This, Ladies and Gentlemen, is far from being all that might be said about parapraxes. Much remains that might be examined and discussed. But I am satisfied if our discussion of the subject so far has to some extent shaken your previous views and has made you a little prepared to accept new ones. I am content, for the rest, to leave you faced with an unclarified situation. We cannot establish all our doctrines from a study of parapraxes and we are not obliged to draw our evidence from that material alone. The great value of parapraxes for our purposes lies in their being very common phenomena which, moreover, can easily be observed in oneself, and which can occur without the slightest implication of illness. There is only one of your unanswered questions which I should like to put into words before I end. If, as we have found from many instances, people come so close to an understanding of parapraxes and so often behave as though they grasped their sense, how is it possible that they none the less set down these same phenomena as being in general chance events without sense or meaning, and that they can oppose the psycho-analytic elucidation of them with so much vigour?

[1916-1917, 3183]
Evidence of its being of use for throwing light on other than pathological mental activity was early forthcoming in connection with two kinds of phenomena: with the very frequent parapraxes that occur in everyday life - such as forgetting things, slips of the tongue, and mislaying objects - and with the dreams dreamt by healthy and psychically normal people. Small failures of functioning, like the temporary forgetting of normally familiar proper names, slips of the tongue and of the pen, and so on, had hitherto not been considered worthy of any explanation at all or were supposed to be accounted for by conditions of fatigue, by distraction of the attention, etc. The present writer then showed from many examples, in his book *The Psychopathology of Everyday Life* (1901b), that events of this kind have a meaning, and arise owing to a conscious intention being interfered with by another, suppressed or actually unconscious one. As a rule, quick reflection or a short analysis is enough to reveal the interfering influence. Owing to the frequency of such parapraxes as slips of the tongue, it became easy for anyone to convince himself from his own experience of the existence of mental processes which are not conscious, but which are nevertheless operative and which at least find expression as inhibitions and modifications of other, intended acts.

In the second place, I shall pick a single instance to represent an immensely large class of phenomena.¹ The President of a public body (the Lower House of the Austrian Parliament) on one occasion opened a sitting with the following words: 'I take notice that a full quorum of members is present and herewith declare the sitting closed.' It was a slip of the tongue - for there can be no doubt that what the President intended to say was 'opened'. Why, then, did he say the opposite? We shall expect to be told it was an accidental mistake, a failure in carrying out an intention such as may easily happen for various reasons: it had no meaning - and in any case contraries are particularly easily substituted for each other. If, however, we bear in mind the situation in which the slip of the tongue occurred, we shall be inclined to prefer another explanation. Many of the previous sittings of the House had been disagreeably stormy and had accomplished nothing, so that it would be only too natural for the President to think at the moment of making his opening statement: 'If only the sitting that's just beginning were finished! I would much rather be closing then opening it!' When he began to speak he was probably not aware of this wish - it was not conscious to him - but it was certainly present and it succeeded in making itself effective, against the speaker's will, in his apparent mistake. A single instance can scarcely enable us to decide between two such different explanations. But what if every other instance of a slip of the tongue could be explained in the same way, and similarly every slip of the pen, every case of mis-reading or mis-hearing, and every faulty action? What if in all those instances (one might actually say, without a single exception) it was possible to demonstrate the presence of a psychical act - a thought, a wish or an intention - which would account for the apparent mistake and which was unconscious at the moment at which it became effective, even though it may have been conscious previously? If that were so, it would really no longer be possible to dispute the fact that psychical acts which are unconscious do exist and that they are even sometimes active while they are unconscious and that in that case they can even sometimes get the better of conscious intentions. The person concerned in a mistake of this kind can react to it in various ways. He may overlook it completely or he may notice it himself and become embarrassed and ashamed. He cannot as a rule find the explanation of it himself without outside help; and he often refuses to accept the solution when it is put before him - for a time, at all events.

[1924f, 4109]

[1940b [1938], 5069]
I hope that readers will not overlook the difference in value between these interpretations, of which no proof is possible, and the examples that I have myself collected and explained by means of an analysis. But if I still secretly cling to my expectation that even apparently simple slips of the tongue could be traced to interference by a half-suppressed idea that lies outside the intended context, I am tempted to do so by an observation of Meringer's which is highly deserving of attention. This author says that it is a curious fact that no one is ready to admit having made a slip of the tongue. There are some very sensible and honest people who are offended if they are told they have made one. I would not venture to put it so generally as does Meringer in saying 'no one'. But the trace of affect which follows the revelation of the slip, and which is clearly in the nature of shame, has a definite significance. It may be compared to the annoyance we feel when we cannot recall a forgotten name, and to our surprise at the tenacity of an apparently indifferent memory; and it invariably indicates that some motive has contributed to the occurrence of the interference.

[1901b, 1174]

The symptomatic acts that can be observed in almost inexhaustible abundance in healthy people no less than in sick ones have more than one claim to our interest. To the doctor they often serve as valuable clues which enable him to get his bearings in new or unfamiliar situations; to the observer of human nature they often betray everything - and at times even more than he cares to know. A person who is familiar with their significance may at times feel like King Solomon who, according to oriental legend, understood the language of animals. One day I was to examine a young man, whom I did not know, at his mother's house. As he came towards me I was struck by a large stain on his trousers - made by albumen, as I could tell from its peculiar stiff edges. After a moment's embarrassment the young man apologized and said that he had felt hoarse and so had swallowed a raw egg; some of the slippery white of egg had probably fallen on his clothes. He was able to confirm this by pointing to the egg-shell, which was still visible in the room on a small plate. In this way the suspicious stain was given an innocent explanation; but when his mother had left us alone I thanked him for making my diagnosis so very much easier, and without more ado took as the basis of our discussion his confession that he was suffering from the troubles arising from masturbation. Another time I was paying a visit to a lady who was as rich as she was miserly and foolish, and who was in the habit of giving the doctor the task of working through a host of complaints before the simple cause of her condition could be reached. When I entered she was sitting at a small table and was busy arranging silver florins in little piles. On rising she knocked some of the coins on to the floor. I helped her to pick them up, and soon cut short her account of her sufferings by asking: 'Has your noble son-in-law robbed you of so much money then?' She denied this angrily, only to go on very soon afterwards to tell the sad story of the agitation which her son-in-law's extravagance had caused her. She has not however sent for me since. I cannot claim that one always makes friends of those to whom one shows the meaning of their symptomatic acts.

