cuts short the dream and wakes in a fright. (Dreams of this class are known as anxiety-dreams.) A similar failure in the function of dreaming occurs if an external stimulus becomes too strong to be fended off. (This is the class of arousal-dreams.) I have given the name of dream-work to the process which, with the co-operation of the censorship, converts the latent thoughts into the manifest content of the dream. It consists of a peculiar way of treating the preconscious material of thought, so that its component parts become condensed, its psychical emphasis becomes displaced, and the whole of it is translated into visual images or dramatized, and completed by a deceptive secondary revision. The dream-work is an excellent example of the processes occurring in the deeper, unconscious layers of the mind, which differ considerably from the familiar normal processes of thought. It also displays a number of archaic characteristics, such as the use of a symbolism (in this case of a predominantly sexual kind) which it has since also been possible to discover in other spheres of mental activity.
I myself set a higher value on my contributions to the psychology of religion, which began with the establishment of a remarkable similarity between obsessive actions and religious practices or ritual (1907b). Without as yet understanding the deeper connections, I described the obsessional neurosis as a distorted private religion and religion as a kind of universal obsessional neurosis. Later on, in 1912, Jung's forcible indication of the far-reaching analogies between the mental products of neurotics and of primitive peoples led me to turn my attention to that subject. In four essays, which were collected into a book with the title of Totem and Taboo, I showed that the horror of incest was even more marked among primitive than among civilized races and had given rise to very special measures of defence against it. I examined the relations between taboo-prohibitions (the earliest form in which moral restrictions make their appearance) and emotional ambivalence; and I discovered under the primitive scheme of the universe known as 'animism' the principle of the over-estimation of the importance of psychical reality - the belief in 'the omnipotence of thoughts' - which lies at the root of magic as well. I developed the comparison with the obsessional neurosis at every point, and showed how many of the postulates of primitive mental life are still in force in that remarkable illness. Above all, however, I was attracted by totemism, the first system of organization in primitive tribes, a system in which the beginnings of social order are united with a rudimentary religion and the implacable domination of a small number of taboo-prohibitions. The being that is revered is ultimately always an animal, from which the clan also claims to be descended. Many indications pointed to the conclusion that every race, even the most highly developed, had once passed through the stage of totemism. [1925d, 4239]

Let us go back once more to the latent dream-thoughts. Their most powerful element is the repressed instinctual impulse which has created in them an expression for itself on the basis of the presence of chance stimuli and by transference on to the day's residues - though an expression that is toned down and disguised. Like every instinctual impulse, it too presses for satisfaction by action; but its path to motility is blocked by the physiological regulations implied in the state of sleep; it is compelled to take the backwards course in the direction of perception and to be content with a hallucinated satisfaction. The latent dream-thoughts are thus transformed into a collection of sensory images and visual scenes. It is as they travel on this course that what seems to us so novel and so strange occurs to them. All the linguistic instruments by which we express the subtler relations of thought - the conjunctions and prepositions, the changes in declension and conjugation - are dropped, because there are no means of representing them; just as in a primitive language without any grammar, only the raw material of thought is expressed and abstract terms are taken back to the concrete ones that are at their basis. What is left over after this may well appear disconnected. The copious employment of symbols, which have become alien to conscious thinking, for representing certain objects and processes is in harmony alike with the archaic regression in the mental apparatus and with the demands of the censorship. [1933a, 4632]
Experience shows us that this path leading through the preconscious to consciousness is barred to the dream-thoughts during the daytime by the censorship imposed by resistance. During the night they are able to obtain access to consciousness; but the question arises as to how they do so and thanks to what modification. If what enabled the dream-thoughts to achieve this were the fact that at night there is a lowering of the resistance which guards the frontier between the unconscious and the preconscious, we should have dreams which were in the nature of ideas and which were without the hallucinatory quality in which we are at the moment interested. Thus the lowering of the censorship between the two systems Ucs. and Pcs. can only explain dreams formed like 'Autodidasker' and not dreams like that of the burning child which we took as the starting-point of our investigations.

The only way in which we can describe what happens in hallucinatory dreams is by saying that the excitation moves in a backward direction. Instead of being transmitted towards the motor end of the apparatus it moves towards the sensory end and finally reaches the perceptual system. If we describe as 'progressive' the direction taken by psychical processes arising from the unconscious during waking life, then we may speak of dreams as having a 'regressive' character.

¹ [Footnote added 1914:] The first hint at the factor of regression is to be found as far back as in Albertus Magnus. The 'imaginatio', he tells us, constructs dreams out of the stored-up images of sensory objects; and the process is carried out in a reverse direction to that in waking life. (Quoted by Diepgen, 1912, 14.) - Hobbes writes in the Leviathan (1651, Pt. I, Chapter 2): 'In sum, our dreams are the reverse of our waking imaginations, the motion, when we are awake, beginning at one end, and when we dream at another.' (Quoted by Havelock Ellis, 1911, 109.)

This regression, then, is undoubtedly one of the psychological characteristics of the process of dreaming; but we must remember that it does not occur only in dreams. Intentional recollection and other constituent processes of our normal thinking involve a retrogressive movement in the psychical apparatus from a complex ideational act back to the raw material of the memory-traces underlying it. In the waking state, however, this backward movement never extends beyond the mnemonic images; it does not succeed in producing a hallucinatory revival of the perceptual images. Why is it otherwise in dreams? When we were considering the work of condensation in dreams we were driven to suppose that the intensities attaching to ideas can be completely transferred by the dream-work from one idea to another. It is probably this alteration in the normal psychical procedure which makes possible the cathexis of the system Pcpt. in the reverse direction, starting from thoughts, to the pitch of complete sensory vividness.
We must not delude ourselves into exaggerating the importance of these considerations. We have done no more than give a name to an inexplicable phenomenon. We call it 'regression' when in a dream an idea is turned back into the sensory image from which it was originally derived. But even this step requires justification. What is the point of this nomenclature if it teaches us nothing new? I believe the name 'regression' is of help to us in so far as it connects a fact that was already known to us with our schematic picture, in which the mental apparatus was given a sense or direction. And it is at this point that that picture begins to repay us for having constructed it. For an examination of it, without any further reflection, reveals a further characteristic of dream-formation. If we regard the process of dreaming as a regression occurring in our hypothetical mental apparatus, we at once arrive at the explanation of the empirically established fact that all the logical relations belonging to the dream-thoughts disappear during the dream-activity or can only find expression with difficulty. According to our schematic picture, these relations are contained not in the first Mnem. systems but in later ones; and in case of regression they would necessarily lose any means of expression except in perceptual images. In regression the fabric of the dream-thoughts is resolved into its raw material.

[1900a, 976]

What modification is it that renders possible a regression which cannot occur in daytime? We must be content with some conjectures on this point. No doubt it is a question of changes in the cathexes of energy attaching to the different systems, changes which increase or diminish the facility with which those systems can be passed through by the excitatory process. But in any apparatus of this kind the same results upon the passage of excitations might be produced in more than one way. Our first thoughts will of course be of the state of sleep and the changes in cathexis which it brings about at the sensory end of the apparatus. During the day there is a continuous current from the $Popt. \Psi$-system flowing in the direction of motor activity; but this current ceases at night and could no longer form an obstacle to a current of excitation flowing in the opposite sense. Here we seem to have the 'shutting-out of the external world', which some authorities regard as the theoretical explanation of the psychological characteristics of dreams. (See p. 560.)

[1900a, 977]

In explaining regression in dreams, however, we must bear in mind the regressions which also occur in pathological waking states; and here the explanation just given leaves us in the lurch. For in those cases regression occurs in spite of a sensory current flowing without interruption in a forward direction. My explanation of hallucinations in hysteria and paranoia and of visions in mentally normal subjects is that they are in fact regressions - that is, thoughts transformed into images - but that the only thoughts that undergo this transformation are those which are intimately linked with memories that have been suppressed or have remained unconscious.

[1900a, 977]
The two instances that I have quoted are neither of them entirely devoid of connection with the state of sleep and for that reason are perhaps not well chosen for what I want them to prove. I will therefore refer the reader to my analysis of a woman suffering from hallucinatory paranoia (Freud, 1896b) as well as to the findings in my still unpublished studies on the psychology of the psychoneuroses, for evidence that in such instances of the regressive transformation of thoughts we must not overlook the influence of memories, mostly from childhood, which have been suppressed or have remained unconscious. The thoughts which are connected with a memory of this kind and which are forbidden expression by the censorship are, as it were, attracted by the memory into regression as being the form of representation in which the memory itself is couched. I may also recall that one of the facts arrived at in the *Studies on Hysteria* was that when it was possible to bring infantile scenes (whether they were memories or phantasies) into consciousness, they were seen like hallucinations and lost that characteristic only in the process of being reported. It is moreover a familiar observation that, even in those whose memory is not normally of a visual type, the earliest recollections of childhood retain far into life the quality of sensory vividness.

Let us bring together what we have found out about the peculiar propensity of dreams to recast their ideational content into sensory images. We have not explained this feature of the dream-work, we have not traced it back to any known psychological laws; but we have rather picked it out as something that suggests unknown implications and we have characterized it with the word 'regressive.' We have put forward the view that in all probability this regression, wherever it may occur, is an effect of a resistance opposing the progress of a thought into consciousness along the normal path, and of a simultaneous attraction exercised upon the thought by the presence of memories possessing great sensory force.¹ In the case of dreams, regression may perhaps be further facilitated by the cessation of the progressive current - which streams in during the daytime from the sense organs; in other forms of regression, the absence of this accessory factor must be made up for by a greater intensity of the other motives for regression. Nor must we forget to observe that in these pathological cases of regression as well as in dreams the process of transference of energy must differ from what it is in regressions occurring in normal mental life, since in the former cases that process makes possible a complete hallucinatory cathexis of the perceptual systems. What we have described, in our analysis of the dream-work, as 'regard for representability' might be brought into connection with the selective attraction exercised by the visually recollected scenes touched upon by the dream-thoughts.

It is further to be remarked that regression plays a no less important part in the theory of the formation of neurotic symptoms than it does in that of dreams. Three kinds of regression are thus to be distinguished: (a) topographical regression, in the sense of the schematic picture of the Ψ-systems which we have explained above; (b) temporal regression, in so far as what is in question is a harking back to older psychical structures; and (c) formal regression, where primitive methods of expression and representation take the place of the usual ones. All these three kinds of regression are, however, one at bottom and occur together as a rule; for what is older in time is more primitive in form and in psychical topography lies nearer to the perceptual end.

¹ [1900a, 978]

[1900a, 980]
Nor can we leave the subject of regression in dreams without setting down in words a notion by which we have already repeatedly been struck and which will recur with fresh intensity when we have entered more deeply into the study of the psycho-neuroses: namely that dreaming is on the whole an example of regression to the dreamer's earliest condition, a revival of his childhood, of the instinctual impulses which dominated it and of the methods of expression which were then available to him. Behind this childhood of the individual we are promised a picture of a phylogenetic childhood - a picture of the development of the human race, of which the individual's development is in fact an abbreviated recapitulation influenced by the chance circumstances of life. We can guess how much to the point is Nietzsche's assertion that in dreams 'some primaeval relic of humanity is at work which we can now scarcely reach any longer by a direct path'; and we may expect that the analysis of dreams will lead us to a knowledge of man's archaic heritage, of what is psychically innate in him. Dreams and neuroses seem to have preserved more mental antiquities than we could have imagined possible; so that psycho-analysis may claim a high place among the sciences which are concerned with the reconstruction of the earliest and most obscure periods of the beginnings of the human race. [1900a, 981]

The situation is this. Either residues of the previous day have been left over from the activity of waking life and it has not been possible to withdraw the whole cathexis of energy from them; or the activity of waking life during the course of the day has led to the stirring up of an unconscious wish; or these two events have happened to coincide. (We have already discussed the various possibilities in this connection.) The unconscious wish links itself up with the day's residues and effects a transference on to them; this may happen either in the course of the day or not until a state of sleep has been established. A wish now arises which has been transferred on to the recent material; or a recent wish, having been suppressed, gains fresh life by being reinforced from the unconscious. This wish seeks to force its way along the normal path taken by thought processes, though the Pcs. (to which, indeed, it in part belongs) to consciousness. But it comes up against the censorship, which is still functioning and to the influence of which it now submits. At this point it takes on the distortion for which the way has already been paved by the transference of the wish on to recent material. So far it is on the way to becoming an obsessive idea or a delusion or something of the kind - that is, a thought which has been intensified by transference and distorted in its expression by censorship. Its further advance is halted, however, by the sleeping state of the preconscious. (The probability is that that system has protected itself against the invasion by diminishing its own excitations.) The dream-process consequently enters on a regressive path, which lies open to it precisely owing to the peculiar nature of the state of sleep, and it is led along that path by the attraction exercised on it by groups of memories; some of these memories themselves exist only in the form of visual cathexes and not as translations into the terminology of the later systems. In the course of its regressive path the dream-process acquires the attribute of representability. (I shall deal later with the question of compression.) It has now completed the second portion of its zigzag journey. The first portion was a progressive one, leading from the unconscious scenes or phantasies to the preconscious; the second portion led from the frontier of the censorship back again to perceptions. But when the content of the dream process has become perceptual, by that fact it has, as it were, found a way of evading the obstacle put in its way by the censorship and the state of sleep in the Pcs. It succeeds in drawing attention to itself and in being noticed by consciousness. [1900a, 1002]
It has naturally not occurred to us to throw any doubt on the significance, which has been experimentally demonstrated, of external sensory stimuli during sleep; but we have shown that such material stands in the same relation to the dream-wish as do the residues of thought left over from day-time activity. Nor have we seen any reason to dispute the view that dreams interpret objective sensory stimuli just as illusions do; but we have found the motive which provides the reason for that interpretation, a reason which has been left unspecified by other writers. Interpretation is carried out in such a way that the object perceived shall not interrupt sleep and shall be usable for purposes of wish-fulfilment. As regards subjective states of excitation in the sense organs during sleep, the occurrence of which seems to have been proved by Trumbull Ladd, it is true that we have not accepted them as a particular source of dreams; but we have been able to explain them as resulting from the regressive revival of memories that are in operation behind the dream.

[1900a, 1016]

As regards the embittered and apparently irreconcilable dispute as to whether the mind sleeps at night or is as much in command of all its faculties as it is by day, we have found that both parties are right but that neither is wholly right. We have found evidence in the dream-thoughts of a highly complex intellectual function, operating with almost the whole resources of the mental apparatus. Nevertheless it cannot be disputed that these dream-thoughts originated during the day, and it is imperative to assume that there is such a thing as a sleeping state of the mind. Thus even the theory of partial sleep has shown its value, though we have found that what characterizes the state of sleep is not the disintegration of mental bonds but the concentration of the psychical system which is in command during the day upon the wish to sleep. The factor of withdrawal from the external world retains its significance in our scheme; it helps, though not as the sole determinant, to make possible the regressive character of representation in dreams. The renunciation of voluntary direction of the flow of ideas cannot be disputed; but this does not deprive mental life of all purpose, for we have seen how, after voluntary purposive ideas have been abandoned, involuntary ones assume command. We have not merely accepted the fact of the looseness of associative connections in dreams, but we have shown that it extends far further than had been suspected; we have found, however, that these loose connections are merely obligatory substitutes for others which are valid and significant. It is quite true that we have described dreams as absurd; but examples have taught us how sensible a dream can be even when it appears to be absurd.

[1900a, 1017]
In the most favourable cases the generation of unpleasure ceases along with the withdrawal of cathexis from the transference thoughts in the Pcs.; and this outcome signifies that the intervention of the unpleasure principle has served a useful purpose. But it is another matter when the repressed unconscious wish receives an organic reinforcement, which it passes on to its transference thoughts; in that way it may place them in a position to make an attempt at forcing their way through with their excitation, even if they have lost their cathexis from the Pcs. There then follows a defensive struggle - for the Pcs. in turn reinforces its opposition to the repressed thoughts (i.e. produces an 'anticathexis') - and thereafter the transference thoughts, which are the vehicles of the unconscious wish, force their way through in some form of compromise which is reached by the production of a symptom. But from the moment at which the repressed thoughts are strongly cathected by the unconscious wishful impulse and, on the other hand, abandoned by the preconscious cathexis, they become subject to the primary psychical process and their one aim is motor discharge or, if the path is open, hallucinatory revival of the desired perceptual identity. We have already found empirically that the irrational processes which we have described are only carried out with thoughts that are under repression. We can now see our way a little further into the whole position. The irrational processes which occur in the psychical apparatus are the primary ones. They appear wherever ideas are abandoned by the preconscious cathexis, are left to themselves and can become charged with the uninhibited energy from the unconscious which is striving to find an outlet. Some other observations lend support to the view that these processes which are described as irrational are not in fact falsifications of normal processes - intellectual errors - but are modes of activity of the psychical apparatus that have been freed from an inhibition. Thus we find that the transition from preconscious excitation to movement is governed by the same processes, and that the linking of preconscious ideas to words may easily exhibit the same displacements and confusions, which are then attributed to inattention. Evidence, finally, of the increase in activity which becomes necessary when these primary modes of functioning are inhibited is to be found in the fact that we produce a comic effect, that is, a surplus of energy which has to be discharged in laughter, if we allow these modes of thinking to force their way through into consciousness.

[1900a, 1032]

¹ Here and elsewhere I have intentionally left gaps in the treatment of my theme because to fill them would on the one hand require too great an effort and on the other would involve my basing myself on material that is alien to the subject of dreams. For instance, I have omitted to state whether I attribute different meanings to the words 'suppressed' and 'repressed.' It should have been clear, however, that the latter lays more stress than the former upon the fact of attachment to the unconscious. Nor have I entered into the obvious problem of why the dream-thoughts are subjected to distortion by the censorship even in cases where they have abandoned the progressive path towards consciousness and have chosen the regressive one. And there are many similar omissions. What I was above all anxious to do was to create an impression of the problems to which a further analysis of the dream-work must lead and to give a hint of the other topics with which that further analysis would come into contact. It has not always been easy for me to decide the point at which to break off my pursuit of this line of exposition. There are special reasons, which may not be what my readers expect, why I have not given any exhaustive treatment to the part played in dreams by the world of sexual ideas and why I have avoided analysing dreams of obviously sexual content. Nothing could be further from my own views or from the theoretical opinions which I hold in neuropathology than to regard sexual life as something shameful, with which neither a physician nor a scientific research worker has any concern. Moreover, the moral indignation by which the translator of the Oneirocritica of Artemidorus of Daldis allowed himself to be led into withholding the chapter on sexual dreams from the knowledge of his readers strikes me as laughable. What governed my decision was simply my seeing that an explanation of sexual dreams would involve me deeply in the still unsolved problems of perversion and bisexuality; and I accordingly reserved this material for another occasion.
The dream-thoughts which we arrive at by means of analysis reveal themselves as a psychical complex of the most intricate possible structure. Its portions stand in the most manifold logical relations to one another: they represent foreground and background, conditions, digressions and illustrations, chains of evidence and counter-arguments. Each train of thought is almost invariably accompanied by its contradictory counterpart. This material lacks none of the characteristics that are familiar to us from our waking thinking. If now all of this is to be turned into a dream, the psychical material will be submitted to a pressure which will condense it greatly, to an internal fragmentation and displacement which will, as it were, create new surfaces, and to a selective operation in favour of those portions of it which are the most appropriate for the construction of situations. If we take into account the genesis of the material, a process of this sort deserves to be described as a 'regression.' In the course of this transformation, however, the logical links which have hitherto held the psychical material together are lost. It is only, as it were, the substantive content of the dream-thoughts that the dream-work takes over and manipulates. The restoration of the connections which the dream-work has destroyed is a task which has to be performed by the work of analysis.

[1901a, 1075]

The dream-work, then - to which I return after this digression - submits the thought-material, which is brought forward in the optative mood, to a most strange revision. First, it takes the step from the optative to the present indicative; it replaces 'Oh! if only . . .' by 'It is'. The 'It is' is then given a hallucinatory representation; and this I have called the 'regression' in the dream-work - the path that leads from thoughts to perceptual images, or, to use the terminology of the still unknown topography of the mental apparatus (which is not to be taken anatomically), from the region of thought-structures to that of sensory perceptions. On this path, which is in the reverse direction to that taken by the course of development of mental complications, the dream-thoughts are given a pictorial character; and eventually a plastic situation is arrived at which is the core of the manifest 'dream-picture'. In order for it to be possible for the dream-thoughts to be represented in sensory form, their expression has to undergo far-reaching modifications. But while the thoughts are being changed back into sensory images still further alterations occur in them, some of which can be seen to be necessary while others are surprising. We can understand that, as a subsidiary result of regression, almost all the internal relations between the thoughts which linked them together will be lost in the manifest dream. The dream-work, as we might say, only undertakes to represent the raw material of the ideas and not the logical relations in which they stand to one another; or at all events it reserves the liberty to disregard the latter. On the other hand, there is another part of the dream-work which we cannot attribute to regression, to the change back into sensory images; and it is precisely this part which has an important bearing on our analogy with the formation of jokes. In the course of the dream-work the material of the dream-thoughts is subjected to a quite extraordinary compression or condensation. A starting point for it is provided by any common elements that may be present in the dream-thoughts, whether by chance or from the nature of their content. Since these are not as a rule sufficient for any considerable condensation, new artificial and transient common elements are created in the dream-work, and to this end there is actually a preference for the use of words the sound of which expresses different meanings. The newly-created common elements of condensation enter the manifest content of the dream as representatives of the dream-thoughts, so that an element in the dream corresponds to a nodal point or junction in the dream-thoughts, and, as compared with these latter, must quite generally be described as 'overdetermined'. The fact of condensation is the piece of the dream-work which can be most easily recognized; it is only necessary to compare the text of a dream as it is noted down with the record of the dream-thoughts arrived at by analysis in order to get a good impression of the extensiveness of dream-condensation.

[1905c, 1748]
Transformation with a view to the possibility of representation, condensation and displacement are the three major achievements that may be ascribed to the dream-work. A fourth, which was perhaps too shortly considered in *The Interpretation of Dreams*, is not relevant for our present purposes. If the ideas of a 'topography of the mental apparatus' and of 'regression' are consistently followed up (and only in that way could these working hypotheses come to have any value), we must attempt to determine the stages of regression at which the various transformations of the dream-thoughts take place. This attempt has not yet been seriously undertaken; but it can at least be stated with certainty that displacement must take place in the thought-material while it is at the stage of the unconscious processes, while condensation must probably be pictured as a process stretching over the whole course of events till the perceptual region is reached. But in general we must be content to assume that all the forces which take part in the formation of dreams operate simultaneously. Though one must, as will be realized, exercise reserve in dealing with such problems, and though there are fundamental doubts, which cannot be entered into here, as to whether the question should be framed in this manner, yet I should like to venture on the assertion that the process of the dream-work preparatory to the dream must be located in the region of the unconscious. Thus, speaking roughly, there would in all be three stages to be distinguished in the formation of a dream: first, the transplanting of the preconscious day's residues into the unconscious, in which the conditions governing the state of sleep must play a part; then, the dream-work proper in the unconscious; and thirdly, the regression of the dream-material, thus revised, to perception, in which form the dream becomes conscious.

[1905c, 1749]

Let us now recall what it was during our investigation of jokes that gave us occasion to think of dreams. We found that the characteristics and effects of jokes are linked with certain forms of expression or technical methods, among which the most striking are condensation, displacement and indirect representation. Processes, however, which lead to the same results - condensation, displacement and indirect representation - have become known to us as peculiarities of the dream-work. Does not this agreement suggest the conclusion that joke-work and dream-work must, at least in some essential respect, be identical? The dream-work has, I think, been revealed to us as regards its most important characteristics. Of the psychical processes in jokes the part that is hidden from us is precisely the one that may be compared to the dream-work - namely, what happens during the formation of a joke in the first person. Shall we not yield to the temptation to construct that process on the analogy of the formation of a dream? A few of the characteristics of dreams are so alien to jokes that the part of the dream-work corresponding to those characteristics cannot be transferred to the formation of jokes. There is no doubt that the regression of the train of thought to perception is absent in jokes. But the other two stages of dream-formation, the sinking of a preconscious thought into the unconscious and its unconscious revision, if they could be supposed to occur in joke-formation, would present the precise outcome that we can observe in jokes. Let us decide, then, to adopt the hypothesis that this is the way in which jokes are formed in the first person: *a preconscious thought is given over for a moment to unconscious revision and the outcome of this is at once grasped by conscious perception.*

[1905c, 1750]
Unconscious processes only become cognizable by us under the conditions of dreaming and of neurosis - that is to say, when processes of the higher, Pcs., system are set back to an earlier stage by being lowered (by regression). In themselves they cannot be cognized, indeed are even incapable of carrying on their existence; for the system Ucs. is at a very early moment overlaid by the Pcs. which has taken over access to consciousness and to motility. Discharge from the system Ucs. passes into somatic innervation that leads to development of affect; but even this path of discharge is, as we have seen, contested by the Pcs. By itself, the system Ucs. would not in normal conditions be able to bring about any expedient muscular acts, with the exception of those already organized as reflexes.

[1915e, 3010]

We are not in the habit of devoting much thought to the fact that every night human beings lay aside the wrappings in which they have enveloped their skin, as well as anything which they may use as a supplement to their bodily organs (so far as they have succeeded in making good those organs' deficiencies by substitutes), for instance, their spectacles, their false hair and teeth, and so on. We may add that when they go to sleep they carry out an entirely analogous undressing of their minds and lay aside most of their psychical acquisitions. Thus on both counts they approach remarkably close to the situation in which they began life. Somatically, sleep is a reactivation of intrauterine existence, fulfilling as it does the conditions of repose, warmth and exclusion of stimulus; indeed, in sleep many people resume the foetal posture. The psychical state of a sleeping person is characterized by an almost complete withdrawal from the surrounding world and a cessation of all interest in it.

[1917d, 3027]

In investigating psychoneurotic states, we find ourselves led to emphasize in each of them what are known as temporal regressions, i.e. the amount of developmental recession peculiar to it. We distinguish two such regressions - one affecting the development of the ego and the other that of the libido. In the state of sleep, the latter is carried to the point of restoring primitive narcissism, while the former goes back to the stage of hallucinatory satisfaction of wishes.

[1917d, 3027]

We have now to consider the further vicissitudes undergone by this wishful impulse, which in its essence represents an unconscious instinctual demand and which has been formed in the Pcs. as a dream-wish (a wish-fulfilling phantasy). Reflection tells us that this wishful impulse may be dealt with along three different paths. It may follow the path that would be normal in waking life, by pressing from the Pcs. to consciousness; or it may bypass the Cs. and find direct motor discharge; or it may take the unexpected path which observation enables us in fact to trace. In the first case, it would become a delusion having as content the fulfilment of the wish; but in the state of sleep this never happens. With our scanty knowledge of the metapsychological conditions of mental processes, we may perhaps take this fact as a hint that a complete emptying of a system renders it little susceptible to instigation. The second case, that of direct motor discharge, should be excluded by the same principle; for access to motility normally lies yet another step beyond the censorship of consciousness. But we do meet with exceptional instances in which this happens, in the form of somnambulism. We do not know what conditions make this possible, or why it does not happen more often. What actually happens in dream-formation is a very remarkable and quite unforeseen turn of events. The process, begun in the Pcs. and reinforced by the Ucs., pursues a backward course, through the Ucs. to perception, which is pressing upon consciousness. This regression is the third phase of dream-formation. For the sake of clarity, we will repeat the two earlier ones: the reinforcement of the Pcs. by the Ucs., and the setting up of the dream-wish.

[1917d, 3032]
We call this kind of regression a topographical one, to distinguish it from the previously mentioned temporal or developmental regression. The two do not necessarily always coincide, but they do so in the particular example before us. The reversal of the course of the excitation from the Pcs. through the Ucs. to perception is at the same time a return to the early stage of hallucinatory wish-fulfilment.
[1917d, 3032]

We have already in The Interpretation of Dreams described the way in which the regression of the preconscious day's residues takes place in dream-formation. In this process thoughts are transformed into images, mainly of a visual sort; that is to say, word-presentations are taken back to the thing-presentations which correspond to them, as if, in general, the process were dominated by considerations of representability. When regression has been completed, a number of cathexes are left over in the system Ucs. - cathexes of memories of things. The primary psychical process is brought to bear on these memories, till, by condensation of them and displacement between their respective cathexes, it has shaped the manifest dream-content. Only where the word-presentations occurring in the day's residues are recent and current residues of perceptions, and not the expression of thoughts, are they themselves treated like thing-presentations, and subjected to the influence of condensation and displacement. Hence the rule laid down in The Interpretation of Dreams, and since confirmed beyond all doubt, that words and speeches in the dream-content are not freshly formed, but are modelled on speeches from the day preceding the dream (or on some other recent impressions, such as something that has been read). It is very noteworthy how little the dream-work keeps to the word-presentations; it is always ready to exchange one word for another till it finds the expression which is most handy for plastic representation.¹
[1917d, 3033]

The completion of the dream-process consists in the thought-content - regressively transformed and worked over into a wishful phantasy - becoming conscious as a sense-perception; while this is happening it undergoes secondary revision, to which every perceptual concept is subject. The dream-wish, as we say, is hallucinated, and, as a hallucination, meets with belief in the reality of its fulfilment. It is precisely round this concluding piece in the formation of dreams that the gravest uncertainties centre, and it is in order to clear them up that we are proposing to compare dreams with pathological states akin to them.
[1917d, 3034]
Let us be clear that the hallucinatory wishful psychosis - in dreams or elsewhere - achieves two by no means identical results. It not only brings hidden or repressed wishes into consciousness; it also represents them, with the subject's entire belief, as fulfilled. The concurrence of these two results calls for explanation. It is quite impossible to maintain that unconscious wishes must necessarily be taken for realities when once they have become conscious; for, as we know, our judgement is very well able to distinguish realities from ideas and wishes, however intense they may be. On the other hand, it seems justifiable to assume that belief in reality is bound up with perception through the senses. When once a thought has followed the path to regression as far back as to the unconscious memory-traces of objects and thence to perception, we accept the perception of it as real. So hallucination brings belief in reality with it. We now have to ask ourselves what determines the coming into being of a hallucination. The first answer would be regression, and this would replace the problem of the origin of hallucination by that of the mechanism of regression. As regards dreams, this latter problem need not remain long unanswered. Regression of Pcs. dream-thoughts to mnemic images of things is clearly the result of the attraction which the Ucs. instinctual representatives - e.g. repressed memories of experiences - exercise upon the thoughts which have been put into words. But we soon perceive that we are on a false scent. If the secret of hallucination is nothing else than that of regression, every regression of sufficient intensity would produce hallucination with belief in its reality. But we are quite familiar with situations in which a process of regressive reflection brings to consciousness very clear visual mnemic images, though we do not on that account for a single moment take them for real perceptions. Again, we could very well imagine the dream-work penetrating to mnemic images of this kind, making conscious to us that was previously unconscious, and holding up to us a wishful phantasy which rouses our longing, but which we should not regard as a real fulfilment of the wish. Hallucination must therefore be something more than the regressive revival of mnemic images that are in themselves Ucs.

We must, however, put off discussing this difficulty till we can focus our interest upon the system Cs. itself. In the present connection we may be allowed to assume that hallucination consists in a cathexis of the system Cs. (Pcpt.), which, however, is not effected - as normally - from without, but from within, and that a necessary condition for the occurrence of hallucination is that regression shall be carried far enough to reach this system itself and in so doing be able to pass over reality-testing.¹

What is performed in amentia by this 'repression' is performed in dreams by voluntary renunciation. The state of sleep does not wish to know anything of the external world; it takes no interest in reality, or only so far as abandoning the state of sleep - waking up - is concerned. Hence it withdraws cathexis from the system Cs. as well as from the other systems, the Pcs. and the Ucs., in so far as the cathexes in them obey the wish to sleep. With the system Cs. thus uncathected, the possibility of reality-testing is abandoned; and the excitations which, independently of the state of sleep, have entered on the path of regression will find that path clear as far as the system Cs. where they will count as undisputed reality.¹

¹ Here the principle of the insusceptibility to excitation of uncathected systems appears to be invalidated in the case of the system Cs. (Pcpt.). But it may be a question of only the partial removal of cathexis; and for the perceptual system in especial we must assume many conditions for excitation which are widely divergent from those of other systems. - We are not, of course, intending to disguise or gloss over the uncertain and tentative character of these metapsychological discussions. Only deeper investigation can lead to the achievement of a certain degree of probability.
In what follows I shall not be able to avoid a schematic method of exposition. Let us assume that in a particular case we have before us all the latent thoughts, charged with a greater or less amount of affect, by which the manifest dream has been replaced after its interpretation has been completed. We shall then be struck by one difference among these latent thoughts, and that difference will take us a long way. Almost all these dream-thoughts are recognized by the dreamer or acknowledged by him; he admits that he has thought this, now or at some other time, or that he might have thought it. There is only one single thought that he refuses to accept; it is strange to him or even perhaps repellent; he may possibly reject it with passionate feeling. It now becomes evident to us that the other thoughts are portions of a conscious, or, more accurately, a preconscious train of thinking. They might have been thought in waking life too, and indeed they were probably formed during the previous day. This one repudiated thought, however, or, properly speaking, this one impulse, is a child of night; it belongs to the dreamer's unconscious and on that account it is repudiated and rejected by him. It had to wait for the nightly relaxation of repression in order to arrive at any kind of expression. And in any case this expression is a weakened, distorted and disguised one; without our work of dream-interpretation we should not have found it. This unconscious impulse has to thank its link with the other, unobjectionable, dream-thoughts for the opportunity of slipping past the barrier of the censorship in an inconspicuous disguise. On the other hand, the preconscious dream-thoughts have to thank this same link for the power to occupy mental life during sleep as well. For there is no doubt about it: this unconscious impulse is the true creator of the dream; it is what produces the psychical energy for the dream's construction. Like any other instinctual impulse, it cannot strive for anything other than its own satisfaction; and our experience in interpreting dreams shows us too that that is the sense of all dreaming. In every dream an instinctual wish has to be represented as fulfilled. The shutting-off of mental life from reality at night and the regression to primitive mechanisms which this makes possible enable this wished-for instinctual satisfaction to be experienced in a hallucinatory manner as occurring in the present. As a result of this same regression, ideas are transformed in the dream into visual pictures: the latent dream-thoughts, that is to say, are dramatized and illustrated.

This piece of the dream-work gives us information about some of the most striking and peculiar features of dreams. I will repeat the course of events in dream-formation. As an introduction: the wish to sleep and intentional turning away from the external world. Next, two consequences of this for the mental apparatus: first, the possibility for older and more primitive methods of working to emerge in it - regression; secondly, the lowering of the resistance due to repression which weighs down upon the unconscious. As a result of this last factor the possibility arises for the formation of a dream and this is taken advantage of by the precipitating causes, the internal and external stimuli which have become active. The dream which originates in this way is already a compromise-structure. It has a double function; on the one hand it is ego-syntonic, since, by getting rid of the stimuli which are interfering with sleep, it serves the wish to sleep; on the other hand it allows a repressed instinctual impulse to obtain the satisfaction that is possible in these circumstances, in the form of the hallucinated fulfilment of a wish. The whole process of forming a dream which is permitted by the sleeping ego is, however, subject to the condition of the censorship, which is exercised by the residue of the repression still in operation. I cannot present the process more simply: it is not more simple. But I can proceed now with my description of the dream-work.
Let us go back once more to the latent dream-thoughts. Their most powerful element is the repressed instinctual impulse which has created in them an expression for itself on the basis of the presence of chance stimuli and by transference on to the day's residues - though an expression that is toned down and disguised. Like every instinctual impulse, it too presses for satisfaction by action; but its path to motility is blocked by the physiological regulations implied in the state of sleep; it is compelled to take the backwards course in the direction of perception and to be content with a hallucinated satisfaction. The latent dream-thoughts are thus transformed into a collection of sensory images and visual scenes. It is as they travel on this course that what seems to us so novel and so strange occurs to them. All the linguistic instruments by which we express the subtiler relations of thought - the conjunctions and prepositions, the changes in declension and conjugation - are dropped, because there are no means of representing them; just as in a primitive language without any grammar, only the raw material of thought is expressed and abstract terms are taken back to the concrete ones that are at their basis. What is left over after this may well appear disconnected. The copious employment of symbols, which have become alien to conscious thinking, for representing certain objects and processes is in harmony alike with the archaic regression in the mental apparatus and with the demands of the censorship.

[1933a, 4632]
Can we feel sure that none of the possible techniques of jokes has escaped our investigation? Of course not. But a continued examination of fresh material can convince us that we have got to know the commonest and most important technical methods of the joke-work - at all events as much as is required for forming a judgement on the nature of that psychical process. So far we have not arrived at any such judgement; but on the other hand we are now in possession of an important indication of the direction from which we may expect to receive further light upon the problem. The interesting processes of condensation accompanied by the formation of a substitute, which we have recognized as the core of the technique of verbal jokes, point towards the formation of dreams, in the mechanism of which the same psychical processes have been discovered. This is equally true, however, of the techniques of conceptual jokes - displacement, faulty reasoning, absurdity, indirect representation, representation by the opposite - which re-appear one and all in the technique of the dream-work. Displacement is responsible for the puzzling appearance of dreams, which prevents our recognizing that they are a continuation of our waking life. The use of absurdity and nonsense in dreams has cost them the dignity of being regarded as psychical products and has led the authorities to suppose that a disintegration of the mental activities and a cessation of criticism, morality and logic are necessary conditions of the formation of dreams. Representation by the opposite is so common in dreams that even the popular books of dream-interpretation, which are on a completely wrong tack, are in the habit of taking it into account. Indirect representation - the replacement of a dream-thought by an allusion, by something small, a symbolism akin to analogy - is precisely what distinguishes the mode of expression of dreams from that of our waking life.¹ So far-reaching an agreement between the methods of the joke-work and those of the dream-work can scarcely be a matter of chance. To demonstrate this agreement in detail and to examine its basis will be one of our later tasks.

[1905c, 1686]

Among displacements are to be counted not merely diversions from a train of thought but every sort of indirect representation as well, and in particular the replacement of an important but objectionable element by one that is indifferent and that appears innocent to the censorship, something that seems like a very remote allusion to the other one - substitution by a piece of symbolim, or an analogy, or something small. It cannot be disputed that portions of such indirect representation are already present in the dream's preconscious thoughts - for instance, representation by symbols or analogies - because otherwise the thought would not have reached the stage of preconscious expression at all. Indirect representations of this kind, and allusions whose reference to the thing intended is easy to discover, are indeed permissible and much-used methods of expression in our conscious thinking as well. The dream-work, however, exaggerates this method of indirect expression beyond all bounds. Under the pressure of the censorship, any sort of connection is good enough to serve as a substitute by allusion, and displacement is allowed from any element to any other. Replacement of internal associations (similarity, causal connection, etc.) by what are known as external ones (simultaneity in time, contiguity in space, similarity of sound) is quite specially striking and characteristic of the dream-work.

[1905c, 1755]
It is true that as a rule the childhood scene is only represented in the dream's manifest content by an allusion, and has to be arrived at by an interpretation of the dream. Such instances when they are recorded, cannot carry much conviction, since as a rule there is no other evidence of these childhood experiences having occurred: if they date back to a very early age they are no longer recognized as memories. The general justification for inferring the occurrence of these childhood experiences from dreams is provided by a whole number of factors in psycho-analytic work, which are mutually consistent and thus seem sufficiently trustworthy. If I record some of these inferred childhood experiences torn from their context for the purposes of dream-interpretation, they may perhaps create little impression, especially as I shall not even be able to quote all the material on which the interpretations were based. Nevertheless I shall not allow this to deter me from relating them. [1900a, 682]

Just as the author of the novel, in choosing the name 'Sappho', had in mind an allusion to Lesbian practices, so too the pieces of the dream that spoke of people 'up above' and 'down below' alluded to phantasies of a sexual nature which occupied the patient's mind and, as suppressed desires, were not without a bearing on his neurosis. (The interpretation of the dream did not itself show us that what were thus represented in the dream were phantasies and not recollections of real events; an analysis only gives us the content of a thought and leaves it to us to determine its reality. Real and imaginary events appear in dreams at first sight as of equal validity; and that is so not only in dreams but in the production of more important psychical structures.) [1900a, 761]
Indeed, when we look into the matter more closely, we must recognize the fact that the
dream-work is doing nothing original in making substitutions of this kind. In order to gain its
ends - in this case the possibility of a representation hampered by censorship - it merely follows
the paths which it finds already laid down in the unconscious; and it gives preference to those
transformations of the repressed material which can also become conscious in the form of jokes
or allusions and of which the phantasies of neurotic patients are so full. At this point we
suddenly reach an understanding of Scherner's dream interpretations, whose essential
correctness I have defended elsewhere. The imagination's pre-occupation with the subject's
own body is by no means peculiar to dreams or characteristic only of them. My analyses have
shown me that it is habitually present in the unconscious thoughts of neurotics, and that it is
derived from sexual curiosity, which, in growing youths or girls, is directed to the genitals of the
other sex, and to those of their own as well. Nor, as Scherner and Volkelt have rightly insisted,
is a house the only circle of ideas employed for symbolizing the body; and this is equally true of
dreams and of the unconscious phantasies of neurosis. It is true that I know patients who have
retained an architectural symbolism for the body and the genitals. (Sexual interest ranges far
beyond the sphere of the external genitalia.) For these patients pillars and columns represent
the legs (as they do in the Song of Solomon), every gateway stands for one of the bodily orifices
(a 'hole'), every water-pipe is a reminder of the urinary apparatus, and so on. But the circle of
ideas centring round plant-life or the kitchen may just as readily be chosen to conceal sexual
images.' In the former case the way has been well prepared by linguistic usage, itself the
precipitate of imaginative similes reaching back to remote antiquity: e.g. the Lord's vineyard, the
seed, and the maiden's garden in the Song of Solomon. The ugliest as well as the most intimate
details of sexual life may be thought and dreamt of in seemingly innocent allusions to activities
in the kitchen; and the symptoms of hysteria could never be interpreted if we forgot that sexual
symbolism can find its best hiding-place behind what is commonplace and inconspicuous.
There is a valid sexual meaning behind the neurotic child's intolerance of blood or raw meat, or
his nausea at the sight of eggs or macaroni, and behind the enormous exaggeration in neurotics
of the natural human dread of snakes. Wherever neuroses make use of such disguises they are
following paths along which all humanity passed in the earliest periods of civilization - paths of
whose continued existence today, under the thinnest of veils, evidence is to be found in
linguistic usages, superstitions and customs.
[1900a, 815]
The function of 'secondary revision', which we have attributed to the fourth of the factors concerned in shaping the content of dreams, shows us in operation once more the activity which is able to find free vent in the creation of day-dreams without being inhibited by any other influences. We might put it simply by saying that this fourth factor of ours seeks to mould the material offered to it into something like a day-dream. If, however, a day-dream of this kind has already been formed within the nexus of the dream-thoughts, this fourth factor in the dream-work will prefer to take possession of the ready-made day-dream and seek to introduce it into the content of the dream. There are some dreams which consist merely in the repetition of a day-time phantasy which may perhaps have remained unconscious: such, for instance, as the boy's dream of driving in a war-chariot with the heroes of the Trojan War. In my 'Autodidasker' dream the second part at all events was a faithful reproduction of a daytime phantasy, innocent in itself, of a conversation with Professor N. In view of the complicated conditions which a dream has to satisfy when it comes into existence, it happens more frequently that the ready-made phantasy forms only a portion of the dream, or that only a portion of the phantasy forces its way into the dream. Thereafter, the phantasy is treated in general like any other portion of the latent material, though it often remains recognizable as an entity in the dream. There are often parts of my dreams which stand out as producing a different impression from the rest. They strike me as being, as it were, more fluent, more connected and at the same time more fleeting than other parts of the same dream. These, I know, are unconscious phantasies which have found their way into the fabric of the dream, but I have never succeeded in pinning down a phantasy of this kind. Apart from this, these phantasies, like any other component of the dream-thoughts, are compressed, condensed, superimposed on one another, and so on. There are, however, transitional cases, between the case in which they constitute the content (or at least the façade) of the dream unaltered and the extreme opposite in which they are represented in the content of the dream only by one of their elements or by a distant allusion. What happens to phantasies present in the dream-thoughts is evidently also determined by any advantages they may have to offer the requirements of the censorship and of the urge towards condensation.

[1900a, 932]

'No doubt you will be inclined to expect that the element "channel," since it was so indistinct, would be inaccessible to interpretation. You are right in suspecting a difficulty; but the difficulty did not arise from the indistinctness: both the difficulty and the indistinctness arose from another cause. Nothing occurred to the dreamer in connection with "channel," and I could of course throw no light on it. A little later - it was the next day, in point of fact - she told me that she had thought of something that might have something to do with it. It was a joke, too - a joke she had heard. On the steamer between Dover and Calais a well-known author fell into conversation with an Englishman. The latter had occasion to quote the phrase: "Du sublime au ridicule il n'y a qu'un pas. [It is only a step from the sublime to the ridiculous.]" Yes, replied the author, "le Pas de Calais" - meaning that he thought France sublime and England ridiculous. But the Pas de Calais is a channel - the English Channel. You will ask whether I think this had anything to do with the dream. Certainly I think so; and it provides the solution of the puzzling element of the dream. Can you doubt that this joke was already present before the dream occurred, as the unconscious thought behind the element "channel"? Can you suppose that it was introduced as a subsequent invention? The association betrayed the scepticism which lay concealed behind the patient's ostensible admiration; and her resistance against revealing this was no doubt the common cause both of her delay in producing the association and of the indistinctness of the dream-element concerned. Consider the relation of the dream-element to its unconscious background: it was, as it were, a fragment of that background, an allusion to it, but it was made quite incomprehensible by being isolated.'

[1900a, 952]
The material in the dream-thoughts which is packed together for the purpose of constructing a dream-situation must of course in itself be adaptable for that purpose. There must be one or more common elements in all the components. The dream-work then proceeds just as Francis Galton did in constructing his family photographs. It superimposes, as it were, the different components upon one another. The common element in them then stands out clearly in the composite picture, while contradictory details more or less wipe one another out. This method of production also explains to some extent the varying degrees of characteristic vagueness shown by so many elements in the content of dreams. Basing itself on this discovery, dream-interpretation has laid down the following rule: In analysing a dream, if an uncertainty can be resolved into an 'either-or', we must replace it for purposes of interpretation by an 'and', and take each of the apparent alternatives as an independent starting-point for a series of associations.

[1901a, 1066]

This 'wet' had a decisive influence on the further content of the dream; though it was represented in it only by a distant allusion and by its opposite.

[1905e, 1425]

Can we feel sure that none of the possible techniques of jokes has escaped our investigation? Of course not. But a continued examination of fresh material can convince us that we have got to know the commonest and most important technical methods of the joke-work - at all events as much as is required for forming a judgement on the nature of that psychical process. So far we have not arrived at any such judgement; but on the other hand we are now in possession of an important indication of the direction from which we may expect to receive further light upon the problem. The interesting processes of condensation accompanied by the formation of a substitute, which we have recognized as the core of the technique of verbal jokes, point towards the formation of dreams, in the mechanism of which the same psychical processes have been discovered. This is equally true, however, of the techniques of conceptual jokes - displacement, faulty reasoning, absurdity, indirect representation, representation by the opposite - which re-appear one and all in the technique of the dream-work. Displacement is responsible for the puzzling appearance of dreams, which prevents our recognizing that they are a continuation of our waking life. The use of absurdity and nonsense in dreams has cost them the dignity of being regarded as psychical products and has led the authorities to suppose that a disintegration of the mental activities and a cessation of criticism, morality and logic are necessary conditions of the formation of dreams. Representation by the opposite is so common in dreams that even the popular books of dream-interpretation, which are on a completely wrong tack, are in the habit of taking it into account. Indirect representation - the replacement of a dream-thought by an allusion, by something small, a symbolism akin to analogy - is precisely what distinguishes the mode of expression of dreams from that of our waking life.¹ So far-reaching an agreement between the methods of the joke-work and those of the dream-work can scarcely be a matter of chance. To demonstrate this agreement in detail and to examine its basis will be one of our later tasks.

[1905c, 1686]
The abundant and unrestrained use in the dream-work of indirect representation, of displacements, and especially of allusions, has a result which I mention not for its own importance but because it became my subjective reason for taking up the problem of jokes. If one gives an account to an uninformed or unaccustomed person of a dream-analysis, in which are set out, therefore, the strange processes of allusions and displacements - processes so obnoxious to waking life - of which the dream-work has made use, the reader receives an uncomfortable impression and declares that these interpretations are 'in the nature of a joke'. But he clearly does not regard them as successful jokes, but as forced, and in some way violating the rules of jokes. It is easy to explain this impression. It arises from the fact that the dream-work operates by the same methods as jokes, but in its use of them it transgresses the limits that are respected by jokes. We shall presently learn that, as a result of the part played by the third person, jokes are bound by a certain condition which does not apply to dreams.

¹ I also ascribe to considerations of representability the fact which is insisted on and perhaps over-estimated by Silberer that some dreams admit of two simultaneous, and yet essentially different interpretations, one of which he calls the 'analytic' and the other the 'anagogic'. When this happens, we are invariably concerned with thoughts of a very abstract nature, which must have made their representation in the dream very difficult. We might compare it with the problem of representing in pictures a leading article from a political newspaper. In such cases, the dream-work must first replace the text that consists of abstract thoughts by one more concrete, connected with the former in some way - by comparison, symbolism, allegorical allusion, or best of all, genetically - so that the more concrete text then takes the place of the abstract one as material for the dream-work. The abstract thoughts yield the so-called anagogic interpretation, which, in our interpretative work, we discover more easily than the true analytic one. Otto Rank has justly remarked that certain dreams about their treatment, dreamt by patients in analysis, are the best models on which to form a view of these dreams which admit of more than one interpretation.

The moment seems to me to have arrived for introducing two terms, which we could have made use of long ago. We will describe what the dream actually tells us as the manifest dream-content, and the concealed material, which we hope to reach by pursuing the ideas that occur to the dreamer, as the latent dream-thoughts. Thus we are here considering the relations between the manifest content of the dream and the latent dream-thoughts as shown in these examples. These relations may be of very many different kinds. In examples (a) and (b) the manifest element is also a constituent of the latent thoughts, though only a small fragment of them. A small piece of the large and complicated psychical structure of unconscious dream-thoughts has made its way into the manifest dream as well - a fragment of them, or, in other cases, an allusion to them, a caption, as it were, or an abbreviation in telegraphic style. It is the business of the work of interpretation to complete these fragments or this allusion into a whole - which was achieved particularly nicely in the case of example (b). Thus one form of the distortion which constitutes the dream-work is replacement by a fragment or an allusion. In example (c) another kind of relation is to be observed in addition; and we shall find this expressed in a purer and clearer form in the examples which follow.
The first thing the dreamer reported to us was that the precipitating cause of the dream was touched on in its manifest content. Her husband had in fact told her that Elise L., who was approximately her contemporary, had just become engaged. The dream was a reaction to this information. We know already that it is easy in the case of many dreams to point to a precipitating cause like this from the previous day, and that the dreamer is often able to trace this for us without any difficulty. The dreamer in the present case put similar information at our disposal for other elements of the manifest dream as well. - Where did the detail come from about one side of the stalls being empty? It was an allusion to a real event of the previous week. She had planned to go to a particular play and had therefore bought her tickets early - so early that she had had to pay a booking fee. When they got to the theatre it turned out that her anxiety was quite uncalled-for, since one side of the stalls was almost empty. It would have been early enough if she had bought the tickets on the actual day of the performance. Her husband had kept on teasing her for having been in too much of a hurry. - What was the origin of the 1 florin 50 kreuzers? It arose in quite another connection, which had nothing to do with the former one but also alluded to some information from the previous day. Her sister-in-law had been given a present of 150 florins by her husband and had been in a great hurry - the silly goose - to rush off to the jewellers' and exchange the money for a piece of jewellery. - Where did the 'three' come from? She could think of nothing in connection with that, unless we counted the idea that her newly-engaged friend, Elise L., was only three months her junior, though she herself had been a married woman for nearly ten years. - And the absurd notion of taking three tickets for only two people? She had nothing to say to that, and refused to report any further ideas or information.

The second achievement of the dream-work is displacement. Fortunately we have made some preliminary examination of this: for we know that it is entirely the work of the dream censorship. It manifests itself in two ways: in the first, a latent element is replaced not by a component part of itself but by something more remote - that is, by an allusion; and in the second, the psychical accent is shifted from an important element on to another which is unimportant, so that the dream appears differently centred and strange.

Replacing something by an allusion to it is a process familiar in our waking thought as well, but there is a difference. In waking thought the allusion must be easily intelligible, and the substitute must be related in its subject-matter to the genuine thing it stands for. Jokes, too, often make use of allusion. They drop the precondition of there being an association in subject matter, and replace it by unusual external associations such as similarity of sound, verbal ambiguity, and so on. But they retain the precondition of intelligibility: a joke would lose all its efficiency if the path back from the allusion to the genuine thing could not be followed easily. The allusions employed for displacement in dreams have set themselves free from both of these restrictions. They are connected with the element they replace by the most external and remote relations and are therefore unintelligible; and when they are undone, their interpretation gives the impression of being a bad joke or of an arbitrary and forced explanation dragged in by the hair of its head. For the dream-censorship only gains its end if it succeeds in making it impossible to find the path back from the allusion to the genuine thing.
On the whole, therefore, I have made no concession to your objection to the theory of wish-fulfilment. It is our duty, however, to be able to indicate the wish-fulfilment in any distorted dream we may come across, and we shall certainly not evade the task. Let us go back to the dream we have already interpreted of the three bad theatre-tickets for 1 florin 50, from which we have already learnt so much. I hope you still recollect it. A lady, whose husband had told her during the day that her friend Elise, who was only three months her junior, had become engaged, dreamt that she was at the theatre with her husband. One side of the stalls was almost empty. Her husband said to her that Elise and her fiancé had wanted to go to the theatre too but had not been able to, since they had only got bad seats - three for 1 florin 50. She thought it would not really have done any harm if they had. We found that the dream-thoughts related to her anger at having married so early and to her dissatisfaction with her husband. We may be curious to discover how these gloomy thoughts were transformed into the fulfilment of a wish and where any trace of it is to be found in the manifest content of the dream. We already know that the element 'too early, in a hurry' was eliminated from the dream by the censorship. The empty stalls were an allusion to it. The mysterious 'three for 1 florin 50' now becomes more intelligible to us with the help of the symbolism with which we have meanwhile become acquainted. The '3' really means a man and the manifest element is easy to translate: buying a husband with her dowry. ('I could have got one ten times better with my dowry.') 'Marrying' is clearly replaced by 'going to the theatre'. 'Taking the theatre tickets too early' is, indeed, an immediate substitute for 'marrying too early'. This substitution is, however, the work of a wish-fulfilment. Our dreamer was not always so dissatisfied with her early marriage as she was on the day when she received the news of her friend's engagement. She had been proud of it at one time and regarded herself as at an advantage over her friend. Simple-minded girls, after becoming engaged, are reputed often to express their joy that they will soon be able to go to the theatre, to all the plays which have hitherto been prohibited, and will be allowed to see everything. The pleasure in looking, or curiosity, which is revealed in this was no doubt originally a sexual desire to look, directed towards sexual happenings and especially on to the girls' parents, and hence it became a powerful motive for urging them to an early marriage. In this way a visit to the theatre became an obvious substitute, by way of allusion, for being married. Thus the dreamer, in her present anger at her early marriage, harked back to the time at which early marriage was the fulfilment of a wish because it satisfied her scopophilia, and, under the lead of this old wishful impulse, she replaced marriage by going to the theatre.

The matter under consideration relates in essence to the results of displacement, which you have become acquainted with as the most powerful instrument of the dream-censorship. With the help of displacement the dream-censorship creates substitutive structures which we have described as allusions. But they are allusions which are not easily recognizable as such, from which the path back to the genuine thing is not easily traced, and which are connected with the genuine thing by the strangest, most unusual, external associations. In all these cases it is a question, however, of things which are meant to be hidden, which are condemned to concealment, for that is what the dream-censorship is aiming at. But we must not expect that a thing which has been hidden will be found in its own place, in its proper position. The frontier-control commissions which are operating to-day are more cunning in this respect than the Swiss school authorities. In their search for documents and plans they are not content with examining brief-cases and portfolios, but they consider the possibility that spies and smugglers may have these forbidden things in the most secret portions of their clothing where they decidedly do not belong - for instance, between the double soles of their boots. If the hidden things are there, it will certainly be possible to call them 'far-fetched', but it is also true that a great deal will have been found.
'In this story the tree appears, upon which the wolves were sitting in the dream. But it also contains an unmistakable allusion to the castration complex. The old wolf was docked of his tail by the tailor. The fox-tails of the wolves in the dream were probably compensations for this taillessness.
[1918b, 3522]

They were quite white. This feature is unessential in itself, but is strongly emphasized in the dreamer's narrative. It owes its intensity to a copious fusion of elements from all the strata of the material, and it combines unimportant details from the other sources of the dream with a fragment of the primal scene which is more significant. This last part of its determination goes back to the white of his parents' bedclothes and underclothes, and to this is added the white of the flocks of sheep, and of the sheep-dogs, as an allusion to his sexual researches among animals, and the white in the fairy tale of 'The Seven Little Goats', in which the mother is recognized by the white of her hand. Later on we shall see that the white clothes are also an allusion to death.
[1918b, 3532]

Let there be no misunderstanding, however. The associations to the dream are not yet the latent dream-thoughts. The latter are contained in the associations like an alkali in the mother liquor, but yet not quite completely contained in them. On the one hand, the associations give us far more than we need for formulating the latent dream-thoughts - namely all the explanations, transitions, and connections which the patient's intellect is bound to produce in the course of his approach to the dream-thoughts. On the other hand, an association often comes to a stop precisely before the genuine dream-thought: it has only come near to it and has only had contact with it through allusions. At that point we intervene on our own; we fill in the hints, draw undeniable conclusions, and give explicit utterance to what the patient has only touched on in his associations. This sounds as though we allowed our ingenuity and caprice to play with the material put at our disposal by the dreamer and as though we misused it in order to interpret into his utterances what cannot be interpreted from them. Nor is it easy to show the legitimacy of our procedure in an abstract description of it. But you have only to carry out a dream-analysis yourselves or study a good account of one in our literature and you will be convinced of the cogent manner in which interpretative work like this proceeds.
[1933a, 4626]

We meet with the second of these facts almost every day in the course of our analytic work; and it does not imply such an important objection as the other does. One of the tasks of psycho-analysis, as you know, is to lift the veil of amnesia which hides the earliest years of childhood and to bring to conscious memory the manifestations of early infantile sexual life which are contained in them. Now these first sexual experiences of a child are linked to painful impressions of anxiety, prohibition, disappointment and punishment. We can understand their having been repressed; but, that being so, we cannot understand how it is that they have such free access to dream-life, that they provide the pattern for so many dream-phantasies and that dreams are filled with reproductions of these scenes from childhood and with allusions to them. It must be admitted that their unpleasurable character and the dream-work's wish-fulfilling purpose seem far from mutually compatible. But it may be that in this case we are magnifying the difficulty. After all, these same infantile experiences have attached to them all the imperishable, unfulfilled instinctual wishes which throughout life provide the energy for the construction of dreams, and to which we may no doubt credit the possibility, in their mighty uprush, of forcing to the surface, along with the rest, the material of distressing events. And on the other hand the manner and form in which this material is reproduced shows unmistakably the efforts of the dream-work directed to denying the unpleasure by means of distortion and to transforming disappointment into attainment.
[1933a, 4641]
The laws that govern the passage of events in the unconscious, which come to light in this manner, are remarkable enough and suffice to explain most of what seems strange to us about dreams. Above all there is a striking tendency to *condensation*, an inclination to form fresh unities out of elements which in our waking thought we should certainly have kept separate. As a consequence of this, a single element of the manifest dream often stands for a whole number of latent dream-thoughts as though it were a combined allusion to all of them; and in general the compass of the manifest dream is extraordinarily small in comparison with the wealth of material from which it has sprung. Another peculiarity of the dream-work, not entirely independent of the former one, is the ease with which psychical intensities (cathexes) are displaced from one element to another, so that it often happens that an element which was of little importance in the dream-thoughts appears as the clearest and accordingly most important feature of the manifest dream, and, *vice versa*, that essential elements of the dream-thoughts are represented in the manifest dream only by slight allusions. Moreover, as a rule the existence of quite insignificant points in common between two elements is enough to allow the dream-work to replace one by the other in all further operations. It will easily be imagined how greatly these mechanisms of condensation and displacement can increase the difficulty of interpreting a dream and of revealing the relations between the manifest dream and the latent dream-thoughts. From the evidence of the existence of these two tendencies to condensation and displacement our theory infers that in the unconscious id the energy is in a freely mobile state and that the id sets more store by the possibility of discharging quantities of excitation than by any other consideration;¹ and our theory makes use of these two peculiarities in defining the character of the primary process we have attributed to the id.

[1940a [1938], 4978]
Whereas his seduction to masturbate must have occurred in solitude and secrecy. It is just that contrast that inclines me to accept your view: it serves once again to make the scene innocent. Do you know what it means when in a dream we see 'a lot of strangers', as happens so often in dreams of nakedness in which we feel so terribly embarrassed? Nothing more nor less than secrecy, which there again is expressed by its opposite. However, our interpretation remains a jest, since we have no idea whether a Frenchman would recognize an allusion to masturbation in the words **casser une branche d'un arbre** or in some suitably emended phrase. [1899a, 500]

I then recalled that there was still a piece of the dream which the interpretation had not touched. After the idea had occurred to me that R. was my uncle, I had had a warm feeling of affection for him in the dream. Where did that feeling belong? I had naturally never had any feeling of affection for my Uncle Josef. I had been fond of my friend R. and had esteemed him for many years; but if I had gone up to him and expressed my sentiments in terms approaching the degree of affection I had felt in the dream, there could be no doubt that he would have been astonished. My affection for him struck me as ungenuine and exaggerated - like the judgement of his intellectual qualities which I had expressed by fusing his personality with my uncle's, though *there* the exaggeration had been in the opposite direction. But a new light began to dawn on me. The affection in the dream did not belong to the latent content, to the thoughts that lay behind the dream; it stood in contradiction to them and was calculated to conceal the true interpretation of the dream. And probably that was precisely its *raison d'être*. I recalled my resistance against embarking on the interpretation, how long I had put it off and how I had declared that the dream was sheer nonsense. My psycho-analytic treatments taught me how a repudiation of that kind was to be interpreted: it had no value as a judgement but was simply an expression of emotion. If my little daughter did not want an apple that was offered to her, she asserted that the apple tasted sour without having tasted it. And if my patients behaved like the child, I knew that they were concerned with an idea which they wanted to repress. The same was true of my dream. I did not want to interpret it, because the interpretation contained something that I was struggling against. When I had completed the interpretation I learnt what it was that I had been struggling against - namely, the assertion that R. was a simpleton. The affection that I felt for R. could not be derived from the latent dream-thoughts; but no doubt it originated from this struggle of mine. If my dream was distorted in this respect from its latent content - and distorted into its opposite - then the affection that was manifest in the dream served the purpose of this distortion. In other words, distortion was shown in this case to be deliberate and to be a means of *dissimulation*. My dream thoughts had contained a slander against R.; and, in order that I might not notice this, what appeared in the dream was the opposite, a feeling of affection for him. [1900a, 637]
The patient's (elder) brother also appeared in the content of the dream, the brother being up above and the patient himself down below. This was once again the reverse of the actual situation; for, as I knew, the brother had lost his social position while the patient had maintained his. In repeating the content of the dream to me, the dreamer had avoided saying that his brother was up above and he himself 'on the ground floor'. That would have put the position too clearly, since here in Vienna if we say someone is 'on the ground floor' we mean that he has lost his money and his position - in other words, that he has 'come down in the world'. Now there must have been a reason for some of this part of the dream being represented by its reverse. Further, the reversal must hold good of some other relation between dream-thoughts and dream-content as well; and we have a hint of where to look for this reversal. It must evidently be at the end of the dream, where once again there was a reversal of the difficulty in going upstairs as described in Sappho. We can then easily see what reversal is intended. In Sappho the man carried a woman who was in a sexual relation to him; in the dream-thoughts the position was reversed, and a woman was carrying a man. And since this can only happen in childhood, the reference was once more to the wet-nurse bearing the weight of the infant in her arms. Thus the end of the dream made a simultaneous reference to Sappho and to the wet-nurse.

Incidentally, reversal, or turning a thing into its opposite, is one of the means of representation most favoured by the dream-work and one which is capable of employment in the most diverse directions. It serves in the first place to give expression to the fulfilment of a wish in reference to some particular element of the dream-thoughts. 'If only it had been the other way round!' This is often the best way of expressing the ego's reaction to a disagreeable fragment of memory. Again, reversal is of quite special use as a help to the censorship, for it produces a mass of distortion in the material which is to be represented, and this has a positively paralysing effect, to begin with, on any attempt at understanding the dream. For that reason, if a dream obstinately declines to reveal its meaning, it is always worth while to see the effect of reversing some particular elements in its manifest content, after which the whole situation often becomes immediately clear.

And, apart from the reversal of subject-matter, chronological reversal must not be overlooked. Quite a common technique of dream-distortion consists in representing the outcome of an event or the conclusion of a train of thought at the beginning of a dream and of placing at its end the premises on which the conclusion was based or the causes which led to the event. Anyone who fails to bear in mind this technical method adopted by dream-distortion will be quite at a loss when confronted with the task of interpreting a dream.¹

(a) whether it is to be taken in a positive or negative sense (as an antithetic relation),

[1900a, 760]

[1900a, 797]

[1900a, 810]
There is yet another alternative way in which the dream-work can deal with affects in the dream-thoughts, in addition to allowing them through or reducing them to nothing. It can turn them into their opposite. We have already become acquainted with the interpretative rule according to which every element in a dream can, for purposes of interpretation, stand for its opposite just as easily as for itself. We can never tell beforehand whether it stands for the one or for the other; only the context can decide. A suspicion of this truth has evidently found its way into popular consciousness: ‘dream books’ very often adopt the principle of contraries in their interpretation of dreams. This turning of a thing into its opposite is made possible by the intimate associative chain which links the idea of a thing with its opposite in our thoughts. Like my other kind of displacement it can serve the ends of the censorship; but it is also frequently a product of wish-fulfilment, for wish-fulfilment consists in nothing else than a replacement of a disagreeable thing by its opposite. Just as ideas of things can make their appearance in dreams turned into their opposite, so too can the affects attaching to dream-thoughts; and it seems likely that this reversal of affect is brought about as a rule by the dream-censorship. In social life, which has provided us with our familiar analogy with the dream-censorship, we also make use of the suppression and reversal of affect, principally for purposes of dissimulation. If I am talking to someone whom I am obliged to treat with consideration while wishing to say something hostile to him, it is almost more important that I should conceal any expression of my affect from him than that I should mitigate the verbal form of my thoughts. If I were to address him in words that were not impolite, but accompanied them with a look or gesture of hatred and contempt, the effect which I should produce on him would not be very different from what it would have been if I had thrown my contempt openly in his face. Accordingly, the censorship bids me above all suppress my affects; and, if I am a master of dissimulation, I shall assume the opposite affect - smile when I am angry and seem affectionate when I wish to destroy.

‘That is to say, you knew that it was so. - The meaning of the dream is now becoming even clearer. You said to yourself: “This man is persecuting me; he wants to force his way into my room. My ‘jewel-case’ is in danger, and if anything happens it will be Father's fault.” For that reason in the dream you chose a situation which expresses the opposite - a danger from which your father is saving you. In this part of the dream everything is turned into its opposite; you will soon discover why. As you say, the mystery turns upon your mother. You ask how she comes into the dream? She is, as you know, your former rival in your father's affections. In the incident of the bracelet, you would have been glad to accept what your mother had rejected. Now let us just put "give" instead of "accept" and "withhold" instead of "reject". Then it means that you were ready to give your father what your mother withheld from him; and the thing in question was connected with jewellery.¹ Now bring your mind back to the jewel-case which Herr K. gave you. You have there the starting-point for a parallel line of thoughts, in which Herr K. is to be put in the place of your father just as he was in the matter of standing beside your bed. He gave you a jewel-case; so you are to give him your jewel-case. That was why I spoke just now of a “return-present”. In this line of thoughts your mother must be replaced by Frau K. (You will not deny that she, at any rate, was present at the time.) So you are ready to give Herr K, what his wife withholds from him. That is the thought which has had to be repressed with so much energy, and which has made it necessary for every one of its elements to be turned into its opposite. The dream confirms once more what I had already told you before you dreamt it - that you are summoning up your old love for your father in order to protect yourself against your love for Herr K. But what do all these efforts show? Not only that you are afraid of Herr K., but that you are still more afraid of yourself, and of the temptation you feel to yield to him. In short, these efforts prove once more how deeply you loved him.’²

¹ [1905e, 914]

² [1905e, 1407]

This 'wet' had a decisive influence on the further content of the dream; though it was represented in it only by a distant allusion and by its opposite.

[1905e, 1425]
The opposite of 'wet' and 'water' can easily be 'fire' and 'burning'. The chance that, when they arrived at the place, her father had expressed his anxiety at the risk of fire, helped to decide that the danger from which her father was to rescue her should be a fire. The situation chosen for the dream-picture was based upon this chance, and upon the opposition to 'wet': 'There was a fire. Her father was standing beside her bed to wake her.' Her father's chance utterance would, no doubt, not have obtained such an important position in the dream if it had not fitted in so excellently with the dominating current of feeling, which was determined to regard him at any cost as a protector and saviour. 'He foresaw the danger from the very moment of our arrival! He was in the right!' (In actual fact, it was he who had brought the girl into danger.)

Can we feel sure that none of the possible techniques of jokes has escaped our investigation? Of course not. But a continued examination of fresh material can convince us that we have got to know the commonest and most important technical methods of the joke-work - at all events as much as is required for forming a judgement on the nature of that psychical process. So far we have not arrived at any such judgement; but on the other hand we are now in possession of an important indication of the direction from which we may expect to receive further light upon the problem. The interesting processes of condensation accompanied by the formation of a substitute, which we have recognized as the core of the technique of verbal jokes, point towards the formation of dreams, in the mechanism of which the same psychical processes have been discovered. This is equally true, however, of the techniques of conceptual jokes - displacement, faulty reasoning, absurdity, indirect representation, representation by the opposite - which re-appear one and all in the technique of the dream-work. Displacement is responsible for the puzzling appearance of dreams, which prevents our recognizing that they are a continuation of our waking life. The use of absurdity and nonsense in dreams has cost them the dignity of being regarded as psychical products and has led the authorities to suppose that a disintegration of the mental activities and a cessation of criticism, morality and logic are necessary conditions of the formation of dreams. Representation by the opposite is so common in dreams that even the popular books of dream-interpretation, which are on a completely wrong tack, are in the habit of taking it into account. Indirect representation - the replacement of a dream-thought by an allusion, by something small, a symbolism akin to analogy - is precisely what distinguishes the mode of expression of dreams from that of our waking life.¹ So far-reaching an agreement between the methods of the joke-work and those of the dream-work can scarcely be a matter of chance. To demonstrate this agreement in detail and to examine its basis will be one of our later tasks.

[1905c, 1686]
Among the techniques common to jokes and dreams, representation by the opposite and the use of nonsense claim some amount of our interest. The former is one of the more effective methods employed in jokes, as may be seen among others by the examples of 'overstatement jokes' (p. 1670 f.). Incidentally, representation by the opposite is not able, like most other joke-techniques, to escape conscious attention. A person who tries to bring the joke-work into operation in himself as deliberately as possible - a professional wag - soon discovers as a rule that the easiest way of replying to an assertion by a joke is by asserting its contrary and by leaving it to the inspiration of the moment to get rid of the objection which his contradiction is likely to provoke, by giving what he has said a fresh interpretation. It may be that representation by the opposite owes the favour it enjoys to the fact that it forms the core of another pleasurable way of expressing a thought, which can be understood without any need for bringing in the unconscious. I am thinking of irony, which comes very close to joking and is counted among the sub-species of the comic. Its essence lies in saying the opposite of what one intends to convey to the other person, but in sparing him contradiction by making him understand - by one's tone of voice, by some accompanying gesture, or (where writing is concerned) by some small stylistic indications - that one means the opposite of what one says. Irony can only be employed when the other person is prepared to hear the opposite, so that he cannot fail to feel an inclination to contradict. As a result of this condition, irony is exposed particularly easily to the danger of being misunderstood. It brings the person who uses it the advantage of enabling him readily to evade the difficulties of direct expression, for instance in invectives. It produces comic pleasure in the hearer, probably because it stirs him into a contradictory expenditure of energy which is at once recognized as being unnecessary. A comparison like this between jokes and a closely related type of the comic may confirm our assumption that what is peculiar to jokes is their relation to the unconscious and that this may perhaps distinguish them from the comic as well.¹

In the dream-work, representation by the opposite plays a far greater part even than in jokes. Dreams are not merely fond of representing two contraries by one and the same composite structure, but they so often change something in the dream-thoughts into its opposite that this leads to a great difficulty in the work of interpretation. 'There is no way of deciding at a first glance whether any element that admits of a contrary is present in the dream-thoughts as a positive or as a negative.'²

(3) A particularly extensive distortion is effected by an antagonistic inversion of the innervations. This is analogous to the transformation of an element into its opposite, which commonly happens in the dream-work. For instance, an embrace may be represented in the attack by drawing back the arms convulsively till the hands meet over the spinal column. It is possible that the well-known arc de cercle which occurs during attacks in major hysteria is nothing else than an energetic repudiation like this, through antagonistic innervation, of a posture of the body that is suitable for sexual intercourse. ³

¹ [1905c, 1757]
² [1905c, 1757]
³ [1909a, 1982]
The first thing we learn is that the outbreak of the anxiety state was by no means so sudden as appeared at first sight. A few days earlier the child had woken from an anxiety-dream to the effect that his mother had gone away, and that now he had no mother to coax with. This dream alone points to the presence of a repressive process of ominous intensity. We cannot explain it, as we can so many other anxiety-dreams, by supposing that the child had in his dream felt anxiety arising from some somatic cause and had made use of the anxiety for the purpose of fulfilling an unconscious wish which would otherwise have been deeply repressed.¹ We must regard it rather as a genuine punishment and repression dream, and, moreover, as a dream which failed in its function, since the child woke from his sleep in a state of anxiety. We can easily reconstruct what actually occurred in the unconscious. The child dreamt of exchanging endearments with his mother and of sleeping with her; but all the pleasure was transformed into anxiety, and all the ideational content into its opposite. Repression had defeated the purpose of the mechanism of dreaming.

[1909b, 2101]

I may add a word upon the interpretation of the 'sanction' which, it will be remembered, was to the effect that 'otherwise the rat punishment will be carried out on both of them'. It was based upon the influence of two infantile sexual theories, which I have discussed elsewhere.¹ The first of these theories is that babies come out of the anus; and the second, which follows logically from the first, is that men can have babies just as well as women. According to the technical rules for interpreting dreams, the notion of coming out of the rectum can be represented by the opposite notion of creeping into the rectum (as in the rat punishment), and vice versa.

[1909d, 2171]

'The way in which dreams treat the category of contraries and contradictories is highly remarkable. It is simply disregarded. "No" seems not to exist so far as dreams are concerned. They show a particular preference for combining contraries into a unity or for representing them as one and the same thing. Dreams feel themselves at liberty, moreover, to represent any element by its wishful contrary; so that there is no way of deciding at a first glance whether any element that admits of a contrary is present in the dream-thoughts as a positive or as a negative.'¹

[1910e, 2318]

The dream-interpreters of antiquity seem to have made the most extensive use of the notion that a thing in a dream can mean its opposite. This possibility has also occasionally been recognized by modern students of dreams, in so far as they concede at all that dreams have a meaning and can be interpreted.² Nor do I think that I shall be contradicted if I assume that all who have followed me in interpreting dreams on scientific lines have found confirmation of the statement quoted above.

[1910e, 2318]
For comparison with the dream-work there is another extremely strange characteristic of the ancient Egyptian language which is significant. In Egyptian, words can - apparently, we will say to begin with - reverse their sound as well as their sense. Let us suppose that the German word “gut” [“good”] was Egyptian: it could then mean “bad” as well as “good”, and be pronounced “tug” as well as “gut”. Numerous examples of such reversals of sound, which are too frequent to be explained as chance occurrences, can be produced from the Aryan and Semitic languages as well. Confining ourselves in the first instance to Germanic languages we may note: Topf [pot] - pot; boat - tub; wait - täuwen [tarry]; hurry - Ruhe [rest]; care - reck; Balken [beam] - Klobe [log], club. If we take the other Indo-Germanic languages into consideration, the number of relevant instances grows accordingly; for example, capere [Latin for "take"] - packen [German for "seize"]; ren [Latin for "kidney"] - Niere [German for "kidney"]; leaf - folium [Latin for "leaf"]; düm-a [Russian for "thought"], θυμός [Greek for "spirit", "courage"] - mēdh, mūdha [Sanskrit for "mind"], Mut [German for "courage"]; rauchen [German for "to smoke"] - Kur-It [Russian for "to smoke"]; kreischen [German for "to shriek"] - to shriek, etc.¹

Abel tries to explain the phenomenon of reversal of sound as a doubling or reduplication of the root. Here we should find some difficulty in following the philologist. We remember in this connection how fond children are of playing at reversing the sound of words and how frequently the dream-work makes use of a reversal of the representational material for various purposes. (Here it is no longer letters but images whose order is reversed.) We should therefore be more inclined to derive reversal of sound from a factor of deeper origin.¹

In the correspondence between the peculiarity of the dream-work mentioned at the beginning of the paper and the practice discovered by philology in the oldest languages, we may see a confirmation of the view we have formed about the regressive, archaic character of the expression of thoughts in dreams. And we psychiatrists cannot escape the suspicion that we should be better at understanding and translating the language of dreams if we knew more about the development of language.²

Behind this first interpretation we have a glimpse of deeper and purely sexual material. Here the room was the vagina. (The room was in her - this was reversed in the dream.) The little man who made grimaces and behaved so funnily was the penis. The narrow door and the steep stairs confirmed the view that the situation was a representation of intercourse. As a rule we are accustomed to find the penis symbolized by a child; but we shall find there was good reason for a father being introduced to represent the penis in this instance.³

Let us look once more at our material. In the Estonian epic, just as in the tale from the Gesta Romanorum, the subject is a girl choosing between three suitors; in the scene from The Merchant of Venice the subject is apparently the same, but at the same time something appears in it that is in the nature of an inversion of the theme: a man chooses between three - caskets. If what we were concerned with were a dream, it would occur to us at once that caskets are also women, symbols of what is essential in woman, and therefore of a woman herself - like coffers, boxes, cases, baskets, and so on. If we boldly assume that there are symbolic substitutions of the same kind in myths as well, then the casket scene in The Merchant of Venice really becomes the inversion we suspected. With a wave of the wand, as though we were in a fairy tale, we have stripped the astral garment from our theme; and now we see that the theme is a human one, a man's choice between three women.³
However, contradictions of a certain kind - replacements by the precise opposite - offer no serious difficulty to the work of analytic interpretation. We shall not appeal here to the fact that contraries are so often represented by one and the same element in the modes of expression used by the unconscious, as for instance in dreams. But we shall remember that there are motive forces in mental life which bring about replacement by the opposite in the form of what is known as reaction-formation; and it is precisely in the revelation of such hidden forces as these that we look for the reward of this enquiry. The Moerae were created as a result of a discovery that warned man that he too is a part of nature and therefore subject to the immutable law of death. Something in man was bound to struggle against this subjection, for it is only with extreme unwillingness that he gives up his claim to an exceptional position. Man, as we know, makes use of his imaginative activity in order to satisfy the wishes that reality does not satisfy. So his imagination rebelled against the recognition of the truth embodied in the myth of the Moerae, and constructed instead the myth derived from it, in which the Goddess of Death was replaced by the Goddess of Love and by what was equivalent to her in human shape. The third of the sisters was no longer Death; she was the fairest, best, most desirable and most lovable of women. Nor was this substitution in any way technically difficult: it was prepared for by an ancient ambivalence, it was carried out along a primaeval line of connection which could not long have been forgotten. The Goddess of Love herself, who now took the place of the Goddess of Death, had once been identical with her. Even the Greek Aphrodite had not wholly relinquished her connection with the underworld, although she had long surrendered her chthonic role to other divine figures, to Persephone, or to the tri-form Artemis-Hecate. The great Mother-goddesses of the oriental peoples, however, all seem to have been both creators and destroyers - both goddesses of life and fertility and goddesses of death. Thus the replacement by a wishful opposite in our theme harks back to a primaeval identity.

[1913f, 2612]

I shall no doubt be overstepping common linguistic usage in postulating an interest in psycho-analysis on the part of philologists, that is of experts in speech. For in what follows ‘speech’ must be understood not merely to mean the expression of thought in words but to include the speech of gesture and every other method, such, for instance, as writing, by which mental activity can be expressed. That being so, it may be pointed out that the interpretations made by psycho-analysis are first and foremost translations from an alien method of expression into the one which is familiar to us. When we interpret a dream we are simply translating a particular thought-content (the latent dream-thoughts) from the ‘language of dreams’ into our waking speech. In the course of doing so we learn the peculiarities of this dream language and it is borne in upon us that it forms part of a highly archaic system of expression. Thus, to take an instance, there is no special indication for the negative in the language of dreams. Contraries may stand for each other in the dream’s content and may be represented by the same element. Or we may put it like this: concepts are still ambivalent in dream-language, and unite within themselves contrary meanings - as is the case, according to the hypotheses of philologists, in the oldest roots of historical languages. Another striking feature of our dream-language is its extremely frequent use of symbols, which make us able to some extent to translate the content of dreams without reference to the associations of the individual dreamer. Our researches have not yet sufficiently elucidated the essential nature of these symbols. They are in part substitutes and analogies based upon obvious similarities; but in some of these symbols the tertium comparationis which is presumably present escapes our conscious knowledge. It is precisely this latter class of symbols which must probably originate from the earliest phases of linguistic development and conceptual construction. In dreams it is above all the sexual organs and sexual activities which are represented symbolically instead of directly. A philologist, Hans Sperber, of Uppsala, has only recently (1912) attempted to prove that words which originally represented sexual activities have, on the basis of analogies of this kind, undergone an extraordinarily far-reaching change in their meaning.

[1913], 2813]
The remaining phrases in the manifest dream can be explained now in relation to the
masturbation complex. 'He looked bad' is indeed an allusion to another remark of the dentist's to
the effect that it looks bad if one has lost a tooth in that part of the mouth; but it relates at the
same time to the 'looking bad' by which a young man at puberty betrays, or is afraid he betrays,
his excessive sexual activity. It was not without relief to his own feelings that in the manifest
content the dreamer displaced the 'looking bad' from himself on to his father - one of the kinds
of reversal by the dream-work which is familiar to you. 'He had been living since then' coincides
with the wish to bring back to life as well as with the dentist's promise that the tooth would
survive. The sentence 'the dreamer was doing all he could to prevent him (his father) noticing it'
is very subtly devised to mislead us into thinking that it should be completed by the words 'that
he was dead'. The only completion, however, that makes sense comes once more from the
masturbation complex; in that connection it is self-evident that the young man did all he could to
conceal his sexual life from his father. And finally, remember that we must always interpret what
are called 'dreams with a dental stimulus' as relating to masturbation and the dreaded
punishment for it.
[1916-1917, 3281]

You will no doubt recognize the pursuit by the officer in the red cap and the breathless
climbing upstairs as representing the sexual act. The fact that it was the dreamer who locked
herself up against her pursuer will serve as an example of the reversals that are used so
commonly in dreams, for it was the man who had avoided the consummation of the sexual act.
In the same way, her grief was displaced on to the man, for it was he who wept in the dream -
and this was simultaneously a representation of the emission of semen.
[1916-1917, 3283]

The courtyard in which the sheet of tin was spread out is not to be taken symbolically in the
first instance. It was derived from the business premises of the dreamer's father. For reasons of
discretion I have substituted 'tin' for another material in which his father actually dealt: but I have
made no other change in the wording of the dream. The dreamer had entered his father's
business and had taken violent objection to the somewhat dubious practices on which the firm's
earnings in part depended. Consequently the dream-thought I have just interpreted may have
continued in this way: '(If I had asked him), he would have deceived me just as he deceives his
customers.' As regards the 'pulling off' which served to represent his father's dishonesty in
business, the dreamer himself produced a second explanation - namely that it stood for
masturbating. Not only have we long been familiar with this interpretation, but there was
something to confirm it in the fact that the secret nature of masturbation was represented by its
reverse: it might be done openly. Just as we should expect, the masturbatory activity was once
again displaced on to the dreamer's father, like the questioning in the first scene of the dream.
He promptly interpreted the shaft as a vagina, having regard to the soft cushioning of its walls. I
added on my own authority that climbing down, like climbing up in other cases, described
sexual intercourse in the vagina.
[1916-1917, 3285]
In connection with this he thought of a story told him by a friend. A lunatic was being conveyed in a compartment on an Italian line, but through carelessness a traveller was allowed in with him. The madman killed the other traveller. Thus he was identifying himself with the madman, and based his right to do so on an obsession by which he was tormented from time to time that he must 'get rid of all accessory witnesses'. But then he himself found a better reason, and this led to the precipitating cause of the dream. At the theatre the night before he had once more seen the girl whom he had wanted to marry but had withdrawn from because she had given him ground for being jealous. In view of the intensity reached by his jealousy he would, he thought, really be mad to want to marry her. This meant that he regarded her as so untrustworthy that, in his jealousy, he would have to kill everyone who came his way. We have already come across walking through a series of rooms (here, railway coaches) as a symbol of marriage (a reversal of 'monogamy').

[1916-1917, 3288]

(1) You may have formed an impression that, even though the technique is correctly carried out, the findings of our interpretative work on dreams admit of so many uncertainties as to defeat any secure translation of the manifest dream into the latent dream-thoughts. You will argue in support of this that in the first place one never knows whether a particular element of the dream is to be understood in its actual sense or as a symbol, since the things employed as symbols do not cease on that account to be themselves. If, however, one has no objective clue for deciding this, the interpretation must at that point be left to the arbitrary choice of the interpreter. Furthermore, as a result of the fact that in the dream-work contraries coalesce, it is always left undetermined whether a particular element is to be understood in a positive or negative sense - as itself or as its contrary. Here is a fresh opportunity for the interpreter to exercise an arbitrary choice. Thirdly, in consequence of the reversals of every kind of which dreams are so fond, it is open to the interpreter to carry out a reversal like this in connection with any passage in the dream he chooses. And lastly, you will mention having heard that one is never certain whether the interpretation one has found for a dream is the only possible one. We run the risk of overlooking a perfectly admissible 'over-interpretation' of the same dream. In these circumstances, you will conclude, so much room is left to the interpreter's arbitrary decision as to be incompatible with objective certainty in the findings. Or alternatively you may suppose that the fault does not lie with dreams but that the inadequacies of our dream-interpretation are to be attributed to errors in our views and premisses.

[1916-1917, 3315]

Let us recall that we have said that the dream-work makes a translation of the dream-thoughts into a primitive mode of expression similar to picture-writing. All such primitive systems of expression, however, are characterized by indefiniteness and ambiguity of this sort, without justifying us in casting doubts on their serviceability. The coalescence of contraries in the dream-work is, as you know, analogous to the so-called 'antithetical meaning of primal words' in the most ancient languages. Indeed, Abel (1884), the philologist to whom we owe this line of thought, implores us not to suppose that communications made by one person to another with the help of such ambivalent words were on that account ambiguous. On the contrary, intonation and gesture must have made it quite certain in the context of the speech which of the two contraries the speaker intended to convey. In writing, where gesture is absent, its place was taken by an additional pictograph which was not intended to be spoken - for instance by a picture of a little man, limply squatting or stiffly erect, according to whether the ambiguous hieroglyph 'ken' was to mean 'weak' or 'strong'. In this way, in spite of the ambiguity of the sounds and signs, misunderstanding was avoided.

[1916-1917, 3316]
The parts of the manifest content of the dream which were emphasized by the dreamer, the factors of attentive looking and of motionlessness, must lead to the content of this scene. We must naturally expect to find that this material reproduces the unknown material of the scene in some distorted form, perhaps even distorted into its opposite.

[1918b, 3525]

One day the patient began to continue with the interpretation of the dream. He thought that the part of the dream which said that 'suddenly the window opened of its own accord' was not completely explained by its connection with the window at which the tailor was sitting and through which the wolf came into the room. 'It must mean: "My eyes suddenly opened." I was asleep, therefore, and suddenly woke up, and as I woke I saw something: the tree with the wolves.' No objection could be made to this; but the point could be developed further. He had woken up and had seen something. The attentive looking, which in the dream was ascribed to the wolves, should rather be shifted on to him. At a decisive point, therefore, a transposition has taken place; and moreover this is indicated by another transposition in the manifest content of the dream. For the fact that the wolves were sitting on the tree was also a transposition, since in his grandfather's story they were underneath, and were unable to climb on to the tree.

[1918b, 3525]

What, then, if the other factor emphasized by the dreamer were also distorted by means of a transposition or reversal? In that case instead of immobility (the wolves sat there motionless; they looked at him, but did not move) the meaning would have to be: the most violent motion. That is to say, he suddenly woke up, and saw in front of him a scene of violent movement at which he looked with strained attention. In the one case the distortion would consist in an interchange of subject and object, of activity and passivity: being looked at instead of looking. In the other case it would consist in a transformation into the opposite; rest instead of motion.

[1918b, 3526]

*They were sitting on the tree.* In the first place they replace the Christmas presents hanging on the tree. But they are also transposed on to the tree because that can mean that they are looking. In his grandfather's story they were posted underneath the tree. Their relation to the tree has therefore been reversed in the dream; and from this it may be concluded that there are further reversals of the latent material to be found in the content of the dream.

[1918b, 3532]

*The fear of being eaten up by the wolves.* It seemed to the dreamer as though the motive force of this fear was not derived from the content of the dream. He said he need not have been afraid, for the wolves looked more like foxes or dogs, and they did not rush at him as though to bite him, but were very still and not at all terrible. We observe that the dream-work tries for some time to make the distressing content harmless by transforming it into its opposite. ('They aren't moving, and, only look, they have the loveliest tails!') Until at last this expedient fails, and the fear breaks out. It expresses itself by the help of the fairy tale, in which the goat-children are eaten up by the wolf-father. This part of the fairy tale may perhaps have acted as a reminder of threats made by the child's father in fun when he was playing with him; so that the fear of being eaten up by the wolf may be a reminiscence as well as a substitute by displacement.

[1918b, 3532]

A dream-structure of this kind will excite less astonishment if one considers how frequently dream-distortion, acting in the service of the censorship, replaces a particular element by something that is in some sense or other its opposite or contrary. It is only a short step from there to the replacement of a characteristic portion of the content of the dream by a defensive contradiction, and one further step will lead to the whole objectionable dream-content being replaced by the punishment dream. I should like to give a couple of characteristic examples of the intermediate phase in the falsification of the manifest content.

[1923c, 4040]
If the psychological discoveries gained from the study of dreams were firmly kept in view, only one further step was needed before psycho-analysis could be proclaimed as the theory of the deeper mental processes not directly accessible to consciousness - as a 'depth-psychology' - and before it could be applied to almost all the mental sciences. This step lay in the transition from the mental activity of individual men to the psychical functions of human communities and peoples - that is, from individual to group psychology; and many surprising analogies forced this transition upon us. It had been found, for instance, that in the deep strata of unconscious mental activity contraries are not distinguished from each other but are expressed by the same element. But already in 1884 Karl Abel the philologist had put forward the view (in his 'Über den Gegensinn der Urworte') that the oldest languages known to us treat contraries in the same way. Thus Ancient Egyptian, for example, had in the first instance only one word for 'strong' and 'weak', and not till later were the two sides of the antithesis distinguished by slight modifications. Even in the most modern languages clear relics of such antithetical meanings are to be found. So in German 'Boden' means the highest as well as the lowest thing in the house; similarly in Latin 'altus' means 'high' and 'deep'. Thus the equivalence of contraries in dreams is a universal archaic trait in human thinking.
[1924f, 4115]

I was able to show from a short story by W. Jensen called Gradiva, which has no particular merit in itself, that invented dreams can be interpreted in the same way as real ones and that the unconscious mechanisms familiar to us in the 'dream-work' are thus also operative in the processes of imaginative writing. My book on Jokes and their Relation to the Unconscious was a side-issue directly derived from The Interpretation of Dreams. The only friend of mine who was at that time interested in my work remarked to me that my interpretations of dreams often impressed him as being like jokes. In order to throw some light on this impression, I began to investigate jokes and found that their essence lay in the technical methods employed in them, and that these were the same as the means used in the 'dream-work' - that is to say, condensation, displacement, the representation of a thing by its opposite or by something very small, and so on. This led to an economic enquiry into the origin of the high degree of pleasure obtained from hearing a joke. And to this the answer was that it was due to the momentary suspension of the expenditure of energy upon maintaining repression, owing to the attraction exercised by the offer of a bonus of pleasure (fore-pleasure).
[1925d, 4239]
The methods of representation employed by the dream-work - fascinating material, scarcely capable of exhaustion - have been made more and more familiar to us by closer study. I will give you a few examples of them. Thus, for instance, dreams represent the relation of frequency by a multiplication of similar things. Here is a young girl's remarkable dream. She dreamt she came into a great hall and found some one in it sitting on a chair; this was repeated six or eight times or more, but each time it was her father. This is easy to understand when we discover, from accessory details in the interpretation, that this room stood for the womb. The dream then becomes equivalent to the phantasy, familiarly found in girls, of having met their rather already during their intra-uterine life when he visited the womb while their mother was pregnant. You should not be confused by the fact that something is reversed in the dream - that her father's 'coming-in' is displaced on to herself; incidentally, this has a special meaning of its own as well. The multiplication of the figure of the father can only express the fact that the event in question occurred repeatedly. After all, it must be allowed that the dream is not taking very much on itself in expressing frequency by multiplicity. It has only needed to go back to the original significance of the former word; to-day it means to us a repetition in time, but it is derived from an accumulation in space. In general, indeed, where it is possible, the dream-work changes temporal relations into spatial ones and represents them as such. In a dream, for instance, one may see a scene between two people who look very small and a long way off, as though one were seeing them through the wrong end of a pair of opera-glasses. Here, both the smallness and the remoteness in space have the same significance: what is meant is remoteness in time and we are to understand that the scene is from the remote past.

[1933a, 4638]

For I think my hypothesis - that, in order to gain control over fire, men had to renounce the homosexually-tinged desire to put it out with a stream of urine - can be confirmed by an interpretation of the Greek myth of Prometheus, provided that we bear in mind the distortions which must be expected to occur in the transition from facts to the contents of a myth. These distortions are of the same sort as, and no worse than, those which we acknowledge every day, when we reconstruct from patients' dreams the repressed but extremely important experiences of their childhood. The mechanisms employed in the distortions I have in mind are symbolic representation and turning into the opposite. I should not venture to explain all the features of our myth in this fashion; apart from the original set of facts, other and later occurrences may have contributed to its content. But the elements which admit of analytic interpretation are, after all, the most striking and important - viz. the manner in which Prometheus transported the fire, the character of his act (an outrage, a theft, a defrauding of the gods) and the meaning of his punishment.

[1932a, 4781]

The myth tells us that Prometheus the Titan, a culture-hero who was still a god¹ and who was perhaps originally himself a demiurge and a creator of men, brought fire to men, having stolen it from the gods, hidden in a hollow stick, a fennel-stalk. If we were interpreting a dream we should be inclined to regard such an object as a penis symbol, although the unusual stress laid on its hollowness might make us hesitate. But how can we bring this penis-tube into connection with the preservation of fire? There seems little chance of doing this, till we remember the procedure of reversal, of turning into the opposite, of inverting relationships, which is so common in dreams and which so often conceals their meaning from us. What a man harbours in his penis-tube is not fire. On the contrary, it is the means of quenching fire; it is the water of his stream of urine. This relationship between fire and water then connects up with a wealth of familiar analytic material.

[1932a, 4782]
A reversal into the opposite is unexpectedly found in another myth which in appearance has very little to do with the fire myth. The Lernaean hydra with its countless flickering serpent's heads - one of which was immortal - was, as its name tells us, a water-dragon. Heracles, the culture-hero, fought it by cutting off its heads; but they always grew again, and it was only after he had burnt up the immortal head with fire that he overcame the monster. A water-dragon subdued by fire - that surely makes no sense. But, as in so many dreams, sense emerges if we reverse the manifest content. In that case the hydra is a brand of fire and the flickering serpent's heads are the flames; and these, in proof of their libidinal nature, once more display, like Prometheus's liver, the phenomenon of re-growth, of renewal after attempted destruction. Heracles, then, extinguishes this brand of fire with - water. (The immortal head is no doubt the phallus itself, and its destruction signifies castration.) But Heracles was also the deliverer of Prometheus and slew the bird which devoured his liver. Should we not suspect a deeper connection between the two myths? It is as though the deed of the one hero was made up for by the other. Prometheus (like the Mongolian law) had forbidden the quenching of fire; Heracles permitted it in the case in which the brand of fire threatened disaster. The second myth seems to correspond to the reaction of a later epoch of civilization to the events of the acquisition of power over fire. It looks as though this line of approach might take us quite a distance into the secrets of the myth; but admittedly we should carry a feeling of certainty with us only a short way.

[1932a, 4785]

The study of the dream-work has taught us many other characteristics of the processes in the unconscious which are as remarkable as they are important; but we must only mention a few of them here. The governing rules of logic carry no weight in the unconscious; it might be called the Realm of the Illogical. Urges with contrary aims exist side by side in the unconscious without any need arising for an adjustment between them. Either they have no influence whatever on each other, or, if they have, no decision is reached, but a compromise comes about which is nonsensical since it embraces mutually incompatible details. With this is connected the fact that contraries are not kept apart but treated as though they were identical, so that in the manifest dream any element may also have the meaning of its opposite. Certain philologists have found that the same held good in the most ancient languages and that contraries such as 'strong-weak', 'light-dark' and 'high-deep' were originally expressed by the same roots, until two different modifications of the primitive word distinguished between the two meanings. Residues of this original double meaning seem to have survived even in a highly developed language like Latin in its use of words such as 'altus' ('high' and 'deep') and 'sacer' ('sacred' and 'infamous').

[1940a [1938], 4979]
(4) Scarcely less confusing and misleading is a *reversal of the chronological order* within the phantasy that is portrayed, which once more has its complete counterpart in a number of dreams which begin with the end of the action and end with its beginning. Supposing, for instance, that a hysterical woman has a phantasy of seduction in which she is sitting reading in a park with her skirt slightly lifted so that her foot is visible; a gentleman approaches and speaks to her; they then go somewhere and make love to one another. This phantasy is acted out in the attack by her beginning with the convulsive stage, which corresponds to the coitus, by her then getting up, going into another room, sitting down and reading and presently answering an imaginary remark addressed to her.

[1909a, 1982]

Reversals like this, which occur here with individual words, take place in various ways in the dream-work. We already know reversal of meaning, replacement of something by its opposite. Besides this we find in dreams reversals of situation, of the relation between two people - a 'topsy-turvy' world. Quite often in dreams it is the hare that shoots the sportsman. Or again we find a reversal in the order of events, so that what precedes an event causally comes after it in the dream - like a theatrical production by a third-rate touring company, in which the hero falls down dead and the shot that killed him is not fired in the wings till afterwards. Or there are dreams where the whole order of the elements is reversed, so that to make sense in interpreting it we must take the last one first and the first one last. You will remember too from our study of dream symbolism that going or falling into the water means the same as coming out of it - that is, giving birth or being born, and that climbing up a staircase or a ladder is the same thing as coming down it. It is not hard to see the advantage that dream-distortion can derive from this freedom of representation.

[1916-1917, 3271]
Provisionally, then, it may be said that the logical relations between the dream-thoughts are not given any separate representation in dreams. For instance, if a contradiction occurs in a dream, it is either a contradiction of the dream itself or a contradiction derived from the subject-matter of one of the dream-thoughts. A contradiction in a dream can only correspond in an exceedingly indirect manner to a contradiction between the dream-thoughts. But just as the art of painting eventually found a way of expressing, by means other than the floating labels, at least the intention of the words of the personages represented - affection, threats, warnings, and so on - so too there is a possible means by which dreams can take account of some of the logical relations between their dream-thoughts, by making an appropriate modification in the method of representation characteristic of dreams. Experience shows that different dreams vary greatly in this respect. While some dreams completely disregard the logical sequence of their material, others attempt to give as full an indication of it as possible. In doing so dreams depart sometimes more and some times less widely from the text that is at their disposal for manipulation. Incidentally dreams vary similarly in their treatment of the chronological sequence of the dream-thoughts, if such a sequence has been established in the unconscious (as, for instance, in the dream of Irma's injection).

This very often stands for the age of the dreamer at some particular period in his childhood. In one dream a quarter past five in the morning meant the age of five years and three months, which was significant, since that was the dreamer's age at the time of the birth of his younger brother. - Many similar examples.

The methods of representation employed by the dream-work - fascinating material, scarcely capable of exhaustion - have been made more and more familiar to us by closer study. I will give you a few examples of them. Thus, for instance, dreams represent the relation of frequency by a multiplication of similar things. Here is a young girl's remarkable dream. She dreamt she came into a great hall and found some one in it sitting on a chair; this was repeated six or eight times or more, but each time it was her father. This is easy to understand when we discover, from accessory details in the interpretation, that this room stood for the womb. The dream then becomes equivalent to the phantasy, familiarly found in girls, of having met their rather already during their intra-uterine life when he visited the womb while their mother was pregnant. You should not be confused by the fact that something is reversed in the dream - that her father's 'coming-in' is displaced on to herself; incidentally, this has a special meaning of its own as well. The multiplication of the figure of the father can only express the fact that the event in question occurred repeatedly. After all, it must be allowed that the dream is not taking very much on itself in expressing frequency by multiplicity. It has only needed to go back to the original significance of the former word; to-day it means to us a repetition in time, but it is derived from an accumulation in space. In general, indeed, where it is possible, the dream-work changes temporal relations into spatial ones and represents them as such. In a dream, for instance, one may see a scene between two people who look very small and a long way off, as though one were seeing them through the wrong end of a pair of opera-glasses. Here, both the smallness and the remoteness in space have the same significance: what is meant is remoteness in time and we are to understand that the scene is from the remote past.
The different portions of this complicated structure stand, of course, in the most manifold logical relations to one another. They can represent foreground and background, digressions and illustrations, conditions, chains of evidence and counter-arguments. When the whole mass of these dream-thoughts is brought under the pressure of the dream-work, and its elements are turned about, broken into fragments and jammed together - almost like pack-ice - the question arises of what happens to the logical connections which have hitherto formed its framework. What representation do dreams provide for 'if', 'because', 'just as', 'although', 'either-or', and all the other conjunctions without which we cannot understand sentences or speeches?

[1900a, 782]

In the first resort our answer must be that dreams have no means at their disposal for representing these logical relations between the dream-thoughts. For the most part dreams disregard all these conjunctions, and it is only the substantive content of the dream-thoughts that they take over and manipulate. The restoration of the connections which the dream-work has destroyed is a task which has to be performed by the interpretative process.

[1900a, 782]

At this point an objection may perhaps be raised in dispute of the idea that dreams are unable to represent logical relations. For there are dreams in which the most complicated intellectual operations take place, statements are contradicted or confirmed, ridiculed or compared, just as they are in waking thought. But here again appearances are deceitful. If we go into the interpretation of dreams such as these, we find that the whole of this is part of the material of the dream-thoughts and is not a representation of intellectual work performed during the dream itself. What is reproduced by the ostensible thinking in the dream is the subject-matter of the dream-thoughts and not the mutual relations between them, the assertion of which constitutes thinking. I shall bring forward some instances of this. But the easiest point to establish in this connection is that all spoken sentences which occur in dreams and are specifically described as such are unmodified or slightly modified reproductions of speeches which are also to be found among the recollections in the material of the dream-thoughts. A speech of this kind is often no more than an allusion to some event included among the dream-thoughts, and the meaning of the dream may be a totally different one.

[1900a, 783]

Provisionally, then, it may be said that the logical relations between the dream-thoughts are not given any separate representation in dreams. For instance, if a contradiction occurs in a dream, it is either a contradiction of the dream itself or a contradiction derived from the subject-matter of one of the dream-thoughts. A contradiction in a dream can only correspond in an exceedingly indirect manner to a contradiction between the dream-thoughts. But just as the art of painting eventually found a way of expressing, by means other than the floating labels, at least the intention of the words of the personages represented - affection, threats, warnings, and so on - so too there is a possible means by which dreams can take account of some of the logical relations between their dream-thoughts, by making an appropriate modification in the method of representation characteristic of dreams. Experience shows that different dreams vary greatly in this respect. While some dreams completely disregard the logical sequence of their material, others attempt to give as full an indication of it as possible. In doing so dreams depart sometimes more and some times less widely from the text that is at their disposal for manipulation. Incidentally dreams vary similarly in their treatment of the chronological sequence of the dream-thoughts, if such a sequence has been established in the unconscious (as, for instance, in the dream of Irma's injection).

[1900a, 783]

What means does the dream-work possess for indicating these relations in the dream-thoughts which it is so hard to represent? I will attempt to enumerate them one by one.

[1900a, 784]
In the first place, dreams take into account in a general way the connection which undeniably exists between all the portions of the dream-thoughts by combining the whole material into a single situation or event. They reproduce *logical connection* by *simultaneity in time*. Here they are acting like the painter who, in a picture of the School of Athens or of Parnassus, represents in one group all the philosophers or all the poets. It is true that they were never in fact assembled in a single hall or on a single mountain-top; but they certainly form a group in the conceptual sense.

[1900a, 784]

The alternative 'either-or' cannot be expressed in dreams in any way whatever. Both of the alternatives are usually inserted in the text of the dream as though they were equally valid. The dream of Irma’s injection contains a classic instance of this. Its latent thoughts clearly ran: 'I am not responsible for the persistence of Irma’s pains; the responsibility lies *either* in her recalcitrance to accepting my solution, *or* in the unfavourable sexual conditions under which she lives and which I cannot alter, *or* in the fact that her pains are not hysterical at all but of an organic nature.' The dream, on the other hand, fulfilled all of these possibilities (which were almost mutually exclusive), and did not hesitate to add a fourth solution, based on the dream-wish. After interpreting the dream, I proceeded to insert the 'either-or' into the context of the dream thoughts.

[1900a, 786]

If, however, in reproducing a dream, its narrator feels inclined to make use of an 'either-or' - e.g. 'it was either a garden or a sitting-room' - what was present in the dream-thoughts was not an alternative but an 'and', a simple addition. An 'either-or' is mostly used to describe a dream-element that has a quality of vagueness - which, however, is capable of being resolved. In such cases the rule for interpretation is: treat the two apparent alternatives as of equal validity and link them together with an 'and'.

[1900a, 787]

In a few instances the difficulty of representing an alternative is got over by dividing the dream into two pieces of equal length.

[1900a, 788]

Sometimes, in a dream in which the same situation and setting have persisted for some time, an interruption will occur which is described in these words: 'But then it was as though at the same time it was another place, and there such and such a thing happened.' After a while the main thread of the dream may be resumed, and what interrupted it turns out to be a subordinate clause in the dream-material - an interpolated thought. A conditional in the dream-thoughts has been represented in the dream by simultaneity: 'if' has become 'when'.

[1900a, 804]
We have been occupied so far with investigating the means by which dreams represent the relations between the dream-thoughts. In the course of this investigation, however, we have more than once touched upon the further topic of the general nature of the modifications which the material of the dream-thoughts undergoes for the purpose of the formation of a dream. We have learnt that that material, stripped to a large extent of its relations, is submitted to a process of compression, while at the same time displacements of intensity between its elements necessarily bring about a psychical transvaluation of the material. The displacements we have hitherto considered turned out to consist in the replacing of some one particular idea by another in some way closely associated with it, and they were used to facilitate condensation in so far as, by their means, instead of two elements, a single common element intermediate between them found its way into the dream. We have not yet referred to any other sort of displacement. Analyses show us, however, that another sort exists and that it reveals itself in a change in the verbal expression of the thoughts concerned. In both cases there is a displacement along a chain of associations; but a process of such a kind can occur in various psychical spheres, and the outcome of the displacement may in one case be that one element is replaced by another, while the outcome in another case may be that a single element has its verbal form replaced by another.

¹ These findings are in some respects a correction of what I have said above (p. 783) on the representation of logical relations in dreams. This earlier passage describes the general behaviour of the dream-work but takes no account of the finer and more precise details of its functioning.

[1900a, 808]
I will now try to sum up this lengthy disquisition on the dream-work. We were faced by the question whether the mind employs the whole of its faculties without reserve in constructing dreams or only a functionally restricted fragment of them. Our investigations led us to reject entirely the form in which the question was framed as being inadequate to the circumstances. If, however, we had to reply to the question on the basis of the terms in which it was stated, we should be obliged to reply in the affirmative to both the alternatives, mutually exclusive though they appear to be. Two separate functions may be distinguished in mental activity during the construction of a dream: the production of the dream-thoughts, and their transformation into the content of the dream. The dream-thoughts are entirely rational and are constructed with an expenditure of all the psychical energy of which we are capable. They have their place among thought-processes that have not become conscious - processes from which, after some modification, our conscious thoughts, too, arise. However many interesting and puzzling questions the dream-thoughts may involve, such questions have, after all, no special relation to dreams and do not call for treatment among the problems of dreams.¹ On the other hand, the second function of mental activity during dream-construction, the transformation of the unconscious thoughts into the content of the dream, is peculiar to dream-life and characteristic of it. This dream-work proper diverges further from our picture of waking thought than has been supposed even by the most determined depreciator of psychical functioning during the formation of dreams. The dream-work is not simply more careless, more irrational, more forgetful and more incomplete than waking thought; it is completely different from it qualitatively and for that reason not immediately comparable with it. It does not think, calculate or judge in any way at all; it restricts itself to giving things a new form. It is exhaustively described by an enumeration of the conditions which it has to satisfy in producing its result. That product, the dream, has above all to evade the censorship, and with that end in view the dream-work makes use of a displacement of psychical intensities to the point of a transvaluation of all psychical values. The thoughts have to be reproduced exclusively or predominantly in the material of visual and acoustic memory-traces, and this necessity imposes upon the dream-work considerations of representability which it meets by carrying out fresh displacements. Greater intensities have probably to be produced than are available in the dream-thoughts at night, and this purpose is served by the extensive condensation which is carried out with the constituents of the dream-thoughts. Little attention is paid to the logical relations between the thoughts; those relations are ultimately given a disguised representation in certain formal characteristics of dreams. Any affect attached to the dream-thoughts undergoes less modification than their ideational content. Such affects are as a rule suppressed; when they are retained, they are detached from the ideas that properly belong to them, affects of a similar character being brought together. Only a single portion of the dream-work and one which operates to an irregular degree, the working over of the material by partly aroused waking thought, tallies to some extent with the view which other writers have sought to apply to the entire activity of dream-construction.

[1900a, 944]
We must not delude ourselves into exaggerating the importance of these considerations. We have done no more than give a name to an inexplicable phenomenon. We call it 'regression' when in a dream an idea is turned back into the sensory image from which it was originally derived. But even this step requires justification. What is the point of this nomenclature if it teaches us nothing new? I believe the name 'regression' is of help to us in so far as it connects a fact that was already known to us with our schematic picture, in which the mental apparatus was given a sense or direction. And it is at this point that that picture begins to repay us for having constructed it. For an examination of it, without any further reflection, reveals a further characteristic of dream-formation. If we regard the process of dreaming as a regression occurring in our hypothetical mental apparatus, we at once arrive at the explanation of the empirically established fact that all the logical relations belonging to the dream-thoughts disappear during the dream-activity or can only find expression with difficulty. According to our schematic picture, these relations are contained not in the first Mnem. systems but in later ones; and in case of regression they would necessarily lose any means of expression except in perceptual images. In regression the fabric of the dream-thoughts is resolved into its raw material.

[1900a, 976]

The modes of expression open to a dream may therefore be qualified as meagre by comparison with those of our intellectual speech; nevertheless a dream need not wholly abandon the possibility of reproducing the logical relations present in the dream-thoughts. On the contrary, it succeeds often enough in replacing them by formal characteristics in its own texture.

[1901a, 1075]

In the first place, dreams take into account the connection which undeniably exists between all the portions of the dream-thoughts by combining the whole material into a single situation. They reproduce logical connection by approximation in space and time, just as a painter will represent all the poets in a single group in a picture of Parnassus. It is true that they were never in fact assembled on a single mountain-top; but they certainly form a conceptual group. Dreams carry this method of reproduction down to details; and often when they show us two elements in the dream-content close together, this indicates that there is some specially intimate connection between what correspond to them among the dream-thoughts. Incidentally, it is to be observed that all dreams produced during a single night will be found on analysis to be derived from the same circle of thoughts.

[1901a, 1076]

This short series of rough comments is of course inadequate to deal with the full extent of the formal means employed by dreams for the expression of logical relations in the dream-thoughts. Different dreams are more or less carefully constructed in this respect; they keep more or less closely to the text presented to them; they make more or less use of the expedients that are open to the dream-work. In the second case they appear obscure, confused and disconnected. If, however, a dream strikes one as obviously absurd, if its content includes a piece of palpable nonsense, this is intentionally so; its apparent disregard of all the requirements of logic is expressing a piece of the intellectual content of the dream-thoughts. Absurdity in a dream signifies the presence in the dream-thoughts of contradiction, ridicule and derision. Since this statement is in the most marked opposition to the view that dreams are the product of a dissociated and uncritical mental activity, I will emphasize it by means of an example.

[1901a, 1077]
I also ascribe to considerations of representability the fact which is insisted on and perhaps over-estimated by Silberer that some dreams admit of two simultaneous, and yet essentially different interpretations, one of which he calls the 'analytic' and the other the 'anagogic'. When this happens, we are invariably concerned with thoughts of a very abstract nature, which must have made their representation in the dream very difficult. We might compare it with the problem of representing in pictures a leading article from a political newspaper. In such cases, the dream-work must first replace the text that consists of abstract thoughts by one more concrete, connected with the former in some way - by comparison, symbolism, allegorical allusion, or best of all, genetically - so that the more concrete text then takes the place of the abstract one as material for the dream-work. The abstract thoughts yield the so-called anagogic interpretation, which, in our interpretative work, we discover more easily than the true analytic one. Otto Rank has justly remarked that certain dreams about their treatment, dreamt by patients in analysis, are the best models on which to form a view of these dreams which admit of more than one interpretation.

In regard to the first picture the dreamer (a Jew) remarked that his uncle was a pious man who never had done and never could do anything sinful like that. In regard to the woman in the second picture nothing occurred to him except his mother. These two pictures or thoughts must obviously be seen in connection with each other. But how? Since he expressly disputed the reality of his uncle's action, it is plausible to insert an 'if': 'If my uncle, that pious man, were to smoke a cigarette on a Saturday, then I might let myself, too, be cuddled by my mother.' This clearly means that cuddling with his mother was something impermissible, like smoking on a Saturday to a pious Jew. - You will recall that I told you that in the course of the dream-work all the relations between the dream-thoughts drop out; these are resolved into their raw material and it is the task of the interpretation to re-insert the omitted relations.

[1916-1917, 3277]
For representing causal relations dreams have two procedures which are in essence the same. Suppose the dream-thoughts run like this: 'Since this was so and so, such and such was bound to happen.' Then the commoner method of representation would be to introduce the dependent clause as an introductory dream and to add the principal clause as the main dream. If I have interpreted aright, the temporal sequence may be reversed. But the more extensive part of the dream always corresponds to the principal clause.

[1900a, 785]

The division of a dream into two unequal parts does not invariably, so far as I can see, signify that there is a causal relation between the thoughts behind the two parts. It often seems as though the same material were being represented in the two dreams from different points of view. (This is certainly the case where a series of dreams during one night end in an emission or orgasm - a series in which the somatic need finds its way to progressively clearer expression.) Or the two dreams may have sprung from separate centres in the dream-material, and their content may overlap, so that what is the centre in one dream is present as a mere hint in the other, and vice versa. But in a certain number of dreams a division into a shorter preliminary dream and a longer sequel does in fact signify that there is a causal relation between the two pieces.

[1900a, 786]

The other method of representing a causal relation is adapted to less extensive material and consists in one image in the dream, whether of a person or thing, being transformed into another. The existence of a causal relation is only to be taken seriously if the transformation actually occurs before our eyes and not if we merely notice that one thing has appeared in the place of another.

[1900a, 786]

A causal relation between two thoughts is either left unrepresented or is replaced by a sequence of two pieces of dream of different lengths. Here the representation is often reversed, the beginning of the dream standing for the consequence and its conclusion for the premise. An immediate transformation of one thing into another in a dream seems to represent the relation of cause and effect.

[1901a, 1076]
One and one only of these logical relations is very highly favoured by the mechanism of dream-formation; namely, the relation of similarity, consonance or approximation - the relation of 'just as'. This relation, unlike any other, is capable of being represented in dreams in a variety of ways.¹ Parallels or instances of 'just as' inherent in the material of the dream-thoughts constitute the first foundations for the construction of a dream, and no inconsiderable part of the dream-work consists in creating fresh parallels where those which are already present cannot find their way into the dream owing to the censorship imposed by resistance. The representation of the relation of similarity is assisted by the tendency of the dream-work towards condensation.

In identification, only one of the persons who are linked by a common element succeeds in being represented in the manifest content of the dream, while the second or remaining persons seem to be suppressed in it. But this single covering figure appears in the dream in all the relations and situations which apply either to him or to the figures which he covers. In composition, where this is extended to persons, the dream-image contains features which are peculiar to one or other of the persons concerned but not common to them; so that the combination of these features leads to the appearance of a new unity, a composite figure. The actual process of composition can be carried out in various ways. On the one hand, the dream-figure may bear the name of one of the persons related to it - in which case we simply know directly, in a manner analogous to our waking knowledge, that this or that person is intended - while its visual features may belong to the other person. Or, on the other hand, the dream-image itself may be composed of visual features belonging in reality partly to the one person and partly to the other. Or again the second person's share in the dream-image may lie, not in its visual features, but in the gestures that we attribute to it, the words that we make it speak, or the situation in which we place it. In this last case the distinction between identification and the construction of a composite figure begins to lose its sharpness. But it may also happen that the formation of a composite figure of this kind is unsuccessful. If so, the scene in the dream is attributed to one of the persons concerned, while the other (and usually the more important one) appears as an attendant figure without any other function. The dreamer may describe the position in such a phrase as: 'My mother was there as well.' (Stekel.) An element of this kind in the dream-content may be compared to the 'determinatives' used in hieroglyphic script, which are not meant to be pronounced but serve merely to elucidate other signs.

[1900a, 790]
The common element which justifies, or rather causes, the combination of the two persons may be represented in the dream or may be omitted from it. As a rule the identification or construction of a composite person takes place for the very purpose of avoiding the representation of the common element. Instead of saying: 'A has hostile feelings towards me and so has B', I make a composite figure out of A and B in the dream, or I imagine A performing an act of some other kind which is characteristic of B. The dream-figure thus constructed appears in the dream in some quite new connection, and the circumstance that it represents both A and B justifies me in inserting at the appropriate point in the dream the element which is common to both of them, namely a hostile attitude towards me. It is often possible in this way to achieve quite a remarkable amount of condensation in the content of a dream; I can save myself the need for giving a direct representation of very complicated circumstances relating to one person, if I can find another person to whom some of these circumstances apply equally. It is easy to see, too, how well this method of representation by means of identification can serve to evade the censorship due to resistance, which imposes such severe conditions upon the dream-work. What the censorship objects to may lie precisely in certain ideas which, in the material of the dream-thoughts, are attached to a particular person; so I proceed to find a second person, who is also connected with the objectionable material, but only with part of it. The contact between the two persons upon this censorable point now justifies me in constructing a composite figure characterized by indifferent features derived from both. This figure, arrived at by identification or composition, is then admissible to the dream-content without censorship, and thus, by making use of dream-condensation, I have satisfied the claims of the dream-censorship.
[1900a, 791]

When a common element between two persons is represented in a dream, it is usually a hint for us to look for another, concealed common element whose representation has been made impossible by the censorship. A displacement in regard to the common element has been made in order, as it were, to facilitate its representation. The fact that the composite figure appears in the dream with an indifferent common element leads us to conclude that there is another far from indifferent common element present in the dream-thoughts.
[1900a, 792]

Accordingly, identification or the construction of composite figures serves various purposes in dreams: firstly to represent an element common to two persons, secondly to represent a displaced common element, and thirdly, too, to express a merely wishful common element. Since wishing that two persons had a common element frequently coincides with exchanging one for the other, this latter relation is also expressed in dreams by means of identification. In the dream of Irma's injection, I wished to exchange her for another patient: I wished, that is, that the other woman might be my patient just as Irma was. The dream took this wish into account by showing me a person who was called Irma, but who was examined in a position in which I had only had occasion to see the other woman. In the dream about my uncle an exchange of this kind became the central point of the dream: I identified myself with the Minister by treating and judging my colleagues no better than he did.
[1900a, 792]
In the first place, dreams take into account the connection which undeniably exists between all the portions of the dream-thoughts by combining the whole material into a single situation. They reproduce logical connection by approximation in space and time, just as a painter will represent all the poets in a single group in a picture of Parnassus. It is true that they were never in fact assembled on a single mountain-top; but they certainly form a conceptual group. Dreams carry this method of reproduction down to details; and often when they show us two elements in the dream-content close together, this indicates that there is some specially intimate connection between what correspond to them among the dream-thoughts. Incidentally, it is to be observed that all dreams produced during a single night will be found on analysis to be derived from the same circle of thoughts.
[1901a, 1076]

One and one only of these logical relations - that of similarity, consonance, the possession of common attributes - is very highly favoured by the mechanism of dream-formation. The dream-work makes use of such cases as a foundation for dream-condensation, by bringing together everything that shows an agreement of this kind into a new unity.
[1901a, 1077]
The way in which dreams treat the category of contraries and contradictories is highly remarkable. It is simply disregarded. 'No' seems not to exist so far as dreams are concerned. They show a particular preference for combining contraries into a unity or for representing them as one and the same thing. Dreams feel themselves at liberty, moreover, to represent any element by its wishful contrary; so that there is no way of deciding at a first glance whether any element that admits of a contrary is present in the dream-thoughts as a positive or as a negative.¹

I have asserted above that dreams have no means of expressing the relation of a contradiction, a contrary or a 'no'. I shall now proceed to give a first denial of this assertion. One class of cases which can be comprised under the heading of 'contraries' are, as we have seen, simply represented by identification - cases, that is, in which the idea of an exchange or substitution can be brought into connection with the contrast. I have given a number of instances of this. Another class of contraries in the dream-thoughts, falling into a category which may be described as 'contrariwise' or 'just the reverse', find their way into dreams in the following remarkable fashion, which almost deserves to be described as a joke. The 'just the reverse' is not itself represented in the dream-content, but reveals its presence in the material through the fact that some piece of the dream-content, which has already been constructed and happens (for some other reason) to be adjacent to it, is - as it were by an afterthought - turned round the other way. The process is more easily illustrated than described. In the interesting 'Up and Down' dream (p. 759 ff.) the representation of the climbing in the dream was the reverse of what it was in its prototype in the dream-thoughts - that is, in the introductory scene from Daudet's Sappho: in the dream the climbing was difficult at first but easier later, while in the Daudet scene it was easy at first but more and more difficult later. Further, the 'up above' and 'down below' in the dreamer's relation to his brother were represented the other way round in the dream. This pointed to the presence of a reversed or contrary relation between two pieces of the material in the dream-thoughts; and we found it in the dreamer's childhood phantasy of being carried by his wet-nurse, which was the reverse of the situation in the novel, where the hero was carrying his mistress. So too in my dream of Goethe's attack on Herr M. (see below, p. 886 ff.) there is a similar 'just the reverse' which has to be put straight before the dream can be successfully interpreted. In the dream Goethe made an attack on a young man, Herr M.; in the real situation contained in the dream-thoughts a man of importance, my friend, had been attacked by an unknown young writer. In the dream I based a calculation on the date of Goethe's death; in reality the calculation had been made from the year of the paralytic patient's birth. The thought which turned out to be the decisive one in the dream-thoughts was a contradiction of the idea that Goethe should be treated as though he were a lunatic. 'Just the reverse', said the dream, 'if you don't understand the book, it's you that are feeble-minded, and not the author.' I think, moreover, that all these dreams of turning things round the other way include a reference to the contemptuous implications of the idea of 'turning one's back on something.' (E.g. the dreamer's turning round in relation to his brother in the Sappho dream.) It is remarkable to observe, moreover, how frequently reversal is employed precisely in dreams arising from repressed homosexual impulses.

The wish-fulfilment of the dream evidently lay in my being recognized as an honest man and told I could go. There must therefore have been all kinds of material in the dream-thoughts containing a contradiction of this. That I could go was a sign of my absolution. If therefore something happened at the end of the dream which prevented my going, it seems plausible to suppose that the suppressed material containing the contradiction was making itself felt at that point. My not being able to find my hat meant accordingly: 'After all you're not an honest man.' Thus the 'not being able to do something' in this dream was a way of expressing a contradiction - a 'no' - so that my earlier statement that dreams cannot express a 'no' requires correction.¹

[1900a, 788]

[1900a, 796]

[1900a, 806]
A dream is made absurd, then, if a judgement that something 'is absurd' is among the elements included in the dream thoughts - that is to say, if any one of the dreamer's unconscious trains of thought has criticism or ridicule as its motive. Absurdity is accordingly one of the methods by which the dream-work represents a contradiction - alongside such other methods as the reversal in the dream-content of some material relation in the dream-thoughts, or the exploitation of the sensation of motor inhibition. Absurdity in a dream, however, is not to be translated by a simple 'no'; it is intended to reproduce the mood of the dream-thoughts, which combines derision or laughter with the contradiction. It is only with such an aim in view that the dream-work produces anything ridiculous. Here once again it is a giving a manifest form to a portion of the latent content.¹

Ideas which are contraries are by preference expressed in dreams by one and the same element.¹ 'No' seems not to exist so far as dreams are concerned. Opposition between two thoughts, the relation of reversal, may be represented in dreams in a most remarkable way. It may be represented by some other piece of the dream-content being turned into its opposite - as it were by an afterthought. We shall hear presently of a further method of expressing contradiction. The sensation of inhibition of movement which is so common in dreams also serves to express a contradiction between two impulses, a conflict of will.

'The way in which dreams treat the category of contraries and contradictories is highly remarkable. It is simply disregarded. "No" seems not to exist so far as dreams are concerned. They show a particular preference for combining contraries into a unity or for representing them as one and the same thing. Dreams feel themselves at liberty, moreover, to represent any element by its wishful contrary; so that there is no way of deciding at a first glance whether any element that admits of a contrary is present in the dream-thoughts as a positive or as a negative.'¹

The dream-interpreters of antiquity seem to have made the most extensive use of the notion that a thing in a dream can mean its opposite. This possibility has also occasionally been recognized by modern students of dreams, in so far as they concede at all that dreams have a meaning and can be interpreted.² Nor do I think that I shall be contradicted if I assume that all who have followed me in interpreting dreams on scientific lines have found confirmation of the statement quoted above.

I did not succeed in understanding the dream-work's singular tendency to disregard negation and to employ the same means of representation for expressing contraries until I happened by chance to read a work by the philologist Karl Abel, which was published in 1884 as a separate pamphlet and included in the following year in the author's Sprachwissenschaftliche Abhandlungen [Philological Essays]. The subject is of sufficient interest to justify my quoting here the full text of the crucial passages in Abel's paper (omitting, however, most of the examples). We obtain from them the astonishing information that the behaviour of the dream-work which I have just described is identical with a peculiarity in the oldest languages known to us.
However, contradictions of a certain kind - replacements by the precise opposite - offer no serious difficulty to the work of analytic interpretation. We shall not appeal here to the fact that contraries are so often represented by one and the same element in the modes of expression used by the unconscious, as for instance in dreams. But we shall remember that there are motive forces in mental life which bring about replacement by the opposite in the form of what is known as reaction-formation; and it is precisely in the revelation of such hidden forces as these that we look for the reward of this enquiry. The Moerae were created as a result of a discovery that warned man that he too is a part of nature and therefore subject to the immutable law of death. Something in man was bound to struggle against this subjection, for it is only with extreme unwillingness that he gives up his claim to an exceptional position. Man, as we know, makes use of his imaginative activity in order to satisfy the wishes that reality does not satisfy. So his imagination rebelled against the recognition of the truth embodied in the myth of the Moerae, and constructed instead the myth derived from it, in which the Goddess of Death was replaced by the Goddess of Love and by what was equivalent to her in human shape. The third of the sisters was no longer Death; she was the fairest, best, most desirable and most lovable of women. Nor was this substitution in any way technically difficult: it was prepared for by an ancient ambivalence, it was carried out along a primaeval line of connection which could not long have been forgotten. The Goddess of Love herself, who now took the place of the Goddess of Death, had once been identical with her. Even the Greek Aphrodite had not wholly relinquished her connection with the underworld, although she had long surrendered her chthonic role to other divine figures, to Persephone, or to the tri-form Artemis-Hecate. The great Mother-goddesses of the oriental peoples, however, all seem to have been both creators and destroyers - both goddesses of life and fertility and goddesses of death. Thus the replacement by a wishful opposite in our theme harks back to a primaeval identity.

[1913f, 2612]

I shall no doubt be overstepping common linguistic usage in postulating an interest in psycho-analysis on the part of philologists, that is of experts in speech. For in what follows 'speech' must be understood not merely to mean the expression of thought in words but to include the speech of gesture and every other method, such, for instance, as writing, by which mental activity can be expressed. That being so, it may be pointed out that the interpretations made by psycho-analysis are first and foremost translations from an alien method of expression into the one which is familiar to us. When we interpret a dream we are simply translating a particular thought-content (the latent dream-thoughts) from the 'language of dreams' into our waking speech. In the course of doing so we learn the peculiarities of this dream language and it is borne in upon us that it forms part of a highly archaic system of expression. Thus, to take an instance, there is no special indication for the negative in the language of dreams. Contraries may stand for each other in the dream's content and may be represented by the same element. Or we may put it like this: concepts are still ambivalent in dream-language, and unite within themselves contrary meanings - as is the case, according to the hypotheses of philologists, in the oldest roots of historical languages.¹ Another striking feature of our dream-language is its extremely frequent use of symbols, which make us able to some extent to translate the content of dreams without reference to the associations of the individual dreamer. Our researches have not yet sufficiently elucidated the essential nature of these symbols. They are in part substitutes and analogies based upon obvious similarities; but in some of these symbols the tertium comparationis which is presumably present escapes our conscious knowledge. It is precisely this latter class of symbols which must probably originate from the earliest phases of linguistic development and conceptual construction. In dreams it is above all the sexual organs and sexual activities which are represented symbolically instead of directly. A philologist, Hans Sperber, of Uppsala, has only recently (1912) attempted to prove that words which originally represented sexual activities have, on the basis of analogies of this kind, undergone an extraordinarily far-reaching change in their meaning.

[1913j, 2813]
Among the most surprising findings is the way in which the dream-work treats contraries that occur in the latent dream. We know already that conformities in the latent material are replaced by condensations in the manifest dream. Well, contraries are treated in the same way as conformities, and there is a special preference for expressing them by the same manifest element. Thus an element in the manifest dream which is capable of having a contrary may equally well be expressing either itself or its contrary or both together: only the sense can decide which translation is to be chosen. This connects with the further fact that a representation of 'no' - or at any rate an unambiguous one - is not to be found in dreams. [1916-1917, 3269]

The study of the dream-work has taught us many other characteristics of the processes in the unconscious which are as remarkable as they are important; but we must only mention a few of them here. The governing rules of logic carry no weight in the unconscious; it might be called the Realm of the Illogical. Urges with contrary aims exist side by side in the unconscious without any need arising for an adjustment between them. Either they have no influence whatever on each other, or, if they have, no decision is reached, but a compromise comes about which is nonsensical since it embraces mutually incompatible details. With this is connected the fact that contraries are not kept apart but treated as though they were identical, so that in the manifest dream any element may also have the meaning of its opposite. Certain philologists have found that the same held good in the most ancient languages and that contraries such as 'strong-weak', 'light-dark' and 'high-deep' were originally expressed by the same roots, until two different modifications of the primitive word distinguished between the two meanings. Residues of this original double meaning seem to have survived even in a highly developed language like Latin in its use of words such as 'altus' ('high' and 'deep') and 'sacer' ('sacred' and 'infamous'). [1940a [1938], 4979]
\footnote{1 [Footnote added 1911:] I was astonished to learn from a pamphlet by K. Abel, \textit{The Antithetical Meaning of Primal Words} (1884) (cf. my review of it, 1910e) - and the fact has been confirmed by other philologists - that the most ancient languages behave exactly like dreams in this respect. In the first instance they have only a single word to describe the two contraries at the extreme ends of a series of qualities or activities (e.g. 'strong-weak', 'old-young', 'far-near', 'bind-sever'); they only form distinct terms for the two contraries by a secondary process of making small modifications in the common word. Abel demonstrates this particularly from Ancient Egyptian; but he shows that there are distinct traces of the same course of development in the Semitic and Indo-Germanic languages as well.\hspace{1cm}[1900a, 788]

There is yet another alternative way in which the dream-work can deal with affects in the dream-thoughts, in addition to allowing them through or reducing them to nothing. It can \textit{turn them into their opposite}. We have already become acquainted with the interpretative rule according to which every element in a dream can, for purposes of interpretation, stand for its opposite just as easily as for itself. We can never tell beforehand whether it stands for the one or for the other; only the context can decide. A suspicion of this truth has evidently found its way into popular consciousness: 'dream books' very often adopt the principle of contraries in their interpretation of dreams. This turning of a thing into its opposite is made possible by the intimate associative chain which links the idea of a thing with its opposite in our thoughts. Like my other kind of displacement it can serve the ends of the censorship; but it is also frequently a product of wish-fulfilment, for wish-fulfilment consists in nothing else than a replacement of a disagreeable thing by its opposite. Just as ideas of things can make their appearance in dreams turned into their opposite, so too can the affects attaching to dream-thoughts; and it seems likely that this reversal of affect is brought about as a rule by the dream-censorship. In social life, which has provided us with our familiar analogy with the dream-censorship, we also make use of the suppression and reversal of affect, principally for purposes of dissimulation. If I am talking to someone whom I am obliged to treat with consideration while wishing to say something hostile to him, it is almost more important that I should conceal any expression of my affect from him than that I should mitigate the verbal form of my thoughts. If I were to address him in words that were not impolite, but accompanied them with a look or gesture of hatred and contempt, the effect which I should produce on him would not be very different from what it would have been if I had thrown my contempt openly in his face. Accordingly, the censorship bids me above all suppress my affects; and, if I am a master of dissimulation, I shall assume the opposite affect - smile when I am angry and seem affectionate when I wish to destroy.\hspace{1cm}[1900a, 914]

\footnote{1 [Footnote added 1911:] It deserves to be remarked that well-known philologists have asserted that the most ancient human languages tended in general to express contradictory opposites by the same word. (E.g. 'strong-weak', 'inside-outside.' This has been described as 'the antithetical meaning of primal words'.)}\hspace{1cm}[1901a, 1076]
In a short essay designed for a wider circle of readers, Meringer (1900) has claimed that a special practical significance attaches to particular cases in which one word is put for another — viz. to those cases in which a word is replaced by another that has the opposite meaning. "You probably still recall", he writes, "the way in which the President of the Lower House of the Austrian Parliament opened the sitting a short while ago: "Gentlemen: I take notice that a full quorum of members is present and herewith declare the sitting closed!" His attention was only drawn by the general merriment and he corrected his mistake. In this particular case the explanation no doubt was that the President secretly wished he was already in a position to close the sitting, from which little good was to be expected. But this accompanying idea, as frequently happens, broke through, at least partially, and the result was "closed" instead of "open" — the opposite, that is, of what was intended to be expressed. Now extensive observations have taught me that words with opposite meanings are, quite generally, very often interchanged; they are already associated in our linguistic consciousness, they lie very close to each other and it is easy for the wrong one to be evoked.¹

¹ The highly remarkable and still insufficiently appreciated behaviour of the relation between contraries in the unconscious is no doubt likely to help our understanding of 'negativism' in neurotic and insane patients. (Cf. the two last works on the subject: Bleuler, 1904 and Gross, 1904. [Added 1912:] See also my review of 'The Antithetical Meaning of Primal Words' (1910e).)

I did not succeed in understanding the dream-work's singular tendency to disregard negation and to employ the same means of representation for expressing contraries until I happened by chance to read a work by the philologist Karl Abel, which was published in 1884 as a separate pamphlet and included in the following year in the author's Sprachwissenschaftliche Abhandlungen [Philological Essays]. The subject is of sufficient interest to justify my quoting here the full text of the crucial passages in Abel's paper (omitting, however, most of the examples). We obtain from them the astonishing information that the behaviour of the dream-work which I have just described is identical with a peculiarity in the oldest languages known to us.

After stressing the antiquity of the Egyptian language which must have been developed a very long time before the first hieroglyphic inscriptions, Abel goes on (1884, 4):

Before any explanation is attempted, mention must also be made of a further stage in this unintelligible behaviour of the Egyptian language. 'Of all the eccentricities of the Egyptian vocabulary perhaps the most extraordinary feature is that, quite apart from the words that combine antithetical meanings, it possesses other compound words in which two vocables of antithetical meanings are united so as to form a compound which bears the meaning of only one of its two constituents. Thus in this extraordinary language there are not only words meaning equally "strong" or "weak", and "command" or "obey"; but there are also compounds like "old-young", "far-near", "bind-sever", "outside-inside" . . . which, in spite of combining the extremes of difference, mean only "young", "near", "bind" and "inside" respectively . . . So that in these compound words contradictory concepts have been quite intentionally combined, not in order to produce a third concept, as occasionally happens in Chinese, but only in order to use the compound to express the meaning of one of its contradictory parts - a part which would have had the same meaning by itself . . .'.

Since language serves not only to express one's own thoughts but essentially to communicate them to others the question may be raised how it was that the 'primal Egyptian' made his neighbour understand 'which side of the twin concept he meant on any particular occasion'. In the written language this was done with the help of the so-called 'determinative' signs which, placed after the alphabetical ones, assign their meaning to them and are not themselves intended to be spoken. (Ibid., 18): 'If the Egyptian word "ken" is to mean "strong", its sound, which is written alphabetically, is followed by the picture of an upright armed man; if the same word has to express "weak", the letters which represent the sound are followed by the picture of a squatting, limp figure. The majority of other words with two meanings are similarly accompanied by explanatory pictures.' Abel thinks that in speech the desired meaning of the spoken word was indicated by gesture.

Proof of the existence of contradictory primal meanings, which is easily established in Egyptian, extends, according to Abel, to the Semitic and Indo-European languages as well. 'How far this may happen in other language-groups remains to be seen; for although antithesis must have been present originally to the thinking minds of every race, it need not necessarily have become recognizable or have been retained everywhere in the meanings of words.'

In his essay on 'The Origin of Language' Abel (1885, 305) calls attention to further traces of ancient difficulties in thinking. Even to-day the Englishman in order to express 'ohne' says 'without' ('mitohne' ['with-without'] in German), and the East Prussian does the same. The word 'with' itself, which to-day corresponds to the German 'mit', originally meant 'without' as well as 'with', as can be recognized from 'withdraw and 'withhold'. The same transformation can be seen in the German 'wider' ('against') and 'wieder' ('together with').

In the correspondence between the peculiarity of the dream-work mentioned at the beginning of the paper and the practice discovered by philology in the oldest languages, we may see a confirmation of the view we have formed about the regressive, archaic character of the expression of thoughts in dreams. And we psychiatrists cannot escape the suspicion that we should be better at understanding and translating the language of dreams if we knew more about the development of language.²

² It is plausible to suppose, too, that the original antithetical meaning of words exhibits the ready-made mechanism which is exploited for various purposes by slips of the tongue that result in the opposite being said..

Our discussions, on the contrary, lead us to the simple conclusion that the word 'taboo' had a double meaning from the very first and that it was used to designate a particular kind of ambivalence and whatever arose from it. 'Taboo' is itself an ambivalent word; and one feels on looking back that the well-attested meaning of the word should alone have made it possible to infer - what has actually been arrived at as a result of extensive researches - that the prohibitions of taboo are to be understood as consequences of an emotional ambivalence. Study of the earliest languages has taught us that there were once many such words, which expressed contrary ideas and in a sense (though not in quite the same sense as the word 'taboo') were ambivalent.¹ Slight modifications in the pronunciation of the antithetical 'primal word' made it possible subsequently to give separate verbal expression to the two contrary ideas which were originally combined in it.

[1910e, 2321]

[1910e, 2322]

[1910e, 2323]

[1912-1913, 2711]
A welcome analogy to this strange behaviour of the dream-work is provided for us in the development of language. Some philologists have maintained that in the most ancient languages contraries such as 'strong-weak', 'light-dark', 'big-small' are expressed by the same verbal roots. (What we term 'the antithetical meaning of primal words.') Thus in Ancient Egyptian 'ken' originally meant 'strong' and 'weak'. In speaking, misunderstanding from the use of such ambivalent words was avoided by differences of intonation and by the accompanying gesture, and in writing, by the addition of what is termed a 'determinative' - a picture which is not itself intended to be spoken. For instance, 'ken' meaning 'strong' was written with a picture of a little upright man after the alphabetic signs; when 'ken' stood for 'weak', what followed was the picture of a man squatting down limply. It was only later, by means of slight modifications of the original homologous word, that two distinct representations were arrived at of the contraries included in it. Thus from 'ken' 'strong-weak' were derived 'kenr' 'strong' and 'kan' 'weak'. The remains of this ancient antithetical meaning seem to have been preserved not only in the latest developments of the oldest languages but also in far younger ones and even in some that are still living. Here is some evidence of this, derived from K. Abel (1884).

Let us recall that we have said that the dream-work makes a translation of the dream-thoughts into a primitive mode of expression similar to picture-writing. All such primitive systems of expression, however, are characterized by indefiniteness and ambiguity of this sort, without justifying us in casting doubts on their serviceability. The coalescence of contraries in the dream-work is, as you know, analogous to the so-called 'antithetical meaning of primal words' in the most ancient languages. Indeed, Abel (1884), the philologist to whom we owe this line of thought, implores us not to suppose that communications made by one person to another with the help of such ambivalent words were on that account ambiguous. On the contrary, intonation and gesture must have made it quite certain in the context of the speech which of the two contraries the speaker intended to convey. In writing, where gesture is absent, its place was taken by an additional pictograph which was not intended to be spoken - for instance by a picture of a little man, limply squatting or stiffly erect, according to whether the ambiguous hieroglyph 'ken' was to mean 'weak' or 'strong'. In this way, in spite of the ambiguity of the sounds and signs, misunderstanding was avoided.

If the psychological discoveries gained from the study of dreams were firmly kept in view, only one further step was needed before psycho-analysis could be proclaimed as the theory of the deeper mental processes not directly accessible to consciousness - as a 'depth-psychology' - and before it could be applied to almost all the mental sciences. This step lay in the transition from the mental activity of individual men to the psychical functions of human communities and peoples - that is, from individual to group psychology; and many surprising analogies forced this transition upon us. It had been found, for instance, that in the deep strata of unconscious mental activity contraries are not distinguished from each other but are expressed by the same element. But already in 1884 Karl Abel the philologist had put forward the view (in his 'Über den Gegensinn der Urworte') that the oldest languages known to us treat contraries in the same way. Thus Ancient Egyptian, for example, had in the first instance only one word for 'strong' and 'weak', and not till later were the two sides of the antithesis distinguished by slight modifications. Even in the most modern languages clear relics of such antithetical meanings are to be found. So in German 'Boden' means the highest as well as the lowest thing in the house; similarly in Latin 'altus' means 'high' and 'deep'. Thus the equivalence of contraries in dreams is a universal archaic trait in human thinking.
The study of the dream-work has taught us many other characteristics of the processes in the unconscious which are as remarkable as they are important; but we must only mention a few of them here. The governing rules of logic carry no weight in the unconscious; it might be called the Realm of the Illogical. Urges with contrary aims exist side by side in the unconscious without any need arising for an adjustment between them. Either they have no influence whatever on each other, or, if they have, no decision is reached, but a compromise comes about which is nonsensical since it embraces mutually incompatible details. With this is connected the fact that contraries are not kept apart but treated as though they were identical, so that in the manifest dream any element may also have the meaning of its opposite. Certain philologists have found that the same held good in the most ancient languages and that contraries such as 'strong-weak', 'light-dark' and 'high-deep' were originally expressed by the same roots, until two different modifications of the primitive word distinguished between the two meanings. Residues of this original double meaning seem to have survived even in a highly developed language like Latin in its use of words such as 'altus' ('high' and 'deep') and 'sacer' ('sacred' and 'infamous'). [1940a [1938], 4979]
This second species of displacement which occurs in dream-formation is not only of great theoretical interest but is also specially well calculated to explain the appearance of fantastic absurdity in which dreams are disguised. The direction taken by the displacement usually results in a colourless and abstract expression in the dream-thought being exchanged for a pictorial and concrete one. The advantage, and accordingly the purpose, of such a change jumps to the eyes. A thing that is pictorial is, from the point of view of a dream, a thing that is capable of being represented: it can be introduced into a situation in which abstract expressions offer the same kind of difficulties to representation in dreams as a political leading article in a newspaper would offer to an illustrator. But not only representability, but the interests of condensation and the censorship as well can be the gainers from this exchange. A dream-thought is unusable so long as it is expressed in an abstract form; but when once it has been transformed into pictorial language, contrasts and identifications of the kind which the dream-work requires, and which it creates if they are not already present, can be established more easily than before between the new form of expression and the remainder of the material underlying the dream. This is so because in every language concrete terms, in consequence of the history of their development, are richer in associations than conceptual ones. We may suppose that a good part of the intermediate work done during the formation of a dream, which seeks to reduce the dispersed dream-thoughts to the most succinct and unified expression possible, proceeds along the line of finding appropriate verbal transformations for the individual thoughts. Any one thought, whose form of expression may happen to be fixed for other reasons, will operate in a determinant and selective manner on the possible forms of expression allotted to the other thoughts, and it may do so, perhaps, from the very start - as is the case in writing a poem. If a poem is to be written in rhymes, the second line of a couplet is limited by two conditions: it must express an appropriate meaning, and the expression of that meaning must rhyme with the first line. No doubt the best poem will be one in which we fail to notice the intention of finding a rhyme, and in which the two thoughts have, by mutual influence, chosen from the very start a verbal expression which will allow a rhyme to emerge with only slight subsequent adjustment.
In a few instances a change of expression of this kind assists dream-condensation even more directly, by finding a form of words which owing to its ambiguity is able to give expression to more than one of the dream-thoughts. In this way the whole domain of verbal wit is put at the disposal of the dream-work. There is no need to be astonished at the part played by words in dream-formation. Words, since they are the nodal point of numerous ideas, may be regarded as predestined to ambiguity; and the neuroses (e.g. in framing obsessions and phobias), no less than dreams, make unashamed use of the advantages thus offered by words for purposes of condensation and disguise.¹ It is easy to show that dream-distortion too profits from displacement of expression. If one ambiguous word is used instead of two unambiguous ones the result is misleading; and if our everyday, sober method of expression is replaced by a pictorial one, our understanding is brought to a halt, particularly since a dream never tells us whether its elements are to be interpreted literally or in a figurative sense or whether they are to be connected with the material of the dream-thoughts directly or through the intermediary of some interpolated phraseology. In interpreting any dream-element it is in general doubtful

I have already given several examples of representations in dreams which are only held together by the ambiguity of their wording. (For instance, 'She opened her mouth properly' in the dream of Irma's injection and 'I could not go after all' in the dream which I last quoted.) I will now record a dream in which a considerable part was played by the turning of abstract thought into pictures. The distinction between dream-interpretation of this kind and interpretation by means of symbolism can still be drawn quite sharply. In the case of symbolic dream-interpretation the key to the symbolization is arbitrarily chosen by the interpreter; whereas in our cases of verbal disguise the keys are generally known and laid down by firmly established linguistic usage. If one has the right idea at one's disposal at the right moment, one can solve dreams of this kind wholly or in part even independently of information from the dreamer.

We shall not be surprised to find that, for the purpose of representation in dreams, the spelling of words is far less important than their sound, especially when we bear in mind that the same rule holds good in rhyming verse. Rank (1910, 482) has recorded in detail, and analysed very fully, a girl's dream in which the dreamer described how she was walking through the fields and cutting off rich ears ['Ähren'] of barley and wheat. A friend of her youth came towards her, but she tried to avoid meeting him. The analysis showed that the dream was concerned with a kiss - an 'honourable kiss' ['Kuss in Ehren' pronounced the same as 'Ähren']. In the dream itself the 'Ähren', which had to be cut off, not pulled off, figured as ears of corn, while, condensed with 'Ehren', they stood for a whole number of other thoughts.

On the other hand, in other cases, the course of linguistic evolution has made things very easy for dreams. For language has a whole number of words at its command which originally had a pictorial and concrete significance, but are used to-day in a colourless and abstract sense. All that the dream need do is to give these words their former, full meaning or to go back a little way to an earlier phase in their development. A man had a dream, for instance, of his brother being in a Kasten ['box']. In the course of interpretation the Kasten was replaced by a Schrank ['cupboard' - also used abstractly for 'barrier', 'restriction']. The dream-thought had been to the effect that his brother ought to restrict himself ['sich einschränken'] - instead of the dreamer doing so.

According to Henzen dreams involving puns and turns of speech occur particularly often in the old Norse sagas, in which scarcely a dream is to be found which does not contain an ambiguity or a play upon words.
I may here add a few supplementary interpretations to those that have already been given: The 'Madonna' was obviously Dora herself; in the first place because of the 'adorer' who had sent her the pictures, in the second place because she had won Herr K.'s love chiefly by the motherliness she had shown towards his children, and lastly because she had had a child though she was still a girl (this being a direct allusion to the phantasy of childbirth). Moreover, the notion of the 'Madonna' is a favourite counter-idea in the mind of girls who feel themselves oppressed by imputations of sexual guilt, - which was the case with Dora. A first suspicion of this connection came to me while I was working as a physician at the Psychiatric Clinic of the University. I there came across a case of confusional insanity with hallucinations, in which the attack, which ran a rapid course, turned out to be a reaction to a reproach made against the patient by her fiancé. - If the analysis had been continued, Dora's maternal longing for a child would probably have been revealed as an obscure though powerful motive in her behaviour. The numerous questions which she had been raising latterly seem to have been belated derivatives of questions inspired by the sexual curiosity which she had tried to gratify with the encyclopaedia. The subjects which she read up in it were presumably pregnancy, childbirth, virginity, and so on. - In reproducing the dream Dora had forgotten one of the questions which need to be inserted into the course of the second situation in the dream. This question could only be: 'Does Herr -- live here?' or 'Where does Herr -- live?' There must have been some reason for her having forgotten this apparently innocent question, especially as she need not have brought it into the dream at all. This reason, it seems to me, lay in her surname itself, which also denoted an object and in fact more than one kind of object, and which could therefore be regarded as an 'ambiguous' word. Unluckily I cannot give the name and show how well designed it was to indicate something 'ambiguous' and 'improper'. This interpretation was supported by the discovery of a similar play upon words in another part of the dream, where the material was derived from Dora's recollections of her aunt's death ('they have already gone to the cemetery') and where there was similarly a play upon her aunt's name. These improper words seemed to point to a second and oral source of information, since the encyclopaedia would not cover them. I should not have been surprised to hear that this source had been Frau K. herself, Dora's calumniator. In that case she would have been the one person whom Dora generously spared, while she pursued the others with an almost malignant vindictiveness. Behind the almost limitless series of displacements which were thus brought to light, it was possible to divine the operation of a single simple factor - Dora's deep-rooted homosexual love for Frau K.

¹ The word 'take [nehmen]' is very well adapted to form a basis for play upon words owing to the variety of ways in which it can be used. I will give a plain example, as a contrast to the displacement jokes reported above: 'A well-known stock-exchange speculator and bank-director was walking with a friend along the Ringstrasse. As they went past a cafe he remarked: "Let's go inside and take something!" His friend held him back: "But, Herr Hofrat, the place is full of people!"'

Here then we seem to have finished off the interpretation of this second dream as well. Both of them have been made intelligible to us on the presupposition that a dreamer knows in his unconscious thoughts all that he has forgotten in his conscious ones, and that in the former he judges correctly what in the latter he misunderstands in a delusion. In the course of our arguments we have no doubt been obliged to make some assertions which have seemed strange to the reader because of their unfamiliarity; and we have probably often roused a suspicion that what we pretended was the author's meaning was in fact only our own. I am anxious to do all I can to dissipate this suspicion, and for that reason I will gladly enter into more detail over one of the most delicate points - I mean the use of ambiguous words and phrases, such as: 'Somewhere in the Sun Gradiva was sitting.'

Anyone who reads *Gradiva* must be struck by the frequency with which the author puts ambiguous remarks into the mouths of his two principal characters. In Hanold's case these remarks are intended by him unambiguously and it is only the heroine, Gradiva, who is struck by their second meaning. Thus, for instance, when in reply to her first answer he exclaimed 'I knew your voice sounded like that', Zoe, who was still in ignorance, could not but ask how that could be, since he had not heard her speak before. In their second conversation the girl was for a moment thrown into doubt about his delusion, when he told her that he had recognized her at once. She could not help taking these words in the sense (correct so far as his unconscious was concerned) of being a recognition that their acquaintance went back to their childhood; whereas he, of course, knew nothing of this implication of his remark and explained it only by reference to his dominant delusion. On the other hand, the remarks made by the girl, whose personality shows the most lucid clarity of mind in contrast to Hanold's delusion, exhibit an *intentional* ambiguity. One of their meanings chimes in with Hanold's delusion, so as to be able to penetrate into his conscious understanding, but the other rises above the delusion and gives us as a rule its translation into the unconscious truth for which it stands. It is a triumph of ingenuity and wit to be able to express the delusion and the truth in the same turn of words.

In the course of the psychotherapeutic treatment of a delusion or of an analogous disorder, ambiguous speeches of this kind are often produced by the patient, as new symptoms of the briefest duration; and it can happen that the doctor finds himself too in the position of making use of them. In that way it not infrequently happens that with the meaning that is intended for the patient's conscious he stirs up an understanding of the meaning that applies to his unconscious. I know from experience that the part thus played by ambiguity is apt to raise the greatest objection in the uninitiated and to give rise to the greatest misunderstandings. But in any case our author was right in giving a place in his creation to a picture of this characteristic feature of what takes place in the formation of dreams and delusions.

¹ The dream-work, too, occasionally treats words like things, and so creates very similar 'schizophrenic' utterances or neologisms.
Readers of Hebrew and especially young people eager for knowledge are presented in this volume with psycho-analysis clothed in the ancient language which has been awakened to a new life by the will of the Jewish people. The author can well picture the problem which this has set its translator. Nor need he suppress his doubt whether Moses and the Prophets would have found these Hebrew lectures intelligible. But he begs their descendants (among whom he himself is numbered), for whom this book is designed, not to react too quickly to their first impulses of criticism and dislike by rejecting it. Psycho-analysis brings forward so much that is new, and among it so much that contradicts traditional opinions and wounds deeply rooted feelings, that it is bound at first to provoke denial. A reader who suspends his judgement and allows psycho-analysis as a whole to make its impression on him will perhaps become open to a conviction that even this undesired novelty is worth knowing and is indispensable for anyone who wishes to understand the mind and human life.
[1916-1917, 3127]
But before taking leave of infantile dreams with their undisguised wish-fulfilments, I must not omit to mention one principal feature of dreams, which has long been evident and which emerges particularly clearly precisely in this group. Every one of these dreams can be replaced by an optative clause: 'Oh, if only the trip on the lake had lasted longer!' - 'If only I were already washed and dressed!' - 'If only I could have kept the cherries instead of giving them to Uncle!' But dreams give us more than such optative clauses. They show us the wish as already fulfilled; they represent its fulfilment as real and present; and the material employed in dream-representation consists principally, though not exclusively, of situations and of sensory images, mostly of a visual character. Thus, even in this infantile group, a species of transformation, which deserves to be described as dream-work, is not completely absent: a thought expressed in the optative has been replaced by a representation in the present tense.

[1901a, 1065]

We shall be inclined to suppose that a transformation of some such kind has occurred even in confused dreams, though we cannot tell whether what has been transformed was an optative in their case too. There are, however, two passages in the specimen dream which I have reported, and with whose analysis we have made some headway, that give us reason to suspect something of the kind. The analysis showed that my wife had concerned herself with some other people at table, and that I had found this disagreeable; the dream contained precisely the opposite of this - the person who took the place of my wife was turning her whole attention to me. But a disagreeable experience can give rise to no more suitable wish than that its opposite might have occurred - which was what the dream represented as fulfilled. There was an exactly similar relation between the bitter thought revealed in the analysis that I had never had anything free of cost and the remark made by the woman in the dream - 'You've always had such beautiful eyes.' Some part of the opposition between the manifest and latent content of dreams is thus attributable to wish-fulfilment.

[1901a, 1066]
The dream-work, then - to which I return after this digression - submits the thought-material, which is brought forward in the optative mood, to a most strange revision. First, it takes the step from the optative to the present indicative; it replaces 'Oh! if only . . .' by 'It is'. The 'It is' is then given a hallucinatory representation; and this I have called the 'regression' in the dream-work - the path that leads from thoughts to perceptual images, or, to use the terminology of the still unknown topography of the mental apparatus (which is not to be taken anatomically), from the region of thought-structures to that of sensory perceptions. On this path, which is in the reverse direction to that taken by the course of development of mental complications, the dream-thoughts are given a pictorial character; and eventually a plastic situation is arrived at which is the core of the manifest 'dream-picture'. In order for it to be possible for the dream-thoughts to be represented in sensory form, their expression has to undergo far-reaching modifications. But while the thoughts are being changed back into sensory images still further alterations occur in them, some of which can be seen to be necessary while others are surprising. We can understand that, as a subsidiary result of regression, almost all the internal relations between the thoughts which linked them together will be lost in the manifest dream. The dream-work, as we might say, only undertakes to represent the raw material of the ideas and not the logical relations in which they stand to one another; or at all events it reserves the liberty to disregard the latter. On the other hand, there is another part of the dream-work which we cannot attribute to regression, to the change back into sensory images; and it is precisely this part which has an important bearing on our analogy with the formation of jokes. In the course of the dream-work the material of the dream-thoughts is subjected to a quite extraordinary compression or condensation. A starting point for it is provided by any common elements that may be present in the dream-thoughts, whether by chance or from the nature of their content. Since these are not as a rule sufficient for any considerable condensation, new artificial and transient common elements are created in the dream-work, and to this end there is actually a preference for the use of words the sound of which expresses different meanings. The newly-created common elements of condensation enter the manifest content of the dream as representatives of the dream-thoughts, so that an element in the dream corresponds to a nodal point or junction in the dream-thoughts, and, as compared with these latter, must quite generally be described as 'overdetermined'. The fact of condensation is the piece of the dream-work which can be most easily recognized; it is only necessary to compare the text of a dream as it is noted down with the record of the dream-thoughts arrived at by analysis in order to get a good impression of the extensiveness of dream-condensation.

[1905c, 1748]
The incapacity of dreams to express these things must lie in the nature of the psychical material out of which dreams are made. The plastic arts of painting and sculpture labour, indeed, under a similar limitation as compared with poetry, which can make use of speech; and here once again the reason for their incapacity lies in the nature of the material which these two forms of art manipulate in their effort to express something. Before painting became acquainted with the laws of expression by which it is governed, it made attempts to get over this handicap. In ancient paintings small labels were hung from the mouths of the persons represented, containing in written characters the speeches which the artist despaired of representing pictorially.

[1900a, 782]

In the first place, dreams take into account the connection which undeniably exists between all the portions of the dream-thoughts by combining the whole material into a single situation. They reproduce logical connection by approximation in space and time, just as a painter will represent all the poets in a single group in a picture of Parnassus. It is true that they were never in fact assembled on a single mountain-top; but they certainly form a conceptual group. Dreams carry this method of reproduction down to details; and often when they show us two elements in the dream-content close together, this indicates that there is some specially intimate connection between what correspond to them among the dream-thoughts. Incidentally, it is to be observed that all dreams produced during a single night will be found on analysis to be derived from the same circle of thoughts.

[1901a, 1076]
There is a fair amount of agreement, however, over the interpretation of various forms of dreams that are described as 'typical', because they occur in large numbers of people and with very similar content. Such are the familiar dreams of falling from a height, of teeth falling out, of flying and of embarrassment at being naked or insufficiently clad. This last dream is attributed simply to the sleeper's perceiving that he has thrown off his bedclothes in his sleep and is lying exposed to the air. The dream of teeth falling out is traced back to a 'dental stimulus', though this does not necessarily imply that the excitation of the teeth is a pathological one. According to Strümpell the flying dream is the image which is found appropriate by the mind as an interpretation of the stimulus produced by the rising and sinking of the lobes of the lungs at times when cutaneous sensations in the thorax have ceased to be conscious: it is this latter circumstance that leads to the feeling which is attached to the idea of floating. The dream of falling from a height is said to be due to an arm falling away from the body or a flexed knee being suddenly extended at a time when the sense of cutaneous pressure is beginning to be no longer conscious; the movements in question cause the tactile sensations to become conscious once more, and the transition to consciousness is represented psychically by the dream of falling (ibid., 118). The obvious weakness of these attempted explanations, plausible though they are, lies in the fact that, without any other evidence, they can make successive hypotheses that this or that group of organic sensations enters or disappears from mental perception, till a constellation has been reached which affords an explanation of the dream. I shall later have occasion to return to the question of typical dreams and their origin.

We are not in general in a position to interpret another person's dream unless he is prepared to communicate to us the unconscious thoughts that lie behind its content. The practical applicability of our method of interpreting dreams is in consequence severely restricted.¹ We have seen that, as a general rule, each person is at liberty to construct his dream-world according to his individual peculiarities and so to make it unintelligible to other people. It now appears, however, that, in complete contrast to this, there are a certain number of dreams which almost everyone has dreamt alike and which we are accustomed to assume must have the same meaning for everyone. A special interest attaches, moreover, to these typical dreams because they presumably arise from the same sources in every case and thus seem particularly well qualified to throw light on the sources of dreams.

It is therefore with quite particular anticipations that we shall attempt to apply our technique of dream-interpretation to these typical dreams; and it is with great reluctance that we shall have to confess that our art disappoints our expectations precisely in relation to this material. If we attempt to interpret a typical dream, the dreamer fails as a rule to produce the associations which would in other cases have led us to understand it, or else his associations become obscure and insufficient so that we cannot solve our problem with their help. We shall learn in a later portion of this work why this is so and how we can make up for this defect in our technique. My readers will also discover why it is that at the present point I am able to deal only with a few members of the group of typical dreams and must postpone my consideration of the rest until this later point in my discussion.
I cannot, however, disguise from myself that I am unable to produce any complete explanation of this class of typical dreams. My material has left me in the lurch precisely at this point. I must, however, insist upon the general assertion that all the tactile and motor sensations which occur in these typical dreams are called up immediately there is any psychical reason for making use of them and that they can be disregarded when no such need for them arises. I am also of the opinion that the relation of these dreams to infantile experiences has been established with certainty from the indications I have found in the analyses of psychoneurotics. I am not able to say, however, what other meanings may become attached to the recollection of such sensations in the course of later life - different meanings, perhaps, in every individual case, in spite of the typical appearance of the dreams; and I should be glad to be able to fill up the gap by a careful analysis of clear instances. If anyone feels surprised that, in spite of the frequency precisely of dreams of flying, falling and pulling out teeth, etc., I should be complaining of lack of material on this particular topic, I must explain that I myself have not experienced any dreams of the kind since I turned my attention to the subject of dream-interpretation. The dreams of neurotics, moreover, of which I might otherwise avail myself, cannot always be interpreted not, at least, in many cases, so as to reveal the whole of their concealed meaning; a particular psychical force, which was concerned with the original constructing of the neurosis and is brought into operation once again when attempts are made at resolving it, prevents us from interpreting such dreams down to their last secret.

[1900a, 748]

It is only now, after we have properly assessed the importance of symbolism in dreams, that it becomes possible for us to take up the theme of typical dreams, which was broken off on p. 541 above. I think we are justified in dividing such dreams roughly into two classes: those which really always have the same meaning, and those which, in spite of having the same or a similar content, must nevertheless be interpreted in the greatest variety of ways. Among typical dreams of the first class I have already dealt in some detail with examination dreams.

[1900a, 842]

It would be possible to mention a whole number of other 'typical' dreams if we take the term to mean that the same manifest dream-content is frequently to be found in the dreams of different dreamers. For instance we might mention dreams of passing though narrow streets or of walking through whole suites of rooms, and dreams of burglars - against whom, incidentally, nervous people take precautions before they go to sleep; dreams of being pursued by wild animals (or by bulls or horses) or of being threatened with knives, daggers or lances - these last two classes being characteristic of the manifest content of the dreams of people who suffer from anxiety - and many more. An investigation specially devoted to this material would thoroughly repay the labour involved. But instead of this I have two observations to make, though these do not apply exclusively to typical dreams.

[1900a, 852]

Dream-symbolism is also indispensable to an understanding of what are known as 'typical' dreams, which are common to everyone, and of 'recurrent' dreams in individuals.

[1901a, 1097]
A quite similar difficulty faces us in the theory of dreams. I could not deal with it in our earlier discussions on dreams. The manifest content of dreams is of the greatest diversity and individual variety, and we have shown in detail what one derives from this content by means of analysis. But alongside of these there are dreams which equally deserve to be called 'typical', which happen in everyone in the same way, dreams with a uniform content, which offer the same difficulties to interpretation. They are dreams of falling, flying, floating, swimming, of being inhibited, of being naked and certain other anxiety dreams - which lead, in different people, now to this and now to that interpretation, without any light being thrown on their monotony and typical occurrence. But in these dreams too we observe that this common background is enlivened by additions that vary individually; and it is probable that, with a widening of our knowledge, it will be possible, without constraint, to include these dreams too in the understanding of dream-life which we have acquired from other dreams.

[1916-1917, 3350]
Numerous examples of dreams of this infantile type can be found occurring in adults as well, though, as I have said, they are usually brief in content. Thus a number of people regularly respond to a stimulus of thirst during the night with dreams of drinking, which thus endeavour to get rid of the stimulus and enable sleep to continue. In some people ‘dreams of convenience’ of this kind often occur before waking, when the necessity for getting up presents itself. They dream that they are already up and at the washing-stand, or that they are already at the school or office where they are due at some particular time. During the night before a journey we not infrequently dream of having arrived at our destination; so too, before a visit to the theatre or a party, a dream will often anticipate the pleasure that lies ahead - out of impatience, as it were. In other dreams the wish-fulfilment is expressed a stage more indirectly: some connection or implication must be established - that is, the work of interpretation must be begun - before the wish-fulfilment can be recognized. A man told me, for instance, that his young wife had had a dream that her period had started. I reflected that if this young woman had missed her period she must have known that she was faced with a pregnancy. Thus when she reported her dream she was announcing her pregnancy, and the meaning of the dream was to represent as fulfilled her wish that the pregnancy might be postponed for a while. Under unusual or extreme conditions dreams of this infantile character are particularly common. Thus the leader of a polar expedition has recorded that the members of his expedition, while they were wintering in the ice-field and living on a monotonous diet and short rations, regularly dreamt like children of large meals, of mountains of tobacco, and of being back at home.

It would indeed be a simple and satisfactory solution of the riddle of dreams if the work of analysis were to enable us to trace even the meaningless and confused dreams of adults back to the infantile type of fulfilment of an intensely felt wish of the previous day. There can be no doubt, however, that appearances do not speak in favour of such an expectation. Dreams are usually full of the most indifferent and strangest material, and there is no sign in their content of the fulfilment of any wish.

Now that we have established the concept of repression and have brought dream-distortion into relation with repressed psychical material, we can express in general terms the principal finding to which we have been led by the analysis of dreams. In the case of dreams which are intelligible and have a meaning, we have found that they are undisguised wish-fulfilments; that is, that in their case the dream-situation represents as fulfilled a wish which is known to consciousness, which is left over from daytime life, and which is deservedly of interest. Analysis has taught us something entirely analogous in the case of obscure and confused dreams: once again the dream-situation represents a wish as fulfilled - a wish which invariably arises from the dream-thoughts, but one which is represented in an unrecognizable form and can only be explained when it has been traced back in analysis. The wish in such cases is either itself a repressed one and alien to consciousness, or it is intimately connected with repressed thoughts and is based upon them. Thus the formula for such dreams is as follows: they are disguised fulfilsments of repressed wishes. It is interesting in this connection to observe that the popular belief that dreams always foretell the future is confirmed. Actually the future which the dream shows us is not the one which will occur but the one which we should like to occur. The popular mind is behaving here as it usually does: what it wishes, it believes.
Adults have learnt to make this distinction; they have also grasped the uselessness of wishing, and after lengthy practice know how to postpone their desires until they can find satisfaction by the long and roundabout path of altering the external world. In their case, accordingly, wish-fulfilments along the short psychical path are rare in sleep too; it is even possible, indeed, that they never occur at all, and that anything that may seem to us to be constructed on the pattern of a child's dream in fact requires a far more complicated solution. On the other hand, in the case of adults - and this no doubt applies without exception to everyone in full possession of his senses - a differentiation has occurred in the psychical material, which was not present in children. A psychical agency has come into being, which, taught by experience of life, exercises a dominating and inhibiting influence upon mental impulses and maintains that influence with jealous severity, and which, owing to its relation to consciousness and to voluntary movement, is armed with the strongest instruments of psychical power. A portion of the impulses of childhood has been suppressed by this agency as being useless to life, and any thought-material derived from those impulses is in a state of repression. [1901a, 1092]
It is easy to prove that dreams often reveal themselves without any disguise as fulfilments of wishes; so that it may seem surprising that the language of dreams was not understood long ago. For instance, there is a dream that I can produce in myself as often as I like - experimentally, as it were. If I eat anchovies or olives or any other highly salted food in the evening, I develop thirst during the night which wakes me up. But my waking is preceded by a dream; and this always has the same content, namely, that I am drinking. I dream I am swallowing down water in great gulps, and it has the delicious taste that nothing can equal but a cool drink when one is parched with thirst. Then I wake up and have to have a real drink. This simple dream is occasioned by the thirst which I become aware of when I wake. The thirst gives rise to a wish to drink, and the dream shows me that wish fulfilled. In doing so it is performing a function - which it was easy to divine. I am a good sleeper and not accustomed to be woken by any physical need. If I can succeed in appeasing my thirst by dreaming that I am drinking, then I need not wake up in order to quench it. This, then, is a dream of convenience. Dreaming has taken the place of action, as it often does elsewhere in life. Unluckily my need for water to quench my thirst cannot be satisfied by a dream in the same way as my thirst for revenge against my friend Otto and Dr. M.; but the good intention is there in both cases. Not long ago this same dream of mine showed some modification. I had felt thirsty even before I fell asleep, and I had emptied a glass of water that stood on the table beside my bed. A few hours later during the night I had a fresh attack of thirst, and this had inconvenient results. In order to provide myself with some water I should have had to get up and fetch the glass standing on the table by my wife's bed. I therefore had an appropriate dream that my wife was giving me a drink out of a vase; this vase was an Etruscan cinerary urn which I had brought back from a journey to Italy and had since given away. But the water in it tasted so salty (evidently because of the ashes in the urn) that I woke up. It will be noticed how conveniently everything was arranged in this dream. Since its only purpose was to fulfil a wish, it could be completely egoistical. A love of comfort and convenience is not really compatible with consideration for other people. The introduction of the cinerary urn was probably yet another wish-fulfilment. I was sorry that the vase was no longer in my possession - just as the glass of water on my wife's table was out of my reach. The urn with its ashes fitted in, too, with the salty taste in my mouth which had now grown stronger and which I knew was bound to wake me.¹

¹ Weygandt (1893, 41) was aware of the occurrence of thirst dreams, for he writes: 'The sensation of thirst is perceived with greater precision than any other; it always gives rise to an idea of its being quenched. The manner in which the thirst is represented as being quenched in the dream varies, and derives its special form from some near-by memory. Another general feature in these cases is that immediately after the idea of the thirst being quenched there follows a disappointment over the small effect produced by the imaginary refreshment.' Weygandt, however, overlooks the fact that this reaction of a dream to a stimulus is one which holds good universally. Other people who are attacked by thirst in the night may wake up without having had a dream; but that is no objection to my experiment. It merely shows that they are worse sleepers than I am. - Compare in this connection Isaiah xxix, 8: 'It shall even be as when an hungry man dreameth, and, behold, he eateth; but he awaketh, and his soul is empty: or as when a thirsty man dreameth, and, behold, he drinketh; but he awaketh, and, behold, he is faint, and his soul hath appetite.'

[1900a, 632]

If this sentence is taken in the sense in which it was intended, it merely shows the unconscientious manner in which critics are accustomed to perform their functions, and the readiness with which opponents overlook the clearest statements if they do not give scope to their aggressive inclinations. For only a few pages earlier I had mentioned the variety of the wishes whose fulfilments are to be found in children's dreams (wishes to take part in an excursion or a sail on a lake, or to make up for a missed meal, and so on); and in other passages I had discussed dreams of hunger, dreams stimulated by thirst or by excretory needs, and dreams of mere convenience. Even Rank himself made no absolute assertion. The words he used were 'also as a rule erotic wishes', and what he said can be amply confirmed in the dreams of most adults.

[1900a, 653]
Let us compare this dream of the first Napoleon (who, incidentally, was an extremely sound sleeper) with that of the sleepy student who was roused by his landlady and told that it was time to go to the hospital, and who proceeded to dream that he was in bed at the hospital and then slept on, under the pretext that as he was already in the hospital there was no need for him to get up and go there. This latter dream was clearly a dream of convenience. The dreamer admitted his motive for dreaming without any disguise; but at the same time he gave away one of the secrets of dreaming in general. All dreams are in a sense dreams of convenience: they serve the purpose of prolonging sleep instead of waking up. Dreams are the GUARDIANS of sleep and not its disturbers. We shall have occasion elsewhere to justify this view of them in relation to awakening factors of a psychical kind; but we are already in a position to show that it is applicable to the part played by objective external stimuli. Either the mind pays no attention at all to occasions for sensation during sleep - if it is able to do this despite the intensity of the stimuli and the significance which it knows attaches to them; or it makes use of a dream in order to deny the stimuli; or, thirdly, if it is obliged to recognize them, it seeks for an interpretation of them which will make the currently active sensation into a component part of a situation which is wished for and which is consistent with sleeping. The currently active sensation is woven into a dream in order to rob it of reality. Napoleon could sleep on - with a conviction that what was trying to disturb him was only a dream-memory of the thunder of the guns at Arcole.¹

This is an appropriate point at which to return to a topic that was broken off in an earlier chapter (p. 716): the problem of the part played in the formation of dreams by organic stimuli which disturb sleep. Dreams which come about under their influence openly exhibit not only the usual tendency to wish-fulfilment and to serving the end of convenience, but very often a perfectly transparent symbolism as well; for it not infrequently happens that a stimulus awakens a dreamer after a vain attempt has been made to deal with it in a dream under a symbolic disguise. This applies to dreams of emission or orgasm as well as to those provoked by a need to micturate or defaecate. 'The peculiar nature of emission dreams not only puts us in a position to reveal directly certain sexual symbols which are already known as being typical, but which have nevertheless been violently disputed; it also enables us to convince ourselves that some apparently innocent situations in dreams are no more than a symbolic prelude to crudely sexual scenes. The latter are as a rule represented undisguisedly in the relatively rare emission dreams, whereas they culminate often enough in anxiety dreams, which have the same result of awakening the sleeper.' [1900a, 858]
This determined wish on the part of the preconscious to sleep exercises a generally facilitating effect on the formation of dreams. Let me recall the dream dreamt by the man who was led to infer from the glare of light coming out of the next room that his child's body might be on fire. The father drew this inference in a dream instead of allowing himself to be woken up by the glare; and we have suggested that one of the psychical forces responsible for this result was a wish which prolonged by that one moment the life of the child whom he pictured in the dream. Other wishes, originating from the repressed, probably escape us, since we are unable to analyse the dream. But we may assume that a further motive force in the production of the dream was the father's need to sleep; his sleep, like the child's life, was prolonged by one moment by the dream. 'Let the dream go on' - such was his motive - 'or I shall have to wake up.' In every other dream, just as in this one, the wish to sleep lends its support to the unconscious wish. On p. 624 f., I described some dreams which appeared openly as dreams of convenience. But in fact all dreams can claim a right to the same description. The operation of the wish to continue sleeping is most easily to be seen in arousal dreams, which modify external sensory stimuli in such a way as to make them compatible with a continuance of sleep; they weave them into a dream in order to deprive them of any possibility of acting as reminders of the external world. That same wish must, however, play an equal part in allowing the occurrence of all other dreams, though it may only be from within that they threaten to shake the subject out of his sleep. In some cases, when a dream carries things too far, the Ucs. says to consciousness: 'Never mind! go on sleeping! after all it's only a dream!' But this describes in general the attitude of our dominant mental activity towards dreams, though it may not be openly expressed. I am driven to conclude that throughout our whole sleeping state we know just as certainly that we are dreaming as we know that we are sleeping. We must not pay too much attention to the counter-argument that our consciousness is never brought to bear on the latter piece of knowledge and that it is only brought to bear on the former on particular occasions when the censorship feels that it has, as it were, been taken off its guard.

Numerous examples of dreams of this infantile type can be found occurring in adults as well, though, as I have said, they are usually brief in content. Thus a number of people regularly respond to a stimulus of thirst during the night with dreams of drinking, which thus endeavour to get rid of the stimulus and enable sleep to continue. In some people 'dreams of convenience' of this kind often occur before waking, when the necessity for getting up presents itself. They dream that they are already up and at the washing-stand, or that they are already at the school or office where they are due at some particular time. During the night before a journey we not infrequently dream of having arrived at our destination; so too, before a visit to the theatre or a party, a dream will often anticipate the pleasure that lies ahead - out of impatience, as it were. In other dreams the wish-fulfilment is expressed a stage more indirectly: some connection or implication must be established - that is, the work of interpretation must be begun - before the wish-fulfilment can be recognized. A man told me, for instance, that his young wife had had a dream that her period had started. I reflected that if this young woman had missed her period she must have known that she was faced with a pregnancy. Thus when she reported her dream she was announcing her pregnancy, and the meaning of the dream was to represent as fulfilled her wish that the pregnancy might be postponed for a while. Under unusual or extreme conditions dreams of this infantile character are particularly common. Thus the leader of a polar expedition has recorded that the members of his expedition, while they were wintering in the ice-field and living on a monotonous diet and short rations, regularly dreamt like children of large meals, of mountains of tobacco, and of being back at home.
But before taking leave of infantile dreams with their undisguised wish-fulfilments, I must not omit to mention one principal feature of dreams, which has long been evident and which emerges particularly clearly precisely in this group. Every one of these dreams can be replaced by an optative clause: 'Oh, if only the trip on the lake had lasted longer!' - 'If only I were already washed and dressed!' - 'If only I could have kept the cherries instead of giving them to Uncle!' But dreams give us more than such optative clauses. They show us the wish as already fulfilled; they represent its fulfilment as real and present; and the material employed in dream-representation consists principally, though not exclusively, of situations and of sensory images, mostly of a visual character. Thus, even in this infantile group, a species of transformation, which deserves to be described as dream-work, is not completely absent: a thought expressed in the optative has been replaced by a representation in the present tense.

Moreover I do not mean to assert that the wish-fulfilment dreams of adults which are constructed on infantile lines only appear as reactions to the imperative needs that I have mentioned. We are acquainted as well with short, clear dreams of this sort which, under the influence of some dominant situation, arise out of what are unquestionably psychical sources of stimulation. There are, for instance, dreams of impatience: if someone has made preparations for a journey, for a theatrical performance that is important to him, for going to a lecture or paying a visit, he may dream of a premature fulfilment of his expectation; he may, during the night before the event, see himself arrived at his destination, present at the theatre, in conversation with the person he is going to visit. Or there are what are justly known as dreams of convenience, in which a person who would like to sleep longer dreams that he is already up and is washing, or is already at school, whereas he is really still sleeping and would rather get up in a dream than in reality. The wish to sleep, which we have recognized as regularly playing a part in the construction of dreams, comes into the open in these dreams and reveals itself in them as the essential dream-constructor. There is good reason for ranking the need to sleep alongside of the other great bodily needs.

But you must not blame the dream itself on account of its evil content. Do not forget that it performs the innocent and indeed useful function of preserving sleep from disturbance. This wickedness is not part of the essential nature of dreams. Indeed you know too that there are dreams which can be recognized as the satisfaction of justified wishes and of pressing bodily needs. These, it is true, have no dream-distortion; but they have no need of it, for they can fulfil their function without insulting the ethical and aesthetic purposes of the ego. Bear in mind, too, that dream-distortion is proportionate to two factors. On the one hand it becomes greater the worse the wish that has to be censored; but on the other hand it also becomes greater the more severe the demands of the censorship at the moment. Thus a strictly brought-up and prudish young girl, with a relentless censorship, will distort dream-impulses which we doctors, for instance, would have to regard as permissible, harmless, libidinal wishes, and on which in ten years’ time the dreamer herself will make the same judgement.
Let us take as an example the so-called dreams of recovery. If a patient has had a dream of this kind, in which he seems to abandon the restrictions of his neurosis - if, for instance, he overcomes some phobia or gives up some emotional attachment - we are inclined to think that he has made a great step forward, that he is ready to take his place in a new state of life, that he has begun to reckon on his recovery, etc. This may often be true, but quite as often such dreams of recovery only have the value of dreams of convenience: they signify a wish to be well at last, in order to avoid another portion of the work of analysis which is felt to lie ahead. In this sense, dreams of recovery very frequently occur, for instance, when the patient is about to enter upon a new and disagreeable phase of the transference. He is behaving in this just like some neurotics who after a few hours of analysis declare they have been cured - because they want to escape all the unpleasantness that is bound to come up for discussion in the analysis. Sufferers from war neuroses, too, who gave up their symptoms because the therapy adopted by the army doctors succeeded in making being ill even more uncomfortable than serving at the front - these sufferers, too, were following the same economic laws and in both cases alike the cures have proved to be only temporary.

[1923c, 4033]

The analysis of dreams led further: it was brought to public notice by the present writer as early as in 1900 in *The Interpretation of Dreams*. This showed that dreams are constructed in just the same way as neurotic symptoms. Like them, they may appear strange and senseless; but, if we examine them by a technique which differs little from the free association used in psycho-analysis, we are led from their manifest content to a secret meaning, to the latent dream-thoughts. This latent meaning is always a wishful impulse which is represented as fulfilled at the moment of the dream. But, except in young children and under the pressure of imperative physical needs, this secret wish can never be expressed recognizably. It has first to submit to a distortion, which is the work of restrictive, censoring forces in the dreamer's ego. In this way the manifest dream, as it is remembered in waking life, comes about. It is distorted, to the pitch of being unrecognizable, by concessions made to the dream-censorship; but it can be revealed once more by analysis as an expression of a situation of satisfaction or as the fulfilment of a wish. It is a compromise between two conflicting groups of mental trends, just as we have found to be the case with hysterical symptoms. The formula which, at bottom, best meets the essence of the dream is this: a dream is a (disguised) fulfilment of a (repressed) wish. The study of the process which transforms the latent dream-wish into the manifest content of the dream - a process known as the 'dream-work' - has taught us the best part of what we know of unconscious mental life.

[1924f, 4109]
We have explained that the unconscious instinctual impulse of the dream connects itself with a residue of the day, with some interest of waking life which has not been disposed of; it thus gives the dream which it constructs a double value for the work of analysis. For on the one hand a dream that has been analysed reveals itself as the fulfilment of a repressed wish; but on the other hand it may be a continuation of some preconscious activity of the day before and may contain every kind of subject-matter and give expression to an intention, a warning, a reflection, or once more to the fulfilment of a wish. Analysis exploits the dream in both directions, as a means of obtaining knowledge alike of the patient's conscious and of his unconscious processes. It also profits from the fact that dreams have access to the forgotten material of childhood, and so it happens that infantile amnesia is for the most part overcome in connection with the interpretation of dreams. In this respect dreams achieve a part of what was previously the task of hypnotism. On the other hand, I have never maintained the assertion which has so often been ascribed to me that dream-interpretation shows that all dreams have a sexual content or are derived from sexual motive forces. It is easy to see that hunger, thirst, or the need to excrete, can produce dreams of satisfaction just as well as any repressed sexual or egoistic impulse. The case of young children affords us a convenient test of the validity of our theory of dreams. In them the various psychical systems are not yet sharply divided and the repressions have not yet grown deep, so that we often come upon dreams which are nothing more than undisguised fulfilments of wishful impulses left over from waking life. Under the influence of imperative needs, adults may also produce dreams of this infantile type.¹

[1925d, 4221]

It remains for us to give a dynamic explanation of why the sleeping ego takes on the task of the dream-work at all. The explanation is fortunately easy to find. With the help of the unconscious, every dream that is in process of formation makes a demand upon the ego - for the satisfaction of an instinct, if the dream originates from the id; for the solution of a conflict, the removal of a doubt or the forming of an intention, if the dream originates from a residue of preconscious activity in waking life. The sleeping ego, however, is focused on the wish to maintain sleep; it feels this demand as a disturbance and seeks to get rid of the disturbance. The ego succeeds in doing this by what appears to be an act of compliance: it meets the demand with what is in the circumstances a harmless fulfilment of a wish and so gets rid of it. This replacement of the demand by the fulfilment of a wish remains the essential function of the dream-work. It may perhaps be worth while to illustrate this by three simple examples - a hunger dream, a dream of convenience and a dream prompted by sexual desire. A need for food makes itself felt in a dreamer during his sleep: he has a dream of a delicious meal and sleeps on. The choice, of course, was open to him either of waking up and eating something or of continuing his sleep. He decided in favour of the latter and satisfied his hunger by means of the dream - for the time being, at all events, for if his hunger had persisted he would have had to wake up nevertheless. Here is the second example. A sleeper had to wake up so as to be in time for his work at the hospital. But he slept on, and had a dream that he was already at the hospital - but as a patient, who has no need to get up. Or again, a desire becomes active during the night for the enjoyment of a forbidden sexual object, the wife of a friend of the sleeper. He has a dream of sexual intercourse - not, indeed, with this person but with someone else of the same name to whom he is in fact indifferent; or his struggle against the desire may find expression in his mistress remaining altogether anonymous.

[1940a [1938], 4980]
Dreams with an intestinal stimulus throw light in an analogous fashion on the symbolism involved in them, and at the same time confirm the connection between gold and faeces which is also supported by copious evidence from social anthropology. (See Freud, 1908b; Rank, 1912a; Dattner, 1913; and Reik, 1915.) 'Thus, for instance, a woman who was receiving medical treatment for an intestinal disorder dreamt of someone who was burying a treasure in the neighbourhood of a little wooden hut which looked like a rustic out-door closet. There was a second part to the dream in which she was wiping the behind of her little girl who had dirtied herself.'
[1900a, 859]
Rank has shown from a series of dreams that birth-dreams make use of the same symbolism as dreams with a urinary stimulus. The erotic stimulus is represented in the latter as a urinary stimulus; and the stratification of meaning in these dreams corresponds to a change that has come over the meaning of the symbol since infancy.

[1900a, 857]

The symbolism of dreams with a urinary stimulus is especially transparent and has been recognized from the earliest times. The view was already expressed by Hippocrates that dreams of fountains and springs indicate a disorder of the bladder (Havelock Ellis). Scherner studied the multiplicity of the symbolism of urinary stimuli and asserted that 'any urinary stimulus of considerable strength invariably passes over into stimulation of the sexual regions and symbolic representations of them. . . . Dreams with a urinary stimulus are often at the same time representatives of sexual dreams.'

[1900a, 858]

Otto Rank, whose discussion in his paper on the stratification of symbols in arousal dreams I am here following, has made it seem highly probable that a great number of dreams with a urinary stimulus have in fact been caused by a sexual stimulus which has made a first attempt to find satisfaction regressively in the infantile form of urethral erotism. Those cases are particularly instructive in which the urinary stimulus thus set up leads to awakening and emptying the bladder, but in which the dream is nevertheless continued and the need then expressed in undisguisedly erotic imagery.'

[1900a, 859]
This determined wish on the part of the preconscious to sleep exercises a generally facilitating effect on the formation of dreams. Let me recall the dream dreamt by the man who was led to infer from the glare of light coming out of the next room that his child's body might be on fire. The father drew this inference in a dream instead of allowing himself to be woken up by the glare; and we have suggested that one of the psychical forces responsible for this result was a wish which prolonged by that one moment the life of the child whom he pictured in the dream. Other wishes, originating from the repressed, probably escape us, since we are unable to analyse the dream. But we may assume that a further motive force in the production of the dream was the father's need to sleep; his sleep, like the child's life, was prolonged by one moment by the dream. 'Let the dream go on' - such was his motive - 'or I shall have to wake up.' In every other dream, just as in this one, the wish to sleep lends its support to the unconscious wish. On p. 624 f. I described some dreams which appeared openly as dreams of convenience. But in fact all dreams can claim a right to the same description. The operation of the wish to continue sleeping is most easily to be seen in arousal dreams, which modify external sensory stimuli in such a way as to make them compatible with a continuance of sleep; they weave them into a dream in order to deprive them of any possibility of acting as reminders of the external world. That same wish must, however, play an equal part in allowing the occurrence of all other dreams, though it may only be from within that they threaten to shake the subject out of his sleep. In some cases, when a dream carries things too far, the Ucs. says to consciousness: 'Never mind! go on sleeping! after all it's only a dream!' But this describes in general the attitude of our dominant mental activity towards dreams, though it may not be openly expressed. I am driven to conclude that throughout our whole sleeping state we know just as certainly that we are dreaming as we know that we are sleeping. We must not pay too much attention to the counter-argument that our consciousness is never brought to bear on the latter piece of knowledge and that it is only brought to bear on the former on particular occasions when the censorship feels that it has, as it were, been taken off its guard.

And now consider that arousal dreams offer the best chance of establishing the influence of external sleep-disturbing stimuli. In most other cases it will become more difficult. We do not wake out of every dream, and if we remember a dream of the past night in the morning, how are we to discover a disturbing stimulus which may perhaps have made its impact on us during the night? I once succeeded in identifying a sound-stimulus of that kind retrospectively, but only, of course, owing to special circumstances. I woke up one morning in a mountain resort in the Tyrol, knowing I had had a dream that the Pope was dead. I could not explain the dream to myself; but later on my wife asked me if I had heard the fearful noise made by the pealing of bells towards morning which had broken out from all the churches and chapels. No, I had heard nothing, my sleep is more resistant than hers; but thanks to her information I understood my dream. How often may stimuli of this kind instigate dreams in a sleeper without his getting news of them afterwards? Perhaps very often, but perhaps not. If the stimulus can no longer be pointed to, we cannot be convinced of its existence. And in any case we have changed our view of the importance of external stimuli that disturb sleep since we learnt that they can explain only a small portion of the dream and not the whole dream-reaction.
There is no difficulty in discovering the general function of dreaming. It serves the purpose of fending off, by a kind of soothing action, external or internal stimuli which would tend to arouse the sleeper, and thus of securing sleep against interruption. External stimuli are fended off by being given a new interpretation and by being woven into some harmless situation; internal stimuli, caused by instinctual demands, are given free play by the sleeper and allowed to find satisfaction in the formation of dreams, so long as the latent dream-thoughts submit to the control of the censorship. But if they threaten to break free and the meaning of the dream becomes too plain, the sleeper cuts short the dream and wakes in a fright. (Dreams of this class are known as *anxiety-dreams*.) A similar failure in the function of dreaming occurs if an external stimulus becomes too strong to be fended off. (This is the class of *arousal-dreams*.) I have given the name of *dream-work* to the process which, with the co-operation of the censorship, converts the latent thoughts into the manifest content of the dream. It consists of a peculiar way of treating the preconscious material of thought, so that its component parts become *condensed*, its psychical emphasis becomes *displaced*, and the whole of it is translated into visual images or *dramatized*, and completed by a deceptive *secondary revision*. The dream-work is an excellent example of the processes occurring in the deeper, unconscious layers of the mind, which differ considerably from the familiar normal processes of thought. It also displays a number of archaic characteristics, such as the use of a *symbolism* (in this case of a predominantly sexual kind) which it has since also been possible to discover in other spheres of mental activity. 

[1925d, 4220]
Now how did this staircase and this female figure come to be in my dream? The feeling of shame at not being completely dressed is no doubt of a sexual nature; but the maid-servant whom I dreamt about was older than I am, surly and far from attractive. The only answer to the problem that occurred to me was this. When I paid my morning visits to this house I used as a rule to be seized with a desire to clear my throat as I went up the stairs and the product of my expectoration would fall on the staircase. For on neither of these floors was there a spittoon; and the view I took was that the cleanliness of the stairs should not be maintained at my expense but should be made possible by the provision of a spittoon. The concierge, an equally elderly and surly woman (but of cleanly instincts, as I was prepared to admit), looked at the matter in a different light. She would lie in wait for me to see whether I should again make free of the stairs, and, if she found that I did, I used to hear her grumbling audibly; and for several days afterwards she would omit the usual greeting when we met. The day before I had the dream the concierge's party had received a reinforcement in the shape of the maid-servant. I had, as usual, concluded my hurried visit to the patient, when the servant stopped me in the hall and remarked: 'You might have wiped your boots, doctor, before you came into the room today. You've made the red carpet all dirty again with your feet.' This was the only claim the staircase and the maid-servant had to appearing in my dream.

I must postpone my further interpretation of this dream till I can explain the origin of the typical dream of being incompletely dressed. I will only point out as a provisional conclusion to be drawn from the present dream that a sensation of inhibited movement in dreams is produced whenever the particular context requires it. The cause of this part of the dream's content cannot have been that some special modification in my powers of movement had occurred during my sleep, since only a moment earlier I had seen myself (almost as though to confirm this fact) running nimbly up the stairs.

Dreams of being naked or insufficiently dressed in the presence of strangers sometimes occur with the additional feature of there being a complete absence of any such feeling as shame on the dreamer's part. We are only concerned here, however, with those dreams of being naked in which one does feel shame and embarrassment and tries to escape or hide, and is then overcome by a strange inhibition which prevents one from moving and makes one feel incapable of altering one's distressing situation. It is only with this accompaniment that the dream is typical; without it, the gist of its subject-matter may be included in every variety of context or may be ornamented with individual trimmings. Its essence lies in a distressing feeling in the nature of shame and in the fact that one wishes to hide one's nakedness, as a rule by locomotion, but finds one is unable to do so. I believe the great majority of my readers will have found themselves in this situation in dreams.

The nature of the undress involved is customarily far from clear. The dreamer may say 'I was in my chemise', but this is rarely a distinct picture. The kind of undress is usually so vague that the description is expressed as an alternative: 'I was in my chemise or petticoat.' As a rule the defect in the dreamer's toilet is not so grave as to appear to justify the shame to which it gives rise. In the case of a man who has worn the Emperor's uniform, nakedness is often replaced by some breach of the dress regulations: 'I was walking in the street without my sabre and saw some officers coming up', or 'I was without my necktie', or 'I was wearing civilian check trousers', and so on.
The people in whose presence one feels ashamed are almost always strangers, with their features left indeterminate. In the typical dream it never happens that the clothing which causes one so much embarrassment is objected to or so much as noticed by the onlookers. On the contrary, they adopt indifferent or (as I observed in one particularly clear dream) solemn and stiff expressions of face. This is a suggestive point.

The embarrassment of the dreamer and the indifference of the onlookers offer us, when taken together, a contradiction of the kind that is so common in dreams. It would after all be more in keeping with the dreamer's feelings if strangers looked at him in astonishment and derision or with indignation. But this objectionable feature of the situation has, I believe, been got rid of by wish-fulfilment, whereas some force has led to the retention of the other features; and the two portions of the dream are consequently out of harmony with each other. We possess an interesting piece of evidence that the dream in the form in which it appears - partly distorted by wish-fulfilment - has not been rightly understood. For it has become the basis of a fairy tale which is familiar to us all in Hans Andersen's version, *The Emperor's New Clothes*, and which has quite recently been put into verse by Ludwig Fulda in his *Der Talisman*. Hans Andersen's fairy tale tells us how two impostors weave the Emperor a costly garment which, they say, will be visible only to persons of virtue and loyalty. The Emperor walks out in this invisible garment, and all the spectators, intimidated by the fabric's power to act as a touchstone, pretend not to notice the Emperor's nakedness.

In the case of our dream we are in a position to indicate the material upon which the misinterpretation is based. The impostor is the dream and the Emperor is the dreamer himself; the moralizing purpose of the dream reveals an obscure knowledge of the fact that the latent dream-content is concerned with forbidden wishes that have fallen victim to repression. For the context in which dreams of this sort appear during my analyses of neurotics leaves no doubt that they are based upon memories from earliest childhood. It is only in our childhood that we are seen in inadequate clothing both by members of our family and by strangers - nurses, maidservants, and visitors; and it is only then that we feel no shame at our nakedness.¹ We can observe how undressing has an almost intoxicating effect on many children even in their later years, instead of making them feel ashamed. They laugh and jump about and slap themselves, while their mother, or whoever else may be there, reproves them and says: 'Ugh! Shocking! You mustn't ever do that!' Children frequently manifest a desire to exhibit. One can scarcely pass through a country village in our part of the world without meeting some child of two or three who lifts up his little shirt in front of one - in one's honour, perhaps. One of my patients has a conscious memory of a scene in his eighth year, when at bed-time he wanted to dance into the next room where his little sister slept, dressed in his night-shirt, but was prevented by his nurse. In the early history of neurotics an important part is played by exposure to children of the opposite sex; in paranoia delusions of being observed while dressing and undressing are to be traced back to experiences of this kind; while among persons who have remained at the stage of perversion there is one class in which this infantile impulse has reached the pitch of a symptom - the class of 'exhibitionists'.

¹ [1900a, 722]
When we look back at this unashamed period of childhood it seems to us a Paradise; and Paradise itself is no more than a group phantasy of the childhood of the individual. That is why mankind were naked in Paradise and were without shame in one another’s presence; till a moment arrived when shame and anxiety awoke, expulsion followed, and sexual life and the tasks of cultural activity began. But we can regain this Paradise every night in our dreams. I have already expressed a suspicion that impressions of earliest childhood (that is, from the prehistoric epoch until about the end of the third year of life) strive to achieve reproduction, from their very nature and irrespectively perhaps of their actual content, and that their repetition constitutes the fulfilment of a wish. Thus dreams of being naked are dreams of exhibiting.¹

The core of a dream of exhibiting lies in the figure of the dreamer himself (not as he was as a child but as he appears at the present time) and his inadequate clothing (which emerges indistinctly, whether owing to superimposed layers of innumerable later memories of being in undress or as a result of the censorship). Added to these are the figures of the people in whose presence the dreamer feels ashamed. I know of no instance in which the actual spectators of the infantile scene of exhibiting have appeared in the dream; a dream is scarcely ever a simple memory. Curiously enough, the people upon whom our sexual interest was directed in childhood are omitted in all the reproductions which occur in dreams, in hysteria and in obsessional neurosis. It is only in paranoia that these spectators reappear and, though they remain invisible, their presence is inferred with fanatical conviction. What takes their place in dreams - ‘a lot of strangers’ who take no notice of the spectacle that is offered - is nothing more nor less than the wishful contrary of the single familiar individual before whom the dreamer exposed himself. Incidentally, ‘a lot of strangers’ frequently appear in dreams in many other connections, and they always stand as the wishful contrary of ‘secrecy’. It is to be noticed that even in paranoia, where the original state of things is restored, this reversal into a contrary is observed. The subject feels that he is no longer alone, he has no doubt that he is being observed, but the observers are ‘a lot of strangers’ whose identity is left curiously vague.

¹ [Footnote added 1911:] Ferenczi has recorded a number of interesting dreams of being naked dreamt by women. There was no difficulty in tracing these back to the infantile desire to exhibit; but they differed in some respects from the ‘typical’ dreams of being naked which I have discussed in the text.

In addition to this, repression plays a part in dreams of exhibiting; for the distress felt in such dreams is a reaction on the part of the second system against the content of the scene of exhibiting having found expression in spite of the ban upon it. If the distress was to be avoided, the scene should never have been revived.
(1) I was sitting in a café, turning over the pages of a copy of the *Leipziger Illustrierte* (which I was holding up at an angle), when I read the following legend under a picture that stretched across the page: ‘A Wedding Celebration in the *Odysee*.’ It caught my attention; in surprise I took hold of the paper in the proper way and then corrected my error: ‘A Wedding Celebration on the *Ostee*.’ How did I come to make this absurd mistake in reading? My thoughts at once turned to a book by Ruths (1898), *Experimentaluntersuchungen über Musikphantome* . . . , which had occupied me a good deal recently since it trenches on the psychological problems that I have been concerned with. The author promised that he would shortly be bringing out a book to be called ‘Analysis and Principles of Dream Phenomena’. Seeing that I have just published an *Interpretation of Dreams* it is not surprising that I should await this book with the keenest interest. In Ruths' work on music phantoms I found at the beginning of the list of contents an announcement of a detailed inductive proof that the ancient Greek myths and legends have their main source of origin in phantoms of sleep and music, in the phenomena of dreams and also in deliria. Thereupon I at once plunged into the text to find out whether he also realized that the scene in which Odysseus appears before Nausicaä was derived from the common dream of being naked. A friend had drawn my attention to the fine passage in Gottfried Keller's *Der Grüne Heinrich* which explains this episode in the *Odyssey* as an objective representation of the dreams of a sailor wandering far from home; and I had pointed out the connection with exhibitionist dreams of being naked.¹ I found nothing on the subject in Ruths' book. In this instance it is obvious that my thoughts were occupied with questions of priority. [1901b, 1193]
One day I had been trying to discover what might be the meaning of the feelings of being inhibited, of being glued to the spot, of not being able to get something done, and so on, which occur so often in dreams and are so closely akin to feelings of anxiety. That night I had the following dream: [1900a, 717]

I must postpone my further interpretation of this dream till I can explain the origin of the typical dream of being incompletely dressed. I will only point out as a provisional conclusion to be drawn from the present dream that a sensation of inhibited movement in dreams is produced whenever the particular context requires it. The cause of this part of the dream's content cannot have been that some special modification in my powers of movement had occurred during my sleep, since only a moment earlier I had seen myself (almost as though to confirm this fact) running nimbly up the stairs. [1900a, 719]

Dreams of being naked or insufficiently dressed in the presence of strangers sometimes occur with the additional feature of there being a complete absence of any such feeling as shame on the dreamer's part. We are only concerned here, however, with those dreams of being naked in which one does feel shame and embarrassment and tries to escape or hide, and is then overcome by a strange inhibition which prevents one from moving and makes one feel incapable of altering one's distressing situation. It is only with this accompaniment that the dream is typical; without it, the gist of its subject-matter may be included in every variety of context or may be ornamented with individual trimmings. Its essence lies in a distressing feeling in the nature of shame and in the fact that one wishes to hide one's nakedness, as a rule by locomotion, but finds one is unable to do so. I believe the great majority of my readers will have found themselves in this situation in dreams. [1900a, 721]

We shall return later to the feeling of being inhibited. It serves admirably in dreams to represent a conflict in the will or a negative. The unconscious purpose requires the exhibiting to proceed; the censorship demands that it shall be stopped. [1900a, 725]
The difficulty which he dreamt of and probably actually experienced during the dream - the laborious climbing up the rise accompanied by dyspnoea - was one of the symptoms which the patient had in fact exhibited years before and which had at that time been attributed, along with certain other symptoms, to tuberculosis. (The probability is that this was hysterically simulated.) The peculiar sensation of inhibited movement that occurs in this dream is already familiar to us from dreams of exhibiting and we see once more that it is material available at any time for any other representational purpose. The piece of the dream-content which described how the climb began by being difficult and became easy at the end of the rise reminded me, when I heard it, of the masterly introduction to Alphonse Daudet's *Sappho*. That well known passage describes how a young man carries his mistress upstairs in his arms; at first she is as light as a feather, but the higher he climbs the heavier grows her weight. The whole scene foreshadows the course of their love-affair, which was intended by Daudet as a warning to young men not to allow their affections to be seriously engaged by girls of humble origin and a dubious past.¹ Though I knew that my patient had been involved in a love-affair which he had recently broken off with a lady on the stage, I did not expect to find my guess at an interpretation justified. Moreover the situation in *Sappho* was the reverse of what it had been in the dream. In the dream the climbing had been difficult to begin with and had afterwards become easy; whereas the symbolism in the novel only made sense if something that had been begun lightly ended by becoming a heavy burden. But to my astonishment my patient replied that my interpretation fitted in very well with a piece he had seen at the theatre the evening before. It was called *Rund um Wien* [*Round Vienna*] and gave a picture of the career of a girl who began by being respectable, who then became a demi-mondaine and had liaisons with men in high positions and so 'went up in the world', but who ended by 'coming down in the world'. The piece had moreover reminded him of another, which he had seen some years earlier, called *Von Stufe zu Stufe* [*Step by Step*], and which had been advertised by a poster showing a staircase with a flight of steps.

[1900a, 759]

What is the meaning of the sensation of inhibited movement which appears so commonly in dreams and verges so closely upon anxiety? One tries to move forward but finds oneself glued to the spot, or one tries to reach something but is held up by a series of obstacles. A train is on the point of departure but one is unable to catch it. One raises one's hand to avenge an insult but finds it powerless and so forth. We have already met with this sensation in dreams of exhibiting, but have not as yet made any serious attempt to interpret it. An easy but insufficient answer would be to say that motor paralysis prevails in sleep and that we become aware of it in the sensation we are discussing. But it may be asked why in that case we are not perpetually dreaming of these inhibited movements; and it is reasonable to suppose that this sensation, though one which can be summoned up at any moment during sleep, serves to facilitate some particular kind of representation, and is only aroused when the material of the dream-thoughts needs to be represented in that way.

[1900a, 805]
This 'not being able to do anything' does not always appear in dreams as a sensation but is sometimes simply a part of the content of the dream. A case of this sort seems to me particularly well qualified to throw light on the meaning of this feature of dreaming. Here is an abridged version of a dream in which I was apparently charged with dishonesty. The place was a mixture of a private sanatorium and several other institutions. A man-servant appeared to summon me to an examination. I knew in the dream that something had been missed and that the examination was due to a suspicion that I had appropriated the missing article. (The analysis showed that the examination was to be taken in two senses and included a medical examination.) Conscious of my innocence and of the fact that I held the position of a consultant in the establishment, I accompanied the servant quietly. At the door we were met by another servant who said, pointing to me: 'Why have you brought him? He's a respectable person.' I then went, unattended, into a large hall, with machines standing in it, which reminded me of an Inferno with its hellish instruments of punishment. Stretched out on one apparatus I saw one of my colleagues, who had every reason to take some notice of me; but he paid no attention. I was then told I could go. But I could not find my hat and could not go after all.

[1900a, 805]

In other dreams, in which the 'not carrying out' of a movement occurs as a sensation and not simply as a situation, the sensation of the inhibition of a movement gives a more forcible expression to the same contradiction - it expresses a volition which is opposed by a counter-volition. Thus the sensation of the inhibition of a movement represents a conflict of will. We shall learn later that the motor paralysis accompanying sleep is precisely one of the fundamental determinants of the psychical process during dreaming. Now an impulse transmitted along the motor paths is nothing other than a volition, and the fact of our being so certain that we shall feel that impulse inhibited during sleep is what makes the whole process so admirably suited for representing an act of volition and a 'no' which opposes it. It is also easy to see, on my explanation of anxiety, why the sensation of an inhibition of will approximates so closely to anxiety and is so often linked with it in dreams. Anxiety is a libidinal impulse which has its origin in the unconscious and is inhibited by the preconscious.² When, therefore, the sensation of inhibition is linked with anxiety in a dream, it must be a question of an act of volition which was at one time capable of generating libido - that is, it must be a question of a sexual impulse.

[1900a, 806]
A twenty-seven-year-old man, who had been seriously ill for a year, reported that when he was between eleven and thirteen he had repeatedly dreamt (to the accompaniment of severe anxiety) that a man with a hatchet was pursuing him; he tried to run away, but seemed to be paralysed and could not move from the spot. This is a good example of a very common sort of anxiety-dream, which would never be suspected of being sexual. In analysis, the dreamer first came upon a story (dating from a time later than the dream) told him by his uncle, of how he had been attacked in the street one night by a suspicious-looking individual; the dreamer himself concluded from this association that he may have heard of some similar episode at the time of the dream. In connection with the hatchet, he remembered that at about that time he had once injured his hand with a hatchet while he was chopping up wood. He then passed immediately to his relations with his younger brother. He used to ill-treat this brother and knock him down; and he particularly remembered an occasion when he had kicked him on the head with his boot and had drawn blood, and how his mother had said: 'I'm afraid he'll be the death of him one day.' While he still seemed to be occupied with the subject of violence, a recollection from his ninth year suddenly occurred to him. His parents had come home late and had gone to bed while he pretended to be asleep; soon he had heard sounds of panting and other noises which had seemed to him uncanny, and he had also been able to make out their position in the bed. Further thoughts showed that he had drawn an analogy between this relation between his parents and his own relation to his younger brother. He had subsumed what happened between his parents under the concept of violence and struggling; and he had found evidence in favour of this view in the fact that he had often noticed blood in his mother's bed.

[1900a, 1012]

Ideas which are contraries are by preference expressed in dreams by one and the same element.¹ 'No' seems not to exist so far as dreams are concerned. Opposition between two thoughts, the relation of reversal, may be represented in dreams in a most remarkable way. It may be represented by some other piece of the dream-content being turned into its opposite - as it were by an afterthought. We shall hear presently of a further method of expressing contradiction. The sensation of inhibition of movement which is so common in dreams also serves to express a contradiction between two impulses, a conflict of will.

[1901a, 1076]

¹ The phantasy of defloration formed the second component of the situation. The emphasis upon the difficulty of getting forward and the anxiety felt in the dream indicated the stress which the dreamer was so ready to lay upon her virginity - a point alluded to in another place by means of the Sistine Madonna. These sexual thoughts gave an unconscious ground-colouring to the wishes (which were perhaps merely kept secret) concerned with the suitor who was waiting for her in Germany. We have already recognized the phantasy of revenge as the first component of the same situation in the dream. The two components do not coincide completely, but only in part. We shall subsequently come upon the traces of a third and still more important train of thought.

[1905e, 1435]
ANALYSIS. - The situation in the dream is taken from everyday reality. I occupy two flats in a house in Vienna, which are connected only by the public staircase. My consulting-room and study are on the upper ground floor and my living rooms are one storey higher. When, late in the evening, I have finished my work down below, I go up the stairs to my bedroom. On the evening before I had the dream, I had in fact made this short journey in rather disordered dress - that is to say, I had taken off my collar and tie and cuffs. In the dream this had been turned into a higher degree of undress, but, as usual, an indeterminate one. I usually go upstairs two or three steps at a time; and this was recognized in the dream itself as a wish-fulfilment: the ease with which I achieved it reassured me as to the functioning of my heart. Further, this method of going upstairs was an effective contrast to the inhibition in the second half of the dream. It showed me - what needed no proving - that dreams find no difficulty in representing motor acts carried out to perfection. (One need only recall dreams of flying.) [1900a, 717]

I have no experience of my own of other kinds of typical dreams, in which the dreamer finds himself flying through the air to the accompaniment of agreeable feelings or falling with feelings of anxiety; and whatever I have to say on the subject is derived from psycho-analyses. The information provided by the latter forces me to conclude that these dreams, too, reproduce impressions of childhood; they relate, that is, to games involving movement, which are extraordinarily attractive to children. There cannot be a single uncle who has not shown a child how to fly by rushing across the room with him in his outstretched arms, or who has not played at letting him fall by riding him on his knee and then suddenly stretching out his leg, or by holding him up high and then suddenly pretending to drop him. Children are delighted by such experiences and never tire of asking to have them repeated, especially if there is something about them that causes a little fright or giddiness. In after years they repeat these experiences in dreams; but in the dreams they leave out the hands which held them up, so that they float or fall unsupported. The delight taken by young children in games of this kind (as well as in swings and see-saws) is well known; and when they come to see acrobatic feats in a circus their memory of such games is revived.¹ Hysterical attacks in boys sometimes consist merely in reproductions of feats of this kind, carried out with great skill. It not uncommonly happens that these games of movement, though innocent in themselves, give rise to sexual feelings.² Childish 'romping', if I may use a word which commonly describes all such activities, is what is being repeated in dreams of flying, falling, giddiness and so on; while the pleasurable feelings attached to these experiences are transformed into anxiety. But often enough, as every mother knows, romping among children actually ends in squabbling and tears. [1900a, 747]

Thus I have good grounds for rejecting the theory that what provokes dreams of flying and falling is the state of our tactile feelings during sleep or sensations of the movement of our lungs, and so on. In my view these sensations are themselves reproduced as part of the memory to which the dream goes back: that is to say, they are part of the content of the dream and not its source. [1900a, 747]

¹ [Footnote added 1925:] Analytic research has shown us that in addition to pleasure derived from the organs concerned, there is another factor which contributes to the delight taken by children in acrobatic performances and to their repetition in hysterical attacks. This other factor is a memory-image, often unconscious, of an observation of sexual intercourse, whether between human beings or animals. [1900a, 747]
I cannot, however, disguise from myself that I am unable to produce any complete explanation of this class of typical dreams. My material has left me in the lurch precisely at this point. I must, however, insist upon the general assertion that all the tactile and motor sensations which occur in these typical dreams are called up immediately there is any psychical reason for making use of them and that they can be disregarded when no such need for them arises. I am also of the opinion that the relation of these dreams to infantile experiences has been established with certainty from the indications I have found in the analyses of psychoneurotics. I am not able to say, however, what other meanings may become attached to the recollection of such sensations in the course of later life - different meanings, perhaps, in every individual case, in spite of the typical appearance of the dreams; and I should be glad to be able to fill up the gap by a careful analysis of clear instances. If anyone feels surprised that, in spite of the frequency precisely of dreams of flying, falling and pulling out teeth, etc., I should be complaining of lack of material on this particular topic, I must explain that I myself have not experienced any dreams of the kind since I turned my attention to the subject of dream-interpretation. The dreams of neurotics, moreover, of which I might otherwise avail myself, cannot always be interpreted not, at least, in many cases, so as to reveal the whole of their concealed meaning; a particular psychical force, which was concerned with the original constructing of the neurosis and is brought into operation once again when attempts are made at resolving it, prevents us from interpreting such dreams down to their last secret.