[1901b, 1277]
By parapraxes, then, I understand the occurrence in healthy and normal people of such events as forgetting words and names that are normally familiar to one, forgetting what one intends to do, making slips of the tongue and pen, misreading, mislaying things and being unable to find them, losing things, making mistakes against one's better knowledge, and certain habitual gestures and movements. All of these have on the whole had little attention paid to them by psychology; they have been classed as instances of 'absent-mindedness' and have been attributed to fatigue, to distracted attention or to the contributory effects of certain slight illnesses. Analytic enquiry, however, shows with enough certainty to satisfy every requirement that these latter factors merely operate as facilitating factors and may be absent. Parapraxes are full-blown psychical phenomena and always have a meaning and an intention. They serve definite purposes which, owing to the prevailing psychological situation, cannot be expressed in any other way. These situations as a rule involve a psychical conflict which prevents the underlying intention from finding direct expression and diverts it along indirect paths. A person who is guilty of a parapraxis may notice it or overlook it; the suppressed intention underlying it may well be familiar to him; but he is usually unaware, without analysis, that that intention is responsible for the parapraxis in question. Analyses of parapraxes are often quite easily and quickly made. If a person's attention is drawn to a blunder, the next thought that occurs to him provides its explanation.

We can now turn, however, to the main question, which we have long postponed, of what sort of intentions these are, which find expression in this unusual fashion as disturbers of other intentions. Well, they are obviously of very different sorts, among which we must look for the common factor. If we examine a number of examples with this in view, they will soon fall into three groups. The first group contains those cases in which the disturbing purpose is known to the speaker and moreover had been noticed by him before he made the slip of the tongue. Thus, in the 'Vorschwein' slip the speaker admitted not only that he had formed the judgement 'Schweinereien' about the events in question, but also that he had had the intention, from which he afterwards drew back, of expressing his judgement in words. A second group is made up of other cases in which the disturbing purpose is equally recognized as his by the speaker, but in which he was unaware that it was active in him just before he made the slip. Thus, he accepts our interpretation of his slip, but nevertheless remains to some extent surprised at it. Instances of this kind of attitude can perhaps be found in other sorts of parapraxes more easily than in slips of the tongue. In a third group the interpretation of the disturbing intention is vigorously rejected by the speaker; he not only denies that it was active in him before he made the slip, but seeks to maintain that it is entirely foreign to him. You will recall the example of the 'hiccough' and the positively rude denial which I brought on myself from the speaker by uncovering his disturbing intention. As you know, we have not yet come to any agreement in our views on these cases. I should pay no attention to the denial put forward by the proposer of the toast and should persist in my interpretation unruffled, while you, I suppose, are still affected by his protest and raise the question of whether we ought not to give up interpreting parapraxes of this kind and regard them as purely physiological acts in the pre-analytic sense. I can well imagine what it is that deters you. My interpretation carries with it the hypothesis that intentions can find expression in a speaker of which he himself knows nothing but which I am able to infer from circumstantial evidence. You are brought up short in the face of such a novel and momentous hypothesis. I can understand that, and I see your point so far as that goes. But one thing is certain. If you want to apply consistently the view of parapraxes which has been confirmed by so many examples, you will have to make up your mind to accept the strange hypothesis I have mentioned. If you cannot do that, you will have once more to abandon the understanding of parapraxes which you have only just achieved.
The second point I have in mind is this. If in a large majority of instances we find confirmation of the fact that the forgetting of an intention goes back to a counter-will, we grow bold enough to extend the solution to another set of instances in which the person under analysis does not confirm but denies the counter-will we have inferred. Take as examples of this such extremely common events as forgetting to return books one has been lent or to pay bills or debts. We shall venture to insist to the person concerned that an intention exists in him to keep the books and not to pay the debts, while he will deny this intention but will not be able to produce any other explanation of his behaviour. Thereupon we shall go on to say that he has this intention but knows nothing about it, but that it is enough for us that it reveals its presence by producing the forgetting in him. He may repeat to us that he has in fact forgotten. You will now recognize the situation as one in which we found ourselves once before. If we want to pursue our interpretations of parapraxes, which have so frequently proved justified, to a consistent conclusion, we are forced to the inescapable hypothesis that there are purposes in people which can become operative without their knowing about them. But this brings us into opposition to all the views that dominate both ordinary life and psychology.

In the second place, I shall pick a single instance to represent an immensely large class of phenomena. The President of a public body (the Lower House of the Austrian Parliament) on one occasion opened a sitting with the following words: 'I take notice that a full quorum of members is present and herewith declare the sitting closed.' It was a slip of the tongue - for there can be no doubt that what the President intended to say was 'opened'. Why, then, did he say the opposite? We shall expect to be told it was an accidental mistake, a failure in carrying out an intention such as may easily happen for various reasons: it had no meaning - and in any case contraries are particularly easily substituted for each other. If, however, we bear in mind the situation in which the slip of the tongue occurred, we shall be inclined to prefer another explanation. Many of the previous sittings of the House had been disagreeably stormy and had accomplished nothing, so that it would be only too natural for the President to think at the moment of making his opening statement: 'If only the sitting that's just beginning were finished! I would much rather be closing then opening it!' When he began to speak he was probably not aware of this wish - it was not conscious to him - but it was certainly present and it succeeded in making itself effective, against the speaker's will, in his apparent mistake. A single instance can scarcely enable us to decide between two such different explanations. But what if every other instance of a slip of the tongue could be explained in the same way, and similarly every slip of the pen, every case of mis-reading or mis-hearing, and every faulty action? What if in all those instances (one might actually say, without a single exception) it was possible to demonstrate the presence of a psychical act - a thought, a wish or an intention - which would account for the apparent mistake and which was unconscious at the moment at which it became effective, even though it may have been conscious previously? If that were so, it would really no longer be possible to dispute the fact that psychical acts which are unconscious do exist and that they are even sometimes active while they are unconscious and that in that case they can even sometimes get the better of conscious intentions. The person concerned in a mistake of this kind can react to it in various ways. He may overlook it completely or he may notice it himself and become embarrassed and ashamed. He cannot as a rule find the explanation of it himself without outside help; and he often refuses to accept the solution when it is put before him - for a time, at all events.

[1916-1917, 3179]

[1940b [1938], 5069]
This and other similar experiences have led me to conclude that actions carried out unintentionally must inevitably become the source of misunderstandings in human relations. The agent, who knows nothing of there being an intention connected with these actions, does not feel that they are chargeable to him and does not hold himself responsible for them. The second party, on the other hand, since he regularly bases his conclusions as to the agent's intentions and sentiments on such actions among others, knows more of the other's psychical processes than that person himself is ready to admit or believes he has communicated. The agent, indeed, grows indignant if these conclusions drawn from his symptomatic acts are brought up against him; he declares them to be baseless, since he is not conscious of having had the intention at the time they were carried out, and complains of being misunderstood by the second party. Strictly considered, misunderstandings of his kind are based on too intimate and too extensive understanding. The more two people suffer from 'nerves', the more readily will they give each other cause for disputes, the responsibility for which each disclaims just as decidedly in regard to himself as he considers it certain in regard to the other person. And this is no doubt the punishment for people's internal dishonesty in only giving expression under the pretext of forgetting, bungling and doing things unintentionally to impulses that would better be admitted to themselves and to others if they can no longer be controlled. It can in fact be said quite generally that everyone is continually practising psychical analysis on his neighbours and consequently learns to know them better than they know themselves. The road whose goal it is to observe the precept γνώθι σεαυτόν\(^1\) runs via the study of one's own apparently accidental actions and omissions.