[1900a, 748]

The meaning of dreams 'with a dental stimulus', which I often had to analyse in patients, escaped me for a long time because, to my surprise, there were invariably too strong resistances against their interpretation. Overwhelming evidence left me at last in no doubt that in males the motive force of these dreams was derived from nothing other than the masturbatory desires of the pubertal period. I will analyse two dreams of this kind, one of which is also a 'flying dream.' They were both dreamt by the same person, a young man with strong homosexual leanings, which were, however, inhibited in real life.

[1900a, 842]

The second group of typical dreams include those in which the dreamer flies or floats in the air, falls, swims, etc. What is the meaning of such dreams? It is impossible to give a general reply. As we shall hear, they mean something different in every instance; it is only the raw material of sensations contained in them which is always derived from the same source.

[1900a, 850]
The information provided by psycho-analyses forces me to conclude that these dreams, too, reproduce impressions of childhood; they relate, that is, to games involving movement, which are extraordinarily attractive to children. There cannot be a single uncle who has not shown a child how to fly by rushing across the room with him in his outstretched arms, or who has not played at letting him fall by riding him on his knee and then suddenly stretching out his leg, or by holding him up high and then suddenly pretending to drop him. Children are delighted by such experiences and never tire of asking to have them repeated, especially if there is something about them that causes a little fright or giddiness. In after years they repeat these experiences in dreams; but in the dreams they leave out the hands which held them up, so that they float or fall unsupported. The delight taken by young children in games of this kind (as well as in swings and see-saws) is well known; when they come to see acrobatic feats in a circus their memory of such games is revived. Hysterical attacks in boys sometimes consist merely in reproductions of feats of this kind, carried out with great skill. It not uncommonly happens that these games of movement, though innocent in themselves, give rise to sexual feelings. Childish romping ['Hetzen'], if I may use a word which commonly describes all such activities, is what is being repeated in dreams of flying, falling, giddiness and so on; while the pleasurable feelings attached to these experiences are transformed into anxiety. But, often enough, as every mother knows, romping among children actually ends in squabbling and tears.

[1900a, 850]

Thus I have good grounds for rejecting the theory that what provokes dreams of flying and falling is the state of our tactile feelings during sleep or sensations of the movement of our lungs, and so on. In my view these sensations are themselves reproduced as part of the memory to which the dream goes back: that is to say, they are part of the content of the dream and not its source.¹

[1900a, 850]

This material, then, consisting of sensations of movement of similar kinds and derived from the same source, is used to represent dream-thoughts of every possible sort. Dreams of flying or floating in the air (as a rule, pleasurably toned) require the most various interpretations; with some people these interpretations have to be of an individual character, whereas with others they may even be of a typical kind. One of my women patients used very often to dream that she was floating at a certain height over the street without touching the ground. She was very short, and she dreaded the contamination involved in contact with other people. Her floating dream fulfilled her two wishes, by raising her feet from the ground and lifting her head into a higher stratum of air. In other women I have found that flying dreams expressed a desire 'to be like a bird'; while other dreamers became angels during the night because they had not been called angels during the day. The close connection of flying with the idea of birds explains how it is that in men flying dreams usually have a grossly sensual meaning; and we shall not be surprised when we hear that some dreamer or other is very proud of his powers of flight.

[1900a, 851]

It is a remarkable fact that Mourly Vold, a sober-minded investigator of dreams and one who is disinclined to interpretation of any kind, also supports the erotic interpretation of flying or floating dreams (Vold, 1910-12, 2, 791). He speaks of the erotic factor as 'the most powerful motive for floating dreams', draws attention to the intense feeling of vibration in the body that accompanies such dreams and points to the frequency with which they are connected with erections or emissions.

[1900a, 851]
Dreams of falling, on the other hand, are more often characterized by anxiety. Their interpretation offers no difficulty in the case of women, who almost always accept the symbolic use of falling as a way of describing a surrender to an erotic temptation. Nor have we yet exhausted the infantile sources of dreams of falling. Almost every child has fallen down at one time or other and afterwards been picked up and petted; or if he has fallen out of his cot at night, has been taken into bed with his mother or nurse.

[1900a, 852]

People who have frequent dreams of swimming and who feel great joy in cleaving their way through the waves, and so on, have as a rule been bed-wetters and are repeating in their dreams a pleasure which they have long learnt to forgo. We shall learn presently from more than one example what it is that dreams of swimming are most often used to represent.

[1900a, 852]

The findings, mentioned above, which we have reached concerning the development of the mental life of children suggest the view that in Leonardo's case too the first researches of childhood were concerned with the problems of sexuality. Indeed he himself gives this away in a transparent disguise by connecting his urge for research with the vulture phantasy, and by singling out the problem of the flight of birds as one to which, as the result of a special chain of circumstances, he was destined to turn his attention. A highly obscure passage in his notes which is concerned with the flight of birds, and which sounds like a prophecy, gives a very good demonstration of the degree of affective interest with which he clung to his wish to succeed in imitating the art of flying himself: 'The great bird will take its first flight from the back of its Great Swan; it will fill the universe with stupefaction, and all writings with renown, and be the eternal glory of the nest where it was born.'¹ He probably hoped that he himself would be able to fly one day, and we know from wish-fulfilling dreams what bliss is expected from the fulfilment of that hope.

[1910c, 2296]

But why do so many people dream of being able to fly? The answer that psycho-analysis gives is that to fly or to be a bird is only a disguise for another wish, and that more than one bridge, involving words or things, leads us to recognize what it is. When we consider that inquisitive children are told that babies are brought by a large bird, such as the stork; when we find that the ancients represented the phallus as having wings; that the commonest expression in German for male sexual activity is ‘vögeln’ ['to bird'; 'Vogel' is the German for 'bird']; that the male organ is actually called 'l'uccello' ['the bird'] in Italian - all of these are only small fragments from a whole mass of connected ideas, from which we learn that in dreams the wish to be able to fly is to be understood as nothing else than a longing to be capable of sexual performance.² This is an early infantile wish. When an adult recalls his childhood it seems to him to have been a happy time, in which one enjoyed the moment and looked to the future without any wishes; it is for this reason that he envies children. But if children themselves were able to give us information earlier they would probably tell a different story. It seems that childhood is not the blissful idyll into which we distort it in retrospect, and that, on the contrary, children are goaded on through the years of childhood by the one wish to get big and do what grown-ups do. This wish is the motive of all their games. Whenever children feel in the course of their sexual researches that in the province which is so mysterious but nevertheless so important there is something wonderful of which adults are capable but which they are forbidden to know of and do, they are filled with a violent wish to be able to do it, and they dream of it in the form of flying, or they prepare this disguise of their wish to be used in their later flying dreams. Thus aviation, too, which in our day is at last achieving its aim, has its infantile erotic roots.

[1910c, 2296]
The dreamer himself gave a biographical explanation of the fact that the first shaft was followed by a longish platform and then by another shaft. He had practised intercourse for a time but had then given it up on account of inhibitions, and he now hoped to be able to resume it by the help of the treatment. The dream became more indistinct, however, towards the end, and it must seem probable to anyone who is familiar with these things that the influence of another topic was already making itself felt in the second scene of the dream, and was hinted at by the father's business, by his deceitful conduct and by the interpretation of the first shaft as a vagina: all this pointed to a connection with the dreamer's mother.

[1900a, 827]

One of my patients, a man whose sexual abstinence was imposed on him by a severe neurosis, and whose phantasies were fixed upon his mother, had repeated dreams of going upstairs in her company. I once remarked to him that a moderate amount of masturbation would probably do him less harm than his compulsive self-restraint, and this provoked the following dream:

[1900a, 832]

When I insist to one of my patients on the frequency of Oedipus dreams, in which the dreamer has sexual intercourse with his own mother, he often replies: 'I have no recollection of having had any such dream.' Immediately afterwards, however, a memory will emerge of some other inconspicuous and indifferent dream, which the patient has dreamt repeatedly. Analysis then shows that this is in fact a dream with the same content - once more an Oedipus dream. I can say with certainty that disguised dreams of sexual intercourse with the dreamer's mother are many times more frequent than straightforward ones.¹

[1900a, 855]

¹ [Footnote added 1911:] I have published elsewhere a typical example of a disguised Oedipus dream of this kind. [Reprinted below.] Another example, with a detailed analysis, has been published by Otto Rank (1911a). - [Added 1914:] For some other disguised Oedipus dreams, in which eye-symbolism is prominent, see Rank (1913). Other papers on eye-dreams and eye-symbolism, by Eder, Ferenczi and Reitler will be found in the same place. The blinding in the legend of Oedipus, as well as elsewhere, stands for castration. - [Added 1911:] Incidentally, the symbolic interpretation of undisguised Oedipus dreams was not unknown to the ancients. Rank (1910, 534) writes: 'Thus Julius Caesar is reported to have had a dream of sexual intercourse with his mother which was explained by the dream-interpreters as a favourable augury for his taking possession of the earth (Mother Earth). The oracle given to the Tarquins is equally well known, which prophesied that the conquest of Rome would fall to that one of them who should first kiss his mother ("osculum matri tulerit"). This was interpreted by Brutus as referring to Mother Earth. ("Terram osculo contigit, scilicet quod ea communis mater omnium mortalium esset" Livy, I, 56.)' - [Added 1914:] Compare in this connection the dream of Hippias reported by Herodotus (VI, 107): 'As for the Persians, they were guided to Marathon by Hippias son of Pisistratus. Hippias in the past night had seen a vision in his sleep wherein he thought that he lay with his own mother; he interpreted this dream to signify that he should return to Athens and recover his power, and so die an old man in his own mother-country.' - [Added 1911:] These myths and interpretations reveal a true psychological insight. I have found that people who know that they are preferred or favoured by the mother give evidence in their lives of a peculiar self-reliance and an unshakeable optimism which often seem like heroic attributes and bring actual success to their possessors.

[1900a, 855]
In attempting to analyse this small mistake I first thought of the phrase 'sich an der Alten
vergreifen',¹ which provided a short cut to the solution. I was under the influence of a dream
which had been told me by a young man the previous evening and the content of which could
only point to sexual intercourse with his own mother.² The strange fact that the legend finds
nothing objectionable in Queen Jocasta's age seemed to me to fit in well with the conclusion
that in being in love with one's own mother one is never concerned with her as she is in the
present but with her youthful mnemic image carried over from one's childhood. Such
incongruities always appear when a phantasy that fluctuates between two periods is made
conscious and so becomes definitely attached to one of the two periods. While absorbed in
thoughts of this kind I came to my patient, who is over ninety, and I must have been on the way
to grasping the universal human application of the Oedipus myth as correlated with the Fate
which is revealed in the oracles; for at that point I did violence to or committed a blunder on 'the
old woman'. Here again the bungled action was a harmless one; of the two possible errors,
using the morphine solution for the eye or the eye lotion for the injection, I had chosen by far the
more harmless one. This still leaves the question open of whether we may admit the possibility
of an unconscious intention in mistakes that can cause serious harm, in the same way as in the
cases which I have discussed.

[1901b, 1258]

² The 'Oedipus dream', as I am in the habit of calling it, because it contains the key to the understanding
of the legend of King Oedipus. In the text of Sophocles a reference to such a dream is put into Jocasta's
mouth. Cf. The Interpretation of Dreams (1900a), p. 739 ff.
[1901b, 1258]

The first thing we learn is that the outbreak of the anxiety state was by no means so sudden
as appeared at first sight. A few days earlier the child had woken from an anxiety-dream to the
effect that his mother had gone away, and that now he had no mother to coax with. This dream
alone points to the presence of a repressive process of ominous intensity. We cannot explain it,
as we can so many other anxiety-dreams, by supposing that the child had in his dream felt
anxiety arising from some somatic cause and had made use of the anxiety for the purpose of
fulfilling an unconscious wish which would otherwise have been deeply repressed.¹ We must
regard it rather as a genuine punishment and repression dream, and, moreover, as a dream
which failed in its function, since the child woke from his sleep in a state of anxiety. We can
easily reconstruct what actually occurred in the unconscious. The child dreamt of exchanging
endearments with his mother and of sleeping with her; but all the pleasure was transformed into
anxiety, and all the ideational content into its opposite. Repression had defeated the purpose of
the mechanism of dreaming.
[1909b, 2101]

¹ This dream consisted only of two short pictures: His uncle was smoking a cigarette
although it was Saturday. - A woman was caressing and fondling him as though he were her
child.
[1916-1917, 3277]
In regard to the first picture the dreamer (a Jew) remarked that his uncle was a pious man who never had done and never could do anything sinful like that. In regard to the woman in the second picture nothing occurred to him except his mother. These two pictures or thoughts must obviously be seen in connection with each other. But how? Since he expressly disputed the reality of his uncle's action, it is plausible to insert an 'if': 'If my uncle, that pious man, were to smoke a cigarette on a Saturday, then I might let myself, too, be cuddled by my mother.' This clearly means that cuddling with his mother was something impermissible, like smoking on a Saturday to a pious Jew. - You will recall that I told you that in the course of the dream-work all the relations between the dream-thoughts drop out; these are resolved into their raw material and it is the task of the interpretation to re-insert the omitted relations.

[1916-1917, 3277]
It cannot be said that the world has shown much gratitude to psycho-analytic research for its revelation of the Oedipus complex. On the contrary, the discovery has provoked the most violent opposition among adults; and those who had neglected to take part in the repudiation of this proscribed and tabooed emotional relationship made up for their fault later by depriving the complex of its value through twisted re-interpretations. It is my unaltered conviction that there is nothing in this to be disavowed or glossed over. We must reconcile ourselves to the fact which was recognized by the Greek legend itself as an inevitable fate. It is once again an interesting fact that the Oedipus complex, which has been rejected from real life, has been left to imaginative writing, has been placed freely, as it were, at its disposal. Otto Rank has shown in a careful study how the Oedipus complex has provided dramatic authors with a wealth of themes in endless modifications, softenings and disguises - in distortions, that is to say, of the kind which we are already familiar with as the work of a censorship. We may therefore also ascribe this Oedipus complex to dreamers who have been fortunate enough to escape conflicts with their parents in later life. And, intimately linked with it, we find what we call the 'castration complex', the reaction to the threats against the child aimed at putting a stop to his early sexual activities and attributed to his father.

Among these forbidden wishes special emphasis deserves to be further laid on the incestuous ones - that is, on those aiming at sexual intercourse with parents and brothers and sisters. You know what horror is felt, or at least professed, in human society at such intercourse, and what stress is laid on the prohibitions directed against it. Tremendous efforts have been made to explain this horror of incest. Some people have supposed that breeding considerations on the part of Nature have found psychical representation in this prohibition, since inbreeding would impair racial characters. Others have maintained that, as a result of living together from early childhood onwards, sexual desire has been diverted from the people in question. In both these cases, it may be remarked, an avoidance of incest would be secured automatically, and it would not be clear why such severe prohibitions were called for, which would point rather to the presence of a strong desire for it. Psycho-analytic researches have shown unmistakably that the choice of an incestuous love-object is, on the contrary, the first and invariable one, and that it is not until later that resistance to it sets in; it is no doubt impossible to trace back this resistance to individual psychology.

And now I have reached the point I wish to put before you. We have endeavoured to maintain the strictest impartiality and have allowed two conceptions of the dream to rank as equally probable and equally unproved. According to the first the dream is a reaction to a telepathic message: 'your daughter has just brought twins into the world.' According to the second an unconscious process of thought underlies the dream, which may be reproduced somewhat as follows: 'To-day is the day the confinement should take place if the young people in Berlin are really out in their reckoning by a month, as I suspect. And if my (first) wife were still alive, she certainly would not be content with one grandchild. To please her there would have to be at least twins!' If this second view is right, no new problems arise. It is simply a dream like any other. The (preconscious) dream-thoughts as outlined above are reinforced by the (unconscious) wish that no other than the daughter should be the dreamer's second wife, and thus the manifest dream as described to us arises.
Who then is the man, by whom the dreamer wishes to have a child, or of whose likeness she would like to be the mother? She often tried to see his face, but the dream never allowed her to; the man had to remain incognito. We know from countless analyses what this concealment means, and the conclusion we should base on analogy is verified by another statement of the dreamer's. Under the influence of paraldehyde she once recognized the face of the man in the dream as that of the hospital physician who was treating her, and who meant nothing more to her conscious emotional life. The original thus never divulged its identity, but this impression of it in 'transference' establishes the conclusion that earlier it must always have been her father. Ferenczi is perfectly right in pointing out that these 'dreams of the unsuspecting' are valuable sources of information, as confirming the conjectures of analysis. Our dreamer was the eldest of twelve children; how often must she have suffered the pangs of jealousy and disappointment when it was not she but her mother who obtained from her father the child she longed for!

With these indications of tenderness for her father, of contact with his genitals, and of death-wishes against her mother, the outline of the female Oedipus complex is sketched in. Her long retention of her ignorance of sexual matters, and her frigidity at a later period bear out these suppositions. The writer of the letter became potentially - and at times no doubt actually - a hysterical neurotic. The forces of life have, for her own happiness, carried her along with them. They have awakened in her the sexual feelings of a woman and brought her the joys of motherhood, and the capacity to work. But a portion of her libido still clings to its points of fixation in childhood; she still dreams the dream that throws her out of bed and punishes her for her incestuous object-choice by 'not inconsiderable injuries'.

But our interest in the genesis of these manifestly immoral dreams is greatly reduced when we find from analysis that the majority of dreams - innocent dreams, dreams without affect and anxiety-dreams - are revealed, when the distortions of the censorship have been undone, as the fulfilments of immoral - egoistic, sadistic, perverse or incestuous - wishful impulses. As in the world of waking life, these masked criminals are far commoner than those with their visors raised. The straightforward dream of sexual relations with one's mother, which Jocasta alludes to in the Oedipus Rex, is a rarity in comparison with all the multiplicity of dreams which psycho-analysis must interpret in the same sense.
Another group of dreams which may be described as typical are those containing the death of some loved relative - for instance, of a parent, of a brother or sister, or of a child. Two classes of such dreams must at once be distinguished: those in which the dreamer is unaffected by grief, so that on awakening he is astonished at his lack of feeling, and those in which the dreamer feels deeply pained by the death and may even weep bitterly in his sleep.

[1900a, 727]

Very different are the dreams of the other class - those in which the dreamer imagines the death of a loved relative and is at the same time painfully affected. The meaning of such dreams, as their content indicates, is a wish that the person in question may die. And since I must expect that the feelings of all of my readers and any others who have experienced similar dreams will rebel against my assertion, I must try to base my evidence for it on the broadest possible foundation.

[1900a, 728]

If anyone dreams, with every sign of pain, that his father or mother or brother or sister has died, I should never use the dream as evidence that he wishes for that person's death at the present time. The theory of dreams does not require as much as that; it is satisfied with the inference that this death has been wished for at some time or other during the dreamer's childhood. I fear, however, that this reservation will not appease the objectors; they will deny the possibility of their ever having had such a thought with just as much energy as they insist that they harbour no such wishes now. I must therefore reconstruct a portion of the vanished mental life of children on the basis of the evidence of the present.

[1900a, 728]

Many people, therefore, who love their brothers and sisters and would feel bereaved if they were to die, harbour evil wishes against them in their unconscious, dating from earlier times; and these are capable of being realized in dreams.

[1900a, 730]

At this point someone will perhaps interrupt: 'Granted that children have hostile impulses towards their brothers and sisters, how can a child's mind reach such a pitch of depravity as to wish for the death of his rivals or of playmates stronger than himself, as though the death penalty were the only punishment for every crime?' Anyone who talks like this has failed to bear in mind that a child's idea of being 'dead' has nothing much in common with ours apart from the word. Children know nothing of the horrors of corruption, of freezing in the ice-cold grave, of the terrors of eternal nothingness - ideas which grown-up people find it so hard to tolerate, as is proved by all the myths of a future life. The fear of death has no meaning to a child; hence it is that he will play with the dreadful word and use it as a threat against a playmate: 'If you do that again, you'll die, like Franz!' Meanwhile the poor mother gives a shudder and remembers, perhaps, that the greater half of the human race fail to survive their childhood years. It was actually possible for a child, who was over eight years old at the time, coming home from a visit to the Natural History Museum, to say to his mother: 'I'm so fond of you, Mummy: when you die I'll have you stuffed and I'll keep you in this room, so that I can see you all the time.' So little resemblance is there between a child's idea of being dead and our own!

[1900a, 733]

Thus if a child has reasons for wishing the absence of another, there is nothing to restrain him from giving his wish the form of the other child being dead. And the psychical reaction to dreams containing death-wishes proves that, in spite of the different content of these wishes in the case of children, they are nevertheless in some way or other the same as wishes expressed in the same terms by adults.

[1900a, 734]
A solution of this difficulty is afforded by the observation that dreams of the death of parents apply with preponderant frequency to the parent who is of the same sex as the dreamer: that men, that is, dream mostly of their father's death and women of their mother's. I cannot pretend that this is universally so, but the preponderance in the direction I have indicated is so evident that it requires to be explained by a factor of general importance.¹ It is as though - to put it bluntly - a sexual preference were making itself felt at an early age: as though boys regarded their fathers and girls their mothers as their rivals in love, whose elimination could not fail to be to their advantage.

¹ [Footnote added 1925:] The situation is often obscured by the emergence of a self-punititive impulse, which threatens the dreamer, by way of a moral reaction, with the loss of the parent whom he loves.

All of this is patent to the eyes of everyone. But it does not help us in our endeavour to explain dreams of a parent's death in people whose piety towards their parents has long been unimpeachably established. Previous discussions, moreover, will have prepared us to learn that the death-wish against parents dates back to earliest childhood.

Though observations of this kind on small children fit in perfectly with the interpretation I have proposed, they do not carry such complete conviction as is forced upon the physician by psycho-analyses of adult neurotics. In the latter case dreams of the sort we are considering are introduced into the analysis in such a context that it is impossible to avoid interpreting them as wishful dreams.

I cannot leave the subject of typical dreams of the death of loved relatives, without adding a few more words to throw light on their significance for the theory of dreams in general. In these dreams we find the highly unusual condition realized of a dream-thought formed by a repressed wish entirely eluding censorship and passing into the dream without modification. There must be special factors at work to make this event possible, and I believe that the occurrence of these dreams is facilitated by two such factors. Firstly, there is no wish that seems more remote from us than this one: 'we couldn't even dream' - so we believe - of wishing such a thing. For this reason the dream-censorship is not armed to meet such a monstrosity, just as Solon's penal code contained no punishment for parricide. Secondly, in this case the repressed and unsuspected wish is particularly often met half-way by a residue from the previous day in the form of a worry about the safety of the person concerned. This worry can only make its way into the dream by availing itself of the corresponding wish; while the wish can disguise itself behind the worry that has become active during the day. We may feel inclined to think that things are simpler than this and that one merely carries on during the night and in dreams with what one has been turning over in one's mind during the day; but if so we shall be leaving dreams of the death of people of whom the dreamer is fond completely in the air and without any connection with our explanation of dreams in general, and we shall thus be clinging quite unnecessarily to a riddle which is perfectly capable of solution.
It is also instructive to consider the relation of these dreams to anxiety-dreams. In the dreams we have been discussing, a repressed wish has found a means of evading censorship - and the distortion which censorship involves. The invariable concomitant is that painful feelings are experienced in the dream. In just the same way anxiety-dreams only occur if the censorship has been wholly or partly overpowered; and, on the other hand, the overpowering of the censorship is facilitated if anxiety has already been produced as an immediate sensation arising from somatic sources. We can thus plainly see the purpose for which the censorship exercises its office and brings about the distortion of dreams: it does so in order to prevent the generation of anxiety or other forms of distressing affect.

[1900a, 744]

There is another kind of absurdity, which occurs in dreams of dead relatives but which does not express ridicule and derision. It indicates an extreme degree of repudiation, and so makes it possible to represent a repressed thought which the dreamer would prefer to regard as utterly unthinkable. It seems impossible to elucidate dreams of this kind unless one bears in mind the fact that dreams do not differentiate between what is wished and what is real. For instance, a man who had nursed his father during his last illness and had been deeply grieved by his death, had the following senseless dream some time afterwards. His father was alive once more and talking to him in his usual way, but (the remarkable thing was that) he had really died, only he did not know it. This dream only becomes intelligible if, after the words 'but he had really died' we insert 'in consequence of the dreamer's wish', and if we explain that what 'he did not know' was that the dreamer had had this wish. While he was nursing his father he had repeatedly wished his father were dead; that is to say, he had had what was actually a merciful thought that death might put an end to his sufferings. During his mourning, after his father's death, even this sympathetic wish became a subject of unconscious self-reproach, as though by means of it he had really helped to shorten the sick man's life. A stirring up of the dreamer's earliest infantile impulses against his father made it possible for this self-reproach to find expression as a dream; but the fact that the instigator of the dream and the daytime thoughts were such worlds apart was precisely what necessitated the dream's absurdity.¹

[1900a, 880]

It is true that dreams of dead people whom the dreamer has loved raise difficult problems in dream-interpretation and that these cannot always be satisfactorily solved. The reason for this is to be found in the particularly strongly marked emotional ambivalence which dominates the dreamer's relation to the dead person. It very commonly happens that in dreams of this kind the dead person is treated to begin with as though he were alive, that he then suddenly turns out to be dead and that in a subsequent part of the dream he is alive once more. This has a confusing effect. It eventually occurred to me that this alternation between death and life is intended to represent indifference on the part of the dreamer. ('It's all the same to me whether he's alive or dead.') This indifference is, of course, not real but merely desired; it is intended to help the dreamer to repudiate his very intense and often contradictory emotional attitudes and it thus becomes a dream-representation of his ambivalence. - In other dreams in which the dreamer associates with dead people, the following rule often helps to give us our bearings. If there is no mention in the dream of the fact that the dead man is dead, the dreamer is equating himself with him: he is dreaming of his own death. If, in the course of the dream, the dreamer suddenly says to himself in astonishment, 'why, he died ever so long ago', he is repudiating this equation and is denying that the dream signifies his own death. - But I willingly confess to a feeling that dream-interpretation is far from having revealed all the secrets of dreams of this character.

[1900a, 880]
Dreams can be divided into three categories in respect of the relation between their latent and manifest content. In the first place, we may distinguish those dreams which make sense and are at the same time intelligible, which, that is to say, can be inserted without further difficulty into the context of our mental life. We have numbers of such dreams. They are for the most part short and appear to us in general to deserve little attention, since there is nothing astonishing or strange about them. Incidentally, their occurrence constitutes a powerful argument against the theory according to which dreams originate from the isolated activity of separate groups of brain cells. They give no indication of reduced or fragmentary psychical activity, but nevertheless we never question the fact of their being dreams, and do not confuse them with the products of waking life. A second group is formed by those dreams which, though they are connected in themselves and have a clear sense, nevertheless have a bewildering effect, because we cannot see how to fit that sense into our mental life. Such would be the case if we were to dream, for instance, that a relative of whom we were fond had died of the plague, when we had no reason for expecting, fearing or assuming any such thing; we should ask in astonishment: ‘How did I get hold of such an idea?’ The third group, finally, contains those dreams which are without either sense or intelligibility, which seem disconnected, confused, and meaningless. The preponderant majority of the products of our dreaming exhibit these characteristics, which are the basis of the low opinion in which dreams are held and of the medical theory that they are the outcome of a restricted mental activity. The most evident signs of incoherence are seldom absent, especially in dream-compositions of any considerable length and complexity.

¹ Another child, rather older than Hans, welcomed his younger brother with the words: ‘The stork can take him away again.’ Compare in this connection my remarks in The Interpretation of Dreams on dreams of the death of loved relatives.

Westermarck is right in insisting that savages draw no distinction between violent and natural death. In the view of unconscious thinking, a man who has died a natural death is a murdered man: evil wishes have killed him.¹ Anyone who investigates the origin and significance of dreams of the death of loved relatives (of parents or brothers or sisters) will be able to convince himself that dreamers, children and savages are at one in their attitude towards the dead - an attitude based upon emotional ambivalence.

Suppose, on the other hand, that we were to take into account the finding arrived at by psycho-analysis from the dreams of normal people, to the effect that we ourselves are subject, more strongly and more often than we suspect, to a temptation to kill someone and that that temptation produces psychical effects even though it remains out of sight of our consciousness. Suppose, again, that we were to recognize the compulsive observances of certain neurotics as being guarantees against an intensified impulse to murder or as being self-punishments on account of it. In that case we should have to attach still greater importance to our thesis that where there is a prohibition there must be an underlying desire. We should have to suppose that the desire to murder is actually present in the unconscious and that neither taboos nor moral prohibitions are psychologically superfluous but that on the contrary they are explained and justified by the existence of an ambivalent attitude towards the impulse to murder.
The ego, freed from all ethical bonds, also finds itself at one with all the demands of sexual desire, even those which have long been condemned by our aesthetic upbringing and those which contradict all the requirements of moral restraint. The desire for pleasure - the 'libido', as we call it - chooses its objects without inhibition, and by preference, indeed, the forbidden ones: not only other men's wives, but above all incestuous objects, objects sanctified by the common agreement of mankind, a man's mother and sister, a woman's father and brother. (The dream of our fifty-year-old lady, too, was incestuous; her libido was unmistakably directed to her son.) Lusts which we think of as remote from human nature show themselves strong enough to provoke dreams. Hatred, too, rages without restraint. Wishes for revenge and death directed against those who are nearest and dearest in waking life, against the dreamer's parents, brothers and sisters, husband or wife, and his own children are nothing unusual. These censored wishes appear to rise up out of a positive Hell; after they have been interpreted when we are awake, no censorship of them seems to us too severe.

The dreamer now began, without any further encouragement, to talk about his father's illness and death as well as about his own relations with him. His father was ill for a long time, and the nursing and treatment had cost him (the son) a lot of money. Yet it was never too much, he was never impatient, he never wished that after all it might soon come to an end. He was proud of his truly Jewish filial piety towards his father, of his strict obedience to Jewish Law. And here we are struck by a contradiction in the thoughts belonging to the dream. He had identified the tooth and his father. He wanted to proceed with the tooth in accordance with Jewish Law, which commanded him to pluck it out if it caused him pain or offence. He also wanted to proceed with his father, too, in accordance with the precepts of the Law, but in this case it commanded him to spare no expense or trouble, to take every burden on himself and to allow no hostile intention to emerge against the object that was causing him pain. Would not the two attitudes have agreed much more convincingly if he had really developed feelings towards his sick father similar to those towards his sick tooth - that is, if he had wished that an early death would put an end to his unnecessary, painful and costly existence?

I do not doubt that this was really his attitude towards his father during the tedious illness and that his boastful assurances of his filial piety were meant to distract him from these memories. Under such conditions the death-wish against a father is apt to become active and to hide itself under the mask of such sympathetic reflections as that 'it would be a happy release for him'. But please observe that here we have passed a barrier in the latent dream-thoughts themselves. No doubt the first portion of them was unconscious only temporarily - that is, during the construction of the dream; but his hostile impulses against his father must have been permanently unconscious. They may have originated from scenes in his childhood and have occasionally slipped into consciousness, timidly and disguised, during his father's illness. We can assert this with greater certainty of other latent thoughts which have made unmistakable contributions to the content of the dream. Nothing, indeed, is to be discovered in the dream of his hostile impulses towards his father. But if we look for the roots of such hostility to a father in childhood, we shall recall that fear of a father is set up because, in the very earliest years, he opposes a boy's sexual activities, just as he is bound to do once more from social motives after the age of puberty. This relation to his father applies to our dreamer as well: his love for him included a fair admixture of awe and anxiety, which had their source in his having been early deterred by threats from sexual activity.
This same piece of information can be further applied to another of the riddles we have come up against. You recall the amazement which was caused by our discovery that what instigates dreams are actively evil and extravagantly sexual wishes, which have made the censorship and distortion of dreams necessary. When we have interpreted a dream of this sort to the dreamer and if, to take the most favourable case, he does not actually attack the interpretation, he nevertheless regularly raises the question of where these wishes come from, since they feel alien to him and their opposite is what he is conscious of. We need have no hesitation in pointing out their origin. These evil wishful impulses arise from the past, and often from a past that is not very remote. It can be shown that there was a time when they were familiar and conscious, even if they are no longer so to-day. A woman, whose dream meant that she would like to see her only daughter, now seventeen years old, dead before her eyes, found under our guidance that she had indeed at one time harboured this death wish. The child was the fruit of an unhappy marriage which was soon dissolved. Once, while she still bore her daughter in her womb, in a fit of rage after a violent scene with her husband she had beaten with her fists on her body in order to kill the child inside it. How many mothers, who love their children tenderly, perhaps over-tenderly, to-day, conceived them unwillingly and wished at that time that the living thing within them might not develop further! They may even have expressed that wish in various, fortunately harmless, actions. Thus their death-wish against someone they love, which is later so mysterious, originates from the earliest days of their relationship to that person. [1916-1917, 3291]

In the same way, a father had a dream which justified the interpretation that he wished for the death of his favourite eldest child. He too was led to remember that there had been a time when this wish was not strange to him. When the child was still an infant in arms, the father, discontented with his choice of a wife, often thought that if the little creature, who meant nothing to him, were to die, he would be free once more and would make better use of his freedom. The same origin can be shown in the case of a great number of similar impulses of hatred; they are recollections of something belonging to the past, which was once conscious and played its part in mental life. You will be inclined to conclude from this that such wishes and such dreams ought not to arise in cases where transformations of this kind in one's relation to someone never occurred, where the relation was of the same kind from the first. I am prepared to admit this; but I must remind you that what you must take into consideration is not the wording of the dream but its sense after it has been interpreted. It is possible that a manifest dream of the death of someone loved has merely assumed a horrifying mask and may mean something quite different, or that the loved person is intended as a misleading substitute for someone else. [1916-1917, 3291]
We will keep to wishes forgetting rid of someone, which may for the most part be attributed to the dreamer's unrestricted egoism. A wish of this kind can very often be pointed to as the constructor of a dream. Whenever anyone in the course of one's life gets in one's way - and how often this must happen in view of the complication of one's relationships in life! - a dream is promptly ready to kill that person, even if it be father or mother, brother or sister, husband or wife. This wickedness of human nature came as a great surprise to us and we were decidedly disinclined to accept this outcome of dream-interpretation without question. But as soon as we were led to look for the origin of these wishes in the past, we discovered the period of the individual's past in which there was no longer anything strange in such egoism and such wishful impulses, directed even against his closest relatives. It is children, and precisely in those earliest years which are later veiled by amnesia, who often exhibit this egoism to an extremely marked degree and who invariably show clear rudiments or, more correctly speaking, residues of it. Children love themselves first, and it is only later that they learn to love others and to sacrifice something of their own ego to others. Even those people whom a child seems to love from the beginning are loved by him at first because he needs them and cannot do without them - once again from egoistic motives. Not until later does the impulse to love make itself independent of egoism. It is literally true that his egoism has taught him to love.

[1916-1917, 3292]
Everyone who has passed the matriculation examination at the end of his school studies complains of the obstinacy with which he is pursued by anxiety-dreams of having failed, or of being obliged to take the examination again, etc. In the case of those who have obtained a University degree this typical dream is replaced by another one which represents them as having failed in their University Finals; and it is in vain that they object, even while they are still asleep, that for years they have been practising medicine or working as University lecturers or heads of offices. The ineradicable memories of the punishments that we suffered for our evil deeds in childhood become active within us once more and attach themselves to the two crucial points in our studies - the 'dies irae, dies illa' of our stiffest examinations. The 'examination anxiety' of neurotics owes its intensification to these same childhood fears. After we have ceased to be school-children, our punishments are no longer inflicted on us by our parents or by those who brought us up or later by our schoolmasters. The relentless causal chains of real life take charge of our further education, and now we dream of Matriculation or Finals (and who has not trembled on those occasions, even if he was well-prepared for the examination?) whenever, having done something wrong or failed to do something properly, we expect to be punished by the event - whenever, in short, we feel the burden of responsibility.

For a further explanation of examination dreams I have to thank an experienced colleague, who once declared at a scientific meeting that so far as he knew dreams of Matriculation only occur in people who have successfully passed it and never in people who have failed in it. It would seem, then, that anxious examination dreams (which, as has been confirmed over and over again, appear when the dreamer has some responsible activity ahead of him next day and is afraid there may be a fiasco) search for some occasion in the past in which great anxiety has turned out to be unjustified and has been contradicted by the event. This, then, would be a very striking instance of the content of a dream being misunderstood by the waking agency. What is regarded as an indignant protest against the dream: 'But I'm a doctor, etc., already!' would in reality be the consolation put forward by the dream, and would accordingly run: 'Don't be afraid of tomorrow! Just think how anxious you were before your Matriculation, and yet nothing happened to you. You're a doctor, etc., already.' And the anxiety which is attributed to the dream would really have arisen from the day's residues.

Such tests as I have been able to make of this explanation on myself and on other people, though they have not been sufficiently numerous, have confirmed its validity. For instance, I myself failed in Forensic Medicine in my Finals; but I have never had to cope with this subject in dreams, whereas I have quite often been examined in Botany, Zoology or Chemistry. I went in for the examination in these subjects with well-founded anxiety; but, whether by the grace of destiny or of the examiners, I escaped punishment. In my dreams of school examinations, I am invariably examined in History, in which I did brilliantly - though only, it is true, because my kindly master (the one-eyed benefactor of another dream, see p. 531) did not fail to notice that on the paper of questions which I handed him back I had run my finger-nail through the middle one of the three questions included, to warn him not to insist upon that particular one. One of my patients, who decided not to sit for his Matriculation the first time but passed it later, and who subsequently failed in his army examination and never got a commission, has told me that he often dreams of the former of these examinations but never of the latter.
The interpretation of examination dreams is faced by the difficulty which I have already referred to as characteristic of the majority of typical dreams. It is but rarely that the material with which the dreamer provides us in associations is sufficient to interpret the dream. It is only by collecting a considerable number of examples of such dreams that we can arrive at a better understanding of them. Not long ago I came to the conclusion that the objection, ‘You’re a doctor, etc., already’, does not merely conceal a consolation but also signifies a reproach. This would have run: ‘You’re quite old now, quite far advanced in life, and yet you go on doing these stupid, childish things.’ This mixture of self-criticism and consolation would thus correspond to the latent content of examination dreams. If so, it would not be surprising if the self-reproaches for being ‘stupid’ and ‘childish’ in these last examples referred to the repetition of reprehensible sexual acts.

Wilhelm Stekel, who put forward the first interpretation of dreams of Matriculation (‘Matura’), was of the opinion that they regularly related to sexual tests and sexual maturity. My experience has often confirmed his view.

It is only now, after we have properly assessed the importance of symbolism in dreams, that it becomes possible for us to take up the theme of typical dreams, which was broken off on p. 541 above. I think we are justified in dividing such dreams roughly into two classes: those which really always have the same meaning, and those which, in spite of having the same or a similar content, must nevertheless be interpreted in the greatest variety of ways. Among typical dreams of the first class I have already dealt in some detail with examination dreams.

Dreams of missing a train deserve to be put alongside examination dreams on account of the similarity of their affect, and their explanation shows that we shall be right in doing so. They are dreams of consolation for another kind of anxiety felt in sleep - the fear of dying. ‘Departing’ on a journey is one of the commonest and best authenticated symbols of death. These dreams say in a consoling way: ‘Don’t worry, you won’t die (depart)’, just as examination dreams say soothingly: ‘Don’t be afraid, no harm will come to you this time either.’ The difficulty of understanding both these kinds of dreams is due to the fact that the feeling of anxiety is attached precisely to the expression of consolation.
In this series of dreams dreamt by an author who had been a journeyman tailor in his youth, it is hard to recognize the dominance of wish-fulfilment. All the dreamer's enjoyment lay in his day-time existence, whereas in his dreams he was still haunted by the shadow of an unhappy life from which he had at last escaped. Some dreams of my own of a similar kind have enabled me to throw a little light on the subject. As a young doctor I worked for a long time at the Chemical Institute without ever becoming proficient in the skills which that science demands; and for that reason in my waking life I have never liked thinking of this barren and indeed humiliating episode in my apprenticeship. On the other hand I have a regularly recurring dream of working in the laboratory, of carrying out analyses and of having various experiences there. These dreams are disagreeable in the same way as examination dreams and they are never very distinct. While I was interpreting one of them, my attention was eventually attracted by the word *analysis*, which gave me a key to their understanding. Since those days I have become an 'analyst', and I now carry out analyses which are very highly spoken of, though it is true that they are 'psycho-analyses'. It was now clear to me: if I have grown proud of carrying out analyses of that kind in my daytime life and feel inclined to boast to myself of how successful I have become, my dreams remind me during the night of those other, unsuccessful analyses of which I have no reason to feel proud. They are the punishment dreams of a *parvenu*, like the dreams of the journeyman tailor who had grown into a famous author. But how does it become possible for a dream, in the conflict between a *parvenu*’s pride and his self-criticism, to side with the latter, and choose as its content a sensible warning instead of an unlawful wish-fulfilment? As I have already said, the answer to this question raises difficulties. We may conclude that the foundation of the dream was formed in the first instance by an exaggeratedly ambitious phantasy, but that humiliating thoughts that poured cold water on the phantasy found their way into the dream instead. It may be remembered that there are masochistic impulses in the mind, which may be responsible for a reversal such as this. I should have no objection to this class of dreams being distinguished from 'wish-fulfilment dreams' under the name of 'punishment dreams'. I should not regard this as implying any qualification of the theory of dreams which I have hitherto put forward; it would be no more than a linguistic expedient for meeting the difficulties of those who find it strange that opposites should converge. But a closer examination of some of these dreams brings something more to light. In an indistinct part of the background of one of my laboratory dreams I was of an age which placed me precisely in the gloomiest and most unsuccessful year of my medical career. I was still without a post and had no idea how I could earn my living; but at the same time I suddenly discovered that I had a choice open to me between several women whom I might marry! So I was once more young, and, more than everything, she was once more young - the woman who had shared all these difficult years with me. The unconscious instigator of the dream was thus revealed as one of the constantly gnawing wishes of a man who is growing older. The conflict raging in other levels of the mind between vanity and self-criticism had, it is true, determined the content of the dream; but it was only the more deeply-rooted wish for youth that had made it possible for that conflict to appear as a dream. Even when we are awake we sometimes say to ourselves: 'Things are going very well to-day and times were hard in the old days; all the same, it was lovely then - I was still young.'

[1900a, 918]
Dreams of missing a train deserve to be put alongside examination dreams on account of the similarity of their affect, and their explanation shows that we shall be right in doing so. They are dreams of consolation for another kind of anxiety felt in sleep - the fear of dying. 'Departing' on a journey is one of the commonest and best authenticated symbols of death. These dreams say in a consoling way: 'Don't worry, you won't die (depart)', just as examination dreams say soothingly: 'Don't be afraid, no harm will come to you this time either.' The difficulty of understanding both these kinds of dreams is due to the fact that the feeling of anxiety is attached precisely to the expression of consolation.

[1900a, 842]
The value of the views put forward by Scherner and Volkelt lies in the fact that they draw attention to a number of characteristics of the content of dreams which call for explanation and seem to promise fresh discoveries. It is perfectly true that dreams contain symbolizations of bodily organs and functions, that water in a dream often points to a urinary stimulus, and that the male genitals can be represented by an upright stick or a pillar, and so on. In the case of dreams in which the field of vision is full of movement and bright colours, in contrast to the drabness of other dreams, it is scarcely possible not to interpret them as 'dreams with a visual stimulus'; nor can one dispute the part played by illusions in the case of dreams characterized by noise and a confusion of voices. Scherner reports a dream of two rows of pretty, fair-haired boys standing opposite each other on a bridge, and of their attacking each other and then going back to their original position, till at last the dreamer saw himself sitting down on a bridge and pulling a long tooth out of his jaw. Similarly Volkelt reports a dream in which two rows of drawers in a cupboard played a part and which once more ended with the dreamer pulling out a tooth. Dream-formations such as these, which are recorded in great numbers by the two authors, forbid our dismissing Scherner's theory as an idle invention without looking for its kernel of truth. The task, then, that faces us is to find an explanation of another kind for the supposed symbolization of what is alleged to be a dental stimulus.

The meaning of dreams 'with a dental stimulus', which I often had to analyse in patients, escaped me for a long time because, to my surprise, there were invariably too strong resistances against their interpretation. Overwhelming evidence left me at last in no doubt that in males the motive force of these dreams was derived from nothing other than the masturbatory desires of the pubertal period. I will analyse two dreams of this kind, one of which is also a 'flying dream.' They were both dreamt by the same person, a young man with strong homosexual leanings, which were, however, inhibited in real life.

The many modifications of the typical dream with a dental stimulus (dreams, for instance, of a tooth being pulled out by someone else, etc.) are, I think, to be explained in the same way.¹ It may, however, puzzle us to discover how 'dental stimuli' have come to have this meaning. But I should like to draw attention to the frequency with which sexual repression makes use of transpositions from a lower to an upper part of the body. Thanks to them it becomes possible in hysteria for all kinds of sensations and intentions to be put into effect, if not where they properly belong - in relation to the genitals, at least in relation to other, unobjectionable parts of the body. One instance of a transposition of this kind is the replacement of the genitals by the face in the symbolism of unconscious thinking. Linguistic usage follows the same line in recognizing the buttocks as homologous to the cheeks, and by drawing a parallel between the 'labia' and the lips which frame the aperture of the mouth. Comparisons between nose and penis are common, and the similarity is made more complete by the presence of hair in both places. The one structure which affords no possibility of an analogy is the teeth; and it is precisely this combination of similarity and dissimilarity which makes the teeth so appropriate for representational purposes when pressure is being exercised by sexual repression.

I cannot pretend that the interpretation of dreams with a dental stimulus as dreams of masturbation - an interpretation whose correctness seems to me beyond doubt - has been entirely cleared up.² I have given what explanation I can and must leave what remains unsolved. But I may draw attention to another parallel to be found in linguistic usage. In our part of the world the act of masturbation is vulgarly described as 'sich einen ausreissen' or 'sich einen herunterreissen'.³ I know nothing of the source of this terminology or of the imagery on which it is based; but 'a tooth' would fit very well into the first of the two phrases.
A tooth being pulled out by someone else in a dream is as a rule to be interpreted as castration (like having one's hair cut by a barber, according to Stekel). A distinction must in general be made between dreams with a dental stimulus and dentist dreams, such as those recorded by Conat (1913).

A communication by C. G. Jung informs us that dreams with a dental stimulus occurring in women have the meaning of birth dreams. - Ernest Jones has brought forward clear confirmation of this. The element in common between this interpretation and the one put forward above lies in the fact that in both cases (castration and birth) what is in question is the separation of a part of the body from the whole.

The remaining phrases in the manifest dream can be explained now in relation to the masturbation complex. 'He looked bad' is indeed an allusion to another remark of the dentist's to the effect that it looks bad if one has lost a tooth in that part of the mouth; but it relates at the same time to the 'looking bad' by which a young man at puberty betrays, or is afraid he betrays, his excessive sexual activity. It was not without relief to his own feelings that in the manifest content the dreamer displaced the 'looking bad' from himself on to his father - one of the kinds of reversal by the dream-work which is familiar to you. 'He had been living since then' coincides with the wish to bring back to life as well as with the dentist's promise that the tooth would survive. The sentence 'the dreamer was doing all he could to prevent him (his father) noticing it' is very subtly devised to mislead us into thinking that it should be completed by the words 'that he was dead'. The only completion, however, that makes sense comes once more from the masturbation complex; in that connection it is self-evident that the young man did all he could to conceal his sexual life from his father. And finally, remember that we must always interpret what are called 'dreams with a dental stimulus' as relating to masturbation and the dreaded punishment for it.
The interpretation of dreams of fire justifies the nursery law which forbids a child to ‘play with fire’ - so that he shall not wet his bed at night. For in their case, too, there is an underlying recollection of the enuresis of childhood. In my 'Fragment of an Analysis of a Case of Hysteria', I have given a complete analysis and synthesis of a fire dream of this kind in connection with the dreamer's case history, and I have shown what impulses of adult years this infantile material can be used to represent.

[1900a, 852]
A large number of dreams, often accompanied by anxiety and having as their content such subjects as passing through narrow spaces or being in water, are based upon phantasies of intra-uterine life, of existence in the womb and of the act of birth. What follows was the dream of a young man who, in his imagination, had taken advantage of an intra-uterine opportunity of watching his parents copulating.

[1900a, 856]

² [Footnote added 1909:] It was not for a long time that I learned to appreciate the importance of phantasies and unconscious thoughts about life in the womb. They contain an explanation of the remarkable dread that many people have of being buried alive; and they also afford the deepest unconscious basis for the belief in survival after death, which merely represents a projection into the future of this uncanny life before birth. Moreover, the act of birth is the first experience of anxiety, and thus the source and prototype of the affect of anxiety.

[1900a, 856]

Rank has shown from a series of dreams that birth-dreams make use of the same symbolism as dreams with a urinary stimulus. The erotic stimulus is represented in the latter as a urinary stimulus; and the stratification of meaning in these dreams corresponds to a change that has come over the meaning of the symbol since infancy.

[1900a, 857]

Rescue dreams are connected with birth dreams. In women's dreams, to rescue, and especially to rescue from the water, has the same significance as giving birth; but the meaning is modified if the dreamer is a man.²

[1900a, 859]

Artemidorus, the dream-interpreter of antiquity, was certainly right in maintaining that the meaning of a dream depends on who the dreamer happens to be. Under the laws governing the expression of unconscious thoughts, the meaning of rescuing may vary, depending on whether the author of the phantasy is a man or a woman. It can equally mean (in a man) making a child, i.e. causing it to be born, or (in a woman) giving birth oneself to a child. These various meanings of rescuing in dreams and phantasies can be recognized particularly clearly when they are found in connection with water. A man rescuing a woman from the water in a dream means that he makes her a mother, which in the light of the preceding discussion amounts to making her his own mother. A woman rescuing someone else (a child) from the water acknowledges herself in this way as the mother who bore him, like Pharaoh's daughter in the legend of Moses (Rank, 1909). At times there is also a tender meaning contained in rescue-phantasies directed towards the father. In such cases they aim at expressing the subject's wish to have his father as a son - that is, to have a son who is like his father.

[1910h, 2334]
The dream which the writer of the letter asks us to interpret is not hard to understand. It is a dream of rescuing from water, a typical birth-dream. The language of symbolism, as you are aware, knows no grammar; it is an extreme case of a language of infinitives, and even the active and passive are represented by one and the same image. If in a dream a woman pulls (or tries to pull) a man out of the water, that may mean that she wants to be his mother (takes him for her son as Pharaoh's daughter did with Moses). Or it may mean that she wants him to make her into a mother: she wants to have a son by him, who, as a likeness of him, can be his equivalent. The tree-trunk to which the woman was clinging is easily recognized as a phallic symbol, even though it is not standing straight up, but inclined towards the surface of the water - in the dream the word is 'bent'. The onrush and recoil of the breakers brought to the mind of another dreamer who was relating a similar dream a comparison with the intermittent pains of labour; and when, knowing that she had not yet borne a child, I asked her how she knew of this characteristic of labour, she said that she imagined labour as a kind of colic - a quite unimpeachable description physiologically. She gave the association ‘The Waves of the Sea and of Love’. How our present dreamer at so early as age can have arrived at the finer details of symbolism - tongue of land, palm-tree - I am naturally unable to say. We must not, moreover, overlook the fact that, when people assert that they have for years been pursued by the same dream, it often turns out that the manifest content is not quite the same. Only the kernel of the dream has recurred each time; the details of the content are changed or additions are made to them.

[1922a, 3892]

Rank's researches have made us acquainted with the source and purpose of this myth. I need only refer to them with some brief indications. A hero is someone who has had the courage to rebel against his father and has in the end victoriously overcome him. Our myth traces this struggle back as far as the individual's prehistory, for it represents him as being born against his father's will and rescued despite his father's evil intention. The exposure in a casket is an unmistakable symbolic representation of birth: the casket is the womb and the water is the amniotic fluid. The parent-child relationship is represented in countless dreams by pulling out of the water or rescuing from the water. When a people’s imagination attaches the myth of birth which we are discussing to an outstanding figure, it is intending in that way to recognize him as a hero and to announce that he has fulfilled the regular pattern of a hero's life. In fact, however, the source of the whole poetic fiction is what is known as a child's 'family romance', in which the son reacts to a change in his emotional relation to his parents and in particular to his father. A child's earliest years are dominated by an enormous overvaluation of his father; in accordance with this a king and queen in dreams and fairy tales invariably stand for parents. Later, under the influence of rivalry and of disappointment in real life, the child begins to detach himself from his parents and to adopt a critical attitude towards his father. Thus the two families in the myth - the aristocratic one and the humble one - are both of them reflections of the child's own family as they appeared to him in successive periods of his life.

[1939a, 4843]
Rescue dreams are connected with birth dreams. In women's dreams, to rescue, and especially to rescue from the water, has the same significance as giving birth; but the meaning is modified if the dreamer is a man.²

² [Footnote added 1911:] A dream of this kind has been reported by Pfister (1909). For the symbolic meaning of rescuing see Freud, 1910d, and Freud, 1910h. [Added 1914:] See also Rank (1911b) and Reik (1911). [Added 1919:] See further, Rank (1914). [1900a, 859]

Artemidorus, the dream-interpreter of antiquity, was certainly right in maintaining that the meaning of a dream depends on who the dreamer happens to be. Under the laws governing the expression of unconscious thoughts, the meaning of rescuing may vary, depending on whether the author of the phantasy is a man or a woman. It can equally mean (in a man) making a child, i.e. causing it to be born, or (in a woman) giving birth oneself to a child. These various meanings of rescuing in dreams and phantasies can be recognized particularly clearly when they are found in connection with water. A man rescuing a woman from the water in a dream means that he makes her a mother, which in the light of the preceding discussion amounts to making her his own mother. A woman rescuing someone else (a child) from the water acknowledges herself in this way as the mother who bore him, like Pharoah's daughter in the legend of Moses (Rank, 1909). At times there is also a tender meaning contained in rescue-phantasies directed towards the father. In such cases they aim at expressing the subject's wish to have his father as a son - that is, to have a son who is like his father. [1910h, 2334]
I can imagine that to point out the existence of lying dreams of this kind, 'obliging' dreams, will arouse a positive storm of helpless indignation in some readers who call themselves analysts. 'What!' they will exclaim, 'the unconscious, the real centre of our mental life, the part of us that is so much nearer the divine than our poor consciousness - it too can lie! Then how can we still build on the interpretations of analysis and the accuracy of our findings?' To which one must reply that the recognition of these lying dreams does not constitute any shattering novelty. I know, indeed, that the craving of mankind for mysticism is ineradicable, and that it makes ceaseless efforts to win back for mysticism the territory it has been deprived of by *The Interpretation of Dreams*, but surely in the case under consideration everything is simple enough. A dream is not the 'unconscious'; it is the form into which a thought left over from preconscious, or even from conscious, waking life, can, thanks to the favouring state of sleep, be recast. In the state of sleep this thought has been reinforced by unconscious wishful impulses and has thus experienced distortion through the dream-work, which is determined by the mechanisms prevailing in the unconscious. With our dreamer, the intention to mislead me, just as she did her father, certainly emanated from the preconscious, and may indeed have been conscious; it could come to expression by entering into connection with the unconscious wishful impulse to please her father (or father-substitute), and in this way it created a lying dream. The two intentions, to betray and to please her father, originated in the same complex; the former resulted from the repression of the latter, and the later one was brought back by the dream-work to the earlier one. There can therefore be no question of any devaluation of the unconscious, nor of a shattering of our confidence in the results of analysis. [1920a, 3854]
Hypocritical dreams of this description are not uncommon events in my own case or in that of other people. While I was engaged in working out a certain scientific problem, I was troubled for several nights in close succession by a somewhat confusing dream which had as its subject a reconciliation with a friend whom I had dropped many years before. On the fourth or fifth occasion I at last succeeded in understanding the meaning of the dream. It was an incitement to abandon my last remnants of consideration for the person in question and to free myself from him completely, and it had been hypocritically disguised as its opposite. I have reported elsewhere a 'hypocritical Oedipus dream', dreamt by a man, in which the hostile impulses and death-wishes contained in the dream-thoughts were replaced by manifest affection. Another kind of hypocritical dream will be mentioned below in Chapter VI.

[1900a, 916]

There is one class of dreams which have a particular claim to be described as 'hypocritical' and which offer a hard test to the theory of wish-fulfilment. My attention was drawn to them when Frau Dr. M. Hilferding brought up the following record of a dream of Peter Rosegger's for discussion by the Vienna Psycho-Analytical Society.

[1900a, 916]

Rosegger writes in his story 'Fremd gemacht!' ['Dismissed!] 'As a rule I am a sound sleeper but many a night I have lost my rest - for, along with my modest career as a student and man of letters, I have for many years dragged around with me, like a ghost from which I could not set myself free, the shadow of a tailor's life.

[1900a, 916]

'It is not as though in the day-time I had reflected very often or very intensely on my past. One who had cast off the skin of a Philistine and was seeking to conquer Earth and Heaven had other things to do. Nor would I, when I was a dashing young fellow, have given more than a thought to my nightly dreams. Only later, when the habit had come to me of reflecting upon everything, or when the Philistine within me began to stir a trifle, did I ask myself why it should be that, if I dreamt at all, I was always a journeyman tailor and that I spent so long a time as such with my master and worked without pay in his workshop. I knew well enough, as I sat like that beside him, sewing and ironing, that my right place was no longer there and that as a townsman I had other things to occupy me. But I was always on vacation, I was always having summer holidays, and so it was that I sat beside my master as his assistant. It often irked me and I felt sad at the loss of time in which I might well have found better and more useful things to do. Now and then, when something went awry, I had to put up with a scolding from my master, though there was never any talk of wages. Often, as I sat there with bent back in the dark workshop, I thought of giving notice and taking my leave. Once I even did so; but my master paid no heed and I was soon sitting beside him again and sewing.

[1900a, 916]

'After such tedious hours, what a joy it was to wake! And I determined that if this persistent dream should come again I would throw it from me with energy and call aloud: "This is mere hocus-pocus, I am lying in bed and want to sleep. . . ." But next night I was once more sitting in the tailor's workshop.

[1900a, 917]
'And so it went on for years with uncanny regularity. Now it happened once that my master and I were working at Alpelhofer’s (the peasant in whose house I had worked when I was first apprenticed) and my master showed himself quite especially dissatisfied with my work. "I'd like to know where you're wool-gathering," he said, and looked at me darkly. The most reasonable thing to do, I thought, would be to stand up and tell him that I was only with him to please him and then go off. But I did not do so. I made no objection when my master took on an apprentice and ordered me to make room for him on the bench. I moved into the corner and sewed. The same day another journeyman was taken on as well, a canting hypocrite - he was a Bohemian - who had worked at our place nineteen years before, and had fallen into the brook once on his way back from the inn. When he looked for a seat there was no more room. I turned to my master questioningly, and he said to me: "You've no gift for tailoring, you can go! you're dismissed!" My fright at this was so overpowering that I awoke.

[1900a, 917]

'The grey light of morning was glimmering through the uncurtained windows into my familiar home. Works of art surrounded me; there in my handsome book-case stood the eternal Homer, the gigantic Dante, the incomparable Shakespeare, the glorious Goethe—all the magnificent immortals. From the next room rang out the clear young voices of the awakening children joking with their mother. I felt as though I had found afresh this idyllically sweet, this peaceful, poetic, spiritual life in which I had so often and so deeply felt a meditative human happiness. Yet it vexed me that I had not been beforehand with my master in giving him notice, but had been dismissed by him.

[1900a, 917]

'And how astonished I was! From the night on which my master dismissed me, I enjoyed peace; I dreamt no more of the tailoring days which lay so far back in my past-days which had been so cheerfully unassuming but had thrown such a long shadow over my later years.'

[1900a, 917]
In this series of dreams dreamt by an author who had been a journeyman tailor in his youth, it is hard to recognize the dominance of wish-fulfilment. All the dreamer's enjoyment lay in his day-time existence, whereas in his dreams he was still haunted by the shadow of an unhappy life from which he had at last escaped. Some dreams of my own of a similar kind have enabled me to throw a little light on the subject. As a young doctor I worked for a long time at the Chemical Institute without ever becoming proficient in the skills which that science demands; and for that reason in my waking life I have never liked thinking of this barren and indeed humiliating episode in my apprenticeship. On the other hand I have a regularly recurring dream of working in the laboratory, of carrying out analyses and of having various experiences there. These dreams are disagreeable in the same way as examination dreams and they are never very distinct. While I was interpreting one of them, my attention was eventually attracted by the word 'analysis', which gave me a key to their understanding. Since those days I have become an 'analyst', and I now carry out analyses which are very highly spoken of, though it is true that they are 'psycho-analyses'. It was now clear to me: if I have grown proud of carrying out analyses of that kind in my daytime life and feel inclined to boast to myself of how successful I have become, my dreams remind me during the night of those other, unsuccessful analyses of which I have no reason to feel proud. They are the punishment dreams of a parvenu, like the dreams of the journeyman tailor who had grown into a famous author. But how does it become possible for a dream, in the conflict between a parvenu's pride and his self-criticism, to side with the latter, and choose as its content a sensible warning instead of an unlawful wish-fulfilment?

As I have already said, the answer to this question raises difficulties. We may conclude that the foundation of the dream was formed in the first instance by an exaggeratedly ambitious phantasy, but that humiliating thoughts that poured cold water on the phantasy found their way into the dream instead. It may be remembered that there are masochistic impulses in the mind, which may be responsible for a reversal such as this. I should have no objection to this class of dreams being distinguished from 'wish-fulfilment dreams' under the name of 'punishment dreams'. I should not regard this as implying any qualification of the theory of dreams which I have hitherto put forward; it would be no more than a linguistic expedient for meeting the difficulties of those who find it strange that opposites should converge. But a closer examination of some of these dreams brings something more to light. In an indistinct part of the background of one of my laboratory dreams I was of an age which placed me precisely in the gloomiest and most unsuccessful year of my medical career. I was still without a post and had no idea how I could earn my living; but at the same time I suddenly discovered that I had a choice open to me between several women whom I might marry! So I was once more young, and, more than everything, she was once more young - the woman who had shared all these difficult years with me. The unconscious instigator of the dream was thus revealed as one of the constantly gnawing wishes of a man who is growing older. The conflict raging in other levels of the mind between vanity and self-criticism had, it is true, determined the content of the dream; but it was only the more deeply-rooted wish for youth that had made it possible for that conflict to appear as a dream. Even when we are awake we sometimes say to ourselves: "Things are going very well to-day and times were hard in the old days; all the same, it was lovely then - I was still young." [1900a, 918]

Another group of dreams, which I have often come across in myself and recognized as hypocritical, have as their content a reconciliation with people with whom friendly relations have long since ceased. In such cases analysis habitually reveals some occasion which might urge me to abandon the last remnant of consideration for these former friends and to treat them as strangers or enemies. The dream, however, prefers to depict the opposite relationship. [1900a, 919]
There was a single piece of material in the course of this analysis which I could regard as a positive transference, as a greatly weakened revival of the girl's original passionate love for her father. Even this manifestation was not quite free from other motives, but I mention it because it brings up, in another direction, an interesting problem of analytic technique. At a certain period, not long after the treatment had begun, the girl brought a series of dreams which, distorted according to rule and couched in the usual dream-language, could nevertheless be easily translated with certainty. Their content, when interpreted, was, however, remarkable. They anticipated the cure of the inversion through the treatment, expressed her joy over the prospects in life that would then be opened before her, confessed her longing for a man's love and for children, and so might have been welcomed as a gratifying preparation for the desired change. The contradiction between them and the girl's utterances in waking life at the time was very great. She did not conceal from me that she meant to marry, but only in order to escape from her father's tyranny and to follow her true inclinations undisturbed. As for the husband, she remarked rather contemptuously, she would easily deal with him, and besides, one could have sexual relations with a man and a woman at one and the same time, as the example of the adored lady showed. Warned through some slight impression or other, I told her one day that I did not believe these dreams, that I regarded them as false or hypocritical, and that she intended to deceive me just as she habitually deceived her father. I was right; after I had made this clear, this kind of dream ceased. But I still believe that, beside the intention to mislead me, the dreams partly expressed the wish to win my favour; they were also an attempt to mislead me, perhaps in order to disappoint me all the more thoroughly later on.

[1920a, 3853]
Like every other writer on the subject, with the exception of Robert, I have pointed out as a third peculiarity of the content of dreams that it may include impressions which date back to earliest childhood, and which seem not to be accessible to waking memory. It is naturally hard to determine how rarely or how frequently this occurs, since the origin of the dream elements in question is not recognized after waking. Proof that what we are dealing with are impressions from childhood must therefore be established by external evidence and there is seldom an opportunity for doing this. A particularly convincing example is that given by Maury of the man who determined one day to revisit his old home after an absence of more than twenty years. During the night before his departure he dreamt that he was in a totally unknown place and there met an unknown man in the street and had a conversation with him. When he reached his home, he found that the unknown place was a real one in the immediate neighbourhood of his native town, and the unknown man in the dream turned out to be a friend of his dead father's who was still living there. This was conclusive evidence that he had seen both the man and the place in his childhood. This dream is also to be interpreted as a dream of impatience like that of the girl with the concert-ticket in her pocket (p. 647 f.), that of the child whose father had promised to take her on an excursion to the Hameau (cf. p. 628 f.), and similar ones. The motives which led the dreamers to reproduce one particular impression from their childhood rather than any other cannot, of course, be discovered without an analysis.

Numerous examples of dreams of this infantile type can be found occurring in adults as well, though, as I have said, they are usually brief in content. Thus a number of people regularly respond to a stimulus of thirst during the night with dreams of drinking, which thus endeavour to get rid of the stimulus and enable sleep to continue. In some people 'dreams of convenience' of this kind often occur before waking, when the necessity for getting up presents itself. They dream that they are already up and at the washing-stand, or that they are already at the school or office where they are due at some particular time. During the night before a journey we not infrequently dream of having arrived at our destination; so too, before a visit to the theatre or a party, a dream will often anticipate the pleasure that lies ahead - out of impatience, as it were. In other dreams the wish-fulfilment is expressed a stage more indirectly: some connection or implication must be established - that is, the work of interpretation must be begun - before the wish-fulfilment can be recognized. A man told me, for instance, that his young wife had had a dream that her period had started. I reflected that if this young woman had missed her period she must have known that she was faced with a pregnancy. Thus when she reported her dream she was announcing her pregnancy, and the meaning of the dream was to represent as fulfilled her wish that the pregnancy might be postponed for a while. Under unusual or extreme conditions dreams of this infantile character are particularly common. Thus the leader of a polar expedition has recorded that the members of his expedition, while they were wintering in the ice-field and living on a monotonous diet and short rations, regularly dreamt like children of large meals, of mountains of tobacco, and of being back at home.

[1900a, 675]

[1901a, 1064]
A girl had a dream of seeing her sister's only surviving child lying dead in the same surroundings in which a few years earlier she had in fact seen the dead body of her sister's first child. She felt no pain over this; but she naturally rejected the idea that this situation represented any wish of hers. Nor was there any need to suppose this. It had been beside the first child's coffin, however, that, years before, she had seen and spoken to the man she was in love with; if the second child died, she would no doubt meet the man again in her sister's house. She longed for such a meeting, but fought against the feeling. On the dream-day she had bought a ticket for a lecture which was to be given by this same man, to whom she was still devoted. Her dream was a simple dream of impatience of the kind that often occurs before journeys, visits to the theatre, and similar enjoyments that lie ahead. But in order to disguise this longing from her, the situation was displaced on to an event of a kind most unsuitable for producing a feeling of enjoyment, though it had in fact done so in the past. It is to be observed that the emotional behaviour in the dream was appropriate to the real content which lay in the background and not to what was pushed into the foreground. The dream-situation anticipated the meeting she had so long desired; it offered no basis for any painful feelings.

Moreover I do not mean to assert that the wish-fulfilment dreams of adults which are constructed on infantile lines only appear as reactions to the imperative needs that I have mentioned. We are acquainted as well with short, clear dreams of this sort which, under the influence of some dominant situation, arise out of what are unquestionably psychical sources of stimulation. There are, for instance, dreams of impatience: if someone has made preparations for a journey, for a theatrical performance that is important to him, for going to a lecture or paying a visit, he may dream of a premature fulfilment of his expectation; he may, during the night before the event, see himself arrived at his destination, present at the theatre, in conversation with the person he is going to visit. Or there are what are justly known as dreams of convenience, in which a person who would like to sleep longer dreams that he is already up and is washing, or is already at school, whereas he is really still sleeping and would rather get up in a dream than in reality. The wish to sleep, which we have recognized as regularly playing a part in the construction of dreams, comes into the open in these dreams and reveals itself in them as the essential dream-constructor. There is good reason for ranking the need to sleep alongside of the other great bodily needs.

The wishes which act as motive forces in this dream are obvious. First there are the superficial wishes of the day, that Christmas with its presents may already be here (a dream of impatience) and accompanying these is the deeper wish, now permanently present, for sexual satisfaction from the dreamer's father. This is immediately replaced by the wish to see once more what was then so fascinating. The mental process then proceeds on its way. Starting from the fulfilment of this last wish with the conjuring up of the primal scene, it passes on to what has now become inevitable - the repudiation of that wish and its repression.
This dream, which I have brought forward on account of its symbolic elements, may be described as a 'biographical' one. Dreams of this kind occur frequently during psycho-analysis, but perhaps only rarely outside it.¹

[1900a, 817]
In some dreams of landscapes or other localities emphasis is laid in the dream itself on a convinced feeling of having been there once before. (Occurrences of 'déjà vu' in dreams have a special meaning.) These places are invariably the genitals of the dreamer's mother; there is indeed no other place about which one can assert with such conviction that one has been there once before.

[1900a, 856]

On one occasion only I was perplexed by an obsessional neurotic who told me a dream in which he was visiting a house that he had been in twice before. But this particular patient had told me a considerable time before of an episode during his sixth year. On one occasion he had been sharing his mother's bed and misused the opportunity by inserting his finger into her genitals while she was asleep.

[1900a, 856]

To conclude this collection of examples, which is certainly not complete, I will relate an instance taken from psycho-analytic experience; if it does not rest upon mere coincidence, it furnishes a beautiful confirmation of our theory of the uncanny. It often happens that neurotic men declare that they feel there is something uncanny about the female genital organs. This unheimlich place, however, is the entrance to the former Heim of all human beings, to the place where each one of us lived once upon a time and in the beginning. There is a joking saying that 'Love is home-sickness'; and whenever a man dreams of a place or a country and says to himself, while he is still dreaming: 'this place is familiar to me, I've been here before', we may interpret the place as being his mother's genitals or her body. In this case too, then, the unheimlich is what was once heimlich, familiar; the prefix 'un' is the token of repression.

[1919h, 3694]
Robbers, burglars and ghosts, of whom some people feel frightened before going to bed, and who sometimes pursue their victims after they are asleep, all originate from one and the same class of infantile reminiscence. They are the nocturnal visitors who rouse children and take them up to prevent their wetting their beds, or who lift the bed-clothes to make sure where they have put their hands in their sleep. Analyses of some of these anxiety-dreams have made it possible for me to identify these nocturnal visitors more precisely. In every case the robbers stood for the sleeper's father, whereas the ghosts corresponded to female figures in white nightgowns.

[1900a, 859]

² In the course of psycho-analyses of neurotics who suffer (or who suffered in their childhood) from fear of ghosts, it is often possible to show without much difficulty that the ghosts are disguises for the patient's parents. Cf. in this connection a paper upon 'Sexual Ghosts' by Haeberlin (1912). Here the person concerned was not the subject's parent (who was dead) but someone else of erotic significance to him. [1912-1913, 2709]
The core of a dream of exhibiting lies in the figure of the dreamer himself (not as he was as a child but as he appears at the present time) and his inadequate clothing (which emerges indistinctly, whether owing to superimposed layers of innumerable later memories of being in undress or as a result of the censorship). Added to these are the figures of the people in whose presence the dreamer feels ashamed. I know of no instance in which the actual spectators of the infantile scene of exhibiting have appeared in the dream; a dream is scarcely ever a simple memory. Curiously enough, the people upon whom our sexual interest was directed in childhood are omitted in all the reproductions which occur in dreams, in hysteria and in obsessional neurosis. It is only in paranoia that these spectators reappear and, though they remain invisible, their presence is inferred with fanatical conviction. What takes their place in dreams - 'a lot of strangers' who take no notice of the spectacle that is offered - is nothing more nor less than the wishful contrary of the single familiar individual before whom the dreamer exposed himself. Incidentally, 'a lot of strangers' frequently appear in dreams in many other connections, and they always stand as the wishful contrary of 'secrecy'. It is to be noticed that even in paranoia, where the original state of things is restored, this reversal into a contrary is observed. The subject feels that he is no longer alone, he has no doubt that he is being observed, but the observers are 'a lot of strangers' whose identity is left curiously vague.

[1900a, 724]

My two cases of paranoia showed an instructive contrast in the behaviour of their dreams. Whereas those of the first case were free from delusion, as has already been said, the other patient produced great numbers of persecutory dreams, which may be regarded as forerunners of or substitutes for the delusional ideas. The pursuer, whom he only managed to escape with great fear, was usually a powerful bull or some other male symbol which even in the dream itself he sometimes recognized as representing his father. One day he produced a very characteristic paranoid transference-dream. He saw me shaving in front of him, and from the scent he realized that I was using the same soap as his father had used. I was doing this in order to oblige him to make a father-transference on to me. The choice of this incident for his dream quite unmistakably betrays the patient's depreciatory attitude to his paranoid phantasies and his disbelief in them; for his own eyes could tell him every day that I was never in a position to make use of shaving-soap and that therefore there was in this respect nothing to which a father-transference could attach itself.

[1922b, 3906]

A comparison of the dreams of the two patients shows, however, that the question whether or not paranoia (or any other psychoneurosis) can penetrate into dreams is based on a false conception of dreams. Dreams are distinguished from waking thought by the fact that they can include material (belonging to the region of the repressed) which must not emerge in waking thought. Apart from this, dreams are merely a form of thinking, a transformation of preconscious material of thought by the dream-work and its conditions. Our terminology of the neuroses is not applicable to repressed material; this cannot be called hysterical, nor obsessional, nor paranoid. As against this, the other part of the material which is subjected to the process of dream-formation - the preconscious thoughts - may be normal or may bear the character of any neurosis; they may be the products of any of the pathogenic processes in which the essence of a neurosis lies. There seems to be no reason why any such pathological idea should not be transformed into a dream. A dream may therefore quite simply represent a hysterical phantasy, an obsessional idea, or a delusion - that is, may reveal one or other of these upon interpretation. Observation of the two paranoics shows that the dreams of the one were quite normal while he was subject to his delusion, and that those of the other were paranoid in content while he was treating his delusional ideas with contempt. In both cases, therefore, the dream took up the material that was at the time forced into the background in waking life. This too, however, need not necessarily be an invariable rule.
The first part of the content of this dream related to the treatment and was a transference on to me. The second part contained an allusion to a scene in childhood. The two parts were linked together by the mention of the bed.

[1900a, 684]

(10) It is not surprising that a person undergoing psycho-analytic treatment should often dream of it and be led to give expression in his dreams to the many thoughts and expectations to which the treatment gives rise. The imagery most frequently chosen to represent it is that of a journey, usually by motor-car, as being a modern and complicated vehicle. The speed of the car will then be used by the patient as an opportunity for giving vent to ironical comments. -If 'the unconscious', as an element in the subject's waking thoughts, has to be represented in a dream, it may be replaced very appropriately by subterranean regions. -These, where they occur without any reference to analytic treatment, stand for the female body or the womb. -'Down below' in dreams often relates to the genitals, 'up above', on the contrary, to the face, mouth or breast. -Wild beasts are as a rule employed by the dream-work to represent passionate impulses of which the dreamer is afraid, whether they are his own or those of other people. (It then needs only a slight displacement for the wild beasts to come to represent the people who are possessed by these passions. We have not far to go from here to cases in which a dreaded father is represented by a beast of prey or a dog or wild horse - a form of representation recalling totemism.) It might be said that the wild beasts are used to represent the libido, a force dreaded by the ego and combated by means of repression. It often happens, too, that the dreamer separates off his neurosis, his 'sick personality', from himself and depicts it as an independent person.

[1900a, 865]

A discussion of this childhood scene will be found in the footnote, and here I will only remark that its emergence shook the patient for the first time in his refusal to believe that at some prehistoric period in his childhood he had been seized with fury (which had subsequently become latent) against the father whom he loved so much. I must confess that I had expected it to have a greater effect, for the incident had been described to him so often - even by his father himself - that there could be no doubt of its objective reality. But, with that capacity for being illogical which never fails to bewilder one in such highly intelligent people as obsessional neurotics, he kept urging against the evidential value of the story the fact that he himself could not remember the scene. And so it was only along the painful road of transference that he was able to reach a conviction that his relation to his father really necessitated the postulation of this unconscious complement. Things soon reached a point at which, in his dreams, his waking phantasies, and his associations, he began heaping the grossest and filthiest abuse upon me and my family, though in his deliberate actions he never treated me with anything but the greatest respect. His demeanour as he repeated these insults to me was that of a man in despair. 'How can a gentleman like you, sir,' he used to ask, 'let yourself be abused in this way by a low, good-for-nothing fellow like me? You ought to turn me out: that's all I deserve.' While he talked like this, he would get up from the sofa and roam about the room, - a habit which he explained at first as being due to delicacy of feeling: he could not bring himself, he said, to utter such horrible things while he was lying there so comfortably. But soon he himself found a more cogent explanation, namely, that he was avoiding my proximity for fear of my giving him a beating. If he stayed on the sofa he behaved like some one in desperate terror trying to save himself from castigations of terrific violence; he would bury his head in his hands, cover his face with his arm, jump up suddenly and rush away, his features distorted with pain, and so on. He recalled that his father had had a passionate temper, and sometimes in his violence had not known where to stop. Thus, little by little, in this school of suffering, the patient won the sense of conviction which he had lacked - though to any disinterested mind the truth would have been almost self-evident.

[1909d, 2163]
In conclusion, I will mention a particular type of dream which, in the nature of the case, occurs only in the course of psycho-analytic treatment, and may bewilder or mislead beginners. These are the corroborative dreams which, as it were 'tag along behind'; they are easily accessible to analysis, and their translation merely presents what the treatment has inferred during the last new days from the material of the daily associations. When this happens, it looks as though the patient has been amiable enough to bring us in dream-form exactly what we had been 'suggesting' to him immediately before. The more experienced analyst will no doubt have some difficulty in attributing any such amiability to the patient; he accepts such dreams as hoped-for confirmations, and recognizes that they are only observed under certain conditions brought about by the influence of the treatment. The great majority of dreams forge ahead of the analysis; so that, after subtraction of everything in them which is already known and understood, there still remains a more or less clear hint at something which has hitherto been hidden.
[1911e, 2454]

The symptoms of the illness (anxiety, etc.), when they appear in a dream, seem generally speaking to mean: 'I fell ill because of this (i.e. in connection with the earlier elements of the dream).’ Such dreams, accordingly, correspond to a continuation of the analysis in the dream. [1913h, 2833]

There was a single piece of material in the course of this analysis which I could regard as a positive transference, as a greatly weakened revival of the girl's original passionate love for her father. Even this manifestation was not quite free from other motives, but I mention it because it brings up, in another direction, an interesting problem of analytic technique. At a certain period, not long after the treatment had begun, the girl brought a series of dreams which, distorted according to rule and couched in the usual dream-language, could nevertheless be easily translated with certainty. Their content, when interpreted, was, however, remarkable. They anticipated the cure of the inversion through the treatment, expressed her joy over the prospects in life that would then be opened before her, confessed her longing for a man's love and for children, and so might have been welcomed as a gratifying preparation for the desired change. The contradiction between them and the girl's utterances in waking life at the time was very great. She did not conceal from me that she meant to marry, but only in order to escape from her father's tyranny and to follow her true inclinations undisturbed. As for the husband, she remarked rather contemptuously, she would easily deal with him, and besides, one could have sexual relations with a man and a woman at one and the same time, as the example of the adored lady showed. Warned through some slight impression or other, I told her one day that I did not believe these dreams, that I regarded them as false or hypocritical, and that she intended to deceive me just as she habitually deceived her father. I was right; after I had made this clear, this kind of dream ceased. But I still believe that, beside the intention to mislead me, the dreams partly expressed the wish to win my favour; they were also an attempt to gain my interest and my good opinion - perhaps in order to disappoint me all the more thoroughly later on. [1920a, 3853]
I can imagine that to point out the existence of lying dreams of this kind, 'obliging' dreams, will arouse a positive storm of helpless indignation in some readers who call themselves analysts. 'What!' they will exclaim, 'the unconscious, the real centre of our mental life, the part of us that is so much nearer the divine than our poor consciousness - it too can lie! Then how can we still build on the interpretations of analysis and the accuracy of our findings?' To which one must reply that the recognition of these lying dreams does not constitute any shattering novelty. I know, indeed, that the craving of mankind for mysticism is ineradicable, and that it makes ceaseless efforts to win back for mysticism the territory it has been deprived of by The Interpretation of Dreams, but surely in the case under consideration everything is simple enough. A dream is not the 'unconscious'; it is the form into which a thought left over from preconscious, or even from conscious, waking life, can, thanks to the favouring state of sleep, be recast. In the state of sleep this thought has been reinforced by unconscious wishful impulses and has thus experienced distortion through the dream-work, which is determined by the mechanisms prevailing in the unconscious. With our dreamer, the intention to mislead me, just as she did her father, certainly emanated from the preconscious, and may indeed have been conscious; it could come to expression by entering into connection with the unconscious wishful impulse to please her father (or father-substitute), and in this way it created a lying dream. The two intentions, to betray and to please her father, originated in the same complex; the former resulted from the repression of the latter, and the later one was brought back by the dream-work to the earlier one. There can therefore be no question of any devaluation of the unconscious, nor of a shattering of our confidence in the results of analysis.

[1920a, 3854]

My two cases of paranoia showed an instructive contrast in the behaviour of their dreams. Whereas those of the first case were free from delusion, as has already been said, the other patient produced great numbers of persecutory dreams, which may be regarded as forerunners of or substitutes for the delusional ideas. The pursuer, whom he only managed to escape with great fear, was usually a powerful bull or some other male symbol which even in the dream itself he sometimes recognized as representing his father. One day he produced a very characteristic paranoid transference-dream. He saw me shaving in front of him, and from the scent he realized that I was using the same soap as his father had used. I was doing this in order to oblige him to make a father-transference on to me. The choice of this incident for his dream quite unmistakably betrays the patient's depreciatory attitude to his paranoic phantasies and his disbelief in them; for his own eyes could tell him every day that I was never in a position to make use of shaving-soap and that therefore there was in this respect nothing to which a father-transference could attach itself.

[1922b, 3906]

Let us take as an example the so-called dreams of recovery. If a patient has had a dream of this kind, in which he seems to abandon the restrictions of his neurosis - if, for instance, he overcomes some phobia or gives up some emotional attachment - we are inclined to think that he has made a great step forward, that he is ready to take his place in a new state of life, that he has begun to reckon on his recovery, etc. This may often be true, but quite as often such dreams of recovery only have the value of dreams of convenience: they signify a wish to be well at last, in order to avoid another portion of the work of analysis which is felt to lie ahead. In this sense, dreams of recovery very frequently occur, for instance, when the patient is about to enter upon a new and disagreeable phase of the transference. He is behaving in this just like some neurotics who after a few hours of analysis declare they have been cured - because they want to escape all the unpleasantness that is bound to come up for discussion in the analysis. Sufferers from war neuroses, too, who gave up their symptoms because the therapy adopted by the army doctors succeeded in making being ill even more uncomfortable than serving at the front - these sufferers, too, were following the same economic laws and in both cases alike the cures have proved to be only temporary.

[1923c, 4033]
It is by no means easy to arrive at general conclusions upon the value of correctly translated dreams. If a conflict due to ambivalence is taking place in a patient, then the emergence in him of a hostile thought certainly does not imply a permanent overcoming of his affectionate impulse - that is to say, a resolution of the conflict: neither does any such implication follow from a dream with a similarly hostile content. During a conflict such as this arising from ambivalence, there are often two dreams every night, each of them representing an opposite attitude. In that case the progress lies in the fact that a complete isolation of the two contrasted impulses has been achieved and that each of them, with the help of its unconscious reinforcements, can be followed and understood to its extreme limits. And if it sometimes happens that one of the two ambivalent dreams has been forgotten, one must not be deceived into assuming that a decision has been made in favour of the one side. The fact that one of the dreams has been forgotten shows, it is true, that for the moment one tendency is in the ascendant, but that is true only of the one day, and may be changed. The next night may perhaps bring the opposite expression into the foreground. The true state of the conflict can only be determined by taking into account all the other indications, including those of waking life.

The question of the value to be assigned to dreams is intimately related to the other question of their susceptibility to influence from 'suggestion' by the physician. Analysts may at first be alarmed at the mention of this possibility. But on further reflection this alarm will give place to the realization that the influencing of the patient's dreams is no more a blunder on the part of the analyst or disgrace to him than the guiding of the patient's conscious thoughts.

The fact that the manifest content of dreams is influenced by the analytic treatment stands in no need of proof. It follows from our knowledge that dreams take their start from waking life and work over material derived from it. Occurrences during analytic treatment are of course among the impressions of waking life and soon become some of the most powerful of these. So it is not to be wondered at that patients should dream of things which the analyst has discussed with them and of which he has aroused expectations in them. At least it is no more to be wondered at than what is implied in the familiar fact of 'experimental' dreams.

But from here our interest proceeds to the question whether the latent dream-thoughts that have to be arrived at by interpretation can also be influenced or suggested by the analyst. And to this the answer must once more be that they obviously can be. For a portion of these latent dream-thoughts correspond to preconscious thought-formations, perfectly capable of being conscious, with which the dreamer might quite well have reacted to the physician's remarks in his waking state too - whether the patient's reactions were in harmony with those remarks or in opposition to them. In fact, if we replace the dream by the dream-thoughts which it contains, the question of how far one can suggest dreams coincides with the more general question of how far a patient in analysis is accessible to suggestion.

On the mechanism of dream-formation itself, on the dream-work in the strict sense of the word, one never exercises any influence: of that one may be quite sure.
If a dream brings up situations that can be interpreted as referring to scenes from the dreamer's past, it seems especially important to ask whether the physician's influence can also play a part in such contents of the dream as these. And this question is most urgent of all in the case of what are called 'corroborative' dreams, dreams which, as it were, 'tag along behind' the analysis. With some patients these are the only dreams that one obtains. Such patients reproduce the forgotten experiences of their childhood only after one has constructed them from their symptoms, associations and other signs and has propounded these constructions to them. Then follow the corroborative dreams, concerning which, however, the doubt arises whether they may not be entirely without evidential value, since they may have been imagined in compliance with the physician's words instead of having been brought to light from the dreamer's unconscious. This ambiguous position cannot be escaped in the analysis, since with these patients unless one interprets, constructs and propounds, one never obtains access to what is repressed in them.

The situation takes a favourable turn if the analysis of a corroborative dream of this sort, which 'tags along behind', is immediately followed by feelings of remembering what has hitherto been forgotten. But even then the sceptic can fall back upon an assertion that the recollections are illusory. Moreover, such feelings are for the most part absent. The repressed material is only allowed through bit by bit; and every lack of completeness inhibits or delays the forming of a sense of conviction. Furthermore, what we are dealing with may not be the reproduction of a real and forgotten event but the bringing forward of an unconscious phantasy, about which no feeling of memory is ever to be expected, though the possibility may sometimes remain of a sense of subjective conviction.

Is it possible, then, that corroborative dreams are really the result of suggestion, that they are 'obliging' dreams? The patients who produce only corroborative dreams are the same patients in whom doubt plays the principal part in resistance. One makes no attempt at shouting down this doubt by means of one's authority or at reducing it by arguments. It must persist until it is brought to an end in the further course of the analysis. The analyst, too, may himself retain a doubt of the same kind in some particular instances. What makes him certain in the end is precisely the complication of the problem before him, which is like the solution of a jig-saw puzzle. A coloured picture, pasted upon a thin sheet of wood and fitting exactly into a wooden frame, is cut into a large number of pieces of the most irregular and crooked shapes. If one succeeds in arranging the confused heap of fragments, each of which bears upon it an unintelligible piece of drawing, so that the picture acquires a meaning, so that there is no gap anywhere in the design and so that the whole fits into the frame - if all these conditions are fulfilled, then one knows that one has solved the puzzle and that there is no alternative solution.
An analogy of this kind can of course have no meaning for a patient while the work of analysis is still uncompleted. At this point I recall a discussion which I was led into with a patient whose exceptionally ambivalent attitude was expressed in the most intense compulsive doubt. He did not dispute my interpretations of his dreams and was very much struck by their agreement with the hypotheses which I put forward. But he asked whether these corroborative dreams might not be an expression of his compliance towards me. I pointed out that the dreams had also brought up a quantity of details of which I could have had no suspicion and that his behaviour in the treatment apart from this had not been precisely characterized by compliance. Whereupon he switched over to another theory and asked whether his narcissistic wish to be cured might not have caused him to produce these dreams, since, after all, I had held out to him a prospect of recovery if he were able to accept my constructions. I could only reply that I had not yet come across any such mechanism of dream-formation. But a decision was reached by another road. He recollected some dreams which he had had before starting analysis and indeed before he had known anything about it; and the analysis of these dreams, which were free from all suspicion of suggestion, led to the same interpretations as the later ones. It is true that his obsession for contradiction once more found a way out in the idea that the earlier dreams had been less clear than those that occurred during the treatment; but I was satisfied with their similarity. I think that in general it is a good plan occasionally to bear in mind the fact that people were in the habit of dreaming before there was such a thing as psycho-analysis.

[1923c, 4037]

It may well be that dreams during psycho-analysis succeed in bringing to light what is repressed to a greater extent than dreams outside that situation. But it cannot be proved, since the two situations are not comparable; the employment of dreams in analysis is something very remote from their original purpose. On the other hand, it cannot be doubted that within an analysis far more of the repressed is brought to light in connection with dreams than by any other method. In order to account for this, there must be some motive power, some unconscious force, which is better able to lend support to the purposes of analysis during the state of sleep than at other times. What is here in question cannot well be any factor other than the patient's compliance towards the analyst which is derived from his parental complex - in other words, the positive portion of what we call the transference; and in fact, in many dreams which recall what has been forgotten and repressed, it is impossible to discover any other unconscious wish to which the motive force for the formation of the dream can be attributed. So that if anyone wishes to maintain that most of the dreams that can be made use of in analysis are obliging dreams and owe their origin to suggestion, nothing can be said against that opinion from the point of view of analytic theory. In that case I need only add a reference to what I have said in my Introductory Lectures, where I have dealt with the relation between transference and suggestion and shown how little the trustworthiness of our results is affected by a recognition of the operation of suggestion in our sense.

[1923c, 4038]
In *Beyond the Pleasure Principle* (1920g) I have dealt with the economic problem of how what are in every respect distressing experiences of the early infantile sexual period can succeed in forcing their way through to some kind of reproduction. I was obliged to ascribe to them an extraordinarily strong upward drive in the shape of the 'compulsion to repeat' - a force able to overcome the repression which, in obedience to the pleasure principle, weighs down upon them - though not until 'the work of treatment has gone half-way to meet it and has loosened the repression'. Here we may add that it is the positive transference that gives this assistance to the compulsion to repeat. Thus an alliance has been made between the treatment and the compulsion to repeat, an alliance which is directed in the first instance against the pleasure principle but of which the ultimate purpose is the establishment of the dominion of the reality principle. As I have shown in the passage to which I am referring, it happens only too often that the compulsion to repeat throws over its obligations under this alliance and is not content with the return of the repressed merely in the form of dream-pictures.

[1923c, 4038]
There is another way in which it can be established with certainty without the assistance of interpretation that a dream contains elements from childhood. This is where the dream is of what has been called the 'recurrent' type: that is to say, where a dream was first dreamt in childhood and then constantly reappears from time to time during adult sleep. I am able to add to the familiar examples of such dreams a few from my own records, though I have never myself experienced one. A physician in his thirties told me that from the earliest days of his childhood to the present time a yellow lion frequently appeared in his dreams; he was able to give a minute description of it. This lion out of his dreams made its appearance one day in bodily form, as a china ornament that had long disappeared. The young man then learnt from his mother that this object had been his favourite toy during his early childhood, though he himself had forgotten the fact.

Dream-symbolism is also indispensable to an understanding of what are known as 'typical' dreams, which are common to everyone, and of 'recurrent' dreams in individuals.

Just at a moment when there was a prospect that the material that was coming up for analysis would throw light upon an obscure point in Dora's childhood, she reported that a few nights earlier she had once again had a dream which she had already dreamt in exactly the same way on many previous occasions. A periodically recurrent dream was by its very nature particularly well calculated to arouse my curiosity; and in any case it was justifiable in the interests of the treatment to consider the way in which the dream worked into the analysis as a whole. I therefore determined to make an especially careful investigation of it.

Are we to suppose that when this dream occurred at L-- it had precisely the same content as when it recurred during the treatment? It does not seem necessary to do so. Experience shows that people often assert that they have had the same dream, when as a matter of fact the separate appearances of the recurrent dream have differed from one another in numerous details and in other respects that were of no small importance. Thus one of my patients told me that she had had her favourite dream again the night before, and that it always recurred in the same form: she had dreamed of swimming in the blue sea, of joyfully cleaving her way through the waves, and so on. On closer investigation it turned out that upon a common background now one detail and now another was brought out; on one occasion, even, she was swimming in a frozen sea and was surrounded by icebergs. This patient had other dreams, which turned out to be closely connected with the recurrent one, though even she made no attempt to claim that they were identical with it. Once, for instance, she was looking at a view of Heligoland (based on a photograph, but life-size) which showed the upper and lower parts of the island simultaneously; on the sea was a ship, in which were two people whom she had known in her youth, and so on.
The dream which the writer of the letter asks us to interpret is not hard to understand. It is a dream of rescuing from water, a typical birth-dream. The language of symbolism, as you are aware, knows no grammar; it is an extreme case of a language of infinitives, and even the active and passive are represented by one and the same image. If in a dream a woman pulls (or tries to pull) a man out of the water, that may mean that she wants to be his mother (takes him for her son as Pharaoh's daughter did with Moses). Or it may mean that she wants him to make her into a mother: she wants to have a son by him, who, as a likeness of him, can be his equivalent. The tree-trunk to which the woman was clinging is easily recognized as a phallic symbol, even though it is not standing straight up, but inclined towards the surface of the water - in the dream the word is 'bent'. The onrush and recoil of the breakers brought to the mind of another dreamer who was relating a similar dream a comparison with the intermittent pains of labour; and when, knowing that she had not yet borne a child, I asked her how she knew of this characteristic of labour, she said that she imagined labour as a kind of colic - a quite unimpeachable description physiologically. She gave the association 'The Waves of the Sea and of Love'. How our present dreamer at so early an age can have arrived at the finer details of symbolism - tongue of land, palm-tree - I am naturally unable to say. We must not, moreover, overlook the fact that, when people assert that they have for years been pursued by the same dream, it often turns out that the manifest content is not quite the same. Only the kernel of the dream has recurred each time; the details of the content are changed or additions are made to them.

[1922a, 3892]
I see that I must take up the defence of its genuineness. You are going too far. You have accepted my assertion that every suppressed phantasy of this kind tends to slip away into a childhood scene. But suppose now that this cannot occur unless there is a memory-trace the content of which offers the phantasy a point of contact - comes, as it were, half way to meet it. Once a point of contact of this kind has been found - in the present instance it was the deflowering, the taking away of the flowers - the remaining content of the phantasy is remodelled with the help of every legitimate intermediate idea - take the bread as an example - till it can find further points of contact with the content of the childhood scene. It is very possible that in the course of this process the childhood scene itself also undergoes changes; I regard it as certain that falsifications of memory may be brought about in this way too. In your case the childhood scene seems only to have had some of its lines engraved more deeply: think of the over-emphasis on the yellow and the exaggerated niceness of the bread. But the raw material was utilizable. If that had not been so, it would not have been possible for this particular memory, rather than any others, to make its way forward into consciousness. No such scene would have occurred to you as a childhood memory, or perhaps some other one would have - for you know how easily our ingenuity can build connecting bridges from any one point to any other. And apart from your own subjective feeling which I am not inclined to under-estimate, there is another thing that speaks in favour of the genuineness of your dandelion memory. It contains elements which have not been solved by what you have told me and which do not in fact fit in with the sense required by the phantasy. For instance, your boy cousin helping you to rob the little girl of her flowers - can you make any sense of the idea of being helped in deflowering someone? or of the peasant woman and the nurse in front of the cottage?

The difficulties of presentation have been further increased by the peculiarities of the material which I have had to use to illustrate the interpreting of dreams. It will become plain in the course of the work itself why it is that none of the dreams already reported in the literature of the subject or collected from unknown sources could be of any use for my purposes. The only dreams open to my choice were my own and those of my patients undergoing psycho-analytic treatment. But I was precluded from using the latter material by the fact that in its case the dream-processes were subject to an undesirable complication owing to the added presence of neurotic features. But if I was to report my own dreams, it inevitably followed that I should have to reveal to the public gaze more of the intimacies of my mental life than I liked, or than is normally necessary for any writer who is a man of science and not a poet. Such was the painful but unavoidable necessity; and I have submitted to it rather than totally abandon the possibility of giving the evidence for my psychological findings. Naturally, however, I have been unable to resist the temptation of taking the edge off some of my indiscretions by omissions and substitutions. But whenever this has happened, the value of my instance has been very definitely diminished. I can only express a hope that readers of this book will put themselves in my difficult situation and treat me with indulgence, and further, that anyone who finds any sort of reference to himself in my dreams may be willing to grant me the right of freedom of thought - in my dream-life, if nowhere else.
An equal durability and power to withstand any far-reaching alterations during the process of revision has been shown by the material of the book, consisting as it does of dreams of my own which have for the most part been overtaken or made valueless by the march of events and by which I illustrated the rules of dream-interpretation. For this book has a further subjective significance for me personally - a significance which I only grasped after I had completed it. It was, I found, a portion of my own self-analysis, my reaction to my father's death - that is to say, to the most important event, the most poignant loss, of a man's life. Having discovered that this was so, I felt unable to obliterate the traces of the experience. To my readers, however, it will be a matter of indifference upon what particular material they learn to appreciate the importance of dreams and how to interpret them.

At this point we are faced with a choice between two alternatives. We may admit it as a fact that it is impossible to follow the laws governing the formation of dreams any further; and we may accordingly refrain from enquiring whether there may not be other determinants governing the interpretation put by the dreamer upon the illusion called up by the sense-impression. Or, on the other hand, we may have a suspicion that the sensory stimulus which impinges on the sleeper plays only a modest part in generating his dream and that other factors determine the choice of the mnemic images which are to be aroused in him. In fact, if we examine Maury's experimentally produced dreams (which I have related in such detail for this very reason), we shall be tempted to say that the experiment in fact accounts for the origin of only one element of the dreams; the rest of their content seems too self-contained, too definite in its details, to be explicable solely by the necessity for fitting in with the element experimentally introduced from outside. Indeed, one begins to have doubts about the illusion theory and about the power of objective impressions to give a shape to dreams when one finds that those impressions are sometimes subjected in dreams to the most peculiar and far-fetched interpretations. Thus Simon (1888) tells us of a dream in which he saw some gigantic figures seated at table and clearly heard the frightful snapping noise made by their jaws coming together as they chewed. When he awoke he heard the beat of a horse's hooves galloping past his window. The noise made by the horse's hooves may have suggested ideas from a group of memories connected with *Gulliver's Travels* - the giants of Brobdingnag and the virtuous Houyhnhnms - if I may venture on an interpretation without the dreamer's assistance. Is it not probable, then, that the choice of such an unusual group of memories as these was facilitated by motives other than the objective stimulus alone?¹

¹ [Footnote added 1911:] The appearance of gigantic figures in a dream gives grounds for supposing that some scene from the dreamer's childhood is involved. - [Added 1925:] Incidentally, the interpretation given in the text, pointing to a reminiscence of *Gulliver's Travels*, is a good example of what an interpretation ought not to be. The interpreter of a dream should not give free play to his own ingenuity and neglect the dreamer's associations.

[1900a, 509]

[1900a, 542]
The title that I have chosen for my work makes plain which of the traditional approaches to the problem of dreams I am inclined to follow. The aim which I have set before myself is to show that dreams are capable of being interpreted; and any contributions I may be able to make towards the solution of the problems dealt with in the last chapter will only arise as by products in the course of carrying out my proper task. My presumption that dreams can be interpreted at once puts me in opposition to the ruling theory of dreams and in fact to every theory of dreams with the single exception of Scherner’s; for ‘interpreting’ a dream implies assigning a ‘meaning’ to it - that is, replacing it by something which fits into the chain of our mental acts as a link having a validity and importance equal to the rest. As we have seen, the scientific theories of dreams leave no room for any problem of interpreting them, since in their view a dream is not a mental act at all, but a somatic process signalizing its occurrence by indications registered in the mental apparatus. Lay opinion has taken a different attitude throughout the ages. It has exercised its indefeasible right to behave inconsistently; and, though admitting that dreams are unintelligible and absurd, it cannot bring itself to declare that they have no significance at all. Led by some obscure feeling, it seems to assume that, in spite of everything, every dream has a meaning, though a hidden one, that dreams are designed to take the place of some other process of thought, and that we have only to undo the substitution correctly in order to arrive at this hidden meaning.

Thus the lay world has from the earliest times concerned itself with ‘interpreting’ dreams and in its attempts to do so it has made use of two essentially different methods.

The first of these procedures considers the content of the dream as a whole and seeks to replace it by another content which is intelligible and in certain respects analogous to the original one. This is ‘symbolic’ dream-interpreting; and it inevitably breaks down when faced by dreams which are not merely unintelligible but also confused. An example of this procedure is to be seen in the explanation of Pharaoh’s dream propounded by Joseph in the Bible. The seven fat kine followed by seven lean kine that ate up the fat kine - all this was a symbolic substitute for a prophecy of seven years of famine in the land of Egypt which should consume all that was brought forth in the seven years of plenty. Almost of the artificial dreams constructed by imaginative writers are designed for a symbolic interpretation of this sort: they reproduce the writer’s thoughts under a disguise which is regarded as harmonizing with the recognized characteristics of dreams.¹ The idea of dreams being chiefly concerned with the future and being able to foretell it - a remnant of the old prophetic significance of dreams - provides a reason for transposing the meaning of the dream, when it has been arrived at by symbolic interpretation, into the future tense. It is of course impossible to give instructions upon the method of arriving at a symbolic interpretation. Success must be a question of hitting on a clever idea, of direct intuition, and for that reason it was possible for dream-interpretation by means of symbolism to be exalted into an artistic activity dependent on the possession of peculiar gifts.²
The second of the two popular methods of interpreting dreams is far from making any such claims. It might be described as the ‘decoding’ method, since it treats dreams as a kind of cryptography in which each sign can be translated into another sign having a known meaning, in accordance with a fixed key. Suppose, for instance, that I have dreamt of a letter and also of a funeral. If I consult a ‘dream-book’, I find that ‘letter’ must be translated by ‘trouble’ and ‘funeral’ by ‘betrothal’. It then remains for me to link together the key words which I have deciphered in this way and, once more, to transpose the result into the future tense. An interesting modification of the process of decoding, which to some extent corrects the purely mechanical character of its method of transposing, is to be found in the book written upon the interpretation of dreams by Artemidorus of Daldis.¹ This method takes into account not only the content of the dream but also the character and circumstances of the dreamer; so that the same dream-element will have a different meaning for a rich man, a married man or, let us say, an orator, from what it has for a poor man, a bachelor or a merchant. The essence of the decoding procedure, however, lies in the fact that the work of interpretation is not brought to bear on the dream as a whole but on each portion of the dream’s content independently, as though the dream were a geological conglomerate in which each fragment of rock required a separate assessment. There can be no question that the invention of the decoding method of interpretation was suggested by disconnected and confused dreams.²

¹ [Footnote added 1914:] Artemidorus of Daldis, who was probably born at the beginning of the second century A.D., has left us the most complete and painstaking study of dream-interpretation as practised in the Graeco-Roman world. As Theodor Gomperz (1866, 7 f.) points out, he insisted on the importance of basing the interpretation of dreams on observation and experience, and made a rigid distinction between his own art and others that were illusory. The principle of his interpretative art, according to Gomperz, is identical with magic, the principle of association. A thing in a dream means what it recalls to the mind - to the dream-interpreter’s mind, it need hardly be said. An insuperable source of arbitrariness and uncertainty arises from the fact that the dream-element may recall various things to the interpreter’s mind and may recall something different to different interpreters. The technique which I describe in the pages that follow differs in one essential respect from the ancient method: it imposes the task of interpretation upon the dreamer himself. It is not concerned with what occurs to the interpreter in connection with a particular element of the dream, but with what occurs to the dreamer. - Recent reports, however, from a missionary, Father Tfinkdji (1913), show that modern dream-interpreters in the East also make free use of the dreamer’s collaboration. He writes as follows of dream-interpreters among the Arabs of Mesopotamia: ‘Pour interpréter exactement un songe, les oniromanciens les plus habiles s’informent de ceux qui les consultent de toutes les circonstances qu’ils regardent nécessaires pour la bonne explication. . . . En un mot, nos oniromanciens ne laissent aucune circonstance leur échapper et ne donnent l’interprétation désirée avant d’avoir parfaitement saisie et reçu toutes les interrogations désirables.’ [‘In order to give a precise interpretation of a dream, the most skilful dream-diviners find out from those who consult them all the circumstances which they consider essential in order to arrive at a right explanation. . . . In short, these dream-diviners do not allow a single point to escape them and only give their interpretation after they have completely mastered the replies to all the necessary enquiries.’] Among these enquiries are habitually included questions as to the dreamer’s closest family relations - his parents, wife and children - as well as such a typical formula as: ‘Habuiistine in hac nocte copulam conjugam ante vel post somnium?’ [‘Did you copulate with your wife that night before or after you had the dream?’] ‘L’idée dominante dans l’interprétation des songes consiste à expliquer le rêve par son opposée.’ [‘The principal idea in interpreting dreams lies in explaining a dream by its opposite.’]

² [1900a, 603]

It cannot be doubted for a moment that neither of the two popular procedures for interpreting dreams can be employed for a scientific treatment of the subject. The symbolic method is restricted in its application and incapable of being laid down on general lines. In the case of the decoding method everything depends on the trustworthiness of the ‘key’ - the dream-book, and of this we have no guarantee. Thus one might feel tempted to agree with the philosophers and the psychiatrists and, like them, rule out the problem of dream-interpretation as a purely fanciful task.¹

[1900a, 603]
My knowledge of that procedure was reached in the following manner. I have been engaged for many years (with a therapeutic aim in view) in unravelling certain psychopathological structures - hysterical phobias, obsessional ideas, and so on. I have been doing so, in fact, ever since I learnt from an important communication by Josef Breuer that as regards these structures (which are looked on as pathological symptoms) unravelling these coincides with removing them. (Cf. Breuer and Freud, 1895.) If a pathological idea of this sort can be traced back to the elements in the patient's mental life from which it originated, it simultaneously crumbles away and the patient is freed from it. Considering the impotence of our other therapeutic efforts and the puzzling nature of these disorders, I felt tempted to follow the path marked out by Breuer, in spite of every difficulty, till a complete explanation was reached. I shall have on another occasion to report at length upon the form finally taken by this procedure and the results of my labours. It was in the course of these psycho-analytic studies that I came upon dream-interpretation. My patients were pledged to communicate to me every idea or thought that occurred to them in connection with some particular subject; amongst other things they told me their dreams and so taught me that a dream can be inserted into the psychical chain that has to be traced backwards in the memory from a pathological idea. It was then only a short step to treating the dream itself as a symptom and to applying to dreams the method of interpretation that had been worked out for symptoms.