[1901b, 1287]

The jealousy of the second layer, projected jealousy, is derived in both men and women either from their own actual unfaithfulness in real life or from impulses towards it which have succumbed to repression. It is a matter of everyday experience that fidelity, especially that degree of it required in marriage, is only maintained in the face of continual temptations. Anyone who denies these temptations in himself will nevertheless feel their pressure so strongly that he will be glad enough to make use of an unconscious mechanism to alleviate his situation. He can obtain this alleviation - and, indeed, acquittal by his conscience - if he projects his own impulses to faithlessness on to the partner to whom he owes faith. This strong motive can then make use of the perceptual material which betrays unconscious impulses of the same kind in the partner, and the subject can justify himself with the reflection that the other is probably not much better than he is himself.\(^1\)

[1922b, 3901]
The conflict between a conventional duty and the unavowed view which we privately take of it similarly provides an explanation for those cases in which we forget to carry out actions that we promised to do as a favour to someone. Here the regular result is that it is only the would-be benefactor who believes that forgetting has the power to act as an excuse; the person who asked the favour gives what is unquestionably the right answer: 'He is not interested in the matter, otherwise he would not have forgotten.' There are some people who are known as being forgetful in general, and who are for that reason excused their lapses in the same kind of way as short-sighted people who fail to greet us in the street.¹ These people forget all their small promises, and they fail to carry out any of the commissions they receive. In this way they show themselves unreliable in little things, and they demand that we should not take these minor offences amiss - that is, that we should not attribute them to their character but refer them to an organic idiosyncracy.² I am not one of these people myself, and have had no opportunity of analysing the actions of a person of this kind, so that, by examining the choice of occasions for forgetting, I might discover its motivation. I cannot however help suspecting on the basis of analogy that in these cases the motive is an unusually large amount of unavowed contempt for other people which exploits the constitutional factor for its own ends.³

This and other similar experiences have led me to conclude that actions carried out unintentionally must inevitably become the source of misunderstandings in human relations. The agent, who knows nothing of there being an intention connected with these actions, does not feel that they are chargeable to him and does not hold himself responsible for them. The second party, on the other hand, since he regularly bases his conclusions as to the agent's intentions and sentiments on such actions among others, knows more of the other's psychic processes than that person himself is ready to admit or believes he has communicated. The agent, indeed, grows indignant if these conclusions drawn from his symptomatic acts are brought up against him; he declares them to be baseless, since he is not conscious of having had the intention at the time they were carried out, and complains of being misunderstood by the second party. Strictly considered, misunderstandings of his kind are based on too intimate and too extensive understanding. The more two people suffer from 'nerves', the more readily will they give each other cause for disputes, the responsibility for which each disclaims just as decidedly in regard to himself as he considers it certain in regard to the other person. And this is no doubt the punishment for people's internal dishonesty in only giving expression under the pretext of forgetting, bungling and doing things unintentionally to impulses that would better be admitted to themselves and to others if they can no longer be controlled. It can in fact be said quite generally that everyone is continually practising psychical analysis on his neighbours and consequently learns to know them better than they know themselves. The road whose goal it is to observe the precept λόγος να σε αναφερόνει⁴ runs via the study of one's own apparently accidental actions and omissions.

(C) Although the motivation of the parapraxes described in the preceding chapters is something of which from the very nature of the case conscious thought must lack knowledge, it would nevertheless be desirable to discover a psychological proof of the existence of that motivation; indeed, for reasons which a closer knowledge of the unconscious reveals, it is probable that such proofs are somewhere discoverable. There are in fact two spheres in which it is possible to demonstrate phenomena that appear to correspond to an unconscious, and therefore displaced, knowledge of that motivation.

[1901b, 1237]

[1901b, 1287]

[1901b, 1325]
(b) Another indication that we possess unconscious and displaced knowledge of the motivation in chance actions and parapraxes is to be found in the phenomenon of superstition. I will make my meaning clear by a discussion of the small experience that started me on these reflections.
[1901b, 1326]

Unfortunately I am unable, for familiar reasons, to enter into the history of the case as far as I should like, and I must restrict myself to the account which follows. Up to the time of her falling ill the patient had been a happy and almost completely satisfied wife. She wanted to have children, from motives based on an infantile fixation of her wishes, and she fell ill when she learned that it was impossible for her to have any by the husband who was the only object of her love. The anxiety hysteria with which she reacted to this frustration corresponded, as she herself soon learned to understand, to the repudiation of phantasies of seduction in which her firmly implanted wish for a child found expression. She now did all she could to prevent her husband from guessing that she had fallen ill owing to the frustration of which he was the cause. But I have had good reason for asserting that everyone possesses in his own unconscious an instrument with which he can interpret the utterances of the unconscious in other people. Her husband understood, without any admission or explanation on her part, what his wife's anxiety meant; he felt hurt, without showing it, and in his turn reacted neurotically by - for the first time - failing in sexual intercourse with her. Immediately afterwards he started on a journey. His wife believed that he had become permanently impotent, and produced her first obsessional symptoms on the day before his expected return.
[1913i, 2626]

The problem would seem even more difficult if we had to admit that mental impulses could be so completely suppressed as to leave no trace whatever behind them. But that is not the case. Even the most ruthless suppression must leave room for distorted surrogate impulses and for reactions resulting from them. If so, however, we may safely assume that no generation is able to conceal any of its more important mental processes from its successor. For psycho-analysis has shown us that everyone possesses in his unconscious mental activity an apparatus which enables him to interpret other people's reactions, that is, to undo the distortions which other people have imposed on the expression of their feelings. An unconscious understanding such as this of all the customs, ceremonies and dogmas left behind by the original relation to the father may have made it possible for later generations to take over their heritage of emotion.
[1912-1913, 2797]

Psycho-analysis demands nothing more than that we should apply this process of inference to ourselves also - a proceeding to which, it is true, we are not constitutionally inclined. If we do this, we must say: all the acts and manifestations which I notice in myself and do not know how to link up with the rest of my mental life must be judged as if they belonged to someone else: they are to be explained by a mental life ascribed to this other person. Furthermore, experience shows that we understand very well how to interpret in other people (that is, how to fit into their chain of mental events) the same acts which we refuse to acknowledge as being mental in ourselves. Here some special hindrance evidently deflects our investigations from our own self and prevents our obtaining a true knowledge of it.
[1915e, 2993]