[1900a, 603]

This involves some psychological preparation of the patient. In the attention he pays to his own psychical perceptions and the elimination of the criticism by which he normally sifts the thoughts that occur to him. In order that he may be able to concentrate his attention on his self-observation it is an advantage for him to lie in a restful attitude and shut his eyes. It is necessary to insist explicitly on his renouncing all criticism of the thoughts that he perceives. We therefore tell him that the success of the psycho-analysis depends on his noticing and reporting whatever comes into his head and not being misled, for instance, into suppressing an idea because it strikes him as unimportant or irrelevant or because it seems to him meaningless. He must adopt a completely impartial attitude to what occurs to him, since it is precisely his critical attitude which is responsible for his being unable, in the ordinary course of things, to achieve the desired unravelling of his dream or obsessional idea or whatever it may be.

[1900a, 604]

Our first step in the employment of this procedure teaches us that what we must take as the object of our attention is not the dream as a whole but the separate portions of its content. If I say to a patient who is still a novice: 'What occurs to you in connection with this dream?', as a rule his mental horizon becomes a blank. If, however, I put the dream before him cut up into pieces, he will give me a series of associations to each piece, which might be described as the 'background thoughts' of that particular part of the dream. Thus the method of dream interpretation which I practise already differs in this first important respect from the popular, historic and legendary method of interpretation by means of symbolism and approximates to the second or 'decoding' method. Like the latter, it employs interpretation en détail and not en masse; like the latter, it regards dreams from the very first as being of a composite character, as being conglomerates of psychical formations.

[1900a, 605]
In the course of my psycho-analyses of neurotics I must already have analysed over a thousand dreams; but I do not propose to make use of this material in my present introduction to the technique and theory of dream-interpretation. Apart from the fact that such a course would be open to the objection that these are the dreams of neuropaths, from which no valid inferences could be made as to the dreams of normal people, there is quite another reason which forces this decision upon me. The subject to which these dreams of my patients lead up is always, of course, the case history which underlies their neurosis. Each dream would therefore necessitate a lengthy introduction and an investigation of the nature and aetiological determinants of the psychoneuroses. But these questions are in themselves novelties and highly bewildering and would distract attention from the problem of dreams. On the contrary, it is my intention to make use of my present elucidation of dreams as a preliminary step towards solving the more difficult problems of the psychology of the neuroses. If, however, I forego my principal material, the dreams of my neurotic patients, I must not be too particular about what is left to me. All that remains are such dreams as have been reported to me from time to time by normal persons of my acquaintance, and such others as have been quoted as instances in the literature dealing with dream-life. Unluckily, however, none of these dreams are accompanied by the analysis without which I cannot discover a dream's meaning. My procedure is not so convenient as the popular decoding method which translates any given piece of a dream's content by a fixed key. I, on the contrary, am prepared to find that the same piece of content may conceal a different meaning when it occurs in various people or in various contexts. Thus it comes about that I am led to my own dreams, which offer a copious and convenient material, derived from an approximately normal person and relating to multifarious occasions of daily life. No doubt I shall be met by doubts of the trustworthiness of 'self-analyses' of this kind; and I shall be told that they leave the door open to arbitrary conclusions. In my judgement the situation is in fact more favourable in the case of self-observation than in that of other people; at all events we may make the experiment and see how far self-analysis takes us with the interpretation of dreams. But I have other difficulties to overcome, which lie within myself. There is some natural hesitation about revealing so many intimate facts about one's mental life; nor can there be any guarantee against misinterpretation by strangers. But it must be possible to overcome such hesitations. 'Tout psychologue', writes Delboeuf, 'est obligé de faire l'aveu même de ses faiblesses s'il croit par là jeter du jour sur quelque problème obscur.'¹ And it is safe to assume that my readers too will very soon find their initial interest in the indiscretions which I am bound to make replaced by an absorbing immersion in the psychological problems upon which they throw light.²

¹[1900a, 606]
²[1900a, 607]
During the summer of 1895 I had been giving psycho-analytic treatment to a young lady who was on very friendly terms with me and my family. It will be readily understood that a mixed relationship such as this may be a source of many disturbed feelings in a physician and particularly in a psychotherapist. While the physician's personal interest is greater, his authority is less; any failure would bring a threat to the old-established friendship with the patient's family. This treatment had ended in a partial success; the patient was relieved of her hysterical anxiety but did not lose all her somatic symptoms. At that time I was not yet quite clear in my mind as to the criteria indicating that a hysterical case history was finally closed, and I proposed a solution to the patient which she seemed unwilling to accept. While we were thus at variance, we had broken off the treatment for the summer vacation. - One day I had a visit from a junior colleague, one of my oldest friends, who had been staying with my patient, Irma, and her family at their country resort. I asked him how he had found her and he answered: 'She's better, but not quite well.' I was conscious that my friend Otto's words, or the tone in which he spoke them, annoyed me. I fancied I detected a reproof in them, such as to the effect that I had promised the patient too much; and, whether rightly or wrongly, I attributed the supposed fact of Otto's siding against me to the influence of my patient's relatives, who, as it seemed to me, had never looked with favour on the treatment. However, my disagreeable impression was not clear to me and I gave no outward sign of it. The same evening I wrote out Irma's case history, with the idea of giving it to Dr. M. (a common friend who was at that time the leading figure in our circle) in order to justify myself. That night (or more probably the next morning) I had the following dream, which I noted down immediately after waking.¹

¹[1900a, 607]

I was alarmed at the idea that I had missed an organic illness. This, as may well be believed, is a perpetual source of anxiety to a specialist whose practice is almost limited to neurotic patients and who is in the habit of attributing to hysteria a great number of symptoms which other physicians treat as organic. On the other hand, a faint doubt crept into my mind - from where, I could not tell - that my alarm was not entirely genuine. If Irma's pains had an organic basis, once again I could not be held responsible for curing them; my treatment only set out to get rid of hysterical pains. It occurred to me, in fact, that I was actually wishing that there had been a wrong diagnosis; for, if so, the blame for my lack of success would also have been got rid of.

¹[1900a, 610]
I took her to the window to look down her throat. She showed some recalcitrance, like women with false teeth. I thought to myself that really there was no need for her to do that. I had never had any occasion to examine Irma's oral cavity. What happened in the dream reminded me of an examination I had carried out some time before of a governess: at a first glance she had seemed a picture of youthful beauty, but when it came to opening her mouth she had taken measures to conceal her plate. This led to recollections of other medical examinations and of little secrets revealed in the course of them - to the satisfaction of neither party. 'There was really no need for her to do that' was no doubt intended in the first place as a compliment to Irma; but I suspected that it had another meaning besides. (If one carries out an analysis attentively, one gets a feeling of whether or not one has exhausted all the background thoughts that are to be expected.) The way in which Irma stood by the window suddenly reminded me of another experience. Irma had an intimate woman friend of whom I had a very high opinion. When I visited this lady one evening I had found her by a window in the situation reproduced in the dream, and her physician, the same Dr. M., had pronounced that she had a diphtheritic membrane. The figure of Dr. M. and the membrane reappear later in the dream. It now occurred to me that for the last few months I had had every reason to suppose that this other lady was also a hysteric. Indeed, Irma herself had betrayed the fact to me. What did I know of her condition? One thing precisely: that, like my Irma of the dream, she suffered from hysterical choking. So in the dream I had replaced my patient by her friend. I now recollected that I had often played with the idea that she too might ask me to relieve her of her symptoms. I myself, however, had thought this unlikely, since she was of a very reserved nature. She was recalcitrant, as was shown in the dream. Another reason was that there was need for her to do it: she had so far shown herself strong enough to master her condition without outside help. There still remained a few features that I could not attach either to Irma or to her friend: pale; puffy; false teeth. The false teeth took me to the governess whom I have already mentioned; I now felt inclined to be satisfied with bad teeth. I then thought of someone else to whom these features might be alluding. She again was not one of my patients, nor should I have liked to have her as a patient, since I had noticed that she was bashful in my presence and I could not think she would make an amenable patient. She was usually pale, and once, while she had been in specially good health, she had looked puffy.⁰ Thus I had been comparing my patient Irma with two other people who would also have been recalcitrant to treatment. What could the reason have been for my having exchanged her in the dream for her friend? Perhaps it was that I should have liked to exchange her: either I felt more sympathetic towards her friend or had a higher opinion of her intelligence. For Irma seemed to me foolish because she had not accepted my solution. Her friend would have been wiser, that is to say she would have yielded sooner. She would then have opened her mouth properly, and have told me more than Irma.²

¹ The still unexplained complaint about pains in the abdomen could also be traced back to this third figure. The person in question was, of course, my own wife; the pains in the abdomen reminded me of one of the occasions on which I had noticed her bashfulness. I was forced to admit to myself that I was not treating either Irma or my wife very kindly in this dream; but it should be observed by way of excuse that I was measuring them both by the standard of the good and amenable patient.

² I had a feeling that the interpretation of this part of the dream was not carried far enough to make it possible to follow the whole of its concealed meaning. If I had pursued my comparison between the three women, it would have taken me far afield. There is at least one spot in every dream at which it is unplumbable - a navel, as it were, that is its point of contact with the unknown.
*What I saw in her throat: a white patch and turbinal bones with scabs on them.* The white patch reminded me of diphtheritis and so of Irma's friend, but also of a serious illness of my eldest daughter's almost two years earlier and of the fright I had had in those anxious days. The scabs on the turbinal bones recalled a worry about my own state of health. I was making frequent use of cocaine at that time to reduce some troublesome nasal swellings, and I had heard a few days earlier that one of my women patients who had followed my example had developed an extensive necrosis of the nasal mucous membrane. I had been the first to recommend the use of cocaine, in 1885, and this recommendation had brought serious reproaches down on me. The misuse of that drug had hastened the death of a dear friend of mine. This had been before 1895.

[1900a, 611]

*Dr. M. was pale, had a clean-shaven chin and walked with a limp.* This was true to the extent that his unhealthy appearance often caused his friends anxiety. The two other features could only apply to someone else. I thought of my elder brother, who lives abroad, who is clean-shaven and whom, if I remembered right, the M. of the dream closely resembled. We had had news a few days earlier that he was walking with a limp owing to an arthritic affection of his hip. There must, I reflected, have been some reason for my fusing into one the two figures in the dream. I then remembered that I had a similar reason for being in an ill-humour with each of them: they had both rejected a certain suggestion I had recently laid before them.

[1900a, 612]

*A portion of the skin on the left shoulder was infiltrated.* I saw at once that this was the rheumatism in my own shoulder, which I invariably notice if I sit up late into the night. Moreover the wording in the dream was most ambiguous: 'I noticed this, just as he did . . . .' I noticed it in my own body, that is. I was struck, too, by the unusual phrasing: 'a portion of the skin was infiltrated.' We are in the habit of speaking of 'a left upper posterior infiltration', and this would refer to the lung and so once more to tuberculosis.

[1900a, 613]

When, during the course of the morning, the dream came into my head, I laughed aloud and said: 'The dream's nonsense!' But it refused to go away and followed me about all day, till at last in the evening I began to reproach myself: 'If one of your patients who was interpreting a dream could find nothing better to say than that it was nonsense, you would take him up about it and suspect that the dream had some disagreeable story at the back of it which he wanted to avoid becoming aware of. Treat yourself in the same way. Your opinion that the dream is nonsense only means that you have an internal resistance against interpreting it. Don't let yourself be put off like this.' So I set about the interpretation.

[1900a, 635]
I still had no idea at all what could be the purpose of this comparison, against which I continued to struggle. It did not go very deep, after all, since my uncle was a criminal, whereas my friend R. bore an unblemished character . . . except for having been fined for knocking a boy down with his bicycle. Could I have had that crime in mind? That would have been making fun of the comparison. At this point I remembered another conversation which I had had a few days earlier with another colleague, N., and, now I came to think of it, upon the same subject. I had met N. in the street. He too had been recommended for a professorship. He had heard of the honour that had been paid me and had offered me his congratulations on it; but I had unhesitatingly refused to accept them. 'You are the last person', I had said, 'to make that kind of joke; you know what such a recommendation is worth from your own experience.' 'Who can say?' he had answered - jokingly, it seemed; 'there was something definite against me. Don't you know that a woman once started legal proceedings against me? I needn't assure you that the case was dismissed. (It was a disgraceful attempt at blackmail; and I had the greatest difficulty in saving the prosecutrix from being punished. But perhaps they may be using this at the Ministry as an excuse for not appointing me. But you have an unblemished character.' This told me who the criminal was, and at the same time showed me how the dream was to be interpreted and what its purpose was. My Uncle Josef represented my two colleagues who had not been appointed to professorships - the one as a simpleton and the other as a criminal. I now saw too why they were represented in this light. If the appointment of my friends R. and N. had been postponed for 'denominational' reasons, my own appointment was also open to doubt; if, however, I could attribute the rejection of my two friends to other reasons, which did not apply to me, my hopes would remain untouched. This was the procedure adopted by my dream: it made one of them, R., into a simpleton and the other, N., into a criminal, whereas I was neither the one nor the other; thus we no longer had anything in common; I could rejoice at my appointment to a professorship, and I could avoid drawing the distressing conclusion that R.'s report of what the high official had said to him must apply equally to me.

[1900a, 636]
I then recalled that there was still a piece of the dream which the interpretation had not touched. After the idea had occurred to me that R. was my uncle, I had had a warm feeling of affection for him in the dream. Where did that feeling belong? I had naturally never had any feeling of affection for my Uncle Josef. I had been fond of my friend R. and had esteemed him for many years; but if I had gone up to him and expressed my sentiments in terms approaching the degree of affection I had felt in the dream, there could be no doubt that he would have been astonished. My affection for him struck me as unguenuine and exaggerated - like the judgement of his intellectual qualities which I had expressed by fusing his personality with my uncle's, though there the exaggeration had been in the opposite direction. But a new light began to dawn on me. The affection in the dream did not belong to the latent content, to the thoughts that lay behind the dream; it stood in contradiction to them and was calculated to conceal the true interpretation of the dream. And probably that was precisely its raison d'être. I recalled my resistance against embarking on the interpretation, how long I had put it off and how I had declared that the dream was sheer nonsense. My psycho-analytic treatments taught me how a repudiation of that kind was to be interpreted: it had no value as a judgement but was simply an expression of emotion. If my little daughter did not want an apple that was offered to her, she asserted that the apple tasted sour without having tasted it. And if my patients behaved like the child, I knew that they were concerned with an idea which they wanted to repress. The same was true of my dream. I did not want to interpret it, because the interpretation contained something that I was struggling against. When I had completed the interpretation I learnt what it was that I had been struggling against - namely, the assertion that R. was a simpleton. The affection that I felt for R. could not be derived from the latent dream-thoughts; but no doubt it originated from this struggle of mine. If my dream was distorted in this respect from its latent content - and distorted into its opposite - then the affection that was manifest in the dream served the purpose of this distortion. In other words, distortion was shown in this case to be deliberate and to be a means of dissimulation. My dream thoughts had contained a slander against R.; and, in order that I might not notice this, what appeared in the dream was the opposite, a feeling of affection for him.

I answered, of course, that analysis was the only way of deciding on the meaning of the dream; though I admitted that at first sight it seemed sensible and coherent and looked like the reverse of a wish-fulfilment. 'But what material did the dream arise from? As you know, the instigation to a dream is always to be found in the events of the previous day.'

This explanation struck me as unconvincing. Inadequate reasons like this usually conceal unconfessed motives. They remind one of Bernheim's hypnotized patients. When one of these carries out a post-hypnotic suggestion and is asked why he is acting in this way, instead of saying that he has no idea he feels compelled to invent some obviously unsatisfactory reason. The same was no doubt true of my patient and the caviare. I saw that she was obliged to create an unfulfilled wish for herself in her actual life; and the dream represented this renunciation as having been put into effect. But why was it that she stood in need of an unfulfilled wish?

The associations which she had so far produced had not been sufficient to interpret the dream. I pressed her for some more. After a short pause, such as would correspond to the over coming of a resistance, she went on to tell me that the day before she had visited a woman friend of whom she confessed she felt jealous because her (my patient's) husband was constantly singing her praises. Fortunately this friend of hers is very skinny and thin and her husband admires a plumper figure. I asked her what she had talked about to her thing friend. Naturally, she replied, of that lady's wish to grow a little stouter. Her friend had enquired, too: 'When are you going to ask us to another meal? You always feed one so well.'
The meaning of the dream was now clear, and I was able to say to my patient: 'It is just as though when she made this suggestion you said to yourself: "A likely thing! I'm to ask you to come and eat in my house so that you may get stout and attract my husband still more! I'd rather never give another supper-party." What the dream was saying to you was that you were unable to give any supper-parties, and it was thus fulfilling your wish not to help your friend to grow plumper. The fact that what people eat at parties makes them stout had been brought home to you by your husband's decision not to accept any more invitations to supper in the interests of his plan to reduce his weight.' All that was now lacking was some coincidence to confirm the solution. The smoked salmon in the dream had not yet been accounted for. 'How', I asked, 'did you arrive at the salmon that came into your dream?' 'Oh', she replied, 'smoked salmon is my friend's favourite dish.' I happen to be acquainted with the lady in question myself, and I can confirm the fact that she grudges herself salmon no less than my patient grudges herself caviare.

The same dream admits of another and subtler interpretation, which in fact becomes unavoidable if we take a subsidiary detail into account. (The two interpretations are not mutually contradictory, but both cover the same ground; they are a good instance of the fact that dreams, like all other psychopathological structures, regularly have more than one meaning.) My patient, it will be remembered, at the same time as she was occupied with her dream of the renunciation of a wish, was also trying to bring about a renounced wish (for the caviare sandwich) in real life. Her friend had also given expression to a wish - to become stouter - and it would not have been surprising if my patient had dreamt that her friend's wish was unfulfilled; for my patient's own wish was that her friend's wish (to put on weight) should not be fulfilled. But instead of this she dreamt that one of her own wishes was not fulfilled. Thus the dream will acquire a new interpretation if we suppose that the person indicated in the dream was not herself but her friend, that she had put herself in her friend's place, or, as we might say, that she had 'identified' herself with her friend. I believe she had in fact done this; and the circumstance of her having brought about a renounced wish in real life was evidence of this identification.

I assured her that this last interpretation was out of question. And after reflecting a little I was able to give her the correct interpretation of the dream, which she afterwards confirmed. I was able to do so because I was familiar with the whole of the dreamer's previous history.
I owe the following dream, not to a patient, but to an intelligent jurist of my acquaintance. He
told it to me, once again, in order to restrain me from rash generalizing on the theory of wishful
dreams. 'I dreamt', said my informant, 'that I came up to my house with a lady on my arm. A
closed carriage was standing in front of it and a man came up to me, showed me his credentials
as a police officer and requested me to follow him. I asked him to allow me a little time to put my
affairs in order. Can you suppose that I have a wish to be arrested?' - Of course not, I could
only agree. Do you happen to know the charge on which you were arrested? - 'Yes, for
infanticide, I believe.' - Infanticide? But surely you're aware that that's a crime that can only be
committed by a mother on a new-born child? - 'Quite true.' - And what were the circumstances
in which you had the dream? What happened on the previous evening? - 'I would prefer not to
tell you. It's a delicate matter.' - Nevertheless I shall have to hear it; otherwise we shall have to
give up the idea of interpreting the dream. - 'Very well then, listen. I didn't spend last night at
home but with a lady who means a great deal to me. When we woke up in the morning there
was a further passage between us, after which I went to sleep again and had the dream I
described to you.' - Is she a married woman? - 'Yes.' - And you don't want to have a child by
her? - 'Oh, no; that might give us away.' - So you don't practice normal intercourse? - 'I take the
precaution of withdrawing before ejaculation.' - I think I may assume that you had used this
device several times during the night, and that after repeating it in the morning you felt a little
uncertain whether you had carried it out success fully. - 'That's possible, no doubt.' - In that case
your dream was the fulfilment of a wish. It gave you a reassurance that you had not procreated
a child, or, what amounts to the same thing, that you had killed a child. The intermediate links
are easily indicated. You remember that a few days ago we were talking about marriage
difficulties and how inconsistent it is that there should be no objection to carrying out intercourse
in such a way that no fertilization takes place, whereas any interference when once the ovum
and semen have come together and a foetus has been formed is punished as a crime. We went
on to recall the mediaeval controversy over the exact point of time at which the soul enters the
foetus, since it is not until after that that the concept of murder becomes applicable. No doubt,
too, you know Lenau's gruesome poem in which child murder and child prevention are equated.
- 'Oddly enough I happened to think of Lenau this morning, quite by chance, as it seemed.' - An
after-echo of your dream. And now I can show you another incidental wish-fulfilment contained
in your dream. You came up to your house with the lady on your arm. Thus you were bringing
her home, instead of spending the night in her house as you did in reality. There may be more
than one reason why the wish-fulfilment which constitutes the core of the dream was disguised
in such a disagreeable form. Perhaps you have learned from my paper on the aetiology of
anxiety neurosis that I regard coitus interruptus as one of the aetiological factors in the
development of neurotic anxiety? It would tally with this if, after carrying out sexual intercourse
in this way several times, you were left in an uneasy mood which afterwards became an
element in the construction of your dream. Moreover, you made use of this moodiness to help
disguise the wish-fulfilment. Incidentally, your reference to infanticide has not been explained.

How did you come to light on this specifically feminine crime? - 'I must admit that some years
ago I became involved in an occurrence of that kind. I was responsible for a girl's trying to avoid
the consequence of a love-affair with me by means of an abortion. I had nothing to do with her
carrying out her intention, but for a long time I naturally felt very nervous in case the business
came out.' - I quite understand that. This recollection provides a second reason why you must
have been worried by your suspicion that your device might have gone wrong.
[1900a, 650]

¹ It often happens that the account first given of a dream is incomplete and that the memory of the
omitted portions only emerges in the course of analysis. These subsequently added portions regularly turn
out to provide the key to the dream's interpretation. Cf. the discussion below on the forgetting of dreams.
[1900a, 650]
I hope that the foregoing examples will be enough (till the next objection is raised) to make it seem plausible that even dreams with a distressing content are to be construed as wish-fulfilments. Nor will anyone regard it as a chance coincidence that the interpretation of these dreams has brought us up each time against topics about which people are loth to speak or to think. The distressing feeling aroused by these dreams is no doubt identical with the repugnance which tends (usually with success) to restrain us from discussing or mentioning such topics, and which each of us has to overcome if we nevertheless find ourselves compelled to embark on them. But the unpleasurable feeling which thus recurs in dreams does not disprove the existence of a wish. Everyone has wishes that he would prefer not to disclose to other people, and wishes that he will not admit even to himself. On the other hand, we are justified in linking the unpleasurable character of all these dreams with the fact of dream-distortion. And we are justified in concluding that these dreams are distorted and the wish-fulfilment contained in them disguised to the point of being unrecognizable precisely owing to the repugnance felt for the topic of the dream or for the wish derived from it and to an intention to repress them. The distorsion in the dream is thus shown in fact to be an act of the censorship. We shall be taking into account everything that has been brought to light by our analysis of unpleasurable dreams if we make the following modification in the formula in which we have sought to express the nature of dreams: a dream is a (disguised) fulfilment of a (suppressed or repressed) wish.¹

[1900a, 653]

When the analysis of the dream of Irma's injection showed us that a dream could be the fulfilment of a wish, our interest was at first wholly absorbed by the question of whether we had come upon a universal characteristic of dreams, and for the time being we stifled our curiosity about any other scientific problems that may have arisen during the work of the interpretation. Having followed one path to its end, we may now retrace our steps and choose another starting-point for our rambles through the problems of dream-life: for the time being, we may leave the topic of wish-fulfilment on one side, though we are still far from having exhausted it.

[1900a, 655]

Now that the application of our procedure for interpreting dreams enables us to disclose a latent content in them which is of far greater significance than their manifest one, the pressing task at once arises of re-examining one by one the various problems raised by dreams, to see whether we may not now be in a position to find satisfactory solutions for the conundrums and contradictions which seemed intractable so long as we were only acquainted with the manifest content.

[1900a, 655]

If I examine my own experience on the subject of the origin of the elements included in the content of dreams, I must begin with an assertion that in every dream it is possible to find a point of contact with the experiences of the previous day. This view is confirmed by every dream that I look into, whether my own or anyone else's. Bearing this fact in mind, I am able, on occasion, to begin a dream's interpretation by looking for the event of the previous day which set it in motion; in many instances, indeed, this is the easiest method. In the two dreams which I have analysed in detail in my last chapters (the dream of Irma's injection and the dream of my uncle with a yellow beard) the connection with the previous day is so obvious as to require no further comment. But in order to show the regularity with which such a connection can be traced, I will go through the records of my own dreams and give some instances. I shall only quote enough of the dream to indicate the source we are looking for:

[1900a, 656]
Cyclamens, I reflected, were my wife's favourite flowers and I reproached myself for so rarely remembering to bring her flowers, which was what she liked. - The subject of 'bringing flowers' recalled an anecdote which I had recently repeated to a circle of friends and which I had used as evidence in favour of my theory that forgetting is very often determined by an unconscious purpose and that it always enables one to deduce the secret intentions of the person who forgets. A young woman was accustomed to receiving a bouquet of flowers from her husband on her birthday. One year this token of his affection failed to appear, and she burst into tears. Her husband came in and had no idea why she was crying till she told him that to-day was her birthday. He clasped his hand to his head and exclaimed: 'I'm so sorry, but I'd quite forgotten. I'll go out at once and fetch your flowers.' But she was not to be consoled; for she recognized that her husband's forgetfulness was a proof that she no longer had the same place in his thoughts as she had formerly. - This lady, Frau L., had met my wife two days before I had the dream, had told her that she was feeling quite well and enquired after me. Some years ago she had come to me for treatment.

[1900a, 657]

I now made a fresh start. Once, I recalled, I really had written something in the nature of a monograph on a plant, namely a dissertation on the coca-plant, which had drawn Karl Koller's attention to the anaesthetic properties of cocaine. I had myself indicated this application of the alkaloid in my published paper, but I had not been thorough enough to pursue the matter further. This reminded me that on the morning of the day after the dream - I had not found time to interpret it till the evening - I had thought about cocaine in a kind of day-dream. If ever I got glaucoma, I had thought, I should travel to Berlin and get myself operated on, incognito, in my friend's house, by a surgeon recommended by him. The operating surgeon, who would have no idea of my identity, would boast once again of how easily such operations could be performed since the introduction of cocaine; and I should not give the slightest hint that I myself had had a share in the discovery. This phantasy had led on to reflections of how awkward it is, when all is said and done, for a physician to ask for medical treatment for himself from his professional colleagues. The Berlin eye-surgeon would not know me, and I should be able to pay his fees like anyone else. It was not until I had recalled this day-dream that I realized that the recollection of a specific event lay behind it. Shortly after Koller's discovery, my father had in fact been attacked by glaucoma; my friend Dr. Königstein, the ophthalmic surgeon, had operated on him; while Dr. Koller had been in charge of the cocaine anaesthesia and had commented on the fact that this case had brought together all of the three men who had had a share in the introduction of cocaine.

[1900a, 658]

I will make an attempt at interpreting the other determinants of the content of the dream as well. There was a dried specimen of the plant included in the monograph, as though it had been a herbarium. This led me to a memory from my secondary school. Our headmaster once called together the boys from the higher forms and handed over the school's herbarium to them to be looked through and cleaned. Some small worms - book worms - had found their way into it. He does not seem to have had much confidence in my helpfulness, for he handed me only a few sheets. These, as I could still recall, included some Crucifers. I never had a specially intimate contact with botany. In my preliminary examination in botany I was also given a Crucifer to identify - and failed to do so. My prospects would not have been too bright, if I had not been helped out by my theoretical knowledge. I went on from the Crucifers to the Compositae. It occurred to me that artichokes were Compositae, and indeed I might fairly have called them my favourite flowers. Being more generous than I am, my wife often brought me back these favourite flowers of mine from the market.

[1900a, 659]
I saw the monograph which I had written lying before me. This again led me back to something. I had had a letter from my friend in Berlin the day before in which he had shown his power of visualization: ‘I am very much occupied with your dream-book. I see it lying finished before me and I see myself turning over its pages. How much I envied him his gift as a seer! If only I could have seen it lying finished before me!’ [1900a, 660]

The folded coloured plate. While I was a medical student I was the constant victim of an impulse only to learn things out of monographs. In spite of my limited means, I succeeded in getting hold of a number of volumes of the proceedings of medical societies and was enthralled by their coloured plates. I was proud of my hankering for thoroughness. When I myself had begun to publish papers, I had been obliged to make my own drawings to illustrate them and I remembered that one of them had been so wretched that a friendly colleague had jeered at me over it. There followed, I could not quite make out how, a recollection from very early youth. It had once amused my father to hand over a book with coloured plates (an account of a journey through Persia) for me and my eldest sister to destroy. Not easy to justify from the educational point of view! I had been five years old at the time and my sister not yet three; and the picture of the two of us blissfully pulling the book to pieces (leaf by leaf, like an artichoke, I found myself saying) was almost the only plastic memory that I retained from that period of my life. Then, when I became a student, I had developed a passion for collecting and owning books, which was analogous to my liking for learning out of monographs: a favourite hobby. (The idea of ‘favourite’ had already appeared in connection with cyclamens and artichokes.) I had become a book-worm. I had always, from the time I first began to think about myself, referred this first passion of mine back to the childhood memory I have mentioned. Or rather, I had recognized that the childhood scene was a ‘screen memory’ for my later bibliophile propensities.¹ And I had early discovered, of course, that passions often lead to sorrow. When I was seventeen I had run up a largish account at the bookseller’s and had nothing to meet it with; and my father had scarcely taken it as an excuse that my inclinations might have chosen a worse outlet. The recollection of this experience from the later years of my youth at once brought back to my mind the conversation with my friend Dr. Königstein. For in the course of it we had discussed the same question of my being blamed for being too much absorbed in my favourite hobbies. [1900a, 660]
For reasons with which we are not concerned, I shall not pursue the interpretation of this dream any further, but will merely indicate the direction in which it lay. In the course of the work of analysis I was reminded of my conversation with Dr. Königstein, and I was brought to it from more than one direction. When I take into account the topics touched upon in that conversation, the meaning of the dream becomes intelligible to me. All the trains of thought starting from the dream - the thoughts about my wife's and my own favourite flowers, about cocaine, about the awkwardness of medical treatment among colleagues, about my preference for studying monographs and about my neglect of certain branches of science such as botany - all of these trains of thought, when they were further pursued, led ultimately to one or other of the many ramifications of my conversation with Dr. Königstein. Once again the dream, like the one we first analysed - the dream of Irma's injection - turns out to have been in the nature of a self-justification, a plea on behalf of my own rights. Indeed, it carried the subject that was raised in the earlier dream a stage further and discussed it with reference to fresh material that had arisen in the interval between the two dreams. Even the apparently indifferent form in which the dream was couched turns out to have had significance. What it meant was: 'After all, I'm the man who wrote the valuable and memorable paper (on cocaine)', just as in the earlier dream I had said on my behalf: 'I'm a conscientious and hard-working student.' In both cases what I was insisting was: 'I may allow myself to do this.' There is, however, no need for me to carry the interpretation of the dream any further, since my only purpose in reporting it was to illustrate by an example the relation between the content of a dream and the experience of the previous day which provoked it. So long as I was aware only of the dream's manifest content, it appeared to be related only to a single event of the dream-day. But when the analysis was carried out, a second source of the dream emerged in another experience of the same day. The first of these two impressions with which the dream was connected was an indifferent one, a subsidiary circumstance: I had seen a book in a shop-window whose title attracted my attention for a moment but whose subject-matter could scarcely be of interest to me. The second experience had a high degree of psychical importance: I had had a good hour's lively conversation with my friend the eye-surgeon; in the course of it I had given him some information which was bound to affect both of us closely, and I had had memories stirred up in me which had drawn my attention to a great variety of internal stresses in my own mind. Moreover, the conversation had been interrupted before its conclusion because we had been joined by acquaintances.

We must now ask what was the relation of the two impressions of the dream-day to each other and to the dream of the subsequent night. In the manifest content of the dream only the indifferent impression was alluded to, which seems to confirm the notion that dreams have a preference for taking up unimportant details of waking life. All the strands of the interpretation, on the other hand, led to the important impression, to the one which had justifiably stirred my feelings. If the sense of the dream is judged, as it can only rightly be, by its latent content as revealed by the analysis, a new and significant fact is unexpectedly brought to light. The conundrum of why dreams are concerned only with worthless fragments of waking life seems to have lost all its meaning; nor can it any longer be maintained that waking life is not pursued further in dreams and that dreams are thus psychical activity wasted upon foolish material. The contrary is true: our dream-thoughts are dominated by the same material that has occupied us during the day and we only bother to dream of things which have given us cause for reflection in the daytime.
Why is it, then, that, though the occasion of my dreaming was a daytime impression by which I had been justifiably stirred, I nevertheless actually dreamt of something indifferent? The most obvious explanation, no doubt, is that we are once more faced by one of the phenomena of dream-distortion, which in my last chapter I traced to a psychical force acting as a censorship. My recollection of the monograph on the genus Cyclamen would thus serve the purpose of being an allusion to the conversation with my friend, just as the 'smoked salmon' in the dream of the abandoned supper-party served as an allusion to the dreamer's thought of her woman friend. The only question is as to the intermediate links which enabled the impression of the monograph to serve as an allusion to the conversation with the eye-surgeon, since at first sight there is no obvious connection between them. In the example of the abandoned supper-party the connection was given at once: 'smoked salmon', being the friend's favourite dish, was an immediate constituent of the group of ideas which were likely to be aroused in the dreamer's mind by the personality of her friend. In this later example there were two detached impressions which at a first glance only had in common the fact of their having occurred on the same day: I had caught sight of the monograph in the morning and had had the conversation the same evening. The analysis enabled us to solve the problem as follows: connections of this kind, when they are not present in the first instance, are woven retrospectively between the ideational content of one impression and that of the other. I have already drawn attention to the intermediate links in the present case by the words I have italicized in my record of the analysis. If there had been no influences from another quarter, the idea of the monograph on the Cyclamen would only, I imagine, have led to the idea of its being my wife's favourite flower, and possibly also to Frau L.'s absent bouquet. I scarcely think that these background thoughts would have sufficed to evoke a dream. As we are told in *Hamlet*:
[1900a, 662]

But, lo and behold, I was reminded in the analysis that the man who interrupted our conversation was called Gärtner and that I had thought his wife looked blooming. And even as I write these words I recall that one of my patients, who bore the charming name of Flora, was for a time the pivot of our discussion. These must have been the intermediate links, arising from the botanical group of ideas, which formed the bridge between the two experiences of that day, the indifferent and the stirring one. A further set of connections was then established - those surrounding the idea of cocaine, which had every right to serve as a link between the figure of Dr. Königstein and a botanical monograph which I had written; and these connections strengthened the fusion between the two groups of ideas so that it became possible for a portion of the one experience to serve as an allusion to the other one.
[1900a, 662]

Thus the fact that the content of dreams includes remnants of trivial experiences is to be explained as a manifestation of dream-distortion (by displacement); and it will be recalled that we came to the conclusion that dream-distortion was the product of a censorship operating in the passage-way between two psychical agencies. It is to be expected that the analysis of a dream will regularly reveal its true, psychically significant source in waking life, though the emphasis has been displaced from the recollection of that source on to that of an indifferent one. This explanation brings us into complete conflict with Robert's theory, which ceases to be of any service to us. For the fact which Robert sets out to explain is a non-existent one. His acceptance of it rests on a misunderstanding, on his failure to replace the apparent content of dreams by their real meaning. And there is another objection that can be raised to Robert's theory. If it were really the business of dreams to relieve our memory of the 'dregs' of daytime recollections by a special psychical activity, our sleep would be more tormented and harder worked than our mental life while we are awake. For the number of indifferent impressions from which our memory would need to be protected is clearly immensely large: the night would not be long enough to cope with such a mass. It is far more likely that the process of forgetting indifferent impressions goes forward without the active intervention of our psychical forces.
[1900a, 665]
An intelligent and cultivated young woman, reserved and undemonstrative in her behaviour, reported as follows: *I dreamt that I arrived too late at the market and could get nothing either from the butcher or from the woman who sells vegetables*. An innocent dream, no doubt; but dreams are not as simple as that, so I asked to be told it in greater detail. She thereupon gave me the following account. *She dreamt she was going to the market with her cook, who was carrying the basket. After she had asked for something, the butcher said to her: 'That's not obtainable any longer', and offered her something else, adding 'This is good too.' She rejected it and went on to the woman who sells vegetables, who tried to get her to buy a peculiar vegetable that was tied up in bundles but was of a black colour. She said: 'I don't recognize that; I won't take it.'*

[1900a, 670]

The dream's connection with the previous day was quite straightforward. She had actually gone to the market too late and had got nothing. The situation seemed to shape itself into the phrase *Die Flieschbank war schon geschlossen*. I pulled myself up: was not that, or rather its opposite, a vulgar description of a certain sort of slovenliness in a man's dress? However, the dreamer herself did not use the phrase; she may perhaps have avoided using it. Let us endeavour, then, to arrive at an interpretation of the details of the dream.

[1900a, 670]

When anything in a dream has the character of direct speech, that is to say, when it is said or heard and not merely thought (and it is easy as a rule to make the distinction with certainty), then it is derived from something actually spoken in waking life - though, to be sure, this something is merely treated as raw material and may be cut up and slightly altered and, more especially, divorced from its context.¹ In carrying out an interpretation, one method is to start from spoken phrases of this kind. What, then, was the origin of the butcher's remark *'That's not obtainable any longer'*? The answer was that it came from me myself. A few days earlier I had explained to the patient that the earliest experiences of childhood were *'not obtainable any longer as such'*, but were replaced in analysis by 'transferences' and dreams. So I was the butcher and she was rejecting these transfers into the present of old habits of thinking and feeling. -What, again, was the origin of her own remark in the dream *'I don't recognize that; I won't take it'*? For the purposes of the analysis this had to be divided up. *'I don't recognize that' was something she had said the day before to her cook, with whom she had had a dispute; but at the time she had gone on: 'Behave yourself properly!' At this point there had clearly been a displacement. Of the two phrases that she had used in the dispute with her cook, she had chosen the insignificant one for inclusion in the dream. But it was only the suppressed one, *'Behave yourself properly!'* that fitted in with the rest of the content of the dream: those would have been the appropriate words to use if someone had ventured to make improper suggestions and had forgotten to close his meat-shop. The allusions underlying the incident with the vegetable-seller were a further confirmation that our interpretation was on the right track. A vegetable that is sold tied up in bundles (lengthways, as the patient added afterwards) and is also black, could only be a dream-combination of asparagus and black (Spanish) radishes. No knowledgeable person of either sex will ask for an interpretation of asparagus. But the other vegetable - *'Schwarzer Retting' - can be taken as an exclamation - *'Schwarzer rett' dich'*, and accordingly it too seems to hint at the same sexual topic which we suspected at the very beginning, when we felt inclined to introduce the phrase about the meat-shop being closed into the original account of the dream. We need not enquire now into the full meaning of the dream. So much is quite clear: it *had* a meaning and that meaning was far from innocent.*²

[1900a, 671]
I will interrupt this series for a moment and insert a short innocent dream produced by a young man. He dreamt that he was putting on his winter overcoat once more, which was a dreadful thing. The ostensible reason for this dream was a sudden return of cold weather. If we look more closely, however, we shall notice that the two short pieces that make up the dream are not in complete harmony. For what could there be ‘dreadful’ about putting on a heavy or thick overcoat in cold weather? Moreover, the innocence of the dream was decidedly upset by the first association that occurred to the dreamer in the analysis. He recalled that a lady confided to him the day before that her youngest child owed its existence to a torn condom. On that basis he was able to reconstruct his thoughts. A thin condom was dangerous, but a thick one was bad. The condom was suitably represented as an overcoat, since one slips into both of them. But an occurrence such as the lady described to him would certainly be ‘dreadful’ for an unmarried man.

In order that we may not be tempted to draw conclusions too easily from dreams as to the dreamer's actual life, I will add one more dream of the same patient's, which once more has an innocent appearance. 'I dreamt,' she said, 'of what I really did yesterday: I filled a small trunk so full of books that I really had difficulty in shutting it and I dreamt what really happened.' In this instance the narrator herself laid the chief emphasis on the agreement between the dream and reality. All such judgements on a dream and comments upon it, though they have made themselves a place in waking thought, invariably form in fact part of the latent content of the dream, as we shall find confirmed by other examples later on. What we were being told, then, was that what the dream described had really happened the day before. It would take up too much space to explain how it was that the idea occurred to me of making use of the English language in the interpretation. It is enough to say that once again what was in question was a little 'box' (cf. the dream of the dead child in the 'case', p. 649 f.) which was so full that nothing more could get into it. Anyhow, nothing bad this time.

If we turn now from the manifest content of dreams to the dream-thoughts which only analysis uncovers, we find to our astonishment that experiences from childhood also play a part in dreams whose content would never have led one to suppose it. I owe a particularly agreeable and instructive example of a dream of this kind to my respected colleague of the yellow lion. After reading Nansen's narrative of his polar expedition, he had a dream of being in a field of ice and of giving the gallant explorer galvanic treatment for an attack of sciatica from which he was suffering. In the course of analysing the dream, he thought of a story dating from his childhood, which alone, incidentally, made the dream intelligible. One day, when he was a child of three or four, he had heard the grown-ups talking of voyages of discovery and had asked his father whether that was a serious illness. He had evidently confused 'Reisen' ['voyages'] with 'Reissen' ['gripes'], and his brothers and sisters saw to it that he never forgot this embarrassing mistake.
In another instance it became apparent that, though the wish which instigated the dream was a present-day one, it had received a powerful reinforcement from memories that stretched far back into childhood. What I have in mind is a series of dreams which are based upon a longing to visit Rome. For a long time to come, no doubt, I shall have to continue to satisfy that longing in my dreams: for at the season of the year when it is possible for me to travel, residence in Rome must be avoided for reasons of health.¹ For instance, I dreamt once that I was looking out of a railway-carriage window at the Tiber and the Ponte Sant' Angelo. The train began to move off, and it occurred to me that I had not so much as set foot in the city. The view that I had seen in my dream was taken from a well-known engraving which I had caught sight of for a moment the day before in the sitting-room of one of my patients. Another time someone led me to the top of a hill and showed me Rome half-shrouded in mist; it was so far away that I was surprised at my view of it being so clear. There was more in the content of this dream than I feel prepared to detail; but the theme of 'the promised land seen from afar' was obvious in it. The town which I saw in this way for the first time, shrouded in mist, was - Lübeck, and the prototype of the hill was - at Gleichenberg. In a third dream I had at last got to Rome, as the dream itself informed me; but I was disappointed to find that the scenery was far from being of an urban character. There was a narrow stream of dark water; on one side of it were black cliffs and on the other meadows with big white flowers. I noticed a Herr Zucker (whom I knew slightly) and determined to ask him the way to the city. I was clearly making a vain attempt to see in my dream a city which I had never seen in my waking life. Breaking up the landscape in the dream into its elements, I found that the white flowers took me to Ravenna, which I have visited and which, for a time at least, superseded Rome as capital of Italy. In the marshes round Ravenna we found the loveliest water-lilies growing in black water. Because we had had such difficulty in picking them out of the water, the dream made them grow in meadows like the narcissi at our own Aussee. The dark cliff, so close to the water, reminded me vividly of the valley of the Tepl near Karlsbad. ‘Karlsbad’ enabled me to explain the curious detail of my having asked Herr Zucker the way. The material out of which the dream was woven included at this point two of those facetious Jewish anecdotes which contain so much profound and often bitter worldly wisdom and which we so greatly enjoy quoting in our talk and letters. Here is the first one: the 'constitution' story. An impecunious Jew had stowed himself away without a ticket in the fast train to Karlsbad. He was caught, and each time tickets were inspected he was taken out of the train and treated more and more severely. At one of the stations on his via dolorosa he met an acquaintance, who asked him where he was travelling to. 'To Karlsbad', was his reply, 'if my constitution can stand it.' My memory then passed on to another story: of a Jew who could not speak French and had been recommended when he was in Paris to ask the way to the rue Richelieu. Paris itself had for many long years been another goal of my longings; and the blissful feelings with which I first set foot on its pavement seemed to me a guarantee that others of my wishes would be fulfilled as well. 'Asking the way', moreover, was a direct allusion to Rome, since it is well known that all roads lead there. Again, the name Zucker was once more an allusion to Karlsbad; for we are in the habit of prescribing treatment there for anyone suffering from the constitutional complaint of diabetes. The instigation to this dream had been a proposal made by my friend in Berlin that we should meet in Prague at Easter. What we were going to discuss there would have included something with a further connection with 'sugar' and 'diabetes'.

[1900a, 679]
It is true that as a rule the childhood scene is only represented in the dream's manifest content by an allusion, and has to be arrived at by an interpretation of the dream. Such instances when they are recorded, cannot carry much conviction, since as a rule there is no other evidence of these childhood experiences having occurred: if they date back to a very early age they are no longer recognized as memories. The general justification for inferring the occurrence of these childhood experiences from dreams is provided by a whole number of factors in psycho-analytic work, which are mutually consistent and thus seem sufficiently trustworthy. If I record some of these inferred childhood experiences torn from their context for the purposes of dream-interpretation, they may perhaps create little impression, especially as I shall not even be able to quote all the material on which the interpretations were based. Nevertheless I shall not allow this to deter me from relating them.

[1900a, 682]

This was the same lady who always felt 'rushed' in her dreams, just as she had rushed and romped about when she was a child. The first scene in the dream was evidently derived from the sight of a horse fallen down; in the same way the word 'broken-down' referred to horse-racing. In her youth she had ridden horses, and no doubt when she was still younger she had actually been a horse. The falling down was related to a memory from very early childhood of the seventeen-year-old son of the house-porter who had fallen down in the street in an epileptic fit and been brought home in a carriage. She had of course only heard about this, but the idea of epileptic fits (of the 'falling sickness') had obtained a hold on her imagination and had later influenced the form taken by her own hysterical attacks. - If a woman dreams of falling, it almost invariably has a sexual sense: she is imagining herself as a 'fallen woman'. The present dream in particular scarcely left any room for doubt, since the place where my patient fell was the Graben, a part of Vienna notorious as a promenade for prostitutes. The shopping-basket [Korb] led to more than one interpretation. It reminded her of the numerous rebuffs [Körbe] which she had dealt out to her suitors, as well as of those which she complained of having later received herself. This also connected with the fact that no one helped her up, which she herself explained as a rebuff. The shopping-basket further reminded her of phantasies which had already come up in her analysis, in which she was married far beneath her and had to go marketing herself. And lastly it might serve as the mark of a servant. At this point further childhood recollections emerged. First, of a cook who had been dismissed for stealing, and who had fallen on her knees and begged to be forgiven. She herself had been twelve at the time. Then, of a housemaid who had been dismissed on account of a love-affair with the family coachman (who incidentally married her subsequently). Thus this memory was also one of the sources of the coachmen (drivers) in the dream (who, in contradistinction to the actual coachman, failed to raise the fallen woman). There remained to be explained the fact of the basket being thrown in after her and through the window. This reminded her of handing in luggage to be sent off by rail, of the country custom of lovers climbing in through their sweethearts' window and of other little episodes from her life in the country: how a gentleman had thrown some blue plums to a lady through the window of her room, and how her own younger sister had been scared by the village idiot looking in through her window. An obscure memory from her tenth year then began to emerge, of a nurse in the country who had had love-scenes (which the girl might have seen something of) with one of the servants in the house and who, along with her lover, had been sent off, thrown out (the opposite of the dream-image 'thrown in') - a story that we had already approached from several other directions. A servant's luggage or trunk is referred to contemptuously in Vienna as 'seven plums: 'pack up your seven plums and out you go!''

[1900a, 686]
When I began analysing this dream, I thought quite unexpectedly of the first novel I ever read (when I was thirteen, perhaps); as a matter of fact I began at the end of the first volume. I have never known the name of the novel or of its author; but I have a vivid memory of its ending. The hero went mad and kept calling out the names of the three women who had brought the greatest happiness and sorrow into his life. One of these names was Pélagie. I still had no notion what this recollection was going to lead to in the analysis. In connection with the three women I thought of the three Fates who spin the destiny of man, and I knew that one of the three women - the inn-hostess in the dream - was the mother who gives life, and furthermore (as in my own case) gives the living creature its first nourishment. Love and hunger, I reflected, meet at a woman's breast. A young man who was a great admirer of feminine beauty was talking once - so the story went - of the good-looking wet-nurse who had suckled him when he was a baby: 'I'm sorry', he remarked, 'that I didn't make a better use of my opportunity.' I was in the habit of quoting this anecdote to explain the factor of 'deferred action' in the mechanism of the psychoneuroses. - One of the Fates, then, was rubbing the palms of her hands together as though she was making dumplings: a queer occupation for a Fate, and one that cried out for an explanation. This was provided by another and earlier memory of my childhood. When I was six years old and was given my first lessons by my mother, I was expected to believe that we were all made of earth and must therefore return to earth. This did not suit me and I expressed doubts of the doctrine. My mother thereupon rubbed the palms of her hands together - just as she did in making dumplings, except that there was no dough between them - and showed me the blackish scales of epidermis produced by the friction as a proof that we were made of earth. My astonishment at this ocular demonstration knew no bounds and I acquiesced in the belief which I was later to hear expressed in the words: 'Du bist der Natur einen Tod schuldig.' ['Thou owest Nature a death.']¹ So they really were Fates that I found in the kitchen when I went into it - as I had so often done in my childhood when I was hungry, while my mother, standing by the fire, had admonished me that I must wait till dinner was ready. - And now for the dumplings - the Knödel! One at least of my teachers at the University - and precisely the one to whom I owe my histological knowledge (for instance of the epidermis) - would infallibly be reminded by the name Knödl of a person against whom he had been obliged to take legal action for plagiarizing his writings. The idea of plagiarizing - of appropriating whatever one can, even though it belongs to someone else - clearly led on to the second part of the dream, in which I was treated as though I were the thief who had for some time carried on his business of stealing overcoats in the lecture-rooms. I had written down the word 'plagiarizing', without thinking about it, because it occurred to me; but now I noticed that it could form a bridge [Brücke] between different pieces of the dream's manifest content. A chain of associations (Pélagie - plagiarizing - plagiostomes² or sharks [Haifische] - a fish's swimming-bladder [Fischblase]) connected the old novel with the case of Knödl and with the overcoats, which clearly referred to implements used in sexual technique. (Cf. Maury's alliterative dreams.) No doubt it was a very far-fetched and senseless chain of thought; but I could never have constructed it in waking life unless it had already been constructed by the dream-work. And, as though the need to set up forced connections regarded nothing as sacred, the honoured name of Brücke (cf. the verbal bridge above) reminded me of the Institute in which I spent the happiest hours of my student life, free from all other desires - [1900a, 688]
The dream as a whole gives one the impression of being in the nature of a phantasy in which the dreamer was carried back to the Revolutionary year 1848. Memories of that year had been recalled to me by the Jubilee in 1898, as well as by a short trip which I had made to the Wachau, in the course of which I had visited Emmersdorf,² the place of retirement of the student-leader Fischhof, to whom certain elements in the manifest content of the dream may allude. My associations then led me to England and to my brother's house there. He used often to tease his wife with the words 'Fifty Years Ago' (from the title of one of Lord Tennyson's poems), which his children used then to correct to 'fifteen years ago'. This revolutionary phantasy, however, which was derived from ideas aroused in me by seeing Count Thun, was like the façade of an Italian church in having no organic relation with the structure lying behind it. But it differed from those façades in being disordered and full of gaps, and in the fact that portions of the interior construction had forced their way through into it at many points.

[1900a, 692]

The first situation in the dream was an amalgam of several scenes, which I can separate out. The insolent attitude adopted by the Count in the dream was copied from a scene at my secondary school when I was fifteen years old. We had hatched a conspiracy against an unpopular and ignorant master, the moving spirit of which had been one of my school-fellows who since those days seemed to have taken Henry VIII of England as his model. The leadership in the chief assault was allotted to me, and the signal for open revolt was a discussion on the significance of the Danube to Austria (cf. the Wachau). One of our fellow-conspirators had been the only aristocratic boy in the class, who, on account of his remarkable length of limb, was called 'the Giraffe'. He was standing up, like the Count in my dream, having been taken to task by the school tyrant, the German language master. The favourite flower and the putting into his buttonhole of something in the nature of a flower (which last made me think of some orchids which I had brought the same day for a woman friend and also of a rose of Jericho) were a striking reminder of the scene in one of Shakespeare's historical plays which represented the beginning of the Wars of the Red and White Roses. (The mention of Henry VIII opened the way to this recollection.) - From there it was only a short step to red and white carnations. (Two little couplets, one in German and the other in Spanish, slipped into the analysis at this point:

[1900a, 693]

The remaining elements of this first situation in the dream were derived from deeper layers. What was the meaning of the Count's pronouncement about colt's foot? To find the answer, I followed a train of associations: colt's foot ['Huflattich', literally 'hoof lettuce'] - lettuce - salad - dog-in-the-manger ['Salathund', literally 'salad dog']. Here was a whole collection of terms of abuse: 'Giraffe' ['Affe' is the German for 'ape'], 'swine', 'dog' - and I could have arrived at 'donkey' if I had made a detour through another name and insulted yet another academic teacher. Moreover, I translated 'colt's foot' - whether rightly or wrongly I could not tell - by the French 'pisse-en-lit'. This information was derived from Zola's Germinal, in which a child was told to pick some of that plant for salad. The French word for 'dog' - 'chien' - reminded me of the major function ('chier' in French, compared with 'pisser' for the minor one). Soon, I thought, I should have collected examples of impropriety in all three states of matter - solid, liquid and gaseous; - for this same book, Germinal, which had plenty to do with the approaching revolution, contained an account of a very peculiar sort of competition - for the production of a gaseous excretion known by the name of 'flatus'.¹ I now saw that the path leading to flatus had been prepared far ahead: from flowers, through the Spanish couplet, Isabelita, Isabella and Ferdinand, Henry VIII, English history, and the Armada which sailed against England, after whose defeat a medal was struck, bearing the inscription 'Flavit et dissipati sunt', since the storm-blast had scattered the Spanish fleet. I had thought, half seriously, of using those words as the heading to the chapter on 'Therapy', if ever I got so far as producing a detailed account of my theory and treatment of hysteria.

[1900a, 694]
We are not in general in a position to interpret another person's dream unless he is prepared to communicate to us the unconscious thoughts that lie behind its content. The practical applicability of our method of interpreting dreams is in consequence severely restricted.¹ We have seen that, as a general rule, each person is at liberty to construct his dream-world according to his individual peculiarities and so to make it unintelligible to other people. It now appears, however, that, in complete contrast to this, there are a certain number of dreams which almost everyone has dreamt alike and which we are accustomed to assume must have the same meaning for everyone. A special interest attaches, moreover, to these typical dreams because they presumably arise from the same sources in every case and thus seem particularly well qualified to throw light on the sources of dreams.

It is therefore with quite particular anticipations that we shall attempt to apply our technique of dream-interpretation to these typical dreams; and it is with great reluctance that we shall have to confess that our art disappoints our expectations precisely in relation to this material. If we attempt to interpret a typical dream, the dreamer fails as a rule to produce the associations which would in other cases have led us to understand it, or else his associations become obscure and insufficient so that we cannot solve our problem with their help. We shall learn in a later portion of this work why this is so and how we can make up for this defect in our technique. My readers will also discover why it is that at the present point I am able to deal only with a few members of the group of typical dreams and must postpone my consideration of the rest until this later point in my discussion.

¹ [Footnote added 1925:] This assertion that our method of interpreting dreams cannot be applied unless we have access to the dreamer's associative material requires supplementing: our interpretative activity is in one instance independent of these associations - if, namely, the dreamer has employed symbolic elements in the content of the dream. In such case we make use of what is, strictly speaking, a second and auxiliary method of dream-interpretation. (See below.)

The core of a dream of exhibiting lies in the figure of the dreamer himself (not as he was as a child but as he appears at the present time) and his inadequate clothing (which emerges indistinctly, whether owing to superimposed layers of innumerable later memories of being in undress or as a result of the censorship). Added to these are the figures of the people in whose presence the dreamer feels ashamed. I know of no instance in which the actual spectators of the infantile scene of exhibiting have appeared in the dream; a dream is scarcely ever a simple memory. Curiously enough, the people upon whom our sexual interest was directed in childhood are omitted in all the reproductions which occur in dreams, in hysteria and in obsessional neurosis. It is only in paranoia that these spectators reappear and, though they remain invisible, their presence is inferred with fanatical conviction. What takes their place in dreams - 'a lot of strangers' who take no notice of the spectacle that is offered - is nothing more nor less than the wishful contrary of the single familiar individual before whom the dreamer exposed himself. Incidentally, 'a lot of strangers' frequently appear in dreams in many other connections, and they always stand as the wishful contrary of 'secrecy'. It is to be noticed that even in paranoia, where the original state of things is restored, this reversal into a contrary is observed. The subject feels that he is no longer alone, he has no doubt that he is being observed, but the observers are 'a lot of strangers' whose identity is left curiously vague.

We shall return later to the feeling of being inhibited. It serves admirably in dreams to represent a conflict in the will or a negative. The unconscious purpose requires the exhibiting to proceed; the censorship demands that it shall be stopped.
My own dream (recorded on p. 717) of running upstairs and of soon afterwards finding myself glued to the steps was equally a dream of exhibiting, since it bears the essential marks of being one. It should be possible, therefore, to trace it back to experiences during my childhood, and if these could be discovered they should enable us to judge how far the maid-servant’s behaviour to me - her accusing me of dirtying the carpet - helped to give her her place in my dream. I can, as it happens, provide the necessary particulars. In a psycho-analysis one learns to interpret propinquity in time as representing connection in subject-matter. Two thoughts which occur in immediate sequence without any apparent connection are in fact part of a single unity which has to be discovered; in just the same way, if I write an ‘a’ and a ‘b’ in succession, they have to be pronounced as a single syllable ‘ab’. The same is true of dreams. The staircase dream to which I have referred was one of a series of dreams; and I understood the interpretation of the other members of the series. Since this particular dream was surrounded by the others it must have dealt with the same subject. Now these other dreams were based on a recollection of a nurse in whose charge I had been from some date during my earliest infancy till I was two and a half. I even retain an obscure conscious memory of her. According to what I was told not long ago by my mother, she was old and ugly, but very sharp and efficient. From what I can infer from my own dreams her treatment of me was not always excessive in its amiability and her words could be harsh if I failed to reach the required standard of cleanliness. And thus the maid servant, since she had undertaken the job of carrying on this educational work, acquired the right to be treated in my dream as a reincarnation of the prehistoric old nurse. It is reasonable to suppose that the child loved the old woman who taught him these lessons, in spite of her rough treatment of him.¹

[1900a, 726]

One day one of my women patients was in a distressed and tearful mood. ‘I don’t want ever to see my relations again’, she said, ‘they must think me horrible.’ She then went on, with almost no transition, to say that she remembered a dream, though of course she had no idea what it meant. When she was four years old she had a dream that a lynx or a fox was walking on the roof; then something had fallen down or she had fallen down; and then her mother was carried out of the house dead - and then she wept bitterly. I told her that this dream must mean that when she was a child she had wished she could see her mother dead, and that it must be on account of the dream that she felt her relations must think her horrible. I had scarcely said this when she produced some material which threw light on the dream. ‘Lynx eye’ was a term of abuse that had been thrown at her by a street-urchin when she was a very small child. When she was three years old, a tile off the roof had fallen on her mother’s head and made it bleed violently.

[1900a, 738]

¹ The appearance in dreams of things of great size and in great quantities and amounts, and of exaggeration generally, may be another childish characteristic. Children have no more ardent wish than to be big and grown-up and to get as much of things as grown-up people do. They are hard to satisfy, know no such word as ‘enough’ and insist insatiably on a repetition of things which they have enjoyed or whose taste they liked. It is only the civilizing influence of education that teaches them moderation and how to be content or resigned. Everyone knows that neurotics are equally inclined to be extravagant and immoderate. [1900a, 745]
Otto is my family doctor, and I owe him more than I can ever hope to repay: he has watched over my children's health for many years, he has treated them successfully when they have been ill, and, in addition, whenever circumstances have given him an excuse, he has given them presents. He had visited us on the dream-day, and my wife had remarked that he looked tired and strained. That night I had my dream, which showed him with some of the signs of Basedow's disease. Anyone who interprets this dream without regard for my rules will conclude that I was worried about my friend's health and that this worry was realized in the dream. This would not only contradict my assertion that dreams are wish-fulfilments, but my other assertion, too, that they are accessible only to egoistic impulses. But I should be glad if anyone interpreting the dream in this way would be good enough to explain to me why my fears on Otto's behalf should have lighted on Basedow's disease - a diagnosis for which his actual appearance gives not the slightest ground. My analysis, on the other hand, brought up the following material from an occurrence six years earlier. A small group of us, which included Professor R., were driving in pitch darkness through the forest of N., which lay some hours' drive from the place at which we were spending our summer holidays. The coachman, who was not perfectly sober, spilt us, carriage and all, over an embankment, and it was only by a piece of luck that we all escaped injury. We were obliged, however, to spend the night in a neighbouring inn, at which the news of our accident brought us a lot of sympathy. A gentleman, with unmistakable signs of Basedow's disease - incidentally, just as in the dream, only the brown discoloration of the skin of the face and the protruding eyes, but no goitre - placed himself entirely at our disposal and asked what he could do for us. Professor R. replied in his decisive manner: 'Nothing except to lend me a night-shirt.' To which the fine gentleman rejoined: 'I'm sorry, but I can't do that', and left the room.

1900a, 746

As I continued my analysis, it occurred to me that Basedow was the name not only of a physician but also of a famous educationalist. (In my waking state I no longer felt quite so certain about this.) But my friend Otto was the person whom I had asked to watch over my children's physical education, especially at the age of puberty (hence the night-shirt), in case anything happened to me. By giving my friend Otto in the dream the symptoms of our noble helper, I was evidently saying that if anything happened to me he would do just as little for the children as Baron L. had done on that occasion in spite of his kind offers of assistance. This seems to be sufficient evidence of the egoistic lining of the dream.¹

1900a, 746
I cannot, however, disguise from myself that I am unable to produce any complete explanation of this class of typical dreams. My material has left me in the lurch precisely at this point. I must, however, insist upon the general assertion that all the tactile and motor sensations which occur in these typical dreams are called up immediately there is any psychical reason for making use of them and that they can be disregarded when no such need for them arises. I am also of the opinion that the relation of these dreams to infantile experiences has been established with certainty from the indications I have found in the analyses of psychoneurotics. I am not able to say, however, what other meanings may become attached to the recollection of such sensations in the course of later life - different meanings, perhaps, in every individual case, in spite of the typical appearance of the dreams; and I should be glad to be able to fill up the gap by a careful analysis of clear instances. If anyone feels surprised that, in spite of the frequency precisely of dreams of flying, falling and pulling out teeth, etc., I should be complaining of lack of material on this particular topic, I must explain that I myself have not experienced any dreams of the kind since I turned my attention to the subject of dream-interpretation. The dreams of neurotics, moreover, of which I might otherwise avail myself, cannot always be interpreted not, at least, in many cases, so as to reveal the whole of their concealed meaning; a particular psychical force, which was concerned with the original constructing of the neurosis and is brought into operation once again when attempts are made at resolving it, prevents us from interpreting such dreams down to their last secret.

[1900a, 748]

Every attempt that has hitherto been made to solve the problem of dreams has dealt directly with their manifest content as it is presented in our memory. All such attempts have endeavoured to arrive at an interpretation of dreams from their manifest content or (if no interpretation was attempted) to form a judgement as to their nature on the basis of that same manifest content. We are alone in taking something else into account. We have introduced a new class of psychical material between the manifest content of dreams and the conclusions of our enquiry: namely, their latent content, or (as we say) the 'dream-thoughts', arrived at by means of our procedure. It is from these dream-thoughts and not from a dream's manifest content that we disentangle its meaning. We are thus presented with a new task which had no previous existence: the task, that is, of investigating the relations between the manifest content of dreams and the latent dream-thoughts, and of tracing out the processes by which the latter have been changed into the former.

[1900a, 751]
The dream-thoughts and the dream-content are presented to us like two versions of the same subject-matter in two different languages. Or, more properly, the dream-content seems like a transcript of the dream-thoughts into another mode of expression, whose characters and syntactic laws it is our business to discover by comparing the original and the translation. The dream-thoughts are immediately comprehensible, as soon as we have learnt them. The dream-content, on the other hand, is expressed as it were in a pictographic script, the characters of which have to be transposed individually into the language of the dream-thoughts. If we attempted to read these characters according to their pictorial value instead of according to their symbolic relation, we should clearly be led into error. Suppose I have a picture-puzzle, a rebus, in front of me. It depicts a house with a boat on its roof, a single letter of the alphabet, the figure of a running man whose head has been conjured away, and so on. Now I might be misled into raising objections and declaring that the picture as a whole and its component parts are nonsensical. A boat has no business to be on the roof of a house, and a headless man cannot run. Moreover, the man is bigger than the house; and if the whole picture is intended to represent a landscape, letters of the alphabet are out of place in it since such objects do not occur in nature. But obviously we can only form a proper judgement of the rebus if we put aside criticisms such as these of the whole composition and its parts and if, instead, we try to replace each separate element by a syllable or word that can be represented by that element in some way or other. The words which are put together in this way are no longer nonsensical but may form a poetical phrase of the greatest beauty and significance. A dream is a picture puzzle of this sort and our predecessors in the field of dream interpretation have made the mistake of treating the rebus as a pictorial composition: and as such it has seemed to them nonsensical and worthless.

[1900a, 751]

The first thing that becomes clear to anyone who compares the dream-content with the dream-thoughts is that a work of condensation on a large scale has been carried out. Dreams are brief, meagre and laconic in comparison with the range and wealth of the dream-thoughts. If a dream is written out it may perhaps fill half a page. The analysis setting out the dream-thoughts underlying it may occupy six, eight or a dozen times as much space. This relation varies with different dreams; but so far as my experience goes its direction never varies. As a rule one underestimates the amount of compression that has taken place, since one is inclined to regard the dream-thoughts that have been brought to light as the complete material, whereas if the work of interpretation is carried further it may reveal still more thoughts concealed behind the dream. I have already had occasion to point out that it is in fact never possible to be sure that a dream has been completely interpreted. Even if the solution seems satisfactory and without gaps, the possibility always remains that the dream may have yet another meaning. Strictly speaking, then, it is impossible to determine the amount of condensation.

[1900a, 752]
There is an answer, which at first sight seems most plausible, to the argument that the great lack of proportion between the dream-content and the dream-thoughts implies that the psychical material has undergone an extensive process of condensation in the course of the formation of the dream. We very often have an impression that we have dreamt a great deal all through the night and have since forgotten most of what we dreamt. On this view, the dream which we remember when we wake up would only be a fragmentary remnant of the total dream-work; and this, if we could recollect it in its entirety, might well be as extensive as the dream-thoughts. There is undoubtedly some truth in this: there can be no question that dreams can be reproduced most accurately if we try to recall them as soon as we wake up and that our memory of them becomes more and more incomplete towards evening. But on the other hand it can be shown that the impression that we have dreamt a great deal more than we can reproduce is very often based on an illusion, the origin of which I shall discuss later. Moreover the hypothesis that condensation occurs during the dream-work is not affected by the possibility of dreams being forgotten, since this hypothesis is proved to be correct by the quantities of ideas which are related to each individual piece of the dream which has been retained. Even supposing that a large piece of the dream has escaped recollection, this may merely have prevented our having access to another group of dream-thoughts. There is no justification for supposing that the lost pieces of the dream would have related to the same thoughts which we have already reached from the pieces of the dream that have survived.¹

[1900a, 752]

In view of the very great number of associations produced in analysis to each individual element of the content of a dream, some readers may be led to doubt whether, as a matter of principle, we are justified in regarding as part of the dream-thoughts all the associations that occur to us during the subsequent analysis - whether we are justified, that is, in supposing that all these thoughts were already active during the state of sleep and played a part in the formation of the dream. Is it not more probable that new trains of thought have arisen in the course of the analysis which had no share in forming the dream? I can only give limited assent to this argument. It is no doubt true that some trains of thought arise for the first time during the analysis. But one can convince oneself in all such cases that these new connections are only set up between thoughts which were already linked in some other way in the dream-thoughts. The new connections are, as it were, loop-lines or short-circuits, made possible by the existence of other and deeper-lying connecting paths. It must be allowed that the great bulk of the thoughts which are revealed in analysis were already active during the process of forming the dream; for, after working through a string of thoughts which seem to have no connection with the formation of a dream, one suddenly comes upon one which is represented in its content and is indispensable for its interpretation, but which could not have been reached except by this particular line of approach. I may here recall the dream of the botanical monograph, which strikes one as the product of an astonishing amount of condensation, even though I have not reported its analysis in full.

[1900a, 753]
The element in this dream which stood out most was the botanical monograph. This arose from the impressions of the dream day: I had in fact seen a monograph on the genus Cyclamen in the window of a book-shop. There was no mention of this genus in the content of the dream; all that was left in it was the monograph and its relation to botany. The 'botanical monograph' immediately revealed its connection with the work upon cocaine which I had once written. From 'cocaine' the chains of thought led on the one hand to the Festschrift and to certain events in a University laboratory, and on the other hand to my friend Dr. Königstein, the eye surgeon, who had had a share in the introduction of cocaine. The figure of Dr. Königstein further reminded me of the interrupted conversation which I had had with him the evening before and of my various reflections upon the payment for medical services among colleagues. This conversation was the actual currently active instigator of the dream; the monograph on the cyclamen was also a currently active impression, but one of an indifferent nature. As I perceived, the 'botanical monograph' in the dream turned out to be an 'intermediate common entity' between the two experiences of the previous day: it was taken over unaltered from the indifferent impression and was linked with the psychically significant event by copious associative connections.

Not only the compound idea, 'botanical monograph', however, but each of its components, 'botanical' and 'monograph' separately, led by numerous connecting paths deeper and deeper into the tangle of dream-thoughts. 'Botanical' was related to the figure of Professor Gärtner [Gardener], the blooming looks of his wife, to my patient Flora and to the lady of whom I had told the story of the forgotten flowers. Gärtner led in turn to the laboratory and to my conversation with Königstein. My two patients had been mentioned in the course of this conversation. A train of thought joined the lady with the flowers to my wife's favourite flowers and thence to the title of the monograph which I had seen for a moment during the day. In addition to these, 'botanical' recalled an episode at my secondary school and an examination while I was at the University. A fresh topic touched upon in my conversation with Dr. Königstein - my favourite hobbies - was joined, through the intermediate link of what I jokingly called my favourite flower, the artichoke, with the train of thought proceeding from the forgotten flowers. Behind 'artichokes' lay, on the one hand, my thoughts about Italy and, on the other hand, a scene from my childhood which was the opening of what have since become my intimate relations with books. Thus 'botanical' was a regular nodal point in the dream. Numerous trains of thought converged upon it, which, as I can guarantee, had appropriately entered into the context of the conversation with Dr. Königstein. Here we find ourselves in a factory of thoughts where, as in the 'weaver's masterpiece' -

We discover still more when we come to examine the remaining constituents of the dream in relation to their appearance in the dream-thoughts. The coloured plate which I was unfolding led (see the analysis, p. 660 f.) to a new topic, my colleagues' criticisms of my activities, and to one which was already represented in the dream, my favourite hobbies; and it led, in addition, to the childhood memory in which I was pulling to pieces a book with coloured plates. The dried specimen of the plant touched upon the episode of the herbarium at my secondary school and specially stressed that memory.

We should not think very highly of this dream, judging by its manifest content. In defiance of the rules, I shall begin its interpretation with the portion which the dreamer described as being the most distinct.

[1900a, 755]
A 'large party' meant, as we already know, a secret. His brother was simply the representative (introduced into the childhood scene by a 'retrospective phantasy') of all his later rivals for a woman's affection. The episode of the gentleman who abused the King of Italy related once again, via the medium of a recent and in itself indifferent experience, to people of lower rank pushing their way into higher society. It was just as though the child at the breast was being given a warning parallel to the one which Daudet had given to young men.¹

[1900a, 761]

'Set them free' made her think of a passage in the Magic Flute:

[1900a, 764]

'May-beetles' also made her think of Kätchen's words:

[1900a, 764]

Another interesting example of condensation in this dream was the mention in it of 'propyls'. What was contained in the dream-thoughts was not 'propyls' but 'amyls.' It might be supposed that a single displacement had taken place at this point in the construction of the dream. This was indeed the case. But the displacement served the purposes of condensation, as is proved by the following addition to the analysis of the dream. When I allowed my attention to dwell for a moment longer on the word 'propyls', it occurred to me that it sounded like 'Propylaea'. But there are Propylaea not only in Athens but in Munich. A year before the dream I had gone to Munich to visit a friend who was seriously ill at the time - the same friend who was unmistakably alluded to in the dream by the word 'trimethylamin' which occurred immediately after 'propyls.'

[1900a, 767]

One of my women patients told me a short dream which ended in a meaningless verbal compound. She dreamt she was with her husband at a peasant festivity and said: 'This will end in a general "Maistollmütz."' In the dream she had a vague feeling that it was some kind of pudding made with maize - a sort of polenta. Analysis divided the word into 'Mais' ['maize'], 'toll' ['mad'], 'mannstoll' ['nymphomaniac' - literally 'mad for men'] and Olmütz [a town in Moravia]. All these fragments were found to be remnants of a conversation she had had at table with her relatives. The following words lay behind 'Mais' (in addition to a reference to the recently opened Jubilee Exhibition): 'Meissen' (a Meissen porcelain figure representing a bird); 'Miss' (her relatives' English governess had just gone to Olmütz); and 'mies' (a Jewish slang term, used jokingly to mean 'disgusting'). A long chain of thoughts and associations led off from each syllable of this verbal hotch potch.

[1900a, 769]
In order to solve this difficulty we shall make use of another impression derived from our enquiry into the overdetermination of the dream-content. Perhaps some of those who have read that enquiry may already have formed an independent conclusion that the overdetermination of the elements of dreams is no very important discovery, since it is a self-evident one. For in analysis we start out from the dream-elements and note down all the associations which lead off from them; so that there is nothing surprising in the fact that in the thought-material arrived at in this way we come across these same elements with peculiar frequency. I cannot accept this objection; but I will myself put into words something that sounds not unlike it. Among the thoughts that analysis brings to light are many which are relatively remote from the kernel of the dream and which look like artificial interpolations made for some particular purpose. That purpose is easy to divine. It is precisely they that constitute a connection, often a forced and far-fetched one, between the dream-content and the dream thoughts; and if these elements were weeded out of the analysis the result would often be that the component parts of the dream-content would be left not only without overdetermination but without any satisfactory determination at all. We shall be led to conclude that the multiple determination which decides what shall be included in a dream is not always a primary factor in dream-construction but is often the secondary product of a psychical force which is still unknown to us. Nevertheless multiple determination must be of importance in choosing what particular elements shall enter a dream, since we can see that a considerable expenditure of effort is used to bring it about in cases where it does not arise from the dream-material unassisted.

The question of the interplay of these factors - of displacement, condensation and overdetermination - in the construction of dreams, and the question which is a dominant factor and which a subordinate one - all of this we shall leave aside for later investigation. But we can state provisionally a second condition which must be satisfied by those elements of the dream-thoughts which make their way into the dream: they must escape the censorship imposed by resistance. And henceforward in interpreting dreams we shall take dream-displacement into account as an undeniable fact.

But first, even at the risk of appearing to bring our progress to a halt, I should like to take a preliminary glance at the processes involved in carrying out the interpretation of a dream. I cannot disguise from myself that the easiest way of making those processes clear and of defending their trustworthiness against criticism would be to take some particular dream as a sample, go through its interpretation (just as I have done with the dream of Irma's injection in my second chapter), and then collect the dream-thoughts which I have discovered and so on to reconstruct from them the process by which the dream was formed - in other words, to complete a dream-analysis by a dream-synthesis. I have in fact carried out that task for my own instruction on several specimens; but I cannot reproduce them here, since I am forbidden to do so for reasons connected with the nature of the psychical material involved - reasons which are of many kinds and which will be accepted as valid by any reasonable person. Such considerations interfered less in the analysis of dreams, since an analysis could be incomplete and nevertheless retain its value, even though it penetrated only a small way into the texture of the dream. But in the case of the synthesis of a dream I do not see how it can be convincing unless it is complete. I could only give a complete synthesis of dreams dreamt by people unknown to the reading public. Since, however, this condition is fulfilled only by my patients, who are neurotics, I must postpone this part of my exposition of the subject till I am able - in another volume - to carry the psychological elucidation of neuroses to a point at which it can make contact with our present topic.¹
My attempts at building up dreams by synthesis from the dream-thoughts have taught me that the material which emerges in the course of interpretation is not all of the same value. One part of it is made up of the essential dream-thoughts - those, that is, which completely replace the dream, and which, if there were no censorship of dreams, would be sufficient in themselves to replace it. The other part of the material is usually to be regarded as of less importance. Nor is it possible to support the view that all the thoughts of this second kind had a share in the formation of the dream. On the contrary, there may be associations among them which relate to events that occurred after the dream, between the times of dreaming and interpreting. This part of the material includes all the connecting paths that led from the manifest dream-content to the latent dream-thoughts, as well as the intermediate and linking associations by means of which, in the course of the process of interpretation, we came to discover these connecting paths.

We are here interested only in the essential dream-thoughts. These usually emerge as a complex of thoughts and memories of the of the most intricate possible structure, with all the attributes of the trains of thought familiar to us in waking life. They are not infrequently trains of thought starting out from more than one centre, though having points of contact. Each train of thought is almost invariably accompanied by its contradictory counterpart, linked with it by antithetical association.

In one of the dreams recorded just above, the first clause of which has already been interpreted ('because my descent was such and such'), the dreamer saw herself climbing down over some palisades holding a blossoming branch in her hand. In connection with this image she thought of the angel holding a spray of lilies in pictures of the Annunciation - her own name was Maria - and of girls in white robes walking in Corpus Christi processions, when the streets are decorated with green branches. Thus the blossoming branch in the dream without any doubt alluded to sexual innocence. However, the branch was covered with red flowers, each of which was like a camellia. By the end of her walk - so the dream went on - the blossoms were already a good deal faded. There then followed some unmistakable allusions to menstruation. Accordingly, the same branch which was carried like a lily and as though by an innocent girl was at the same time an allusion to the Dame aux camélias who, as we know, usually wore a white camellia, except during her periods, when she wore a red one. The same blossoming branch (cf. ‘des Mädchens Blüten’ ['the maiden's blossoms'] in Goethe's poem 'Der Müllerin Verrat') represented both sexual innocence and its contrary. And the same dream which expressed her joy at having succeeded in passing through life immaculately gave one glimpses at certain points (e.g. in the fading of the blossoms) of the contrary train of ideas - of her having been guilty of various sins against sexual purity (in her childhood, that is). In analysing the dream it was possible clearly to distinguish the two trains of thought, of which the consoling one seemed the more superficial and the self-reproachful one the deeper-lying - trains of thought which were diametrically opposed to each other but whose similar though contrary elements were represented by the same elements in the manifest dream.
It is my experience, and one to which I have found no exception, that every dream deals with the dreamer himself. Dreams are completely egoistical.¹ Whenever my own ego does not appear in the content of the dream, but only some extraneous person, I may safely assume that my own ego lies concealed, by identification, behind this other person; I can insert my ego into the context. On other occasions, when my own ego does appear in the dream, the situation in which it occurs may teach me that some other person lies concealed, by identification behind my ego. In that case the dream should warn me to transfer on to myself, when I am interpreting the dream, the concealed common element attached to this other person. There are also dreams in which my ego appears along with other people who, when the identification is resolved, are revealed once again as my ego. These identifications should then make it possible for me to bring into contact with my ego certain ideas whose acceptance has been forbidden by the censorship. Thus my ego may be represented in a dream several times over, now directly and now through identification with extraneous persons. By means of a number of such identifications it becomes possible to condense an extraordinary amount of thought-material.² The fact that the dreamer's own ego appears several times, or in several forms, in a dream is at bottom no more remarkable than that the ego should be contained in a conscious thought several times or in different places or connections - e.g. in the sentence 'when I think what a healthy child I was'.

² When I am in doubt behind which of the figures appearing in the dream my ego is to be looked for, I observe the following rule: the person who in the dream feels an emotion which I myself experience in my sleep is the one who conceals my ego.

Incidentally, reversal, or turning a thing into its opposite, is one of the means of representation most favoured by the dream-work and one which is capable of employment in the most diverse directions. It serves in the first place to give expression to the fulfilment of a wish in reference to some particular element of the dream-thoughts. 'If only it had been the other way round!' This is often the best way of expressing the ego's reaction to a disagreeable fragment of memory. Again, reversal is of quite special use as a help to the censorship, for it produces a mass of distortion in the material which is to be represented, and this has a positively paralysing effect, to begin with, on any attempt at understanding the dream. For that reason, if a dream obstinately declines to reveal its meaning, it is always worth while to see the effect of reversing some particular elements in its manifest content, after which the whole situation often becomes immediately clear.

And, apart from the reversal of subject-matter, chronological reversal must not be overlooked. Quite a common technique of dream-distortion consists in representing the outcome of an event or the conclusion of a train of thought at the beginning of a dream and of placing at its end the premises on which the conclusion was based or the causes which led to the event. Anyone who fails to bear in mind this technical method adopted by dream-distortion will be quite at a loss when confronted with the task of interpreting a dream.¹
In some instances, indeed, it is only possible to arrive at the meaning of a dream after one has carried out quite a number of reversals of its content in various respects. For instance, in the case of a young obsessional neurotic, there lay concealed behind one of his dreams the memory of a death-wish dating from his childhood and directed against his father, of whom he had been afraid. Here is the text of the dream: *His father was scolding him for coming home so late.* The context in which the dream occurred in the psycho-analytic treatment and the dreamer's associations showed, however, that the original wording must have been that he was angry with his father, and that in his view his father always came home too early (i.e. too soon). He would have preferred it if his father had not come home at all, and this was the same thing as a death-wish against his father. (See p. 733 f.) For as a small boy, during his father's temporary absence, he had been guilty of an act of sexual aggression against someone, and as a punishment had been threatened in these words: 'Just you wait till your father comes back!' [1900a, 797]

¹ [Footnote added 1909:] Hysterical attacks sometimes make use of the same kind of chronological reversal in order to disguise their meaning from observers. For instance, a hysterical girl needed to represent something in the nature of a brief romance in one of her attacks - a romance of which she had had a phantasy in her unconscious after an encounter with someone on the suburban railway. She imagined how the man had been attracted by the beauty of her foot and had spoken to her while she was reading; whereupon she had gone off with him and had had a passionate love-scene. Her attack began with a representation of this love-scene by convulsive twitching of her body, accompanied by movements of her lips to represent kissing and tightening of her arms to represent embracing. She then hurried into the next room, sat down on a chair, raised her skirt so as to show her foot, pretended to be reading a book and spoke to me (that is, answered me). - [Added 1914:] Cf. in this connection what Artemidorus says: 'In interpreting the images seen in dreams one must sometimes follow them from the beginning to the end and sometimes from the end to the beginning . . .'

[1900a, 797]

The intensity of the elements of a dream turns out to be determined otherwise - and by two independent factors. In the first place, it is easy to see that the elements by which the wish-fulfilment is expressed are represented with special intensity. And in the second place, analysis shows that the most vivid elements of a dream are the starting-point of the most numerous trains of thought - that the most vivid elements are also those with the most numerous determinants. We shall not be altering the sense of this empirically based assertion if we put it in these terms: the greatest intensity is shown by those elements of a dream on whose formation the greatest amount of condensation has been expended. We may expect that it will eventually turn out to be possible to express this determinant and the other (namely relation to the wish-fulfilment) in a single formula.

[1900a, 799]

The problem with which I have just dealt - the causes of the greater or less intensity or clarity of particular elements of a dream - is not to be confounded with another problem, which relates to the varying clarity of whole dreams or sections of dreams. In the former case clarity is contrasted with vagueness, but in the latter case it is contrasted with confusion. Nevertheless it cannot be doubted that the increase and decrease of the qualities in the two scales run parallel. A section of a dream which strikes us as perspicuous usually contains intense elements; a dream which is obscure, on the other hand, is composed of elements of small intensity. Yet the problem presented by the scale which runs from what is apparently clear to what is obscure and confused is far more complicated than that of the varying degrees of vividness of dream-elements. Indeed, for reasons which will appear later, the former problem cannot yet be discussed.

[1900a, 800]
In a few cases we find to our surprise that the impression of clarity or indistinctness given by a dream has no connection at all with the make-up of the dream itself but arises from the material of the dream-thoughts and is a constituent of it. Thus I remember a dream of mine which struck me when I woke up as being so particularly well-constructed, flawless and clear that, while I was still half-dazed with sleep, I thought of introducing a new category of dreams which were not subject to the mechanisms of condensation and displacement but were to be described as 'phantasies during sleep.' Closer examination proved that this rarity among dreams showed the same gaps and flaws in its structure as any other; and for that reason I dropped the category of 'dream-phantasies.'¹ The content of the dream, when it was arrived at, represented me as laying before my friend a difficult and long-sought theory of bisexuality; and the wish-fulfilling power of the dream was responsible for our regarding this theory (which, incidentally, was not given in the dream) as clear and flawless. Thus what I had taken to be a judgement on the completed dream was actually a part, and indeed the essential part, of the dream-content. The dream-work had in this case encroached, as it were, upon my first waking thoughts and had conveyed to me as a judgement upon the dream the part of the material of the dream-thoughts which it had not succeeded in representing accurately in the dream. I once came across a precise counterpart to this in a woman patient's dream during analysis. To begin with she refused altogether to tell it me, 'because it was so indistinct and muddled'. At length, protesting repeatedly that she felt no certainty that her account was correct, she informed me that several people had come into the dream - she herself, her husband and her father - and that it was as though she had not known whether her husband was her father, or who her father was, or something of that sort. This dream, taken in conjunction with her associations during the analytic session, showed beyond a doubt that it was a question of the somewhat commonplace story of a servant-girl who was obliged to confess that she was expecting a baby but was in doubts as to 'who the (baby's) father really was'.² Thus here again the lack of clarity shown by the dream was a part of the material which instigated the dream: part of this material, that is, was represented in the form of the dream. The form of a dream, or the form in which it is dreamt is used with quite surprising frequency for representing its concealed subject-matter.

Glosses on a dream, or apparently innocent comments on it, often serve to disguise a portion of what has been dreamt in the subtlest fashion, though in fact betraying it. For instance, a dreamer remarked that at one point 'the dream had been wiped away'; and the analysis led to an infantile recollection of his listening to someone wiping himself after defaecating. Or here is another example which deserves to be recorded in detail. A young man had a very clear dream which reminded him of some phantasies of his boyhood that had remained conscious. He dreamt that it was evening and that he was in a hotel at a summer resort. He mistook the number of his room and went into one in which an elderly lady and her two daughters were undressing and going to bed. He proceeded: 'Here there are some gaps in the dream; there's something missing. Finally there was a man in the room who tried to throw me out, and I had to have a struggle with him.' He made vain endeavours to recall the gist and drift of the boyish phantasy to which the dream was evidently alluding; until at last the truth emerged that what he was in search of was already in his possession in his remark about the obscure part of the dream. The 'gaps' were the genital apertures of the women who were going to bed; and 'there's something missing' described the principal feature of the female genitalia. When he was young he had had a consuming curiosity to see a woman's genitals and had been inclined to hold to the infantile sexual theory according to which women have male organs.

An analogous recollection of another dreamer assumed a very similar shape. He dreamt as follows: 'I was going into the Volkergarten Restaurant with Fräulein K. . . . . then came an obscure patch, an interruption . . . . then I found myself in the salon of a brothel, where I saw two or three women, one of them in her chemise and drawers.'
The content of all dreams that occur during the same night forms part of the same whole; the fact of their being divided into several sections, as well as the grouping and number of those sections - all of this has a meaning and may be regarded as a piece of information arising from the latent dream-thoughts. In interpreting dreams consisting of several main sections or, in general, dreams occurring during the same night, the possibility should not be overlooked that separate and successive dreams of this kind may have the same meaning, and may be giving expression to the same impulses in different material. If so, the first of these homologous dreams to occur is often the more distorted and timid, while the succeeding one will be more confident and distinct.

Otto Rank (1910) has produced a neat confirmation of this law of Scherner's. A girl's dream reported by him was composed of two separate dreams dreamt, with an interval between them, during the same night, the second of which ended with an orgasm. It was possible to carry out a detailed interpretation of this second dream even without many contributions from the dreamer; and the number of connections between the contents of the two dreams made it possible to see that the first dream represented in a more timid fashion the same thing as the second. So that the second, the dream with the orgasm, helped towards the complete explanation of the first. Rank rightly bases upon this example a discussion of the general significance of dreams of orgasm or emission for the theory of dreaming.

I shall deal elsewhere (see below) with the meaning and psychical significance of the judgement which often turns up in dreams expressed in the phrase 'after all this is only a dream'. Here I will merely say in anticipation that it is intended to detract from the importance of what is being dreamt. The interesting and allied problem, as to what is meant when some of the content of a dream is described in the dream itself as 'dreamt' - the enigma of the 'dream within a dream' - has been solved in a similar sense by Stekel, who has analysed some convincing examples. The intention is, once again, to detract from the importance of what is 'dreamt' in the dream, to rob it of its reality. What is dreamt in a dream after waking from the 'dream within a dream' is what the dream-wish seeks to put in the place of an obliterated reality. It is safe to suppose, therefore, that what has been 'dreamt' in the dream is a representation of the reality, the true recollection, while the continuation of the dream, on the contrary, merely represents what the dreamer wishes. To include something in a 'dream within a dream' is thus equivalent to wishing that the thing described as a dream had never happened. In other words, if a particular event is inserted into a dream as a dream by the dream-work itself, this implies the most decided confirmation of the reality of the event - the strongest affirmation of it. The dream-work makes use of dreaming as a form of repudiation, and so confirms the discovery that dreams are wish-fulfilments.
In a few instances a change of expression of this kind assists dream-condensation even more directly, by finding a form of words which owing to its ambiguity is able to give expression to more than one of the dream-thoughts. In this way the whole domain of verbal wit is put at the disposal of the dream-work. There is no need to be astonished at the part played by words in dream-formation. Words, since they are the nodal point of numerous ideas, may be regarded as predestined to ambiguity; and the neuroses (e.g. in framing obsessions and phobias), no less than dreams, make unashamed use of the advantages thus offered by words for purposes of condensation and disguise.¹ It is easy to show that dream-distortion too profits from displacement of expression. If one ambiguous word is used instead of two unambiguous ones the result is misleading; and if our everyday, sober method of expression is replaced by a pictorial one, our understanding is brought to a halt, particularly since a dream never tells us whether its elements are to be interpreted literally or in a figurative sense or whether they are to be connected with the material of the dream-thoughts directly or through the intermediary of some interpolated phraseology. In interpreting any dream-element it is in general doubtful

Even though the dream was well focused on a single situation, yet in other respects it was sufficiently senseless: the tower in the middle of the stalls, for instance, with the conductor directing the orchestra from the top of it! And above all the coal that her sister handed up to her! I deliberately refrained from asking for an analysis of the dream. But since I had some knowledge of the dreamer's personal relations, I was able to interpret certain pieces of it independently of her. I knew she had had a great deal of sympathy for a musician whose career had been prematurely cut short by insanity. So I decided to take the tower in the stalls metaphorically. It then emerged that the man whom she had wanted to see in Hans Richter's place towered high above the other members of the orchestra. The tower might be described as a composite picture formed by apposition. The lower part of its structure represented the man's greatness; the railing at the top, behind which he was running round like a prisoner or an animal in a cage - this was an allusion to the unhappy man's name¹ - represented his ultimate fate. The two ideas might have been brought together in the word 'Narrenturm'.²

She herself and her woman friend had been left unmarried. Her younger sister, who still had prospects of marriage, handed her up the coal 'because she had not known it would be so long'. The dream did not specify what would be so long. If it were a story, we should say 'the performance'; but since it is a dream, we may take the phrase as an independent entity, decide that it was used ambiguously and add the words 'before she got married.' Our interpretation of 'secret love' is further supported by the mention of the dreamer's cousin sitting with his wife in the stalls, and by the open love-affair attributed to the latter. The dream was dominated by the antithesis between secret and open love and between the dreamer's own fire and the coldness of the young wife. In both cases, moreover, there was someone 'highly-placed' - a term applying equally to the Aristocrat and to the musician on whom such high hopes had been pinned.

Dreams make use of this symbolism for the disguised representation of their latent thoughts. Incidentally, many of the symbols are habitually or almost habitually employed to express the same thing. Nevertheless, the peculiar plasticity of the psychical material must never be forgotten. Often enough a symbol has to be interpreted in its proper meaning and not symbolically; while on other occasions a dreamer may derive from his private memories the power to employ as sexual symbols all kinds of things which are not ordinarily employed as such. If a dreamer has a choice open to him between a number of symbols, he will decide in favour of the one which is connected in its subject-matter with the rest of the material of his thoughts - which, that is to say, has individual grounds for its acceptance in addition to the typical ones.

[1900a, 810]

[1900a, 811]

[1900a, 820]
Though the later investigations since the time of Scherner have made it impossible to dispute the existence of dream symbolism - even Havelock Ellis admits that there can be no doubt that our dreams are full of symbolism - yet it must be confessed that the presence of symbols in dreams not only facilitates their interpretation but also makes it more difficult. As a rule the technique of interpreting according to the dreamer's free associations leaves us in the lurch when we come to the symbolic elements in the dream-content. Regard for scientific criticism forbids our returning to the arbitrary judgement of the dream-interpreter, as it was employed in ancient times and seems to have been revived in the reckless interpretations of Stekel. We are thus obliged, in dealing with those elements of the dream-content which must be recognized as symbolic, to adopt a combined technique, which on the one hand rests on the dreamer's associations and on the other hand fills the gaps from the interpreter's knowledge of symbols. We must combine a critical caution in resolving symbols with a careful study of them in dreams which afford particularly clear instances of their use, in order to disarm any charge of arbitrariness in dream-interpretation. The uncertainties which still attach to our activities as interpreters of dreams spring in part from our incomplete knowledge, which can be progressively improved as we advance further, but in part from certain characteristics of dream-symbols themselves. They frequently have more than one or even several meanings, and, as with Chinese script, the correct interpretation can only be arrived at on each occasion from the context. This ambiguity of the symbols links up with the characteristic of dreams for admitting of 'over-interpretation' - for representing in a single piece of content thoughts and wishes which are often widely divergent in their nature.

[1900a, 820]

One of the generalizations put forward by Stekel concerns the double significance of genital symbols. 'Where', he asks, 'is there a symbol which - provided that the imagination by any means admits of it - cannot be employed both in a male and in a female sense?' In any case the clause in parenthesis removes much of the certainty from this assertion, since in fact the imagination does not always admit of it. But I think it is worth while remarking that in my experience Stekel's generalization cannot be maintained in the face of the greater complexity of the facts. In addition to symbols which can stand with equal frequency for the male and for the female genitals, there are some which designate one of the sexes predominantly or almost exclusively, and yet others which are known only with a male or a female meaning. For it is a fact that the imagination does not admit of long, stiff objects and weapons being used as symbols of the female genitals, or of hollow objects, such as chests, cases, boxes, etc., being used as symbols for the male ones. It is true that the tendency of dreams and of unconscious phantasies to employ sexual symbols bisexually betrays an archaic characteristic; for in childhood the distinction between the genitals of the two sexes is unknown and the same kind of genitals are attributed to both of them. But it is possible, too, to be misled into wrongly supposing that a sexual symbol is bisexual, if one forgets that in some dreams there is a general inversion of sex, so that what is male is represented as female and vice versa. Dreams of this kind may, for instance, express a woman's wish to be a man.

[1900a, 822]
Since nothing occurred to her in connection with the hat in the dream, I said: 'No doubt the hat was a male genital organ, with its middle-piece sticking up and its two side-pieces hanging down. It may seem strange, perhaps, that a hat should be a man, but you will remember the phrase "Unter die Haube kommen" ["to find a husband" (literally "to come under the cap").] I intentionally gave her no interpretation of the detail about the two side-pieces hanging down unevenly; though it is precisely details of this kind that must point the way in determining an interpretation. I went on to say that as she had a husband with such fine genitals there was no need for her to be afraid of the officers - no need, that is, for her to wish for anything from them, since as a rule she was prevented from going for a walk unprotected and unaccompanied owing to her phantasies of being seduced. I had already been able to give her this last explanation of her anxiety on several occasions upon the basis of other material.

ANALYSIS. - It is no easy matter to give a complete interpretation of the dream. It formed part of a cycle of dreams and can only be fully understood if it is taken in connection with the others. There is difficulty in obtaining in sufficient isolation the material necessary for establishing the symbolism. - In the first place, the patient declared that the train journey was to be interpreted historically, as an allusion to a journey she had taken when she was leaving a sanatorium for nervous diseases, with whose director, needless to say, she had been in love. Her mother had fetched her away, and the doctor had appeared at the station and handed her a bouquet of flowers as a parting present. It had been very awkward that her mother should have witnessed this tribute. At this point, then, her mother figured as interfering with her attempts at a love affair; and this had in fact been the part played by that severe lady during the patient's girlhood. - Her next association related to the sentence: 'she looked round to see whether the parts could not be seen from behind.' The façade of the dream would of course lead one to think of the parts of her little daughter who had been run over and mangled. But her association led in quite another direction. She recollected having once seen her father naked in the bath room from behind; she went on to talk of the distinctions between the sexes, and laid stress on the fact that a man's genitals can be seen even from behind but a woman's cannot. In this connection she herself interpreted 'the little one' as meaning the genitals and 'her little one' - she had a four-year-old daughter - as her own genitals. She reproached her mother with having expected her to live as though she had no genitals, and pointed out that the same reproach was expressed in the opening sentence of the dream: 'her mother sent her little one away, so that she had to go by herself.' In her imagination 'going by herself in the streets' meant not having a man, not having any sexual relations ('coire' in Latin means literally 'to go with') - and she disliked that. Her accounts all went to show that when she was a girl she had in fact suffered from her mother's jealousy owing to the preference shown her by her father.

The deeper interpretation of this dream was shown by another dream of the same night, in which the dreamer identified herself with her brother. She had actually been a boyish girl, and had often been told that she should have been a boy. This identification with her brother made it particularly clear that 'the little one' meant a genital organ. Her mother was threatening him (or her) with castration, which could only have been a punishment for playing with her penis; thus the identification also proved that she herself had masturbated as a child - a memory which till then she had only had as applied to her brother. The information supplied by the second dream showed that she must have come to know about the male organ at an early age and have afterwards forgotten it. Further, the second dream alluded to the infantile sexual theory according to which girls are boys who have been castrated. When I suggested to her that she had had this childish belief, she at once confirmed the fact by telling me that she had heard the anecdote of the little boy's saying to the little girl: 'Cut off?' and of the little girl's replying: 'No, always been like that.'
The failure of the dreamer's associations gave us a right to attempt an interpretation by symbolic substitution. The two pears - "pommes ou poires" - were his mother's breasts which had given him nourishment; the window-sill was the projection formed by her bosom - like balconies in dreams of houses (see p. 821). His feeling of reality after waking was justified, for his mother had really suckled him, and had done so, in fact, for far longer than the usual time and his mother's breast was still available to him. The dream must be translated: 'Give (or show) me your breast again, Mother, that I used to drink from in the past.' 'In the past' was represented by his eating one of the pears; 'again' was represented by his longing for the other. The temporal repetition of an act is regularly shown in dreams by the numerical multiplication of an object.

I will here interpolate a dream (recorded in a paper by Alfred Robitsek, 1912) in which the beautifully chosen symbolism made an interpretation possible with only slight assistance from the dreamer.

"One objection which is frequently brought forward by opponents of psycho-analysis, and which has lately been voiced by Havelock Ellis (1911, 168), argues that though dream-symbolism may perhaps occur as a product of the neurotic mind, it is not to be found in normal persons. Now psycho-analytic research finds no fundamental, but only quantitative, distinctions between normal and neurotic life; and indeed the analysis of dreams, in which repressed complexes are operative alike in the healthy and the sick, shows a complete identity both in their mechanisms and in their symbolism. The naive dreams of healthy people actually often contain a much simpler, more perspicuous and more characteristic symbolism than those of neurotics; for in the latter, as a result of the more powerful workings of the censorship and of the consequently more far-reaching dream-distortion, the symbolism may be obscure and hard to interpret. The dream recorded below will serve to illustrate this fact. It was dreamt by a girl who is not neurotic but is of a somewhat prudish and reserved character. In the course of conversation with her I learnt that she was engaged, but that there were some difficulties in the way of her marriage which were likely to lead to its postponement. Of her own accord she told me the following dream.

"Popular" symbolism made it possible for me to translate the dream unaided. It was an expression of her bridal wishes: the table with its floral centre-piece symbolized herself and her genitals; she represented her wishes for the future as fulfilled, for her thoughts were already occupied with the birth of a baby; so her marriage lay a long way behind her.

Ferenczi (1917) has justly pointed out that the meaning of symbols and the significance of dreams can be arrived at with particular ease from the dreams of precisely those people who are uninitiated into psycho-analysis.
The more one is concerned with the solution of dreams, the more one is driven to recognize that the majority of the dreams of adults deal with sexual material and give expression to erotic wishes. A judgement on this point can be formed only by those who really analyse dreams, that is to say, who make their way through their manifest content to the latent dream-thoughts, and never by those who are satisfied with making a note of the manifest content alone (like Näcke, for instance, in his writings on sexual dreams). Let me say at once that this fact is not in the least surprising but is in complete harmony with the principles of my explanation of dreams. No other instinct has been subjected since childhood to so much suppression as the sexual instinct with its numerous components (cf. my *Three Essays on the Theory of Sexuality*, 1905d); from no other instinct are so many and such powerful unconscious wishes left over, ready to produce dreams in a state of sleep. In interpreting dreams we should never forget the significance of sexual complexes, though we should also, of course, avoid the exaggeration of attributing exclusive importance to them.

[1900a, 853]

Extract from a dream dreamt by a lady shortly before her treatment came to an end: She was going to pay for something. Her daughter took 3 florins and 65 kreuzers from her (the mother's) purse. The dreamer said to her: 'What are you doing? It only costs 21 kreuzers.' Owing to my knowledge of the dreamer's circumstances, this bit of dream was intelligible to me without any further explanation on her part. The lady came from abroad and her daughter was at school in Vienna. She was in a position to carry on her treatment with me as long as her daughter remained in Vienna. The girl's school year was due to end in three weeks and this also meant the end of the lady's treatment. The day before the dream, the headmistress had asked her whether she would not consider leaving her daughter at school for another year. From this suggestion she had evidently gone on to reflect that in that case she might also continue her treatment. This was what the dream referred to. One year is equal to 365 days. The three weeks which remained both of the school-year and of the treatment were equivalent to 21 days (though the hours of treatment would be less than this). The numbers, which in the dream-thoughts referred to periods of time, were attached in the dream itself to sums of money - not but what there was a deeper meaning involved, for 'time is money.' 365 kreuzers only amount to 3 florins and 65 kreuzers; and the smallness of the sums that occurred in the dream was obviously the result of wish-fulfilment. The dreamer's wish reduced the cost both of the treatment and of the year's school-fees.

[1900a, 869]

Let me now put the dream-thoughts in place of the dream. 'It was absurd to marry so early. There was no need for me to be in such a hurry. I see from Elise L.'s example that I should have got a husband in the end. Indeed, I should have got one a hundred times better' (a treasure ) 'if I had only waited' (in antithesis to her sister-in-law's hurry ). 'My money' (or dowry) 'could have bought three men just as good.'

[1900a, 870]
A great part of the impression of absurdity in this dream was brought about by running together sentences from different parts of the dream-thoughts without any transition. Thus the sentence 'I went to him in the next room', etc., dropped the subject with which the preceding sentences had been dealing and correctly reproduced the circumstances in which I informed my father of my having become engaged to be married without consulting him. This sentence was therefore reminding me of the admirable unselfishness displayed by the old man on that occasion, and contrasting it with the behaviour of someone else - of yet another person. It is to be observed that the dream was allowed to ridicule my father because in the dream-thoughts he was held up in unqualified admiration as a model to other people. It lies in the very nature of every censorship that of forbidden things it allows those which are untrue to be said rather than those which are true. The next sentence, to the effect that he recollected 'having once got drunk and been locked up for it', was no longer concerned with anything that related to my father in reality. Here the figure for whom he stood was no less a person than the great Meynert, in whose footsteps I had trodden with such deep veneration and whose behaviour towards me, after a short period of favour, had turned to undisguised hostility. The dream reminded me that he himself had told me that at one time in his youth he had indulged in the habit of making himself intoxicated with chloroform and that on account of it he had had to go into a home. It also reminded me of another incident with him shortly before his death. I had carried on an embittered controversy with him in writing, on the subject of male hysteria, the existence of which he denied. When I visited him during his fatal illness and asked after his condition, he spoke at some length about his state and ended with these words: ‘You know. I was always one of the clearest cases of male hysteria.’ He was thus admitting, to my satisfaction and astonishment, what he had for so long obstinately contested. But the reason why I was able in this scene of the dream to use my father as a screen for Meynert did not lie in any analogy that I had discovered between the two figures. The scene was a concise but entirely adequate representation of a conditional sentence in the dream-thoughts, which ran in full: ‘If only I had been the second generation, the son of a professor or Hofrat, I should certainly have got on faster.’ In the dream I made my father into a Hofrat and professor. -The most blatant and disturbing absurdity in the dream resides in its treatment of the date 1851, which seemed to me not to differ from 1856, just as though a difference of five years was of no significance whatever. But this last was precisely what the dream-thoughts sought to express. Four or five years was the length of time during which I enjoyed the support of the colleague whom I mentioned earlier in this analysis; but it was also the length of time during which I made my fiancée wait for our marriage; and it was also, by a chance coincidence which was eagerly exploited by the dream-thoughts, the length of time during which I made my patient of longest standing wait for a complete recovery. ‘What are five years?’ asked the dream-thoughts; ‘that’s no time at all, so far as I am concerned; it doesn’t count. I have time enough in front of me. And just as I succeeded in the end in that, though you would not believe it, so I shall achieve this, too.’ Apart from this, however, the number 51 by itself, without the number of the century, was determined in another, and indeed, in an opposite sense; and this, too, is why it appeared in the dream several times. 51 is the age which seems to be a particularly dangerous one to men; I have known colleagues who have died suddenly at that age, and amongst them one who, after long delays, had been appointed to a professorship only a few days before his death.

¹ This dream also provides a good example of the generally valid truth that dreams which occur during the same night, even though they are recollected as separate, spring from the ground-work of the same thoughts. Incidentally, the situation in the dream of my removing my children to safety from the City of Rome was distorted by being related back to an analogous event that occurred in my own childhood: I was envying some relatives who, many years earlier, had had an opportunity of removing their children to another country.