It is a very remarkable thing that the Ucs. of one human being can react upon that of another, without passing through the Cs. This deserves closer investigation, especially with a view to finding out whether preconscious activity can be excluded as playing a part in it; but, descriptively speaking, the fact is incontestable.
[1915e, 3016]
This makes it clear that people give slips of the tongue and other parapraxies the same interpretation that I advocate in this book, even if they do not endorse theoretically the view I put forward, and even if they are disinclined, so far as it applies to themselves, to renounce the convenience that goes along with tolerating parapraxies. The amusement and derision which such oral slips are certain to evoke at the crucial moment can be taken as evidence against what purports to be the generally accepted convention that a mistake in speaking is a *lapsus linguae* and of no psychological significance. It was no less a person than the German Imperial Chancellor Prince Bülow who protested on these lines in an effort to save the situation, when the wording of his speech in defence of his Emperor (in November, 1907) was given the opposite meaning by a slip of the tongue. 'As for the present, the new epoch of the Emperor Wilhelm II, I can only repeat what I said a year ago, namely that *it would be unfair and unjust to speak of a coterie of responsible advisors round our Emperor . . .* (loud cries of 'irresponsible') ' . . . irresponsible advisors. Forgive the *lapsus linguae.*' (Laughter.)

[1901b, 1183]  
Psycho-analysis demands nothing more than that we should apply this process of inference to ourselves also - a proceeding to which, it is true, we are not constitutionally inclined. If we do this, we must say: all the acts and manifestations which I notice in myself and do not know how to link up with the rest of my mental life must be judged as if they belonged to someone else: they are to be explained by a mental life ascribed to this other person. Furthermore, experience shows that we understand very well how to interpret in other people (that is, how to fit into their chain of mental events) the same acts which we refuse to acknowledge as being mental in ourselves. Here some special hindrance evidently deflects our investigations from our own self and prevents our obtaining a true knowledge of it.

[1915e, 2993]  
The forgetting of intentions can in general be traced to an opposing current of thought, which is unwilling to carry out the intention. But this view is not only held by us psycho-analysts; it is the general opinion, accepted by everyone in their daily lives and only denied when it comes to theory. A patron who gives his *protégé* the excuse of having forgotten his request fails to justify himself. The *protégé* immediately thinks: 'It means nothing to him; it's true he promised, but he doesn't really want to do it.' For that reason forgetting is banned in certain circumstances of ordinary life; the distinction between the popular and the psycho-analytic view of these parapraxes seems to have disappeared. Imagine the lady of the house receiving her guest with the words: 'What? have you come to-day? I'd quite forgotten I invited you for to-day.' Or imagine a young man confessing to his fiancée that he had forgotten to keep their last rendez-vous. He will certainly not confess it; he will prefer to invent on the spur of the moment the most improbable obstacles which prevented his appearing at the time and afterwards made it impossible for him to let her know. We all know too that in military affairs the excuse of having forgotten something is of no help and is no protection against punishment, and we must all feel that that is justified. Here all at once everyone is united in thinking that a particular parapraxis has a sense and in knowing what that sense is. Why are they not consistent enough to extend this knowledge to the other parapraxes and to admit them fully? There is of course an answer to this question too.

[1916-1917, 3161]
The jealousy of the second layer, projected jealousy, is derived in both men and women either from their own actual unfaithfulness in real life or from impulses towards it which have succumbed to repression. It is a matter of everyday experience that fidelity, especially that degree of it required in marriage, is only maintained in the face of continual temptations. Anyone who denies these temptations in himself will nevertheless feel their pressure so strongly that he will be glad enough to make use of an unconscious mechanism to alleviate his situation. He can obtain this alleviation - and, indeed, acquittal by his conscience - if he projects his own impulses to faithlessness on to the partner to whom he owes faith. This strong motive can then make use of the perceptual material which betrays unconscious impulses of the same kind in the partner, and the subject can justify himself with the reflection that the other is probably not much better than he is himself.¹

[1922b, 3901]
In fact she turned out to be under the influence of unconscious thoughts about pregnancy and contraception. By the words 'shut up like a pocket-knife', which she uttered consciously as a complaint, she wanted to describe the position of a child in the womb. The word 'Ernst' in my opening remark had reminded her of the name (S. Ernst) of a well known Viennese firm in the Kärntnerstrasse which used to advertise the sale of contraceptives.

[1901b, 1153]

In the psychotherapeutic procedure which I employ for resolving and removing neurotic symptoms I am very often faced with the task of discovering, from the patient's apparently casual utterances and associations, a thought-content which is at pains to remain concealed but which cannot nevertheless avoid unintentionally betraying its existence in a whole variety of ways. Slips of the tongue often perform a most valuable service here, as I could show by some highly convincing and at the same time very singular examples. Thus, for instance, a patient will be speaking of his aunt and, without noticing the slip, will consistently call her 'my mother'; or another will refer to her husband as her 'brother'. In this way they draw my attention to the fact that they have 'identified' these persons with one another - that they have put them into a series which implies a recurrence of the same type in their emotional life. To give another example: a young man of twenty introduced himself to me during my consulting hours in these words: 'I am the father of So-and-so who came to you for treatment. I beg your pardon, I meant to say I am his brother: he is four years older than I am.' I inferred that he intended this slip to express the view that, like his brother, he had fallen ill through the fault of his father; that, like his brother, he wished to be cured; but that his father was the one who most needed to be cured. - At other times an arrangement of words that sounds unusual, or an expression that seems forced, is enough to reveal that a repressed thought is participating in the patient's remarks, which had a different end in view..

[1901b, 1171]

The symptomatic acts that can be observed in almost inexhaustible abundance in healthy people no less than in sick ones have more than one claim to our interest. To the doctor they often serve as valuable clues which enable him to get his bearings in new or unfamiliar situations; to the observer of human nature they often betray everything - and at times even more than he cares to know. A person who is familiar with their significance may at times feel like King Solomon who, according to oriental legend, understood the language of animals. One day I was to examine a young man, whom I did not know, at his mother's house. As he came towards me I was struck by a large stain on his trousers - made by albumen, as I could tell from its peculiar stiff edges. After a moment's embarrassment the young man apologized and said that he had felt hoarse and so had swallowed a raw egg; some of the slippery white of egg had probably fallen on his clothes. He was able to confirm this by pointing to the egg-shell, which was still visible in the room on a small plate. In this way the suspicious stain was given an innocent explanation; but when his mother had left us alone I thanked him for making my diagnosis so much easier, and without more ado took as the basis of our discussion his confession that he was suffering from the troubles arising from masturbation. Another time I was paying a visit to a lady who was as rich as she was miserly and foolish, and who was in the habit of giving the doctor the task of working through a host of complaints before the simple cause of her condition could he reached. When I entered she was sitting at a small table and was busy arranging silver florins in little piles. On rising she knocked some of the coins on to the floor. I helped her to pick them up, and soon cut short her account of her sufferings by asking: 'Has your noble son-in-law robbed you of so much money then?' She denied this angrily, only to go on very soon afterwards to tell the sad story of the agitation which her son-in-law's extravagance had caused her. She has not however sent for me since. I cannot claim that one always makes friends of those to whom one shows the meaning of their symptomatic acts.

[1901b, 1277]
It must be said that it is precisely such symptomatic acts that often offer the best approach to an understanding of people's intimate mental life. [1901b, 1286]

It may, in general, seem astonishing that the urge to tell the truth is so much stronger than is usually supposed. Perhaps, however, my being scarcely able to tell lies any more is a consequence of my occupation with psycho-analysis. As often as I try to distort something I succumb to an error or some other parapraxis that betrays my insincerity, as can be seen in this last example and in the previous ones. [1901b, 1295]

I assume that this conscious ignorance and unconscious knowledge of the motivation of accidental psychical events is one of the psychical roots of superstition. Because the superstitious person knows nothing of the motivation of his own chance actions, and because the fact of this motivation presses for a place in his field of recognition, he is forced to allocate it, by displacement, to the external world. If such a connection exists, it can hardly be limited to this single application. In point of fact I believe that a large part of the mythological view of the world, which extends a long way into the most modern religions, is nothing but psychology projected into the external world. The obscure recognition¹ (the endopsychic perception, as it were) of psychical factors and relations in the unconscious is mirrored - it is difficult to express it in other terms, and here the analogy with paranoia must come to our aid - in the construction of a supernatural reality, which is destined to be changed back once more by science into the psychology of the unconscious. One could venture to explain in this way the myths of paradise and the fall of man, of God, of good and evil, of immortality, and so on, and to transform metaphysics into metapsychology. The gap between the paranoic's displacement and that of the superstitious person is less wide than it appears at first sight. When human beings began to think, they were, as is well known, forced to explain the external world anthropomorphically by means of a multitude of personalities in their own image; chance events, which they interpreted superstitiously, were thus actions and manifestations of persons. They behaved, therefore, just like paranotics, who draw conclusions from insignificant signs given them by other people, and just like all normal people, who quite rightly base their estimate of their neighbours' characters on their chance and unintentional actions. It is only in our modern, scientific but as yet by no means perfected Weltanschauung that superstition seems so very much out of place; in the Weltanschauung of pre-scientific times and peoples it was justified and consistent. [1901b, 1328]

There is a great deal of symbolism of this kind in life, but as a rule we pass it by without heeding it. When I set myself the task of bringing to light what human beings keep hidden within them, not by the compelling power of hypnosis, but by observing what they say and what they show, I thought the task was a harder one than it really is. He that has eyes to see and ears to hear may convince himself that no mortal can keep a secret. If his lips are silent, he chatters with his finger-tips; betrayal oozes out of him at every pore. And thus the task of making conscious the most hidden recesses of the mind is one which it is quite possible to accomplish. [1905e, 1414]

¹ This is the same mechanism that governs slips of the tongue and other phenomena of self-betrayal. See The Psychopathology of Everyday Life (1901b). [1905c, 1700]
Another of your indications of a complex - the change in the content of the reaction - also plays its part in the technique of psycho-analysis. We quite generally regard even slight deviations in our patients from the ordinary forms of expression as a sign of some hidden meaning, and we are quite willing to expose ourselves for a while to the patient's ridicule by making interpretations in that sense, all that we require in order to uncover the complex. [1906c, 1894]

The psycho-analyst thinks differently. To him nothing is too small to be a manifestation of hidden mental processes. He has learnt long ago that such cases of forgetting or repetition are significant, and that it is the 'distraction' which allows impulses that are otherwise hidden to be revealed. [1910c, 2290]

Nevertheless, in spite of the apparent triviality of these phenomena, the psycho-analytic explanation of parapraxes involves some slight modifications in our view of the world. We find that even normal people are far more frequently moved by contradictory motives than we should have expected. The number of occurrences that can be described as 'accidental' is considerably diminished. It is almost a consolation to be able to exclude the loss of objects from among the chance events of life; our blunders often turn out to be a cover for our secret intentions. But - what is more important - many serious accidents that we should otherwise have ascribed entirely to chance reveal under analysis the participation of the subject's own volition, though without its being clearly admitted by him. The distinction between a chance accident and deliberate self-destruction, which in practice is so often hard to draw, becomes even more dubious when looked at from an analytic point of view. [1913j, 2805]

Psycho-analysis finds as a rule no credence among laymen for assertions such as these. They reject them as calumnies which are confuted by conscious experience, and they adroitly overlook the faint indications by which even the unconscious is apt to betray itself to consciousness. It is therefore relevant to point out that many thinkers who could not have been influenced by psycho-analysis have quite definitely accused our unspoken thoughts of being ready, heedless of the prohibition against murder, to get rid of anything which stands in our way. From many examples of this I will choose one that has become famous: [1915b, 3090]

Psycho-analysis has inferred from the dreams and parapraxes of healthy people, as well as from the symptoms of neurotics, that the primitive, savage and evil impulses of mankind have not vanished in any of its individual members but persist, although in a repressed state, in the unconscious (to use our technical terms), and lie wait for opportunities of becoming active once more. It has further taught us that our intellect is a feeble and dependent thing, a plaything and tool of our instincts and affects, and that we are all compelled to behave cleverly or stupidly according to the commands of our attitudes and internal resistances. [1915b, 3092]
The jealousy of the second layer, projected jealousy, is derived in both men and women either from their own actual unfaithfulness in real life or from impulses towards it which have succumbed to repression. It is a matter of everyday experience that fidelity, especially that degree of it required in marriage, is only maintained in the face of continual temptations. Anyone who denies these temptations in himself will nevertheless feel their pressure so strongly that he will be glad enough to make use of an unconscious mechanism to alleviate his situation. He can obtain this alleviation - and, indeed, acquittal by his conscience - if he projects his own impulses to faithlessness on to the partner to whom he owes faith. This strong motive can then make use of the perceptual material which betrays unconscious impulses of the same kind in the partner, and the subject can justify himself with the reflection that the other is probably not much better than he is himself.¹

[1922b, 3901]
This and other similar experiences have led me to conclude that actions carried out unintentionally must inevitably become the source of misunderstandings in human relations. The agent, who knows nothing of there being an intention connected with these actions, does not feel that they are chargeable to him and does not hold himself responsible for them. The second party, on the other hand, since he regularly bases his conclusions as to the agent's intentions and sentiments on such actions among others, knows more of the other's psychical processes than that person himself is ready to admit or believes he has communicated. The agent, indeed, grows indignant if these conclusions drawn from his symptomatic acts are brought up against him; he declares them to be baseless, since he is not conscious of having had the intention at the time they were carried out, and complains of being misunderstood by the second party. Strictly considered, misunderstandings of his kind are based on too intimate and too extensive understanding. The more two people suffer from 'nerves', the more readily will they give each other cause for disputes, the responsibility for which each disclaims just as decidedly in regard to himself as he considers it certain in regard to the other person. And this is no doubt the punishment for people's internal dishonesty in only giving expression under the pretext of forgetting, bungling and doing things unintentionally to impulses that would better be admitted to themselves and to others if they can no longer be controlled. It can in fact be said quite generally that everyone is continually practising psychical analysis on his neighbours and consequently learns to know them better than they know themselves. The road whose goal it is to observe the precept γνώθι σεαυτόν runs via the study of one's own apparently accidental actions and omissions.