[1900a, 885]

[1900a, 890]
My reply is as follows: *Everything that appears in dreams as the ostensible activity of the function of judgement is to be regarded not as an intellectual achievement of the dream-work but as belonging to the material of the dream-thoughts and as having been lifted from them into the manifest content of the dream as a ready-made structure.* I can even carry this assertion further. Even the judgements made after waking upon a dream that has been remembered, and the feelings called up in us by the reproduction of such a dream, form part, to a great extent, of the latent content of the dream and are to be included in its interpretation.

I have already quoted a striking example of this. A woman patient refused to tell me a dream of hers because 'it was not clear enough.' She had seen someone in the dream but did not know whether it was her husband or her father. There then followed a second piece of dream in which a dust-bin [*Mistrügerl*] appeared, and this gave rise to the following recollection. When she had first set up house she had jokingly remarked on one occasion in the presence of a young relative who was visiting in the house that her next job was to get hold of a new dust-bin. The next morning one arrived for her, but it was filled with lilies of the valley. This piece of the dream served to represent a common phrase 'not grown on my own manure.'¹ When the analysis was completed, it turned out that the dream-thoughts were concerned with the after-effects of a story, which the dreamer had heard when she was young, of how a girl had had a baby and of how it was not clear who the father really was. Here, then, the dream-representation had overflowed into the waking thoughts: one of the elements of the dream-thoughts had found representation in a waking judgement passed upon the dream as a whole.

Here is a similar case. One of my patients had a dream which struck him as interesting, for immediately after waking he said to himself: 'I must tell the doctor that.' The dream was analysed and produced the clearest allusions to a liaison which he had started during the treatment and which he had decided to himself not to tell me about.²

² [Footnote added 1909:] If in the actual course of a dream dreamt during psycho-analytic treatment the dreamer says to himself: 'I must tell the doctor that,' it invariably implies the presence of a strong resistance against confessing the dream - which is not infrequently thereupon forgotten.

When I woke up I had a feeling of great satisfaction, the reason for which I explained to myself as being that I was going to discover from this analysis the meaning of 'I've dreamt of that before.'¹ In fact, however, the analysis taught me nothing of the kind; what it did show me was that the satisfaction belonged to the latent content of the dream and not to any judgement upon it. My satisfaction was with the fact that my marriage had brought me children. P. was a person whose course in life lay for some time alongside mine, who then out distanced me both socially and materially, but whose marriage was childless. The two events which occasioned the dream will serve, instead of a complete analysis, to indicate its meaning. The day before, I had read in a newspaper the announcement of the death of Frau Dona A-----y (which I turned into 'Doni' in the dream), who had died in childbirth. My wife told me that the dead woman had been looked after by the same midwife who had attended her at the birth of our two youngest children. The name 'Dona' had struck me because I had met it for the first time a short while before in an English novel. The second occasion for the dream was provided by the date on which it occurred. It was on the night before the birthday of my eldest boy - who seems to have some poetic gifts.

¹ [1900a, 891]

² [1900a, 892]
The resolution of what are ostensibly acts of judgement in dreams may serve to remind us of the rules laid down at the beginning of this book for carrying out the work of interpretation: namely, that we should disregard the apparent coherence between a dream's constituents as an unessential illusion, and that we should trace back the origin of each of its elements on its own account. A dream is a conglomerate which, for purposes of investigation, must be broken up once more into fragments. On the other hand, however, it will be observed that a psychical force is at work in dreams which creates this apparent connectedness, which, that is to say, submits the material produced by the dream-work to a 'secondary revision'. This brings us face to face with the manifestations of a force whose importance we shall later assess as the fourth of the factors concerned in the construction of dreams.

¹ This description was unintelligible even to myself; but I have followed the fundamental rule of reporting a dream in the words which occurred to me as I was writing it down. The wording chosen is itself part of what is represented by the dream.

In the case of a psychical complex which has come under the influence of the censorship imposed by resistance, the affects are the constituent which is least influenced and which alone can give us a pointer as to how we should fill in the missing thoughts. This is seen even more clearly in the psychoneuroses than in dreams. Their affects are always appropriate, at least in their quality though we must allow for their intensity being increased owing to displacements of neurotic attention. If a hysterical is surprised at having to be so frightened of something trivial or if a man suffering from obsessions is surprised at such distressing self-reproaches arising out of a mere nothing, they have both gone astray, because they regard the ideational content - the triviality or the mere nothing - as what is essential; and they put up an unsuccessful fight because they take this ideational content as the starting-point of their thought-activity. Psychoanalysis can put them upon the right path by recognizing the affect as being, on the contrary, justified and by seeking out the idea which belongs to it but has been repressed and replaced by a substitute. A necessary premise to all this is that the release of affect and the ideational content do not constitute the indissoluble organic unity as which we are in the habit of treating them, but that these two separate entities may be merely soldered together and can thus be detached from each other by analysis. Dream-interpretation shows that this is in fact the case.
Because, as the analysis showed, the most agreeable and satisfying thoughts contributed to bringing the dream about. What at once occurred to me in the analysis were the Augean stables which were cleansed by Hercules. This Hercules was I. The hill and bushes came from Aussee, where my children were stopping at the time. I had discovered the infantile aetiology of the neuroses and had thus saved my own children from falling ill. The seat (except, of course, for the hole) was an exact copy of a piece of furniture which had been given to me as a present by a grateful woman patient. It thus reminded me of how much my patients honoured me. Indeed, even the museum of human excrement could be given an interpretation to rejoice my heart. However much I might be disgusted by it in reality, in the dream it was a reminiscence of the fair land of Italy where, as we all know, the W.C.s in the small towns are furnished in precisely this way. The stream of urine which washed everything clean was an unmistakable sign of greatness. It was in that way that Gulliver extinguished the great fire in Lilliput though incidentally this brought him into disfavour with its tiny queen. But Gargantua, too, Rabelais' superman, revenged himself in the same way on the Parisians by sitting astride on Notre Dame and turning his stream of urine upon the city. It was only on the previous evening before going to sleep that I had been turning over Garnier's illustrations to Rabelais. And, strangely enough, here was another piece of evidence that I was the superman. The platform of Notre Dame was my favourite resort in Paris; every free afternoon I used to clamber about there on the towers of the church between the monsters and the devils. The fact that all the faeces disappeared so quickly under the stream recalled the motto: 'Afflavit et dissipati sunt', which I intended one day to put at the head of a chapter upon the therapy of hysteria.

[1900a, 912]

There is yet another alternative way in which the dream-work can deal with affects in the dream-thoughts, in addition to allowing them through or reducing them to nothing. It can turn them into their opposite. We have already become acquainted with the interpretative rule according to which every element in a dream can, for purposes of interpretation, stand for its opposite just as easily as for itself. We can never tell beforehand whether it stands for the one or for the other; only the context can decide. A suspicion of this truth has evidently found its way into popular consciousness: 'dream books' very often adopt the principle of contraries in their interpretation of dreams. This turning of a thing into its opposite is made possible by the intimate associative chain which links the idea of a thing with its opposite in our thoughts. Like my other kind of displacement it can serve the ends of the censorship; but it is also frequently a product of wish-fulfilment, for wish-fulfilment consists in nothing else than a replacement of a disagreeable thing by its opposite. Just as ideas of things can make their appearance in dreams turned into their opposite, so too can the affects attaching to dream-thoughts; and it seems likely that this reversal of affect is brought about as a rule by the dream-censorship. In social life, which has provided us with our familiar analogy with the dream-censorship, we also make use of the suppression and reversal of affect, principally for purposes of dissimulation. If I am talking to someone whom I am obliged to treat with consideration while wishing to say something hostile to him, it is almost more important that I should conceal any expression of my affect from him than that I should mitigate the verbal form of my thoughts. If I were to address him in words that were not impolite, but accompanied them with a look or gesture of hatred and contempt, the effect which I should produce on him would not be very different from what it would have been if I had thrown my contempt openly in his face. Accordingly, the censorship bids me above all suppress my affects; and, if I am a master of dissimulation, I shall assume the opposite affect - smile when I am angry and seem affectionate when I wish to destroy.

[1900a, 914]
And now at last we can turn to the fourth of the factors concerned in the construction of dreams. If we pursue our investigation of the content of dreams in the manner in which we have begun it - that is, by comparing conspicuous events in the dream-content with their sources in the dream-thoughts, we shall come upon elements the explanation of which calls for an entirely new assumption. What I have in mind are cases in which the dreamer is surprised, annoyed or repelled in the dream, and, moreover, by a piece of the dream-content itself. As I have shown in a number of instances, the majority of these critical feelings in dreams are not in fact directed against the content of the dream, but turn out to be portions of the dream-thoughts which have been taken over and used to an appropriate end. But some material of this kind does not lend itself to this explanation; its correlate in the material of the dream-thoughts is nowhere to be found. What, for instance, is the meaning of a critical remark found so often in dreams: 'This is only a dream'? Here we have a genuine piece of criticism of the dream, such as might be made in waking life. Quite frequently, too, it is actually a prelude to waking up; and still more frequently it has been preceded by some distressing feeling which is set at rest by the recognition that the state is one of dreaming. When the thought 'this is only a dream' occurs during a dream, it has the same purpose in view as when the words are pronounced on the stage by la belle Hélène in Offenbach's comic opera of that name: it is aimed at reducing the importance of what has just been experienced and at making it possible to tolerate what is to follow. It serves to lull a particular agency to sleep which would have every reason at that moment to bestir itself and forbid the continuance of the dream - or the scene in the opera. It is more comfortable, however, to go on sleeping and tolerate the dream, because, after all, 'it is only a dream.' In my view the contemptuous critical judgement, 'it's only a dream', appears in a dream when the censorship, which is never quite asleep, feels that it has been taken unawares by a dream which has already been allowed through. It is too late to suppress it, and accordingly the censorship uses these words to meet the anxiety or the distressing feeling aroused by it. The phrase is an example of esprit d'escalier on the part of the psychical censorship.

[1900a, 928]

We can have no hesitation in deciding in favour of the second alternative. There can be no doubt that the censoring agency, whose influence we have so far only recognized in limitations and omissions in the dream-content, is also responsible for interpolations and additions in it. The interpolations are easy to recognize. They are often reported with hesitation, and introduced by an 'as though'; they are not in themselves particularly vivid and are always introduced at points at which they can serve as links between two portions of the dream-content or to bridge a gap between two parts of the dream. They are less easily retained in the memory than genuine derivatives of the material of the dream-thoughts; if the dream is to be forgotten they are the first part of it to disappear, and I have a strong suspicion that the common complaint of having dreamt a lot, but of having forgotten most of it and of having only retained fragments, is based upon the rapid disappearance precisely of these connecting thoughts. In a complete analysis these interpolations are sometimes betrayed by the fact that no material connected with them is to be found in the dream-thoughts. But careful examination leads me to regard this as the less frequent case; as a rule the connecting thoughts lead back nevertheless to material in the dream-thoughts, but to material which could have no claim to acceptance in the dream either on its own account or owing to its being over-determined. Only in extreme cases, it seems, does the psychical function in dream-formation which we are now considering proceed to make new creations. So long as possible, it employs anything appropriate that it can find in the material of the dream-thoughts.

[1900a, 929]
The thing that distinguishes and at the same time reveals this part of the dream-work is its purpose. This function behaves in the manner which the poet maliciously ascribes to philosophers: it fills up the gaps in the dream-structure with shreds and patches. As a result of its efforts, the dream loses its appearance of absurdity and disconnectedness and approximates to the model of an intelligible experience. But its efforts are not always crowned with success. Dreams occur which, at a superficial view, may seem faultlessly logical and reasonable; they start from a possible situation, carry it on through a chain of consistent modifications and - though far less frequently - bring it to a conclusion which causes no surprise. Dreams which are of such a kind have been subjected to a far-reaching revision by this psychical function that is akin to waking thought; they appear to have a meaning, but that meaning is as far removed as possible from their true significance. If we analyse them, we can convince ourselves that it is in these dreams that the secondary revision has played about with the material the most freely, and has retained the relations present in that material to the least extent. They are dreams which might be said to have been already interpreted once, before being submitted to waking interpretation. In other dreams this tendentious revision has only partly succeeded; coherence seems to rule for a certain distance, but the dream then becomes senseless or confused, while perhaps later on in its course it may for a second time present an appearance of rationality. In yet other dreams the revision has failed altogether; we find ourselves hopelessly face to face with a heap of fragmentary material.

There is no doubt, then, that it is our normal thinking that is the psychical agency which approaches the content of dreams with a demand that it must be intelligible, which subjects it to a first interpretation and which consequently produces a complete misunderstanding of it. For the purposes of our interpretation it remains an essential rule invariably to leave out of account the ostensible continuity of a dream as being of suspect origin, and to follow the same path back to the material of the dream-thoughts, no matter whether the dream itself is clear or confused.

¹ [Footnote added 1925:] I used at one time to find it extraordinarily difficult to accustom readers to the distinction between the manifest content of dreams and the latent dream-thoughts. Again and again arguments and objections would be brought up based upon some uninterpreted dream in the form in which it had been retained in the memory, and the need to interpret it would be ignored. But now that analysts at least have become reconciled to replacing the manifest dream by the meaning revealed by its interpretation, many of them have become guilty of falling into another confusion which they cling to with equal obstinacy. They seek to find the essence of dreams in their latent content and in so doing they overlook the distinction between the latent dream-thoughts and the dream-work. At bottom, dreams are nothing other than a particular form of thinking, made possible by the conditions of the state of sleep. It is the dream-work which creates that form, and it alone is the essence of dreaming - the explanation of its peculiar nature. I say this in order to make it possible to assess the value of the notorious 'prospective purpose' of dreams. The fact that dreams concern themselves with attempts at solving the problems by which our mental life is faced is no more strange than that our conscious waking life should do so; beyond this it merely tells us that that activity can also be carried on in the preconscious - and this we already knew.
There can be no doubt what the peculiar feature is which attracts our interest to this brief dream. Hitherto we have been principally concerned with the secret meaning of dreams and the method of discovering it and with the means employed by the dream-work for concealing it. The problems of dream-interpretation have hitherto occupied the centre of the picture. And now we come upon a dream which raises no problem of interpretation and the meaning of which is obvious, but which, as we see, nevertheless retains the essential characteristics that differentiate dreams so strikingly from waking life and consequently call for explanation. It is only after we have disposed of everything that has to do with the work of interpretation that we can begin to realize the incompleteness of our psychology of dreams.

[1900a, 946]

Hitherto in interpreting dreams we have disregarded such warnings. On the contrary, we have accepted it as being just as important to interpret the smallest, least conspicuous and most uncertain constituents of the content of dreams as those that are most clearly and certainly preserved. The dream of Irma's injection contained the phrase "I at once called in Dr. M."; and we assumed that even this detail would not have found its way into the dream unless it had had some particular origin. It was thus that we came upon the story of the unfortunate patient to whose bedside I had 'at once' called in my senior colleague. In the apparently absurd dream which treated the difference between 51 and 56 as a negligible quantity, the number 51 was mentioned several times. Instead of regarding this as a matter of course or as something indifferent, we inferred from it that there was a second line of thought in the latent content of the dream leading to the number 51; and along this track we arrived at my fears of 51 years being the limit of my life, in glaring contrast to the dream's dominant train of thought which was lavish in its boasts of a long life. In the 'Non vixit' dream there was an inconspicuous interpolation which I overlooked at first: 'As P. failed to understand him, Fl. asked me', etc. When the interpretation was held up, I went back to these words and it was they that led me on to the childhood phantasy which turned out to be an intermediate nodal point in the dream-thoughts. This was arrived at by way of the lines:

[1900a, 949]

Examples could be found in every analysis to show that precisely the most trivial elements of a dream are indispensable to its interpretation and that the work in hand is held up if attention is not paid to these elements until too late. We have attached no less importance in interpreting dreams to every shade of the form of words in which they were laid before us. And even when it happened that the text of the dream as we had it was meaningless or inadequate - as though the effort to give a correct account of it had been unsuccessful - we have taken this defect into account as well. In short, we have treated as Holy Writ what previous writers have regarded as an arbitrary improvisation, hurriedly patched together in the embarrassment of the moment. This contradiction stands in need of an explanation.

[1900a, 949]
The explanation is in our favour, though without putting the other writers in the wrong. In the light of our newly-won understanding of the origin of dreams the contradiction disappears completely. It is true that we distort dreams in attempting to reproduce them; here we find at work once more the process which we have described as the secondary (and often ill-conceived) revision of the dream by the agency which carries out normal thinking. But this distortion is itself no more than a part of the revision to which the dream-thoughts are regularly subjected as a result of the dream-censorship. The other writers have at this point noticed or suspected the part of dream-distortion which operates manifestly; we are less interested, since we know that a much more far-reaching process of distortion, though a less obvious one, has already developed the dream out of the hidden dream-thoughts. The only mistake made by previous writers has been in supposing that the modification of the dream in the course of being remembered and put into words is an arbitrary one and cannot be further resolved and that it is therefore calculated to give us a misleading picture of the dream. They have underestimated the extent to which psychical events are determined. There is nothing arbitrary about them. It can be shown quite generally that if an element is left undetermined by one train of thought, its determination is immediately effected by a second one. For instance, I may try to think of a number arbitrarily. But this is impossible: the number that occurs to me will be unambiguously and necessarily determined by thoughts of mine, though they may be remote from my immediate intention.¹ The modifications to which dreams are submitted under the editorship of waking life are just as little arbitrary. They are associatively linked to the material which they replace, and serve to show us the way to that material, which may in its turn be a substitute for something else.

[1900a, 950]

In analysing the dreams of my patients I sometimes put this assertion to the following test, which has never failed me. If the first account given me by a patient of a dream is too hard to follow I ask him to repeat it. In doing so he rarely uses the same words. But the parts of the dream which he describes in different terms are by that fact revealed to me as the weak spot in the dream's disguise: they serve my purpose just as Hagen's was served by the embroidered mark on Siegfried's cloak. That is the point at which the interpretation of the dream can be started. My request to the patient to repeat his account of the dream has warned him that I was proposing to take special pains in solving it; under pressure of the resistance, therefore, he hastily covers the weak spots in the dream's disguise by replacing any expressions that threaten to betray its meaning by other less revealing ones. In this way he draws my attention to the expression which he has dropped out. The trouble taken by the dreamer in preventing the solution of the dream gives me a basis for estimating the care with which its cloak has been woven.

[1900a, 950]
Previous writers have had less justification in devoting so much space to the doubt with which our judgement receives accounts of dreams. For this doubt has no intellectual warrant. There is in general no guarantee of the correctness of our memory; and yet we yield to the compulsion to attach belief to its data far more often than is objectively justified. Doubt whether a dream or certain of its details have been correctly reported is once more a derivative of the dream-censorship, of resistance to the penetration of the dream-thoughts into consciousness. This resistance has not been exhausted even by the displacements and substitutions it has brought about; it persists in the form of doubt attaching to the material which has been allowed through. We are especially inclined to misunderstand this doubt since it is careful never to attack the more intense elements of a dream but only the weak and indistinct ones. As we already know, however, a complete reversal of all psychical values takes place between the dream-thoughts and the dream. Distortion is only made possible by a withdrawal of psychical value; it habitually expresses itself by that means and is occasionally content to require nothing more. If, then, an indistinct element of a dream's content is in addition attacked by doubt, we have a sure indication that we are dealing with a comparatively direct derivative of one of the proscribed dream-thoughts. The state of things is what it was after some sweeping revolution in one of the republics of antiquity or the Renaissance. The noble and powerful families which had previously dominated the scene were sent into exile and all the high offices were filled by newcomers. Only the most impoverished and powerless members of the vanquished families, or their remote dependants, were allowed to remain in the city; and even so they did not enjoy full civic rights and were viewed with distrust. The distrust in this analogy corresponds to the doubt in the case we are considering. That is why in analysing a dream I insist that the whole scale of estimates of certainty shall be abandoned and that the faintest possibility that something of this or that sort may have occurred in the dream shall be treated as complete certainty. In tracing any element of a dream it will be found that unless this attitude is firmly adopted the analysis will come to a standstill. If any doubt is thrown upon the value of the element in question, the psychical result in the patient is that none of the involuntary ideas underlying that element comes into his head. This result is not a self-evident one. It would not make nonsense if someone were to say: 'I don't know for certain whether such and such a thing came into the dream, but here is what occurs to me in connection with it.' But in fact no one ever does say this; and it is precisely the fact that doubt produces this interrupting effect upon an analysis that reveals it as a derivative and tool of psychical resistance. Psycho-analysis is justly suspicious. One of its rules is that whatever interrupts the progress of analytic work is a resistance.¹

The forgetting of dreams, too, remains inexplicable unless the power of the psychical censorship is taken into account. In a number of cases the feeling of having dreamt a great deal during the night and of only having retained a little of it may in fact have some other meaning, such as that the dream-work has been perceptibly proceeding all through the night but has only left a short dream behind. It is no doubt true that we forget dreams more and more as time passes after waking; we often forget them in spite of the most painstaking efforts to recall them. But I am of opinion that the extent of this forgetting is as a rule overestimated; and there is a similar overestimation of the extent to which the gaps in a dream limit our knowledge of it. It is often possible by means of analysis to restore all that has been lost by the forgetting of the dream's content; at least, in quite a number of cases one can reconstruct from a single remaining fragment not, it is true, the dream - which is in any case a matter of no importance - but all the dream-thoughts. This demands a certain amount of attention and self-discipline in carrying out the analysis; that is all - but it shows that there was no lack of a hostile purpose at work in the forgetting of the dream.¹

¹[1900a, 951]

¹[1900a, 952]
Convincing evidence of the fact that the forgetting of dreams is tendentious and serves the purpose of resistance¹ is afforded when it is possible to observe in analyses a preliminary stage of forgetting. It not infrequently happens that in the middle of the work of interpretation an omitted portion of the dream comes to light and is described as having been forgotten till that moment. Now a part of a dream that has been rescued from oblivion in this way is invariably the most important part; it always lies on the shortest road to the dream’s solution and has for that reason been exposed to resistance more than any other part. Among the specimen dreams scattered through this volume, there is one in which a part of its content was added like this as an after-thought. It is the travel dream in which I revenged myself on two disagreeable fellow-travellers and which I had to leave almost uninterpreted on account of its gross indecency. The omitted portion ran as follows: 'I said, referring to one of Schiller’s works: “It is from . . .” but, noticing the mistake, I corrected myself: “It is by . . .” “Yes”, the man commented to his sister, “he said that right.”'²

Moreover I am in a position to offer an ocular demonstration of the fact that the forgetting of dreams is to a great extent a product of resistance. One of my patients will tell me he has had a dream but has forgotten every trace of it: it is therefore just as though it had never happened. We proceed with our work. I come up against a resistance; I therefore explain something to the patient and help him by encouragement and pressure to come to terms with some disagreeable thought. Hardly have I succeeded in this than he exclaims: ‘Now I remember what it was I dreamt.’ The same resistance which interfered with our work that day also made him forget the dream. By overcoming this resistance I have recalled the dream to his memory.

An observation which I have been able to make in the course of preparing this manuscript has shown me that dreams are no more forgotten than other mental acts and can be compared, by no means to their disadvantage, with other mental functions in respect of their retention in the memory. I had kept records of a large number of my own dreams which for one reason or another I had not been able to interpret completely at the time or had left entirely uninterpreted. And now, between one and two years later, I have attempted to interpret some of them for the purpose of obtaining more material in illustration of my views. These attempts have been successful in every instance; indeed the interpretation may be said to have proceeded more easily after this long interval than it did at the time when the dream was a recent experience. A possible explanation of this is that in the meantime I have overcome some of the internal resistances which previously obstructed me. When making these subsequent interpretations I have compared the dream-thoughts that I elicited at the time of the dream with the present, usually far more copious, yield, and I have always found that the old ones are included among the new. My astonishment at this was quickly halted by the reflection that I had long been in the habit of getting my patients, who sometimes tell me dreams dating from earlier years, to interpret them - by the same procedure and with the same success - as though they had dreamt them the night before. When I come to discuss anxiety-dreams I shall give two examples of postponed interpretations like these. I was led into making my first experiment of this kind by the justifiable expectation that in this as in other respects dreams would behave like neurotic symptoms. When I treat a psychoneurotic - a hysterical, let us say - by psycho-analysis, I am obliged to arrive at an explanation for the earliest and long since vanished symptoms of his illness no less than for the contemporary ones which brought him to me for treatment; and I actually find the earlier problem easier to solve than the immediate one. As long ago as in 1895 I was able to give an explanation in Studies on Hysteria of the first hysterical attack which a woman of over forty had had in her fifteenth year.'
And here I will mention a number of further, somewhat disconnected, points on the subject of interpreting dreams, which may perhaps help to give readers their bearings should they feel inclined to check my statements by subsequent work upon their own dreams.

[1900a, 957]

No one should expect that an interpretation of his dreams will fall into his lap like manna from the skies. Practice is needed even for perceiving endoptic phenomena or other sensations from which our attention is normally withheld; and this is so even though there is no psychical motive fighting against such perceptions. It is decidedly more difficult to get hold of 'involuntary ideas.' Anyone who seeks to do so must familiarize himself with the expectations raised in the present volume and must, in accordance with the rules laid down in it, endeavour during the work to refrain from any criticism, any parti pris, and any emotional or intellectual bias. He must bear in mind Claude Bernard's advice to experimenters in a physiological laboratory: 'travailler comme une bête' - he must work, that is, with as much persistence as an animal and with as much disregard of the result. If this advice is followed, the task will no longer be a hard one.

[1900a, 957]

The interpretation of a dream cannot always be accomplished at a single sitting. When we have followed a chain of associations, it not infrequently happens that we feel our capacity exhausted; nothing more is to be learnt from the dream that day. The wisest plan then is to break off and resume our work another day: another part of the dream's content may then attract our attention and give us access to another stratum of dream-thoughts. This procedure might be described as 'fractional' dream-interpretation.

[1900a, 957]

It is only with the greatest difficulty that the beginner in the business of interpreting dreams can be persuaded that his task is not at an end when he has a complete interpretation in his hands - an interpretation which makes sense, is coherent and throws light upon every element of the dream's content. For the same dream may perhaps have another interpretation as well, an 'over-interpretation', which has escaped him. It is, indeed, not easy to form any conception of the abundance of the unconscious trains of thought, all striving to find expression, which are active in our minds. Nor is it easy to credit the skill shown by the dream-work in always hitting upon forms of expression that can bear several meanings - like the Little Tailor in the fairy story who hit seven flies at a blow. My readers will always be inclined to accuse me of introducing an unnecessary amount of ingenuity into my interpretations; but actual experience would teach them better.

[1900a, 957]
On the other hand, I cannot confirm the opinion, first stated by Silberer, that all dreams (or many dreams, or certain classes of dreams) require two different interpretations, which are even stated to bear a fixed relation to each other. One of these interpretations, which Silberer calls the 'psycho-analytic' one, is said to give the dream some meaning or other, usually of an infantile-sexual kind; the other and more important interpretation, to which he gives the name of 'anagogic', is said to reveal the more serious thoughts, often of profound import, which the dream-work has taken as its material. Silberer has not given evidence in support of this opinion by reporting a series of dreams analysed in the two directions. And I must object that the alleged fact is non-existent. In spite of what he says, the majority of dreams require no 'over-interpretation' and, more particularly, are insusceptible to an anagogic interpretation. As in the case of many other theories put forward in recent years, it is impossible to overlook the fact that Silberer's views are influenced to some extent by a purpose which seeks to disguise the fundamental circumstances in which dreams are formed and to divert interest from their instinctual roots. In a certain number of cases I have been able to confirm Silberer's statements. Analysis showed that in such cases the dream-work found itself faced with the problem of transforming into a dream a series of highly abstract thoughts from waking life which were incapable of being given any direct representation. It endeavoured to solve the problem by getting hold of another group of intellectual material, somewhat loosely related (often in a manner which might be described as 'allegorical') to the abstract thoughts, and at the same time capable of being represented with fewer difficulties. The *abstract* interpretation of a dream that has arisen in this way is given by the dreamer without any difficulty; the *correct* interpretation of the material that has been interpolated must be looked for by the technical methods which are now familiar to us.  

[1900a, 958]

The question whether it is possible to interpret *every* dream must be answered in the negative. It must not be forgotten that in interpreting a dream we are opposed by the psychical forces which were responsible for its distortion. It is thus a question of relative strength whether our intellectual interest, our capacity for self-discipline, our psychological knowledge and our practice in interpreting dreams enable us to master our internal resistances. It is always possible to go some distance: far enough, at all events, to convince ourselves that the dream is a structure with a meaning, and as a rule far enough to get a glimpse of what that meaning is. Quite often an immediately succeeding dream allows us to confirm and carry further the interpretation we have tentatively adopted for its predecessor. A whole series of dreams, continuing over a period of weeks or months, is often based upon common ground and must accordingly be interpreted in connection with one another. In the case of two consecutive dreams it can often be observed that one takes as its central point something that is only on the periphery of the other and vice versa, so that their interpretations too are mutually complementary. I have already given instances which show that different dreams dreamt on the same night are, as a quite general rule, to be treated in their interpretation as a single whole.  

[1900a, 959]

There is often a passage in even the most thoroughly interpreted dream which has to be left obscure; this is because we become aware during the work of interpretation that at that point there is a tangle of dream-thoughts which cannot be unravelled and which moreover adds nothing to our knowledge of the content of the dream. This is the dream's navel, the spot where it reaches down into the unknown. The dream-thoughts to which we are led by interpretation cannot, from the nature of things, have any definite endings; they are found to branch out in every direction into the intricate network of our world of thought. It is at some point where this meshwork is particularly close that the dream-wish grows up, like a mushroom out of its mycelium.  

[1900a, 959]
There is another set of objections to our method of interpreting dreams with which we must now deal. Our procedure consists in abandoning all those purposive ideas which normally govern our reflections, in focusing our attention on a single element of the dream and in then taking note of whatever involuntary thoughts may occur to us in connection with it. We then take the next portion of the dream and repeat the process with it. We allow ourselves to be led on by our thoughts regardless of the direction in which they carry us and drift on in this way from one thing to another. But we cherish a confident belief that in the end, without any active intervention on our part, we shall arrive at the dream-thoughts from which the dream originated.

[1900a, 961]

Our critics argue against this along the following lines. There is nothing wonderful in the fact that a single element of the dream should lead us somewhere; every idea can be associated with something. What is remarkable is that such an aimless and arbitrary train of thought should happen to bring us to the dream-thoughts. The probability is that we are deceiving ourselves. We follow a chain of associations from one element, till, for one reason or another, it seems to break off. If we then take up a second element, it is only to be expected that the originally unrestricted character of our associations will be narrowed. For we still have the earlier chain of thoughts in our memory, and for that reason, in analysing the second dream-idea, we are more likely to hit upon associations which have something in common with associations from the first chain. We then delude ourselves into thinking that we have discovered a thought which is a connecting point between two elements of the dream. Since we give ourselves complete liberty to connect thoughts as we please and since in fact the only transitions from one idea to another which we exclude are those which operate in normal thinking, we shall find no difficulty in the long run in concocting out of a number of 'intermediate thoughts' something which we describe as the dream-thoughts and which - though without any guarantee, since we have no other knowledge of what the dream-thoughts are - we allege to be the psychical substitute for the dream. But the whole thing is completely arbitrary; we are merely exploiting chance connections in a manner which gives an effect of ingenuity. In this way anyone who cares to take such useless pains can worry out any interpretation he pleases from any dream.

[1900a, 961]

If we were in fact met by objections such as these, we might defend ourselves by appealing to the impression made by our interpretations, to the surprising connections with other elements of the dream which emerge in the course of our pursuing a single one of its ideas, and to the improbability that anything which gives such an exhaustive account of the dream could have been arrived at except by following up psychical connections which had already been laid down. We might also point out in our defence that our procedure in interpreting dreams is identical with the procedure by which we resolve hysterical symptoms; and there the correctness of our method is warranted by the coincident emergence and disappearance of the symptoms, or, to use a simile, the assertions made in the text are borne out by the accompanying illustrations. But we have no reason for evading the problem of how it is possible to reach a pre-existing goal by following the drift of an arbitrary and purposeless chain of thoughts; since, though we may not be able to solve the problem, we can completely cut the ground from under it.

[1900a, 962]
For it is demonstrably untrue that we are being carried along a purposeless stream of ideas when, in the process of interpreting a dream, we abandon reflection and allow involuntary ideas to emerge. It can be shown that all that we can ever get rid of are purposive ideas that are known to us; as soon as we have done this, unknown - or, as we inaccurately say, 'unconscious' - purposive ideas take charge and thereafter determine the course of the involuntary ideas. No influence that we can bring to bear upon our mental processes can ever enable us to think without purposive ideas; nor am I aware of any states of psychical confusion which can do so.¹ Psychiatrists have been far too ready in this respect to abandon their belief in the connectedness of psychical processes. I know for a fact that trains of thought without purposive ideas no more occur in hysteria and paranoia than they do in the formation or resolution of dreams. It may be that they do not occur in any of the endogenous psychical disorders. Even the deliria of confusional states may have a meaning, if we are to accept Leuret's brilliant suggestion that they are only unintelligible to us owing to the gaps in them. I myself have formed the same opinion when I have had the opportunity of observing them. Deliria are the work of a censorship which no longer takes the trouble to conceal its operation; instead of collaborating in producing a new version that shall be unobjectionable, it ruthlessly deletes whatever it disapproves of, so that what remains becomes quite disconnected. This censorship acts exactly like the censorship of newspapers at the Russian frontier, which allows foreign journals to fall into the hands of the readers whom it is its business to protect only after a quantity of passages have been blacked out.

[1900a, 962]

It may be that free play of ideas with a fortuitous chain of associations is to be found in destructive organic cerebral processes; what is regarded as such in the psychoneuroses can always be explained as an effect of the censorship's influence upon a train of thought which has been pushed into the foregound by purposive ideas that have remained hidden.² It has been regarded as an unfailing sign of an association being uninfluenced by purposive ideas if the associations (or images) in question seem to be interrelated in what is described as a 'superficial' manner - by assonance, verbal ambiguity, temporal coincidence without connection in meaning, or by any association of the kind that we allow in jokes or in play upon words. This characteristic is present in the chains of thought which lead from the elements of a dream to the intermediate thoughts and from these to the dream-thoughts proper; we have seen instances of this - not without astonishment - in many dream-analyses. No connection was too loose, no joke too bad, to serve as a bridge from one thought to another. But the true explanation of this easy-going state of things is soon found. *Whenever one psychical element is linked with another by an objectionable or superficial association, there is also a legitimate and deeper link between them which is subjected to the resistance of the censorship.*

[1900a, 963]

Two cases may here be distinguished, though in essence they are the same. In the first of these, the censorship is directed only against the *connection* between two thoughts, which are unobjectionable separately. If so, the two thoughts will enter consciousness in succession; the connection between them will remain concealed, but, instead, a superficial link between them will occur to us, of which we should otherwise never have thought. This link is usually attached to some part of the complex of ideas quite other than that on which the suppressed and essential connection is based. The second case is where the two thoughts are in themselves subject to censorship on account of their content. If so, neither of them appears in its true shape but only in a modified one which replaces it; and the two replacing thoughts are chosen in such a way that they have a superficial association that repeats the essential connection which relates the two thoughts that have been replaced. *In both these cases the pressure of the censorship has resulted in a displacement from a normal and serious association to a superficial and apparently absurd one.*

[1900a, 964]
Since we are aware that displacements of this kind occur, we have no hesitation when we are interpreting dreams in relying upon superficial associations as much as upon others.¹

¹ The same considerations apply equally, of course, to cases in which the superficial associations appear openly in the content of the dream, as, for instance, in the two dreams of Maury's quoted above on page 59. (Pélerinage - Pelletier-pelle; kilomètre - kilogramme - Gilolo - Lobelia - Lopez - lotto.) My work with neurotic patients has taught me the nature of the memories of which this is a favourite method of representation. They are occasions on which the subject has turned over the pages of encyclopaedias or dictionaries in order (like most people at the inquisitive age of puberty) to satisfy their craving for an answer to the riddles of sex.

There is one true conclusion that we may glean from these objections, namely that we need not suppose that every association that occurs during the work of interpretation had a place in the dream-work during the night. It is true that in carrying out the interpretation in the waking state we follow a path which leads back from the elements of the dream to the dream-thoughts and that the dream-work followed one in the contrary direction. But it is highly improbable that these paths are passable both ways. It appears, rather, that in the daytime we drive shafts which follow along fresh chains of thought and that these shafts make contact with the intermediate thoughts and the dream-thoughts now at one point and now at another. We can see how in this manner fresh daytime material inserts itself into the interpretative chains. It is probable, too, that the increase in resistance that has set in since the night makes new and more devious detours necessary. The number and nature of the collaterals that we spin in this way during the day is of no psychological importance whatever, so long as they lead us to the dream-thoughts of which we are in search.

The tertium comparationis in the analogy that I have just used - the quantity put at the disposal of the entrepreneur in an appropriate amount - is capable of being applied in still greater detail to the purpose of elucidating the structure of dreams. In most dreams it is possible to detect a central point which is marked by peculiar sensory intensity, as I have shown on p. 778. This central point is as a rule the direct representation of the wish-fulfilment, for, if we undo the displacements brought about by the dream-work, we find that the psychical intensity of the elements in the dream-thoughts has been replaced by the sensory intensity of the elements in the content of the actual dream. The elements in the neighbourhood of the wish-fulfilment often have nothing to do with its meaning, but turn out to be derivatives of distressing thoughts that run contrary to the wish. But owing to their being in what is often an artificially established connection with the central element, they have acquired enough intensity to become capable of being represented in the dream. Thus the wish-fulfilment's power of bringing about representation is diffused over a certain sphere surrounding it, within which all the elements - including even those possessing no means of their own - become empowered to obtain representation. In the case of dreams that are actuated by several wishes, it is easy to delimit the spheres of the different wish-fulfilments, and gaps in the dream may often be understood as frontier zones between those spheres.
It is dozens of years since I myself had a true anxiety-dream, but I remember one from my seventh or eighth year, which I submitted to interpretation some thirty years later. It was a very vivid one, and in it I saw my beloved mother, with a peculiarly peaceful, sleeping expression on her features, being carried into the room by two (or three) people with bird's beaks and laid upon the bed. I awoke in tears and screaming, and interrupted my parents' sleep. The strangely draped and unnaturally tall figures with birds' beaks were derived from the illustrations to Philippson's Bible. I fancy they must have been gods with falcons' heads from an ancient Egyptian funerary relief. Besides this, the analysis brought to mind an ill-mannered boy, a son of a concierge, who used to play with us on the grass in front of the house when we were children, and who I am inclined to think was called Philipp. It seems to me that it was from this boy that I first heard the vulgar term for sexual intercourse, instead of which educated people always use a Latin word, 'to copulate', and which was clearly enough indicated by the choice of the falcons' heads. I must have guessed the sexual significance of the word from the face of my young instructor, who was well acquainted with the facts of life. The expression on my mother's features in the dream was copied from the view I had had of any grandfather a few days before his death as he lay snoring in a coma. The interpretation carried out in the dream by the 'secondary revision' must therefore have been that my mother was dying; the funerary relief fitted in with this. I awoke in anxiety, which did not cease till I had woken my parents up. I remember that I suddenly grew calm when I saw my mother's face, as though I had needed to be reassured that she was not dead. But this 'secondary' interpretation of the dream had already been made under the influence of the anxiety which had developed. I was not anxious because I had dreamt that my mother was dying; but I interpreted the dream in that sense in my preconscious revision of it because I was already under the influence of the anxiety. The anxiety can be traced back, when repression is taken into account, to an obscure and evidently sexual craving that had found appropriate expression in the visual content of the dream.

[1900a, 1011]

A twenty-seven-year-old man, who had been seriously ill for a year, reported that when he was between eleven and thirteen he had repeatedly dreamt (to the accompaniment of severe anxiety) that a man with a hatchet was pursuing him; he tried to run away, but seemed to be paralysed and could not move from the spot. This is a good example of a very common sort of anxiety-dream, which would never be suspected of being sexual. In analysis, the dreamer first came upon a story (dating from a time later than the dream) told him by his uncle, of how he had been attacked in the street one night by a suspicious-looking individual; the dreamer himself concluded from this association that he may have heard of some similar episode at the time of the dream. In connection with the hatchet, he remembered that at about that time he had once injured his hand with a hatchet while he was chopping up wood. He then passed immediately to his relations with his younger brother. He used to ill-treat this brother and knock him down; and he particularly remembered an occasion when he had kicked him on the head with his boot and had drawn blood, and how his mother had said: 'I'm afraid he'll be the death of him one day.' While he still seemed to be occupied with the subject of violence, a recollection from his ninth year suddenly occurred to him. His parents had come home late and had gone to bed while he pretended to be asleep; soon he had heard sounds of panting and other noises which had seemed to him uncanny, and he had also been able to make out their position in the bed. Further thoughts showed that he had drawn an analogy between this relation between his parents and his own relation to his younger brother. He had subsumed what happened between his parents under the concept of violence and struggling; and he had found evidence in favour of this view in the fact that he had often noticed blood in his mother's bed.

[1900a, 1012]
It would not be possible for us to answer this question if we had not made some headway in the study of the psychology of the neuroses, and particularly of hysteria. We have found from this that the same irrational psychical processes, and others that we have not specified, dominate the production of hysterical symptoms. In hysteria, too, we come across a series of perfectly rational thoughts, equal in validity to our conscious thoughts; but to begin with we know nothing of their existence in this form and we can only reconstruct them subsequently. If they force themselves upon our notice at any point, we discover by analysing the symptom which has been produced that these normal thoughts have been submitted to abnormal treatment: they have been transformed into the symptom by means of condensation and the formation of compromises, by way of superficial associations and in disregard of contradictions, and also, it may be, along the path of regression. In view of the complete identity between the characteristic features of the dream-work and those of the psychical activity which issues in psychoneurotic symptoms, we feel justified in carrying over to dreams the conclusions we have been led to by hysteria.

[1900a, 1024]

Now that the old antithesis between conscious life and dream life has been reduced to its proper proportions by the establishment of unconscious psychical reality, a number of dream-problems with which earlier writers were deeply concerned have lost their significance. Thus some of the activities whose successful performance in dreams excited astonishment are now no longer to be attributed to dreams but to unconscious thinking, which is active during the day no less than at night. If, as Scherner has said, dreams appear to engage in making symbolic representations of the body, we now know that those representations are the product of certain unconscious phantasies (deriving, probably, from sexual impulses) which find expression not only in dreams but also in hysterical phobias and other symptoms. If a dream carries on the activities of the day and completes them and even brings valuable fresh ideas to light, all we need do is to strip it of the dream disguise, which is the product of dream-work and the mark of assistance rendered by obscure forces from the depths of the mind (cf. the Devil in Tartini's sonata dream); the intellectual achievement is due to the same mental forces which produce every similar result during the daytime. We are probably inclined greatly to over-estimate the conscious character of intellectual and artistic production as well. Accounts given us by some of the most highly productive men, such as Goethe and Helmholtz, show rather that what is essential and new in their creations came to them without premeditation and as an almost ready-made whole. There is nothing strange if in other cases, where a concentration of every intellectual faculty was needed, conscious activity also contributed its share. But it is the much-abused privilege of conscious activity, wherever it plays a part, to conceal every other activity from our eyes.

[1900a, 1038]

Analysis of the dream was helped by questioning, which established the fact that there was no evidence of her having had any recollection at all of the dream on the morning after she dreamt it, until after her walk - evidence such as her having written the dream down or told it to someone before it was fulfilled. On the contrary, she was obliged to accept the following account of what happened, which seems to me more plausible, without raising any objection to it. She was walking along the Kärntnerstrasse one morning and met her old family doctor in front of Hiess's shop. On seeing him she felt convinced that she had dreamt the night before of having this very meeting at that precise spot. According to the rules that apply to the interpretation of neurotic symptoms, her conviction must have been justified; its content may, however, require to be re-interpreted.

[1900a, 1046]
One day I discovered to my great astonishment that the view of dreams which came nearest to the truth was not the medical but the popular one, half-involved though it still was in superstition. For I had been led to fresh conclusions on the subject of dreams by applying to them a new method of psychological investigation which had done excellent service in the solution of phobias, obsessions and delusions, etc. Since then, under the name of 'psycho-analysis', it has found acceptance by a whole school of research workers. The numerous analogies that exist between dream-life and a great variety of conditions of psychical illness in waking life have indeed been correctly observed by many medical investigators. There seemed, therefore, good ground for hoping that a method of investigation which had given satisfactory results in the case of psychopathic structures would also be of use in throwing light upon dreams. Phobias and obsessions are as alien to normal consciousness as dreams are to waking consciousness; their origin is as unknown to consciousness as that of dreams. In the case of these psychopathic structures practical considerations led to an investigation of their origin and mode of development; for experience had shown that the discovery of the trains of thought which, concealed from consciousness, connect the pathological ideas with the remaining contents of the mind is equivalent to a resolution of the symptoms and has as its consequence the mastering of ideas which till then could not be inhibited. Thus psychotherapy was the starting-point of the procedure of which I made use for the explanation of dreams.

This procedure is easily described, although instruction and practice would be necessary before it could be put into effect.

I will now show what results follow if I apply this method of investigation to dreams. Any example of a dream should in fact be equally appropriate for the purpose; but for particular reasons I will choose some dream of my own, one which seems obscure and meaningless as I remember it, and one which has the advantage of brevity. A dream which I actually had last night will perhaps meet these requirements. Its content, as I noted it down immediately after waking up, was as follows:

Reflecting over this dream brought me no nearer to understanding it. I determined, however, to set down without any premeditation or criticism the associations which presented themselves to my self-observation. As I have found, it is advisable for this purpose to divide a dream into its elements and to find the associations attaching to each of these fragments separately.

And now a second association to 'table d'hôte.' A few weeks ago, while we were at table in a hotel at a mountain resort in the Tyrol, I was very much annoyed because I thought my wife was not being sufficiently reserved towards some people sitting near us whose acquaintance I had no desire at all to make. I asked her to concern herself more with me than with these strangers. This was again as though I were getting the worst of the bargain at the table. I was struck too by the contrast between my wife's behaviour at table and that of Frau E. L. in the dream, who 'turned her whole attention to me.'

Frau E. L. is the daughter of a man to whom I was once in debt. I could not help noticing that this revealed an unsuspected connection between parts of the content of the dream and my associations. If one follows the train of association starting out from one element of a dream's content, one is soon brought back to another of its elements. My associations to the dream were bringing to light connections which were not visible in the dream itself.
I will pause here to survey the results I had so far reached in my dream-analysis. By following the associations which arose from the separate elements of the dream divorced from their context, I arrived at a number of thoughts and recollections, which I could not fail to recognize as important products of my mental life. This material revealed by the analysis of the dream was intimately connected with the dream's content, yet the connection was of such a kind that I could never have inferred the fresh material from that content. The dream was unemotional, disconnected and unintelligible; but while I was producing the thoughts behind the dream, I was aware of intense and well-founded affective impulses; the thoughts themselves fell at once into logical chains, in which certain central ideas made their appearance more than once. Thus, the contrast between 'selfish' and 'unselfish', and the elements 'being in debt' and 'without paying for it' were central ideas of this kind, not represented in the dream itself. I might draw closer together the threads in the material revealed by the analysis, and I might then show that they converge upon a single nodal point, but considerations of a personal and not of a scientific nature prevent my doing so in public. I should be obliged to betray many things which had better remain my secret, for on my way to discovering the solution of the dream all kinds of things were revealed which I was unwilling to admit even to myself. Why then, it will be asked, have I not chosen some other dream, whose analysis is better suited for reporting, so that I could produce more convincing evidence of the meaning and connectedness of the material uncovered by analysis? The answer is that every dream with which I might try to deal would lead to things equally hard to report and would impose an equal discretion upon me. Nor should I avoid this difficulty by bringing up someone else's dream for analysis, unless circumstances enabled me to drop all disguise without damage to the person who had confided in me.

[1901a, 1058]

I should, of course, not draw such far-reaching conclusions if only a single dream-analysis was at my disposal. If experience shows me, however, that by uncritically pursuing the associations arising from any dream I can arrive at a similar train of thoughts, among the elements of which the constituents of the dream re-appear and which are interconnected in a rational and intelligible manner, then it will be safe to disregard the slight possibility that the connections observed in a first experiment might be due to chance. I think I am justified, therefore, in adopting a terminology which will crystallize our new discovery. In order to contrast the dream as it is retained in my memory with the relevant material discovered by analysing it, I shall speak of the former as the 'manifest content of the dream' and the latter - without, in the first instance, making any further distinction - as the 'latent content of the dream.' I am now faced by two new problems which have not hitherto been formulated. (1) What is the psychical process which has transformed the latent content of the dream into the manifest one which is known to me from my memory? (2) What are the motive or motives which have necessitated this transformation? I shall describe the process which transforms the latent into the manifest content of dreams as the 'dream-work.' The counterpart to this activity - one which brings about a transformation in the opposite direction - is already known to us as the work of analysis. The remaining problems arising out of dreams - questions as to the instigators of dreams, as to the origin of their material, as to their possible meaning, as to the possible function of dreaming, and as to the reasons for dreams being forgotten - all these problems will be discussed by me on the basis, not of the manifest, but of the newly discovered latent dream-content. Since I attribute all the contradictory and incorrect views upon dream-life which appear in the literature of the subject to ignorance of the latent content of dreams as revealed by analysis, I shall be at the greatest pains henceforward to avoid confusing the manifest dream with the latent dream-thoughts.

[1901a, 1059]
The contrast between the manifest and latent content of dreams is clearly of significance only for dreams of the second and more particularly of the third category. It is there that we are faced by riddles which only disappear after we have replaced the manifest dream by the latent thoughts behind it; and it was on a specimen of the last category - a confused and unintelligible dream - that the analysis which I have just recorded was carried out. Contrary to our expectation, however, we came up against motives which prevented us from becoming fully acquainted with the latent dream-thoughts. A repetition of similar experiences may lead us to suspect that there is an intimate and regular relation between the unintelligible and confused nature of dreams and the difficulty of reporting the thoughts behind them. Before enquiring into the nature of this relation, we may with advantage turn our attention to the more easily intelligible dreams of the first category, in which the manifest and latent content coincide, and there appears to be a consequent saving in dream-work.

[1901a, 1061]

It by no means rarely happens that in the course of a comparatively long, complicated and on the whole confused dream one particularly clear portion stands out, which contains an unmistakable wish-fulfilment, but which is bound up with some other, unintelligible material. But in the case of adults, anyone with some experience in analysing their dreams will find to his surprise that even those dreams which have an appearance of being transparently clear are seldom as simple as those of children, and that behind the obvious wish-fulfilment some other meaning may lie concealed.

[1901a, 1064]
But another achievement of the dream-work, tending as it does to produce incoherent dreams, is even more striking. If in any particular instance we compare the number of ideational elements or the space taken up in writing them down in the case of the dream and of the dream-thoughts to which the analysis leads us and of which traces are to be found in the dream itself, we shall be left in no doubt that the dream-work has carried out a work of compression or condensation on a large scale. It is impossible at first to form any judgement of the degree of this condensation; but the deeper we plunge into a dream-analysis the more impressive it seems. From every element in a dream's content associative threads branch out in two or more directions; every situation in a dream seems to be put together out of two or more impressions or experiences. For instance, I once had a dream of a sort of swimming-pool, in which the bathers were scattering in all directions; at one point on the edge of the pool someone was standing and bending towards one of the people bathing, as though to help her out of the water. The situation was put together from a memory of an experience I had had at puberty and from two paintings, one of which I had seen shortly before the dream. One was a picture from Schwind's series illustrating the legend of Mélusine, which showed the water-nymphs surprised in their pool (cf. the scattering bathers in the dream); the other was a picture of the Deluge by an Italian Master; while the little experience remembered from my puberty was of having seen the instructor at a swimming-school helping a lady out of the water who had stopped in until after the time set aside for men bathers. -In the case of the example which I chose for interpretation, an analysis of the situation led me to a small series of recollections each of which contributed something to the content of the dream. In the first place, there was the episode from the time of my engagement of which I have already spoken. The pressure upon my hand under the table, which was a part of that episode, provided the dream with the detail 'under the table' - a detail which I had to add as an afterthought to my memory of the dream. In the episode itself there was of course no question of 'turning to me'; the analysis showed that this element was the fulfilment of a wish by presenting the opposite of an actual event, and that it related to my wife's behaviour at the table d'hôte. But behind this recent recollection there lay concealed an exactly similar and far more important scene from the time of our engagement, which estranged us for a whole day. The intimate laying of a hand on my knee belonged to a quite different context and was concerned with quite other people. This element in the dream was in turn the starting-point of two separate sets of memories - and so on.

The material in the dream-thoughts which is packed together for the purpose of constructing a dream-situation must of course in itself be adaptable for that purpose. There must be one or more common elements in all the components. The dream-work then proceeds just as Francis Galton did in constructing his family photographs. It superimposes, as it were, the different components upon one another. The common element in them then stands out clearly in the composite picture, while contradictory details more or less wipe one another out. This method of production also explains to some extent the varying degrees of characteristic vagueness shown by so many elements in the content of dreams. Basing itself on this discovery, dream-interpretation has laid down the following rule: In analysing a dream, if an uncertainty can be resolved into an 'either-or', we must replace it for purposes of interpretation by an 'and', and take each of the apparent alternatives as an independent starting-point for a series of associations.

[1901a, 1066]
The composite structures which occur in dreams in such immense numbers are put together in an equal variety of ways, and the same rules apply to their resolution. There is no need for me to quote any instances. Their strangeness disappears completely when once we have made up our minds not to class them with the objects of our waking perception, but to remember that they are products of dream-condensation and are emphasizing in an effectively abbreviated form some common characteristic of the objects which they are thus combining. Here again the common element has as a rule to be discovered by analysis. The content of the dream merely says as it were: 'All these things have an element x in common.' The dissection of these composite structures by means of analysis is often the shortest way to finding the meaning of a dream. - Thus, I dreamt on one occasion that I was sitting on a bench with one of my former University teachers, and that the bench, which was surrounded by other benches, was moving forward at a rapid pace. This was a combination of a lecture theatre and a trottoir roulant.¹ I will not pursue this train of ideas further. - Another time I was sitting in a railway carriage and holding on my lap an object in the shape of a top-hat ['Zylinderhut', literally 'cylinder-hat'], which however was made of transparent glass. The situation made me think at once of the proverb: 'Mit dem Hute in der Hand kommt man durchs ganze land.'² The glass cylinder led me by a short détour to think of an incandescent gas-mantle; and I soon saw that I should like to make a discovery which would make me as rich and independent as my fellow-countryman Dr. Auer von Welsbach was made by his, and that I should like to travel instead of stopping in Vienna. In the dream I was travelling with my discovery, the hat in the shape of a glass cylinder - a discovery which, it is true, was not as yet of any great practical use. - The dream-work is particularly fond of representing two contrary ideas by the same composite structure. Thus, for instance, a woman had a dream in which she saw herself carrying a tall spray of flowers, such as the angel is represented as holding in pictures of the Annunciation. (This stood for innocence; incidentally, her own name was Maria.) On the other hand, the spray was covered with large white flowers like camellias. (This stood for the opposite of innocence; it was associated with La dame aux camélias.)

A good proportion of what we have learnt about condensation in dreams may be summarized in this formula: each element in the content of a dream is 'overdetermined' by material in the dream-thoughts; it is not derived from a single element in the dream-thoughts, but may be traced back to a whole number. These elements need not necessarily be closely related to each other in the dream-thoughts themselves; they may belong to the most widely separated regions of the fabric of those thoughts. A dream-element is, in the strictest sense of the word, the 'representative' of all this disparate material in the content of the dream. But analysis reveals yet another side of the complicated relation between the content of the dream and the dream-thoughts. Just as connections lead from each element of the dream to several dream-thoughts, so as a rule a single dream-thought is represented by more than one dream-element; the threads of association do not simply converge from the dream-thoughts to the dream-content, they cross and interweave with each other many times over in the course of their journey.
First and foremost, when by means of analysis we have arrived at a knowledge of the dream-thoughts, we observe that the manifest dream-content deals with quite different material from the latent thoughts. This, to be sure, is no more than an appearance, which evaporates under closer examination, for we find ultimately that the whole of the dream-content is derived from the dream-thoughts, and that almost all the dream-thoughts are represented in the dream-content. Nevertheless, something of the distinction still remains. What stands out boldly and clearly in the dream as its essential content must, after analysis, be satisfied with playing an extremely subordinate role among the dream-thoughts; and what, on the evidence of our feelings, can claim to be the most prominent among the dream-thoughts is either not present at all as ideational material in the content of the dream or is only remotely alluded to in some obscure region of it. We may put it in this way: in the course of the dream-work the psychical intensity passes over from the thoughts and ideas to which it properly belongs on to others which in our judgement have no claim to any such emphasis. No other process contributes so much to concealing the meaning of a dream and to making the connection between the dream-content and the dream-thoughts unrecognizable. In the course of this process, which I shall describe as 'dream-displacement', the psychical intensity, significance or affective potentiality of the thoughts is, as we further find, transformed into sensory vividness. We assume as a matter of course that the most distinct element in the manifest content of a dream is the most important one; but in fact it is often an indistinct element which turns out to be the most direct derivative of the essential dream-thought.

[1901a, 1070]

If we undo dream-displacement by means of analysis, we obtain what seems to be completely trustworthy information on two much-disputed problems concerning dreams: as to their instigators and as to their connection with waking life. There are dreams which immediately reveal their derivation from events of the day; there are others in which no trace of any such derivation is to be discovered. If we seek the help of analysis, we find that every dream without any possible exception goes back to an impression of the past few days, or, it is probably more correct to say, of the day immediately preceding the dream, of the 'dream-day.' The impression which plays the part of dream-instigator may be such an important one that we feel no surprise at being concerned with it in the daytime, and in that case we rightly speak of the dream as carrying on with the significant interests of our waking life. As a rule, however, if a connection is to be found in the content of the dream with any impression of the previous day, that impression is so trivial, insignificant and unmemorable, that it is only with difficulty that we ourselves can recall it. And in such cases the content of the dream itself, even if it is connected and intelligible, seems to be concerned with the most indifferent trivialities, which would be unworthy of our interest if we were awake. A good deal of the contempt in which dreams are held is due to the preference thus shown in their content for what is indifferent and trivial.

[1901a, 1071]
Analysis does away with the misleading appearance upon which this derogatory judgement is founded. If the content of a dream puts forward some indifferent impression as being its instigator, analysis invariably brings to light a significant experience, and one by which the dreamer has good reason to be stirred. This experience has been replaced by the indifferent one, with which it is connected by copious associative links. Where the content of the dream treats of insignificant and uninteresting ideational material, analysis uncovers the numerous associative paths connecting these trivialities with things that are of the highest psychical importance in the dreamer’s estimation. If what makes their way into the content of dreams are impressions and material which are indifferent and trivial rather than justifiably stirring and interesting, that is only the effect of the process of displacement. If we answer our questions about dream-instigators and the connection between dreaming and daily affairs on the basis of the new insight we have gained from replacing the manifest by the latent content of dreams, we arrive at these conclusions: dreams are never concerned with things with which we should not think it worth while to be concerned during the day, and trivialities which do no affect us during the day are unable to pursue us in our sleep.

The dream-thoughts which we arrive at by means of analysis reveal themselves as a psychical complex of the most intricate possible structure. Its portions stand in the most manifold logical relations to one another: they represent foreground and background, conditions, digressions and illustrations, chains of evidence and counter-arguments. Each train of thought is almost invariably accompanied by its contradictory counterpart. This material lacks none of the characteristics that are familiar to us from our waking thinking. If now all of this is to be turned into a dream, the psychical material will be submitted to a pressure which will condense it greatly, to an internal fragmentation and displacement which will, as it were, create new surfaces, and to a selective operation in favour of those portions of it which are the most appropriate for the construction of situations. If we take into account the genesis of the material, a process of this sort deserves to be described as a ‘regression.’ In the course of this transformation, however, the logical links which have hitherto held the psychical material together are lost. It is only, as it were, the substantive content of the dream-thoughts that the dream-work takes over and manipulates. The restoration of the connections which the dream-work has destroyed is a task which has to be performed by the work of analysis.

The alternative ‘either-or’ is never expressed in dreams, both of the alternatives being inserted in the text of the dream as though they were equally valid. I have already mentioned that an ‘either-or’ used in recording a dream is to be translated by ‘and’.

We have not yet come to the end of our consideration of the dream-work. In addition to condensation, displacement and pictorial arrangement of the psychical material, we are obliged to assign it yet another activity, though this is not to be found in operation in every dream. I shall not deal exhaustively with this part of the dream-work, and will therefore merely remark that the easiest way of forming an idea of its nature is to suppose - though the supposition probably does not meet the facts - that it only comes into operation after the dream-content has already been constructed. Its function would then consist in arranging the constituents of the dream in such a way that they form an approximately connected whole, a dream-composition. In this way the dream is given a kind of façade (though this does not, it is true, hide its content at every point), and thus receives a first, preliminary interpretation, which is supported by interpolations and slight modifications. Incidentally, this revision of the dream-content is only possible if it is not too punctiliously carried out; nor does it present us with anything more than a glaring misunderstanding of the dream-thoughts. Before we start upon the analysis of a dream we have to clear the ground of this attempt at an interpretation.
Dreams which have undergone a revision of this kind at the hands of a psychical activity completely analogous to waking thought may be described as 'well-constructed.' In the case of other dreams this activity has completely broken down; no attempt even has been made to arrange or interpret the material, and, since after we have woken up we feel ourselves identical with this last part of the dream-work, we make a judgement that the dream was 'hopelessly confused.' From the point of view of analysis, however, a dream that resembles a disordered heap of disconnected fragments is just as valuable as one that has been beautifully polished and provided with a surface. In the former case, indeed, we are saved the trouble of demolishing what has been superimposed upon the dream-content.

If the dream that I analyse is not my own, but someone else's, the conclusion will be the same, though the grounds for believing it will be different. If the dreamer is a healthy person, there is no other means open to me of obliging him to recognize the repressed ideas that have been discovered than by pointing out the context of the dream-thoughts; and I cannot help it if he refuses to recognize them. If, however, I am dealing with a neurotic patient, with a hysteric for instance, he will find the acceptance of the repressed thought forced upon him, owing to its connection with the symptoms of his illness, and owing to the improvement he experiences when he exchanges those symptoms for the repressed ideas. In the case, for instance, of the woman patient who had the dream I have just quoted about the three theatre tickets which cost 1 florin 50 kreuzers, the analysis led to the inevitable conclusion that she had a low estimate of her husband (cf. her idea that she could have got one 'a hundred times better'), that she regretted having married him, and that she would have liked to exchange him for another one. It is true that she asserted that she loved her husband, and that her emotional life knew nothing of any such low estimate of him, but all her symptoms led to the same conclusion as the dream. And after her repressed memories had been revived of a particular period during which she had consciously not loved her husband, her symptoms cleared up and her resistance against the interpretation of the dream disappeared.

When the state of sleep is over, the censorship quickly recovers its full strength; and it can now wipe out all that was won from it during the period of its weakness. This must be one part at least of the explanation of the forgetting of dreams, as is shown by an observation which has been confirmed on countless occasions. It not infrequently happens that during the narration of a dream or during its analysis a fragment of the dream-content which had seemed to be forgotten re-emerges. This fragment which has been rescued from oblivion invariably affords us the best and most direct access to the meaning of the dream. And that, in all probability, must have been the only reason for its having been forgotten, that is, for its having been once more suppressed.
There is only one method by which a dream which expresses erotic wishes can succeed in appearing innocently non-sexual in its manifest content. The material of the sexual ideas must not be represented as such, but must be replaced in the content of the dream by hints, allusions and similar forms of indirect representation. But, unlike other forms of indirect representation, that which is employed in dreams must not be immediately intelligible. The modes of representation which fulfil these conditions are usually described as 'symbols' of the things which they represent. Particular interest has been directed to them since it has been noticed that dreamers speaking the same language make use of the same symbols, and that in some cases, indeed, the use of the same symbols extends beyond the use of the same language. Since dreamers themselves are unaware of the meaning of the symbols they use, it is difficult at first sight to discover the source of the connection between the symbols and what they replace and represent. The fact itself, however, is beyond doubt, and it is important for the technique of dream-interpretation. For, with the help of a knowledge of dream-symbolism, it is possible to understand the meaning of separate elements of the content of a dream or separate pieces of a dream or in some cases even whole dreams, without having to ask the dreamer for his associations. Here we are approaching the popular ideal of translating dreams and on the other hand are returning to the technique of interpretation used by the ancients, to whom dream-interpretation was identical with interpretation by means of symbols.

[1901a, 1095]

It would, incidentally, be a mistake to expect that if we had a still profounder knowledge of dream-symbolism ('the language of dreams') we could do without asking the dreamer for his associations to the dream and go back entirely to the technique of dream-interpretation of antiquity. Quite apart from individual symbols and oscillations in the use of universal ones, one can never tell whether any particular element in the content of a dream is to be interpreted symbolically or in its proper sense, and one can be certain that the whole content of a dream is not to be interpreted symbolically. A knowledge of dream-symbolism will never do more than enable us to translate certain constituents of the dream-content, and will not relieve us of the necessity for applying the technical rules which I gave earlier. It will, however, afford the most valuable assistance to interpretation precisely at points at which the dreamer's associations are insufficient or fail altogether.

[1901a, 1096]

Dream-symbolism is also indispensable to an understanding of what are known as 'typical' dreams, which are common to everyone, and of 'recurrent' dreams in individuals.

[1901a, 1097]

I have laid it down as the task of dream-interpretation to replace the dream by the latent dream-thoughts, that is, to unravel what the dream-work has woven. In so doing I have raised a number of new psychological problems dealing with the mechanism of this dream-work itself, as well as with the nature and conditions of what is described as repression; on the other hand I have asserted the existence of the dream-thoughts - a copious store of psychical structures of the highest order, which is characterized by all the signs of normal intellectual functioning, but is nevertheless withdrawn from consciousness till it emerges in distorted form in the dream-content. I cannot but assume that thoughts of this kind are present in everyone, since almost everyone, including the most normal people, is capable of dreaming. The unconscious material of the dream-thoughts and its relation to consciousness and to repression raise further questions of significance to psychology, the answers to which must no doubt be postponed until analysis has clarified the origin of other psychopathological structures, such as hysterical symptoms and obsessional ideas.

[1901a, 1098]
(E) When I recently had occasion to report some examples of the forgetting of names, with their analyses, to a colleague with a philosophical education, he hastened to reply: 'That's all very well; but in my case the forgetting of names happens differently.' The matter can obviously not be dealt with as easily as this; I do not suppose that my colleague had ever before thought of analysing the forgetting of a name, nor could he say how it happened differently in his case. But his comment nevertheless touches on a problem which many people will be inclined to put in the foreground. Does the elucidation given here of parapraxes and chance actions apply quite generally or only in certain cases? and if the latter, what are the conditions under which it can be called in to explain phenomena that might also have been brought about in another way? In answering this question my experiences leave me in the lurch. I can but utter a warning against supposing that a connection of the kind here demonstrated is only rarely found; for every time I have made the test on myself or on my patients, a connection has been clearly shown to exist just as in the examples reported, or there have at least been good grounds for supposing that it did. It is not surprising if success in finding the hidden meaning of a symptomatic act is not achieved every time, for the magnitude of the internal resistances opposing the solution comes into account as a deciding factor. Equally, it is not possible to interpret every single dream of one's own or of one's patients; to prove that the theory holds good in general it is enough if one can penetrate a part of the way into the hidden connection. It often happens that a dream which proves refractory during an attempt to solve it the next day will allow its secret to be wrested from it a week or a month later, after a real change has come about in the meantime and has reduced the contending psychical values. The same applies to the solving of parapraxes and symptomatic acts. The example of misreading on page 1194 ('Across Europe in a Tub') gave me the opportunity of showing how a symptom that is at first insoluble becomes accessible to analysis when the real interest in the repressed thoughts has passed away.¹ As long as the possibility existed of my brother obtaining the envied title before me, this misreading resisted every one of my repeated efforts to analyse it; after it had turned out to be unlikely that he would be preferred to me in this way, the path that led to its solution was suddenly cleared. It would therefore be incorrect to maintain that all the cases which resist analysis are due to a mechanism other than the psychical mechanism disclosed here. Such an assumption would need more than negative evidence. Furthermore, the readiness to believe in a different explanation of parapraxes and symptomatic acts, which is probably to be found in all healthy people, is quite devoid of evidential value; it is obviously a manifestation of the same mental forces which produced the secret and which therefore also devote themselves to preserving it and resist its elucidation.

[1901b, 1339]
I next proceed to mention more particularly what is to be found in this paper and what is not to be found in it. The title of the work was originally 'Dreams and Hysteria', for it seemed to me peculiarly well-adapted for showing how dream-interpretation is woven into the history of a treatment and how it can become the means of filling in amnesias and elucidating symptoms. It was not without good reasons that in the year 1900 I gave precedence to a laborious and exhaustive study of dreams (The Interpretation of Dreams) over the publications upon the psychology of the neuroses which I had in view. And incidentally I was able to judge from its reception with what an inadequate degree of comprehension such efforts are met by other specialists at the present time. In this instance there was no validity in the objection that the material upon which had based my assertions had been withheld and that it was therefore impossible to become convinced of their truth by testing and checking them. For every one can submit his own dreams to analytic examination, and the technique of interpreting dreams may be easily learnt from the instructions and examples which I have given. I must once more insist, just as I did at that time, that a thorough investigation of the problems of dreams is an indispensable prerequisite for any comprehension of the mental processes in hysteria and the other psychoneuroses, and that no one who wishes to shirk that preparatory labour has the smallest prospect of advancing even a few steps into this region of knowledge. Since, therefore, this case history presupposes a knowledge of the interpretation of dreams, it will seem highly unsatisfactory to any reader to whom this presupposition does not apply. Such a reader will find only bewilderment in these pages instead of the enlightenment he is in search of, and he will certainly be inclined to project the cause of his bewilderment on to the author and to pronounce his views fantastic. But in reality this bewildering character attaches to the phenomena of the neurosis itself; its presence there is only concealed by the physician's familiarity with the facts, and it comes to light again with every attempt a explaining them. It could only be completely banished if we could succeed in tracing back every single element of a neurosis to factors with which we were already familiar. But everything tends to show that, on the contrary, we shall be driven by the study of neuroses to assume the existence of many new thing which will later on gradually become the subject of more certain knowledge. What is new has always aroused bewilderment and resistance.  
[1905e, 1353]
In my *Interpretation of Dreams*, published in 1900, I showed that dreams in general can be interpreted, and that after the work of interpretation has been completed they can be replaced by perfectly correctly constructed thoughts which can be assigned a recognizable position in the chain of mental events. I wish to give an example in the following pages of the only practical application of which the art of interpreting dreams seems to admit. I have already mentioned in my book¹ how it was that I came upon the problem of dreams. The problem crossed my path as I was endeavouring to cure psychoneuroses by means of a particular psychotherapeutic method. For, among their other mental experiences, my patients told me their dreams, and these dreams seemed to call for insertion in the long thread of connections which spun itself out between a symptom of the disease and a pathogenic idea. At that time I learnt how to translate the language of dreams into the forms of expression of our own thought-language, which can be understood without further help. And I may add that this knowledge is essential for the psycho-analyst; for the dream is one of the roads along which consciousness can be reached by the psychical material which, on account of the opposition aroused by its content, has been cut off from consciousness and repressed, and has thus become pathogenic. The dream, in short, is one of the *détours by which repression can be evaded*; it is one of the principal means employed by what is known as the indirect method of representation in the mind. The following fragment from the history of the treatment of a hysterical girl is intended to show the way in which the interpretation of dreams plays a part in the work of analysis. It will at the same time give me a first opportunity of publishing at sufficient length to prevent further misunderstanding some of my views upon the psychical processes of hysteria and upon its organic determinants. I need no longer apologize on the score of length, since it is now agreed that the exacting demands which hysteria makes upon physician and investigator can be met only by the most sympathetic spirit of inquiry and not by an attitude of superiority and contempt. For,

[1905e, 1357]

As the dream was a recurrent one, I naturally asked her when she had first dreamt it. She told me she did not know. But she remembered having had the dream three nights in succession at L-- (the place on the lake where the scene with Herr K. had taken place), and it had now come back again a few nights earlier, here.² My expectations from the clearing-up of the dream were naturally heightened when I heard of its connection with the events at L--. But I wanted to discover first what had been the exciting cause of its recent recurrence, and I therefore asked Dora to take the dream bit by bit and tell me what occurred to her in connection with it. She had already had some training in dream-interpretation from having previously analysed a few minor specimens.

[1905e, 1401]

'Something occurs to me,' she said, 'but it cannot belong to the dream, for it is quite recent, whereas I have certainly had the dream before.'

[1905e, 1402]

'That makes no difference,' I replied. 'Start away! It will simply turn out to be the most recent thing that fits in with the dream.'

[1905e, 1402]

¹ I laid stress on these words because they took me aback. They seemed to have an ambiguous ring about them. Are not certain physical needs referred to in the same words? Now, in a line of associations ambiguous words (or, as we may call them, 'switch-words') act like points at a junction. If the points are switched across from the position in which they appear to lie in the dream, then we find ourselves on another set of rails; and along this second track run the thoughts which we are in search of but which still lie concealed behind the dream.

[1905e, 1402]
Her first reply was that she did not know, but after a while she added: 'Yes. I think it was after the scene.'
[1905e, 1403]

'It was then that I made up my mind not to stop on with the K.'s without Father. On the subsequent mornings I could not help feeling afraid that Herr K. would surprise me while I was dressing: so I always dressed very quickly. You see, Father lived at the hotel, and Frau K. used always to go out early so as to go on expeditions with him. But Herr K. did not annoy me again.'
[1905e, 1404]

'I dare say you thought to yourself you would accept it with pleasure.'
[1905e, 1406]

'I don't know.¹ I don't in the least know how Mother comes into the dream; she was not with us at L-- at the time.'²
[1905e, 1406]

'I will explain that to you presently. Does nothing else occur to you in connection with the jewel-case? So far you have only talked about jewellery and have said nothing about a case.'
[1905e, 1406]

¹ The regular formula with which she confessed to anything that had been repressed.
[1905e, 1406]

² This remark gave evidence of a complete misunderstanding of the rules of dream-interpretation, though on other occasions Dora was perfectly familiar with them. This fact, coupled with the hesitancy and meagreness of her associations with the jewel-case, showed me that we were here dealing with material which had been very intensely repressed.
[1905e, 1406]

⁴ A very common way of putting aside a piece of knowledge that emerges from the repressed.
[1905e, 1406]
That is to say, you knew that it was so. - The meaning of the dream is now becoming even clearer. You said to yourself: "This man is persecuting me; he wants to force his way into my room. My 'jewel-case' is in danger, and if anything happens it will be Father's fault." For that reason in the dream you chose a situation which expresses the opposite - a danger from which your father is saving you. In this part of the dream everything is turned into its opposite; you will soon discover why. As you say, the mystery turns upon your mother. You ask how she comes into the dream? She is, as you know, your former rival in your father's affections. In the incident of the bracelet, you would have been glad to accept what your mother had rejected. Now let us just put "give" instead of "accept" and "withhold" instead of "reject". Then it means that you were ready to give your father what your mother withheld from him; and the thing in question was connected with jewellery.¹ Now bring your mind back to the jewel-case which Herr K. gave you. You have there the starting-point for a parallel line of thoughts, in which Herr K. is to be put in the place of your father just as he was in the matter of standing beside your bed. He gave you a jewel-case; so you are to give him your jewel-case. That was why I spoke just now of a "return-present". In this line of thoughts your mother must be replaced by Frau K. (You will not deny that she, at any rate, was present at the time.) So you are ready to give Herr K, what his wife withholds from him. That is the thought which has had to be repressed with so much energy, and which has made it necessary for every one of its elements to be turned into its opposite. The dream confirms once more what I had already told you before you dreamt it - that you are summoning up your old love for your father in order to protect yourself against your love for Herr K. But what do all these efforts show? Not only that you are afraid of Herr K., but that you are still more afraid of yourself, and of the temptation you feel to yield to him. In short, these efforts prove once more how deeply you loved him.² [1905e, 1407]
The interpretation of the dream now seemed to me to be complete.¹ But Dora brought me an addendum to the dream on the very next day. She had forgotten to relate, she said, that each time after waking up she had smelt smoke. Smoke, of course, fitted in well with fire, but it also showed that the dream had a special relation to myself; for when she used to assert that there was nothing concealed behind this or that, I would often say by way of rejoinder: 'There can be no smoke without fire!' Dora objected, however, to such a purely personal interpretation, saying that Herr K. and her father were passionate smokers - as I am too, for the matter of that. She herself had smoked during her stay by the lake, and Herr K. had rolled a cigarette for her before he began his unlucky proposal. She thought, too, that she clearly remembered having noticed the smell of smoke on the three occasions of the dream's occurrence at L--, and not for the first time at its recent reappearance. As she would give me no further information, it was left to me to determine how this addendum was to be introduced into the texture of the dream-thoughts. One thing which I had to go upon was the fact that the smell of smoke had only come up as an addendum to the dream, and must therefore have had to overcome a particularly strong effort on the part of repression. Accordingly it was probably related to the thoughts which were the most obscurely presented and the most successfully repressed in the dream, to the thoughts, that is, concerned with the temptation to show herself willing to yield to the man. If that were so, the addendum to the dream could scarcely mean anything else than the longing for a kiss, which, with a smoker, would necessarily smell of smoke. But a kiss had passed between Herr K. and Dora some two years further back, and it would certainly have been repeated more than once if she had given way to him. So the thoughts of temptation seemed in this way to have harked back to the earlier scene, and to have revived the memory of the kiss against whose seductive influence the little 'thumb-sucker' had defended herself at the time, by the feeling of disgust. Taking into consideration, finally, the indications which seemed to point to there having been a transference on to me - since I am a smoker too - I came to the conclusion that the idea had probably occurred to her one day during a session that she would like to have a kiss from me. This would have been the exciting cause which led her to repeat the warning dream and to form her intention of stopping the treatment. Everything fits together very satisfactorily upon this view; but owing to the characteristics of 'transference' its validity is not susceptible of definite proof.

[1905e, 1410]

In consequence of certain connections which can easily be made from it, the word 'wet' served in the dream-thoughts as a nodal point between several groups of ideas. 'Wet' was connected not only with the bed-wetting, but also with the group of ideas relating to sexual temptation which lay suppressed behind the content of the dream. Dora knew that there was a kind of getting wet involved in sexual intercourse, and that during the act of copulation the man presented the woman with something liquid in the form of drops. She also knew that the danger lay precisely in that, and that it was her business to protect her genitals from being moistened.

[1905e, 1426]
There could be no doubt that these associations really belonged to the material concerned in forming the dream. They included portions which reappeared in the dream unchanged ('she declined and went alone' and 'two hours'). I may remark at once that 'pictures' was a nodal point in the network of her dream-thoughts (the pictures in the album, the pictures at Dresden). I should also like to single out, with a view to subsequent investigation, the theme of the 'Madonna', of the virgin mother. But what was most evident was that in this first part of the dream she was identifying herself with a young man. This young man was wandering about in a strange place, he was striving to reach a goal, but he was being kept back, he needed patience and must wait. If in all this she had been thinking of the engineer, it would have been appropriate for the goal to have been the possession of a woman, of herself. But instead of this it was - a station. Nevertheless, the relation of the question in the dream to the question which had been put in real life allows us to substitute 'box' for 'station'. A box and a woman: the notions begin to agree better.

[1905e, 1432]

At first she would not remember ever having read anything in an encyclopaedia; but she then admitted that a recollection of an occasion of the kind did occur to her, though it was of an innocent enough nature. At the time when the aunt she was so fond of had been so seriously ill and it had already been settled that Dora was to go to Vienna, a letter had come from another uncle, to say that they could not go to Vienna, as a boy of his, a cousin of Dora's therefore, had fallen dangerously ill with appendicitis. Dora had thereupon looked up in the encyclopaedia to see what the symptoms of appendicitis were. From what she had then read she still recollected the characteristic localization of the abdominal pain.

[1905e, 1436]

¹ On another occasion, instead of 'calmly' she said 'not the least sadly' (p. 1430 n.) - I can quote this dream as fresh evidence for the correctness of an assertion made in my Interpretation of Dreams (Chapter VII, Section A; p. 953) to the effect that those pieces of a dream which are at first forgotten and are only subsequently remembered are invariably the most important from the point of view of understanding the dream. In the same place I went on to the conclusion that the forgetting of dreams must also be explained as an effect of endopsychic resistance.

[1905e, 1436]

I have on the contrary shown that this strange 'manifest' content of the dream can regularly be made intelligible as a mutilated and altered transcript of certain rational psychical structures which deserve the name of 'latent dream-thoughts'. We arrive at a knowledge of these by dividing the dream's manifest content into its component parts, without considering any apparent meaning it may have, and by then following the associative threads which start from each of what are now isolated elements. These interweave with one another and finally lead to a tissue of thoughts which are not only perfectly rational but can also be easily fitted into the known context of our mental processes. In the course of this 'analysis', the content of the dream will have cast off all the peculiarities that puzzled us. But if the analysis is to succeed, we must, while it proceeds, firmly reject the critical objections which will unceasingly arise to the reproduction of the various intermediary associations.

[1905c, 1745]
But after all, what we really intended to do originally was only to investigate two or three dreams that are to be found here and there in Gradiva with the help of certain analytic methods. How has it come about, then, that we have been led into dissecting the whole story and examining the mental processes in the two chief characters? This has not in fact been an unnecessary piece of work; it was an essential preliminary. It is equally the case that when we try to understand the real dreams of a real person we have to concern ourselves intensively with his character and his career, and we must get to know not only his experiences shortly before the dream but also those dating far back into the past. It is even my view that we are still not free to turn to our proper task, but that we must linger a little more over the story itself and carry out some further preliminary work.

And another rule tells as that, if a belief in the reality of the dream-images persists unusually long, so that one cannot tear oneself out of the dream, this is not a mistaken judgement provoked by the vividness of the dream-images, but is a psychical act on its own: it is an assurance, relating to the content of the dream, that something in it is really as one has dreamt it; and it is right to have faith in this assurance. If we keep to these two rules, we must conclude that the dream gave some information as to the whereabouts of the Gradiva he was in search of, and that that information tallied with the real state of things. We know Hanold's dream: does the application of these two rules to it yield any reasonable sense?

Let us recall all that we have heard about the nature and origin of the phantasies which are the precursors of delusions. They are substitutes for and derivatives of repressed memories which a resistance will not allow to enter consciousness unaltered, but which can purchase the possibility of becoming conscious by taking account, by means of changes and distortions, of the resistance's censorship. When this compromise has been accomplished, the memories have turned into the phantasies, which can easily be misunderstood by the conscious personality - that is, understood so as to fit in with the dominant psychical current. Now let us suppose that dream-images are what might be described as the creations of people's physiological delusions - the products of the compromise in the struggle between what is repressed and what is dominant which is probably present in every human being, including those who in the day-time are perfectly sound in mind. We shall then understand that dream-images have to be regarded as something distorted, behind which something else must be looked for, something not distorted, but in some sense objectionable, like Hanold's repressed memories behind his phantasies. We can give expression to the contrast which we have thus recognized, by distinguishing what the dreamer remembers when he wakes up as the manifest content of the dream from what constituted the basis of the dream before the distortion imposed by the censorship - namely, the latent dream-thoughts. Thus, interpreting a dream consists in translating the manifest content of the dream into the latent dream-thoughts, in undoing the distortion which the dream-thoughts have had to submit to from the censorship of the resistance. If we apply these notions to the dream we are concerned with, we shall find that its latent dream-thoughts can only have been: 'the girl you are looking for with the graceful gait is really living in this town with you.' But in that form the thought could not become conscious. It was obstructed by the fact that a phantasy had laid it down, as the result of an earlier compromise, that Gradiva was a Pompeian; consequently, if the real fact that she was living in the same place and at the same time was to be affirmed, there was no choice but to adopt the distortion: 'You are living at Pompeii at the time of Gradiva.' This then was the idea which was realized by the manifest content of the dream, and was represented as a present event actually being experienced.
It is only rarely that a dream represents, or, as we might say, ‘stages’, a single thought: there are usually a number of them, a tissue of thoughts. Another component of the content of Hanold's dream can be detached, the distortion of which can easily be got rid of, so that the latent idea represented by it can be detected. This is a piece of the dream to which once again it is possible to extend the assurance of reality with which the dream ended. In the dream Gradiva as she steps along is transformed into a marble sculpture. This is no more than an ingenious and poetical representation of the real event. Hanold had in fact transferred his interest from the living girl to the sculpture: the girl he loved had been transformed for him into a marble relief. The latent dream-thoughts, which were bound to remain unconscious, sought to change the sculpture back into the living girl; what they were saying to him accordingly was something like: 'After all, you're only interested in the statue of Gradiva because it reminds you of Zoe, who is living here and now.' But if this discovery could have become conscious, it would have meant the end of the delusion.

Are we perhaps under an obligation to replace in this way each separate piece of the manifest content of the dream by unconscious thoughts? Strictly speaking, yes; if we were interpreting a dream that had really been dreamt, we could not avoid that duty. But in that case, too, the dreamer would have to give us the most copious explanations. Clearly, we cannot carry out this requirement in the case of the author's creation; nevertheless, we shall not overlook the fact that we have not yet submitted the main content of the dream to the process of interpretation or translation.

For Hanold's dream was an anxiety-dream. Its content was frightening, the dreamer felt anxiety while he slept and he was left with painful feelings afterwards. Now this is far from convenient for our attempt at an explanation; and we must once again borrow heavily from the theory of dream-interpretation. We are warned by that theory not to fall into the error of tracing the anxiety that may be felt in a dream to the content of the dream, and not to treat the content of the dream as though it were the content of an idea occurring in waking life. It points out to us how often we dream the most ghastly things without feeling a trace of anxiety. The true situation, we learn, is quite a different one, which cannot be easily guessed, but which can be proved with certainty. The anxiety in anxiety-dreams, like neurotic anxiety in general, corresponds to a sexual affect, a libidinal feeling, and arises out of libido by the process of repression.¹ When we interpret a dream, therefore, we must replace anxiety by sexual excitement. The anxiety that originates in this way has - not invariably, but frequently - a selective influence on the content of the dream and introduces into it ideational elements which seem, when the dream is looked at from a conscious and mistaken point of view, to be appropriate to the affect of anxiety. As I have said, this is not invariably so, for there are plenty of anxiety-dreams in which the content is not in the least frightening and where it is therefore impossible to give an explanation on conscious lines of the anxiety that is felt.
The application of a few of the rules of dream-interpretation to Hanold's first dream has thus resulted in making it intelligible to us in its main features and in inserting it into the nexus of the story. Surely, then, the author must have observed these rules in creating it? We might ask another question, too: why did the author introduce a dream at all to bring about the further development of the delusion? In my opinion it was an ingenious notion and once again true to reality. We have already heard that in real illnesses a delusion very often arises in connection with a dream, and, after what we have learnt about the nature of dreams, there is no need to see a fresh riddle in this fact. Dreams and delusions arise from the same source - from what is repressed. Dreams are, as one might say, the physiological delusions of normal people. Before what is repressed has become strong enough to break through into waking life as a delusion, it may easily have achieved a first success, under the more favourable conditions of the state of sleep, in the form of a dream with persisting effects. For during sleep, along with a general lowering of mental activity, there is a relaxation in the strength of the resistance with which the dominant psychical forces oppose what is repressed. It is this relaxation that makes the formation of dreams possible, and that is why dreams give us our best access to a knowledge of the unconscious part of the mind - except that, as a rule, with the re-establishment of the psychical cathexes of waking life, the dream once more takes to flight and the ground that had been won by the unconscious is evacuated once again.

[1907a, 1858]

In the further course of the story there is yet another dream, which may perhaps tempt us even more than the first to try to translate it and insert it into the train of events in the hero's mind. But we should save very little by diverging from the author's account and hurrying immediately to this second dream; for no one who wishes to analyse some one else's dream can avoid turning his attention in the greatest detail to all the dreamer's experiences, both external and internal. It will probably be best, therefore, to keep close to the thread of the story and to intersperse it with our glosses as we proceed.

[1907a, 1859]

Are we to venture on an attempt at interpreting this dream too - that is, at replacing it by the latent thoughts from whose distortion it must have arisen? It is as senseless as only a dream can be expected to be; and this absurdity of dreams is the mainstay of the view which refuses to characterize dreams as completely valid psychical acts and maintains that they arise out of a purposeless excitation of the elements of the mind.

[1907a, 1867]

We are able to apply to this dream the technique which may be described as the regular procedure for interpreting dreams. It consists in paying no attention to the apparent connections in the manifest dream but in fixing our eyes upon each portion of its content independently, and in looking for its origin in the dreamer's impressions, memories, and free associations. Since, however, we cannot question Hanold, we shall have to content ourselves with referring to his impressions, and we may very tentatively put our own association in place of his.

[1907a, 1867]
'Somewhere in the sun Gradiva was sitting, catching lizards and speaking.' What impression of the previous day finds an echo in this part of the dream? Undoubtedly the encounter with the elderly gentleman, the lizard-catcher, who was thus replaced in the dream by Gradiva. He sat or lay 'on a sun-bathed slope' and he, too, spoke to Hanold. Furthermore, Gradiva's remarks in the dream were copied from this man's remarks: viz. 'The method prescribed by our colleague Eimer is a really good one; I have made use of it many times already with excellent results. Please keep quite still.' Gradiva used much the same words in the dream, except that 'our colleague Eimer' was replaced by an unnamed 'lady colleague'; moreover, the 'many times' in the zoologist's speech was omitted in the dream and the order of the sentences was somewhat altered. It seems, therefore, that this experience of the previous day was transformed into the dream with the help of a few changes and distortions. Why this particular experience? And what is the meaning of the changes - the replacement of the elderly gentleman by Gradiva and the introduction of the enigmatic 'lady colleague'?

There is a rule in interpreting dreams which runs as follows: 'A speech heard in a dream is always derived from one that has been heard or made by the dreamer in waking life.' This rule seems to have been observed here: Gradiva's speech is only a modification of the old zoologist's speech which Hanold had heard the day before. Another rule in dream-interpretation would tell us that when one person is replaced by another or when two people are mixed up together (for instance, by one of them being shown in a situation that is characteristic of the other), it means that the two people are being equated, that there is a similarity between them. If we venture to apply this rule too to our dream, we should arrive at this translation: 'Gradiva catches lizards just like the old man; she is skilled in lizard-catching just as he is.' This result cannot exactly be said to be intelligible as yet; but we have yet another puzzle to solve. To what impression of the previous day are we to relate the 'lady colleague' who in the dream replaces the famous zoologist Eimer? Fortunately we have very little choice here. A 'lady colleague' can only mean another girl - that is to say, represents/represented the sympathetic young lady whom Hanold had taken for a sister travelling with her brother. 'She was wearing a red Sorrento rose in her dress, the sight of which reminded him of something as he looked across from his corner of the dining-room, but he could not think what.' This remark of the author's gives us a right to regard her as the 'lady colleague' in the dream. What Hanold could not recall were, it cannot be doubted, the words spoken by the supposed Gradiva, who had told him, as she asked him for the white flowers of the dead, that in the spring people give happier girls roses. But behind those words there had lain a hint of wooing. So what sort of lizard-catching was it that the happier 'lady colleague' had carried out so successfully?

And now let us make a bold attempt at replacing Hanold's 'remarkably senseless' dream by the unconscious thoughts that lay behind it and were as unlike it as possible. They ran, perhaps, as follows: 'She is staying in the "Sun" with her father. Why is she playing this game with me? Does she want to make fun of me? Or can it possibly be that she loves me and wants to have me as her husband? - And no doubt while he was still asleep there came an answer dismissing this last possibility as 'the merest madness', a comment which was ostensibly directed against the whole manifest dream.
Critical readers will now justly enquire about the origin of the interpolation (for which I have so far given no grounds) of the reference to being ridiculed by Gradiva. The answer to this is given in *The Interpretation of Dreams*, which explains that if ridicule, derision, or embittered contradiction occurs in the dream-thoughts, this is expressed by the manifest dream being given a senseless form, by absurdity in the dream. This absurdity does not mean, therefore, that there is any paralysis of psychical activity: it is a method of representation employed by the dream-work. As always happens at specially difficult points, the author once more comes to our help here. The senseless dream had a short epilogue, in which a bird uttered a laughing call and carried the lizard away in its beak. But Hanold had heard a similar laughing call after Gradiva's disappearance. It had in fact come from Zoe, who with this laugh was shaking off the gloomy seriousness of her underworld role. Gradiva had really laughed at him. But the dream-image of the bird carrying off the lizard may have been a recollection of the earlier dream, in which the Apollo Belvedere carried off the Capitoline Venus.

[1907a, 1876]

Here then we seem to have finished off the interpretation of this second dream as well. Both of them have been made intelligible to us on the presupposition that a dreamer knows in his unconscious thoughts all that he has forgotten in his conscious ones, and that in the former he judges correctly what in the latter he misunderstands in a delusion. In the course of our arguments we have no doubt been obliged to make some assertions which have seemed strange to the reader because of their unfamiliarity; and we have probably often roused a suspicion that what we pretended was the author's meaning was in fact only our own. I am anxious to do all I can to dissipate this suspicion, and for that reason I will gladly enter into more detail over one of the most delicate points - I mean the use of ambiguous words and phrases, such as: 'Somewhere in the Sun Gradiva was sitting.'

[1907a, 1877]

And now for the final question, whose answer we have already evaded more than once. Our views on repression, on the genesis of delusions and allied disorders, on the formation and solution of dreams, on the part played by erotic life, and on the method by which such disorders are cured, are far from being the common property of science, let alone the assured possession of educated people. If the insight which has enabled the author to construct his 'phantasy' in such a way that we have been able to dissect it like a real case history is in the nature of knowledge, we should be curious to learn what were the sources of that knowledge. One of our circle - the one who, as I said at the beginning, was interested in the dreams in *Gradiva* and their possible interpretation - approached the author with the direct question whether he knew anything of such scientific theories as these. The author replied, as was to be expected, in the negative, and, indeed, somewhat brusquely. His imagination, he said, had inspired *Gradiva*, and he had enjoyed it; if there was anyone whom it did not please, let him simply leave it alone. He had no suspicion of how greatly it had in fact pleased his readers.

[1907a, 1882]

The third of your indications of a complex (mistakes - that is, changes - in the reproduction) is also employed, though in a more restricted field, in the technique of psycho-analysis. One task which often faces us is the interpretation of dreams - that is, the translation of the remembered content of a dream into its hidden meaning. It sometimes happens that we are uncertain at which point to set about the task, and in that case we may make use of a rule, discovered empirically, which recommends us to get the dreamer to tell us his dream once more. In doing so, he usually alters his modes of expression in some parts of it while repeating the rest accurately. The points at which his reproduction is defective owing to changes, and often owing to omissions as well, are the points which we fasten upon, because the inaccuracy guarantees a connection with the complex and promises the best approach to the secret meaning of the dream.¹

[1906c, 1894]
When one carries out the psycho-analysis of a hysterical woman patient whose complaint is manifested in attacks, one soon becomes convinced that these attacks are nothing else but phantasies translated into the motor sphere, projected on to motility and portrayed in pantomime. It is true that the phantasies are unconscious; but apart from this they are of the same nature as the phantasies which can be observed directly in day-dreams or which can be elicited by interpretation from dreams at night. Often a dream takes the place of an attack, and still more often it explains it, since the same phantasy finds a different expression in a dream and in an attack. We might expect then that by observing an attack we should be able to get to know the phantasy represented in it; but this is seldom possible. As a rule, owing to the influence of the censorship, the pantomimic portrayal of the phantasy has undergone distortions which are completely analogous to the hallucinatory distortions of a dream, so that both of them have, in the first resort, become unintelligible to the subject's own consciousness as well as to the observer's comprehension. A hysterical attack, therefore, needs to be subjected to the same interpretative revision as we employ for night-dreams. But not only are the forces from which the distortion proceeds and the purpose of the distortion the same as those we have come to know through the interpretation of dreams; the technique employed in the distortion is the same too.

[1909a, 1981]

If anyone is inclined to turn away in horror from this depravity of the childish heart or feels tempted, indeed, to dispute the possibility of such things, he should observe that these works of fiction, which seem so full of hostility, are none of them really so badly intended, and that they still preserve, under a slight disguise, the child's original affection for his parents. The faithlessness and ingratitude are only apparent. If we examine in detail the commonest of these imaginative romances, the replacement of both parents or of the father alone by grander people, we find that these new and aristocratic parents are equipped with attributes that are derived entirely from real recollections of the actual and humble ones; so that in fact the child is not getting rid of his father but exalting him. Indeed the whole effort at replacing the real father by a superior one is only an expression of the child's longing for the happy, vanished days when his father seemed to him the noblest and strongest of men and his mother the dearest and loveliest of women. He is turning away from the father whom he knows to-day to the father in whom he believed in the earlier years of his childhood; and his phantasy is no more than the expression of a regret that those happy days have gone. Thus in these phantasies the overvaluation that characterizes a child's earliest years comes into its own again. An interesting contribution to this subject is afforded by the study of dreams. We learn from their interpretation that even in later years, if the Emperor and Empress appear in dreams, those exalted personages stand for the dreamer's father and mother.¹ So that the child's overvaluation of his parents survives as well in the dreams of normal adults.

[1909c, 1990]

I may add a word upon the interpretation of the 'sanction' which, it will be remembered, was to the effect that 'otherwise the rat punishment will be carried out on both of them'. It was based upon the influence of two infantile sexual theories, which I have discussed elsewhere.¹ The first of these theories is that babies come out of the anus; and the second, which follows logically from the first, is that men can have babies just as well as women. According to the technical rules for interpreting dreams, the notion of coming out of the rectum can be represented by the opposite notion of creeping into the rectum (as in the rat punishment), and vice versa.

[1909d, 2171]
You can convince yourself that there are such things as latent dream-thoughts and that the relation between them and the manifest content of the dream is really as I have described it, if you carry out an analysis of dreams, the technique of which is the same as that of psychoanalysis. You entirely disregard the apparent connections between the elements in the manifest dream and collect the ideas that occur to you in connection with each separate element of the dream by free association according to the psycho-analytic rule of procedure. From this material you arrive at the latent dream-thoughts, just as you arrived at the patient's hidden complexes from his associations to his symptoms and memories. The latent dream-thoughts which have been reached in this way will at once show you how completely justified we have been in tracing back adults' dreams to children's dreams. The true meaning of the dream, which has now taken the place of its manifest content, is always clearly intelligible; it has its starting-point in experiences of the previous day, and proves to be a fulfilment of unsatisfied wishes. The manifest dream, which you know from your memory when you wake up, can therefore only be described as a disguised fulfilment of repressed wishes.

[1910a, 2222]

However, we should not despair, as we reflect on the number of apparently absurd dreams that we have in the past compelled to give up their meaning. Is there any reason why a memory of childhood should offer us more difficulty than a dream?

[1910c, 2268]

In the correspondence between the peculiarity of the dream-work mentioned at the beginning of the paper and the practice discovered by philology in the oldest languages, we may see a confirmation of the view we have formed about the regressive, archaic character of the expression of thoughts in dreams. And we psychiatrists cannot escape the suspicion that we should be better at understanding and translating the language of dreams if we knew more about the development of language.²

[1910e, 2323]

Artemidorus, the dream-interpreter of antiquity, was certainly right in maintaining that the meaning of a dream depends on who the dreamer happens to be. Under the laws governing the expression of unconscious thoughts, the meaning of rescuing may vary, depending on whether the author of the phantasy is a man or a woman. It can equally mean (in a man) making a child, i.e. causing it to be born, or (in a woman) giving birth oneself to a child. These various meanings of rescuing in dreams and phantasies can be recognized particularly clearly when they are found in connection with water. A man rescuing a woman from the water in a dream means that he makes her a mother, which in the light of the preceding discussion amounts to making her his own mother. A woman rescuing someone else (a child) from the water acknowledges herself in this way as the mother who bore him, like Pharaoh's daughter in the legend of Moses (Rank, 1909). At times there is also a tender meaning contained in rescue-phantasies directed towards the father. In such cases they aim at expressing the subject's wish to have his father as a son - that is, to have a son who is like his father.

[1910h, 2334]

The question with which I now intend to deal is not that of the technique of dream-interpretation: neither the methods by which dreams should be interpreted nor the use of such interpretations when made will be considered, but only the way in which the analyst should employ the art of interpretation in the psycho-analytic treatment of patients. There are undoubtedly different ways of going to work in the matter, but then the answer to questions of technique in analysis is never a matter of course. Although there may perhaps be more than one good road to follow, still there are very many bad ones, and a comparison of the various methods cannot fail to be illuminating, even if it should not lead to a decision in favour of any particular one.

[1911e, 2450]
Anyone coming from dream-interpretation to analytic practice will retain his interest in the content of dreams, and his inclination will be to interpret as fully as possible every dream related by the patient. But he will soon remark that he is now working under quite different conditions, and that if he attempts to carry out his intention he will come into collision with the most immediate tasks of the treatment. Even if a patient's first dream proves to be admirably suited for the introduction of the first explanations to be given, other dreams will promptly appear, so long and so obscure that the full meaning cannot be extracted from them in the limited session of one day's work. If the doctor continues the work of interpretation during the following days, fresh dreams will be produced in the meantime and these will have to be put aside until he can regard the first dream as finally resolved. The production of dreams is at times so copious, and the patient's progress towards comprehension of them so hesitant, that a suspicion will force itself on the analyst that the appearance of the material in this manner may be simply a manifestation of the patient's resistance taking advantage of the discovery that the method is unable to master what is so presented. Moreover, the treatment will meanwhile have fallen quite a distance behind the present and have lost touch with actuality. In opposition to such a technique stands the rule that it is of the greatest importance for the treatment that the analyst should always be aware of the surface of the patient's mind at any given moment, that he should know what complexes and resistances are active in him at the time and what conscious reaction to them will govern his behaviour. It is scarcely ever right to sacrifice this therapeutic aim to an interest in dream-interpretation.

It will now be asked whether we shall not be giving up too much valuable material which might throw light on the unconscious if dream-interpretation is only to be carried out subject to such restrictions of method. The answer to this is that the loss is by no means so great as might appear from a superficial view of the matter. To begin with, it must be recognized that in cases of severe neurosis any elaborate dream-productions must from the nature of things be regarded as incapable of complete solution. A dream of this kind is often based on the entire pathogenic material of the case, as yet unknown to both doctor and patient (so called 'programme-dreams' and biographical dreams), and is sometimes equivalent to a translation into dream-language of the whole content of the neurosis. In the attempt to interpret such a dream all the latent, as yet untouched, resistances will be roused to activity and soon set a limit to its understanding. The full interpretation of such a dream will coincide with the completion of the whole analysis; if a note is made of it at the beginning, it may be possible to understand it at the end, many months later. It is the same as with the elucidation of a single symptom (the main symptom, perhaps). The whole analysis is needed to explain it; in the course of the treatment one must endeavour to lay hold first of this, then of that, fragment of the symptom's meaning, one after another, until they can all be pieced together. Similarly, no more can be expected of a dream occurring in the early stages of the analysis; one must be content if the attempt at interpretation brings a single pathogenic wishful impulse to light.

[1911e, 2450]
Thus nothing attainable is renounced if one gives up the idea of a complete dream-interpretation; nor is anything lost as a rule if one breaks off the interpretation of a comparatively old dream and turns to a more recent one. We have found from fine examples of fully analysed dreams that several successive scenes of one dream may have the same content, which may find expression in them with increasing clarity; and we have learnt, too, that several dreams occurring in the same night need be nothing more than attempts, expressed in various forms, to represent one meaning. In general, we may rest assured that every wishful impulse which creates a dream to-day will re-appear in other dreams as long as it has not been understood and withdrawn from the domination of the unconscious. It often happens, therefore, that the best way to complete the interpretation of a dream is to leave it and to devote one's attention to a new dream, which may contain the same material in a possibly more accessible form. I know that it is asking a great deal, not only of the patient but also of the doctor, to expect them to give up their conscious purposive aims during the treatment, and to abandon themselves to a guidance which, in spite of everything, still seems to us 'accidental'. But I can answer for it that one is rewarded every time one resolves to have faith in one's own theoretical principles, and prevails upon oneself not to dispute the guidance of the unconscious in establishing connecting links.

I submit, therefore, that dream-interpretation should not be pursued in analytic treatment as an art for its own sake, but that its handling should be subject to those technical rules that govern the conduct of the treatment as a whole. Occasionally, of course, one can act otherwise and allow a little free play to one's theoretical interest; but one should always be aware of what one is doing. Another situation to be considered is one which has arisen since we have acquired more confidence in our understanding of dream-symbolism, and know ourselves to be more independent of the patient's associations. An unusually skilful dream-interpreter will sometimes find himself in the position of being able to see through every one of a patient's dreams without requiring him to go through the tedious and time-absorbing process of working over them. Such an analyst is thus exempt from any conflict between the demands of dream-interpretation and those of the treatment. Moreover he will be tempted to make full use of dream-interpretation on every occasion, by telling the patient everything he has detected in his dreams. In doing so, however, he will have adopted a method of treatment which departs considerably from the established one, as I shall point out in another connection. Beginners in psycho-analytic practice, at any rate, are advised not to take this exceptional case as a model.

Every analyst is in the position of the superior dream-interpreter, whom we have been imagining, in regard to the very first dreams that his patients bring, before they have learnt anything of the technique of translating dreams. These initial dreams may be described as unsophisticated: they betray a great deal to the listener, like the dreams of so-called healthy people. The question then arises whether the analyst is at once to translate to the patient all that he himself reads from them. This, however, is not the place for answering this question, for it evidently forms part of a wider one: at what stage in the treatment and how rapidly should the analyst introduce the patient to the knowledge of what lies veiled in his mind? The more the patient has learnt of the practice of dream-interpretation, the more obscure do his later dreams as a rule become. All the knowledge acquired about dreams serves also to put the dream-constructing process on its guard.
In the 'scientific' works about dreams, which in spite of their repudiation of dream-interpretation have received a new stimulus from psycho-analysis, one constantly finds that scrupulous care is most unnecessarily attached to the accurate preservation of the text of the dream. This is supposed to need protection from distortions and attritions in the hours immediately after waking. Some psycho-analysts, even, in giving the patient instructions to write down every dream immediately upon waking, seem not to rely consistently enough upon their knowledge of the conditions of dream-formation. In therapeutic work this rule is superfluous; and patients are glad to make use of it to disturb their sleep and to display great zeal where it can serve no useful purpose. For even if the text of a dream is in this way laboriously rescued from oblivion, it is easy enough to convince oneself that nothing has been achieved for the patient. Associations will not come to the text, and the result is the same as if the dream had not been preserved. No doubt the doctor has acquired some knowledge which he would not have done otherwise. But it is not the same thing whether the analyst knows something or the patient knows it; the importance of this distinction for the technique of psycho-analysis will be more fully considered elsewhere.

In conclusion, I will mention a particular type of dream which, in the nature of the case, occurs only in the course of psycho-analytic treatment, and may bewilder or mislead beginners. These are the corroborative dreams which, as it were 'tag along behind'; they are easily accessible to analysis, and their translation merely presents what the treatment has inferred during the last few days from the material of the daily associations. When this happens, it looks as though the patient has been amiable enough to bring us in dream-form exactly what we had been 'suggesting' to him immediately before. The more experienced analyst will no doubt have some difficulty in attributing any such amiability to the patient; he accepts such dreams as hoped-for confirmations, and recognizes that they are only observed under certain conditions brought about by the influence of the treatment. The great majority of dreams forge ahead of the analysis; so that, after subtraction of everything in them which is already known and understood, there still remains a more or less clear hint at something which has hitherto been hidden.

(b) I cannot advise the taking of full notes, the keeping of a shorthand record, etc., during analytic sessions. Apart from the unfavourable impression which this makes on some patients, the same considerations as have been advanced with regard to attention apply here too. A detrimental selection from the material will necessarily be made as one writes the notes or shorthand, and part of one's own mental activity is tied up in this way, which would be better employed in interpreting what one has heard. No objection can be raised to making exceptions to this rule in the case of dates, the text of dreams, or particular noteworthy events which can easily be detached from their context and are suitable for independent use as instances. But I am not in the habit of doing this either. As regards instances, I write them down from memory in the evening after work is over; as regards texts of dreams to which I attach importance, I get the patient to repeat them to me after he has related them so that I can fix them in my mind.
Recognition of the simultaneous presence of the three factors of 'infantilism', 'sexuality' and 'repression' constitutes the main characteristic of the psycho-analytic theory, and marks its distinction from other views of pathological mental life. At the same time, psycho-analysis has demonstrated that there is no fundamental difference, but only one of degree, between the mental life of normal people, of neurotics and of psychotics. A normal person has to pass through the same repressions and has to struggle with the same substitutive structures; the only difference is that he deals with these events with less trouble and better success. The psycho-analytic method of investigation can accordingly be applied equally to the explanation of normal psychical phenomena, and has made it possible to discover the close relationship between pathological psychical products and normal structures such as dreams, the small blunders of everyday life, and such valuable phenomena as jokes, myths and imaginative works. The explanation of these has been carried furthest in the case of dreams, and has resulted here in the following general formula: 'A dream is a disguised fulfilment of a repressed wish.' The interpretation of dreams has as its object the removal of the disguise to which the dreamer's thoughts have been subjected. It is, moreover, a highly valuable aid to psycho-analytic technique, for it constitutes the most convenient method of obtaining insight into unconscious psychical life.

Owing to the lack of contact between the analyst and the person under analysis, it is scarcely advisable to penetrate deeper into the structure of the dream. But we may perhaps say that so far as it was accessible to interpretation it has provided us with plenty of confirmations as well as with plenty of new problems.

The brown room at first gave rise to difficulties. All that occurred to her was her parents' dining-room, which was panelled in that colour - in brown wood. She then told some stories of beds which were so uncomfortable for two people to sleep in. A few days before, when the subject of conversation had been beds in other countries, she had said something very mal à propos - quite innocently, as she maintained - and everyone in the room had roared with laughter.

I cannot enter here into the technique by which an interpretation of dreams is arrived at, nor can I give the grounds for the conclusions to which the psycho-analytic investigation of dreams has led. I must restrict myself to enunciating some new concepts, reporting my findings and stressing their importance for normal psychology.

Psycho-analysis, then, has demonstrated the following facts. All dreams have a meaning. Their strangeness is due to distortions that have been made in the expression of their meaning. Their absurdity is deliberate and expresses derision, ridicule and contradiction. Their incoherence is a matter of indifference for their interpretation. The dream as we remember it after waking is described by us as its 'manifest content'. In the process of interpreting this, we are led to the 'latent dream-thoughts', which lie hidden behind the manifest content and which are represented by it. These latent dream-thoughts are no longer strange, incoherent or absurd; they are completely valid constituents of our waking thought. We give the name of 'dream-work' to the process which transforms the latent dream-thoughts into the manifest content of the dream; it is this dream-work that brings about the distortion which makes the dream-thoughts unrecognizable in the content of the dream.
If we reflect that the means of representation in dreams are principally visual images and not words, we shall see that it is even more appropriate to compare dreams with a system of writing than with a language. In fact the interpretation of dreams is completely analogous to the decipherment of an ancient pictographic script such as Egyptian hieroglyphs. In both cases there are certain elements which are not intended to be interpreted (or read, as the case may be) but are only designed to serve as 'determinatives', that is to establish the meaning of some other element. The ambiguity of various elements of dreams finds a parallel in these ancient systems of writing; and so too does the omission of various relations, which have in both cases to be supplied from the context. If this conception of the method of representation in dreams has not yet been followed up, this, as will be readily understood, must be ascribed to the fact that psycho-analysts are entirely ignorant of the attitude and knowledge with which a philologist would approach such a problem as that presented by dreams.

[1913], 2814

Now it is in this respect that the essential difference between the dream-work and schizophrenia becomes clear. In the latter, what becomes the subject of modification by the primary process are the words themselves in which the preconscious thought was expressed; in dreams, what are subject to this modification are not the words, but the thing-presentations to which the words have been taken back. In dreams there is a topographical regression; in schizophrenia there is not. In dreams there is free communication between (Pcs.) word-cathexes and (Ucs.) thing-cathexes, while it is characteristic of schizophrenia that this communication is cut off. The impression this difference makes on one is lessened precisely by the dream-interpretations we carry out in psycho-analytic practice. For, owing to the fact that dream-interpretation traces the course taken by the dream-work, follows the paths which lead from the latent thoughts to the dream-elements, reveals the way in which verbal ambiguities have been exploited, and points out the verbal bridges between different groups of material - owing to all this, we get an impression now of a joke, now of schizophrenia, and are apt to forget that for a dream all operations with words are no more than a preparation for a regression to things.

[1917d, 3034]

An excess of criticism may make us suspicious. These objections to dreams as an object of research are obviously carried too far. We have already dealt with the question of unimportance in connection with parapraxes. We have told ourselves that big things can show themselves by small indications. As regards their indistinctness - that is one of the characteristics of dreams, like any other: we cannot lay down for things what their characteristics are to be. And incidentally there are clear and distinct dreams as well. There are, more over, other objects of psychiatric research which suffer from the same characteristic of indistinctness - in many instances, for example, obsessions, and these have been dealt with, after all, by respected and esteemed psychiatrists. I recall the last such case that I came across in my medical practice. This was a woman patient who introduced herself with these words: 'I have a sort of feeling as though I had injured or had wanted to injure some living creature - a child? - no, more like a dog - as though I may have thrown it off a bridge, or something else.' We can help to overcome the defect of the uncertainty in remembering dreams if we decide that whatever the dreamer tells us must count as his dream, without regard to what he may have forgotten or have altered in recalling it. And finally it cannot even be maintained so sweepingly that dreams are unimportant things. We know from our own experience that the mood in which one wakes up from a dream may last for the whole day; doctors have observed cases in which a mental disease has started with a dream and in which a delusion originating in the dream has persisted; historical figures are reported to have embarked on momentous enterprises in response to dreams. We may therefore ask what may be the true source of the contempt in which dreams are held in scientific circles.

[1916-1917, 3187]
Interpreting means finding a hidden sense in something; there can of course be no question of doing that if we adopt this last estimate of the function of dreams. Look at the description of dreams given by Wundt, Jodl, and other more recent philosophers. They content themselves with enumerating the respects in which dream-life differs from waking thought, always in a sense depreciatory to dreams - emphasizing the fact that associations are broken apart, that the critical faculty ceases to work, that all knowledge is eliminated, as well as other signs of diminished functioning. The only valuable contribution to the knowledge of dreams for which we have to thank exact science relates to the effect produced on the content of dreams by the impact of somatic stimuli during sleep. A recently deceased Norwegian author, J. Mourly Vold, published two stout volumes of experimental researches into dreams (German edition, 1910 and 1912), which are devoted almost exclusively to the consequences of alterations in the posture of the limbs. They have been recommended to us as models of exact research into dreams. Can you imagine what exact science would say if it learnt that we want to make an attempt to discover the sense of dreams? Perhaps it has already said it. But we will not let ourselves be frightened off. If it was possible for parapraxes to have a sense, dreams can have one too; and in a great many cases parapraxes have a sense, which has escaped exact science. So let us embrace the prejudice of the ancients and of the people and let us follow in the footsteps of the dream-interpreters of antiquity.

We proceed with our work, accordingly, on the supposition that dreams are psychical phenomena. In that case they are products and utterances of the dreamer's, but utterances which tell us nothing, which we do not understand. Well, what do you do if I make an unintelligible utterance to you? You question me, is that not so? Why should we not do the same thing to the dreamer - question him as to what his dream means?

As you will remember, we found ourselves in this situation once before. It was while we were investigating certain parapraxes - a case of a slip of the tongue. Someone had said: 'Then facts came to Vorschwein' and we thereupon asked him - no, it was luckily not we but some other people who had no connection at all with psycho-analysis - these other people, then, asked him what he meant by this unintelligible remark. And he replied at once that he had intended to say 'these facts were Schweinereien [disgusting]', but had forced this intention back in favour of the milder version 'then facts came to Vorschein [light]'. I pointed out to you at the time that this piece of information was the model for every psycho-analytic investigation, and you will understand now that psycho-analysis follows the technique of getting the people under examination so far as possible themselves to produce the solution of their riddles. Thus, too, it is the dreamer himself who should tell us what his dream means.

But, as we know, things are not so simple with dreams. With parapraxes it worked all right in a number of cases; but then others came along in which the person who was questioned would say nothing, and even indignantly rejected the answer we proposed to him. With dreams cases of the first sort are entirely lacking; the dreamer always says he knows nothing. He cannot reject our interpretation as we have none to offer him. Are we to give up our attempt then? Since he knows nothing and we know nothing and a third person could know even less, there seems to be no prospect of finding out. If you feel inclined, then, give up the attempt! But if you feel otherwise, you can accompany me further. For I can assure you that it is quite possible, and highly probable indeed, that the dreamer does know what his dream means: only that he does not know that he knows it and for that reason thinks that he does not know it.
We may now go back to our task with increased confidence perhaps. It is very probable, then, that the dreamer knows about his dream; the only question is how to make it possible for him to discover his knowledge and communicate it to us. We do not require him to tell us straight away the sense of his dream, but he will be able to find its origin, the circle of thoughts and interests from which it sprang. You will recall that in the case of the parapraxis the man was asked how he had arrived at the wrong word 'Vorschwein' and the first thing that occurred to him gave us the explanation. Our technique with dreams, then, is a very simple one, copied from this example. We shall once more ask the dreamer how he arrived at the dream, and once more his first remark is to be looked on as an explanation. Thus we disregard the distinction between his thinking or not thinking that he knows something, and we treat both cases as one and the same.
[1916-1917, 3203]

This technique is certainly very simple, but I fear it will rouse your liveliest opposition. You will say: 'A fresh assumption! the third! And the most unlikely of all! If I ask the dreamer what occurs to him in connection with the dream, is precisely the first thing that occurs to him going to bring the explanation we are hoping for? But nothing at all may occur to him, or heaven knows what may occur to him. I cannot see what an expectation of that kind is based on. That is really showing too much trust in Providence at a point where rather more exercise of the critical faculty would be appropriate. Besides, a dream is not a single wrong word; it consists of a number of elements. So which association are we to take up?'
[1916-1917, 3203]

You are correct on all your minor points. A dream differs from a slip of the tongue, among other things, in the multiplicity of its elements. Our technique must take this into account. I therefore suggest to you that we should divide the dream into its elements and start a separate enquiry into each element; if we do this, the analogy with a slip of the tongue is re-established. You are also right in thinking that when the dreamer is questioned about the separate elements of the dream he may reply that nothing occurs to him. There are some instances in which we let this reply pass, and you will later hear which these are; strangely enough, they are instances in which definite ideas may occur to us ourselves. But in general if the dreamer asserts that nothing occurs to him we contradict him; we bring urgent pressure to bear on him, we insist that something must occur to him - and we turn out to be right. He will produce an idea - some idea, it is a matter of indifference to us which. He will give us certain pieces of information, which may be described as 'historical', with particular ease. He may say: 'That's something that happened yesterday' (as was the case in our two 'matter-of-fact' dreams), or: 'That reminds me of something that happened a short time ago' - and we shall discover in this way that dreams are connected with impressions of the last day or two much more often than we thought to begin with. And finally he will also recall, starting from the dream, events from further back and even perhaps from the far distant past.
[1916-1917, 3203]

But on your main point you are wrong. If you think it is arbitrary to assume that the first thing that occurs to the dreamer is bound to bring what we are looking for or to lead us to it, if you think that what occurs to him might be anything in the world and might have no connection with what we are looking for, and that it is only exhibiting my trust in Providence if I expect something different - then you are making a great mistake. Once before I ventured to tell you that you nourish a deeply rooted faith in undetermined psychical events and in free will, but that this is quite unscientific and must yield to the demand of a determinism whose rule extends over mental life. I beg you to respect it as a fact that that is what occurred to the man when he was questioned and nothing else. But I am not opposing one faith with another. It can be proved that the idea produced by the man was not arbitrary nor indeterminable nor unconnected with what we were looking for. Indeed, not long ago I learnt - without, I may say, attaching too much importance to the fact - that experimental psychology too had brought up evidence to that effect.
[1916-1917, 3204]
In view of the importance of the matter, I will ask for your special attention. If I ask someone to
tell me what occurs to him in response to a particular element of a dream, I am asking him to
surrender himself to free association while keeping an idea in mind as a starting point. This calls
for a special attitude of the attention which is quite different from reflection and which excludes
reflection. Some people achieve this attitude with ease; others show an incredibly high degree
of clumsiness when they attempt it. There is, however, a higher degree of freedom of
association: that is to say, I may drop the insistence on keeping an initial idea in mind and only
lay down the sort or kind of association I want - I may, for instance, require the experimenter to
allow a proper name or a number to occur to him freely. What then occurs to him would
presumably be even more arbitrary and more indeterminable than with our own technique. It
can be shown, however, that it is always strictly determined by important internal attitudes of
mind which are not known to us at the moment at which they operate - which are as little known
to us as the disturbing purposes of parapraxes and the provoking ones of chance actions.
[1916-1917, 3204]

I and many others after me have repeatedly made such experiments with names and
numbers thought of at random, and a few of these have been published. Here the procedure is
to produce a series of associations to the name which has emerged; these latter associations
are accordingly no longer completely free but have a link, like the associations to the elements
of dreams. One continues doing this until one finds the impulse exhausted. But by then light will
have been thrown both on the motive and the meaning of the random choice of the name.
These experiments always lead to the same result; reports on them often cover a wealth of
material and call for extensive expositions. The associations to numbers chosen at random are
perhaps the most convincing; they run off so quickly and proceed with such incredible certainty
to a hidden goal that the effect is really staggering. I will give you only one example of an
analysis like this of a name, since dealing with it calls for a conveniently small amount of
material.
[1916-1917, 3205]

Having learnt thus much, you will be able to say: 'We acknowledge now that thoughts that
occur to one freely are determined and not arbitrary as we supposed. We admit that this is also
ture of thoughts occurring in response to the elements of dreams. But that is not what we are
concerned with. You assert that what occurs to the dreamer in response to the dream-element
will be determined by the psychical background (unknown to us) of that particular element. This
does not seem to us to be proved. We quite expect that what occurs to the dreamer in response
to the dream-element will turn out to be determined by one of the dreamer's complexes, but
what good does that do us? This does not lead us to an understanding of dreams but, like the
association-experiment, to a knowledge of these so-called complexes. But what have they got
to do with dreams?'
[1916-1917, 3206]

You are right, but you are overlooking one factor. Moreover it is precisely the factor on
account of which I did not choose the association-experiment as the starting-point of this
exposition. In that experiment the single determinant of the reaction - that is, the stimulus-word -
is arbitrarily chosen by us. The reaction is in that case an intermediary between the stimulus-
word and the complex which has been aroused in the subject. In dreams the stimulus-word is
replaced by something that is itself derived from the dreamer's mental life, from sources
unknown to him, and may therefore very easily itself be a 'derivative of a complex'. It is
therefore not precisely fantastic to suppose that the further associations linked to the dream-
elements will be determined by the same complex as that of the element itself and will lead to
its discovery.
[1916-1917, 3207]
Let me show you from another instance that the facts are as we expect. The forgetting of proper names is actually an excellent model of what happens in dream-analysis; the difference is only that events that are shared between two people in dream-analysis are combined in a single person in the parapraxis. If I forget a name temporarily, I nevertheless feel in myself a certainty that I know it - a certainty which in the case of the dreamer we only arrived at by the round-about path of the Bernheim experiment. The name which I have forgotten but which I know is, however, not accessible to me. Experience soon teaches me that thinking about it, with however much effort, is of no help. But in place of the forgotten name I can always call up one or several substitute names. It is only after a substitute name of this kind has occurred to me spontaneously that the conformity of this situation with that of dream-interpretation becomes obvious. Like this substitute name, the dream-element is not the right thing, but only takes the place of something else - of the genuine thing which I do not know and which I am to discover by means of the dream-analysis. The difference is once more only that in the case of forgetting the name, I recognize the substitute unhesitatingly as something ungenuine, whereas we had to acquire this view laboriously in the case of the dream-element. Now in the case of forgetting a name there is also a method by which we can start from the substitute and arrive at the unconscious genuine thing, the forgotten name. If I direct my attention to the substitute names and allow further ideas in response to them to occur to me, I arrive by shorter or longer detours at the forgotten name, and I find when this happens that both the spontaneous substitute name and the ones that I have called up are connected with the forgotten one and were determined by it.

But if it is possible in the case of forgetting a name, it must also be possible in interpreting dreams to proceed from the substitute along the chain of associations attached to it and so to obtain access to the genuine thing which is being held back. From the example of the forgotten name we may conclude that the associations to the dream-element will be determined both by the dream-element and also by the unconscious genuine thing behind it. In this way, then, we seem to have produced some justification of our technique.

LADIES AND GENTLEMEN, - As you see, our study of parapraxes has not been unprofitable. Thanks to our labours over them we have, subject to the premisses I have explained to you, achieved two things: a conception of the nature of dream-elements and a technique for interpreting dreams. The conception of dream-elements tells us that they are ungenuine things, substitutes for something else that is unknown to the dreamer (like the purpose of a parapraxis), substitutes for something the knowledge of which is present in the dreamer but which is inaccessible to him. We are in hopes that it will be possible to carry over the same conception to whole dreams, which are made up of such elements. Our technique lies in employing free association to these elements in order to bring about the emergence of other substitutive structures, which will enable us to arrive at what is concealed from view.

I now propose that we should introduce a change into our nomenclature which will give us more freedom of movement. Instead of speaking of 'concealed', 'inaccessible', or 'ungenuine', let us adopt the correct description and say 'inaccessible to the dreamer's consciousness' or 'unconscious'. I mean nothing else by this than what may be suggested to you when you think of a word that has escaped you or the disturbing purpose in a parapraxis - that is to say, I mean nothing else than 'unconscious at the moment'. In contrast to this, we can of course speak of the dream-elements themselves, and the substitutive ideas that have been newly arrived at from them by association, as 'conscious'. This nomenclature so far involves no theoretical construction. No objection can be made to using the word 'unconscious' as an apt and easily understandable description.
If we carry over our conception of the separate elements to the whole dream, it follows that
the dream as a whole is a distorted substitute for something else, something unconscious, and
that the task of interpreting a dream is to discover this unconscious material. From this,
however, there at once follow three important rules, which we must obey during the work of
interpreting dreams.
[1916-1917, 3210]

1. We must not concern ourselves with what the dream appears to tell us, whether it is
   intelligible or absurd, clear or confused, since it cannot possibly be the unconscious material we
   are in search of. (An obvious limitation to this rule will force itself on our notice later.) 2. We
   must restrict our work to calling up the substitutive ideas for each element, we must not reflect
   about them, or consider whether they contain anything relevant, and we must not trouble
   ourselves with how far they diverge from the dream-element. 3. We must wait till the concealed
   unconscious material we are in search of emerges of its own accord, exactly as the forgotten
   word 'Monaco' did in the experiment I have described.
[1916-1917, 3210]

Now, too, we can understand to what extent it is a matter of indifference how much or how
little the dream is remembered and, above all, how accurately or how uncertainly. For the
remembered dream is not the genuine material but a distorted substitute for it, which should
assist us, by calling up other substitutive images, to come nearer to the genuine material, to
make what is unconscious in the dream conscious. If our memory has been inaccurate,
therefore, it has merely made a further distortion of this substitute - a distortion, moreover,
which cannot have been without a reason.
[1916-1917, 3210]

The work of interpreting can be performed on one's own dreams just as on other people's. In
fact one learns more from one's own: the process carries more conviction. If, then, we make the
attempt, we notice that something is opposing our work. It is true that ideas occur to us, but we
do not allow all of them to count; testing and selecting influences make themselves felt. In the
case of one idea we may say to ourselves: 'No, this is not relevant, it does not belong here'; in
the case of another: 'this is too senseless' and of a third: 'this is totally unimportant'. And we can
further observe how with objections of this sort we may smother ideas and finally expel them
altogether, even before they have become quite clear. Thus on the one hand we keep too close
to the idea which was our starting point, the dream-element itself; and on the other hand we
interfere with the outcome of the free associations by making a selection. If we are not by
ourselves while interpreting the dream, if we get someone else to interpret it, we become very
clearly aware of yet another motive which we employ in making this illicit selection, for
sometimes we say to ourselves: 'No, this idea is too disagreeable; I will not or cannot report it.'
[1916-1917, 3210]
These objections are obviously a threat to the success of our work. We must guard against them, and in our own case we do so by firmly resolving not to give way to them. If we are analysing someone else's dream, we do so by laying it down as an inviolable rule that he must not hold back any idea from us, even if it gives rise to one of the four objections - of being too unimportant or too senseless or of being irrelevant or too distressing to be reported. The dreamer promises to obey the rule, and we may be annoyed afterwards to find how badly he keeps his promise when the occasion arises. We may explain this to ourselves to begin with by supposing that, in spite of our authoritative assurance, he has not yet realized the justification for free association, and we may perhaps have the notion of first convincing him theoretically by giving him books to read or by sending him to lectures which may convert him into a supporter of our views on free association. But we shall be held back from blunders like this when we consider that in the case of ourselves, as to the strength of whose convictions we can, after all, hardly be in doubt, the same objections arise to certain ideas and are only set aside subsequently - by a court of appeal, as it were.

Instead of being annoyed by the dreamer's disobedience, we may take advantage of these experiences by learning something new from them - something which is all the more important the less we are expecting it. We perceive that the work of interpreting dreams is carried out in the face of a resistance, which opposes it and of which the critical objections are manifestations. This resistance is independent of the dreamer's theoretical conviction. We learn still more, indeed. We discover that a critical objection of this kind never turns out to be justified. On the contrary, the ideas which people try to suppress in this way turn out invariably to be the most important ones and those which are decisive in our search for the unconscious material. It amounts, in fact, to a special distinguishing mark, if an idea is accompanied by an objection like this.

This resistance is something entirely new: a phenomenon which we have come upon in connection with our premisses, but one which was not included among them. The appearance of this new factor in our reckoning comes to us as a not altogether pleasant surprise. We suspect at once that it is not going to make our work any easier. It might mislead us into abandoning our whole concern with dreams: something so unimportant as a dream and, on top of that, all these difficulties instead of a simple straightforward technique! But, on the other hand, the difficulties might act precisely as a stimulus and make us suspect that the work will be worth the trouble. We regularly come up against resistance when we try to make our way forward from the substitute which is the dream-element to the unconscious material hidden behind it. So we may conclude that there must be something of importance concealed behind the substitute. Otherwise, what is the point of the difficulties that are trying to keep the concealment going? If a child refuses to open his clenched fist to show what he has in it, we may feel sure that it is something wrong - something he ought not to have.
The moment we introduce the dynamic idea of a resistance into the facts of the case, we must simultaneously reflect that this factor is something variable in quantity. There may be greater and smaller resistances, and we are prepared to find these differences showing themselves during our work as well. We may perhaps be able to link with this another experience we also meet with during the work of interpreting dreams: sometimes it requires only a single response, or no more than a few, to lead us from a dream-element to the unconscious material behind it, while on other occasions long chains of associations and the overcoming of many critical objections are required for bringing this about. We shall conclude that these differences relate to the changing magnitude of the resistance, and we shall probably turn out to be right. If the resistance is small, the substitute cannot be far distant from the unconscious material; but a greater resistance means that the unconscious material will be greatly distorted and that the path will be a long one from the substitute back to the unconscious material.

[1916-1917, 3212]

And now perhaps it is time to take a dream and try our technique upon it and see whether our expectations are confirmed. Yes, but what dream are we to choose for the purpose: You cannot imagine how hard I find it to decide; nor can I yet make the nature of my difficulties plain to you. There must obviously be dreams which have on the whole been subjected to only a little distortion, and the best plan would be to begin with them. But what dreams have been least distorted? The ones that are intelligible and not confused, two examples of which I have already put before you? That would be leading us quite astray. Investigation shows that such dreams have been subjected to an extraordinarily high degree of distortion. If, however, I were to disregard particular requirements and were to select a dream at haphazard, you would probably be greatly disappointed. We might have to notice or record such a profusion of ideas in response to the separate dream-elements that we should be unable to make head or tail of the work. If we write down a dream and then make a note of all the ideas that emerge in response to it, these may prove to be many times longer than the text of the dream. The best plan would therefore seem to be to choose out a number of short dreams for analysis, each of which will at least tell us something or confirm some point. So we will make up our minds to take that course, unless experience may perhaps show us where we can really find dreams that have been only slightly distorted.

[1916-1917, 3213]

I can however think of something else that will make things easier for us - something, moreover, which lies along our path. Instead of starting on the interpretation of whole dreams, we will restrict ourselves to a few dream-elements, and we will trace out in a number of examples how these can be explained by applying our technique to them.

[1916-1917, 3213]

(c) As part of a longish dream a patient dreamt that several members of his family were sitting round a table of peculiar shape, etc. It occurred to him in connection with the table that he had seen a piece of furniture of the kind when he was on a visit to a particular family. His thoughts then went on to say that there was a peculiar relationship between the father and son in this family; and he soon added that the same thing was true of the relationship between himself and his own father. So the table had been taken into the dream in order to point out this parallel.

[1916-1917, 3215]
This dreamer had been long familiar with the requirement of dream-interpretation. Another person might perhaps have taken objection to such a trivial detail as the shape of a table being made the subject of investigation. But in fact we regard nothing in a dream as accidental or indifferent, and we expect to obtain information precisely from the explanation of such trivial and pointless details. You may perhaps also feel surprised that the thought that 'the same thing was true of us and of them' should have been expressed by, in particular, the choice of a table [Tisch]. But this too becomes clear when you learn that the name of the family in question was Tischler [literally, 'carpenter']. By making his relations sit at this Tisch, he was saying that they too were Tischlers. Incidentally, you will notice how inevitably one is led into being indiscreet when one reports these dream-interpretations. And you will guess that this is one of the difficulties I have hinted at over the choice of examples. I could easily have taken another example in place of this one, but I should probably merely have avoided this indiscretion at the price of committing another.
[1916-1917, 3215]

The moment seems to me to have arrived for introducing two terms, which we could have made use of long ago. We will describe what the dream actually tells us as the manifest dream-content, and the concealed material, which we hope to reach by pursuing the ideas that occur to the dreamer, as the latent dream-thoughts. Thus we are here considering the relations between the manifest content of the dream and the latent dream-thoughts as shown in these examples. These relations may be of very many different kinds. In examples (a) and (b) the manifest element is also a constituent of the latent thoughts, though only a small fragment of them. A small piece of the large and complicated psychical structure of unconscious dream-thoughts has made its way into the manifest dream as well - a fragment of them, or, in other cases, an allusion to them, a caption, as it were, or an abbreviation in telegraphic style. It is the business of the work of interpretation to complete these fragments or this allusion into a whole - which was achieved particularly nicely in the case of example (b). Thus one form of the distortion which constitutes the dream-work is replacement by a fragment or an allusion. In example (c) another kind of relation is to be observed in addition; and we shall find this expressed in a purer and clearer form in the examples which follow.
[1916-1917, 3216]
The first thing the dreamer reported to us was that the precipitating cause of the dream was touched on in its manifest content. Her husband had in fact told her that Elise L., who was approximately her contemporary, had just become engaged. The dream was a reaction to this information. We know already that it is easy in the case of many dreams to point to a precipitating cause like this from the previous day, and that the dreamer is often able to trace this for us without any difficulty. The dreamer in the present case put similar information at our disposal for other elements of the manifest dream as well. - Where did the detail come from about one side of the stalls being empty? It was an allusion to a real event of the previous week. She had planned to go to a particular play and had therefore bought her tickets early - so early that she had had to pay a booking fee. When they got to the theatre it turned out that her anxiety was quite uncalled-for, since one side of the stalls was almost empty. It would have been early enough if she had bought the tickets on the actual day of the performance. Her husband had kept on teasing her for having been in too much of a hurry. - What was the origin of the 1 florin 50 kreuzers? It arose in quite another connection, which had nothing to do with the former one but also alluded to some information from the previous day. Her sister-in-law had been given a present of 150 florins by her husband and had been in a great hurry - the silly goose - to rush off to the jewellers' and exchange the money for a piece of jewellery. - Where did the 'three' come from? She could think of nothing in connection with that, unless we counted the idea that her newly-engaged friend, Elise L., was only three months her junior, though she herself had been a married woman for nearly ten years. - And the absurd notion of taking three tickets for only two people? She had nothing to say to that, and refused to report any further ideas or information.

[1916-1917, 3218]

But all the same, she had given us so much material in these few associations that it was possible to guess the latent dream-thoughts from them. We cannot help being struck by the fact that periods of time occur at several points in the information she gave us about the dream, and these provide a common factor between the different parts of the material. She took the theatre tickets too early, bought them over-hurriedly so that she had to pay more than was necessary; so too her sister-in-law had been in a hurry to take her money to the jewellers and buy some jewellery with it, as though otherwise she would miss it. If, in addition to the 'too early' and 'in a hurry' which we have stressed, we take into account the precipitating cause of the dream - the news that her friend, though only three months her junior, had nevertheless got an excellent husband - and the criticism of her sister-in-law expressed in the idea that it was absurd of her to be in such a hurry, then we find ourselves presented almost spontaneously with the following construction of the latent dream-thoughts, for which the manifest dream is a severely distorted substitute:

[1916-1917, 3219]

'Really it was absurd of me to be in such a hurry to get married! I can see from Elise's example that I could have got a husband later too.' (Being in too great a hurry was represented by her own behaviour in buying the tickets and by her sister-in-laws in buying the jewellery. Going to the play appeared as a substitute forgetting married.) This would seem to be the main thought. We may perhaps proceed further, though with less certainty, since the analysis ought not to have been without the dreamer's comments at these points: 'And I could have got one a hundred times better with the money!' (150 florins is a hundred times more than 1 florin 50.) If we were to put her dowry in place of the money, it would mean that her husband was bought with her dowry: the jewellery, and the bad tickets as well, would be substitutes for her husband. It would be still more satisfactory if the actual element 'three tickets' had something to do with a husband. But we have not got so far as that in our understanding of the dream. We have only discovered that the dream expresses the low value assigned by her to her own husband and her regret at having married so early.

[1916-1917, 3219]
In the first place, it is a remarkable thing that the main emphasis in the latent thoughts lies on the element of being in too great a hurry; nothing of the sort is to be found in the manifest dream. Without the analysis, we should have had no suspicion that that factor plays any part. It seems, therefore, to be possible for what is in fact the main thing, the centre of the unconscious thoughts, to be absent in the manifest dream. This means that the impression made by the whole dream must be fundamentally altered. In the second place, there is an absurd combination in the dream: three for 1 florin 50. We detected in the dream-thoughts the assertion that 'it was absurd (to marry so early)'. Can it be doubted that this thought, 'it was absurd', is represented by the inclusion of an absurd element in the manifest dream? And in the third place, a glance of comparison shows us that the relation between the manifest and latent elements is no simple one; it is far from being the case that one manifest element always takes the place of one latent one. It is rather that there is a group-relation between the two layers, within which one manifest element can replace several latent ones or one latent element can be replaced by several manifest ones.

[1916-1917, 3220]

As regards the meaning of the dream and the dreamer's attitude to it, we might point out much that is similarly surprising. She agreed to the interpretation indeed, but she was astonished at it. She was not aware that she assigned such a low value to her husband; nor did she know why she should set such a low value on him. So there is still much that is unintelligible about it. It really seems to me that we are not yet equipped for interpreting a dream and that we need first to be given some further instruction and preparation.

[1916-1917, 3220]

(1) No analysis, no application of any technique is necessary in order to understand these dreams. There is no need to question a child who tells us his dream. One has, however, to add a piece of information to it from the events of the child's life. There is invariably some experience of the previous day which explains the dream to us. The dream is the reaction of the child's mental life in his sleep to this experience of the previous day.

[1916-1917, 3221]

(6) What instigates a dream is a wish, and the fulfilment of that wish is the content of the dream - this is one of the chief characteristics of dreams. The other, equally constant one, is that a dream does not simply give expression to a thought, but represents the wish-fulfilled as a hallucinatory experience. 'I should like to go on the lake' is the wish that instigates the dream. The content of the dream itself is: 'I am going on the lake.' Thus even in these simple children's dreams a difference remains between the latent and the manifest dream, there is a distortion of the latent dream-thought: the transformation of a thought into an experience. In the process of interpreting a dream this alteration must first be undone. If this turns out to be the most universal characteristic of dreams, the fragment of dream which I reported to you earlier 'I saw my brother in a box [Kasten]' is not to be translated 'my brother is restricting himself [schnärt sich ein]' but 'I should like my brother to restrict himself: my brother must restrict himself.' Of the two general characteristics of dreams which I have here brought forward, the second clearly has more prospect of being accepted without contradiction than the first. It is only by means of far-reaching investigations that we shall be able to establish the fact that what instigates dreams must always be a wish and cannot be a worry or an intention or a reproach; but this will not affect the other characteristic - that the dream does not simply reproduce this stimulus, but removes it, gets rid of it, deals with it, by means of a kind of experience.

[1916-1917, 3224]
If dreams of the infantile kind were the only ones, the problem would be solved and our task finished, and that without our questioning the dreamer or bringing in the unconscious or resorting to free association. This is evidently where a continuation of our task lies ahead. We have already found repeatedly that characteristics which were claimed as being of general validity have turned out to apply only to a particular sort and number of dreams. The question for us is therefore whether the general characteristics we inferred from children's dreams have a firmer footing, whether they also hold good of dreams which are not transparently clear and whose manifest content gives no sign of being connected with a wish left over from the previous day. It is our view that these other dreams have undergone a far-reaching distortion and for that reason cannot be judged at a first glance. We suspect too that to explain this distortion we shall need the psycho-analytic technique which we have been able to do without in the understanding we have just gained of children's dreams.

[1916-1917, 3227]

In the same way, dreams create satisfactions under the influence of sexual stimuli, but these show peculiarities which deserve mention. Since it is characteristic of the sexual instinct to be a degree less dependent on its object than hunger and thirst, the satisfaction in dreams of emission can be a real one; and in consequence of certain difficulties (which I shall have to mention later) in its relation to its object, it happens with special frequency that the real satisfaction is nevertheless attached to a dream-content which is obscure or distorted. This characteristic of dreams of emission (as Otto Rank has pointed out) makes them particularly favourable subjects for the study of dream-distortion. Furthermore, all adult dreams arising from bodily needs usually contain, in addition to the satisfaction, other material which is derived from purely psychical sources of stimulation and requires interpretation before it can be understood.

[1916-1917, 3229]

In all dreams other than children's dreams and those of an infantile type our path is, as I have said, obstructed by dream distortion. We cannot tell, to begin with, whether these other dreams too are wish-fulfilments as we suspect, we cannot guess from their manifest content to what psychical stimulus they owe their origin, and we cannot prove that they too are endeavouring to get rid of that stimulus or in some way deal with it. They must be interpreted - that is, translated -, their distortion must be undone, and their manifest content replaced by their latent one, before we can form a judgement as to whether what we have found in infantile dreams can claim to be valid for all dreams.

[1916-1917, 3231]

We have assumed of dreams of another sort, on the basis of various considerations and on the analogy of our views on parapraxes, that they are a distorted substitute for an unknown content, and that the first thing is to trace them back to it. Our immediate task, then, is an enquiry which will lead to an understanding of this *distortion in dreams*.

[1916-1917, 3232]
For that is in fact the case. You will recall that when we began to make use of our technique of free association we made a surprising discovery. We became aware that our efforts at proceeding from the dream-element to the unconscious element for which it is a substitute were being met by a resistance. This resistance, we said, could be of different magnitudes, sometimes enormous and sometimes quite insignificant. In the latter case we need to pass through only a small number of intermediate links in our work of interpretation; but when the resistance is large we have to traverse long chains of associations from the dream-element, we are led far away from it and on our path we have to overcome all the difficulties which represent themselves as critical objections to the ideas that occur. What we met with as resistance in our work of interpretation must now be introduced into the dream-work in the form of the dream-censorship. The resistance to interpretation is only a putting into effect of the dream-censorship. It also proves to us that the force of the censorship is not exhausted in bringing about the distortion of dreams and thereafter extinguished, but that the censorship persists as a permanent institution which has as its aim the maintenance of the distortion. Moreover, just as the strength of the resistance varies in the interpretation of each element in a dream, so too the magnitude of the distortion introduced by the censorship varies for each element in the same dream. If we compare the manifest and the latent dream, we shall find that some particular latent elements have been completely eliminated, others modified to a greater or less extent, while yet others have been carried over into the manifest content of the dream unaltered or even perhaps strengthened.

[1916-1917, 3236]

Yes, indeed! Both simpler and more satisfactory - but not necessarily on that account more correct. Let us give ourselves time: the matter is not yet ripe for judgement. And first we can further strengthen the criticism of our dream-interpretations. The fact that the findings from them are so disagreeable and repellant need not, perhaps, carry very great weight. A stronger argument is that the dreamers to whom we are led to attribute such wishful purposes by the interpretation of their dreams reject them most emphatically and for good reasons. 'What?' says one of them, 'you want to convince me from this dream that I regret the money I have spent on my sister's dowry and my brother's education? But that cannot be so. I work entirely for my brothers and sisters; I have no other interest in life but to fulfil my duties to them, which, as the eldest of the family, I promised our departed mother I would do.' Or a woman dreamer would say: 'You think I wish my husband was dead? That is a shocking piece of nonsense! It is not only that we are most happily married - you would probably not believe me if I said that - but his death would rob me of everything I possess in the world.' Or another man would answer us: 'You say that I have sensual desires for my sister? That is ridiculous! She means nothing at all to me. We are on bad terms with each other and I have not exchanged a word with her for years.' We might still take it lightly, perhaps, if these dreamers neither confirmed nor denied the purposes we attribute to them; we might say that these were just things they did not know about themselves. But when they feel in themselves the precise contrary of the wish we have interpreted to them and when they are able to prove to us by the lives they lead that they are dominated by this contrary wish, it must surely take us aback. Has not the time come to throw aside the whole work we have done on dream-interpretation as something which its findings have reduced ad absurdum?

[1916-1917, 3239]
But it would be unfair if we neglected at this point to emphasize sufficiently another outcome of our investigations. The dream-wishes which seek to disturb us in our sleep are unknown to us and indeed we only learnt of them through dream-interpretation. They are thus to be described, in the sense we have discussed, as unconscious for the time being. But we must reflect that they are unconscious too for more than the time being. The dreamer also disavows them, as we have seen in so many instances, after he has come to know them through the interpretation of his dream. We are then faced once again with the position we first came across in the 'hiccupping' slip of the tongue, where the proposer of the toast protested indignantly that neither then nor at any earlier time had he become conscious of any disrespectful impulse towards his Chief. Already at the time we felt some doubts about the weight of an assurance of this kind, and suggested instead the hypothesis that the speaker was permanently unaware of the presence of this impulse in him. This situation is repeated now with every interpretation of a strongly distorted dream and consequently gains an increased importance in its bearing on the view we have taken. We are now prepared to assume that there are in the mind processes and purposes of which one knows nothing at all has known nothing for a long time, and has even perhaps never known anything. With this the unconscious acquires a new sense for us; the characteristic of 'for the time being' or 'temporary' disappears from its essential nature. It can mean permanently unconscious and not merely 'latent at the time'. We shall of course have to hear more about this on some other occasion.

[1916-1917, 3242]

We come upon this other factor which prevents dreams from being lucid, this new contribution to dream-distortion, by noticing a gap in our technique. I have already admitted to you that it does sometimes really happen that nothing occurs to a person under analysis in response to particular elements of his dreams. It is true that this does not happen as often as he asserts; in a great many cases, with perseverance, an idea is extracted from him. But nevertheless there remain cases in which an association fails to emerge or, if it is extracted, does not give us what we expected from it. If this happens during a psycho-analytic treatment, it has a peculiar significance with which we are not here concerned. But it also happens in the interpretation of normal people's dreams or in that of our own. If we convince ourselves that in such case no amount of pressure is of any use, we eventually discover that this unwished-for event regularly occurs in connection with particular dream-elements, and we begin to recognize that a fresh general principle is at work where we had begun by thinking we were only faced by an exceptional failure of technique.

[1916-1917, 3243]

In this way we obtain constant translations for a number of dream-elements - just as popular 'dream-books' provide them for everything that appears in dreams. You will not have forgotten, of course, that when we use our associative technique constant replacements of dream-elements never come to light.

[1916-1917, 3244]
Symbolism is perhaps the most remarkable chapter of the theory of dreams. In the first place, since symbols are stable translations, they realize to some extent the ideal of the ancient as well as of the popular interpretation of dreams, from which, with our technique, we had departed widely. They allow us in certain circumstances to interpret a dream without questioning the dreamer, who indeed would in any case have nothing to tell, us about the symbol. If we are acquainted with the ordinary dream-symbols, and in addition with the dreamer's personality, the circumstances in which he lives and the impressions which preceded the occurrence of the dream, we are often in a position to interpret a dream straightaway - to translate it at sight, as it were. A piece of virtuosity of this kind flatters the dream-interpreter and impresses the dreamer; it forms an agreeable contrast to the laborious work of questioning the dreamer. But do not allow yourselves to be led astray by this. It is not our business to perform acts of virtuosity. Interpretation based on a knowledge of symbols is not a technique which can replace or compete with the associative one. It forms a supplement to the latter and yields results which are only of use when introduced into it. And as regards acquaintance with the dreamer's psychical situation, you must bear in mind that the dreams of people you know well are not the only ones you have to analyse, that you are not as a rule familiar with the events of the previous day, which were the instigators of the dream, but that the associations of the person you are analysing will provide you precisely with a knowledge of what we call the psychical situation.

LADIES AND GENTLEMEN, - When you have thoroughly grasped the dream-censorship and representation by symbols, you will not yet, it is true, have completely mastered the distortion in, dreams, but you will nevertheless be in a position to understand most dreams. In doing so you will make use of both of the two complementary techniques: calling up ideas that occur to the dreamer till you have penetrated from the substitute to the genuine thing and, on the ground of your own knowledge, replacing the symbols by what they mean. Later on we shall discuss some uncertainties that arise in this connection.

We can now take up once more a task that we tried to carry out previously with inadequate means, when we were studying the relations between the elements of dreams and the genuine things they stood for. We laid down four main relations of the kind: the relation of a part to a whole, approximation or allusion, the symbolic relation and the plastic representation of words. We now propose to undertake the same thing on a larger scale, by comparing the manifest content of a dream as a whole with the latent dream as it is revealed by interpretation.

I hope you will never again confuse these two things with each other. If you reach that point, you will probably have gone further in understanding dreams than most readers of my Interpretation of Dreams. And let me remind you once again that the work which transforms the latent dream into the manifest one is called the **dream-work**. The work which proceeds in the contrary direction, which endeavours to arrive at the latent dream from the manifest one, is our **work of interpretation**. This work of interpretation seeks to undo the dream-work. The dreams of infantile type which we recognize as obvious fulfilments of wishes have nevertheless experienced some amount of dream-work - they have been transformed from a wish into an actual experience and also, as a rule, from thoughts into visual images. In their case there is no need for interpretation but only for undoing these two transformations. The additional dream-work that occurs in other dreams is called 'dream-distortion', and this has to be undone by our work of interpretation.
Such then, it seems, is the dream-work. As compared with the processes we have come to know in it, interest in the manifest dream must pale into insignificance. But I will devote a few more remarks to the latter, since it is of it alone that we have immediate knowledge.

[1916-1917, 3272]

It is natural that we should lose some of our interest in the manifest dream. It is bound to be a matter of indifference to us whether it is well put together, or is broken up into a series of disconnected separate pictures. Even if it has an apparently sensible exterior, we know that this has only come about through dream-distortion and can have as little organic relation to the internal content of the dream as the façade of an Italian church has to its structure and plan. There are other occasions when this façade of the dream has its meaning, and reproduces an important component of the latent dream-thoughts with little or no distortion. But we cannot know this before we have submitted the dream to interpretation and have been able to form a judgement from it as to the amount of distortion that has taken place. A similar doubt arises when two elements in a dream appear to have been brought into a close relation to each other. This may give us a valuable hint that we may bring together what corresponds to these elements in the latent dream as well; but on other occasions we can convince ourselves that what belongs together in the dream-thoughts has been torn apart in the dream.

[1916-1917, 3272]

In general one must avoid seeking to explain one part of the manifest dream by another, as though the dream had been coherently conceived and was a logically arranged narrative. On the contrary, it is as a rule like a piece of breccia, composed of various fragments of rock held together by a binding medium, so that the designs that appear on it do not belong to the original rocks imbedded in it. And there is in fact one part of the dream-work, known as 'secondary revision', whose business it is to make something whole and more or less coherent out of the first products of the dream-work. In the course of this, the material is arranged in what is often a completely misleading sense and, where it seems necessary, interpolations are made in it.

[1916-1917, 3272]

You, however, would be glad to dispense with this material and would prefer to be given an explanation of the dreams of healthy people or of your own dreams. But this cannot be done, on account of their content. It is impossible to submit either oneself or anyone else whose confidence one enjoys to the ruthless exposure that would be involved in a detailed analysis of his dreams, which, as you already know, are concerned with the most intimate part of one’s personality. But there is another difficulty in the way apart from that of providing the material. You are aware that dreams present an alien appearance to the dreamer himself, and much more so to anyone who is unacquainted with him personally. Our literature is not poor in good and detailed dream-analyses. I myself have published a few within the framework of case histories. Perhaps the best example of the interpretation of a dream is the one reported by Otto Rank consisting of two interrelated dreams dreamt by a young girl, which occupy about two pages of print: but their analysis extends to seventy-six pages. So I should need something like a whole term to conduct you through a piece of work of the sort. If one takes up any comparatively long and much distorted dream, one has to give so many explanations of it, to bring up so much material in the way of associations and memories, to follow up so many by-paths, that a lecture about it would be quite confusing and unsatisfactory. I must therefore ask you to be content with what can be had more easily - an account of small pieces of the dreams of neurotic patients, in which it is possible to recognize this or that point in isolation. What is easiest to demonstrate are dream-symbols and, after them, some characteristics of the regressive representation in dreams. In the case of each of the dreams that follow, I will indicate why it is that I think it worth reporting.

[1916-1917, 3276]
(2) As a result of my publications on dreams I have in a sense become a public consultant on matters relating to them, and for many years I have been receiving communications from the most various sources in which dreams are reported to me or submitted to my judgement. I am of course grateful to anyone who adds enough material to the dream to make an interpretation possible or who gives an interpretation himself. The following dream, dreamt by a medical student in Munich and dating from the year 1910, falls into this category. I am bringing it up in order to show you how impossible it is in general to understand a dream till the dreamer has given us his information about it. For I suspect that at bottom you consider that the ideal method of dream-interpretation is by filling in the meaning of the symbols and that you would like to discard the technique of obtaining associations to the dream; and I am anxious to disabuse you of this damaging mistake.

[1916-1917, 3277]

(1) You may have formed an impression that, even though the technique is correctly carried out, the findings of our interpretative work on dreams admit of so many uncertainties as to defeat any secure translation of the manifest dream into the latent dream-thoughts. You will argue in support of this that in the first place one never knows whether a particular element of the dream is to be understood in its actual sense or as a symbol, since the things employed as symbols do not cease on that account to be themselves. If, however, one has no objective clue for deciding this, the interpretation must at that point be left to the arbitrary choice of the interpreter. Furthermore, as a result of the fact that in the dream-work contraries coalesce, it is always left undetermined whether a particular element is to be understood in a positive or negative sense - as itself or as its contrary. Here is a fresh opportunity for the interpreter to exercise an arbitrary choice. Thirdly, in consequence of the reversals of every kind of which dreams are so fond, it is open to the interpreter to carry out a reversal like this in connection with any passage in the dream he chooses. And lastly, you will mention having heard that one is never certain whether the interpretation one has found for a dream is the only possible one. We run the risk of overlooking a perfectly admissible ‘over-interpretation’ of the same dream. In these circumstances, you will conclude, so much room is left to the interpreter's arbitrary decision as to be incompatible with objective certainty in the findings. Or alternatively you may suppose that the fault does not lie with dreams but that the inadequacies of our dream-interpretation are to be attributed to errors in our views and premisses.

[1916-1917, 3315]

All your material is unimpeachable, but it does not, I think, justify your conclusions, and in two respects: namely that the interpretation of dreams is, as you insist, at the mercy of arbitrary choice and that the lack of results throws doubts on the correctness of our procedure. If instead of the interpreter's arbitrary choice you would speak of his skill, his experience and his understanding, I should agree with you. We cannot, of course, do without a personal factor of that kind, especially in the more difficult problems of dream-interpretation. But the position is no different in other scientific occupations. There is no means of preventing one person from handling a particular technique worse than another, or one person from making better use of it than another. What in other ways gives an impression of arbitrariness - in, for instance, the interpretation of symbols - is done away with by the fact that as a rule the interconnection between the dream-thoughts, or the connection between the dream and the dreamer's life, or the whole psychical situation in which the dream occurs, selects a single one from among the possible determinations presented and dismisses the rest as unserviceable. The conclusion that because of the imperfections of dream-interpretation our hypotheses are incorrect is invalidated by pointing out that on the contrary ambiguity or indefiniteness is a characteristic of dreams which was necessarily to be anticipated.

[1916-1917, 3316]
The matter under consideration relates in essence to the results of displacement, which you have become acquainted with as the most powerful instrument of the dream-censorship. With the help of displacement the dream-censorship creates substitutive structures which we have described as allusions. But they are allusions which are not easily recognizable as such, from which the path back to the genuine thing is not easily traced, and which are connected with the genuine thing by the strangest, most unusual, external associations. In all these cases it is a question, however, of things which are meant to be hidden, which are condemned to concealment, for that is what the dream-censorship is aiming at. But we must not expect that a thing which has been hidden will be found in its own place, in its proper position. The frontier-control commissions which are operating today are more cunning in this respect than the Swiss school authorities. In their search for documents and plans they are not content with examining brief-cases and portfolios, but they consider the possibility that spies and smugglers may have these forbidden things in the most secret portions of their clothing where they decidedly do not belong - for instance, between the double soles of their boots. If the hidden things are there, it will certainly be possible to call them 'far-fetched', but it is also true that a great deal will have been found.

If we recognize that the links between a latent dream-element and its manifest substitute can be of the most out-of-the-way and peculiar nature, sometimes appearing comic and sometimes resembling a joke, we are basing ourselves on copious experience of examples which, as a rule, we have not solved ourselves. It is often impossible to give such interpretations on our own account: no sensible person could guess at the connection. The dreamer gives us the translation either all at once by a direct association - he is able to, since it was he who produced the substitute - or else he brings up so much material that the solution no longer calls for any particular acumen, but presents itself, so to speak, as a matter of course. If the dreamer fails to assist in one or other of these two ways, the manifest element in question will for ever remain unintelligible to us. I will, if I may, give you an example which occurred to me recently. One of my women patients lost her father in the course of the treatment. Since then she has taken every opportunity of bringing him to life in her dreams. In one of these her father appeared (in a particular connection of no further relevance) and said: 'It's a quarter past eleven, it's half-past eleven, it's a quarter to twelve.' By way of interpretation of this oddity all that occurred to her was that her father liked his grown-up children to appear punctually at the family meals. No doubt this was connected with the dream-element, but it threw no light on its origin. There was a suspicion, based on the immediate situation in the treatment, that a carefully suppressed critical revolt against her beloved and honoured father played some part in the dream. In the further course of her associations, apparently remote from the dream, she told how the day before there had been a lot of talk about psychology in her presence, and a relative of hers had remarked: 'The Urmensch [primal man] survives in all of us.' This seemed to provide us with the explanation. It had given her an excellent opportunity of bringing her dead father to life once again. She made him in the dream into an 'Uhrmensch' ['clock-man'] by making him announce the quarter hours at midday.
In psycho-analytic therapy we make use of the same technique that is familiar to you from dream-interpretation. We instruct the patient to put himself into a state of quiet, unreflecting self-observation, and to report to us whatever internal perceptions he is able to make - feelings, thoughts, memories in the order in which they occur to him. At the same time we warn him expressly against giving way to any motive which would lead him to make a selection among these associations or to exclude any of them, whether on the ground that it is too disagreeable or too indiscreet to say, or that it is too unimportant or irrelevant, or that it is nonsensical and need not be said. We urge him always to follow only the surface of his consciousness and to leave aside any criticism of what he finds, whatever shape that criticism may take; and we assure him that the success of the treatment, and above all its duration, depends on the conscientiousness with which he obeys this fundamental technical rule of analysis. We already know from the technique of dream-interpretation that the associations giving rise to the doubts and objections I have just enumerated are precisely the ones that invariably contain the material which leads to the uncovering of the unconscious.

[1916-1917, 3362]

¹ It says 'six or seven' in the dream. Six is the number of the children that were eaten; the seventh escaped into the clock-case. It is always a strict law of dream-interpretation that an explanation must be found for every detail.
[1918b, 3532]

Again, we have thrown light on the sexual impulsions in man by separating them into their component elements; and when we interpret a dream we proceed by ignoring the dream as a whole and starting associations from its single elements.
[1919a, 3629]

¹ In the interpretation of dreams, to which, indeed, we owe our best knowledge of unconscious mental life, we follow a technical rule of disregarding doubt and uncertainty in the narrative of the dream, and of treating every element of the manifest dream as being quite certain. We attribute doubt and uncertainty to the influence of the censorship to which the dream-work is subjected, and we assume that the primary dream-thoughts are not acquainted with doubt and uncertainty as critical processes. They may of course be present, like anything else, as part of the content of the day's residues which lead to the dream.
[1921c, 3773]

It is easy to guess what my answer to this letter was. I was sorry to find that my correspondent's interest in analysis had been so completely killed by his interest in telepathy. I therefore avoided his direct question, and, remarking that the dream contained a good deal besides its connection with the birth of the twins, I asked him to give me any information or ideas that occurred to him which could give me a clue to the meaning of the dream.
[1922a, 3882]

If we now pass on to the analytic treatment of this dream, we are obliged once more to express dissatisfaction. The thoughts that the dreamer associates with the manifest content of the dream are again insufficient; they do not enable us to make any analysis of the dream. For instance, the dream goes into great detail over the likeness of the children to the parents, discusses the colour of their hair and the probable change of colour at a later age, and as an explanation of these elaborate details we only have the dry piece of information from the dreamer that he has always been interested in questions of likeness and heredity. We are accustomed to expect rather more material than this! But at one point the dream does admit of an analytic interpretation, and precisely at this point analysis, which has otherwise no connection with occultism, comes to the aid of telepathy in a remarkable way. It is only on account of this single point that I am asking for your attention to this dream at all.
[1922a, 3886]
Correctly speaking, this dream has no right whatever to be called 'telepathic'. It did not inform the dreamer of anything which (outside his normal knowledge) was taking place elsewhere. What the dream did relate was something quite different from the event reported in the telegram received on the second day after the night of the dream. The dream and the actual occurrence diverge at a particularly important point; but they agree, apart from the coincidence of time, in another very interesting element. In the dream the dreamer's wife had twins. The occurrence, however, was that his daughter had given birth to twins in her distant home. The dreamer did not overlook this difference; he did not seem to know any way of getting over it and, as according to his own account he had no leaning towards the occult, he only asked quite tentatively whether the coincidence between dream and occurrence on the point of the twin-birth could be more than an accident. The psycho-analytic interpretation of dreams, however, does away with this difference between the dream and the event, and gives both the same content. If we consult the associative material to this dream, it shows, in spite of its sparseness, that an intimate bond of feeling existed between the father and daughter, a bond of feeling which is so usual and so natural that we ought to cease to be ashamed of it, one that in daily life merely finds expression as a tender interest and is only pushed to its logical conclusion in dreams. The father knew that his daughter clung to him, he was convinced that she often thought of him during her labour. In his heart I think he grudged her to his son-in-law, to whom in one letter he makes a few disparaging references. On the occasion of her confinement (whether expected or communicated by telepathy) the unconscious wish became active in the repressed part of his mind: 'she ought to be my (second) wife instead'; it was this wish that had distorted the dream-thoughts and was the cause of the difference between the manifest content of the dream and the event. We are entitled to replace the second wife in the dream by the daughter. If we possessed more associations to the dream, we could undoubtedly verify and deepen this interpretation.

[1922a, 3886]

*The Interpretation of Dreams.* - A new approach to the depths of mental life was opened when the technique of free association was applied to dreams, whether one's own or those of patients in analysis. In fact, the greater and better part of what we know of the processes in the unconscious levels of the mind is derived from the interpretation of dreams. Psycho-analysis has restored to dreams the importance which was generally ascribed to them in ancient times, but it treats them differently. It does not rely upon the cleverness of the dream-interpreter but for the most part hands the task over to the dreamer himself by asking him for his associations to the separate elements of the dream. By pursuing these associations further we obtain knowledge of thoughts which coincide entirely with the dream but which can be recognized - up to a certain point - as genuine and completely intelligible portions of waking mental activity. Thus the recollected dream emerges as the *manifest dream content*, in contrast to the *latent dream-thoughts* discovered by interpretation. The process which has transformed the latter into the former, that is to say into 'the dream', and which is undone by the work of interpretation, may be called the 'dream-work'.

[1923a, 3917]

*Symbolism.* - In the course of investigating the form of expression brought about by the dream-work, the surprising fact emerged that certain objects, arrangements and relations are represented, in a sense indirectly, by 'symbols', which are used by the dreamer without his understanding them and to which as a rule he offers no associations. Their translation has to be provided by the analyst, who can himself only discover it empirically by experimentally fitting it into the context. It was later found that linguistic usage, mythology and folklore afford the most ample analogies to dream-symbols. Symbols, which raise the most interesting and hitherto unsolved problems, seem to be a fragment of extremely ancient inherited mental equipment. The use of a common symbolism extends far beyond the use of a common language.

[1923a, 3919]
In interpreting a dream during an analysis a choice lies open to one between several technical procedures. [1923c, 4030]

One can (a) proceed chronologically and get the dreamer to bring up his associations to the elements of the dream in the order in which those elements occurred in his account of the dream. This is the original, classical method, which I still regard as the best if one is analysing one's own dreams. [1923c, 4030]

Or one can (b) start the work of interpretation from some one particular element of the dream which one picks out from the middle of it. For instance, one can choose the most striking piece of it, or the piece which shows the greatest clarity or sensory intensity; or, again, one can start off from some spoken words in the dream, in the expectation that they will lead to the recollection of some spoken words in waking life. [1923c, 4030]

Or one can (c) begin by entirely disregarding the manifest content and instead ask the dreamer what events of the previous day are associated in his mind with the dream he has just described. [1923c, 4030]

Finally, one can (d), if the dreamer is already familiar with the technique of interpretation, avoid giving him any instructions and leave it to him to decide with which associations to the dream he shall begin. [1923c, 4030]

I cannot lay it down that one or the other of these techniques is preferable or in general yields better results. [1923c, 4030]

What is of far greater importance is the question of whether the work of interpretation proceeds under a pressure of resistance which is high or low - a point on which the analyst never remains long in doubt. If the pressure is high, one may perhaps succeed in discovering what the things are with which the dream is concerned, but one cannot make out what it says about these things. It is as though one were trying to listen to a conversation taking place at a distance or in a very low voice. In that case, one can feel confident that there is not much prospect of collaborating with the dreamer, one decides not to bother too much about it and not to give him much help, and one is content to put before him a few translations of symbols that seem probable. [1923c, 4031]

The majority of dreams in a difficult analysis are of this kind; so that one cannot learn much from them about the nature and mechanism of dream-formation. Least of all can one learn anything from them upon the recurring question of where the dream's wish-fulfilment may lie hidden. When the pressure of resistance is quite extremely high, one meets with the phenomenon of the dreamer's associations broadening instead of deepening. In place of the desired associations to the dream that has already been narrated, there appear a constant succession of new fragments of dream, which in their turn remain without associations. [1923c, 4031]
It is only when the resistance is kept within moderate limits that the familiar picture of the work of interpretation comes into view: the dreamer's associations begin by diverging widely from the manifest elements, so that a great number of subjects and ranges of ideas are touched on, after which, a second series of associations quickly converge from these on to the dream-thoughts that are being looked for. When this is so, collaboration between the analyst and the dreamer becomes possible; whereas under a high pressure of resistance it would not even be of any advantage.

[1923c, 4031]

It is possible to distinguish between dreams from above and dreams from below, provided the distinction is not made too sharply. Dreams from below are those which are provoked by the strength of an unconscious (repressed) wish which has found a means of being represented in some of the day's residues. They may be regarded as inroads of the repressed into waking life. Dreams from above correspond to thoughts or intentions of the day before which have contrived during the night to obtain reinforcement from repressed material that is debarred from the ego. When this is so, analysis as a rule disregards this unconscious ally and succeeds in inserting the latent dream-thoughts into the texture of waking thought. This distinction calls for no modification in the theory of dreams.

[1923c, 4032]

In some analyses, or in some periods of an analysis, a divorce may become apparent between dream-life and waking life, like the divorce between the activity of phantasy and waking life which is found in the 'continued story' (a novel in day-dreams). In that case one dream leads off from another, taking as its central point some element which was lightly touched upon in its predecessor, and so on. But we find far more frequently that dreams are not attached to one another but are interpolated into a successive series of portions of waking thought.

[1923c, 4032]

The interpretation of a dream falls into two phases: the phase in which it is translated and the phase in which it is judged or has its value assessed. During the first phase one must not allow oneself to be influenced by any consideration whatever for the second phase. It is as though one had before one a chapter from some work in a foreign language - by Livy, for instance. The first thing one wants to know is what Livy says in the chapter; and it is only after this that the discussion arises of whether what one has read is a historical narrative or a legend or a digression on the part of the author.

[1923c, 4033]

What conclusions can one draw from a correctly translated dream? I have an impression that analytic practice has not always avoided errors and over-estimations on this point, partly owing to an exaggerated respect for the 'mysterious unconscious'. It is only too easy to forget that a dream is as a rule merely a thought like any other, made possible by a relaxation of the censorship and by unconscious reinforcement, and distorted by the operation of the censorship and by unconscious revision.

[1923c, 4033]
It is by no means easy to arrive at general conclusions upon the value of correctly translated dreams. If a conflict due to ambivalence is taking place in a patient, then the emergence in him of a hostile thought certainly does not imply a permanent overcoming of his affectionate impulse - that is to say, a resolution of the conflict: neither does any such implication follow from a dream with a similarly hostile content. During a conflict such as this arising from ambivalence, there are often two dreams every night, each of them representing an opposite attitude. In that case the progress lies in the fact that a complete isolation of the two contrasted impulses has been achieved and that each of them, with the help of its unconscious reinforcements, can be followed and understood to its extreme limits. And if it sometimes happens that one of the two ambivalent dreams has been forgotten, one must not be deceived into assuming that a decision has been made in favour of the one side. The fact that one of the dreams has been forgotten shows, it is true, that for the moment one tendency is in the ascendant, but that is true only of the one day, and may be changed. The next night may perhaps bring the opposite expression into the foreground. The true state of the conflict can only be determined by taking into account all the other indications, including those of waking life.

[1923c, 4034]

But from here our interest proceeds to the question whether the latent dream-thoughts that have to be arrived at by interpretation can also be influenced or suggested by the analyst. And to this the answer must once more be that they obviously can be. For a portion of these latent dream-thoughts correspond to preconscious thought-formations, perfectly capable of being conscious, with which the dreamer might quite well have reacted to the physician's remarks in his waking state too - whether the patient's reactions were in harmony with those remarks or in opposition to them. In fact, if we replace the dream by the dream-thoughts which it contains, the question of how far one can suggest dreams coincides with the more general question of how far a patient in analysis is accessible to suggestion.

[1923c, 4035]

No one can practise the interpretation of dreams as an isolated activity: it remains a part of the work of analysis. In analysis we direct our interest according to necessity, now to the preconscious content of the dream and now to the unconscious contribution to its formation; and we often neglect the one element in favour of the other. Nor would it be of any avail for anyone to endeavour to interpret dreams outside analysis. He would not succeed in escaping the conditions of the analytic situation; and if he worked at his own dreams, he would be undertaking a self-analysis. This comment would not apply to someone who did without the dreamer's collaboration and sought to interpret dreams by intuitive insight. But dream-interpretation of such a kind, without reference to the dreamer's associations, would in the most favourable case remain a piece of unscientific virtuosity of very doubtful value.

[1925i, 4045]

If one practises dream-interpretation according to the sole justifiable technical procedure, one soon notices that success depends entirely upon the tension of resistance between the awakened ego and the repressed unconscious. Work under a 'high pressure of resistance' demands (as I have explained elsewhere) a different attitude on the part of the analyst from work under a low pressure. In analysis one has for long periods at a time to deal with strong resistances which are still unknown to one and which it will in any case be impossible to overcome so long as they remain unknown. It is therefore not to be wondered at that only a certain portion of a patient's dream-products can be translated and made use of, and, even at that, most often incompletely. Even if, owing to one's own experience, one is in a position to understand many dreams to the interpretation of which the dreamer has contributed little, one must always remember that the certainty of such interpretations remains in doubt and one hesitates to press one's conjectures upon the patient.

[1925i, 4045]
We know now that the manifest content is a deception, a façade. It is not worth while to submit it to an ethical examination or to take its breaches of morality any more seriously than its breaches of logic or mathematics. When the 'content' of the dream is spoken of, what must be referred to can only be the content of the preconscious thoughts and of the repressed wishful impulse which are revealed behind the façade of the dream by the work of interpretation. Nevertheless, this immoral façade has a question to put to us. We have heard that the latent dream-thoughts have to submit to a severe censorship before they are allowed access to the manifest content. How can it happen, then, that this censorship, which makes difficulties over more trivial things, breaks down so completely over these manifestly immoral dreams?

[1925i, 4048]

But our interest in the genesis of these manifestly immoral dreams is greatly reduced when we find from analysis that the majority of dreams - innocent dreams, dreams without affect and anxiety-dreams - are revealed, when the distortions of the censorship have been undone, as the fulfilments of immoral - egoistic, sadistic, perverse or incestuous - wishful impulses. As in the world of waking life, these masked criminals are far commoner than those with their vizors raised. The straightforward dream of sexual relations with one's mother, which Jocasta alludes to in the Oedipus Rex, is a rarity in comparison with all the multiplicity of dreams which psycho-analysis must interpret in the same sense.

[1925i, 4049]

The analysis of dreams led further: it was brought to public notice by the present writer as early as in 1900 in The Interpretation of Dreams. This showed that dreams are constructed in just the same way as neurotic symptoms. Like them, they may appear strange and senseless; but, if we examine them by a technique which differs little from the free association used in psycho-analysis, we are led from their manifest content to a secret meaning, to the latent dream-thoughts. This latent meaning is always a wishful impulse which is represented as fulfilled at the moment of the dream. But, except in young children and under the pressure of imperative physical needs, this secret wish can never be expressed recognizably. It has first to submit to a distortion, which is the work of restrictive, censoring forces in the dreamer's ego. In this way the manifest dream, as it is remembered in waking life, comes about. It is distorted, to the pitch of being unrecognizable, by concessions made to the dream-censorship; but it can be revealed once more by analysis as an expression of a situation of satisfaction or as the fulfilment of a wish. It is a compromise between two conflicting groups of mental trends, just as we have found to be the case with hysterical symptoms. The formula which, at bottom, best meets the essence of the dream is this: a dream is a (disguised) fulfilment of a (repressed) wish. The study of the process which transforms the latent dream-wish into the manifest content of the dream - a process known as the 'dream-work' - has taught us the best part of what we know of unconscious mental life.

[1924f, 4109]

The excellent dream which Dr. Odier has put at the author's disposal may give even the uninitiated an idea of the wealth of dream-associations and of the relation between the manifest dream-image and the latent thoughts concealed behind it. It demonstrates too the significance that the analysis of a dream can have in the treatment of a patient.

[1922e, 4174]
With the help of the method of free association and of the related art of interpretation, psychoanalysis succeeded in achieving one thing which appeared to be of no practical importance but which in fact necessarily led to a totally fresh attitude and a fresh scale of values in scientific thought. It became possible to prove that dreams have a meaning, and to discover it. In classical antiquity great importance was attached to dreams as foretelling the future; but modern science would have nothing to do with them, it handed them over to superstition, declaring them to be purely 'somatic' processes - a kind of twitching of a mind that is otherwise asleep. It seemed quite inconceivable that anyone who had done serious scientific work could make his appearance as an 'interpreter of dreams'. But by disregarding the excommunication pronounced upon dreams, by treating them as unexplained neurotic symptoms, as delusional or obsessional ideas, by neglecting their apparent content and by making their separate component images into subjects for free association, psycho-analysis arrived at a different conclusion. The numerous associations produced by the dreamer led to the discovery of a thought-structure which could no longer be described as absurd or confused, which ranked as a completely valid psychical product, and of which the manifest dream was no more than a distorted, abbreviated, and misunderstood translation, and for the most part a translation into visual images. These latent dream-thoughts contained the meaning of the dream, while its manifest content was simply a make-believe, a façade, which could serve as a starting-point for the associations but not for the interpretation.

There were now a whole series of questions to be answered, among the most important of them being whether the formation of dreams had a motive, under what conditions it took place, by what methods the dream-thoughts (which are invariably full of sense) become converted into the dream (which is often senseless), and others besides. I attempted to solve all of these problems in The Interpretation of Dreams, which I published in the year 1900. I can only find space here for the briefest abstract of my investigation. When the latent dream-thoughts that are revealed by the analysis of a dream are examined, one of them is found to stand out from among the rest, which are intelligible and well known to the dreamer. These latter thoughts are residues of waking life (the day's residues, as they are called technically); but the isolated thought is found to be a wishful impulse, often of a very repellent kind, which is foreign to the waking life of the dreamer and is consequently disavowed by him with surprise or indignation. This impulse is the actual constructor of the dream: it provides the energy for its production and makes use of the day's residues as material. The dream which thus originates represents a situation of satisfaction for the impulse, it is the fulfilment of its wish. It would not be possible for this process to take place without being favoured by the presence of something in the nature of a state of sleep. The necessary mental precondition of sleep is the concentration of the ego upon the wish to sleep and the withdrawal of psychical energy from all the interests of life. Since at the same time all the paths of approach to motility are blocked, the ego is also able to reduce the expenditure by which at other times it maintains the repressions. The unconscious impulse makes use of this nocturnal relaxation of repression in order to push its way into consciousness with the dream. But the repressive resistance of the ego is not abolished in sleep but merely reduced. Some of it remains in the shape of a censorship of dreams and forbids the unconscious impulse to express itself in the forms which it would properly assume. In consequence of the severity of the censorship of dreams, the latent dream-thoughts are obliged to submit to being altered and softened so as to make the forbidden meaning of the dream unrecognizable. This is the explanation of dream-distortion, which accounts for the most striking characteristics of the manifest dream. We are therefore justified in asserting that a dream is the (disguised) fulfillment of a (repressed) wish. It will now be seen that dreams are constructed like a neurotic symptom: they are compromises between the demands of a repressed impulse and the resistance of a censoring force in the ego. Since they have a similar origin they are equally unintelligible and stand in equal need of interpretation.
On considering your letter asking me to examine some dreams of Descartes’, my first feeling was an impression of dismay, since working on dreams without being able to obtain from the dreamer himself any indications on the relations which might link them to one another or attach them to the external world - and this is clearly the case when it is a question of the dreams of a historical figure - gives, as a general rule, only a meagre result. In the event my task turned out to be easier than I had anticipated; nevertheless, the fruit of my investigations will no doubt seem to you much less important than you had a right to expect.

[1929b, 4573]

The analysis of dreams of this kind usually leads us to the following position: we cannot understand the dream, but the dreamer - or the patient - can translate it immediately and without difficulty, given that the content of the dream is very close to his conscious thoughts. There then remain certain parts of the dream about which the dreamer does not know what to say: and these are precisely the parts which belong to the unconscious and which are in many respects the most interesting.

[1929b, 4573]

In the most favourable cases we explain this unconscious with the help of the ideas which the dreamer has added to it.

[1929b, 4573]

As regards the melon, the dreamer has had the - original - idea of seeing in it ‘the charms of solitude, but presented by purely human inducements’. This is certainly not correct, but it might provide an association of ideas which would lead to a correct explanation. If it is correlated with his state of sin, this association might stand for a sexual picture which occupied the lonely young man’s imagination.

[1929b, 4574]
Let us look through the volumes of the *Internationale Zeitschrift für (ärztliche) Psychoanalyse*, in which, since 1913, the authoritative writings in our field of work have been brought together. In the earlier volumes you will find a recurrent sectional heading 'On Dream-Interpretation', containing numerous contributions on various points in the theory of dreams. But the further you go the rarer do these contributions become, and finally the sectional heading disappears completely. The analysts behave as though they had no more to say about dreams, as though there was nothing more to be added to the theory of dreams. But if you ask how much of dream-interpretation has been accepted by outsiders - by the many psychiatrists and psychotherapists who warm their pot of soup at our fire (incidentally without being very grateful for our hospitality), by what are described as educated people, who are in the habit of assimilating the more striking findings of science, by the literary men and by the public at large - the reply gives little cause for satisfaction. A few formulas have become generally familiar, among them some that we have never put forward - such as the thesis that all dreams are of a sexual nature - but really important things like the fundamental distinction between the manifest content of dreams and the latent dream-thoughts, the realization that the wish-fulfilling function of dreams is not contradicted by anxiety-dreams, the impossibility of interpreting a dream unless one has the dreamer's associations to it at one's disposal, and, above all, the discovery that what is essential in dreams is the process of the dream-work - all this still seems about as foreign to general awareness as it was thirty years ago. I am in a position to say this, since in the course of that period I have received innumerable letters whose writers present their dreams for interpretation or ask for information about the nature of dreams and who declare that they have read my *Interpretation of Dreams*, though in every sentence they betray their lack of understanding of our theory of dreams. But all this shall not deter us from once more giving a connected account of what we know about dreams. You will recall that last time we devoted a whole number of lectures to showing how we came to understand this hitherto unexplained mental phenomenon.

[1933a, 4622]

Now, however, the difficulties of our task and the enigmas of our subject rise before our eyes. How do we propose to transform the dream into a normal communication and how do we explain the fact that some of the patient's utterances have assumed a form that is unintelligible both to him and to us?

[1933a, 4623]

As you see, Ladies and Gentlemen, this time I am taking the path not of a genetic but of a dogmatic exposition. Our first step is to establish our new attitude to the problem of dreams by introducing two new concepts and names. What has been called the dream we shall describe as the text of the dream or the *manifest* dream, and what we are looking for, what we suspect, so to say, of lying behind the dream, we shall describe as the *latent* dream-thoughts. Having done this, we can express our two tasks as follows. We have to transform the manifest dream into the latent one, and to explain how, in the dreamer's mind, the latter has become the former. The first portion is a *practical* task, for which dream-interpretation is responsible; it calls for a technique. The second portion is a *theoretical* task, whose business it is to explain the hypothetical dream-work; and it can only be a theory. Both of them, the technique of dream-interpretation and the theory of the dream-work, have to be newly created.

[1933a, 4623]
Well then, the patient has told us a dream, which we are to interpret. We have listened passively, without putting our powers of reflection into action. What do we do next? We decide to concern ourselves as little as possible with what we have heard, with the *manifest* dream. Of course this manifest dream exhibits all sorts of characteristics which are not entirely a matter of indifference to us. It may be coherent, smoothly constructed like a literary composition, or it may be confused to the point of unintelligibility, almost like a delirium; it may contain absurd elements or jokes and apparently witty conclusions; it may seem to the dreamer clear and sharp or obscure and hazy; its pictures may exhibit the complete sensory strength of perceptions or may be shadowy like an indistinct mist; the most diverse characteristics may be present in the same dream, distributed over various portions of it; the dream, finally, may show an indifferent emotional tone or be accompanied by feelings of the strongest joy or distress. You must not suppose that we think nothing of this endless diversity in manifest dreams. We shall come back to it later and we shall find a great deal in it that we can make use of in our interpretations. But for the moment we will disregard it and follow the main road that leads to the interpretation of dreams. That is to say, we ask the dreamer, too, to free himself from the impression of the manifest dream, to divert his attention from the dream as a whole on to the separate portions of its content and to report to us in succession everything that occurs to him in relation to each of these portions - what associations present themselves to him if he focuses on each of them separately.

[1933a, 4624]

That is a curious technique, is it not? - not the usual way of dealing with a communication or utterance. And no doubt you guess that behind this procedure there are assumptions which have not yet been expressly stated. But let us proceed. In what order are we to get the patient to take up the portions of his dream? There are various possibilities open to us. We can simply follow the chronological order in which they appeared in the account of the dream. That is what may be called the strictest, classical method. Or we can direct the dreamer to begin by looking out for the ‘day’s residues’ in the dream; for experience has taught us that almost every dream includes the remains of a memory or an allusion to some event (or often to several events) of the day before the dream, and, if we follow these connections, we often arrive with one blow at the transition from the apparently far remote dream-world to the real life of the patient. Or, again, we may tell him to start with those elements of the dream's content which strike him by their special clarity and sensory strength; for we know that he will find it particularly easy to get associations to these. It makes no difference by which of these methods we approach the associations we are in search of.

[1933a, 4625]

And next, we obtain these associations. What they bring us is of the most various kinds: memories from the day before, the 'dream-day', and from times long past, reflections, discussions, with arguments for and against, confessions and enquiries. Some of them the patient pours out; when he comes to others he is held up for a time. Most of them show a clear connection to some element of the dream; no wonder, since those elements were their starting-point. But it also sometimes happens that the patient introduces them with these words: 'This seems to me to have nothing at all to do with the dream, but I tell it you because it occurs to me.'

[1933a, 4625]
If one listens to these copious associations, one soon notices that they have more in common with the content of the dream than their starting-points alone. They throw a surprising light on all the different parts of the dream, fill in gaps between them, and make their strange juxtapositions intelligible. In the end one is bound to become clear about the relation between them and the dream's content. The dream is seen to be an abbreviated selection from the associations, a selection made, it is true, according to rules that we have not yet understood: the elements of the dream are like representatives chosen by election from a mass of people. There can be no doubt that by our technique we have got hold of something for which the dream is a substitute and in which lies the dream's psychical value, but which no longer exhibits its puzzling peculiarities, its strangeness and its confusion.

Let there be no misunderstanding, however. The associations to the dream are not yet the latent dream-thoughts. The latter are contained in the associations like an alkali in the mother liquor, but yet not quite completely contained in them. On the one hand, the associations give us far more than we need for formulating the latent dream-thoughts - namely all the explanations, transitions, and connections which the patient's intellect is bound to produce in the course of his approach to the dream-thoughts. On the other hand, an association often comes to a stop precisely before the genuine dream-thought: it has only come near to it and has only had contact with it through allusions. At that point we intervene on our own; we fill in the hints, draw undeniable conclusions, and give explicit utterance to what the patient has only touched on in his associations. This sounds as though we allowed our ingenuity and caprice to play with the material put at our disposal by the dreamer and as though we misused it in order to interpret into his utterances what cannot be interpreted from them. Nor is it easy to show the legitimacy of our procedure in an abstract description of it. But you have only to carry out a dream-analysis yourselves or study a good account of one in our literature and you will be convinced of the cogent manner in which interpretative work like this proceeds.

If in general and primarily we are dependent, in interpreting dreams, on the dreamer's associations, yet in relation to certain elements of the dream's content we adopt a quite independent attitude, chiefly because we have to, because as a rule associations fail to materialize in their case. We noticed at an early stage that it is always in connection with the same elements that this happens; they are not very numerous, and repeated experience has taught us that they are to be regarded and interpreted as symbols of something else. As contrasted with the other dream-elements, a fixed meaning may be attributed to them, which, however, need not be unambiguous and whose range is determined by special rules with which we are unfamiliar. Since we know how to translate these symbols and the dreamer does not, in spite of having used them himself, it may happen that the sense of a dream may at once become clear to us as soon as we have heard the text of the dream, even before we have made any efforts at interpreting it, while it still remains an enigma to the dreamer himself. But I have said so much to you in my earlier lectures about symbolism, our knowledge of it and the problems it poses us, that I need not repeat it to-day.
That, then, is our method of interpreting dreams. The first and justifiable question is: ‘Can we interpret all dreams by its help?’ And the answer is: ‘No, not all; but so many that we feel confident in the serviceability and correctness of the procedure.’ ‘But why not all?’ The answer to this has something important to teach us, which at once introduces us into the psychical determinants of the formation of dreams: ‘Because the work of interpreting dreams is carried out against a resistance, which varies between trivial dimensions and invincibility (at least so far as the strength of our present methods reaches).’ It is impossible during our work to overlook the manifestations of this resistance. At some points the associations are given without hesitation and the first or second idea that occurs to the patient brings an explanation. At other points there is a stoppage and the patient hesitates before bringing out an association, and, if so, we often have to listen to a long chain of ideas before receiving anything that helps us to understand the dream. We are certainly right in thinking that the longer and more roundabout the chain of associations the stronger the resistance. We can detect the same influence at work in the forgetting of dreams. It happens often enough that a patient, despite all his efforts, cannot remember one of his dreams. But after we have been able in the course of a piece of analytic work to get rid of a difficulty which had been disturbing his relation to the analysis, the forgotten dream suddenly re-emerges. Two other observations are also in place here. It very frequently comes about that, to begin with, a portion of a dream is omitted and added afterwards as an addendum. This is to be regarded as an attempt to forget that portion. Experience shows that it is that particular piece which is the most important; there was a greater resistance, we suppose, in the path of communicating it than the other parts of the dream. Furthermore, we often find that a dreamer endeavours to prevent himself from forgetting his dreams by fixing them in writing immediately after waking up. We can tell him that that is no use. For the resistance from which he has extorted the preservation of the text of the dream will then be displaced on to its associations and will make the manifest dream inaccessible to interpretation. In view of these facts we need not feel surprised if a further increase in the resistance suppresses the associations altogether and thus brings the interpretation of the dream to nothing.

From all this we infer that the resistance which we come across in the work of interpreting dreams must also have had a share in their origin. We can actually distinguish between dreams that arose under a slight and under a high pressure of resistance. But this pressure varies as well from place to place within one and the same dream; it is responsible for the gaps, obscurities and confusions which may interrupt the continuity of even the finest of dreams.

But what is creating the resistance and against what is it aimed? Well, the resistance is the surest sign to us of a conflict. There must be a force here which is seeking to express something and another which is striving to prevent its expression. What comes about in consequence as a manifest dream may combine all the decisions into which this struggle between two trends has been condensed. At one point one of these forces may have succeeded in putting through what it wanted to say, while at another point it is the opposing agency which has managed to blot out the intended communication completely or to replace it by something that reveals not a trace of it. The commonest and most characteristic cases of dream-construction are those in which the conflict has ended in a compromise, so that the communicating agency has, it is true, been able to say what it wanted but not in the way it wanted - only in a softened down, distorted and unrecognized form. If, then, dreams do not give a faithful picture of the dream-thoughts and if the work of interpretation is required in order to bridge the gap between them, that is the outcome of the opposing, inhibiting and restricting agency which we have inferred from our perception of the resistance while we interpret dreams. So long as we studied dreams as isolated phenomena independent of the psychical structures akin to them, we named this agency the censor of dreams.
This was what I wanted to say to you, Ladies and Gentlemen, about dream-interpretation, whose task it is to lead the way from the manifest dream to the latent dream-thoughts. When this has been achieved, interest in a dream, so far as practical analysis is concerned, is for the most part at an end. We add the communication we have received in the form of a dream to the rest of the patient's communications and proceed with the analysis. We, however, have an interest in dwelling a little longer on the dream. We are tempted to study the process by which the latent dream-thoughts were transformed into the manifest dream. We call this the ‘dream-work'. As you will recall, I described it in such detail in my earlier lectures that I can restrict my present survey to the most concise summary.

[1933a, 4630]

In the manifest content of dreams we very often find pictures and situations recalling familiar themes in fairy tales, legends and myths. The interpretation of such dreams thus throws a light on the original interests which created these themes, though we must at the same time not forget, of course, the change in meaning by which this material has been affected in the course of time. Our work of interpretation uncovers, so to say, the raw material, which must often enough be described as sexual in the widest sense, but has found the most varied application in later adaptations. Derivations of this kind are apt to bring down on us the wrath of all non-analytically schooled workers, as though we were seeking to deny or undervalue everything that was later erected on the original basis. Nevertheless, such discoveries are instructive and interesting. The same is true of tracing back the origin of particular themes in plastic art, as, for instance, when M. J. Eissler (1919), following indications in his patients' dreams, gave an analytic interpretation of the youth playing with a little boy represented in the Hermes of Praxiteles. And lastly I cannot resist pointing out how often light is thrown by the interpretation of dreams on mythological themes in particular. Thus, for instance, the legend of the Labyrinth can be recognized as a representation of anal birth: the twisting paths are the bowels and Ariadne's thread is the umbilical cord.

[1933a, 4638]

Again, you may remember that in my earlier lectures I already told you (and illustrated the fact by examples) that we had learnt to make use for our interpretations even of the purely formal features of the manifest dream - that is, to transform them into material coming from the latent dream-thoughts. As you already know, all dreams that are dreamt in a single night belong in a single context. But it is not a matter of indifference whether these dreams appear to the dreamer as a continuum or whether he divides them into several parts and into how many. The number of such parts often corresponds to an equal number of separate focal points in the structural formation of the latent dream-thoughts or to contending trends in the dreamer's mental life, each of which finds a dominant, even though never an exclusive, expression in one particular part of the dream. A short introductory dream and a longer main dream following it often stand in the relation of protasis and apodosis, of which a very clear instance will be found in the old lectures. A dream which is described by the dreamer as 'somehow interpolated' will actually correspond to a dependent clause in the dream-thoughts. Franz Alexander (1925) has shown in a study on pairs of dreams that it not infrequently happens that two dreams in one night share the carrying-out of the dream's task by producing a wish-fulfilment in two stages if they are taken together, though each dream separately would not effect that result. Suppose, for instance, that the dream-wish had as its content some illicit action in regard to a particular person. Then in the first dream the person will appear undisguised, but the action will be only timidly hinted at. The second dream will behave differently. The action will be named without disguise, but the person will either be made unrecognizable or replaced by someone indifferent. This, you will admit, gives one an impression of actual cunning. Another and similar relation between the two members of a pair of dreams is found where one represents a punishment and the other the sinful wish-fulfilment. It amounts to this: 'if one accepts the punishment for it, one can go on to allow oneself the forbidden thing.'

[1933a, 4639]
To begin with, I naturally understood no more about my patients' dreams than the dreamers did themselves. But by applying to these dreams, and more particularly to my own dreams, the procedure which I had already used for the study of other abnormal psychological structures, I succeeded in answering most of the questions which could be raised by an interpretation of dreams. There were many such questions: What do we dream about? Why do we dream at all? What is the origin of all the strange characteristics which distinguish dreams from waking life? - and many more such questions besides. Some of the answers were easily given and turned out to confirm views that had already been put forward; but others involved completely new hypotheses with regard to the structure and functioning of the apparatus of the mind. People dream about the things that have engaged their minds during the waking day. People dream in order to allay impulses that seek to disturb sleep, and in order to be able to sleep on. But why was it possible for dreams to present such a strange appearance, so confusedly senseless, so obviously contrasted with the content of waking thought, in spite of being concerned with the same material? There could be no doubt that dreams were only a substitute for a rational process of thought and could be interpreted - that is to say, translated into a rational process. But what needed explaining was the fact of the distortion which the dream-work had carried out upon the rational and intelligible material.

[1932c, 4808]

We find our way to the understanding ('interpretation') of a dream by assuming that what we recollect as the dream after we have woken up is not the true dream-process but only a façade behind which that process lies concealed. Here we have our distinction between the manifest content of a dream and the latent dream-thoughts. The process which produces the former out of the latter is described as the dream-work. The study of the dream-work teaches us by an excellent example the way in which unconscious material from the id (originally unconscious and repressed unconscious alike) forces its way into the ego, becomes preconscious and, as a result of the ego's opposition, undergoes the changes which we know as dream-distortion. There are no features of a dream which cannot be explained in this way.

[1940a [1938], 4975]

The laws that govern the passage of events in the unconscious, which come to light in this manner, are remarkable enough and suffice to explain most of what seems strange to us about dreams. Above all there is a striking tendency to condensation, an inclination to form fresh unities out of elements which in our waking thought we should certainly have kept separate. As a consequence of this, a single element of the manifest dream often stands for a whole number of latent dream-thoughts as though it were a combined allusion to all of them; and in general the compass of the manifest dream is extraordinarily small in comparison with the wealth of material from which it has sprung. Another peculiarity of the dream-work, not entirely independent of the former one, is the ease with which psychical intensities (cathexes) are displaced from one element to another, so that it often happens that an element which was of little importance in the dream-thoughts appears as the clearest and accordingly most important feature of the manifest dream, and, vice versa, that essential elements of the dream-thoughts are represented in the manifest dream only by slight allusions. Moreover, as a rule the existence of quite insignificant points in common between two elements is enough to allow the dream-work to replace one by the other in all further operations. It will easily be imagined how greatly these mechanisms of condensation and displacement can increase the difficulty of interpreting a dream and of revealing the relations between the manifest dream and the latent dream-thoughts. From the evidence of the existence of these two tendencies to condensation and displacement our theory infers that in the unconscious id the energy is in a freely mobile state and that the id sets more store by the possibility of discharging quantities of excitation than by any other consideration;¹ and our theory makes use of these two peculiarities in defining the character of the primary process we have attributed to the id.

[1940a [1938], 4978]
The study of the dream-work has taught us many other characteristics of the processes in the unconscious which are as remarkable as they are important; but we must only mention a few of them here. The governing rules of logic carry no weight in the unconscious; it might be called the Realm of the Illogical. Urges with contrary aims exist side by side in the unconscious without any need arising for an adjustment between them. Either they have no influence whatever on each other, or, if they have, no decision is reached, but a compromise comes about which is nonsensical since it embraces mutually incompatible details. With this is connected the fact that contraries are not kept apart but treated as though they were identical, so that in the manifest dream any element may also have the meaning of its opposite. Certain philologists have found that the same held good in the most ancient languages and that contraries such as 'strong-weak', 'light-dark' and 'high-deep' were originally expressed by the same roots, until two different modifications of the primitive word distinguished between the two meanings. Residues of this original double meaning seem to have survived even in a highly developed language like Latin in its use of words such as ‘altus’ ('high' and 'deep') and ‘sacer’ ('sacred' and 'infamous').

In view of the complication and ambiguity of the relations between the manifest dream and the latent content lying behind it, it is of course justifiable to ask how it is at all possible to deduce the one from the other and whether all we have to go on is a lucky guess, assisted perhaps by a translation of the symbols that occur in the manifest dream. It may be said in reply that in the great majority of cases the problem can be satisfactorily solved, but only with the help of the associations provided by the dreamer himself to the elements of the manifest content. Any other procedure is arbitrary and can yield no certain result. But the dreamer's associations bring to light intermediate links which we can insert in the gap between the two and by aid of which we can reinstate the latent content of the dream and 'interpret' it. It is not to be wondered at if this work of interpretation (acting in a direction opposite to the dream-work) fails occasionally to arrive at complete certainty.

Naturally, every case is not so simple. Especially in dreams which have originated from undealt-with residues of the previous day, and which have only obtained an unconscious reinforcement during the state of sleep, it is often no easy task to uncover the unconscious motive force and its wish-fulfilment; but we may assume that it is always there. The thesis that dreams are the fulfilments of wishes will easily arouse scepticism when it is remembered how many dreams have an actually distressing content or even wake the dreamer in anxiety, quite apart from the numerous dreams without any definite feeling-tone. But the objection based on anxiety dreams cannot be sustained against analysis. It must not be forgotten that dreams are invariably the product of a conflict, that they are a kind of compromise-structure. Something that is a satisfaction for the unconscious id may for that very reason be a cause of anxiety for the ego.
If we make use of this procedure upon ourselves, we can best assist the investigation by at once writing down what are at first unintelligible associations.

[1901a, 1054]

I will now show what results follow if I apply this method of investigation to dreams. Any example of a dream should in fact be equally appropriate for the purpose; but for particular reasons I will choose some dream of my own, one which seems obscure and meaningless as I remember it, and one which has the advantage of brevity. A dream which I actually had last night will perhaps meet these requirements. Its content, as I noted it down immediately after waking up, was as follows:

[1901a, 1054]

Reflecting over this dream brought me no nearer to understanding it. I determined, however, to set down without any premeditation or criticism the associations which presented themselves to my self-observation. As I have found, it is advisable for this purpose to divide a dream into its elements and to find the associations attaching to each of these fragments separately.

[1901a, 1055]

(E) When I recently had occasion to report some examples of the forgetting of names, with their analyses, to a colleague with a philosophical education, he hastened to reply: 'That's all very well; but in my case the forgetting of names happens differently.' The matter can obviously not be dealt with as easily as this; I do not suppose that my colleague had ever before thought of analysing the forgetting of a name, nor could he say how it happened differently in his case. But his comment nevertheless touches on a problem which many people will be inclined to put in the foreground. Does the elucidation given here of parapraxes and chance actions apply quite generally or only in certain cases? and if the latter, what are the conditions under which it can be called in to explain phenomena that might also have been brought about in another way? In answering this question my experiences leave me in the lurch. I can but utter a warning against supposing that a connection of the kind here demonstrated is only rarely found; for every time I have made the test on myself or on my patients, a connection has been clearly shown to exist just as in the examples reported, or there have at least been good grounds for supposing that it did. It is not surprising if success in finding the hidden meaning of a symptomatic act is not achieved every time, for the magnitude of the internal resistances opposing the solution comes into account as a deciding factor. Equally, it is not possible to interpret every single dream of one's own or of one's patients; to prove that the theory holds good in general it is enough if one can penetrate a part of the way into the hidden connection. It often happens that a dream which proves refractory during an attempt to solve it the next day will allow its secret to be wrested from it a week or a month later, after a real change has come about in the meantime and has reduced the contending psychical values. The same applies to the solving of parapraxes and symptomatic acts. The example of misreading on page 1194 ('Across Europe in a Tub') gave me the opportunity of showing how a symptom that at first insoluble becomes accessible to analysis when the real interest in the repressed thoughts has passed away.¹ As long as the possibility existed of my brother obtaining the envied title before me, this misreading resisted every one of my repeated efforts to analyse it; after it had turned out to be unlikely that he would be preferred to me in this way, the path that led to its solution was suddenly cleared. It would therefore be incorrect to maintain that all the cases which resist analysis are due to a mechanism other than the psychical mechanism disclosed here. Such an assumption would need more than negative evidence. Furthermore, the readiness to believe in a different explanation of parapraxes and symptomatic acts, which is probably to be found in all healthy people, is quite devoid of evidential value; it is obviously a manifestation of the same mental forces which produced the secret and which therefore also devote themselves to preserving it and resist its elucidation.

[1901b, 1339]
I next proceed to mention more particularly what is to be found in this paper and what is not to be found in it. The title of the work was originally 'Dreams and Hysteria', for it seemed to me peculiarly well-adapted for showing how dream-interpretation is woven into the history of a treatment and how it can become the means of filling in amnesias and elucidating symptoms. It was not without good reasons that in the year 1900 I gave precedence to a laborious and exhaustive study of dreams (*The Interpretation of Dreams*) over the publications upon the psychology of the neuroses which I had in view. And incidentally I was able to judge from its reception with what an inadequate degree of comprehension such efforts are met by other specialists at the present time. In this instance there was no validity in the objection that the material upon which had based my assertions had been withheld and that it was therefore impossible to become convinced of their truth by testing and checking them. For every one can submit his own dreams to analytic examination, and the technique of interpreting dreams may be easily learnt from the instructions and examples which I have given. I must once more insist, just as I did at that time, that a thorough investigation of the problems of dreams is an indispensable prerequisite for any comprehension of the mental processes in hysteria and the other psychoneuroses, and that no one who wishes to shirk that preparatory labour has the smallest prospect of advancing even a few steps into this region of knowledge. Since, therefore, this case history presupposes a knowledge of the interpretation of dreams, it will seem highly unsatisfactory to any reader to whom this presupposition does not apply. Such a reader will find only bewilderment in these pages instead of the enlightenment he is in search of, and he will certainly be inclined to project the cause of his bewilderment on to the author and to pronounce his views fantastic. But in reality this bewildering character attaches to the phenomena of the neurosis itself; its presence there is only concealed by the physician's familiarity with the facts, and it comes to light again with every attempt a explaining them. It could only be completely banished if we could succeed in tracing back every single element of a neurosis to factors with which we were already familiar. But everything tends to show that, on the contrary, we shall be driven by the study of neuroses to assume the existence of many new thing which will later on gradually become the subject of more certain knowledge. What is new has always aroused bewilderment and resistance.

[1905e, 1353]

Some years ago I gave as an answer to the question of how one can become an analyst: 'By analysing one's own dreams.' This preparation is no doubt enough for many people, but not for everyone who wishes to learn analysis. Nor can everyone succeed in interpreting his own dreams without outside help. I count it as one of the many merits of the Zurich school of analysis that they have laid increased emphasis on this requirement, and have embodied it in the demand that everyone who wishes to carry out analyses on other people shall first himself undergo an analysis by someone with expert knowledge. Anyone who takes up the work seriously should choose this course, which offers more than one advantage; the sacrifice involved in laying oneself open to another person without being driven to it by illness is amply rewarded. Not only is one's aim of learning to know what is hidden in one's own mind far more rapidly attained and with less expense of affect, but impressions and convictions will be gained in relation to oneself which will be sought in vain from studying books and attending lectures. And lastly, we must not under-estimate the advantage to be derived from the lasting mental contact that is as a rule established between the student and his guide.

[1912e, 2471]
The work of interpreting can be performed on one's own dreams just as on other people's. In fact one learns more from one's own: the process carries more conviction. If, then, we make the attempt, we notice that something is opposing our work. It is true that ideas occur to us, but we do not allow all of them to count; testing and selecting influences make themselves felt. In the case of one idea we may say to ourselves: 'No, this is not relevant, it does not belong here'; in the case of another: 'this is too senseless' and of a third: 'this is totally unimportant'. And we can further observe how with objections of this sort we may smother ideas and finally expel them altogether, even before they have become quite clear. Thus on the one hand we keep too close to the idea which was our starting point, the dream-element itself; and on the other hand we interfere with the outcome of the free associations by making a selection. If we are not by ourselves while interpreting the dream, if we get someone else to interpret it, we become very clearly aware of yet another motive which we employ in making this illicit selection, for sometimes we say to ourselves: 'No, this idea is too disagreeable; I will not or cannot report it.' [1916-1917, 3210]

In interpreting a dream during an analysis a choice lies open to one between several technical procedures. [1923c, 4030]

No one can practise the interpretation of dreams as an isolated activity: it remains a part of the work of analysis. In analysis we direct our interest according to necessity, now to the preconscious content of the dream and now to the unconscious contribution to its formation; and we often neglect the one element in favour of the other. Nor would it be of any avail for anyone to endeavour to interpret dreams outside analysis. He would not succeed in escaping the conditions of the analytic situation; and if he worked at his own dreams, he would be undertaking a self-analysis. This comment would not apply to someone who did without the dreamer's collaboration and sought to interpret dreams by intuitive insight. But dream-interpretation of such a kind, without reference to the dreamer's associations, would in the most favourable case remain a piece of unscientific virtuosity of very doubtful value. [1925i, 4045]

The author of this paper is known to me as a man of strong and independent intelligence. Probably through being somewhat self-willed he failed to get on to good terms with two analysts with whom he made the attempt. He thereupon proceeded to make a systematic application of the procedure of self-analysis which I myself employed in the past for the analysis of my own dreams. His findings deserve attention precisely on account of the peculiar character of his personality and of his technique. [1926c, 4414]
To begin with, I naturally understood no more about my patients' dreams than the dreamers did themselves. But by applying to these dreams, and more particularly to my own dreams, the procedure which I had already used for the study of other abnormal psychological structures, I succeeded in answering most of the questions which could be raised by an interpretation of dreams. There were many such questions: What do we dream about? Why do we dream at all? What is the origin of all the strange characteristics which distinguish dreams from waking life? - and many more such questions besides. Some of the answers were easily given and turned out to confirm views that had already been put forward; but others involved completely new hypotheses with regard to the structure and functioning of the apparatus of the mind. People dream about the things that have engaged their minds during the waking day. People dream in order to allay impulses that seek to disturb sleep, and in order to be able to sleep on. But why was it possible for dreams to present such a strange appearance, so confusedly senseless, so obviously contrasted with the content of waking thought, in spite of being concerned with the same material? There could be no doubt that dreams were only a substitute for a rational process of thought and could be interpreted - that is to say, translated into a rational process. But what needed explaining was the fact of the distortion which the dream-work had carried out upon the rational and intelligible material.

[1932c, 4808]
I should, of course, not draw such far-reaching conclusions if only a single dream-analysis was at my disposal. If experience shows me, however, that by uncritically pursuing the associations arising from any dream I can arrive at a similar train of thoughts, among the elements of which the constituents of the dream re-appear and which are interconnected in a rational and intelligible manner, then it will be safe to disregard the slight possibility that the connections observed in a first experiment might be due to chance. I think I am justified, therefore, in adopting a terminology which will crystallize our new discovery. In order to contrast the dream as it is retained in my memory with the relevant material discovered by analysing it, I shall speak of the former as the 'manifest content of the dream' and the latter - without, in the first instance, making any further distinction - as the 'latent content of the dream.' I am now faced by two new problems which have not hitherto been formulated. (1) What is the psychical process which has transformed the latent content of the dream into the manifest one which is known to me from my memory? (2) What are the motive or motives which have necessitated this transformation? I shall describe the process which transforms the latent into the manifest content of dreams as the 'dream-work.' The counterpart to this activity - one which brings about a transformation in the opposite direction - is already known to us as the work of analysis. The remaining problems arising out of dreams - questions as to the instigators of dreams, as to the origin of their material, as to their possible meaning, as to the possible function of dreaming, and as to the reasons for dreams being forgotten - all these problems will be discussed by me on the basis, not of the manifest, but of the newly discovered latent dream-content. Since I attribute all the contradictory and incorrect views upon dream-life which appear in the literature of the subject to ignorance of the latent content of dreams as revealed by analysis, I shall be at the greatest pains henceforward to avoid confusing the manifest dream with the latent dream-thoughts.

[1901a, 1059]

I have laid it down as the task of dream-interpretation to replace the dream by the latent dream-thoughts, that is, to unravel what the dream-work has woven. In so doing I have raised a number of new psychological problems dealing with the mechanism of this dream-work itself, as well as with the nature and conditions of what is described as repression; on the other hand I have asserted the existence of the dream-thoughts - a copious store of psychical structures of the highest order, which is characterized by all the signs of normal intellectual functioning, but is nevertheless withdrawn from consciousness till it emerges in distorted form in the dream-content. I cannot but assume that thoughts of this kind are present in everyone, since almost everyone, including the most normal people, is capable of dreaming. The unconscious material of the dream-thoughts and its relation to consciousness and to repression raise further questions of significance to psychology, the answers to which must no doubt be postponed until analysis has clarified the origin of other psychopathological structures, such as hysterical symptoms and obsessional ideas.

[1901a, 1098]
The Interpretation of Dreams. - A new approach to the depths of mental life was opened when the technique of free association was applied to dreams, whether one's own or those of patients in analysis. In fact, the greater and better part of what we know of the processes in the unconscious levels of the mind is derived from the interpretation of dreams. Psycho-analysis has restored to dreams the importance which was generally ascribed to them in ancient times, but it treats them differently. It does not rely upon the cleverness of the dream-interpreter but for the most part hands the task over to the dreamer himself by asking him for his associations to the separate elements of the dream. By pursuing these associations further we obtain knowledge of thoughts which coincide entirely with the dream but which can be recognized - up to a certain point - as genuine and completely intelligible portions of waking mental activity. Thus the recollected dream emerges as the \textit{manifest dream content}, in contrast to the \textit{latent dream-thoughts} discovered by interpretation. The process which has transformed the latter into the former, that is to say into 'the dream', and which is undone by the work of interpretation, may be called the '\textit{dream-work}'.

\[1923a, 3917\]

In view of the complication and ambiguity of the relations between the manifest dream and the latent content lying behind it, it is of course justifiable to ask how it is at all possible to deduce the one from the other and whether all we have to go on is a lucky guess, assisted perhaps by a translation of the symbols that occur in the manifest dream. It may be said in reply that in the great majority of cases the problem can be satisfactorily solved, but only with the help of the associations provided by the dreamer himself to the elements of the manifest content. Any other procedure is arbitrary and can yield no certain result. But the dreamer's associations bring to light intermediate links which we can insert in the gap between the two and by aid of which we can reinstate the latent content of the dream and 'interpret' it. It is not to be wondered at if this work of interpretation (acting in a direction opposite to the dream-work) fails occasionally to arrive at complete certainty.

\[1940a [1938], 4979\]
As was to be expected, the patient did not, to begin with, accept my elucidation of the matter. He could not imagine, he said, that the plan of marriage could have had any such effects: it had not made the slightest impression on him at the time. But in the further course of treatment he was forcibly brought to believe in the truth of my suspicion, and in a most singular manner. With the help of a transference phantasy, he experienced, as though it were new and belonged to the present, the very episode from the past which he had forgotten, or which had only passed though his mind unconsciously. There came an obscure and difficult period in the treatment; eventually it turned out that he had once met a young girl on the stairs in my house and had on the spot promoted her into being my daughter. She had pleased him, and he pictured to himself that the only reason I was so kind and incredibly patient with him was that I wanted to have him for a son-in-law. At the same time he raised the wealth and position of my family to a level which agreed with the model he had in mind. But his undying love for his lady fought against the temptation. After we had gone though a series of the severest resistances and bitterest vituperations on his part, he could no longer remain blind to the overwhelming effect of the perfect analogy between the transference phantasy and the actual state of affairs in the past. I will repeat one of the dreams which he had at this period, so as to give an example of his manner of treating the subject. He dreamt that he saw my daughter in front of him; she had two patches of dung instead of eyes. No one who understands the language of dreams will find much difficulty in translating this one: it declared that he was marrying my daughter not for her 'beaux yeux' but for her money.