[1901b, 1287]
But you will have a right to ask another question. If there is no objective verification of psycho-
analysis, and no possibility of demonstrating it, how can one learn psycho-analysis at all, and
convince oneself of the truth of its assertions? It is true that psycho-analysis cannot easily be
learnt and there are not many people who have learnt it properly. But of course there is a
practicable method none the less. One learns psycho-analysis on oneself, by studying one's
own personality. This is not quite the same thing as what is called self-observation, but it can, if
necessary, be subsumed under it. There are a whole number of very common and generally
familiar mental phenomena which, after a little instruction in technique, can be made the subject
of analysis upon oneself. In that way one acquires the desired sense of conviction of the reality
of the processes described by analysis and of the correctness of its views. Nevertheless, there
are definite limits to progress by this method. One advances much further if one is analysed
oneself by a practised analyst and experiences the effects of analysis on one's own self, making
use of the opportunity of picking up the subtler technique of the process from one's analyst. This
excellent method is, of course, applicable only to a single person and never to a whole lecture
room of students together.
[1916-1917, 3132]

All those of us who can look back on a comparatively long experience of life will probably
admit that we should have spared ourselves many disappointments and painful surprises if we
had found the courage and determination to interpret small parapraxes experienced in our
human contacts as auguries and to make use of them as indications of intentions that were still
concealed. As a rule we dare not do so; it would make us feel as though, after a detour through
science, we were becoming superstitious again. Nor do all auguries come true, and you will
understand from our theories that they do not all need to come true.
[1916-1917, 3166]

*The Interpretation of Parapraxes and Haphazard Acts.* - It was a triumph for the interpretative
art of psycho-analysis when it succeeded in demonstrating that certain common mental acts of
normal people, for which no one had hitherto attempted to put forward a psychological
explanation, were to be regarded in the same light as the symptoms of neurotics: that is to say,
they had a *meaning*, which was unknown to the subject but which could easily be discovered by
analytic means. The phenomena in question were such events as the temporary forgetting of
familiar words and names, forgetting to carry out prescribed tasks, everyday slips of the tongue
and of the pen, misreadings, losses and mislayings of objects, certain errors, instances of
apparently accidental self-injury, and finally habitual movements carried out seemingly without
intention or in play, tunes hummed 'thoughtlessly', and so on. All of these were shorn of their
physiological explanation, if any such had ever been attempted, were shown to be strictly
determined and were revealed as an expression of the subject's suppressed intentions or as a
result of a clash between two intentions one of which was permanently or temporarily
unconscious. The importance of this contribution to psychology was of many kinds. The range
of mental determinism was extended by it in an unforeseen manner; the supposed gulf between
normal and pathological mental events was narrowed; in many cases a useful insight was
afforded into the play of mental forces that must be suspected to lie behind the phenomena.
Finally, a class of material was brought to light which is calculated better than any other to
stimulate a belief in the existence of unconscious mental acts even in people to whom the
hypothesis of something at once mental and unconscious seems strange and even absurd. The
study of one's own parapraxes and haphazard acts, for which most people have ample
opportunities, is even to-day the best preparation for an approach to psycho-analysis. In
analytic treatment, the interpretation of parapraxes retains a place as a means of uncovering
the unconscious, alongside the immeasurably more important interpretation of associations.
[1923a, 3917]
I have dealt so exhaustively in these pages with this characteristic of dreams, which indeed provides the motive for their distortion, that I can pass at once from this topic to the problem that lies before us: Must one assume responsibility for the content of one's dreams? For the sake of completeness, it should, however, be added that dreams do not always offer immoral wish-fulfilments, but often energetic reactions against them in the form of 'punishment dreams'. In other words, the dream-censorship cannot only express itself in distortions and the generation of anxiety, but can go so far as to blot out the immoral subject-matter completely and replace it by something else that serves as an atonement, though it allows one to see what lies behind. But the problem of responsibility for the immoral content of dreams no longer exists for us as it formerly did for writers who knew nothing of latent dream-thoughts and the repressed part of our mental life. Obviously one must hold oneself responsible for the evil impulses of one's dreams. What else is one to do with them? Unless the content of the dream (rightly understood) is inspired by alien spirits, it is a part of my own being. If I seek to classify the impulses that are present in me according to social standards into good and bad, I must assume responsibility for both sorts; and if, in defence, I say that what is unknown, unconscious and repressed in me is not my 'ego', then I shall not be basing my position upon psycho-analysis, I shall not have accepted its conclusions - and I shall perhaps be taught better by the criticisms of my fellow-men, by the disturbances in my actions and the confusion of my feelings. I shall perhaps learn that what I am disavowing not only 'is' in me but sometimes 'acts' from out of me as well.

[1925i, 4050]
When I asked another woman patient at the end of the session how her uncle was, she answered: 'I don’t know, nowadays I only see him *in flagranti.*' Next day she began: 'I am really ashamed of myself for having given you such a stupid answer. You must of course have thought me a very uneducated person who is always getting foreign words mixed up. I meant to say: *en passant.*' We did not as yet know the source of the foreign phrase which she had wrongly applied. In the same session, however, while continuing the previous day's topic, she brought up a reminiscence in which the chief role was played by being caught *in flagranti.* The slip of the tongue of the day before had therefore anticipated the memory which at the time had not yet become conscious.

I will add a further instance, in which the slip of the tongue assumed the positively uncanny characteristics of a prophecy. Early in 1923 there was a great stir in the world of finance when the very young banker X. - probably one of the newest of the *'nouveaux riches'* in W., and at any rate the richest and youngest - obtained possession, after a short struggle, of a majority of the shares of the -- Bank; and as a further consequence, a remarkable General Meeting took place at which the old directors of the bank, financiers of the old type, were not re-elected, and young X. became president of the bank. In the valedictory speech which the managing director Dr. Y. went on to deliver in honour of the old president, who had not been re-elected, a number of the audience noticed a distressing slip of the tongue which occurred again and again. He continually spoke of the *expiring* president instead of the *outgoing* president. As it turned out, the old president who was not re-elected died a few days after this meeting. He was, however, over eighty years old! (From Storfer.)