[1909d, 2157]

In the correspondence between the peculiarity of the dream-work mentioned at the beginning of the paper and the practice discovered by philology in the oldest languages, we may see a confirmation of the view we have formed about the regressive, archaic character of the expression of thoughts in dreams. And we psychiatrists cannot escape the suspicion that we should be better at understanding and translating the language of dreams if we knew more about the development of language.²

[1910e, 2323]
I shall no doubt be overstepping common linguistic usage in postulating an interest in psycho-
analysis on the part of philologists, that is of experts in *speech*. For in what follows 'speech' must be understood not merely to mean the expression of thought in words but to include the speech of gesture and every other method, such, for instance, as writing, by which mental activity can be expressed. That being so, it may be pointed out that the interpretations made by psycho-analysis are first and foremost translations from an alien method of expression into the one which is familiar to us. When we interpret a dream we are simply translating a particular thought-content (the latent dream-thoughts) from the 'language of dreams' into our waking speech. In the course of doing so we learn the peculiarities of this dream language and it is borne in upon us that it forms part of a highly archaic system of expression. Thus, to take an instance, there is no special indication for the negative in the language of dreams. Contraries may stand for each other in the dream's content and may be represented by the same element. Or we may put it like this: concepts are still ambivalent in dream-language, and unite within themselves contrary meanings - as is the case, according to the hypotheses of philologists, in the oldest roots of historical languages.¹ Another striking feature of our dream-language is its extremely frequent use of symbols, which make us able to some extent to translate the content of dreams without reference to the associations of the individual dreamer. Our researches have not yet sufficiently elucidated the essential nature of these symbols. They are in part substitutes and analogies based upon obvious similarities; but in some of these symbols the *tertium comparationis* which is presumably present escapes our conscious knowledge. It is precisely this latter class of symbols which must probably originate from the earliest phases of linguistic development and conceptual construction. In dreams it is above all the sexual organs and sexual activities which are represented symbolically instead of directly. A philologist, Hans Sperber, of Uppsala, has only recently (1912) attempted to prove that words which originally represented sexual activities have, on the basis of analogies of this kind, undergone an extraordinarily far-reaching change in their meaning.

[1913j, 2813]

The language of dreams may be looked upon as the method by which unconscious mental activity expresses itself. But the unconscious speaks more than one dialect. According to the differing psychological conditions governing and distinguishing the various forms of neurosis, we find regular modifications in the way in which unconscious mental impulses are expressed. While the gesture-language of hysteria agrees on the whole with the picture-language of dreams and visions, etc., the thought-language of obsessional neurosis and of the paraphrenias (dementia praecox and paranoia) exhibits special idiomatic peculiarities which, in a number of instances, we have been able to understand and interrelate. For instance, what a hysterical expresses by vomiting an obsessional will express by painstaking protective measures against infection, while a paraphrenic will be led to complaints or suspicions that he is being poisoned. These are all of them different representations of the patient's wish to become pregnant which have been repressed into the unconscious, or of his defensive reaction against that wish.

[1913j, 2814]
I need say little about the interpretation of dreams. It came as the first fruits of the technical innovation I had adopted when, following a dim presentiment, I decided to replace hypnosis by free association. My desire for knowledge had not at the start been directed towards understanding dreams. I do not know of any outside influence which drew my interest to them or inspired me with any helpful expectations. Before Breuer and I ceased to meet I only just had time to tell him in a single sentence that I now understood how to translate dreams. Since this was how the discovery came about, it followed that the symbolism in the language of dreams was almost the last thing to become accessible to me, for the dreamer's associations help very little towards understanding symbols. I have held fast to the habit of always studying things themselves before looking for information about them in books, and therefore I was able to establish the symbolism of dreams for myself before I was led to it by Scherner's work on the subject. It was only later that I came to appreciate to its full extent this mode of expression of dreams. This was partly through the influence of the works of Stekel, who at first did such very creditable work but afterwards went totally astray. The close connection between psychoanalytic dream-interpretation and the art of interpreting dreams as practised and held in such high esteem in antiquity only became clear to me much later. Later on I found the essential characteristic and most important part of my dream theory - the derivation of dream-distortion from an internal conflict, a kind of inner dishonesty - in a writer who was ignorant, it is true, of medicine, though not of philosophy, the famous engineer J. Popper, who published his *Phantasien eines Realisten* under the name of Lynkeus.

[1914d, 2888]

The production of composite structures like these must be of great importance to the dream-work, since we can show that, where in the first instance the common elements necessary for them were missing, they are deliberately introduced - for instance, through the choice of the words by which a thought is expressed. We have already come across condensations and composite structures of this sort. They played a part in the production of some slips of the tongue. You will recall the young man who offered to 'begleitdigen' ['begleiten (accompany)' + 'beleidigen (insult)'] a lady. Moreover, there are jokes of which the technique is based on a condensation like this. But apart from these cases, it may be said that the process is something quite unusual and strange. It is true that counterparts to the construction of these composite figures are to be found in some creations of our imagination, which is ready to combine into a unity components of things that do not belong together in our experience - in the centaurs, for instance, and the fabulous beasts which appear in ancient mythology or in Böcklin's pictures. The 'creative' imagination, indeed, is quite incapable of inventing anything; it can only combine components that are strange to one another. But the remarkable thing about the procedure of the dream-work lies in what follows. The material offered to the dream-work consists of thoughts - a few of which may be objectionable and unacceptable, but which are correctly constructed and expressed. The dream-work puts these thoughts into another form, and it is a strange and incomprehensible fact that in making this translation (this rendering, as it were, into another script or language) these methods of merging or combining are brought into use. After all, a translation normally endeavours to preserve the distinctions made in the text and particularly to keep things that are similar separate. The dream-work, quite the contrary, tries to condense two different thoughts by seeking out (like a joke) an ambiguous word in which the two thoughts may come together. We need not try to understand this feature all at once, but it may become important for our appreciation of the dream-work.

[1916-1917, 3264]
The theme of the 'double' has been very thoroughly treated by Otto Rank (1914). He has gone into the connections which the 'double' has with reflections in mirrors, with shadows, with guardian spirits, with the belief in the soul and with the fear of death; but he also lets in a flood of light on the surprising evolution of the idea. For the 'double' was originally an insurance against the destruction of the ego, an 'energetic denial of the power of death', as Rank says; and probably the 'immortal' soul was the first 'double' of the body. This invention of doubling as a preservation against extinction has its counterpart in the language of dreams, which is fond of representing castration by a doubling or multiplication of a genital symbol. The same desire led the Ancient Egyptians to develop the art of making images of the dead in lasting materials. Such ideas, however, have sprung from the soil of unbounded self-love, from the primary narcissism which dominates the mind of the child and of primitive man. But when this stage has been surmounted, the 'double' reverses its aspect. From having been an assurance of immortality, it becomes the uncanny harbinger of death.

[1919h, 3687]

There was a single piece of material in the course of this analysis which I could regard as a positive transference, as a greatly weakened revival of the girl's original passionate love for her father. Even this manifestation was not quite free from other motives, but I mention it because it brings up, in another direction, an interesting problem of analytic technique. At a certain period, not long after the treatment had begun, the girl brought a series of dreams which, distorted according to rule and couched in the usual dream-language, could nevertheless be easily translated with certainty. Their content, when interpreted, was, however, remarkable. They anticipated the cure of the inversion through the treatment, expressed her joy over the prospects in life that would then be opened before her, confessed her longing for a man's love and for children, and so might have been welcomed as a gratifying preparation for the desired change. The contradiction between them and the girl's utterances in waking life at the time was very great. She did not conceal from me that she meant to marry, but only in order to escape from her father's tyranny and to follow her true inclinations undisturbed. As for the husband, she remarked rather contemptuously, she would easily deal with him, and besides, one could have sexual relations with a man and a woman at one and the same time, as the example of the adored lady showed. Warned through some slight impression or other, I told her one day that I did not believe these dreams, that I regarded them as false or hypocritical, and that she intended to deceive me just as she habitually deceived her father. I was right; after I had made this clear, this kind of dream ceased. But I still believe that, beside the intention to mislead me, the dreams partly expressed the wish to win my favour; they were also an attempt to gain my interest and my good opinion - perhaps in order to disappoint me all the more thoroughly later on.

[1920a, 3853]

I have taken but little direct part in certain other applications of psycho-analysis, though they are none the less of general interest. It is only a step from the phantasies of individual neurotics to the imaginative creations of groups and peoples as we find them in myths, legends, and fairy tales. Mythology became the special province of Otto Rank; the interpretation of myths, the tracing of them back to the familiar unconscious complexes of early childhood, the replacing of astral explanations by a discovery of human motives, all of this is to a large extent due to his analytic efforts. The subject of symbolism, too, has found many students among my followers. Symbolism has brought psycho-analysis many enemies; many enquirers with unduly prosaic minds have never been able to forgive it the recognition of symbolism, which followed from the interpretation of dreams. But analysis is guiltless of the discovery of symbolism, for it had long been known in other regions of thought (such as folklore, legends, and myths) and plays an even larger part in them than in the 'language of dreams'.
But first, even at the risk of appearing to bring our progress to a halt, I should like to take a preliminary glance at the processes involved in carrying out the interpretation of a dream. I cannot disguise from myself that the easiest way of making those processes clear and of defending their trustworthiness against criticism would be to take some particular dream as a sample, go through its interpretation (just as I have done with the dream of Irma's injection in my second chapter), and then collect the dream-thoughts which I have discovered and so on to reconstruct from them the process by which the dream was formed - in other words, to complete a dream-analysis by a dream-synthesis. I have in fact carried out that task for my own instruction on several specimens; but I cannot reproduce them here, since I am forbidden to do so for reasons connected with the nature of the psychical material involved - reasons which are of many kinds and which will be accepted as valid by any reasonable person. Such considerations interfered less in the analysis of dreams, since an analysis could be incomplete and nevertheless retain its value, even though it penetrated only a small way into the texture of the dream. But in the case of the synthesis of a dream I do not see how it can be convincing unless it is complete. I could only give a complete synthesis of dreams dreamt by people unknown to the reading public. Since, however, this condition is fulfilled only by my patients, who are neurotics, I must postpone this part of my exposition of the subject till I am able - in another volume - to carry the psychological elucidation of neuroses to a point at which it can make contact with our present topic.¹

My attempts at building up dreams by synthesis from the dream-thoughts have taught me that the material which emerges in the course of interpretation is not all of the same value. One part of it is made up of the essential dream-thoughts - those, that is, which completely replace the dream, and which, if there were no censorship of dreams, would be sufficient in themselves to replace it. The other part of the material is usually to be regarded as of less importance. Nor is it possible to support the view that all the thoughts of this second kind had a share in the formation of the dream. On the contrary, there may be associations among them which relate to events that occurred after the dream, between the times of dreaming and interpreting. This part of the material includes all the connecting paths that led from the manifest dream-content to the latent dream-thoughts, as well as the intermediate and linking associations by means of which, in the course of the process of interpretation, we came to discover these connecting paths.

The complicated process of elimination, diminution and reversal, by means of which the affects in the dream-thoughts are eventually turned into those in the dream, can be satisfactorily followed in suitable syntheses of dreams that have been completely analysed. I will quote a few more examples of affects in dreams where some of the possibilities I have enumerated will be found realized.

These are some of the most striking of the abnormal processes to which the dream-thoughts, previously constructed on rational lines, are subjected in the course of the dream-work. It will be seen that the chief characteristic of these processes is that the whole stress is laid upon making the cathecting energy mobile and capable of discharge; the content and the proper meaning of the psychical elements to which the cathexes are attached are treated as of little consequence. It might have been supposed that condensation and the formation of compromises is only carried out for the sake of facilitating regression, that is, when it is a question of transforming thoughts into images. But the analysis - and still more the synthesis - of dreams which include no such regression to images, e.g. the dream of 'Autodidasker', exhibits the same processes of displacement and condensation as the rest.
I add a few remarks which may help towards the synthesis of this dream. The dream-work began on the afternoon of the day after the scene in the wood, after Dora had noticed that she was no longer able to lock the door of her room. She then said to herself: 'I am threatened by a serious danger here,' and formed her intention of not stopping on in the house alone but of going off with her father. This intention became capable of forming a dream, because it succeeded in finding a continuation in the unconscious. Whatcorresponded to it there was her summoning up her infantile love for her father as a protection against the present temptation. The change which thus took place in her became fixed and brought her into the attitude shown by her supervalent train of thought - jealousy of Frau K. on her father's account, as though she herself were in love with him. There was a conflict within her between a temptation to yield to the man's proposal and a composite force rebelling against that feeling. This latter force was made up of motives of respectability and good sense, of hostile feelings caused by the governess's disclosures (jealousy and wounded pride, as we shall see later), and of a neurotic element, namely, the tendency to a repudiation of sexuality which was already present in her and was based on her childhood history. Her love for her father, which she summoned up to protect her against the temptation, had its origin in this same childhood history.

[1905e, 1424]

This brings us to the contents of the letter in the dream. Her father was dead, and she had left home by her own choice. In connection with this letter I at once reminded Dora of the farewell letter which she had written to her parents or had at least composed for their benefit. This letter had been intended to give her father a fright, so that he should give up Frau K.; or at any rate to take revenge on him if he could not be induced to do that. We are here concerned with the subject of her death and of her father's death. (Cf. 'cemetery' later on in the dream.) Shall we be going astray if we suppose that the situation which formed the façade of the dream was a phantasy of revenge directed against her father? The feelings of pity for him which she remembered from the day before would be quite in keeping with this. According to the phantasy she had left home and gone among strangers, and her father's heart had broken with grief and with longing for her. Thus she would be revenged. She understood very clearly what it was that her father needed when he could not get to sleep without a drink of brandy.³  We will make a note of Dora's craving for revenge as a new element to be taken into account in any subsequent synthesis of her dream-thoughts.

[1905e, 1433]
Of the superior faculties which even a sober comparison may be inclined to attribute to dream-life, the most marked is that of memory; we have already discussed at length the not uncommon evidence in favour of this view. Another point of superiority in dream-life, often praised by earlier writers - that it rises superior to distance in time and space - may easily be shown to have no basis in fact. As Hildebrandt (1875) points out, this advantage is an illusory one; for dreaming rises superior to time and space in precisely the same way as does waking thought, and for the very reason that it is merely a form of thought. It has been claimed for dreams that they enjoy yet another advantage over waking life in relation to time - that they are independent of the passage of time in yet another respect. Dreams such as the one dreamt by Maury of his own guillotining (see above, p. 539 ff.) seem to show that a dream is able to compress into a very short space of time an amount of perceptual matter far greater than the amount of ideational matter that can be dealt with by our waking mind. This conclusion has however been countered by various arguments; since the papers by Le Lorrain (1894) and Egger (1895) on the apparent duration of dreams, a long and interesting discussion on the subject has developed, but it seems unlikely that the last word has yet been said on this subtle question and the deep implications which it involves.¹

The title that I have chosen for my work makes plain which of the traditional approaches to the problem of dreams I am inclined to follow. The aim which I have set before myself is to show that dreams are capable of being interpreted; and any contributions I may be able to make towards the solution of the problems dealt with in the last chapter will only arise as by products in the course of carrying out my proper task. My presumption that dreams can be interpreted at once puts me in opposition to the ruling theory of dreams and in fact to every theory of dreams with the single exception of Scherner's; for 'interpreting' a dream implies assigning a 'meaning' to it - that is, replacing it by something which fits into the chain of our mental acts as a link having a validity and importance equal to the rest. As we have seen, the scientific theories of dreams leave no room for any problem of interpreting them, since in their view a dream is not a mental act at all, but a somatic process signaling its occurrence by indications registered in the mental apparatus. Lay opinion has taken a different attitude throughout the ages. It has exercised its indefeasible right to behave inconsistently; and, though admitting that dreams are unintelligible and absurd, it cannot bring itself to declare that they have no significance at all. Led by some obscure feeling, it seems to assume that, in spite of everything, every dream has a meaning, though a hidden one, that dreams are designed to take the place of some other process of thought, and that we have only to undo the substitution correctly in order to arrive at this hidden meaning.

¹ [Footnote added 1925:] I used at one time to find it extraordinarily difficult to accustom readers to the distinction between the manifest content of dreams and the latent dream-thoughts. Again and again arguments and objections would be brought up based upon some uninterpreted dream in the form in which it had been retained in the memory, and the need to interpret it would be ignored. But now that analysts at least have become reconciled to replacing the manifest dream by the meaning revealed by its interpretation, many of them have become guilty of falling into another confusion which they cling to with equal obstinacy. They seek to find the essence of dreams in their latent content and in so doing they overlook the distinction between the latent dream-thoughts and the dream-work. At bottom, dreams are nothing other than a particular form of thinking, made possible by the conditions of the state of sleep. It is the dream-work which creates that form, and it alone is the essence of dreaming - the explanation of its peculiar nature. I say this in order to make it possible to assess the value of the notorious 'prospective purpose' of dreams. The fact that dreams concern themselves with attempts at solving the problems by which our mental life is faced is no more strange than that our conscious waking life should do so; beyond this it merely tells us that that activity can also be carried on in the preconscious - and this we already knew.
If one bears in mind that dreams are something different from the latent dream-thoughts which they work over, there is nothing surprising in patients dreaming of things with which their minds have been filled during the treatment, whether it be the 'life-task', or 'being on top' or 'underneath'. The dreams of people being analysed can undoubtedly be directed, in the same way as they are by stimuli produced for experimental purposes. One can determine a part of the material which appears in a dream; nothing in the essence or mechanism of dreams is altered by this. Nor do I believe that 'biographical' dreams, as they are called, occur outside analysis. If, on the other hand, one analyses dreams which occurred before treatment, or if one considers the dreamer's own additions to what has been suggested to him in the treatment, or if one avoids setting him any such tasks, then one may convince oneself how far removed it is from the purpose of a dream to produce attempted solutions of the life-task. Dreams are only a form of thinking; one can never reach an understanding of this form by reference to the content of the thoughts; only an appreciation of the dream-work will lead to that understanding.

[1914d, 2927]

A comparison of the dreams of the two patients shows, however, that the question whether or not paranoia (or any other psychoneurosis) can penetrate into dreams is based on a false conception of dreams. Dreams are distinguished from waking thought by the fact that they can include material (belonging to the region of the repressed) which must not emerge in waking thought. Apart from this, dreams are merely a form of thinking, a transformation of preconscious material of thought by the dream-work and its conditions. Our terminology of the neuroses is not applicable to repressed material; this cannot be called hysterical, nor obsessional, nor paranoic. As against this, the other part of the material which is subjected to the process of dream-formation - the preconscious thoughts - may be normal or may bear the character of any neurosis; they may be the products of any of the pathogenic processes in which the essence of a neurosis lies. There seems to be no reason why any such pathological idea should not be transformed into a dream. A dream may therefore quite simply represent a hysterical phantasy, an obsessional idea, or a delusion - that is, may reveal one or other of these upon interpretation. Observation of the two paranoics shows that the dreams of the one were quite normal while he was subject to his delusion, and that those of the other were paranoic in content while he was treating his delusional ideas with contempt. In both cases, therefore, the dream took up the material that was at the time forced into the background in waking life. This too, however, need not necessarily be an invariable rule.

[1922b, 3906]
At the point which I have now reached, I am led to regard the dream as a sort of substitute for the thought-processes, full of meaning and emotion, at which I arrived after the completion of the analysis. We do not yet know the nature of the process which has caused the dream to be generated from these thoughts, but we can see that it is wrong to regard it as purely physical and without psychical meaning, as a process which has arisen from the isolated activity of separate groups of brain cells aroused from sleep.

[1901a, 1058]

Two other things are already clear. The content of the dream is very much shorter than the thoughts for which I regard it as a substitute; and analysis has revealed that the instigator of the dream was an unimportant event of the evening before I dreamt it.

[1901a, 1058]

To begin with, I naturally understood no more about my patients' dreams than the dreamers did themselves. But by applying to these dreams, and more particularly to my own dreams, the procedure which I had already used for the study of other abnormal psychological structures, I succeeded in answering most of the questions which could be raised by an interpretation of dreams. There were many such questions: What do we dream about? Why do we dream at all? What is the origin of all the strange characteristics which distinguish dreams from waking life? - and many more such questions besides. Some of the answers were easily given and turned out to confirm views that had already been put forward; but others involved completely new hypotheses with regard to the structure and functioning of the apparatus of the mind. People dream about the things that have engaged their minds during the waking day. People dream in order to allay impulses that seek to disturb sleep, and in order to be able to sleep on. But why was it possible for dreams to present such a strange appearance, so confusedly senseless, so obviously contrasted with the content of waking thought, in spite of being concerned with the same material? There could be no doubt that dreams were only a substitute for a rational process of thought and could be interpreted - that is to say, translated into a rational process. But what needed explaining was the fact of the distortion which the dream-work had carried out upon the rational and intelligible material.

[1932c, 4808]
A train of thought that has been set going like this in the preconscious may either cease spontaneously or persist. We picture the first of these outcomes as implying that the energy attaching to the train of thought is diffused along all the associative paths that radiate from it; this energy sets the whole network of thoughts in a state of excitation which lasts for a certain time and then dies away as the excitation in search of discharge becomes transformed into a quiescent cathexis. If this first outcome supervenes, the process is of no further significance so far as dream-formation is concerned. Lurking in our preconscious, however, there are other purposive ideas, which are derived from sources in our unconscious and from wishes which are always on the alert. These may take control of the excitation attaching to the group of thoughts which has been left to its own devices, they may establish a connection between it and an unconscious wish, and they may ‘transfer’ to it the energy belonging to the unconscious wish. Thenceforward the neglected or suppressed train of thought is in a position to persist, though the reinforcement it has received gives it no right of entry into consciousness. We may express this by saying that what has hitherto been a preconscious train of thought has now been ‘drawn into the unconscious.’

But what makes dreams so invaluable in giving us insight is the circumstance that, when the unconscious material makes its way into the ego, it brings its own modes of working along with it. This means that the preconscious thoughts in which the unconscious material has found its expression are handled in the course of the dream-work as though they were unconscious portions of the id; and, in the case of the alternative method of dream-formation, the preconscious thoughts which have obtained reinforcement from an unconscious instinctual impulse are brought down to the unconscious state. It is only in this way that we learn the laws which govern the passage of events in the unconscious and the respects in which they differ from the rules that are familiar to us in waking thought. Thus the dream-work is essentially an instance of the unconscious working-over of preconscious thought-processes. To take an analogy from history: invading conquerors govern a conquered country, not according to the judicial system which they find in force there, but according to their own. It is, however, an unmistakable fact that the outcome of the dream-work is a compromise. The ego-organization is not yet paralysed, and its influence is to be seen in the distortion imposed on the unconscious material and in what are often very ineffective attempts at giving the total result a form not too unacceptable to the ego (secondary revision). In our analogy this would be an expression of the continued resistance of the defeated people.

[1900a, 1021]

[1940a [1938], 4977]
A dream, as we have discovered, takes the place of a number of thoughts which are derived from our daily life and which form a completely logical sequence. We cannot doubt, then, that these thoughts originate from our normal mental life. All the attributes which we value highly in our trains of thought, and which characterize them as complex achievements of a high order, are to be found once more in dream-thoughts. There is no need to assume, however, that this activity of thought is performed during sleep - a possibility which would gravely confuse what has hitherto been our settled picture of the psychical state of sleep. On the contrary, these thoughts may very well have originated from the previous day, they may have proceeded unobserved by our consciousness from their start, and may already have been completed at the onset of sleep. The most that we can conclude from this is that it proves that the most complicated achievements of thought are possible without the assistance of consciousness - a fact which we could not fail to learn in any case from every psycho-analysis of a patient suffering from hysteria or from obsessional ideas. These dream-thoughts are certainly not in themselves inadmissible to consciousness; there may have been a number of reasons for their not having become conscious to us during the day. Becoming conscious is connected with the application of a particular psychical function, that of attention - a function which, as it seems, is only available in a specific quantity, and this may have been diverted from the train of thought in question on to some other purpose. There is another way, too, in which trains of thought of this kind may be withheld from consciousness. The course of our conscious reflections shows us that we follow a particular path in our application of attention. If, as we follow this path, we come upon an idea which will not bear criticism, we break off: we drop the cathexis of attention. Now it seems that the train of thought which has thus been initiated and dropped can continue to spin itself out without attention being turned to it again, unless at some point or other it reaches a specially high degree of intensity which forces attention to it. Thus, if a train of thought is initially rejected (consciously, perhaps) by a judgement that it is wrong or that it is useless for the immediate intellectual purposes in view, the result may be that this train of thought will proceed, unobserved by consciousness, until the onset of sleep.

[1900a, 1020]

This, however, is not the gap in the functional efficiency of our mental apparatus which makes it possible for thoughts, which represent themselves as products of the secondary thought activity, to become subject to the primary psychical process - for such is the formula in which we can now describe the activity which leads to dreams and to hysterical symptoms. Inefficiency arises from the convergence of two factors derived from our developmental history. One of these factors devolves entirely upon the mental apparatus and has had a decisive influence on the relation between the two systems, while the other makes itself felt to a variable degree and introduces instinctual forces of organic origin into mental life. Both of them originate in childhood and are a precipitate of the modifications undergone by our mental and somatic organism since our infancy.

[1900a, 1030]
Can we feel sure that none of the possible techniques of jokes has escaped our investigation? Of course not. But a continued examination of fresh material can convince us that we have got to know the commonest and most important technical methods of the joke-work - at all events as much as is required for forming a judgement on the nature of that psychical process. So far we have not arrived at any such judgement; but on the other hand we are now in possession of an important indication of the direction from which we may expect to receive further light upon the problem. The interesting processes of condensation accompanied by the formation of a substitute, which we have recognized as the core of the technique of verbal jokes, point towards the formation of dreams, in the mechanism of which the same psychical processes have been discovered. This is equally true, however, of the techniques of conceptual jokes - displacement, faulty reasoning, absurdity, indirect representation, representation by the opposite - which re-appear one and all in the technique of the dream-work. Displacement is responsible for the puzzling appearance of dreams, which prevents our recognizing that they are a continuation of our waking life. The use of absurdity and nonsense in dreams has cost them the dignity of being regarded as psychical products and has led the authorities to suppose that a disintegration of the mental activities and a cessation of criticism, morality and logic are necessary conditions of the formation of dreams. Representation by the opposite is so common in dreams that even the popular books of dream-interpretation, which are on a completely wrong tack, are in the habit of taking it into account. Indirect representation - the replacement of a dream-thought by an allusion, by something small, a symbolism akin to analogy - is precisely what distinguishes the mode of expression of dreams from that of our waking life.¹ So far-reaching an agreement between the methods of the joke-work and those of the dream-work can scarcely be a matter of chance. To demonstrate this agreement in detail and to examine its basis will be one of our later tasks.

[1905c, 1686]

It will perhaps not be thought too rash to suppose that the impulses arising from the instincts do not belong to the type of bound nervous processes but of freely mobile processes which press towards discharge. The best part of what we know of these processes is derived from our study of the dream-work. We there discovered that the processes in the unconscious systems were fundamentally different from those in the preconscious (or conscious) systems. In the unconscious, cathexes can easily be completely transferred, displaced and condensed. Such treatment, however, could produce only invalid results if it were applied to preconscious material; and this accounts for the familiar peculiarities exhibited by manifest dreams after the preconscious residues of the preceding day have been worked over in accordance with the laws operating in the unconscious. I described the type of process found in the unconscious as the 'primary' psychical process, in contradistinction to the 'secondary' process which is the one obtaining in our normal waking life. Since all instinctual impulses have the unconscious systems as their point of impact, it is hardly an innovation to say that they obey the primary process. Again, it is easy to identify the primary psychical process with Breuer's freely mobile cathexis and the secondary process with changes in his bound or tonic cathexis.¹ If so, it would be the task of the higher strata of the mental apparatus to bind the instinctual excitation reaching the primary process. A failure to effect this binding would provoke a disturbance analogous to a traumatic neurosis; and only after the binding has been accomplished would it be possible for the dominance of the pleasure principle (and of its modification, the reality principle) to proceed unhindered. Till then the other task of the mental apparatus, the task of mastering or binding excitations, would have precedence - not, indeed, in opposition to the pleasure principle, but independently of it and to some extent in disregard of it.

[1920g, 3737]
I can imagine that to point out the existence of lying dreams of this kind, 'obliging' dreams, will arouse a positive storm of helpless indignation in some readers who call themselves analysts. 'What!' they will exclaim, 'the unconscious, the real centre of our mental life, the part of us that is so much nearer the divine than our poor consciousness - it too can lie! Then how can we still build on the interpretations of analysis and the accuracy of our findings?' To which one must reply that the recognition of these lying dreams does not constitute any shattering novelty. I know, indeed, that the craving of mankind for mysticism is ineradicable, and that it makes ceaseless efforts to win back for mysticism the territory it has been deprived of by The Interpretation of Dreams, but surely in the case under consideration everything is simple enough. A dream is not the 'unconscious'; it is the form into which a thought left over from preconscious, or even from conscious, waking life, can, thanks to the favouring state of sleep, be recast. In the state of sleep this thought has been reinforced by unconscious wishful impulses and has thus experienced distortion through the dream-work, which is determined by the mechanisms prevailing in the unconscious. With our dreamer, the intention to mislead me, just as she did her father, certainly emanated from the preconscious, and may indeed have been conscious; it could come to expression by entering into connection with the unconscious wishful impulse to please her father (or father-substitute), and in this way it created a lying dream. The two intentions, to betray and to please her father, originated in the same complex; the former resulted from the repression of the latter, and the later one was brought back by the dream-work to the earlier one. There can therefore be no question of any devaluation of the unconscious, nor of a shattering of our confidence in the results of analysis.
[1920a, 3854]

A comparison of the dreams of the two patients shows, however, that the question whether or not paranoia (or any other psychoneurosis) can penetrate into dreams is based on a false conception of dreams. Dreams are distinguished from waking thought by the fact that they can include material (belonging to the region of the repressed) which must not emerge in waking thought. Apart from this, dreams are merely a form of thinking, a transformation of preconscious material of thought by the dream-work and its conditions. Our terminology of the neuroses is not applicable to repressed material; this cannot be called hysterical, nor obsessional, nor paranoic. As against this, the other part of the material which is subjected to the process of dream-formation - the preconscious thoughts - may be normal or may bear the character of any neurosis; they may be the products of any of the pathogenic processes in which the essence of a neurosis lies. There seems to be no reason why any such pathological idea should not be transformed into a dream. A dream may therefore quite simply represent a hysterical phantasy, an obsessional idea, or a delusion - that is, may reveal one or other of these upon interpretation. Observation of the two paranoics shows that the dreams of the one were quite normal while he was subject to his delusion, and that those of the other were paranoic in content while he was treating his delusional ideas with contempt. In both cases, therefore, the dream took up the material that was at the time forced into the background in waking life. This too, however, need not necessarily be an invariable rule.
[1922b, 3906]
The Dynamic Theory of Dream-Formation. The motive power for the formation of dreams is not provided by the latent dream-thoughts or day's residues, but by an unconscious impulse, repressed during the day, with which the day's residues have been able to establish contact and which contrives to make a wish-fulfilment for itself out of the material of the latent thoughts. Thus every dream is on the one hand the fulfilment of a wish on the part of the unconscious and on the other hand (in so far as it succeeds in guarding the state of sleep against being disturbed) the fulfilment of the normal wish to sleep which set the sleep going. If we disregard the unconscious contribution to the formation of the dream and limit the dream to its latent thoughts, it can represent anything with which waking life has been concerned - a reflection, a warning, an intention, a preparation for the immediate future or, once again, the satisfaction of an unfulfilled wish. The unrecognizability, strangeness and absurdity of the manifest dream are partly the result of the translation of the thoughts into a different, so to say archaic, method of expression, but partly the effect of a restrictive, critically disapproving agency in the mind which does not entirely cease to function during sleep. It is plausible to suppose that the 'dream-censorship', which we regard as being responsible in the first instance for the distortion of the dream-thoughts into the manifest dream, is an expression of the same mental forces which during the day-time had held back or repressed the unconscious wishful impulse.

But what makes dreams so invaluable in giving us insight is the circumstance that, when the unconscious material makes its way into the ego, it brings its own modes of working along with it. This means that the preconscious thoughts in which the unconscious material has found its expression are handled in the course of the dream-work as though they were unconscious portions of the id; and, in the case of the alternative method of dream-formation, the preconscious thoughts which have obtained reinforcement from an unconscious instinctual impulse are brought down to the unconscious state. It is only in this way that we learn the laws which govern the passage of events in the unconscious and the respects in which they differ from the rules that are familiar to us in waking thought. Thus the dream-work is essentially an instance of the unconscious working-over of preconscious thought-processes. To take an analogy from history: invading conquerors govern a conquered country, not according to the judicial system which they find in force there, but according to their own. It is, however, an unmistakable fact that the outcome of the dream-work is a compromise. The ego-organization is not yet paralysed, and its influence is to be seen in the distortion imposed on the unconscious material and in what are often very ineffective attempts at giving the total result a form not too unacceptable to the ego (secondary revision). In our analogy this would be an expression of the continued resistance of the defeated people.

[1923a, 3918]

[1940a [1938], 4977]
The dream-thoughts and the dream-content are presented to us like two versions of the same subject-matter in two different languages. Or, more properly, the dream-content seems like a transcript of the dream-thoughts into another mode of expression, whose characters and syntactic laws it is our business to discover by comparing the original and the translation. The dream-thoughts are immediately comprehensible, as soon as we have learnt them. The dream-content, on the other hand, is expressed as it were in a pictographic script, the characters of which have to be transposed individually into the language of the dream-thoughts. If we attempted to read these characters according to their pictorial value instead of according to their symbolic relation, we should clearly be led into error. Suppose I have a picture-puzzle, a rebus, in front of me. It depicts a house with a boat on its roof, a single letter of the alphabet, the figure of a running man whose head has been conjured away, and so on. Now I might be misled into raising objections and declaring that the picture as a whole and its component parts are nonsensical. A boat has no business to be on the roof of a house, and a headless man cannot run. Moreover, the man is bigger than the house; and if the whole picture is intended to represent a landscape, letters of the alphabet are out of place in it since such objects do not occur in nature. But obviously we can only form a proper judgement of the rebus if we put aside criticisms such as these of the whole composition and its parts and if, instead, we try to replace each separate element by a syllable or word that can be represented by that element in some way or other. The words which are put together in this way are no longer nonsensical but may form a poetical phrase of the greatest beauty and significance. A dream is a picture puzzle of this sort and our predecessors in the field of dream interpretation have made the mistake of treating the rebus as a pictorial composition: and as such it has seemed to them nonsensical and worthless.

[1900a, 751]

I have on the contrary shown that this strange 'manifest' content of the dream can regularly be made intelligible as a mutilated and altered transcript of certain rational psychical structures which deserve the name of 'latent dream-thoughts'. We arrive at a knowledge of these by dividing the dream's manifest content into its component parts, without considering any apparent meaning it may have, and by then following the associative threads which start from each of what are now isolated elements. These interweave with one another and finally lead to a tissue of thoughts which are not only perfectly rational but can also be easily fitted into the known context of our mental processes. In the course of this 'analysis', the content of the dream will have cast off all the peculiarities that puzzled us. But if the analysis is to succeed, we must, while it proceeds, firmly reject the critical objections which will unceasingly arise to the reproduction of the various intermediary associations.

[1905c, 1745]
With the help of the method of free association and of the related art of interpretation, psychoanalysis succeeded in achieving one thing which appeared to be of no practical importance but which in fact necessarily led to a totally fresh attitude and a fresh scale of values in scientific thought. It became possible to prove that dreams have a meaning, and to discover it. In classical antiquity great importance was attached to dreams as foretelling the future; but modern science would have nothing to do with them, it handed them over to superstition, declaring them to be purely ‘somatic’ processes - a kind of twitching of a mind that is otherwise asleep. It seemed quite inconceivable that anyone who had done serious scientific work could make his appearance as an ‘interpreter of dreams’. But by disregarding the excommunication pronounced upon dreams, by treating them as unexplained neurotic symptoms, as delusional or obsessional ideas, by neglecting their apparent content and by making their separate component images into subjects for free association, psycho-analysis arrived at a different conclusion. The numerous associations produced by the dreamer led to the discovery of a thought-structure which could no longer be described as absurd or confused, which ranked as a completely valid psychical product, and of which the manifest dream was no more than a distorted, abbreviated, and misunderstood translation, and for the most part a translation into visual images. These latent dream-thoughts contained the meaning of the dream, while its manifest content was simply a make-believe, a façade, which could serve as a starting-point for the associations but not for the interpretation.
[1925d, 4218]
In all of these 'innocent' dreams the motive for the censorship is obviously the sexual factor. This, however, is a subject of prime importance which I must leave on one side.

[1900a, 674]

It is also instructive to consider the relation of these dreams to anxiety-dreams. In the dreams we have been discussing, a repressed wish has found a means of evading censorship - and the distortion which censorship involves. The invariable concomitant is that painful feelings are experienced in the dream. In just the same way anxiety-dreams only occur if the censorship has been wholly or partly overpowered; and, on the other hand, the overpowering of the censorship is facilitated if anxiety has already been produced as an immediate sensation arising from somatic sources. We can thus plainly see the purpose for which the censorship exercises its office and brings about the distortion of dreams: it does so in order to prevent the generation of anxiety or other forms of distressing affect.

[1900a, 744]

In my case, too, the originality of many of the new ideas employed by me in the interpretation of dreams and in psycho-analysis has evaporated in this way. I am ignorant of the source of only one of these ideas. It was no less than the key to my view of dreams and helped me to solve their riddles, so far as it has been possible to solve them hitherto. I started out from the strange, confused and senseless character of so many dreams, and hit upon the notion that dreams were bound to become like that because something was struggling for expression in them which was opposed by a resistance from other mental forces. In dreams hidden impulses were stirring which stood in contradiction to what might be called the dreamer's official ethical and aesthetic creed; the dreamer was thus ashamed of these impulses, turned away from them and refused to acknowledge them in day-time, and if during the night he could not withhold expression of some kind from them, he submitted them to a 'dream-distortion' which made the content of the dream appear confused and senseless. To the mental force in human beings which keeps watch on this internal contradiction and distorts the dream's primitive instinctual impulses in favour of conventional or of higher moral standards, I gave the name of 'dream-censorship'.

[1923f, 4159]
There were now a whole series of questions to be answered, among the most important of them being whether the formation of dreams had a motive, under what conditions it took place, by what methods the dream-thoughts (which are invariably full of sense) become converted into the dream (which is often senseless), and others besides. I attempted to solve all of these problems in The Interpretation of Dreams, which I published in the year 1900. I can only find space here for the briefest abstract of my investigation. When the latent dream-thoughts that are revealed by the analysis of a dream are examined, one of them is found to stand out from among the rest, which are intelligible and well known to the dreamer. These latter thoughts are residues of waking life (the day's residues, as they are called technically); but the isolated thought is found to be a wishful impulse, often of a very repellent kind, which is foreign to the waking life of the dreamer and is consequently disavowed by him with surprise or indignation. This impulse is the actual constructor of the dream: it provides the energy for its production and makes use of the day's residues as material. The dream which thus originates represents a situation of satisfaction for the impulse, it is the fulfilment of its wish. It would not be possible for this process to take place without being favoured by the presence of something in the nature of a state of sleep. The necessary mental precondition of sleep is the concentration of the ego upon the wish to sleep and the withdrawal of psychical energy from all the interests of life. Since at the same time all the paths of approach to motility are blocked, the ego is also able to reduce the expenditure by which at other times it maintains the repressions. The unconscious impulse makes use of this nocturnal relaxation of repression in order to push its way into consciousness with the dream. But the repressive resistance of the ego is not abolished in sleep but merely reduced. Some of it remains in the shape of a censorship of dreams and forbids the unconscious impulse to express itself in the forms which it would properly assume. In consequence of the severity of the censorship of dreams, the latent dream-thoughts are obliged to submit to being altered and softened so as to make the forbidden meaning of the dream unrecognizable. This is the explanation of dream-distortion, which accounts for the most striking characteristics of the manifest dream. We are therefore justified in asserting that a dream is the (disguised) fulfilment of a (repressed) wish. It will now be seen that dreams are constructed like a neurotic symptom: they are compromises between the demands of a repressed impulse and the resistance of a censoring force in the ego. Since they have a similar origin they are equally unintelligible and stand in equal need of interpretation.

[1925d, 4219]
Now, too, we can understand to what extent it is a matter of indifference how much or how little the dream is remembered and, above all, how accurately or how uncertainly. For the remembered dream is not the genuine material but a distorted substitute for it, which should assist us, by calling up other substitutive images, to come nearer to the genuine material, to make what is unconscious in the dream conscious. If our memory has been inaccurate, therefore, it has merely made a further distortion of this substitute - a distortion, moreover, which cannot have been without a reason.

[1916-1917, 3210]

The moment seems to me to have arrived for introducing two terms, which we could have made use of long ago. We will describe what the dream actually tells us as the manifest dream-content, and the concealed material, which we hope to reach by pursuing the ideas that occur to the dreamer, as the latent dream-thoughts. Thus we are here considering the relations between the manifest content of the dream and the latent dream-thoughts as shown in these examples. These relations may be of very many different kinds. In examples (a) and (b) the manifest element is also a constituent of the latent thoughts, though only a small fragment of them. A small piece of the large and complicated psychical structure of unconscious dream-thoughts has made its way into the manifest dream as well - a fragment of them, or, in other cases, an allusion to them, a caption, as it were, or an abbreviation in telegraphic style. It is the business of the work of interpretation to complete these fragments or this allusion into a whole - which was achieved particularly nicely in the case of example (b). Thus one form of the distortion which constitutes the dream-work is replacement by a fragment or an allusion. In example (c) another kind of relation is to be observed in addition; and we shall find this expressed in a purer and clearer form in the examples which follow.

[1916-1917, 3216]

But all the same, she had given us so much material in these few associations that it was possible to guess the latent dream-thoughts from them. We cannot help being struck by the fact that periods of time occur at several points in the information she gave us about the dream, and these provide a common factor between the different parts of the material. She took the theatre tickets too early, bought them over-hurriedly so that she had to pay more than was necessary; so too her sister-in-law had been in a hurry to take her money to the jewellers and buy some jewellery with it, as though otherwise she would miss it. If, in addition to the 'too early' and 'in a hurry' which we have stressed, we take into account the precipitating cause of the dream - the news that her friend, though only three months her junior, had nevertheless got an excellent husband - and the criticism of her sister-in-law expressed in the idea that it was absurd of her to be in such a hurry, then we find ourselves presented almost spontaneously with the following construction of the latent dream-thoughts, for which the manifest dream is a severely distorted substitute:

[1916-1917, 3219]

LADIES AND GENTLEMEN, - I am under the impression that we have advanced too quickly. Let us go back a little. Before we made our last attempt at overcoming the difficulty of distortion in dreams by the help of our technique, we were saying that our best plan would be to get round the difficulty by keeping to dreams in which there was no distortion or only a very little - if such dreams exist. This will once more mean a divergence from the historical development of our discoveries; for actually it was only after the technique of interpretation had been consistently applied and distorted dreams had been completely analysed that the existence of dreams that are free from distortion came to our notice.

[1916-1917, 3221]
The dreams we are in search of occur in children. They are short, clear, coherent, easy to understand and unambiguous; but they are nevertheless undoubtedly dreams. You must not suppose, however, that all children's dreams are of this kind. Dream-distortion sets in very early in childhood, and dreams dreamt by children of between five and eight have been reported which bear all the characteristics of later ones. But if you limit yourselves to ages between the beginning of observable mental activity and the fourth or fifth year, you will come upon a number of dreams which possess the characteristics that can be described as 'infantile' and you will find a few of the same kind in later years of childhood. Indeed, under certain conditions even adults have dreams which are quite similar to the typically infantile ones.

(3) These dreams are without any dream-distortion, and therefore call for no interpretative activity. Here the manifest and the latent dream coincide. Thus dream-distortion is not part of the essential nature of dreams. I expect this will be a weight off your minds. But when we examine these dreams more closely, we shall recognize a small piece of dream-distortion even in them, a certain distinction between the manifest content of the dream and the latent dream-thoughts.

(6) What instigates a dream is a wish, and the fulfilment of that wish is the content of the dream - this is one of the chief characteristics of dreams. The other, equally constant one, is that a dream does not simply give expression to a thought, but represents the wish-fulfilled as a hallucinatory experience. 'I should like to go on the lake' is the wish that instigates the dream. The content of the dream itself is: 'I am going on the lake.' Thus even in these simple children's dreams a difference remains between the latent and the manifest dream, there is a distortion of the latent dream-thought: the transformation of a thought into an experience. In the process of interpreting a dream this alteration must first be undone. If this turns out to be the most universal characteristic of dreams, the fragment of dream which I reported to you earlier 'I saw my brother in a box [Kasten]' is not to be translated 'my brother is restricting himself [schnärt sich ein]' but 'I should like my brother to restrict himself: my brother must restrict himself.' Of the two general characteristics of dreams which I have here brought forward, the second clearly has more prospect of being accepted without contradiction than the first. It is only by means of far-reaching investigations that we shall be able to establish the fact that what instigates dreams must always be a wish and cannot be a worry or an intention or a reproach; but this will not affect the other characteristic - that the dream does not simply reproduce this stimulus, but removes it, gets rid of it, deals with it, by means of a kind of experience.

If dreams of the infantile kind were the only ones, the problem would be solved and our task finished, and that without our questioning the dreamer or bringing in the unconscious or resorting to free association. This is evidently where a continuation of our task lies ahead. We have already found repeatedly that characteristics which were claimed as being of general validity have turned out to apply only to a particular sort and number of dreams. The question for us is therefore whether the general characteristics we inferred from children's dreams have a firmer footing, whether they also hold good of dreams which are not transparently clear and whose manifest content gives no sign of being connected with a wish left over from the previous day. It is our view that these other dreams have undergone a far-reaching distortion and for that reason cannot be judged at a first glance. We suspect too that to explain this distortion we shall need the psycho-analytic technique which we have been able to do without in the understanding we have just gained of children's dreams.
In the same way, dreams create satisfactions under the influence of sexual stimuli, but these show peculiarities which deserve mention. Since it is characteristic of the sexual instinct to be a degree less dependent on its object than hunger and thirst, the satisfaction in dreams of emission can be a real one; and in consequence of certain difficulties (which I shall have to mention later) in its relation to its object, it happens with special frequency that the real satisfaction is nevertheless attached to a dream-content which is obscure or distorted. This characteristic of dreams of emission (as Otto Rank has pointed out) makes them particularly favourable subjects for the study of dream-distortion. Furthermore, all adult dreams arising from bodily needs usually contain, in addition to the satisfaction, other material which is derived from purely psychical sources of stimulation and requires interpretation before it can be understood.

In all dreams other than children's dreams and those of an infantile type our path is, as I have said, obstructed by dream distortion. We cannot tell, to begin with, whether these other dreams too are wish-fulfilments as we suspect, we cannot guess from their manifest content to what psychical stimulus they owe their origin, and we cannot prove that they too are endeavouring to get rid of that stimulus or in some way deal with it. They must be interpreted - that is, translated -, their distortion must be undone, and their manifest content replaced by their latent one, before we can form a judgement as to whether what we have found in infantile dreams can claim to be valid for all dreams.

We have assumed of dreams of another sort, on the basis of various considerations and on the analogy of our views on parapraxes, that they are a distorted substitute for an unknown content, and that the first thing is to trace them back to it. Our immediate task, then, is an enquiry which will lead to an understanding of this distortion in dreams.

Dream-distortion is what makes a dream seem strange and unintelligible to us. We want to know a number of things about it: firstly, where it comes from - its dynamics -, secondly, what it does and, lastly, how it does it. We can also say that dream distortion is carried out by the dream-work; and we want to describe the dream-work and trace it back to the forces operating in it.

Omission, modification, fresh grouping of the material - these, then, are the activities of the dream-censorship and the instruments of dream-distortion. The dream-censorship itself is the originator, or one of the originators, of the dream-distortion which we are now engaged in examining. We are in the habit of combining the concepts of modification and re-arrangement under the term 'displacement'.

The purposes against which the dream-censorship is directed must be described in the first instance from the point of view of that agency itself. If so, one can only say that they are invariably of a reprehensible nature, repulsive from the ethical, aesthetic and social point of view - matters of which one does not venture to think at all or thinks only with disgust. These wishes, which are censored and given a distorted expression in dreams, are first and foremost manifestations of an unbridled and ruthless egoism. And, to be sure, the dreamer's own ego appears in every dream and plays the chief part in it, even if it knows quite well how to hide itself so far as the manifest content goes. This 'sacro egoismo' of dreams is certainly not unrelated to the attitude we adopt when we sleep, which consists in our withdrawing our interest from the whole external world.
But you must not blame the dream itself on account of its evil content. Do not forget that it performs the innocent and indeed useful function of preserving sleep from disturbance. This wickedness is not part of the essential nature of dreams. Indeed you know too that there are dreams which can be recognized as the satisfaction of justified wishes and of pressing bodily needs. These, it is true, have no dream-distortion; but they have no need of it, for they can fulfil their function without insulting the ethical and aesthetic purposes of the ego. Bear in mind, too, that dream-distortion is proportionate to two factors. On the one hand it becomes greater the worse the wish that has to be censored; but on the other hand it also becomes greater the more severe the demands of the censorship at the moment. Thus a strictly brought-up and prudish young girl, with a relentless censorship, will distort dream-impulses which we doctors, for instance, would have to regard as permissible, harmless, libidinal wishes, and on which in ten years' time the dreamer herself will make the same judgement.

The fourth of my reflections takes us back to the beginning and directs us along our prescribed path. I have said that even if there were no dream-censorship dreams would still not be easily intelligible to us, for we should still be faced with the task of translating the symbolic language of dreams into that of our waking thought. Thus symbolism is a second and independent factor in the distortion of dreams, alongside of the dream-censorship. It is plausible to suppose, however, that the dream-censorship finds it convenient to make use of symbolism, since it leads towards the same end - the strangeness and incomprehensibility of dreams.

It will shortly become clear whether a further study of dreams may not bring us up against yet another factor that contributes to the distortion of dreams. But I should not like to leave the subject of dream-symbolism without once more touching on the problem of how it can meet with such violent resistance in educated people when the wide diffusion of symbolism in myths, religion, art and language is so unquestionable. May it not be that what is responsible is once again its connection with sexuality?

LADIES AND GENTLEMEN, - Shall I remind you once more of the ground we have covered so far? Of how, when we began applying our technique, we came up against the distortion in dreams, of how we thought we would begin by evading it and obtained our first decisive information on the essential nature of dreams from the dreams of children? Of how, after that, armed with what we had learnt from that enquiry, we made a direct assault on dream-distortion and, as I hope, overcame it step by step? We are bound to admit, however, that the things we have discovered by the one path and by the other do not entirely correspond. It will be our task to piece the two sets of findings together and reconcile them with each other.

We found from both sources that the dream-work consists essentially in the transformation of thoughts into a hallucinatory experience. How this can happen is sufficiently mysterious; but it is a problem of general psychology with which we are not properly concerned here. We learnt from children's dreams that it is the intention of the dream-work to get rid of a mental stimulus, which is disturbing sleep, by means of the fulfilment of a wish. We were unable to say anything similar of distorted dreams till we found out how to interpret them. But it was from the first our expectation that we should be able to regard distorted dreams in the same light as those of children. The first confirmation of this expectation was brought to us by the discovery that in point of fact all dreams are children's dreams, that they work with the same infantile material, with the mental impulses and mechanisms of childhood. Now that we believe we have overcome dream-distortion, we must go on to enquire whether the view of dreams as the fulfilment of wishes is also valid of distorted dreams.
The parts of the manifest content of the dream which were emphasized by the dreamer, the factors of attentive looking and of motionlessness, must lead to the content of this scene. We must naturally expect to find that this material reproduces the unknown material of the scene in some distorted form, perhaps even distorted into its opposite.

[1918b, 3525]

I am hoping that you will grant this, but that you will raise the objection that there are, nevertheless, other telepathic dreams in which there is no difference between the event and the dream, and in which there is nothing else to be found but an undistorted reproduction of the event. I have no knowledge of such dreams from my own experience, but I know they have often been reported. If we assume that we have such an undisguised and unadulterated telepathic dream to deal with, another question arises. Ought we to call such a telepathic experience a 'dream' at all? You will certainly do so as long as you keep to popular usage, in which everything that takes place in mental life during sleep is called a dream. You, too, perhaps say, 'I tossed about in my dream', and still less are you conscious of anything incorrect when you say, 'I shed tears in my dream' or 'I felt apprehensive in my dream'. But you will no doubt notice that in all these cases you are using 'dream' and 'sleep' and 'state of being asleep' interchangeably, as if there were no distinction between them. I think it would be in the interests of scientific accuracy to keep 'dream' and 'state of sleep' more distinctly separate. Why should we provide a counterpart to the confusion evoked by Maeder who, by refusing to distinguish between the dream-work and the latent dream-thoughts, has discovered a new function for dreams? Supposing, then, that we are brought face to face with a pure telepathic 'dream', let us rather call it instead a telepathic experience in a state of sleep. A dream without condensation, distortion, dramatization, above all, without wish-fulfilment, surely does not deserve the name. You will remind me that, if so, there are other mental products in sleep to which the right to be called 'dreams' would have to be refused. Actual experiences of the day are sometimes simply repeated in sleep; reproductions of traumatic scenes in 'dreams' have led us only lately to revise the theory of dreams. There are dreams which are to be distinguished from the usual type by certain special qualities, which are, properly speaking, nothing but night-phantasies, not having undergone additions or alterations of any kind and being in all other ways similar to the familiar day-dreams. It would be awkward, no doubt, to exclude these structures from the domain of 'dreams'. But still they all come from within, are products of our mental life, whereas the very conception of the purely 'telepathic dream' lies in its being a perception of something external, in relation to which the mind remains passive and receptive.

[1922a, 3887]

*The Dynamic Theory of Dream-Formation.* The motive power for the formation of dreams is not provided by the latent dream-thoughts or day's residues, but by an unconscious impulse, repressed during the day, with which the day's residues have been able to establish contact and which contrives to make a wish-fulfilment for itself out of the material of the latent thoughts. Thus every dream is on the one hand the fulfilment of a wish on the part of the unconscious and on the other hand (in so far as it succeeds in guarding the state of sleep against being disturbed) the fulfilment of the normal wish to sleep which set the sleep going. If we disregard the unconscious contribution to the formation of the dream and limit the dream to its latent thoughts, it can represent anything with which waking life has been concerned - a reflection, a warning, an intention, a preparation for the immediate future or, once again, the satisfaction of an unfulfilled wish. The unrecognizability, strangeness and absurdity of the manifest dream are partly the result of the translation of the thoughts into a different, so to say archaic, method of expression, but partly the effect of a restrictive, critically disapproving agency in the mind which does not entirely cease to function during sleep. It is plausible to suppose that the 'dream-censorship', which we regard as being responsible in the first instance for the distortion of the dream-thoughts into the manifest dream, is an expression of the same mental forces which during the day-time had held back or repressed the unconscious wishful impulse.

[1923a, 3918]
What conclusions can one draw from a correctly translated dream? I have an impression that analytic practice has not always avoided errors and over-estimations on this point, partly owing to an exaggerated respect for the 'mysterious unconscious'. It is only too easy to forget that a dream is as a rule merely a thought like any other, made possible by a relaxation of the censorship and by unconscious reinforcement, and distorted by the operation of the censorship and by unconscious revision.

But our interest in the genesis of these manifestly immoral dreams is greatly reduced when we find from analysis that the majority of dreams - innocent dreams, dreams without affect and anxiety-dreams - are revealed, when the distortions of the censorship have been undone, as the fulfilsments of immoral - egoistic, sadistic, perverse or incestuous - wishful impulses. As in the world of waking life, these masked criminals are far commoner than those with their vizors raised. The straightforward dream of sexual relations with one's mother, which Jocasta alludes to in the *Oedipus Rex*, is a rarity in comparison with all the multiplicity of dreams which psycho-analysis must interpret in the same sense.

The analysis of dreams led further: it was brought to public notice by the present writer as early as in 1900 in *The Interpretation of Dreams*. This showed that dreams are constructed in just the same way as neurotic symptoms. Like them, they may appear strange and senseless; but, if we examine them by a technique which differs little from the free association used in psycho-analysis, we are led from their manifest content to a secret meaning, to the latent dream-thoughts. This latent meaning is always a wishful impulse which is represented as fulfilled at the moment of the dream. But, except in young children and under the pressure of imperative physical needs, this secret wish can never be expressed recognizably. It has first to submit to a distortion, which is the work of restrictive, censoring forces in the dreamer's ego. In this way the manifest dream, as it is remembered in waking life, comes about. It is distorted, to the pitch of being unrecognizable, by concessions made to the dream-censorship; but it can be revealed once more by analysis as an expression of a situation of satisfaction or as the fulfilment of a wish. It is a compromise between two conflicting groups of mental trends, just as we have found to be the case with hysterical symptoms. The formula which, at bottom, best meets the essence of the dream is this: a dream is a (disguised) fulfilment of a (repressed) wish. The study of the process which transforms the latent dream-wish into the manifest content of the dream - a process known as the 'dream-work' - has taught us the best part of what we know of unconscious mental life.

In my case, too, the originality of many of the new ideas employed by me in the interpretation of dreams and in psycho-analysis has evaporated in this way. I am ignorant of the source of only one of these ideas. It was no less than the key to my view of dreams and helped me to solve their riddles, so far as it has been possible to solve them hitherto. I started out from the strange, confused and senseless character of so many dreams, and hit upon the notion that dreams were bound to become like that because something was struggling for expression in them which was opposed by a resistance from other mental forces. In dreams hidden impulses were stirring which stood in contradiction to what might be called the dreamer's official ethical and aesthetic creed; the dreamer was thus ashamed of these impulses, turned away from them and refused to acknowledge them in day-time, and if during the night he could not withhold expression of some kind from them, he submitted them to a 'dream-distortion' which made the content of the dream appear confused and senseless. To the mental force in human beings which keeps watch on this internal contradiction and distorts the dream's primitive instinctual impulses in favour of conventional or of higher moral standards, I gave the name of 'dream-censorship'.
There were now a whole series of questions to be answered, among the most important of them being whether the formation of dreams had a motive, under what conditions it took place, by what methods the dream-thoughts (which are invariably full of sense) become converted into the dream (which is often senseless), and others besides. I attempted to solve all of these problems in *The Interpretation of Dreams*, which I published in the year 1900. I can only find space here for the briefest abstract of my investigation. When the latent dream-thoughts that are revealed by the analysis of a dream are examined, one of them is found to stand out from among the rest, which are intelligible and well known to the dreamer. These latter thoughts are residues of waking life (the *day's residues*, as they are called technically); but the isolated thought is found to be a wishful impulse, often of a very repellent kind, which is foreign to the waking life of the dreamer and is consequently disavowed by him with surprise or indignation. This impulse is the actual constructor of the dream: it provides the energy for its production and makes use of the day's residues as material. The dream which thus originates represents a situation of satisfaction for the impulse, it is the fulfilment of its wish. It would not be possible for this process to take place without being favoured by the presence of something in the nature of a state of sleep. The necessary mental precondition of sleep is the concentration of the ego upon the wish to sleep and the withdrawal of psychical energy from all the interests of life. Since at the same time all the paths of approach to motility are blocked, the ego is also able to reduce the expenditure by which at other times it maintains the repressions. The unconscious impulse makes use of this nocturnal relaxation of repression in order to push its way into consciousness with the dream. But the repressive resistance of the ego is not abolished in sleep but merely reduced. Some of it remains in the shape of a *censorship of dreams* and forbids the unconscious impulse to express itself in the forms which it would properly assume. In consequence of the severity of the censorship of dreams, the latent dream-thoughts are obliged to submit to being altered and softened so as to make the forbidden meaning of the dream unrecognizable. This is the explanation of *dream-distortion*, which accounts for the most striking characteristics of the manifest dream. We are therefore justified in asserting that a dream is the (disguised) fulfilment of a (repressed) wish. It will now be seen that dreams are constructed like a neurotic symptom: they are compromises between the demands of a repressed impulse and the resistance of a censoring force in the ego. Since they have a similar origin they are equally unintelligible and stand in equal need of interpretation.

There is no difficulty in discovering the general function of dreaming. It serves the purpose of fending off, by a kind of soothing action, external or internal stimuli which would tend to arouse the sleeper, and thus of securing sleep against interruption. External stimuli are fended off by being given a new interpretation and by being woven into some harmless situation; internal stimuli, caused by instinctual demands, are given free play by the sleeper and allowed to find satisfaction in the formation of dreams, so long as the latent dream-thoughts submit to the control of the censorship. But if they threaten to break free and the meaning of the dream becomes too plain, the sleeper cuts short the dream and wakes in a fright. (Dreams of this class are known as *anxiety-dreams*.) A similar failure in the function of dreaming occurs if an external stimulus becomes too strong to be fended off. (This is the class of *arousal-dreams*.) I have given the name of *dream-work* to the process which, with the co-operation of the censorship, converts the latent thoughts into the manifest content of the dream. It consists of a peculiar way of treating the preconscious material of thought, so that its component parts become *condensed*, its psychical emphasis becomes *displaced*, and the whole of it is translated into visual images or *dramatized*, and completed by a deceptive *secondary revision*. The dream-work is an excellent example of the processes occurring in the deeper, unconscious layers of the mind, which differ considerably from the familiar normal processes of thought. It also displays a number of archaic characteristics, such as the use of a *symbolism* (in this case of a predominantly sexual kind) which it has since also been possible to discover in other spheres of mental activity.
Still more remarkable is the other process - displacement or shifting of accent - which in conscious thinking we come across only as faulty reasoning or as means for a joke. The different ideas in the dream-thoughts are, indeed, not all of equal value; they are cathected with quotas of affect of varying magnitude and are correspondingly judged to be important and deserving of interest to a greater or less degree. In the dream-work these ideas are separated from the affects attaching to them. The affects are dealt with independently; they may be displaced on to something else, they may be retained, they may undergo alterations, or they may not appear in the dream at all. The importance of the ideas that have been stripped of their affect returns in the dream as sensory strength in the dream-pictures; but we observe that this accent has passed over from important elements to indifferent ones. Thus something that played only a minor part in the dream-thoughts seems to be pushed into the foreground in the dream as the main thing, while, on the contrary, what was the essence of the dream-thoughts finds only passing and indistinct representation in the dream. No other part of the dream-work is so much responsible for making the dream strange and incomprehensible to the dreamer. Displacement is the principal means used in the dream-distortion to which the dream-thoughts must submit under the influence of the censorship.

[1933a, 4633]

For I think my hypothesis - that, in order to gain control over fire, men had to renounce the homosexually-tinged desire to put it out with a stream of urine - can be confirmed by an interpretation of the Greek myth of Prometheus, provided that we bear in mind the distortions which must be expected to occur in the transition from facts to the contents of a myth. These distortions are of the same sort as, and no worse than, those which we acknowledge every day, when we reconstruct from patients' dreams the repressed but extremely important experiences of their childhood. The mechanisms employed in the distortions I have in mind are symbolic representation and turning into the opposite. I should not venture to explain all the features of our myth in this fashion; apart from the original set of facts, other and later occurrences may have contributed to its content. But the elements which admit of analytic interpretation are, after all, the most striking and important - viz. the manner in which Prometheus transported the fire, the character of his act (an outrage, a theft, a defrauding of the gods) and the meaning of his punishment.

[1932a, 4781]

To begin with, I naturally understood no more about my patients' dreams than the dreamers did themselves. But by applying to these dreams, and more particularly to my own dreams, the procedure which I had already used for the study of other abnormal psychological structures, I succeeded in answering most of the questions which could be raised by an interpretation of dreams. There were many such questions: What do we dream about? Why do we dream at all? What is the origin of all the strange characteristics which distinguish dreams from waking life? - and many more such questions besides. Some of the answers were easily given and turned out to confirm views that had already been put forward; but others involved completely new hypotheses with regard to the structure and functioning of the apparatus of the mind. People dream about the things that have engaged their minds during the waking day. People dream in order to allay impulses that seek to disturb sleep, and in order to be able to sleep on. But why was it possible for dreams to present such a strange appearance, so confusedly senseless, so obviously contrasted with the content of waking thought, in spite of being concerned with the same material? There could be no doubt that dreams were only a substitute for a rational process of thought and could be interpreted - that is to say, translated into a rational process. But what needed explaining was the fact of the distortion which the dream-work had carried out upon the rational and intelligible material.

[1932c, 4808]
Dream-distortion was the profoundest and most difficult problem of dream life. And light was thrown on it by the following consideration, which placed dreams in a class along with other psychopathological formations and revealed them, as it were, as the normal psychoses of human beings. For our mind, that precious instrument by whose means we maintain ourselves in life, is no peacefully self-contained unity. It is rather to be compared with a modern State in which a mob, eager for enjoyment and destruction, has to be held down forcibly by a prudent superior class. The whole flux of our mental life and everything that finds expression in our thoughts are derivations and representatives of the multifarious instincts that are innate in our physical constitution. But these instincts are not all equally susceptible to direction and education, or equally ready to fall in with the demands of the external world and of human society. A number of them have retained their primitive, ungovernable nature; if we let them have their way, they would infallibly bring us to ruin. Consequently, learning by experience, we have developed organizations in our mind which, in the form of inhibitions, set themselves up against the direct manifestations of the instincts. Every impulse in the nature of a wish that arises from the sources of instinctual energy must submit itself to examination by the highest agencies of our mind, and, if it is not approved, is rejected and restrained from exercising any influence upon our movements - that is, from coming into execution. Often enough, indeed, such wishes are even forbidden to enter consciousness, which is habitually unaware even of the existence of these dangerous instinctual sources. We describe such impulses as being repressed from the point of view of consciousness, and as surviving only in the unconscious. If what is repressed contrives somehow to force its way into consciousness or into movement or into both, we are no longer normal: at that point the whole range of neurotic and psychotic symptoms arise. The maintenance of the necessary inhibitions and repressions imposes upon our mind a great expenditure of energy, from which it is glad to be relieved. A good opportunity for this seems to be offered at night by the state of sleep, since sleep involves a cessation of our motor functions. The situation seems safe, and the severity of our internal police-force may therefore be relaxed. It is not entirely withdrawn, since one cannot be certain: it may be that the unconscious never sleeps at all. And now the reduction of pressure upon the repressed unconscious produces its effect. Wishes arise from it which during sleep might find the entrance to consciousness open. If we were to know them we should be appalled, alike by their subject-matter, their unrestraint and indeed the mere possibility of their existence. This, however, occurs only seldom, and when it does we awake as speedily as possible, in a state of fear. But as a rule our consciousness does not experience the dream as it really was. It is true that the inhibitory forces (the dream censorship, as we may call them) are not completely awake, but neither are they wholly asleep. They have had an influence on the dream while it was struggling to find an expression in words and pictures, they have got rid of what was most objectionable, they have altered other parts of it till they are unrecognizable, they have severed real connections while introducing false ones, until the honest but brutal wishful phantasy which lay behind the dream has turned into the manifest dream as we remember it - more or less confused and almost always strange and incomprehensible. Thus the dream (or the distortion which characterizes it) is the expression of a compromise, the evidence of a conflict between the mutually incompatible impulses and strivings of our mental life. And do not let us forget that the same process, the same interplay of forces, which explains the dreams of a normal sleeper, gives us the key to understanding all the phenomena of neurosis and psychosis.

[1932c, 4809]
Now, if we leave psychological terminology out of account, this was the very same explanation of dream-distortion that I had arrived at from my study of dreams. Distortion was a compromise, something in its very nature disingenuous, the product of a conflict between thought and feeling, or, as I had put it, between what is conscious and what is repressed. Where a conflict of this kind was not present and repression was unnecessary, dreams could not be strange or senseless. The man who dreamed in a way no different from that in which he thought while awake was granted by Popper the very condition of internal harmony which, as a social reformer, he aimed at producing in the body politic. And if Science informs us that such a man, wholly without evil and falseness and devoid of all repressions, does not exist and could not survive, yet we may guess that, so far as an approximation to this ideal is possible, it had found its realization in the person of Popper himself.

[1932c, 4810]

We find our way to the understanding ('interpretation') of a dream by assuming that what we recollect as the dream after we have woken up is not the true dream-process but only a façade behind which that process lies concealed. Here we have our distinction between the manifest content of a dream and the latent dream-thoughts. The process which produces the former out of the latter is described as the dream-work. The study of the dream-work teaches us by an excellent example the way in which unconscious material from the id (originally unconscious and repressed unconscious alike) forces its way into the ego, becomes preconscious and, as a result of the ego’s opposition, undergoes the changes which we know as dream-distortion. There are no features of a dream which cannot be explained in this way.

[1940a [1938], 4975]

It is familiar ground that the work of analysis aims at inducing the patient to give up the repressions (using the word in the widest sense) belonging to his early development and to replace them by reactions of a sort that would correspond to a psychically mature condition. With this purpose in view he must be brought to recollect certain experiences and the affective impulses called up by them which he has for the time being forgotten. We know that his present symptoms and inhibitions are the consequences of repressions of this kind: thus that they are a substitute for these things that he has forgotten. What sort of material does he put at our disposal which we can make use of to put him on the way to recovering the lost memories? All kinds of things. He gives us fragments of these memories in his dreams, invaluable in themselves but seriously distorted as a rule by all the factors concerned in the formation of dreams. Again, he produces ideas, if he gives himself up to ‘free association’, in which we can discover allusions to the repressed experiences and derivatives of the suppressed affective impulses as well as of the reactions against them. And, finally, there are hints of repetitions of the affects belonging to the repressed material to be found in actions performed by the patient, some fairly important, some trivial, both inside and outside the analytic situation. Our experience has shown that the relation of transference, which becomes established towards the analyst, is particularly calculated to favour the return of these emotional connections. It is out of such raw material - if we may so describe it - that we have to put together what we are in search of.

[1937d, 5050]
The fact that the phenomena of censorship and of dream-distortion correspond down to their smallest details justifies us in presuming that they are similarly determined. We may therefore suppose that dreams are given their shape in individual human beings by the operation of two psychical forces (or we may describe them as currents or systems); and that one of these forces constructs the wish which is expressed by the dream, while the other exercises a censorship upon this dream-wish and, by the use of that censorship, forcibly brings about a distortion in the expression of the wish. It remains to enquire as to the nature of the power enjoyed by this second agency which enables it to exercise its censorship. When we bear in mind that the latent dream-thoughts are not conscious before an analysis has been carried out, whereas the manifest content of the dream is consciously remembered, it seems plausible to suppose that the privilege enjoyed by the second agency is that of permitting thoughts to enter consciousness. Nothing, it would seem, can reach consciousness from the first system without passing the second agency; and the second agency allows nothing to pass without exercising its rights and making such modifications as it thinks fit in the thought which is seeking admission to consciousness. Incidentally, this enables us to form a quite definite view of the 'essential nature' of consciousness: we see the process of a thing becoming conscious as a specific psychical act, distinct from and independent of the process of the formation of a presentation or idea; and we regard consciousness as a sense organ which perceives data that arise elsewhere. It can be demonstrated that these basic assumptions are absolutely indispensable to psychopathology. We must, however, postpone our further consideration of them to a later stage.

[1900a, 639]

If this picture of the two psychical agencies and their relation to consciousness is accepted, there is a complete analogy in political life to the extraordinary affection which I felt in my dream for my friend R., who was treated with such contumely during the dream's interpretation. Let us imagine a society in which a struggle is in process between a ruler who is jealous of his power and an alert public opinion. The people are in revolt against an unpopular official and demand his dismissal. But the autocrat, to show that he need take no heed of the popular wish, chooses that moment for bestowing a high distinction upon the official, though there is no other reason for doing so. In just the same way my second agency, which commands the approaches to consciousness, distinguished my friend R. by a display of excessive affection simply because the wishful impulses belonging to the first system, for particular reasons of their own on which they were intent at the moment, chose to condemn him as a simpleton.¹

[1900a, 640]

But our interest in the genesis of these manifestly immoral dreams is greatly reduced when we find from analysis that the majority of dreams - innocent dreams, dreams without affect and anxiety-dreams - are revealed, when the distortions of the censorship have been undone, as the fulfilments of immoral - egoistic, sadistic, perverse or incestuous - wishful impulses. As in the world of waking life, these masked criminals are far commoner than those with their vizors raised. The straightforward dream of sexual relations with one's mother, which Jocasta alludes to in the Oedipus Rex, is a rarity in comparison with all the multiplicity of dreams which psycho-analysis must interpret in the same sense.

[1925i, 4049]
In the case of our dream we are in a position to indicate the material upon which the misinterpretation is based. The impostor is the dream and the Emperor the dreamer himself; the moralizing purpose of the dream reveals an obscure knowledge of the fact that the latent dream-content is concerned with forbidden wishes that have fallen victim to repression. For the context in which dreams of this sort appear during my analyses of neurotics leaves no doubt that they are based upon memories from earliest childhood. It is only in our childhood that we are seen in inadequate clothing both by members of our family and by strangers - nurses, maidservants, and visitors; and it is only then that we feel no shame at our nakedness.¹ We can observe how undressing has an almost intoxicating effect on many children even in their later years, instead of making them feel ashamed. They laugh and jump about and slap themselves, while their mother, or whoever else may be there, reproves them and says: 'Ugh! Shocking! You mustn't ever do that!' Children frequently manifest a desire to exhibit. One can scarcely pass through a country village in our part of the world without meeting some child of two or three who lifts up his little shirt in front of one - in one's honour, perhaps. One of my patients has a conscious memory of a scene in his eighth year, when at bed-time he wanted to dance into the next room where his little sister slept, dressed in his night-shirt, but was prevented by his nurse. In the early history of neurotics an important part is played by exposure to children of the opposite sex; in paranoia delusions of being observed while dressing and undressing are to be traced back to experiences of this kind; while among persons who have remained at the stage of perversion there is one class in which this infantile impulse has reached the pitch of a symptom - the class of 'exhibitionists'.

¹ [1900a, 723]

We are here interested only in the essential dream-thoughts. These usually emerge as a complex of thoughts and memories of the of the most intricate possible structure, with all the attributes of the trains of thought familiar to us in waking life. They are not infrequently trains of thought starting out from more than one centre, though having points of contact. Each train of thought is almost invariably accompanied by its contradictory counterpart, linked with it by antithetical association.

¹ [1900a, 782]
I will now try to sum up this lengthy disquisition on the dream-work. We were faced by the question whether the mind employs the whole of its faculties without reserve in constructing dreams or only a functionally restricted fragment of them. Our investigations led us to reject entirely the form in which the question was framed as being inadequate to the circumstances. If, however, we had to reply to the question on the basis of the terms in which it was stated, we should be obliged to reply in the affirmative to both the alternatives, mutually exclusive though they appear to be. Two separate functions may be distinguished in mental activity during the construction of a dream: the production of the dream-thoughts, and their transformation into the content of the dream. The dream-thoughts are entirely rational and are constructed with an expenditure of all the psychical energy of which we are capable. They have their place among thought-processes that have not become conscious - processes from which, after some modification, our conscious thoughts, too, arise. However many interesting and puzzling questions the dream-thoughts may involve, such questions have, after all, no special relation to dreams and do not call for treatment among the problems of dreams.¹ On the other hand, the second function of mental activity during dream-construction, the transformation of the unconscious thoughts into the content of the dream, is peculiar to dream-life and characteristic of it. This dream-work proper diverges further from our picture of waking thought than has been supposed even by the most determined depreciator of psychical functioning during the formation of dreams. The dream-work is not simply more careless, more irrational, more forgetful and more incomplete than waking thought; it is completely different from it qualitatively and for that reason not immediately comparable with it. It does not think, calculate or judge in any way at all; it restricts itself to giving things a new form. It is exhaustively described by an enumeration of the conditions which it has to satisfy in producing its result. That product, the dream, has above all to evade the censorship, and with that end in view the dream-work makes use of a displacement of psychical intensities to the point of a transvaluation of all psychical values. The thoughts have to be reproduced exclusively or predominantly in the material of visual and acoustic memory-traces, and this necessity imposes upon the dream-work considerations of representability which it meets by carrying out fresh displacements. Greater intensities have probably to be produced than are available in the dream-thoughts at night, and this purpose is served by the extensive condensation which is carried out with the constituents of the dream-thoughts. Little attention is paid to the logical relations between the thoughts; those relations are ultimately given a disguised representation in certain formal characteristics of dreams. Any affect attached to the dream-thoughts undergoes less modification than their ideational content. Such affects are as a rule suppressed; when they are retained, they are detached from the ideas that properly belong to them, affects of a similar character being brought together. Only a single portion of the dream-work and one which operates to an irregular degree, the working over of the material by partly aroused waking thought, tallies to some extent with the view which other writers have sought to apply to the entire activity of dream-construction.

[1900a, 944]
¹ [Footnote added 1925:] I used at one time to find it extraordinarily difficult to accustom readers to the distinction between the manifest content of dreams and the latent dream-thoughts. Again and again arguments and objections would be brought up based upon some uninterpreted dream in the form in which it had been retained in the memory, and the need to interpret it would be ignored. But now that analysts at least have become reconciled to replacing the manifest dream by the meaning revealed by its interpretation, many of them have become guilty of falling into another confusion which they cling to with equal obstinacy. They seek to find the essence of dreams in their latent content and in so doing they overlook the distinction between the latent dream-thoughts and the dream-work. At bottom, dreams are nothing other than a particular form of thinking, made possible by the conditions of the state of sleep. It is the dream-work which creates that form, and it alone is the essence of dreaming - the explanation of its peculiar nature. I say this in order to make it possible to assess the value of the notorious 'prospective purpose' of dreams. The fact that dreams concern themselves with attempts at solving the problems by which our mental life is faced is no more strange than that our conscious waking life should do so; beyond this it merely tells us that that activity can also be carried on in the preconscious - and this we already knew.

[1900a, 944]

We have thus been able to find a place in our structure for the most various and contradictory findings of earlier writers, thanks to the novelty of our theory of dreams, which combines them, as it were, into a higher unity. Some of those findings we have put to other uses, but we have wholly rejected only a few. Nevertheless our edifice is still uncompleted. Apart from the many perplexing questions in which we have become involved in making our way into the obscurities of psychology, we seem to be troubled by a fresh contradiction. On the one hand we have supposed that the dream-thoughts arise through entirely normal mental activity; but on the other hand we have discovered a number of quite abnormal processes of thought among the dream-thoughts, which extend into the dream-content, and which we then repeat in the course of our dream-interpretation. Everything that we have described as the 'dream-work' seems to depart so widely from what we recognize as rational thought-processes that the most severe strictures passed by earlier writers on the low level of psychical functioning in dreams must appear fully justified.

[1900a, 1019]
A dream, as we have discovered, takes the place of a number of thoughts which are derived from our daily life and which form a completely logical sequence. We cannot doubt, then, that these thoughts originate from our normal mental life. All the attributes which we value highly in our trains of thought, and which characterize them as complex achievements of a high order, are to be found once more in dream-thoughts. There is no need to assume, however, that this activity of thought is performed during sleep - a possibility which would gravely confuse what has hitherto been our settled picture of the psychical state of sleep. On the contrary, these thoughts may very well have originated from the previous day, they may have proceeded unobserved by our consciousness from their start, and may already have been completed at the onset of sleep. The most that we can conclude from this is that it proves that the most complicated achievements of thought are possible without the assistance of consciousness - a fact which we could not fail to learn in any case from every psycho-analysis of a patient suffering from hysteria or from obsessional ideas. These dream-thoughts are certainly not in themselves inadmissible to consciousness; there may have been a number of reasons for their not having become conscious to us during the day. Becoming conscious is connected with the application of a particular psychical function, that of attention - a function which, as it seems, is only available in a specific quantity, and this may have been diverted from the train of thought in question on to some other purpose. There is another way, too, in which trains of thought of this kind may be withheld from consciousness. The course of our conscious reflections shows us that we follow a particular path in our application of attention. If, as we follow this path, we come upon an idea which will not bear criticism, we break off: we drop the cathexis of attention. Now it seems that the train of thought which has thus been initiated and dropped can continue to spin itself out without attention being turned to it again, unless at some point or other it reaches a specially high degree of intensity which forces attention to it. Thus, if a train of thought is initially rejected (consciously, perhaps) by a judgement that it is wrong or that it is useless for the immediate intellectual purposes in view, the result may be that this train of thought will proceed, unobserved by consciousness, until the onset of sleep.

These are some of the most striking of the abnormal processes to which the dream-thoughts, previously constructed on rational lines, are subjected in the course of the dream-work. It will be seen that the chief characteristic of these processes is that the whole stress is laid upon making the cathecting energy mobile and capable of discharge; the content and the proper meaning of the psychical elements to which the cathexes are attached are treated as of little consequence. It might have been supposed that condensation and the formation of compromises is only carried out for the sake of facilitating regression, that is, when it is a question of transforming thoughts into images. But the analysis - and still more the synthesis - of dreams which include no such regression to images, e.g. the dream of 'Autodidasker', exhibits the same processes of displacement and condensation as the rest.

Thus we are driven to conclude that two fundamentally different kinds of psychical process are concerned in the formation of dreams. One of these produces perfectly rational dream-thoughts, of no less validity than normal thinking; while the other treats these thoughts in a manner which is in the highest degree bewildering and irrational. We have already in Chapter VI segregated this second psychical process as being the dream-work proper. What light have we now to throw upon its origin?
It would not be possible for us to answer this question if we had not made some headway in the study of the psychology of the neuroses, and particularly of hysteria. We have found from this that the same irrational psychical processes, and others that we have not specified, dominate the production of hysterical symptoms. In hysteria, too, we come across a series of perfectly rational thoughts, equal in validity to our conscious thoughts; but to begin with we know nothing of their existence in this form and we can only reconstruct them subsequently. If they force themselves upon our notice at any point, we discover by analysing the symptom which has been produced that these normal thoughts have been submitted to abnormal treatment: they have been transformed into the symptom by means of condensation and the formation of compromises, by way of superficial associations and in disregard of contradictions, and also, it may be, along the path of regression. In view of the complete identity between the characteristic features of the dream-work and those of the psychical activity which issues in psychoneurotic symptoms, we feel justified in carrying over to dreams the conclusions we have been led to by hysteria.

[1900a, 1024]

At the point which I have now reached, I am led to regard the dream as a sort of substitute for the thought-processes, full of meaning and emotion, at which I arrived after the completion of the analysis. We do not yet know the nature of the process which has caused the dream to be generated from these thoughts, but we can see that it is wrong to regard it as purely physical and without psychical meaning, as a process which has arisen from the isolated activity of separate groups of brain cells aroused from sleep.

[1901a, 1058]

I should, of course, not draw such far-reaching conclusions if only a single dream-analysis was at my disposal. If experience shows me, however, that by uncritically pursuing the associations arising from any dream I can arrive at a similar train of thoughts, among the elements of which the constituents of the dream re-appear and which are interconnected in a rational and intelligible manner, then it will be safe to disregard the slight possibility that the connections observed in a first experiment might be due to chance. I think I am justified, therefore, in adopting a terminology which will crystallize our new discovery. In order to contrast the dream as it is retained in my memory with the relevant material discovered by analysing it, I shall speak of the former as the 'manifest content of the dream' and the latter - without, in the first instance, making any further distinction - as the 'latent content of the dream.' I am now faced by two new problems which have not hitherto been formulated. (1) What is the psychical process which has transformed the latent content of the dream into the manifest one which is known to me from my memory? (2) What are the motive or motives which have necessitated this transformation? I shall describe the process which transforms the latent into the manifest content of dreams as the 'dream-work.' The counterpart to this activity - one which brings about a transformation in the opposite direction - is already known to us as the work of analysis. The remaining problems arising out of dreams - questions as to the instigators of dreams, as to the origin of their material, as to their possible meaning, as to the possible function of dreaming, and as to the reasons for dreams being forgotten - all these problems will be discussed by me on the basis, not of the manifest, but of the newly discovered latent dream-content. Since I attribute all the contradictory and incorrect views upon dream-life which appear in the literature of the subject to ignorance of the latent content of dreams as revealed by analysis, I shall be at the greatest pains henceforward to avoid confusing the manifest dream with the latent dream-thoughts.

[1901a, 1059]
The dream-thoughts which we arrive at by means of analysis reveal themselves as a psychical complex of the most intricate possible structure. Its portions stand in the most manifold logical relations to one another: they represent foreground and background, conditions, digressions and illustrations, chains of evidence and counter-arguments. Each train of thought is almost invariably accompanied by its contradictory counterpart. This material lacks none of the characteristics that are familiar to us from our waking thinking. If now all of this is to be turned into a dream, the psychical material will be submitted to a pressure which will condense it greatly, to an internal fragmentation and displacement which will, as it were, create new surfaces, and to a selective operation in favour of those portions of it which are the most appropriate for the construction of situations. If we take into account the genesis of the material, a process of this sort deserves to be described as a 'regression.' In the course of this transformation, however, the logical links which have hitherto held the psychical material together are lost. It is only, as it were, the substantive content of the dream-thoughts that the dream-work takes over and manipulates. The restoration of the connections which the dream-work has destroyed is a task which has to be performed by the work of analysis.

[1901a, 1075]

The dream-work exhibits no activities other than the four that have already been mentioned. If we keep to the definition of 'dream-work' as the process of transforming the dream-thoughts into the dream-content, it follows that the dream-work is not creative, that it develops no phantasies of its own, that it makes no judgements and draws no conclusions; it has no functions whatever other than condensation and displacement of the material and its modification into pictorial form, to which must be added as a variable factor the final bit of interpretative revision. It is true that we find various things in the dream-content which we should be inclined to regard as a product of some other and higher intellectual function; but in every case analysis shows convincingly that these intellectual operations have already been performed in the dream-thoughts and have only been TAKEN OVER by the dream-content. A conclusion drawn in a dream is nothing other than the repetition of a conclusion in the dream-thoughts; if the conclusion is taken over into the dream unmodified, it will appear impeccable; if the dream-work has displaced it on to some other material, it will appear nonsensical. A calculation in the dream-content signifies nothing more than that there is a calculation in the dream-thoughts; but while the latter is always rational, a dream-calculation may produce the wildest results if its factors are condensed or if its mathematical operations are displaced on to other material. Not even the speeches that occur in the dream-content are original compositions; they turn out to be a hotchpotch of speeches made, heard or read, which have been revived in the dream-thoughts and whose wording is exactly reproduced, while their origin is entirely disregarded and their meaning is violently changed.

[1901a, 1082]
The heart of the problem lies in displacement, which is by far the most striking of the special achievements of the dream-work. If we enter deeply into the subject, we come to realize that the essential determining condition of displacement is a purely psychological one: something in the nature of a motive. One comes upon its track if one takes into consideration certain experiences which one cannot escape in analysing dreams. In analysing my specimen dream I was obliged to break off my report of the dream-thoughts on p. 1059, because, as I confessed, there were some among them which I should prefer to conceal from strangers and which I could not communicate to other people without doing serious mischief in important directions. I added that nothing would be gained if I were to choose another dream instead of that particular one with a view to reporting its analysis: I should come upon dream-thoughts which required to be kept secret in the case of every dream with an obscure or confused content. If, however, I were to continue the analysis on my own account, without any reference to other people (whom, indeed, an experience so personal as my dream cannot possibly have been intended to reach), I should eventually arrive at thoughts which would surprise me, whose presence in me I was unaware of, which were not only alien but also disagreeable to me, and which I should therefore feel inclined to dispute energetically, although the chain of thoughts running through the analysis insisted upon them remorselessly. There is only one way of accounting for this state of affairs, which is of quite universal occurrence; and that is to suppose that these thoughts really were present in my mind, and in possession of a certain amount of psychical intensity or energy, but that they were in a peculiar psychological situation, as a consequence of which they could not become conscious to me. (I describe this particular condition as one of ‘repression.’) We cannot help concluding, then, that there is a causal connection between the obscurity of the dream-content and the state of repression (in admissibility to consciousness) of certain of the dream-thoughts, and that the dream had to be obscure so as not to betray the proscribed dream-thoughts. Thus we are led to the concept of a ‘dream-distortion’, which is the product of the dream-work and serves the purpose of dissimulation, that is, of disguise.

If the dream that I analyse is not my own, but someone else’s, the conclusion will be the same, though the grounds for believing it will be different. If the dreamer is a healthy person, there is no other means open to me of obliging him to recognize the repressed ideas that have been discovered than by pointing out the context of the dream-thoughts; and I cannot help it if he refuses to recognize them. If, however, I am dealing with a neurotic patient, with a hysteric for instance, he will find the acceptance of the repressed thought forced upon him, owing to its connection with the symptoms of his illness, and owing to the improvement he experiences when he exchanges those symptoms for the repressed ideas. In the case, for instance, of the woman patient who had the dream I have just quoted about the three theatre tickets which cost 1 florin 50 kreuzers, the analysis led to the inevitable conclusion that she had a low estimate of her husband (cf. her idea that she could have got one ‘a hundred times better’), that she regretted having married him, and that she would have liked to exchange him for another one. It is true that she asserted that she loved her husband, and that her emotional life knew nothing of any such low estimate of him, but all her symptoms led to the same conclusion as the dream. And after her repressed memories had been revived of a particular period during which she had consciously not loved her husband, her symptoms cleared up and her resistance against the interpretation of the dream disappeared.
I have laid it down as the task of dream-interpretation to replace the dream by the latent dream-thoughts, that is, to unravel what the dream-work has woven. In so doing I have raised a number of new psychological problems dealing with the mechanism of this dream-work itself, as well as with the nature and conditions of what is described as repression; on the other hand I have asserted the existence of the dream-thoughts - a copious store of psychical structures of the highest order, which is characterized by all the signs of normal intellectual functioning, but is nevertheless withdrawn from consciousness till it emerges in distorted form in the dream-content. I cannot but assume that thoughts of this kind are present in everyone, since almost everyone, including the most normal people, is capable of dreaming. The unconscious material of the dream-thoughts and its relation to consciousness and to repression raise further questions of significance to psychology, the answers to which must no doubt be postponed until analysis has clarified the origin of other psychopathological structures, such as hysterical symptoms and obsessional ideas.

[1901a, 1098]

In this case the ambiguity of the word 'Beförderung' forms the associative bridge between the two complexes, the unimportant one which was aroused by the newspaper article, and the more interesting but objectionable one which asserted itself here in the form of a disturbance of what was to be read. It can be seen from this example that it is not always easy to explain occurrences such as this mistake in reading. At times one is even forced to postpone solving the problem to a more favourable time. But the harder the work of solving it proves to be, the more certainly can one anticipate that the disturbing thought which is finally disclosed will be judged by our conscious thinking as something alien and opposed to it.

[1901b, 1194]

Are processes similar to those which we have described here as the technique of jokes known already in any other field of mental events? They are - in a single field, and an apparently very remote one. In 1900 I published a book which, as its title (The Interpretation of Dreams) indicates, attempted to throw light on what is puzzling in dreams and to establish them as derivatives of our normal mental functioning. I found occasion there to contrast the manifest, and often strange, content of the dream with the latent, but perfectly logical, dream-thoughts from which the dream is derived; and I entered into an investigation of the processes which make the dream out of the latent dream-thoughts, as well as of the psychical forces which are involved in that transformation. To the totality of these transforming processes I gave the name of the 'dream-work'; and I have described as a part of this dream-work a process of condensation which shows the greatest similarity to the one found in the technique of jokes - which, like it, leads to abbreviation, and creates substitute-formations of the same character. Everyone will be familiar, from a recollection of his own dreams, with the composite structures both of people and of things which emerge in dreams. Indeed, dreams even construct them out of words, and they can then be dissected in analysis. (For instance, 'Autodidasker' = 'Autodidakt' + 'Lasker'.) On other occasions - much more often, in fact - what the work of condensation in dreams produces is not composite structures but pictures which exactly resemble one thing or one person except for an addition or alteration derived from another source - modifications, that is, just like those in Herr N.'s jokes. We cannot doubt that in both cases we are faced by the same psychical process, which we may recognize from its identical results. Such a far-reaching analogy between the technique of jokes and the dream-work will undoubtedly increase our interest in the former and raise an expectation in us that a comparison between jokes and dreams may help to throw light on jokes. But we will refrain from entering upon this task, for we must reflect that so far we have investigated the technique of only a very small number of jokes, so that we cannot tell whether the analogy by which we are proposing to be guided will in fact hold good. We will therefore turn away from the comparison with dreams and go back to the technique of jokes, though at this point we shall, as it were, be leaving a loose end to our enquiry, which at some later stage we may perhaps pick up once more.

[1905c, 1634]
Can we feel sure that none of the possible techniques of jokes has escaped our investigation? Of course not. But a continued examination of fresh material can convince us that we have got to know the commonest and most important technical methods of the joke-work - at all events as much as is required for forming a judgement on the nature of that psychical process. So far we have not arrived at any such judgement; but on the other hand we are now in possession of an important indication of the direction from which we may expect to receive further light upon the problem. The interesting processes of condensation accompanied by the formation of a substitute, which we have recognized as the core of the technique of verbal jokes, point towards the formation of dreams, in the mechanism of which the same psychical processes have been discovered. This is equally true, however, of the techniques of conceptual jokes - displacement, faulty reasoning, absurdity, indirect representation, representation by the opposite - which re-appear one and all in the technique of the dream-work. Displacement is responsible for the puzzling appearance of dreams, which prevents our recognizing that they are a continuation of our waking life. The use of absurdity and nonsense in dreams has cost them the dignity of being regarded as psychical products and has led the authorities to suppose that a disintegration of the mental activities and a cessation of criticism, morality and logic are necessary conditions of the formation of dreams. Representation by the opposite is so common in dreams that even the popular books of dream-interpretation, which are on a completely wrong tack, are in the habit of taking it into account. Indirect representation - the replacement of a dream-thought by an allusion, by something small, a symbolism akin to analogy - is precisely what distinguishes the mode of expression of dreams from that of our waking life.¹ So far-reaching an agreement between the methods of the joke-work and those of the dream-work can scarcely be a matter of chance. To demonstrate this agreement in detail and to examine its basis will be one of our later tasks.

[1905c, 1686]
Let us recall all that we have heard about the nature and origin of the phantasies which are the precursors of delusions. They are substitutes for and derivatives of repressed memories which a resistance will not allow to enter consciousness unaltered, but which can purchase the possibility of becoming conscious by taking account, by means of changes and distortions, of the resistance's censorship. When this compromise has been accomplished, the memories have turned into the phantasies, which can easily be misunderstood by the conscious personality - that is, understood so as to fit in with the dominant psychical current. Now let us suppose that dream-images are what might be described as the creations of people's physiological delusions - the products of the compromise in the struggle between what is repressed and what is dominant which is probably present in every human being, including those who in the day-time are perfectly sound in mind. We shall then understand that dream-images have to be regarded as something distorted, behind which something else must be looked for, something not distorted, but in some sense objectionable, like Hanold's repressed memories behind his phantasies. We can give expression to the contrast which we have thus recognized, by distinguishing what the dreamer remembers when he wakes up as the manifest content of the dream from what constituted the basis of the dream before the distortion imposed by the censorship - namely, the latent dream-thoughts. Thus, interpreting a dream consists in translating the manifest content of the dream into the latent dream-thoughts, in undoing the distortion which the dream-thoughts have had to submit to from the censorship of the resistance. If we apply these notions to the dream we are concerned with, we shall find that its latent dream-thoughts can only have been: 'the girl you are looking for with the graceful gait is really living in this town with you.' But in that form the thought could not become conscious. It was obstructed by the fact that a phantasy had laid it down, as the result of an earlier compromise, that Gradiva was a Pompeian; consequently, if the real fact that she was living in the same place and at the same time was to be affirmed, there was no choice but to adopt the distortion: 'You are living at Pompeii at the time of Gradiva.' This then was the idea which was realized by the manifest content of the dream, and was represented as a present event actually being experienced.

[1907a, 1855]
We would seem to have reached the end. But an attentive reader might remind us that at the beginning we threw out an assertion that dreams are wishes represented as fulfilled and that we gave no proof of this. Well, is our reply, what we have described in these pages might show how little justification there is for trying to cover the explanations we have to give of dreams with the single formula that dreams are wish-fulfilments. Nevertheless the assertion stands and can easily be proved too for the dreams in *Gradiva*. The latent dream-thoughts - we know now what is meant by them - may be of the most various kinds; in *Gradiva* they are 'days' residues', thoughts that have been left over unnoticed and undealt-with from the mental activities of waking life. But in order for a dream to develop out of them, the co-operation of a wish (usually an unconscious one) is required; this contributes the motive force for constructing the dream, while the day's residues provide the material. In Norbert Hanold's first dream two wishes competed with each other in making the dream; one of them was actually admissible to consciousness, while the other belonged to the unconscious and operated from out of repression. The first was a wish, understandable in any archaeologist, to have been present as an eye-witness at the catastrophe in the year 79 A.D. What sacrifice would an archaeologist think too great if this wish could be realized in any way other than in a dream! The other wish, the other constructor of the dream, was of an erotic nature: it might be crudely and also incompletely stated as a wish to be there when the girl he loved lay down to sleep. This was the wish the rejection of which caused the dream to become an anxiety-dream. The wishes that were the motive forces of the second dream are perhaps less conspicuous; but if we recall its translation we shall not hesitate to describe them too as erotic. The wish to be taken captive by the girl he loved, to fall in with her wishes and to be subjected to her - for so we may construe the wish behind the situation of the lizard-catching - was in fact of a passive, masochistic character. Next day the dreamer hit the girl, as though he was dominated by the contrary erotic current . . . But we must stop here, or we may really forget that Hanold and Gradiva are only creatures of their author's mind.

[1907a, 1884]

Psycho-analysis, then, has demonstrated the following facts. All dreams have a meaning. Their strangeness is due to distortions that have been made in the expression of their meaning. Their absurdity is deliberate and expresses derision, ridicule and contradiction. Their incoherence is a matter of indifference for their interpretation. The dream as we remember it after waking is described by us as its 'manifest content'. In the process of interpreting this, we are led to the 'latent dream-thoughts', which lie hidden behind the manifest content and which are represented by it. These latent dream-thoughts are no longer strange, incoherent or absurd; they are completely valid constituents of our waking thought. We give the name of 'dream-work' to the process which transforms the latent dream-thoughts into the manifest content of the dream; it is this dream-work that brings about the distortion which makes the dream-thoughts unrecognizable in the content of the dream.

[1913], 2807]

I am also aware that we are not yet able to make a survey of the whole of the new acquisitions which these studies have brought to psychology. I will only point out the fresh proofs they have provided of the existence of unconscious mental acts - for this is what the latent dream-thoughts are - and what an unimaginably broad access to a knowledge of unconscious mental life we are promised by the interpretation of dreams.

[1916-1917, 3274]
LADIES AND GENTLEMEN, - Let us start out once more from the conclusion we arrived at that
the dream-work, under the influence of the dream-censorship, transposes the latent dream-
thoughts into a different mode of expression. The latent thoughts do not differ from our familiar
conscious thoughts of waking life. The new mode of expression is incomprehensible to us owing
to many of its features. We have said that it harks back to states of our intellectual development
which have long since been superseded - to picture-language, to symbolic connections, to
conditions, perhaps, which existed before our thought-language had developed. We have on
that account described the mode of expression of the dream-work as archaic or regressive.
[1916-1917, 3289]

As the outcome of our whole enquiry, let us grasp two discoveries, though they only signify
the beginning of fresh enigmas and fresh doubts. First, the regression of the dream-work is not
only a formal but also a material one. It not only translates our thoughts into a primitive form of
expression; but it also revives the characteristics of our primitive mental life - the old dominance
of the ego, the initial impulses of our sexual life, and even, indeed, our old intellectual
endowment, if symbolic connections may be regarded as such. And secondly, all this, which is
old and infantile and was once dominant and alone dominant, must to-day be ascribed to the
unconscious, our ideas of which are now becoming altered and extended. 'Unconscious' is no
longer the name of what is latent at the moment; the unconscious is a particular realm of the
mind with its own wishful impulses, its own mode of expression and its peculiar mental
mechanisms which are not in force elsewhere. But the latent dream-thoughts which we have
discovered by interpreting dreams do not belong to this realm; they are on the contrary thoughts
just as we might have thought them in waking life. Nevertheless, they are unconscious. How,
then, is this contradiction to be solved? We begin to suspect that a distinction is to be drawn
here. Something which is derived from our conscious life and shares its characteristics - we call
it 'the day's residues' - combines with something else coming from the realm of the unconscious
in order to construct a dream. The dream-work is accomplished between these two
components. The influence exercised upon the day's residues by the addition of the
unconscious is no doubt among the determinants of regression. This is the deepest insight that
we can reach here into the essential nature of dreams - until we have investigated further
regions of the mind. But the time will soon have come to provide another name for the
unconscious character of the latent dream-thoughts in order to distinguish it from the
unconscious which comes from the realm of the infantile.
[1916-1917, 3299]

I do it because I will not allow a foolish misunderstanding to pass which may rob us of the fruit
of our efforts with dreams - a misunderstanding which confuses the dream with the latent
dream-thoughts, and asserts of the former something that applies solely to the latter. For it is
quite correct to say that a dream can represent and be replaced by everything you have just
enumerated - an intention, a warning, a reflection, a preparation, an attempt at solving a
problem, and so on. But if you look properly, you will see that all this only applies to the latent
dream-thoughts, which have been transformed into the dream. You learn from interpretations of
dreams that people's unconscious thinking is concerned with these intentions, preparations,
reflections, and so on, out of which the dream-work then makes the dreams. If at the moment
you are not interested in the dream-work, but are greatly interested in people's unconscious
thought-activity, you then eliminate the dream-work and say of the dream what is in practice
quite correct that it corresponds to a warning, an intention, and so on, what often happens in
psycho-analytic activity is that our efforts are chiefly directed only to doing away with the dream-
form and inserting in the context instead of it the latent thoughts out of which the dream was
made.
[1916-1917, 3310]
The only essential thing about dreams is the dream-work that has influenced the thought-material. We have no right to ignore it in our theory, even though we may disregard it in certain practical situations. Analytic observation shows further that the dream-work never restricts itself to translating these thoughts into the archaic or regressive mode of expression that is familiar to you. In addition, it regularly takes possession of something else, which is not part of the latent thoughts of the previous day, but which is the true motive force for the construction of the dream. This indispensable addition is the equally unconscious wish for the fulfilment of which the content of the dream is given its new form. A dream may thus be any sort of thing in so far as you are only taking into account the thoughts it represents - a warning, an intention, a preparation, and so on; but it is always also the fulfilment of an unconscious wish and, if you are considering it as a product of the dream-work, it is only that. A dream is therefore never simply an intention, or a warning, but always an intention, etc., translated into the archaic mode of thought by the help of an unconscious wish and transformed to fulfil that wish. The one characteristic, the wish-fulfilment, is the invariable one; the other may vary. It may for its part once more be a wish, in which case the dream will, with the help of an unconscious wish, represent as fulfilled a latent wish of the previous day.

[1916-1917, 3311]

The fresh consideration I wish to bring before you is to draw your attention to the latent dream-thoughts which have now been put in the foreground. I beg you not to forget that in the first place they are unconscious to the dreamer, and secondly that they are completely rational and coherent so that they can be understood as natural reactions to the precipitating cause of the dream, and thirdly that they can be the equivalent of any mental impulse or intellectual operation. I shall now describe these thoughts more strictly than before as the 'day's residues', whether the dreamer confesses to them or not. I shall now distinguish between the day's residues and the latent dream-thoughts, and, in conformity with our earlier usage, I shall designate as latent dream-thoughts everything we learn in interpreting the dream, whereas the day's residues are only a portion of the latent dream-thoughts. Our view is then that something is added to the day's residues, something that was also part of the unconscious, a powerful but repressed wishful impulse; and it is this alone that makes the construction of the dream possible. The influence of this wishful impulse on the day's residues creates the further portion of the latent dream-thoughts - that which need no longer appear rational and intelligible as being derived from waking life.

[1916-1917, 3313]

(3) I can well imagine that you will be especially impressed when you hear that objections to our view of dreams have even been made by people who have themselves, as psycho-analysts, been engaged for a considerable time in interpreting dreams. It would have been too much to expect that such an abundant encouragement to fresh errors as this theory offers should have been neglected; and so, as a result of conceptual confusions and unjustified generalizations, assertions have been made which are not far behind the medical view of dreams in their incorrectness. You know one of them already. It tells us that dreams are concerned with attempts at adaptation to present conditions and with attempts at solving future problems - that they have a 'prospective purpose' (Maeder). We have already shown that this assertion is based on a confusion between the dream and the latent dream-thoughts and is therefore based on disregarding the dream-work. As a characterization of the unconscious intellectual activity of which the latent dream-thoughts form part, it is on the one hand no novelty and on the other not exhaustive, since unconscious intellectual activity is occupied with many other things besides preparing for the future. A far worse confusion seems to underlie the assurance that the idea of death will be found behind every dream. I am not clear exactly what is meant by this formula. But I suspect that it conceals a confusion between the dream and the dreamer's whole personality.

[1916-1917, 3322]
And now I have reached the point I wish to put before you. We have endeavoured to maintain the strictest impartiality and have allowed two conceptions of the dream to rank as equally probable and equally unproved. According to the first the dream is a reaction to a telepathic message: 'your daughter has just brought twins into the world.' According to the second an unconscious process of thought underlies the dream, which may be reproduced somewhat as follows: 'To-day is the day the confinement should take place if the young people in Berlin are really out in their reckoning by a month, as I suspect. And if my (first) wife were still alive, she certainly would not be content with one grandchild. To please her there would have to be at least twins!' If this second view is right, no new problems arise. It is simply a dream like any other. The (preconscious) dream-thoughts as outlined above are reinforced by the (unconscious) wish that no other than the daughter should be the dreamer's second wife, and thus the manifest dream as described to us arises.

[1922a, 3886]

_The Interpretation of Dreams._ - A new approach to the depths of mental life was opened when the technique of free association was applied to dreams, whether one's own or those of patients in analysis. In fact, the greater and better part of what we know of the processes in the unconscious levels of the mind is derived from the interpretation of dreams. Psycho-analysis has restored to dreams the importance which was generally ascribed to them in ancient times, but it treats them differently. It does not rely upon the cleverness of the dream-interpreter but for the most part hands the task over to the dreamer himself by asking him for his associations to the separate elements of the dream. By pursuing these associations further we obtain knowledge of thoughts which coincide entirely with the dream but which can be recognized - up to a certain point - as genuine and completely intelligible portions of waking mental activity. Thus the recollected dream emerges as the _manifest dream content_, in contrast to the _latent dream-thoughts_ discovered by interpretation. The process which has transformed the latter into the former, that is to say into 'the dream', and which is undone by the work of interpretation, may be called the _dream-work_.

[1923a, 3917]

What conclusions can one draw from a correctly translated dream? I have an impression that analytic practice has not always avoided errors and over-estimations on this point, partly owing to an exaggerated respect for the 'mysterious unconscious'. It is only too easy to forget that a dream is as a rule merely a thought like any other, made possible by a relaxation of the censorship and by unconscious reinforcement, and distorted by the operation of the censorship and by unconscious revision.

[1923c, 4033]

But from here our interest proceeds to the question whether the latent dream-thoughts that have to be arrived at by interpretation can also be influenced or suggested by the analyst. And to this the answer must once more be that they obviously can be. For a portion of these latent dream-thoughts correspond to preconscious thought-formations, perfectly capable of being conscious, with which the dreamer might quite well have reacted to the physician's remarks in his waking state too - whether the patient's reactions were in harmony with those remarks or in opposition to them. In fact, if we replace the dream by the dream-thoughts which it contains, the question of how far one can suggest dreams coincides with the more general question of how far a patient in analysis is accessible to suggestion.