The Roman who gave up an important undertaking if he saw an ill-omened flight of birds was therefore in a relative sense justified; his behaviour was consistent with his premisses. But if he withdrew from the undertaking because he had stumbled on the threshold of his door (*un Romain retournerait*) he was also in an absolute sense superior to us unbelievers; he was a better psychologist than we are striving to be. For his stumbling must have revealed to him the existence of a doubt, a counter-current at work within him, whose force might at the moment of execution subtract from the force of his intention. For we are only sure of complete success if all our mental forces are united in striving towards the desired goal. How did Schiller's Tell, who hesitated so long to shoot the apple on his son’s head, answer the Governor's question why he had provided himself with a second arrow?

But if the subject does not himself give us the explanation of the sense of a parapraxis, where are we to find the starting-points for our interpretation - the circumstantial evidence? In various directions. In the first place from analogies with phenomena apart from parapraxes: when, for instance, we assert that distorting a name when it occurs as a slip of the tongue has the same insulting sense as a deliberate twisting of a name. Further, from the psychical situation in which the parapraxis occurs, the character of the person who makes the parapraxis, and the impressions which he has received before the parapraxis and to which the parapraxis is perhaps a reaction. What happens as a rule is that the interpretation is carried out according to general principles: to begin with there is only a suspicion, a suggestion for an interpretation, and we then find a confirmation by examining the psychical situation. Sometimes we have to wait for subsequent events as well (which have, as it were, announced themselves by the parapraxis) before our suspicion is confirmed.
Ladies and Gentlemen, I could multiply this collection of examples indefinitely; but I will not do so here. You will in any case find a profusion of case material for the study of parapraxes in my *Psychopathology of Everyday Life* (first published in 1901). All these examples lead to the same result: they make it probable that parapraxes have a sense, and they show you how that sense is discovered or confirmed by the attendant circumstances. I will be briefer to-day, because we have adopted the limited aim of using the study of these phenomena as a help towards a preparation for psycho-analysis. There are only two groups of observations into which I need enter more fully here: accumulated and combined parapraxes and the confirmation of our interpretations by subsequent events.

It would be agreeable to add further, similar examples. But I must proceed, and give you a glimpse of the cases in which our interpretation has to wait for the future for confirmation. The governing condition of these cases, it will be realized, is that the present psychical situation is unknown to us or inaccessible to our enquiries. Our interpretation is consequently no more than a suspicion to which we ourselves do not attach too much importance. Later, however, something happens which shows us how well-justified our interpretation had been. I was once the guest of a young married couple and heard the young woman laughingly describe her latest experience. The day after her return from the honeymoon she had called for her unmarried sister to go shopping with her as she used to do, while her husband went to his business. Suddenly she noticed a gentleman on the other side of the street, and nudging her sister had cried: 'Look, there goes Herr L.' She had forgotten that this gentleman had been her husband for some weeks. I shuddered as I heard the story, but I did not dare to draw the inference. The little incident only occurred to my mind some years later when the marriage had come to a most unhappy end.

The idea may possibly have occurred to you that in these examples parapraxes have taken the place of the omens or auguries of the ancients. And indeed some omens were nothing else than parapraxes, as, for instance, when someone stumbled or fell down. Others of them, it is true, had the character of objective happenings and not of subjective acts. But you would hardly believe how difficult it sometimes is to decide whether a particular event belongs to the one group or to the other. An act so often understands how to disguise itself as a passive experience.

All those of us who can look back on a comparatively long experience of life will probably admit that we should have spared ourselves many disappointments and painful surprises if we had found the courage and determination to interpret small parapraxes experienced in our human contacts as auguries and to make use of them as indications of intentions that were still concealed. As a rule we dare not do so; it would make us feel as though, after a detour through science, we were becoming superstitious again. Nor do all auguries come true, and you will understand from our theories that they do not all need to come true.
Maeder tells of a lady who, on the eve of her wedding had forgotten to try on her wedding-dress and, to her dressmaker's despair, only remembered it late in the evening. He connects this forgetfulness with the fact that she was soon divorced from her husband. I know a lady now divorced from her husband, who in managing her money affairs frequently signed documents in her maiden name, many years before she in fact resumed it. I know of other women who have lost their wedding-rings during the honeymoon, and I know too that the history of their marriages has given a sense to the accident. And now here is one more glaring example, but with a happier ending. The story is told of a famous German chemist that his marriage did not take place, because he forgot the hour of his wedding and went to the laboratory instead of to the church. He was wise enough to be satisfied with a single attempt and died at a great age unmarried.
[1916-1917, 3166]

An interesting problem attaches to the practical importance of slips of the pen. You may perhaps remember the case of a murderer, H., who found the means of obtaining cultures of highly dangerous pathogenic organisms from scientific institutes by representing himself as a bacteriologist. He then used these cultures for the purpose of getting rid of his near connections by this most modern of methods. Now on one occasion this man complained to the Directors of one of these institutes that the cultures that had been sent to him were ineffective; but he made a slip of the pen, and instead of writing 'in my experiments on mice or guinea-pigs' he wrote quite clearly 'in my experiments on men'¹. The doctors at the institute were struck by the slip, but, so far as I know, drew no conclusions from it. Well, what do you think? Should not the doctors, on the contrary, have taken the slip of the pen as a confession and started an investigation which would have put an early stop to the murderer's activities? Was not ignorance of our view of parapraxes responsible in this case for an omission of practical significance? Well, I think a slip of the pen like this would certainly have seemed to me most suspicious; but something of great importance stands in the way of using it as a confession. The matter is not as simple as all that. The slip was certainly a piece of circumstantial evidence; but it was not enough in itself to start an investigation. It is true that the slip of the pen said that he was concerned with thoughts of infecting men, but it did not make it possible to decide whether these thoughts were to be taken as a clear intention to injure or as a phantasy of no practical importance. It is even possible that a man who had made a slip like this would have every subjective justification for denying the phantasy and would repudiate it as something entirely foreign to him. You will understand these possibilities still better when later on we come to consider the distinction between psychical and material reality. But this is another instance of a parapraxis acquiring importance from subsequent events.
[1916-1917, 3175]
(6) When I asked another woman patient at the end of the session how her uncle was, she answered: 'I don't know, nowadays I only see him in flagranti.' Next day she began: 'I am really ashamed of myself for having given you such a stupid answer. You must of course have thought me a very uneducated person who is always getting foreign words mixed up. I meant to say: en passant.' We did not as yet know the source of the foreign phrase which she had wrongly applied. In the same session, however, while continuing the previous day's topic, she brought up a reminiscence in which the chief role was played by being caught in flagranti. The slip of the tongue of the day before had therefore anticipated the memory which at the time had not yet become conscious.