[1923c, 4035]
With the help of the method of free association and of the related art of interpretation, psychoanalysis succeeded in achieving one thing which appeared to be of no practical importance but which in fact necessarily led to a totally fresh attitude and a fresh scale of values in scientific thought. It became possible to prove that dreams have a meaning, and to discover it. In classical antiquity great importance was attached to dreams as foretelling the future; but modern science would have nothing to do with them, it handed them over to superstition, declaring them to be purely 'somatic' processes - a kind of twitching of a mind that is otherwise asleep. It seemed quite inconceivable that anyone who had done serious scientific work could make his appearance as an 'interpreter of dreams'. But by disregarding the excommunication pronounced upon dreams, by treating them as unexplained neurotic symptoms, as delusional or obsessional ideas, by neglecting their apparent content and by making their separate component images into subjects for free association, psycho-analysis arrived at a different conclusion. The numerous associations produced by the dreamer led to the discovery of a thought-structure which could no longer be described as absurd or confused, which ranked as a completely valid psychical product, and of which the manifest dream was no more than a distorted, abbreviated, and misunderstood translation, and for the most part a translation into visual images. These latent dream-thoughts contained the meaning of the dream, while its manifest content was simply a make-believe, a façade, which could serve as a starting-point for the associations but not for the interpretation.

There were now a whole series of questions to be answered, among the most important of them being whether the formation of dreams had a motive, under what conditions it took place, by what methods the dream-thoughts (which are invariably full of sense) become converted into the dream (which is often senseless), and others besides. I attempted to solve all of these problems in The Interpretation of Dreams, which I published in the year 1900. I can only find space here for the briefest abstract of my investigation. When the latent dream-thoughts that are revealed by the analysis of a dream are examined, one of them is found to stand out from among the rest, which are intelligible and well known to the dreamer. These latter thoughts are residues of waking life (the day's residues, as they are called technically); but the isolated thought is found to be a wishful impulse, often of a very repellent kind, which is foreign to the waking life of the dreamer and is consequently disavowed by him with surprise or indignation. This impulse is the actual constructor of the dream: it provides the energy for its production and makes use of the day's residues as material. The dream which thus originates represents a situation of satisfaction for the impulse, it is the fulfilment of its wish. It would not be possible for this process to take place without being favoured by the presence of something in the nature of a state of sleep. The necessary mental precondition of sleep is the concentration of the ego upon the wish to sleep and the withdrawal of psychical energy from all the interests of life. Since at the same time all the paths of approach to motility are blocked, the ego is also able to reduce the expenditure by which at other times it maintains the repressions. The unconscious impulse makes use of this nocturnal relaxation of repression in order to push its way into consciousness with the dream. But the repressive resistance of the ego is not abolished in sleep but merely reduced. Some of it remains in the shape of a censorship of dreams and forbids the unconscious impulse to express itself in the forms which it would properly assume. In consequence of the severity of the censorship of dreams, the latent dream-thoughts are obliged to submit to being altered and softened so as to make the forbidden meaning of the dream unrecognizable. This is the explanation of dream-distortion, which accounts for the most striking characteristics of the manifest dream. We are therefore justified in asserting that a dream is the (disguised) fulfilment of a (repressed) wish. It will now be seen that dreams are constructed like a neurotic symptom: they are compromises between the demands of a repressed impulse and the resistance of a censoring force in the ego. Since they have a similar origin they are equally unintelligible and stand in equal need of interpretation.
LADIES AND GENTLEMEN, - If, after an interval of more than fifteen years, I have brought you together again to discuss with you what novelties, and what improvements it may be, the intervening time has introduced into psycho-analysis, it is right and fitting from more than one point of view that we should turn our attention first to the position of the theory of dreams. It occupies a special place in the history of psycho-analysis and marks a turning-point; it was with it that analysis took the step from being a psychotherapeutic procedure to being a depth-psychology. Since then, too, the theory of dreams has remained what is most characteristic and peculiar about the young science, something to which there is no counterpart in the rest of our knowledge, a stretch of new country, which has been reclaimed from popular beliefs and mysticism. The strangeness of the assertions it was obliged to put forward has made it play the part of a shibboleth, the use of which decided who could become a follower of psycho-analysis and to whom it remained forever incomprehensible. I myself found it a sheet-anchor during those difficult times when the unrecognized facts of the neuroses used to confuse my inexperienced judgement. Whenever I began to have doubts of the correctness of my wavering conclusions, the successful transformation of a senseless and muddled dream into a logical and intelligible mental process in the dreamer would renew my confidence of being on the right track.

[1933a, 4621]

In what follows I shall not be able to avoid a schematic method of exposition. Let us assume that in a particular case we have before us all the latent thoughts, charged with a greater or less amount of affect, by which the manifest dream has been replaced after its interpretation has been completed. We shall then be struck by one difference among these latent thoughts, and that difference will take us a long way. Almost all these dream-thoughts are recognized by the dreamer or acknowledged by him; he admits that he has thought this, now or at some other time, or that he might have thought it. There is only one single thought that he refuses to accept; it is strange to him or even perhaps repellent; he may possibly reject it with passionate feeling. It now becomes evident to us that the other thoughts are portions of a conscious, or, more accurately, a preconscious train of thinking. They might have been thought in waking life too, and indeed they were probably formed during the previous day. This one repudiated thought, however, or, properly speaking, this one impulse, is a child of night; it belongs to the dreamer's unconscious and on that account it is repudiated and rejected by him. It had to wait for the nightly relaxation of repression in order to arrive at any kind of expression. And in any case this expression is a weakened, distorted and disguised one; without our work of dream-interpretation we should not have found it. This unconscious impulse has to thank its link with the other, unobjectionable, dream-thoughts for the opportunity of slipping past the barrier of the censorship in an inconspicuous disguise. On the other hand, the preconscious dream-thoughts have to thank this same link for the power to occupy mental life during sleep as well. For there is no doubt about it: this unconscious impulse is the true creator of the dream; it is what produces the psychical energy for the dream's construction. Like any other instinctual impulse, it cannot strive for anything other than its own satisfaction; and our experience in interpreting dreams shows us too that that is the sense of all dreaming. In every dream an instinctual wish has to be represented as fulfilled. The shutting-off of mental life from reality at night and the regression to primitive mechanisms which this makes possible enable this wished-for instinctual satisfaction to be experienced in a hallucinatory manner as occurring in the present. As a result of this same regression, ideas are transformed in the dream into visual pictures: the latent dream-thoughts, that is to say, are dramatized and illustrated.

[1933a, 4631]
Let us go back once more to the latent dream-thoughts. Their most powerful element is the repressed instinctual impulse which has created in them an expression for itself on the basis of the presence of chance stimuli and by transference on to the day's residues - though an expression that is toned down and disguised. Like every instinctual impulse, it too presses for satisfaction by action; but its path to motility is blocked by the physiological regulations implied in the state of sleep; it is compelled to take the backwards course in the direction of perception and to be content with a hallucinated satisfaction. The latent dream-thoughts are thus transformed into a collection of sensory images and visual scenes. It is as they travel on this course that what seems to us so novel and so strange occurs to them. All the linguistic instruments by which we express the subtler relations of thought - the conjunctions and prepositions, the changes in declension and conjugation - are dropped, because there are no means of representing them; just as in a primitive language without any grammar, only the raw material of thought is expressed and abstract terms are taken back to the concrete ones that are at their basis. What is left over after this may well appear disconnected. The copious employment of symbols, which have become alien to conscious thinking, for representing certain objects and processes is in harmony alike with the archaic regression in the mental apparatus and with the demands of the censorship.

[1933a, 4632]
It is a proverbial fact that dreams melt away in the morning. They can, of course, be remembered; for we only know dreams from our memory of them after we are awake. But we very often have a feeling that we have only remembered a dream in part and that there was more of it during the night; we can observe, too, how the recollection of a dream, which was still lively in the morning, will melt away, except for a few small fragments, in the course of the day; we often know we have dreamt, without knowing what we have dreamt; and we are so familiar with the fact of dreams being liable to be forgotten, that we see no absurdity in the possibility of someone having had a dream in the night and of his not being aware in the morning either of what he has dreamt or even of the fact that he has dreamt at all. On the other hand, it sometimes happens that dreams show an extraordinary persistence in the memory. I have analysed dreams in my patients which occurred twenty-five and more years earlier; and I can remember a dream of my own separated by at least thirty-seven years from to-day and yet as fresh as ever in my memory. All of this is very remarkable and not immediately intelligible.

Finally, there is another fact to be borne in mind as likely to lead to dreams being forgotten, namely that most people take very little interest in their dreams. Anyone, such as a scientific investigator, who pays attention to his dreams over a period of time will have more dreams than usual - which no doubt means that he remembers his dreams with greater ease and frequency.

In view of all these reasons in favour of dreams being forgotten, it is in fact (as Strümpell himself insists) very remarkable that so many of them are retained in the memory. The repeated attempts by writers on the subject to lay down the rules governing the recollection of dreams amount to an admission that here too we are faced by something puzzling and unexplained. Certain particular characteristics of the recollection of dreams have been rightly emphasized recently (cf. Radestock, 1879, and Tissié, 1898), such as the fact that when a dream seems in the morning to have been forgotten, it may nevertheless be recollected during the course of the day, if its content, forgotten though it is, is touched upon by some chance perception.

But the recollection of dreams in general is open to an objection which is bound to reduce their value very completely in critical opinion. Since so great a proportion of dreams is lost altogether, we may well doubt whether our memory of what is left of them may not be falsified.

These doubts as to the accuracy of the reproduction of dreams are also expressed by Strümpell (1877): 'Thus it may easily happen that waking consciousness unwittingly makes interpolations in the memory of a dream: we persuade ourselves that we have dreamt all kinds of things that were not contained in the actual dreams.'

Jessen (1855, 547) writes with special emphasis on this point: 'Moreover, in investigating and interpreting coherent and consistent dreams a particular circumstance must be borne in mind which, as it seems to me, has hitherto received too little attention. In such cases the truth is almost always obscured by the fact that when we recall dreams of this kind to our memory we almost always - unintentionally and without noticing the fact - fill in the gaps in the dream-images. It is seldom or never that a coherent dream was in fact as coherent as it seems to us in memory. Even the most truth-loving of men is scarcely able to relate a noteworthy dream without some additions or embellishments. The tendency of the human mind to see everything connectedly is so strong that in memory it unwittingly fills in any lack of coherence there may be in an incoherent dream.'
Some remarks made by Egger, though they were no doubt arrived at independently, read almost like a translation of this passage from Jessen: '... L’observation des rêves a ses difficultés spéciales et le seul moyen d’éviter tout erreur en pareille matière est de confier au papier sans le moindre retard ce que l’on vient d’éprouver et de remarquer; sinon, l’oubli vient vite ou total ou partiel; l’oubli total est sans gravité; mais l’oubli partiel est perfide; car si l’on se met ensuite à raconter ce que l’on n’a pas oublié, on est exposé à compléter par imagination les fragments incohérents et disjoints fournis par la mémoire ...; on devient artiste à son insu, et le récit périodiquement répété s’impose à la créance de son auteur, qui, de bonne foi, le présente comme un fait authentique, dûment établi selon les bonnes méthodes. ...'¹

Very similar ideas are expressed by Spitta (1882, 338), who seems to believe that it is not until we try to reproduce a dream that we introduce order of any kind into its loosely associated elements: we 'change things that are merely juxtaposed into sequences or causal chains, that is to say, we introduce a process of logical connection which is lacking in the dream.'²

Since the only check that we have upon the validity of our memory is objective confirmation, and since that is unobtainable for dreams, which are our own personal experience and of which the only source we have is our recollection, what value can we still attach to our memory of dreams?

We can have no hesitation in deciding in favour of the second alternative. There can be no doubt that the censoring agency, whose influence we have so far only recognized in limitations and omissions in the dream-content, is also responsible for interpolations and additions in it. The interpolations are easy to recognize. They are often reported with hesitation, and introduced by an 'as though'; they are not in themselves particularly vivid and are always introduced at points at which they can serve as links between two portions of the dream-content or to bridge a gap between two parts of the dream. They are less easily retained in the memory than genuine derivatives of the material of the dream-thoughts; if the dream is to be forgotten they are the first part of it to disappear, and I have a strong suspicion that the common complaint of having dreamt a lot, but of having forgotten most of it and of having only retained fragments, is based upon the rapid disappearance precisely of these connecting thoughts. In a complete analysis these interpolations are sometimes betrayed by the fact that no material connected with them is to be found in the dream-thoughts. But careful examination leads me to regard this as the less frequent case; as a rule the connecting thoughts lead back nevertheless to material in the dream-thoughts, but to material which could have no claim to acceptance in the dream either on its own account or owing to its being over-determined. Only in extreme cases, it seems, does the psychical function in dream-formation which we are now considering proceed to make new creations. So long as possible, it employs anything appropriate that it can find in the material of the dream-thoughts.

I suggest, therefore, that we should first turn to a topic that raises a difficulty which we have not hitherto considered but which is nevertheless capable of cutting the ground from under all our efforts at interpreting dreams. It has been objected on more than one occasion that we have in fact no knowledge of the dreams that we set out to interpret, or, speaking more correctly, that we have no guarantee that we know them as they actually occurred.(See p. 555 ff.)
Previous writers have had less justification in devoting so much space to the doubt with which our judgement receives accounts of dreams. For this doubt has no intellectual warrant. There is in general no guarantee of the correctness of our memory; and yet we yield to the compulsion to attach belief to its data far more often than is objectively justified. Doubt whether a dream or certain of its details have been correctly reported is once more a derivative of the dream-censorship, of resistance to the penetration of the dream-thoughts into consciousness. This resistance has not been exhausted even by the displacements and substitutions it has brought about; it persists in the form of doubt attaching to the material which has been allowed through. We are especially inclined to misunderstand this doubt since it is careful never to attack the more intense elements of a dream but only the weak and indistinct ones. As we already know, however, a complete reversal of all psychical values takes place between the dream-thoughts and the dream. Distortion is only made possible by a withdrawal of psychical value; it habitually expresses itself by that means and is occasionally content to require nothing more. If, then, an indistinct element of a dream's content is in addition attacked by doubt, we have a sure indication that we are dealing with a comparatively direct derivative of one of the proscribed dream-thoughts. The state of things is what it was after some sweeping revolution in one of the republics of antiquity or the Renaissance. The noble and powerful families which had previously dominated the scene were sent into exile and all the high offices were filled by newcomers. Only the most impoverished and powerless members of the vanquished families, or their remote dependants, were allowed to remain in the city; and even so they did not enjoy full civic rights and were viewed with distrust. The distrust in this analogy corresponds to the doubt in the case we are considering. That is why in analysing a dream I insist that the whole scale of estimates of certainty shall be abandoned and that the faintest possibility that something of this or that sort may have occurred in the dream shall be treated as complete certainty. In tracing any element of a dream it will be found that unless this attitude is firmly adopted the analysis will come to a standstill. If any doubt is thrown upon the value of the element in question, the psychical result in the patient is that none of the involuntary ideas underlying that element comes into his head. This result is not a self-evident one. It would not make nonsense if someone were to say: 'I don't know for certain whether such and such a thing came into the dream, but here is what occurs to me in connection with it.' But in fact no one ever does say this; and it is precisely the fact that doubt produces this interrupting effect upon an analysis that reveals it as a derivative and tool of psychical resistance. Psycho-analysis is justly suspicious. One of its rules is that whatever interrupts the progress of analytic work is a resistance.¹

The forgetting of dreams, too, remains inexplicable unless the power of the psychical censorship is taken into account. In a number of cases the feeling of having dreamt a great deal during the night and of only having retained a little of it may in fact have some other meaning, such as that the dream-work has been perceptibly proceeding all through the night but has only left a short dream behind. It is no doubt true that we forget dreams more and more as time passes after waking; we often forget them in spite of the most painstaking efforts to recall them. But I am of opinion that the extent of this forgetting is as a rule overestimated; and there is a similar overestimation of the extent to which the gaps in a dream limit our knowledge of it. It is often possible by means of analysis to restore all that has been lost by the forgetting of the dream's content; at least, in quite a number of cases one can reconstruct from a single remaining fragment not, it is true, the dream - which is in any case a matter of no importance - but all the dream-thoughts. This demands a certain amount of attention and self-discipline in carrying out the analysis; that is all - but it shows that there was no lack of a hostile purpose at work in the forgetting of the dream.¹

¹[1900a, 951]

¹[1900a, 952]
Convincing evidence of the fact that the forgetting of dreams is tendentious and serves the purpose of resistance¹ is afforded when it is possible to observe in analyses a preliminary stage of forgetting. It not infrequently happens that in the middle of the work of interpretation an omitted portion of the dream comes to light and is described as having been forgotten till that moment. Now a part of a dream that has been rescued from oblivion in this way is invariably the most important part; it always lies on the shortest road to the dream's solution and has for that reason been exposed to resistance more than any other part. Among the specimen dreams scattered through this volume, there is one in which a part of its content was added like this as an after-thought. It is the travel dream in which I revenged myself on two disagreeable fellow-travellers and which I had to leave almost uninterpreted on account of its gross indecency. The omitted portion ran as follows: ‘I said, referring to one of Schiller's works: "It is from . . ." but, noticing the mistake, I corrected myself: "It is by . . ." "Yes", the man commented to his sister, "he said that right."²

Moreover I am in a position to offer an ocular demonstration of the fact that the forgetting of dreams is to a great extent a product of resistance. One of my patients will tell me he has had a dream but has forgotten every trace of it: it is therefore just as though it had never happened. We proceed with our work. I come up against a resistance; I therefore explain something to the patient and help him by encouragement and pressure to come to terms with some disagreeable thought. Hardly have I succeeded in this than he exclaims: 'Now I remember what it was I dreamt.' The same resistance which interfered with our work that day also made him forget the dream. By overcoming this resistance I have recalled the dream to his memory.

Psycho-analytic experience has provided us with yet another proof that the forgetting of dreams depends far more upon resistance than upon the fact, stressed by the authorities, that the waking and sleeping states are alien to each other. It not infrequently happens to me, as well as to other analysts and to patients under treatment, that, having been woken up, as one might say, by a dream, I immediately afterwards, and in full possession of my intellectual powers, set about interpreting it. In such cases I have often refused to rest till I have arrived at a complete understanding of the dream; yet it has sometimes been my experience that after finally waking up in the morning I have entirely forgotten both my interpretative activity and the content of the dream, though knowing that I have had a dream and interpreted it. It happens far more often that the dream draws the findings of my interpretative activity back with it into oblivion than that my intellectual activity succeeds in preserving the dream in my memory. Yet there is no such psychical gulf between my interpretative activity and my waking thoughts as the authorities suppose to account for the forgetting of dreams.

Morton Prince (1910) has objected to my explanation of the forgetting of dreams on the ground that forgetting is only a special case of the amnesia attaching to dissociated mental states, that it is impossible to extend my explanation of this special amnesia to other types and that my explanation is consequently devoid of value even for its immediate purpose. His readers are thus reminded that in the course of all his descriptions of these dissociated states he has never attempted to discover a dynamic explanation of such phenomena. If he had, he would inevitably have found that repression (or, more precisely, the resistance created by it) is the cause both of the dissociations and of the amnesia attaching to their psychical content.
An observation which I have been able to make in the course of preparing this manuscript has shown me that dreams are no more forgotten than other mental acts and can be compared, by no means to their disadvantage, with other mental functions in respect of their retention in the memory. I had kept records of a large number of my own dreams which for one reason or another I had not been able to interpret completely at the time or had left entirely uninterpreted. And now, between one and two years later, I have attempted to interpret some of them for the purpose of obtaining more material in illustration of my views. These attempts have been successful in every instance; indeed the interpretation may be said to have proceeded more easily after this long interval than it did at the time when the dream was a recent experience. A possible explanation of this is that in the meantime I have overcome some of the internal resistances which previously obstructed me. When making these subsequent interpretations I have compared the dream-thoughts that I elicited at the time of the dream with the present, usually far more copious, yield, and I have always found that the old ones are included among the new. My astonishment at this was quickly halted by the reflection that I had long been in the habit of getting my patients, who sometimes tell me dreams dating from earlier years, to interpret them - by the same procedure and with the same success - as though they had dreamt them the night before. When I come to discuss anxiety-dreams I shall give two examples of postponed interpretations like these. I was led into making my first experiment of this kind by the justifiable expectation that in this as in other respects dreams would behave like neurotic symptoms. When I treat a psychoneurotic - a hysteric, let us say - by psycho-analysis, I am obliged to arrive at an explanation for the earliest and long since vanished symptoms of his illness no less than for the contemporary ones which brought him to me for treatment; and I actually find the earlier problem easier to solve than the immediate one. As long ago as in 1895 I was able to give an explanation in *Studies on Hysteria* of the first hysterical attack which a woman of over forty had had in her fifteenth year.¹

[1900a, 956]

But we must return to the facts concerning the forgetting of dreams, for we have failed to draw one important conclusion from them. We have seen that waking life shows an unmistakable inclination to forget any dream that has been formed in the course of the night - whether as a whole directly after waking, or bit by bit in the course of the day; and we have recognized that the agent chiefly responsible for this forgetting is the mental resistance to the dream which has already done what it could against it during the night. But if all this is so, the question arises how it comes about that a dream can be formed at all in the face of this resistance. Let us take the most extreme case, in which waking life has got rid of a dream as though it had never occurred. A consideration of the interplay of psychical forces in this case must lead us to infer that the dream would in fact not have occurred at all if the resistance had been as strong during the night as during the day. We must conclude that during the night the resistance loses some of its power, though we know it does not lose the whole of it, since we have shown the part it plays in the formation of dreams as a distorting agent. But we are driven to suppose that its power may be diminished at night and that this makes the formation of dreams possible. This makes it easy to understand how, having regained its full strength at the moment of waking, it at once proceeds to get rid of what it was obliged to permit while it was weak. Descriptive psychology tells us that the principal *sine qua non* for the formation of dreams is that the mind shall be in a state of sleep; and we are now able to explain this fact: the *state of sleep makes the formation of dreams possible because it reduces the power of the endopsychic censorship.*

[1900a, 960]
It is no doubt tempting to regard this as the only possible inference that can be drawn from the facts of the forgetting of dreams, and to make it the basis for further conclusions as to the conditions of energy prevailing during sleeping and waking. For the moment, however, we will stop at this point. When we have entered a little more deeply into the psychology of dreams we shall find that the factors making possible the formation of dreams can be viewed in another way as well. It may be that the resistance against the dream-thoughts becoming conscious can be evaded without any reduction having taken place in its power. And it seems a plausible idea that both of the two factors favouring the formation of dreams - the reduction and the evasion of the resistance - are simultaneously made possible by the state of sleep. I will break off here, though I shall pick up the argument again presently.

There is one true conclusion that we may glean from these objections, namely that we need not suppose that every association that occurs during the work of interpretation had a place in the dream-work during the night. It is true that in carrying out the interpretation in the waking state we follow a path which leads back from the elements of the dream to the dream-thoughts and that the dream-work followed one in the contrary direction. But it is highly improbable that these paths are passable both ways. It appears, rather, that in the daytime we drive shafts which follow along fresh chains of thought and that these shafts make contact with the intermediate thoughts and the dream-thoughts now at one point and now at another. We can see how in this manner fresh daytime material inserts itself into the interpretative chains. It is probable, too, that the increase in resistance that has set in since the night makes new and more devious detours necessary. The number and nature of the collaterals that we spin in this way during the day is of no psychological importance whatever, so long as they lead us to the dream-thoughts of which we are in search.

Experience shows us that this path leading through the preconscious to consciousness is barred to the dream-thoughts during the daytime by the censorship imposed by resistance. During the night they are able to obtain access to consciousness; but the question arises as to how they do so and thanks to what modification. If what enabled the dream-thoughts to achieve this were the fact that at night there is a lowering of the resistance which guards the frontier between the unconscious and the preconscious, we should have dreams which were in the nature of ideas and which were without the hallucinatory quality in which we are at the moment interested. Thus the lowering of the censorship between the two systems Ucs. and Pcs. can only explain dreams formed like ‘Autodidasker’ and not dreams like that of the burning child which we took as the starting-point of our investigations.

The fact that dreams are distorted and mutilated by memory is accepted by us but in our opinion constitutes no obstacle; for it is no more than the last and manifest portion of a distorting activity which has been in operation from the very start of the dream's formation.
Since the rejection of the mythological hypothesis, however, dreams have stood in need of explanation. The conditions of their origin, their relation to waking mental life, their dependence upon stimuli which force their way upon perception during the state of sleep, the many peculiarities of their content which are repugnant to waking thought, the inconsistency between their ideational images and the affects attaching to them, and lastly their transitory character, the manner in which waking thought pushes them on one side as something alien to it, and mutilates or extinguishes them in memory - all of these and other problems besides have been awaiting clarification for many hundreds of years, and till now no satisfactory solution of them has been advanced. But what stands in the foreground of our interest is the question of the significance of dreams, a question which bears a double sense. It enquires in the first place as to the psychical significance of dreaming, as to the relation of dreams to other mental processes, and as to any biological function that they may have; in the second place it seeks to discover whether dreams can be interpreted, whether the content of individual dreams has a 'meaning', such as we are accustomed to find in other psychical structures.

I should, of course, not draw such far-reaching conclusions if only a single dream-analysis was at my disposal. If experience shows me, however, that by uncritically pursuing the associations arising from any dream I can arrive at a similar train of thoughts, among the elements of which the constituents of the dream re-appear and which are interconnected in a rational and intelligible manner, then it will be safe to disregard the slight possibility that the connections observed in a first experiment might be due to chance. I think I am justified, therefore, in adopting a terminology which will crystallize our new discovery. In order to contrast the dream as it is retained in my memory with the relevant material discovered by analysing it, I shall speak of the former as the 'manifest content of the dream' and the latter - without, in the first instance, making any further distinction - as the 'latent content of the dream.' I am now faced by two new problems which have not hitherto been formulated. (1) What is the psychical process which has transformed the latent content of the dream into the manifest one which is known to me from my memory? (2) What are the motive or motives which have necessitated this transformation? I shall describe the process which transforms the latent into the manifest content of dreams as the 'dream-work.' The counterpart to this activity - one which brings about a transformation in the opposite direction - is already known to us as the work of analysis. The remaining problems arising out of dreams - questions as to the instigators of dreams, as to the origin of their material, as to their possible meaning, as to the possible function of dreaming, and as to the reasons for dreams being forgotten - all these problems will be discussed by me on the basis, not of the manifest, but of the newly discovered latent dream-content. Since I attribute all the contradictory and incorrect views upon dream-life which appear in the literature of the subject to ignorance of the latent content of dreams as revealed by analysis, I shall be at the greatest pains henceforward to avoid confusing the manifest dream with the latent dream-thoughts.

When the state of sleep is over, the censorship quickly recovers its full strength; and it can now wipe out all that was won from it during the period of its weakness. This must be one part at least of the explanation of the forgetting of dreams, as is shown by an observation which has been confirmed on countless occasions. It not infrequently happens that during the narration of a dream or during its analysis a fragment of the dream-content which had seemed to be forgotten re-emerges. This fragment which has been rescued from oblivion invariably affords us the best and most direct access to the meaning of the dream. And that, in all probability, must have been the only reason for its having been forgotten, that is, for its having been once more suppressed.
Our author, who, as we have long since realized, never introduces a single idle or unintentional feature into history, has given us another piece of evidence of the asexual current which dominated Hanold during his journey. As he roamed about for hours in Pompeii, 'strangely enough it never once recurred to his memory that a short time before he had dreamt of being present at the burial of Pompeii in the eruption of 79 A.D.' (47.) It was only when he caught sight of Gradiva that he suddenly remembered the dream and became conscious at the same time of the delusional reason for his puzzling journey. How could this forgetting of the dream, this barrier of repression between the dream and his mental state during the journey, be explained, except by supposing that the journey was undertaken not at the direct inspiration of the dream but as a revolt against it, as an emanation of a mental power that refused to know anything of the secret meaning of the dream?

One piece of information given me by little Hans struck me as particularly remarkable; nor do I venture to give any explanation of it. When he read his case history, he told me, the whole of it came to him as something unknown; he did not recognize himself; he could remember nothing; and it was only when he came upon the journey to Gmunden that there dawned on him a kind of glimmering recollection that it might have been he himself that it happened to. So the analysis had not preserved the events from amnesia, but had been overtaken by amnesia itself. Any one who is familiar with psycho-analysis may occasionally experience something similar in sleep. He will be woken up by a dream, and will decide to analyse it then and there; he will then go to sleep again feeling quite satisfied with the result of his efforts; and next morning dream and analysis will alike be forgotten.

I invite you now to follow me on a brief excursion through the region of dream-problems. When we are awake we are in the habit of treating dreams with the same contempt with which patients regard the associations that are demanded of them by the psycho-analyst. We dismiss them, too, by forgetting them as a rule, quickly and completely. Our low opinion of them is based on the strange character even of those dreams that are not confused and meaningless, and on the obvious absurdity and nonsensicalness of other dreams. Our dismissal of them is related to the uninhibited shamelessness and immorality of the tendencies openly exhibited in some dreams. It is well known that the ancient world did not share this low opinion of dreams. Nor are the lower strata of our own society to-day in any doubt about the value of dreams; like the peoples of antiquity, they expect them to reveal the future. I confess that I feel no necessity for making any mystical assumptions in order to fill the gaps in our present knowledge, and accordingly I have never been able to find anything to confirm the prophetic nature of dreams. There are plenty of other things - sufficiently wonderful too - to be said about them.

And there is something else which from its very nature frustrates the requirements of exact research. In investigating dreams one is not even certain about the object of one's research. A delusion, for instance, meets one squarely and with definite outlines. 'I am the Emperor of China', says the patient straight out. But dreams? As a rule no account at all can be given of them. If anyone gives an account of a dream, has he any guarantee that his account has been correct, or that he may not, on the contrary, have altered his account in the course of giving it and have been obliged to invent some addition to it to make up for the indistinctness of his recollection? Most dreams cannot be remembered at all and are forgotten except for small fragments. And is the interpretation of material of this kind to serve as the basis of a scientific psychology or as a method for treating patients?
That, then, is our method of interpreting dreams. The first and justifiable question is: 'Can we interpret all dreams by its help?' And the answer is: 'No, not all; but so many that we feel confident in the serviceability and correctness of the procedure.' 'But why not all?' The answer to this has something important to teach us, which at once introduces us into the psychical determinants of the formation of dreams: 'Because the work of interpreting dreams is carried out against a resistance, which varies between trivial dimensions and invincibility (at least so far as the strength of our present methods reaches).’ It is impossible during our work to overlook the manifestations of this resistance. At some points the associations are given without hesitation and the first or second idea that occurs to the patient brings an explanation. At other points there is a stoppage and the patient hesitates before bringing out an association, and, if so, we often have to listen to a long chain of ideas before receiving anything that helps us to understand the dream. We are certainly right in thinking that the longer and more roundabout the chain of associations the stronger the resistance. We can detect the same influence at work in the forgetting of dreams. It happens often enough that a patient, despite all his efforts, cannot remember one of his dreams. But after we have been able in the course of a piece of analytic work to get rid of a difficulty which had been disturbing his relation to the analysis, the forgotten dream suddenly re-emerges. Two other observations are also in place here. It very frequently comes about that, to begin with, a portion of a dream is omitted and added afterwards as an addendum. This is to be regarded as an attempt to forget that portion. Experience shows that it is that particular piece which is the most important; there was a greater resistance, we suppose, in the path of communicating it than the other parts of the dream. Furthermore, we often find that a dreamer endeavours to prevent himself from forgetting his dreams by fixing them in writing immediately after waking up. We can tell him that that is no use. For the resistance from which he has extorted the preservation of the text of the dream will then be displaced on to its associations and will make the manifest dream inaccessible to interpretation. In view of these facts we need not feel surprised if a further increase in the resistance suppresses the associations altogether and thus brings the interpretation of the dream to nothing.

After these influences have been brought to bear upon the dream-thoughts the dream is almost complete. A further, somewhat variable, factor also comes into play - known as 'secondary revision' - after the dream has been presented before consciousness as an object of perception. At that point we treat it as we are in general accustomed to treat the contents of our perception: we fill in gaps and introduce connections, and in doing so are often guilty of gross misunderstandings. But this activity, which might be described as a rationalizing one and which at best provides the dream with a smooth façade that cannot fit its true content, may also be omitted or only be expressed to a very modest degree - in which case the dream will display all its rents and cracks openly. It must not be forgotten, on the other hand, that the dream-work does not always operate with equal energy either; it often restricts itself to certain portions of the dream-thoughts only and others of them are allowed to appear in the dream unaltered. In such cases an impression is given of the dream having carried out the most delicate and complex intellectual operations, of its having speculated, made jokes, arrived at decisions and solved problems, whereas all this is a product of our normal mental activity, may have been performed equally well during the day before the dream as during the night, has nothing to do with the dream-work and brings nothing to light that is characteristic of dreams. Nor is it superfluous to insist once more on the contrast within the dream-thoughts themselves between the unconscious instinctual impulse and the day's residues. While the latter exhibit all the multiplicity of our mental acts, the former, which becomes the motive force proper of the forming of the dream, finds its outlet invariably in the fulfilment of a wish.
Let us compare this dream of the first Napoleon (who, incidentally, was an extremely sound sleeper) with that of the sleepy student who was roused by his landlady and told that it was time to go to the hospital, and who proceeded to dream that he was in bed at the hospital and then slept on, under the pretext that as he was already in the hospital there was no need for him to get up and go there. This latter dream was clearly a dream of convenience. The dreamer admitted his motive for dreaming without any disguise; but at the same time he gave away one of the secrets of dreaming in general. All dreams are in a sense dreams of convenience: they serve the purpose of prolonging sleep instead of waking up. Dreams are the GUARDIANS of sleep and not its disturbers. We shall have occasion elsewhere to justify this view of them in relation to awakening factors of a psychological kind; but we are already in a position to show that it is applicable to the part played by objective external stimuli. Either the mind pays no attention at all to occasions for sensation during sleep - if it is able to do this despite the intensity of the stimuli and the significance which it knows attaches to them; or it makes use of a dream in order to deny the stimuli; or, thirdly, if it is obliged to recognize them, it seeks for an interpretation of them which will make the currently active sensation into a component part of a situation which is wished for and which is consistent with sleeping. The currently active sensation is woven into a dream in order to rob it of reality. Napoleon could sleep on - with a conviction that what was trying to disturb him was only a dream-memory of the thunder of the guns at Arcole.¹

[1900a, 712]

Thus the wish to sleep (which the conscious ego is concentrated upon, and which, together with the dream-censorship and the 'secondary revision' which I shall mention later, constitute the conscious ego's share in dreaming) must in every case be reckoned as one of the motives for the formation of dreams, and every successful dream is a fulfilment of that wish. We shall discuss elsewhere the relations subsisting between this universal, invariably present and unchanging wish to sleep and the other wishes, of which now one and now another is fulfilled by the content of the dream. But we have found in the wish to sleep the factor that is able to fill the gap in the theory of Strümpell and Wundt and to explain the perverse and capricious manner in which external stimuli are interpreted. The correct interpretation, which the sleeping mind is perfectly capable of making, would involve an active interest and would require that sleep should be brought to an end; for that reason, of all the possible interpretations, only those are admitted which are consistent with the absolute censorship exercised by the wish to sleep. 'It is the nightingale and not the lark.' For if it were the lark it would mean the end of the lovers' night. Among the interpretations of the stimulus which are accordingly admissible, that one is then selected which can provide the best link with the wishful impulses lurking in the mind. Thus everything is unambiguously determined and nothing is left to arbitrary decision. The misinterpretation is not an illusion but, as one might say, an evasion. Here once again, however, just as when, in obedience to the dream-censorship, a substitution is effected by displacement, we have to admit that we are faced by an act which deviates from normal psychological processes. [1900a, 713]

It has naturally not occurred to us to throw any doubt on the significance, which has been experimentally demonstrated, of external sensory stimuli during sleep; but we have shown that such material stands in the same relation to the dream-wish as do the residues of thought left over from day time activity. Nor have we seen any reason to dispute the view that dreams interpret objective sensory stimuli just as illusions do; but we have found the motive which provides the reason for that interpretation, a reason which has been left unspecified by other writers. Interpretation is carried out in such a way that the object perceived shall not interrupt sleep and shall be usable for purposes of wish-fulfilment. As regards subjective states of excitement in the sense organs during sleep, the occurrence of which seems to have been proved by Trumbull Ladd, it is true that we have not accepted them as a particular source of dreams; but we have been able to explain them as resulting from the regressive revival of memories that are in operation behind the dream.

[1900a, 1016]
The function of the dream as a guardian of sleep becomes particularly evident when an external stimulus impinges upon the senses of a sleeper. It is generally recognized that sensory stimuli arising during sleep influence the content of dreams; this can be proved experimentally and is among the few certain (but, incidentally, greatly overvalued) findings of medical investigation into dreams. But this finding involves a puzzle which has hitherto proved insoluble. For the sensory stimulus which the experimenter causes to impinge upon the sleeper is not correctly recognized in the dream; it is subjected to one of an indefinite number of possible interpretations, the choice being apparently left to an arbitrary psychical determination. But there is, of course, no such thing as arbitrary determination in the mind. There are several ways in which a sleeper may react to an external sensory stimulus. He may wake up or he may succeed in continuing his sleep in spite of it. In the latter case he may make use of a dream in order to get rid of the external stimulus, and here again there is more than one method open to him. For instance, he may get rid of the stimulus by dreaming that he is in a situation which is absolutely incompatible with the stimulus. Such was the line taken by a sleeper who was subject to disturbance by a painful abscess on the perineum. He dreamt that he was riding on a horse, making use of the poultice that was intended to mitigate his pain as a saddle, and in this way he avoided being disturbed. Or, as happens more frequently, the external stimulus is given an interpretation which brings it into the context of a repressed wish which is at the moment awaiting fulfilment; in this way the external stimulus is robbed of its reality and is treated as though it were a portion of the psychical material. Thus someone dreamt that he had written a comedy with a particular plot; it was produced in a theatre, the first act was over, and there were thunders of applause; the clapping was terrific. . . . The dreamer must have succeeded in prolonging his sleep till after the interference had ceased; for when he woke up he no longer heard the noise, but rightly concluded that someone must have been beating a carpet or mattress. Every dream which occurs immediately before the sleeper is woken by a loud noise has made an attempt at explaining away the arousing stimulus by providing another explanation of it and has thus sought to prolong sleep, even if only for a moment.

There is no difficulty in discovering the general function of dreaming. It serves the purpose of fending off, by a kind of soothing action, external or internal stimuli which would tend to arouse the sleeper, and thus of securing sleep against interruption. External stimuli are fended off by being given a new interpretation and by being woven into some harmless situation; internal stimuli, caused by instinctual demands, are given free play by the sleeper and allowed to find satisfaction in the formation of dreams, so long as the latent dream-thoughts submit to the control of the censorship. But if they threaten to break free and the meaning of the dream becomes too plain, the sleeper cuts short the dream and wakes in a fright. (Dreams of this class are known as anxiety-dreams.) A similar failure in the function of dreaming occurs if an external stimulus becomes too strong to be fended off. (This is the class of arousal-dreams.) I have given the name of dream-work to the process which, with the co-operation of the censorship, converts the latent thoughts into the manifest content of the dream. It consists of a peculiar way of treating the preconscious material of thought, so that its component parts become condensed, its psychical emphasis becomes displaced, and the whole of it is translated into visual images or dramatized, and completed by a deceptive secondary revision. The dream-work is an excellent example of the processes occurring in the deeper, unconscious layers of the mind, which differ considerably from the familiar normal processes of thought. It also displays a number of archaic characteristics, such as the use of a symbolism (in this case of a predominantly sexual kind) which it has since also been possible to discover in other spheres of mental activity.

[1901a, 1093]

[1925d, 4220]
The bitter experience of life must have changed this primitive thought-activity into a more expedient secondary one. The establishment of a perceptual identity along the short path of regression within the apparatus does not have the same result elsewhere in the mind as does the cathexis of the same perception from without. Satisfaction does not follow; the need persists. An internal cathexis could only have the same value as an external one if it were maintained unceasingly, as in fact occurs in hallucinatory psychoses and hunger phantasies, which exhaust their whole psychical activity in clinging to the object of their wish. In order to arrive at a more efficient expenditure of psychological force, it is necessary to bring the regression to a halt before it becomes complete, so that it does not proceed beyond the mnemonic image, and is able to seek out other paths which lead eventually to the desired perceptual identity being established from the direction of the external world.¹ This inhibition of the regression and the subsequent diversion of the excitation become the business of a second system, which is in control of voluntary movement - which for the first time, that is, makes use of movement for purposes remembered in advance. But all the complicated thought-activity which is spun out from the mnemonic image to the moment at which the perceptual identity is established by the external world - all this activity of thought merely constitutes a roundabout path to wish-fulfilment which has been made necessary by experience.² Thought is after all nothing but a substitute for a hallucinatory wish; and it is self-evident that dreams must be wish-fulfilments, since nothing but a wish can set our mental apparatus at work. Dreams, which fulfil their wishes along the short path of regression, have merely preserved for us in that respect a sample of the psychological apparatus's primary method of working, a method which was abandoned as being inefficient. What once dominated waking life, while the mind was still young and incompetent, seems now to have been banished into the night - just as the primitive weapons, the bows and arrows, that have been abandoned by adult men, turn up once more in the nursery. Dreaming is a piece of infantile mental life that has been superseded. These methods of working on the part of the psychological apparatus, which are normally suppressed in waking hours, become current once more in psychosis and then reveal their incapacity for satisfying our needs in relation to the external world.³

[1900a, 996]

We have no difference of opinion over the functions that are to be assigned to dreams. The view that dreams act as a safety valve to the mind and that, in the words of Robert, all kinds of harmful things are made harmless by being presented in a dream - not only does this view coincide exactly with our theory of the double wish-fulfilment brought about by dreams, but the way in which it is phrased is more intelligible to us than to Robert himself. The view that the mind has free play in its functioning in dreams is represented in our theory by the fact of the preconscious activity allowing dreams to take their course. Such phrases as 'the return of the mind in dreams to an embryonic point of view' or the words used by Havelock Ellis to describe dreams - 'an archaic world of vast emotions and imperfect thoughts' - strike us as happy anticipations of our own assertions that primitive modes of activity which are suppressed during the day are concerned in the construction of dreams. We have been able to accept entirely as our own what Sully has written: 'Our dreams are a means of conserving these successive personalities. When asleep we go back to the old ways of looking at things and of feeling about them, to impulses and activities which long ago dominated us'. For us no less than for Delage what has been 'suppressed' has become 'the motive force of dreams.'

[1900a, 1018]
In the most favourable cases the generation of unpleasure ceases along with the withdrawal of cathexis from the transference thoughts in the Pcs.; and this outcome signifies that the intervention of the unpleasure principle has served a useful purpose. But it is another matter when the repressed unconscious wish receives an organic reinforcement, which it passes on to its transference thoughts; in that way it may place them in a position to make an attempt at forcing their way through with their excitation, even if they have lost their cathexis from the Pcs. There then follows a defensive struggle - for the Pcs. in turn reinforces its opposition to the repressed thoughts (i.e. produces an 'anticathexis') - and thereafter the transference thoughts, which are the vehicles of the unconscious wish, force their way through in some form of compromise which is reached by the production of a symptom. But from the moment at which the repressed thoughts are strongly cathected by the unconscious wishful impulse and, on the other hand, abandoned by the preconscious cathexis, they become subject to the primary psychical process and their one aim is motor discharge or, if the path is open, hallucinatory revival of the desired perceptual identity. We have already found empirically that the irrational processes we have described are only carried out with thoughts that are under repression. We can now see our way a little further into the whole position. The irrational processes which occur in the psychical apparatus are the primary ones. They appear wherever ideas are abandoned by the preconscious cathexis, are left to themselves and can become charged with the uninhibited energy from the unconscious which is striving to find an outlet. Some other observations lend support to the view that these processes which are described as irrational are not in fact falsifications of normal processes - intellectual errors - but are modes of activity of the psychical apparatus that have been freed from an inhibition. Thus we find that the transition from preconscious excitation to movement is governed by the same processes, and that the linking of preconscious ideas to words may easily exhibit the same displacements and confusions, which are then attributed to inattention. Evidence, finally, of the increase in activity which becomes necessary when these primary modes of functioning are inhibited is to be found in the fact that we produce a comic effect, that is, a surplus of energy which has to be discharged in laughter, if we allow these modes of thinking to force their way through into consciousness.

We must, however, put off discussing this difficulty till we can focus our interest upon the system Cs. itself. In the present connection we may be allowed to assume that hallucination consists in a cathexis of the system Cs. (Pcs.), which, however, is not effected - as normally - from without, but from within, and that a necessary condition for the occurrence of hallucination is that regression shall be carried far enough to reach this system itself and in so doing be able to pass over reality-testing.¹

Let us now bring together what our researches into child psychology have contributed to our understanding of dreams. We have not only found that the material of the forgotten experiences of childhood is accessible to dreams, but we have also seen that the mental life of children with all its characteristics, its egoism, its incestuous choice of love-objects, and so on, still persists in dreams - that is, in the unconscious, and that dreams carry us back every night to this infantile level. The fact is thus confirmed that what is unconscious in mental life is also what is infantile. The strange impression of there being so much evil in people begins to diminish. This frightful evil is simply the initial, primitive, infantile part of mental life, which we can find in actual operation in children, but which, in part, we overlook in them on account of their small size, and which in part we do not take seriously since we do not expect any high ethical standard from children. Since dreams regress to this level, they give the appearance of having brought to light the evil in us. But this is a deceptive appearance, by which we have allowed ourselves to be scared. We are not so evil as we were inclined to suppose from the interpretation of dreams.

[1900a, 1032]

[1917d, 3036]

[1916-1917, 3298]
If these evil impulses in dreams are merely infantile phenomena, a return to the beginnings of our ethical development (since dreams simply make us into children once more in our thoughts and feelings), we need not, if we are reasonable, be ashamed of these evil dreams. But what is reasonable is only a part of mental life, a number of other things take place in the mind which are not sensible; and so it happens that we are ashamed of these dreams in an unreasonable way. We subject them to the dream-censorship, we are ashamed and angry if, as an exception, one of these wishes succeeds in making its was into consciousness in such an undistorted form that we are obliged to recognize it; indeed we are occasionally as ashamed of a distorted dream as if we understood it. Only think of the indignant judgement which the excellent elderly lady passed on her uninterpreted dream of the ‘love services’. So the problem is not yet cleared up, and it is still possible that further consideration of the evil in dreams may lead us to form another judgement and arrive at another estimate of human nature.

Let us recall that we have said that the dream-work makes a translation of the dream-thoughts into a primitive mode of expression similar to picture-writing. All such primitive systems of expression, however, are characterized by indefiniteness and ambiguity of this sort, without justifying us in casting doubts on their serviceability. The coalescence of contraries in the dream-work is, as you know, analogous to the so-called ‘antithetical meaning of primal words’ in the most ancient languages. Indeed, Abel (1884), the philologist to whom we owe this line of thought, implores us not to suppose that communications made by one person to another with the help of such ambivalent words were on that account ambiguous. On the contrary, intonation and gesture must have made it quite certain in the context of the speech which of the two contraries the speaker intended to convey. In writing, where gesture is absent, its place was taken by an additional pictograph which was not intended to be spoken - for instance by a picture of a little man, limply squatting or stiffly erect, according to whether the ambiguous hieroglyph ‘ken’ was to mean ‘weak’ or ‘strong’. In this way, in spite of the ambiguity of the sounds and signs, misunderstanding was avoided.

In this way, in spite of the ambiguity of the sounds and signs, misunderstanding was avoided.

The Dynamic Theory of Dream-Formation. The motive power for the formation of dreams is not provided by the latent dream-thoughts or day's residues, but by an unconscious impulse, repressed during the day, with which the day's residues have been able to establish contact and which contrives to make a wish-fulfilment for itself out of the material of the latent thoughts. Thus every dream is on the one hand the fulfilment of a wish on the part of the unconscious and on the other hand (in so far as it succeeds in guarding the state of sleep against being disturbed) the fulfilment of the normal wish to sleep which set the sleep going. If we disregard the unconscious contribution to the formation of the dream and limit the dream to its latent thoughts, it can represent anything with which waking life has been concerned - a reflection, a warning, an intention, a preparation for the immediate future or, once again, the satisfaction of an unfulfilled wish. The unrecognizability, strangeness and absurdity of the manifest dream are partly the result of the translation of the thoughts into a different, so to say archaic, method of expression, but partly the effect of a restrictive, critically disapproving agency in the mind which does not entirely cease to function during sleep. It is plausible to suppose that the ‘dream-censorship’, which we regard as being responsible in the first instance for the distortion of the dream-thoughts into the manifest dream, is an expression of the same mental forces which during the day-time had held back or repressed the unconscious wishful impulse.

[1916-1917, 3299]

[1916-1917, 3316]

The Dynamic Theory of Dream-Formation. The motive power for the formation of dreams is not provided by the latent dream-thoughts or day's residues, but by an unconscious impulse, repressed during the day, with which the day's residues have been able to establish contact and which contrives to make a wish-fulfilment for itself out of the material of the latent thoughts. Thus every dream is on the one hand the fulfilment of a wish on the part of the unconscious and on the other hand (in so far as it succeeds in guarding the state of sleep against being disturbed) the fulfilment of the normal wish to sleep which set the sleep going. If we disregard the unconscious contribution to the formation of the dream and limit the dream to its latent thoughts, it can represent anything with which waking life has been concerned - a reflection, a warning, an intention, a preparation for the immediate future or, once again, the satisfaction of an unfulfilled wish. The unrecognizability, strangeness and absurdity of the manifest dream are partly the result of the translation of the thoughts into a different, so to say archaic, method of expression, but partly the effect of a restrictive, critically disapproving agency in the mind which does not entirely cease to function during sleep. It is plausible to suppose that the ‘dream-censorship’, which we regard as being responsible in the first instance for the distortion of the dream-thoughts into the manifest dream, is an expression of the same mental forces which during the day-time had held back or repressed the unconscious wishful impulse.

[1923a, 3918]
This piece of the dream-work gives us information about some of the most striking and peculiar features of dreams. I will repeat the course of events in dream-formation. As an introduction: the wish to sleep and intentional turning away from the external world. Next, two consequences of this for the mental apparatus: first, the possibility for older and more primitive methods of working to emerge in it - regression; secondly, the lowering of the resistance due to repression which weighs down upon the unconscious. As a result of this last factor the possibility arises for the formation of a dream and this is taken advantage of by the precipitating causes, the internal and external stimuli which have become active. The dream which originates in this way is already a compromise-structure. It has a double function; on the one hand it is ego-syntonic, since, by getting rid of the stimuli which are interfering with sleep, it serves the wish to sleep; on the other hand it allows a repressed instinctual impulse to obtain the satisfaction that is possible in these circumstances, in the form of the hallucinated fulfilment of a wish. The whole process of forming a dream which is permitted by the sleeping ego is, however, subject to the condition of the censorship, which is exercised by the residue of the repression still in operation. I cannot present the process more simply: it is not more simple. But I can proceed now with my description of the dream-work.

[1933a, 4632]

Let us go back once more to the latent dream-thoughts. Their most powerful element is the repressed instinctual impulse which has created in them an expression for itself on the basis of the presence of chance stimuli and by transference on to the day's residues - though an expression that is toned down and disguised. Like every instinctual impulse, it too presses for satisfaction by action; but its path to motility is blocked by the physiological regulations implied in the state of sleep; it is compelled to take the backwards course in the direction of perception and to be content with a hallucinated satisfaction. The latent dream-thoughts are thus transformed into a collection of sensory images and visual scenes. It is as they travel on this course that what seems to us so novel and so strange occurs to them. All the linguistic instruments by which we express the subtler relations of thought - the conjunctions and prepositions, the changes in declension and conjugation - are dropped, because there are no means of representing them; just as in a primitive language without any grammar, only the raw material of thought is expressed and abstract terms are taken back to the concrete ones that are at their basis. What is left over after this may well appear disconnected. The copious employment of symbols, which have become alien to conscious thinking, for representing certain objects and processes is in harmony alike with the archaic regression in the mental apparatus and with the demands of the censorship.

[1933a, 4632]
This dream was the basis of an interesting discussion between Le Lorrain (1894) and Egger (1895) in the *Revue philosophique*. The question raised was whether and how it was possible for a dreamer to compress such an apparently superabundant quantity of material into the short period elapsing between his perceiving the rousing stimulus and his waking.

Of the superior faculties which even a sober comparison may be inclined to attribute to dream-life, the most marked is that of memory; we have already discussed at length the not uncommon evidence in favour of this view. Another point of superiority in dream-life, often praised by earlier writers - that it rises superior to distance in time and space - may easily be shown to have no basis in fact. As Hildebrandt (1875) points out, this advantage is an illusory one; for dreaming rises superior to time and space in precisely the same way as does waking thought, and for the very reason that it is merely a form of thought. It has been claimed for dreams that they enjoy yet another advantage over waking life in relation to time - that they are independent of the passage of time in yet another respect. Dreams such as the one dreamt by Maury of his own guillotining (see above, p. 539 f.) seem to show that a dream is able to compress into a very short space of time an amount of perceptual matter far greater than the amount of ideational matter that can be dealt with by our waking mind. This conclusion has however been countered by various arguments; since the papers by Le Lorrain (1894) and Egger (1895) on the apparent duration of dreams, a long and interesting discussion on the subject has developed, but it seems unlikely that the last word has yet been said on this subtle question and the deep implications which it involves.¹

Hildebrandt presents us with a far deeper analysis of this mingled rejection and acceptance of responsibility for the moral content of dreams. He argues that in considering the immoral appearance of dreams allowance must be made for the dramatic form in which they are couched, for their compression of the most complicated processes of reflection into the briefest periods of time, as well as for the way in which, as even he admits, the ideational elements of dreams become confused and deprived of their significance. He confesses that he has the greatest hesitation, nevertheless, in thinking that all responsibility for sins and faults in dreams can be repudiated.

If we return for a moment to the point that the dream-work is glad to make use of a ready-made phantasy instead of putting one together out of the material of the dream-thoughts, we may perhaps find ourselves in a position to solve one of the most interesting puzzles connected with dreams. On pp. 568 ff. I told the well-known anecdote of how Maury, having been struck in his sleep on the back of his neck by a piece of wood, woke up from a long dream which was like a full-length story set in the days of the French Revolution. Since the dream, as reported, was a coherent one and was planned entirely with an eye to providing an explanation of the stimulus which woke him and whose occurrence he could not have anticipated, the only possible hypothesis seems to be that the whole elaborate dream must have been composed and must have taken place in the short period of time between the contact of the board with Maury's cervical vertebrae and his consequent awakening. We should never dare to attribute such rapidity to thought-activity in waking life, and we should therefore be driven to conclude that the dream-work possesses the advantage of accelerating our thought-processes to a remarkable degree.

¹ [1900a, 540]

² [1900a, 572]

³ [1900a, 576]

⁴ [1900a, 935]
Strong objections have been raised to what quickly became a popular conclusion by some more recent writers (Le Lorrain, 1894 and 1895, Egger, 1895, and others). On the one hand they throw doubts upon the accuracy of Maury's account of his dream; and on the other hand they attempt to show that the rapidity of the operations of our waking thoughts is no less than in this dream when exaggerations have been discounted. The discussion raised questions of principle which do not seem to me immediately soluble. But I must confess that the arguments brought forward (by Egger, for instance), particularly against Maury's guillotine dream, leave me unconvinced. I myself would propose the following explanation of this dream. Is it so highly improbable that Maury's dream represents a phantasy which had been stored up ready-made in his memory for many years and which was aroused - or I would rather say 'alluded to' - at the moment at which he became aware of the stimulus which woke him? If this were so, we should have escaped the whole difficulty of understanding how such a long story with all its details could have been composed in the extremely short period of time which was at the dreamer's disposal - for the story would have been composed already. If the piece of wood had struck the back of Maury's neck while he was awake, there would have been an opportunity for some such thought as: 'That's just like being guillotined.' But since it was in his sleep that he was struck by the board, the dream-work made use of the impinging stimulus in order rapidly to produce a wish-fulfilment; it was as though it thought (this is to be taken purely figuratively): 'Here's a good opportunity of realizing a wishful phantasy which was formed at such and such a time in the course of reading.' It can hardly be disputed, I think, that the dream-story was precisely of a sort likely to be constructed by a young man under the influence of powerfully exciting impressions. Who - least of all what Frenchman or student of the history of civilization - could fail to be gripped by narratives of the Reign of Terror, when the men and women of the aristocracy, the flower of the nation, showed that they could die with a cheerful mind and could retain the liveliness of their wit and the elegance of their manners till the very moment of the fatal summons? How tempting for a young man to plunge into all this in his imagination - to picture himself bidding a lady farewell - kissing her hand and mounting the scaffold unafraid! Or, if ambition were the prime motive of the phantasy, how tempting for him to take the place of one of those formidable figures who, by the power alone of their thoughts and flaming eloquence, ruled the city in which the heart of humanity beat convulsively in those days - who were led by their convictions to send thousands of men to their death and who prepared the way for the transformation of Europe, while all the time their own heads were insecure and destined to fall one day beneath the knife of the guillotine - how tempting to picture himself as one of the Girondists, perhaps, or as the heroic Danton! There is one feature in Maury's recollection of the dream, his being 'led to the place of execution, surrounded by an immense mob', which seems to suggest that his phantasy was in fact of this ambitious type.

Nor is it necessary that this long-prepared phantasy should have been gone through during sleep; it would have been sufficient for it to be merely touched on. What I mean is this. If a few bars of music are played and someone comments that it is from Mozart's *Figaro* (as happens in *Don Giovanni*) a number of recollections are roused in me all at once, none of which can enter my consciousness singly at the first moment. The key-phrase serves as a port of entry through which the whole network is simultaneously put in a state of excitation. It may well be the same in the case of unconscious thinking. The rousing stimulus excites the psychical port of entry which allows access to the whole guillotine phantasy. But the phantasy is not gone through during sleep but only in the recollection of the sleeper after his awakening. After waking he remembers in all its details the phantasy which was stirred up as a whole in his dream. One has no means of assuring oneself in such a case that one is really remembering something one has dreamt. This same explanation - that it is a question of ready-made phantasies which are brought into excitation as a whole by the rousing stimulus - can be applied to other dreams which are focused upon a rousing stimulus, such, for instance, as Napoleon's battle dream before the explosion of the infernal machine.
Among the dreams collected by Justine Tobowolska in her dissertation on the apparent passage of time in dreams, the most informative seems to me to be the one reported by Macario (1857) as having been dreamt by a dramatic author, Casimir Bonjour. One evening Bonjour wanted to attend the first performance of one of his pieces; but he was so fatigued that as he was sitting behind the scenes he dozed off just at the moment the curtain went up. During his sleep he went through the whole five acts of the play, and observed all the various signs of emotion shown by the audience during the different scenes. At the end of the performance he was delighted to hear his name being shouted with the liveliest demonstrations of applause. Suddenly he woke up. He could not believe either his eyes or his ears, for the performance had not gone beyond the first few lines of the first scene; he could not have been asleep for longer than two minutes. It is surely not too rash to suppose in the case of this dream that the dreamer's going through all five acts of the play and observing the attitude of the public to different passages in it need not have arisen from any fresh production of material during his sleep, but may have reproduced a piece of phantasy-activity (in the sense I have described) which had already been completed. Tobowolska, like other writers, emphasizes the fact that dreams with an accelerated passage of ideas have the common characteristic of seeming specially coherent, quite unlike other dreams, and that the recollection of them is summary far more than detailed. This would indeed be a characteristic which ready-made phantasies of this kind, touched upon by the dream-work, would be bound to possess, though this is a conclusion which the writers in question fail to draw. I do not assert, however, that all arousal dreams admit of this explanation, or that the problem of the accelerated passage of ideas in dreams can be entirely dismissed in this fashion.

[1900a, 936]

But it seems to me unnecessary to suppose that dream-processes really maintain, up to the moment of becoming conscious, the chronological order in which I have described them: that the first thing to appear is the transferred dream-wish, that distortion by the censorship follows, then the regressive change in direction, and so on. I have been obliged to adopt this order in my description; but what happens in reality is no doubt a simultaneous exploring of one path and another, a swinging of the excitation now this way and now that, until at last it accumulates in the direction that is most opportune and one particular grouping becomes the permanent one. Certain personal experiences of my own lead me to suspect that the dream-work often requires more than a day and a night in order to achieve its result; and if this is so, we need no longer feel any amazement at the extraordinary ingenuity shown in the construction of the dream. In my opinion even the demand for the dream to be made intelligible as a perceptual event may be put into effect before the dream attracts consciousness to itself. From then onwards, however, the pace is accelerated, for at that point a dream is treated in the same fashion as anything else that is perceived. It is like a firework, which takes hours to prepare but goes off in a moment.

[1900a, 1005]

The view that the dream-process is a rapid or instantaneous one is in our opinion correct as regards the perception by consciousness of the preconstructed dream-content; it seems probable that the preceding portions of the dream-process run a slow and fluctuating course. We have been able to contribute towards the solution of the riddle of dreams which contain a great amount of material compressed into the briefest moment of time; we have suggested that it is a question in such cases of getting hold of ready-made structures already present in the mind.

[1900a, 1017]
A dream, as we have discovered, takes the place of a number of thoughts which are derived from our daily life and which form a completely logical sequence. We cannot doubt, then, that these thoughts originate from our normal mental life. All the attributes which we value highly in our trains of thought, and which characterize them as complex achievements of a high order, are to be found once more in dream-thoughts. There is no need to assume, however, that this activity of thought is performed during sleep - a possibility which would gravely confuse what has hitherto been our settled picture of the psychical state of sleep. On the contrary, these thoughts may very well have originated from the previous day, they may have proceeded unobserved by our consciousness from their start, and may already have been completed at the onset of sleep. The most that we can conclude from this is that it proves that the most complicated achievements of thought are possible without the assistance of consciousness - a fact which we could not fail to learn in any case from every psycho-analysis of a patient suffering from hysteria or from obsessional ideas. These dream-thoughts are certainly not in themselves inadmissible to consciousness; there may have been a number of reasons for their not having become conscious to us during the day. Becoming conscious is connected with the application of a particular psychical function, that of attention - a function which, as it seems, is only available in a specific quantity, and this may have been diverted from the train of thought in question on to some other purpose. There is another way, too, in which trains of thought of this kind may be withheld from consciousness. The course of our conscious reflections shows us that we follow a particular path in our application of attention. If, as we follow this path, we come upon an idea which will not bear criticism, we break off: we drop the cathexis of attention. Now it seems that the train of thought which has thus been initiated and dropped can continue to spin itself out without attention being turned to it again, unless at some point or other it reaches a specially high degree of intensity which forces attention to it. Thus, if a train of thought is initially rejected (consciously, perhaps) by a judgement that it is wrong or that it is useless for the immediate intellectual purposes in view, the result may be that this train of thought will proceed, unobserved by consciousness, until the onset of sleep.

To sum up - we describe a train of thought such as this as 'preconscious'; we regard it as completely rational and believe that it may either have been simply neglected or broken off and suppressed. Let us add a frank account of how we picture the occurrence of a train of ideas. We believe that, starting from a purposive idea, a given amount of excitation, which we term 'cathectic energy', is displaced along the associative paths selected by that purposive idea. A train of thought which is 'neglected' is one which has not received this cathexis; a train of thought which is 'suppressed' or 'repudiated' is one from which this cathexis has been withdrawn. In both cases they are left to their own excitations. Under certain conditions a train of thought with a purposive cathexis is capable of attracting the attention of consciousness to itself and in that event, through the agency of consciousness, receives a 'hypercathexis.' We shall be obliged presently to explain our view of the nature and function of consciousness.
A train of thought that has been set going like this in the preconscious may either cease spontaneously or persist. We picture the first of these outcomes as implying that the energy attaching to the train of thought is diffused along all the associative paths that radiate from it; this energy sets the whole network of thoughts in a state of excitation which lasts for a certain time and then dies away as the excitation in search of discharge becomes transformed into a quiescent cathexis. If this first outcome supervenes, the process is of no further significance so far as dream-formation is concerned. Lurking in our preconscious, however, there are other purposive ideas, which are derived from sources in our unconscious and from wishes which are always on the alert. These may take control of the excitation attaching to the group of thoughts which has been left to its own devices, they may establish a connection between it and an unconscious wish, and they may ‘transfer’ to it the energy belonging to the unconscious wish. Thenceforward the neglected or suppressed train of thought is in a position to persist, though the reinforcement it has received gives it no right of entry into consciousness. We may express this by saying that what has hitherto been a preconscious train of thought has now been ‘drawn into the unconscious.’

It would be a mistake, however, to suppose that these dream-facades are nothing other than mistaken and somewhat arbitrary revisions of the dream-content by the conscious agency of our mental life. In the erection of a dream-facade use is not infrequently made of wishful phantasies which are present in the dream-thoughts in a pre-constructed form, and are of the same character as the appropriately named ‘day-dreams’ familiar to us in waking life. The wishful phantasies revealed by analysis in night-dreams often turn out to be repetitions or modified versions of scenes from infancy; thus in some cases the facade of the dream directly reveals the dream’s actual nucleus, distorted by an admixture of other material.

Among the derivatives of the Ucs. instinctual impulses, of the sort we have described, there are some which unite in themselves characters of an opposite kind. On the one hand, they are highly organized, free from self-contradiction, have made use of every acquisition of the system Cs. and would hardly be distinguished in our judgement from the formations of that system. On the other hand they are unconscious and are incapable of becoming conscious. Thus qualitatively they belong to the system Pcs., but factually to the Ucs. Their origin is what decides their fate. We may compare them with individuals of mixed race who, taken all round, resemble white men, but who betray their coloured descent by some striking feature or other, and on that account are excluded from society and enjoy none of the privileges of white people. Of such a nature are those phantasies of normal people as well as of neurotics which we have recognized as preliminary stages in the formation both of dreams and of symptoms and which, in spite of their high degree of organization, remain repressed and therefore cannot become conscious. They draw near to consciousness and remain undisturbed so long as they do not have an intense cathexis, but as soon as they exceed a certain height of cathexis they are thrust back. Substitutive formations, too, are highly organized derivatives of the Ucs. of this kind; but these succeed in breaking through into consciousness, when circumstances are favourable - for example, if they happen to join forces with an anticathexis from the Pcs.
The manifestations of a compulsion to repeat (which we have described as occurring in the early activities of infantile mental life as well as among the events of psycho-analytic treatment) exhibit to a high degree an instinctual character and, when they act in opposition to the pleasure principle, give the appearance of some 'daemonic' force at work. In the case of children's play we seemed to see that children repeat unpleasurable experiences for the additional reason that they can master a powerful impression far more thoroughly by being active than they could by merely experiencing it passively. Each fresh repetition seems to strengthen the mastery they are in search of. Nor can children have their pleasurable experiences repeated often enough, and they are inexorable in their insistence that the repetition shall be an identical one. This character trait disappears later on. If a joke is heard for a second time it produces almost no effect; a theatrical production never creates so great an impression the second time as the first; indeed, it is hardly possible to persuade an adult who has very much enjoyed reading a book to re-read it immediately. Novelty is always the condition of enjoyment. But children will never tire of asking an adult to repeat a game that he has shown them or played with them, till he is too exhausted to go on. And if a child has been told a nice story, he will insist on hearing it over and over again rather than a new one; and he will remorselessly stipulate that the repetition shall be an identical one and will correct any alterations of which the narrator may be guilty - though they may actually have been made in the hope of gaining fresh approval. None of this contradicts the pleasure principle; repetition, the re-experiencing of something identical, is clearly in itself a source of pleasure. In the case of a person in analysis, on the contrary, the compulsion to repeat the events of his childhood in the transference evidently disregards the pleasure principle in every way. The patient behaves in a purely infantile fashion and thus shows us that the repressed memory-traces of his primaeval experiences are not present in him in a bound state and are indeed in a sense incapable of obeying the secondary process. It is to this fact of not being bound, moreover, that they owe their capacity for forming, in conjunction with the residues of the previous day, a wishful phantasy that emerges in a dream. This same compulsion to repeat frequently meets us as an obstacle to our treatment when at the end of an analysis we try to induce the patient to detach himself completely from his physician. It may be presumed, too, that when people unfamiliar with analysis feel an obscure fear - a dread of rousing something that, so they feel, is better left sleeping - what they are afraid of at bottom is the emergence of this compulsion with its hint of possession by some 'daemonic' power.

There remains one element of the apparently intimate connection between telepathy and dreams which is not affected by any of these considerations: namely, the incontestable fact that sleep creates favourable conditions for telepathy. Sleep is not, it is true, indispensable to the occurrence of telepathic processes - whether they originate in messages or in unconscious activity. If you are not already aware of this, you will learn it from the instance given by our second correspondent, of the young man's message which came between nine and ten in the morning. We must add, however, that no one has a right to take exception to telepathic occurrences if the event and the intimation (or message) do not exactly coincide in astronomical time. It is perfectly conceivable that a telepathic message might arrive contemporaneously with the event and yet only penetrate to consciousness the following night during sleep (or even in waking life only after a while, during some pause in the activity of the mind). We are, as you know, of opinion that dream-formation itself does not necessarily wait for the onset of sleep before it begins. Often the latent dream-thoughts may have been being got ready during the whole day, till at night they find the contact with the unconscious wish that shapes them into a dream. But if the phenomenon of telepathy is only an activity of the unconscious mind, then, of course, no fresh problem lies before us. The laws of unconscious mental life may then be taken for granted as applying to telepathy.
After these influences have been brought to bear upon the dream-thoughts the dream is almost complete. A further, somewhat variable, factor also comes into play - known as 'secondary revision' - after the dream has been presented before consciousness as an object of perception. At that point we treat it as we are in general accustomed to treat the contents of our perception: we fill in gaps and introduce connections, and in doing so are often guilty of gross misunderstandings. But this activity, which might be described as a rationalizing one and which at best provides the dream with a smooth façade that cannot fit its true content, may also be omitted or only be expressed to a very modest degree - in which case the dream will display all its rents and cracks openly. It must not be forgotten, on the other hand, that the dream-work does not always operate with equal energy either; it often restricts itself to certain portions of the dream-thoughts only and others of them are allowed to appear in the dream unaltered. In such cases an impression is given of the dream having carried out the most delicate and complex intellectual operations, of its having speculated, made jokes, arrived at decisions and solved problems, whereas all this is a product of our normal mental activity, may have been performed equally well during the day before the dream as during the night, has nothing to do with the dream-work and brings nothing to light that is characteristic of dreams. Nor is it superfluous to insist once more on the contrast within the dream-thoughts themselves between the unconscious instinctual impulse and the day's residues. While the latter exhibit all the multiplicity of our mental acts, the former, which becomes the motive force proper of the forming of the dream, finds its outlet invariably in the fulfilment of a wish.

[1933a, 4634]
Examples of this kind leave an impression that of all the sources of dreams the best confirmed are objective sensory stimuli during sleep. Moreover they are the only sources whatever taken into account by laymen. If an educated man, who is unacquainted with the literature of dreams, is asked how dreams arise, he will infallibly answer with a reference to some instance he has come across in which a dream was explained by an objective sensory stimulus discovered after waking. Scientific enquiry, however, cannot stop there. It finds an occasion for further questions in the observed fact that the stimulus which impinges on the senses during sleep does not appear in the dream in its real shape but is replaced by another image in some way related to it. But the relation connecting the stimulus of the dream to the dream which is its result is, to quote Maury’s words (1854, 72); ‘une affinité quelconque, mais qui n’est pas unique et exclusive.’¹ Let us consider in this connection three of Hildebrandt’s alarm-clock dreams (1875, 37 f.). The question they raise is why the same stimulus should have provoked three such different dreams and why it should have provoked these rather than any other.

[1900a, 540]

At this point we are faced with a choice between two alternatives. We may admit it as a fact that it is impossible to follow the laws governing the formation of dreams any further; and we may accordingly refrain from enquiring whether there may not be other determinants governing the interpretation put by the dreamer upon the illusion called up by the sense-impression. Or, on the other hand, we may have a suspicion that the sensory stimulus which impinges on the sleeper plays only a modest part in generating his dream and that other factors determine the choice of the mnemic images which are to be aroused in him. In fact, if we examine Maury’s experimentally produced dreams (which I have related in such detail for this very reason), we shall be tempted to say that the experiment in fact accounts for the origin of only one element of the dreams; the rest of their content seems too self-contained, too definite in its details, to be explicable solely by the necessity for fitting in with the element experimentally introduced from outside. Indeed, one begins to have doubts about the illusion theory and about the power of objective impressions to give a shape to dreams when one finds that those impressions are sometimes subjected in dreams to the most peculiar and far-fetched interpretations. Thus Simon (1888) tells us of a dream in which he saw some gigantic figures seated at table and clearly heard the frightful snapping noise made by their jaws coming together as they chewed. When he awoke he heard the beat of a horse’s hooves galloping past his window. The noise made by the horse’s hooves may have suggested ideas from a group of memories connected with Gulliver’s Travels - the giants of Brobdingnag and the virtuous Houyhnhnms - if I may venture on an interpretation without the dreamer's assistance. Is it not probable, then, that the choice of such an unusual group of memories as these was facilitated by motives other than the objective stimulus alone?¹

[1900a, 542]
In spite of any objections to the contrary, it has to be admitted that the part played by objective sensory excitations during sleep in provoking dreams remains indisputable. And if such stimuli may appear, from their nature and frequency, insufficient to explain every dream-image, we shall be encouraged to seek for other sources of dreams analogous to them in their operation. I cannot say when the idea first cropped up of taking *internal* (subjective) excitations of the sense organs into account alongside of the *external* sensory stimuli. It is, however, the case that this is done, more or less explicitly, in all the more recent discussions of the aetiology of dreams. 'An essential part is also played, I believe', writes Wundt (1874, 657), 'in the production of the illusions that occur in dreams by the subjective visual and auditory sensations which are familiar to us in the waking state as the formless areas of luminosity which become visible to us when our field of vision is darkened, as ringing or buzzing in the ears, and so on. Especially important among these are the subjective excitations of the retina. It is in this way that is to be explained the remarkable tendency of dreams to conjure up before the eyes similar or identical objects in large numbers. We see before us innumerable birds or butterflies or fishes or coloured beads or flowers, etc. Here the luminous dust in the darkened field of vision has taken on a fantastic shape, and the numerous specks of which it consists are incorporated into the dream as an equal number of separate images; and these, on account of their mobility, are regarded as moving objects. -This is no doubt also the basis of the great fondness shown by dreams for animal figures of every sort; for the immense variety of such forms can adjust itself easily to the particular form assumed by the subjective luminous images.' [1900a, 543]
Nevertheless, though these facts are established beyond a doubt, their importance for the study of the sources of dreams is not so great as might have been hoped. Dreams are phenomena which occur in healthy people - perhaps in everyone, perhaps every night - and it is obvious that organic illness cannot be counted among its indispensable conditions. And what we are concerned with is not the origin of certain special dreams but the source that instigates the ordinary dreams of normal people.
[1900a, 547]
We have already explored the fiction of a primitive psychical apparatus whose activities are regulated by an effort to avoid an accumulation of excitation and to maintain itself so far as possible without excitation. For that reason it is built upon the plan of a reflex apparatus. The power of movement, which is in the first instance a means of bringing about internal alterations in its body, is at its disposal as the path to discharge. We went on to discuss the psychical consequences of an 'experience of satisfaction'; and in that connection we were already able to add a second hypothesis, to the effect that the accumulation of excitation (brought about in various ways that need not concern us) is felt as unpleasure and that it sets the apparatus in action with a view to repeating the experience of satisfaction, which involved a diminution of excitation and was felt as pleasure. A current of this kind in the apparatus, starting from unpleasure and aiming at pleasure, we have termed a 'wish'; and we have asserted that only a wish is able to set the apparatus in motion and that the course of the excitation in it is automatically regulated by feelings of pleasure and unpleasure. The first wishing seems to have been a hallucinatory cathecting of the memory of satisfaction. Such hallucinations, however, if they were not to be maintained to the point of exhaustion, proved to be inadequate to bring about the cessation of the need or, accordingly, the pleasure attaching to satisfaction.

[1900a, 1025]
At this point an objection arises, which is based on a better knowledge of unconscious processes. I myself have asserted that unconscious wishes are always active. But in spite of this they seem not to be strong enough to make themselves perceptible during the day. If, however, while a state of sleep prevails, an unconscious wish has shown itself strong enough to construct a dream and arouse the preconscious with it, why should this strength fail after the dream has been brought to knowledge? Should not the dream continue to recur perpetually, precisely as the vexatious fly keeps on coming back after it has been driven away? What right have we to assert that dreams get rid of the disturbance of sleep?

Thus there are two possible outcomes for any particular unconscious excitatory process. Either it may be left to itself, in which case it eventually forces its way through at some point and on this single occasion finds discharge for its excitation in movement; or it may come under the influence of the preconscious, and its excitation, instead of being discharged, may be bound by the preconscious. This second alternative is the one which occurs in the process of dreaming. The cathexis from the Pcs. which goes halfway to meet the dream after it has become perceptual, having been directed on to it by the excitation in consciousness, binds the dream's unconscious excitation and makes it powerless to act as a disturbance. If it is true that the dreamer wakes for an instant, yet he really has brushed away the fly that was threatening to disturb his sleep. It begins to dawn on us that it actually is more expedient and economical to allow the unconscious wish to take its course, to leave the path to regression open to it so that it can construct a dream, and then to bind the dream and dispose of it with a small expenditure of preconscious work - rather than to continue keeping a tight rein on the unconscious throughout the whole period of sleep. It was indeed to be expected that dreaming, even though it may originally have been a process without a useful purpose, would have procured itself some function in the interplay of mental forces. And we can now see what that function is. Dreaming has taken on the task of bringing back under control of the preconscious the excitation in the Ucs. which has been left free; in so doing, it discharges the Ucs. excitation, serves it as a safety valve and at the same time preserves the sleep of the preconscious in return for a small expenditure of waking activity. Thus, like all the other psychical structures in the series of which it is a member, it constitutes a compromise; it is in the service of both of the two systems since it fulfills the two wishes in so far as they are compatible with each other. If we turn back to the 'excretion theory' of dreams put forward by Robert, which I explained on p. 586 ff., we shall see at a glance that in its essence we must accept his account of the function of dreams, though differing from him in his premises and in his view of the dream-process itself.¹

[1900a, 1006]
In the case of children's dreams there should be no difficulty in accepting this statement. The state of sleep or the psychical modification involved in sleep, whatever that may be, is brought about by a resolve to sleep which is either imposed upon the child or is reached on the basis of sensations of fatigue; and it is only made possible by the withholding of stimuli which might suggest to the psychical apparatus aims other than that of sleeping. The means by which external stimuli can be kept off are familiar to us; but what are the means available for controlling internal mental stimuli which set themselves against falling asleep? Let us observe a mother putting her child to sleep. The child gives vent to an unceasing stream of desires: he wants one more kiss, he wants to go on playing. His mother satisfies some of these desires, but uses her authority to postpone others of them to the next day. It is clear that any wishes or needs that may arise have an inhibiting effect upon falling asleep. We all know the amusing story told by Balduin Groller of the bad little boy who woke up in the middle of the night and shouted across the nursery: 'I want the rhino!' A better behaved child, instead of shouting, would have dreamt that he was playing with the rhino. Since a dream that shows a wish as fulfilled is believed during sleep, it does away with the wish and makes sleep possible. It cannot be disputed that dream-images are believed in this way, for they are clothed in the psychical appearance of perceptions, and children have not yet acquired the later faculty of distinguishing hallucinations or phantasies from reality.

There is no difficulty in discovering the general function of dreaming. It serves the purpose of fending off, by a kind of soothing action, external or internal stimuli which would tend to arouse the sleeper, and thus of securing sleep against interruption. External stimuli are fended off by being given a new interpretation and by being woven into some harmless situation; internal stimuli, caused by instinctual demands, are given free play by the sleeper and allowed to find satisfaction in the formation of dreams, so long as the latent dream-thoughts submit to the control of the censorship. But if they threaten to break free and the meaning of the dream becomes too plain, the sleeper cuts short the dream and wakes in a fright. (Dreams of this class are known as anxiety-dreams.) A similar failure in the function of dreaming occurs if an external stimulus becomes too strong to be fended off. (This is the class of arousal-dreams.) I have given the name of dream-work to the process which, with the co-operation of the censorship, converts the latent thoughts into the manifest content of the dream. It consists of a peculiar way of treating the preconscious material of thought, so that its component parts become condensed, its psychical emphasis becomes displaced, and the whole of it is translated into visual images or dramatized, and completed by a deceptive secondary revision. The dream-work is an excellent example of the processes occurring in the deeper, unconscious layers of the mind, which differ considerably from the familiar normal processes of thought. It also displays a number of archaic characteristics, such as the use of a symbolism (in this case of a predominantly sexual kind) which it has since also been possible to discover in other spheres of mental activity.
Greater theoretical interest, however, attaches to the dreams which have the power to rouse us in the middle of our sleep. Bearing in mind the expediency which is everywhere else the rule, we may ask why a dream, that is, an unconscious wish, is given the power to interfere with sleep, that is, with the fulfilment of the preconscious wish. The explanation no doubt lies in relations of energy of which we have no knowledge. If we possessed such knowledge, we should probably find that allowing the dream to take its course and expending a certain amount of more or less detached attention on it is an economy of energy compared with holding the unconscious as tightly under control at night as in the daytime. Experience shows that dreaming is compatible with sleeping, even if it interrupts sleep several times during the night. One wakes up for an instant and then falls asleep again at once. It is like brushing away a fly in one's sleep: a case of *ad hoc* awakening. If one falls asleep again, the interruption has been disposed of. As is shown by such familiar examples as the sleep of a nursing mother or wet nurse, the fulfilment of the wish to sleep is quite compatible with maintaining a certain expenditure of attention in some particular direction.

Thus there are two possible outcomes for any particular unconscious excitatory process. Either it may be left to itself, in which case it eventually forces its way through at some point and on this single occasion finds discharge for its excitation in movement; or it may come under the influence of the preconscious, and its excitation, instead of being *discharged*, may be *bound* by the preconscious. *This second alternative is the one which occurs in the process of dreaming*. The cathexis from the *Pcs*, which goes halfway to meet the dream after it has become perceptual, having been directed on to it by the excitation in consciousness, binds the dream's unconscious excitation and makes it powerless to act as a disturbance. If it is true that the dreamer wakes for an instant, yet he really has brushed away the fly that was threatening to disturb his sleep. It begins to dawn on us that it actually is more expedient and economical to allow the unconscious wish to take its course, to leave the path to regression open to it so that it can construct a dream, and then to bind the dream and dispose of it with a small expenditure of preconscious work - rather than to continue keeping a tight rein on the unconscious throughout the whole period of sleep. It was indeed to be expected that dreaming, even though it may originally have been a process without a useful purpose, would have procured itself some function in the interplay of mental forces. And we can now see what that function is. Dreaming has taken on the task of bringing back under control of the preconscious the excitation in the *Ucs*, which has been left free; in so doing, it discharges the *Ucs* excitation, serves it as a safety valve and at the same time preserves the sleep of the preconscious in return for a small expenditure of waking activity. Thus, like all the other psychical structures in the series of which it is a member, it constitutes a compromise; it is in the service of both of the two systems since it fulfils the two wishes in so far as they are compatible with each other. If we turn back to the 'excretion theory' of dreams put forward by Robert, which I explained on p. 586 ff., we shall see at a glance that in its essence we must accept his account of the function of dreams, though differing from him in his premises and in his view of the dream-process itself.¹

[1900a, 1006]
We have no difference of opinion over the functions that are to be assigned to dreams. The view that dreams act as a safety valve to the mind and that, in the words of Robert, all kinds of harmful things are made harmless by being presented in a dream - not only does this view coincide exactly with our theory of the double wish-fulfilment brought about by dreams, but the way in which it is phrased is more intelligible to us than to Robert himself. The view that the mind has free play in its functioning in dreams is represented in our theory by the fact of the preconscious activity allowing dreams to take their course. Such phrases as 'the return of the mind in dreams to an embryonic point of view' or the words used by Havelock Ellis to describe dreams - 'an archaic world of vast emotions and imperfect thoughts' - strike us as happy anticipations of our own assertions that primitive modes of activity which are suppressed during the day are concerned in the construction of dreams. We have been able to accept entirely as our own what Sully has written: 'Our dreams are a means of conserving these successive personalities. When asleep we go back to the old ways of looking at things and of feeling about them, to impulses and activities which long ago dominated us'. For us no less than for Delage what has been 'suppressed' has become 'the motive force of dreams.'

Now while this agency, in which we recognize our normal ego, is concentrated on the wish to sleep, it appears to be compelled by the psycho-physiological conditions of sleep to relax the energy with which it is accustomed to hold down the repressed material during the day. In itself, no doubt, this relaxation does no harm; however much the suppressed impulses of the childish mind may prance around, their access to consciousness is still difficult and their access to movement is barred as the result of this same state of sleep. The danger of sleep being disturbed by them must, however, be guarded against. We must in any case suppose that even during deep sleep a certain amount of free attention is on duty as a guard against sensory stimuli, and that this guard may sometimes consider waking more advisable than a continuation of sleep. Otherwise there would be no explanation of how it is that we can be woken up at any moment by sensory stimuli of some particular quality. As the physiologist Burdach insisted long ago, a mother, for instance, will be roused by the whimpering of her baby, or a miller if his mill comes to a stop, or most people if they are called softly by their own name. Now the attention which is thus on guard is also directed towards internal wishful stimuli arising from the repressed material, and combines with them to form the dream which, as a compromise, simultaneously satisfies both of the two agencies. The dream provides a kind of psychical consummation for the wish that has been suppressed (or formed with the help of repressed material) by representing it as fulfilled; but it also satisfies the other agency by allowing sleep to continue. In this respect our ego is ready to behave like a child; it gives credence to the dream images, as though what it wanted to say was: 'Yes, yes! you're quite right, but let me go on sleeping!' The low estimate which we form of dreams when we are awake, and which we relate to their confused and apparently illogical character, is probably nothing other than the judgement passed by our sleeping ego upon the repressed impulses, a judgement based, with better right, upon the motor impotence of these disturbers of sleep. We are sometimes aware in our sleep of this contemptuous judgement. If the content of a dream goes too far in overstepping the censorship, we think: 'After all, it's only a dream!' - and go on sleeping.
The path to perversion branches off sharply from that to neurosis. If these regressions rouse no objection from the ego, no neurosis will come about either; and the libido will arrive at some real, even though no longer normal, satisfaction. But if the ego, which has under its control not only consciousness but also the approaches to motor innervation and accordingly to the realization of mental desires, does not agree with these regressions, conflict will follow. The libido is, as it were, cut off and must try to escape in some direction where, in accordance with the requirements of the pleasure principle, it can find a discharge for its cathexis of energy. It must withdraw from the ego. An escape of this kind is offered it by the fixations on the path of its development which it has now entered on regressively - fixations from which the ego had protected itself in the past by repressions. By cathecting these repressed positions as it flows backward, the libido has withdrawn from the ego and its laws, and has at the same time renounced all the education it has acquired under the ego's influence. It was docile so long as satisfaction beckoned to it; but under the double pressure of external and internal frustration it becomes refractory, and recalls earlier and better times. Such is the libido's fundamentally unchangeable character. The ideas to which it now transfers its energy as a cathexis belong to the system of the unconscious and are subject to the processes which are possible there, particularly to condensation and displacement. In this way conditions are established which completely resemble those in dream-construction. The dream proper, which has been completed in the unconscious and is the fulfilment of an unconscious wishful phantasy, is brought up against a portion of (pre)conscious activity which exercises the office of censorship and which, when it has been indemnified, permits the formation of the manifest dream as a compromise. In the same way, what represents the libido in the unconscious has to reckon with the power of the preconscious ego. The opposition which had been raised against it in the ego pursues it as an 'anticathexis' and compels it to choose a form of expression which can at the same time become an expression of the opposition itself. Thus the symptom emerges as a many-times-distorted derivative of the unconscious libidinal wish-fulfilment, an ingeniously chosen piece of ambiguity with two meanings in complete mutual contradiction. In this last respect, however, there is a distinction between the construction of a dream and of a symptom. For in dream-formation the preconscious purpose is merely concerned to preserve sleep, to allow nothing that would disturb it to make its way into consciousness; it does not insist upon calling out sharply 'No! on the contrary!' to the unconscious wishful impulse. It can afford to be more tolerant because the situation of someone sleeping is less perilous. The state of sleep in itself bars any outlet into reality.

[1916-1917, 3418]
There were now a whole series of questions to be answered, among the most important of them being whether the formation of dreams had a motive, under what conditions it took place, by what methods the dream-thoughts (which are invariably full of sense) become converted into the dream (which is often senseless), and others besides. I attempted to solve all of these problems in *The Interpretation of Dreams*, which I published in the year 1900. I can only find space here for the briefest abstract of my investigation. When the latent dream-thoughts that are revealed by the analysis of a dream are examined, one of them is found to stand out from among the rest, which are intelligible and well known to the dreamer. These latter thoughts are residues of waking life (the *day's residues*, as they are called technically); but the isolated thought is found to be a wishful impulse, often of a very repellent kind, which is foreign to the waking life of the dreamer and is consequently disavowed by him with surprise or indignation. This impulse is the actual constructor of the dream: it provides the energy for its production and makes use of the day's residues as material. The dream which thus originates represents a situation of satisfaction for the impulse, it is the fulfilment of its wish. It would not be possible for this process to take place without being favoured by the presence of something in the nature of a state of sleep. The necessary mental precondition of sleep is the concentration of the ego upon the wish to sleep and the withdrawal of psychical energy from all the interests of life. Since at the same time all the paths of approach to motility are blocked, the ego is also able to reduce the expenditure by which at other times it maintains the repressions. The unconscious impulse makes use of this nocturnal relaxation of repression in order to push its way into consciousness with the dream. But the repressive resistance of the ego is not abolished in sleep but merely reduced. Some of it remains in the shape of a *censorship of dreams* and forbids the unconscious impulse to express itself in the forms which it would properly assume. In consequence of the severity of the censorship of dreams, the latent dream-thoughts are obliged to submit to being altered and softened so as to make the forbidden meaning of the dream recognizable. This is the explanation of *dream-distortion*, which accounts for the most striking characteristics of the manifest dream. We are therefore justified in asserting that *a dream is the (disguised) fulfilment of a (repressed) wish*. It will now be seen that dreams are constructed like a neurotic symptom: they are compromises between the demands of a repressed impulse and the resistance of a censoring force in the ego. Since they have a similar origin they are equally unintelligible and stand in equal need of interpretation.

[1925d, 4219]
You have long been aware that this censorship is not an institution peculiar to dream-life. You know that the conflict between the two psychical agencies, which we - inaccurately - describe as the 'unconscious repressed' and the 'conscious', dominates our whole mental life and that the resistance against the interpretation of dreams, the sign of the dream-censorship, is nothing other than the resistance due to repression by which the two agencies are separated. You know too that the conflict between these two agencies may under certain conditions produce other psychical structures which, like dreams, are the outcome of compromises; and you will not expect me to repeat to you here everything that was contained in my introduction to the theory of the neuroses in order to demonstrate to you what we know of the determinants of the formation of such compromises. You have realized that the dream is a pathological product, the first member of the class which includes hysterical symptoms, obsessions and delusions, but that it is distinguished from the others by its transitoriness and by its occurrence under conditions which are part of normal life. For let us bear firmly in mind that, as was already pointed out by Aristotle, dream life is the way in which our mind works during the state of sleep. The state of sleep involves a turning-away from the real external world, and there we have the necessary condition for the development of a psychosis. The most careful study of the severe psychoses will not reveal to us a single feature that is more characteristic of those pathological conditions. In psychoses, however, the turning-away from reality is brought about in two kinds of way: either by the unconscious repressed becoming excessively strong so that it overthrows the conscious, which is attached to reality, or because reality has become so intolerably distressing that the threatened ego throws itself into the arms of the unconscious instinctual forces in a desperate revolt. The harmless dream-psychosis is the result of a withdrawal from the external world which is consciously willed and only temporary, and it disappears when relations to the external world are resumed. During the isolation of the sleeping individual an alteration in the distribution of his psychical energy also sets in; a part of the expenditure on repression, which is normally required in order to hold the unconscious down, can be saved, for if the unconscious makes use of its relative liberation for active purposes, it finds its path to motility closed and the only path open to it is the harmless one leading to hallucinatory satisfaction. Now, therefore, a dream can be formed; but the fact of the dream-censorship shows that even during sleep enough of the resistance due to repression is retained.

[1933a, 4629]
Dream-distortion was the profundest and most difficult problem of dream life. And light was thrown on it by the following consideration, which placed dreams in a class along with other psychopathological formations and revealed them, as it were, as the normal psychoses of human beings. For our mind, that precious instrument by whose means we maintain ourselves in life, is no peacefully self-contained unity. It is rather to be compared with a modern State in which a mob, eager for enjoyment and destruction, has to be held down forcibly by a prudent superior class. The whole flux of our mental life and everything that finds expression in our thoughts are derivations and representatives of the multifarious instincts that are innate in our physical constitution. But these instincts are not all equally susceptible to direction and education, or equally ready to fall in with the demands of the external world and of human society. A number of them have retained their primitive, ungovernable nature; if we let them have their way, they would infallibly bring us to ruin. Consequently, learning by experience, we have developed organizations in our mind which, in the form of inhibitions, set themselves up against the direct manifestations of the instincts. Every impulse in the nature of a wish that arises from the sources of instinctual energy must submit itself to examination by the highest agencies of our mind, and, if it is not approved, is rejected and restrained from exercising any influence upon our movements - that is, from coming into execution. Often enough, indeed, such wishes are even forbidden to enter consciousness, which is habitually unaware even of the existence of these dangerous instinctual sources. We describe such impulses as being repressed from the point of view of consciousness, and as surviving only in the unconscious. If what is repressed contrives somehow to force its way into consciousness or into movement or into both, we are no longer normal: at that point the whole range of neurotic and psychotic symptoms arise. The maintenance of the necessary inhibitions and repressions imposes upon our mind a great expenditure of energy, from which it is glad to be relieved. A good opportunity for this seems to be offered at night by the state of sleep, since sleep involves a cessation of our motor functions. The situation seems safe, and the severity of our internal police-force may therefore be relaxed. It is not entirely withdrawn, since one cannot be certain: it may be that the unconscious never sleeps at all. And now the reduction of pressure upon the repressed unconscious produces its effect. Wishes arise from it which during sleep might find the entrance to consciousness open. If we were to know them we should be appalled, alike by their subject-matter, their unrestraint and indeed the mere possibility of their existence. This, however, occurs only seldom, and when it does we awake as speedily as possible, in a state of fear. But as a rule our consciousness does not experience the dream as it really was. It is true that the inhibitory forces (the dream censorship, as we may call them) are not completely awake, but neither are they wholly asleep. They have had an influence on the dream while it was struggling to find an expression in words and pictures, they have got rid of what was most objectionable, they have altered other parts of it till they are unrecognizable, they have severed real connections while introducing false ones, until the honest but brutal wishful phantasy which lay behind the dream has turned into the manifest dream as we remember it - more or less confused and almost always strange and incomprehensible. Thus the dream (or the distortion which characterizes it) is the expression of a compromise, the evidence of a conflict between the mutually incompatible impulses and strivings of our mental life. And do not let us forget that the same process, the same interplay of forces, which explains the dreams of a normal sleeper, gives us the key to understanding all the phenomena of neurosis and psychosis.

[1932c, 4809]
It is best to begin by pointing out that the formation of a dream can be provoked in two different ways. Either, on the one hand, an instinctual impulse which is ordinarily suppressed (an unconscious wish) finds enough strength during sleep to make itself felt by the ego, or, on the other hand, an urge left over from waking life, a preconscious train of thought with all the conflicting impulses attached to it, finds reinforcement during sleep from an unconscious element. In short, dreams may arise either from the id or from the ego. The mechanism of dream-formation is in both cases the same and so also is the necessary dynamic precondition. The ego gives evidence of its original derivation from the id by occasionally ceasing its functions and allowing a reversion to an earlier state of things. This is logically brought about by its breaking off its relations with the external world and withdrawing its cathexes from the sense organs. We are justified in saying that there arises at birth an instinct to return to the intrauterine life that has been abandoned - an instinct to sleep. Sleep is a return of this kind to the womb. Since the waking ego governs motility, that function is paralysed in sleep, and accordingly a good part of the inhibitions imposed on the unconscious id become superfluous. The withdrawal or reduction of these 'anticathexes' thus allows the id what is now a harmless amount of liberty.

[1940a [1938], 4976]
The inadequacy of the theory of the somatic stimulation of dreams can be demonstrated in other ways. Observation shows that external stimuli do not necessarily compel me to dream, even though such stimuli appear in the content of my dream when and if I do dream. Supposing, let us say, that I am subjected to a tactile stimulus while I am asleep. A variety of different reactions are then open to me. I may disregard it, and when I wake up I may find, for instance, that my leg is uncovered or that there is some pressure on my arm; pathology provides very numerous instances in which various powerfully exciting sensory and motor stimuli can remain without effect during sleep. Or again, I may be aware of the sensation in my sleep - I may be aware of it, as one might say, 'through' my sleep -(which is what happens as a rule in the case of painful stimuli) but without my weaving the pain into a dream. And thirdly, I may react to the stimulus by waking up so as to get rid of it.¹ It is only as a fourth possibility that the nervous stimulus may cause me to dream. Yet the other possibilities are realized at least as frequently as this last one of constructing a dream. And this could not happen unless the motive for dreaming lay elsewhere than in somatic sources of stimulation.

[1900a, 704]

I am prepared to leave room at this point for the operation of a number of special factors which can lend a varying importance to external stimuli in relation to dreams. As I picture it, a combination of individual factors, physiological and accidental, produced by the circumstances of the moment, is what determines how a person shall behave in particular cases of comparatively intense objective stimulation during sleep. The habitual or accidental depth of his sleep, taken in conjunction with the intensity of the stimulus, will make it possible in one case for him to suppress the stimulus so that his sleep is not interrupted and in another case will compel him to wake up or will encourage an attempt to overcome the stimulus by weaving it into a dream. In accordance with these various possible combinations, external objective stimuli will find expression in dreams with greater or less frequency in one person than in another. In my own case, since I am an excellent sleeper and obstinately refuse to allow anything to disturb my sleep, it very rarely happens that external causes of excitation find their way into my dreams; whereas psychical motives obviously cause me to dream very easily. In fact I have only noted a single dream in which an objective and painful source of stimulus is recognizable; and it will be most instructive to examine the effect which the external stimulus produced in this particular dream.

[1900a, 708]

When external nervous stimuli and internal somatic stimuli are intense enough to force psychical attention to themselves, then - provided that their outcome is dreaming and not waking up - they serve as a fixed point for the formation of a dream, a nucleus in its material; a wish-fulfillment is then looked for that shall correspond to this nucleus, just as (see above) intermediate ideas are looked for between two psychical dream stimuli. To that extent it is true that in a number of dreams the content of the dream is dictated by the somatic element. In this extreme instance it may even happen that a wish which is not actually a currently active one is called up for the sake of constructing a dream. A dream, however, has no alternative but to represent a wish in the situation of having been fulfilled; it is, as it were, faced with the problem of looking for a wish which can be represented as fulfilled by the currently active sensation. If this immediate material is of a painful or distressing kind, that does not necessarily mean that it cannot be used for the construction of a dream. The mind has wishes at its disposal whose fulfilment produces unpleasure. This seems self-contradictory; but it becomes intelligible when we take into account the presence of two psychical agencies and a censorship between them.

[1900a, 714]
The function of the dream as a guardian of sleep becomes particularly evident when an external stimulus impinges upon the senses of a sleeper. It is generally recognized that sensory stimuli arising during sleep influence the content of dreams; this can be proved experimentally and is among the few certain (but, incidentally, greatly overvalued) findings of medical investigation into dreams. But this finding involves a puzzle which has hitherto proved insoluble. For the sensory stimulus which the experimenter causes to impinge upon the sleeper is not correctly recognized in the dream; it is subjected to one of an indefinite number of possible interpretations, the choice being apparently left to an arbitrary psychical determination. But there is, of course, no such thing as arbitrary determination in the mind. There are several ways in which a sleeper may react to an external sensory stimulus. He may wake up or he may succeed in continuing his sleep in spite of it. In the latter case he may make use of a dream in order to get rid of the external stimulus, and here again there is more than one method open to him. For instance, he may get rid of the stimulus by dreaming that he is in a situation which is absolutely incompatible with the stimulus. Such was the line taken by a sleeper who was subject to disturbance by a painful abscess on the perineum. He dreamt that he was riding on a horse, making use of the poultice that was intended to mitigate his pain as a saddle, and in this way he avoided being disturbed. Or, as happens more frequently, the external stimulus is given an interpretation which brings it into the context of a repressed wish which is at the moment awaiting fulfilment; in this way the external stimulus is robbed of its reality and is treated as though it were a portion of the psychical material. Thus someone dreamt that he had written a comedy with a particular plot; it was produced in a theatre, the first act was over, and there were thunders of applause; the clapping was terrific. . . . The dreamer must have succeeded in prolonging his sleep till after the interference had ceased; for when he woke up he no longer heard the noise, but rightly concluded that someone must have been beating a carpet or mattress. Every dream which occurs immediately before the sleeper is woken by a loud noise has made an attempt at explaining away the arousing stimulus by providing another explanation of it and has thus sought to prolong sleep, even if only for a moment.

[1901a, 1093]

So far as I can at present see, dreams that occur in a traumatic neurosis are the only genuine exceptions, and punishment dreams are the only apparent exceptions, to the rule that dreams are directed towards wish-fulfilment. In the latter class of dreams we are met by the remarkable fact that actually nothing belonging to the latent dream-thoughts is taken up into the manifest content of the dream. Something quite different appears instead, which must be described as a reaction-formation against the dream-thoughts, a rejection and complete contradiction of them. Such offensive action as this against the dream can only be ascribed to the critical agency of the ego and it must therefore be assumed that the latter, provoked by the unconscious wish-fulfilment, has been temporarily re-established even during the sleeping state. It might have reacted to the undesirable content of the dream by waking up; but it has found a means, by the construction of the punishment dream, of avoiding an interruption of sleep.

[1923c, 4039]
In view of the very great number of associations produced in analysis to each individual element of the content of a dream, some readers may be led to doubt whether, as a matter of principle, we are justified in regarding as part of the dream-thoughts all the associations that occur to us during the subsequent analysis - whether we are justified, that is, in supposing that all these thoughts were already active during the state of sleep and played a part in the formation of the dream. Is it not more probable that new trains of thought have arisen in the course of the analysis which had no share in forming the dream? I can only give limited assent to this argument. It is no doubt true that some trains of thought arise for the first time during the analysis. But one can convince oneself in all such cases that these new connections are only set up between thoughts which were already linked in some other way in the dream-thoughts. The new connections are, as it were, loop-lines or short-circuits, made possible by the existence of other and deeper-lying connecting paths. It must be allowed that the great bulk of the thoughts which are revealed in analysis were already active during the process of forming the dream; for, after working through a string of thoughts which seem to have no connection with the formation of a dream, one suddenly comes upon one which is represented in its content and is indispensable for its interpretation, but which could not have been reached except by this particular line of approach. I may here recall the dream of the botanical monograph, which strikes one as the product of an astonishing amount of condensation, even though I have not reported its analysis in full.

My attempts at building up dreams by synthesis from the dream-thoughts have taught me that the material which emerges in the course of interpretation is not all of the same value. One part of it is made up of the essential dream-thoughts - those, that is, which completely replace the dream, and which, if there were no censorship of dreams, would be sufficient in themselves to replace it. The other part of the material is usually to be regarded as of less importance. Nor is it possible to support the view that all the thoughts of this second kind had a share in the formation of the dream. On the contrary, there may be associations among them which relate to events that occurred after the dream, between the times of dreaming and interpreting. This part of the material includes all the connecting paths that led from the manifest dream-content to the latent dream-thoughts, as well as the intermediate and linking associations by means of which, in the course of the process of interpretation, we came to discover these connecting paths.

There is one true conclusion that we may glean from these objections, namely that we need not suppose that every association that occurs during the work of interpretation had a place in the dream-work during the night. It is true that in carrying out the interpretation in the waking state we follow a path which leads back from the elements of the dream to the dream-thoughts and that the dream-work followed one in the contrary direction. But it is highly improbable that these paths are passable both ways. It appears, rather, that in the daytime we drive shafts which follow along fresh chains of thought and that these shafts make contact with the intermediate thoughts and the dream-thoughts now at one point and now at another. We can see how in this manner fresh daytime material inserts itself into the interpretative chains. It is probable, too, that the increase in resistance that has set in since the night makes new and more devious detours necessary. The number and nature of the collaterals that we spin in this way during the day is of no psychological importance whatever, so long as they lead us to the dream-thoughts of which we are in search.
How, then, are we to picture psychical conditions during the period of sleep which precedes dreams? Are all the dream-thoughts present alongside one another? or do they occur in sequence? or do a number of trains of thought start out simultaneously from different centres and afterwards unite? There is no need for the present, in my opinion, to form any plastic idea of psychical conditions during the formation of dreams. It must not be forgotten, however, that we are dealing with an unconscious process of thought, which may easily be different from what we perceive during purposive reflection accompanied by consciousness.

[1900a, 754]
The content of all dreams that occur during the same night forms part of the same whole; the fact of their being divided into several sections, as well as the grouping and number of those sections - all of this has a meaning and may be regarded as a piece of information arising from the latent dream-thoughts. In interpreting dreams consisting of several main sections or, in general, dreams occurring during the same night, the possibility should not be overlooked that separate and successive dreams of this kind may have the same meaning, and may be giving expression to the same impulses in different material. If so, the first of these homologous dreams to occur is often the more distorted and timid, while the succeeding one will be more confident and distinct.

¹ This dream also provides a good example of the generally valid truth that dreams which occur during the same night, even though they are recollected as separate, spring from the ground-work of the same thoughts. Incidentally, the situation in the dream of my removing my children to safety from the City of Rome was distorted by being related back to an analogous event that occurred in my own childhood: I was envying some relatives who, many years earlier, had had an opportunity of removing their children to another country.

The question whether it is possible to interpret every dream must be answered in the negative. It must not be forgotten that in interpreting a dream we are opposed by the psychical forces which were responsible for its distortion. It is thus a question of relative strength whether our intellectual interest, our capacity for self-discipline, our psychological knowledge and our practice in interpreting dreams enable us to master our internal resistances. It is always possible to go some distance: far enough, at all events, to convince ourselves that the dream is a structure with a meaning, and as a rule far enough to get a glimpse of what that meaning is. Quite often an immediately succeeding dream allows us to confirm and carry further the interpretation we have tentatively adopted for its predecessor. A whole series of dreams, continuing over a period of weeks or months, is often based upon common ground and must accordingly be interpreted in connection with one another. In the case of two consecutive dreams it can often be observed that one takes as its central point something that is only on the periphery of the other and vice versa, so that their interpretations too are mutually complementary. I have already given instances which show that different dreams dreamt on the same night are, as a quite general rule, to be treated in their interpretation as a single whole.

In the first place, dreams take into account the connection which undeniably exists between all the portions of the dream-thoughts by combining the whole material into a single situation. They reproduce logical connection by approximation in space and time, just as a painter will represent all the poets in a single group in a picture of Parnassus. It is true that they were never in fact assembled on a single mountain-top; but they certainly form a conceptual group. Dreams carry this method of reproduction down to details; and often when they show us two elements in the dream-content close together, this indicates that there is some specially intimate connection between what correspond to them among the dream-thoughts. Incidentally, it is to be observed that all dreams produced during a single night will be found on analysis to be derived from the same circle of thoughts.