[1901b, 1154]

In the psychotherapeutic procedure which I employ for resolving and removing neurotic symptoms I am very often faced with the task of discovering, from the patient's apparently casual utterances and associations, a thought-content which is at pains to remain concealed but which cannot nevertheless avoid unintentionally betraying its existence in a whole variety of ways. Slips of the tongue often perform a most valuable service here, as I could show by some highly convincing and at the same time very singular examples. Thus, for instance, a patient will be speaking of his aunt and, without noticing the slip, will consistently call her 'my mother'; or another will refer to her husband as her 'brother'. In this way they draw my attention to the fact that they have 'identified' these persons with one another - that they have put them into a series which implies a recurrence of the same type in their emotional life. To give another example: a young man of twenty introduced himself to me during my consulting hours in these words: 'I am the father of So-and-so who came to you for treatment. I beg your pardon, I meant to say I am his brother: he is four years older than I am.' I inferred that he intended this slip to express the view that, like his brother, he had fallen ill through the fault of his father; that, like his brother, he wished to be cured; but that his father was the one who most needed to be cured. - At other times an arrangement of words that sounds unusual, or an expression that seems forced, is enough to reveal that a repressed thought is participating in the patient's remarks, which had a different end in view..

[1901b, 1171]

This and other similar experiences have led me to conclude that actions carried out unintentionally must inevitably become the source of misunderstandings in human relations. The agent, who knows nothing of there being an intention connected with these actions, does not feel that they are chargeable to him and does not hold himself responsible for them. The second party, on the other hand, since he regularly bases his conclusions as to the agent's intentions and sentiments on such actions among others, knows more of the other's psychical processes than that person himself is ready to admit or believes he has communicated. The agent, indeed, grows indignant if these conclusions drawn from his symptomatic acts are brought up against him; he declares them to be baseless, since he is not conscious of having had the intention at the time they were carried out, and complains of being misunderstood by the second party. Strictly considered, misunderstandings of his kind are based on too intimate and too extensive understanding. The more two people suffer from 'nerves', the more readily will they give each other cause for disputes, the responsibility for which each disclaims just as decidedly in regard to himself as he considers it certain in regard to the other person. And this is no doubt the punishment for people's internal dishonesty in only giving expression under the pretext of forgetting, bungling and doing things unintentionally to impulses that would better be admitted to themselves and to others if they can no longer be controlled. It can in fact be said quite generally that everyone is continually practising psychical analysis on his neighbours and consequently learns to know them better than they know themselves. The road whose goal it is to observe the precept γυώθι σεαντόυ¹ runs via the study of one's own apparently accidental actions and omissions.

[1901b, 1287]
I next proceed to mention more particularly what is to be found in this paper and what is not to be found in it. The title of the work was originally 'Dreams and Hysteria', for it seemed to me peculiarly well-adapted for showing how dream-interpretation is woven into the history of a treatment and how it can become the means of filling in amnesias and elucidating symptoms. It was not without good reasons that in the year 1900 I gave precedence to a laborious and exhaustive study of dreams (The Interpretation of Dreams) over the publications upon the psychology of the neuroses which I had in view. And incidentally I was able to judge from its reception with what an inadequate degree of comprehension such efforts are met by other specialists at the present time. In this instance there was no validity in the objection that the material upon which had based my assertions had been withheld and that it was therefore impossible to become convinced of their truth by testing and checking them. For every one can submit his own dreams to analytic examination, and the technique of interpreting dreams may be easily learnt from the instructions and examples which I have given. I must once more insist, just as I did at that time, that a thorough investigation of the problems of dreams is an indispensable prerequisite for any comprehension of the mental processes in hysteria and the other psychoneuroses, and that no one who wishes to shirk that preparatory labour has the smallest prospect of advancing even a few steps into this region of knowledge. Since, therefore, this case history presupposes a knowledge of the interpretation of dreams, it will seem highly unsatisfactory to any reader to whom this presupposition does not apply. Such a reader will find only bewilderment in these pages instead of the enlightenment he is in search of, and he will certainly be inclined to project the cause of his bewilderment on to the author and to pronounce his views fantastic. But in reality this bewildering character attaches to the phenomena of the neurosis itself; its presence there is only concealed by the physician's familiarity with the facts, and it comes to light again with every attempt a explaining them. It could only be completely banished if we could succeed in tracing back every single element of a neurosis to factors with which we were already familiar. But everything tends to show that, on the contrary, we shall be driven by the study of neuroses to assume the existence of many new thing which will later on gradually become the subject of more certain knowledge. What is new has always aroused bewilderment and resistance.

[1905e, 1353]

You ask me to name 'ten good books' for you, and refrain from adding to this any word of explanation. Thus you leave to me not only the choice of the books but also the interpretation of your request. Accustomed to paying attention to small signs, I must then trust the wording in which you couch your enigmatical demand. You did not say: 'the ten most magnificent works (of world literature)', in which case I should have been obliged to reply, with so many others: Homer, the tragedies of Sophocles, Goethe's Faust, Shakespeare's Hamlet, Macbeth, etc. Nor did you say the 'ten most significant books', among which scientific achievements like those of Copernicus, of the old physician Johann Weier on the belief in witches, Darwin's Descent of Man, and others, would then have found a place. You did not even ask for 'favourite books', among which I should not have forgotten Milton's Paradise Lost and Heine's Lazarus. I think, therefore, that a particular stress falls on the 'good' in your phrase, and that with this predicate you intend to designate books to which one stands in rather the same relationship as to 'good' friends, to whom one owes a part of one's knowledge of life and view of the world - books which one has enjoyed oneself and gladly commends to others, but in connection with which the element of timid reverence, the feeling of one's own smallness in the face of their greatness, is not particularly prominent.

[1906f, 1991]

Parapraxes are the most convenient material for anyone who wishes to convince himself of the trustworthiness of psycho-analytic explanations. In a small work, first published in book form in 1904, I presented a large number of examples of this kind, and since then I have been able to add to my collection many contributions from other observers.¹

[1913j, 2804]
Nevertheless, in spite of the apparent triviality of these phenomena, the psycho-analytic explanation of parapraxes involves some slight modifications in our view of the world. We find that even normal people are far more frequently moved by contradictory motives than we should have expected. The number of occurrences that can be described as 'accidental' is considerably diminished. It is almost a consolation to be able to exclude the loss of objects from among the chance events of life; our blunders often turn out to be a cover for our secret intentions. But - what is more important - many serious accidents that we should otherwise have ascribed entirely to chance reveal under analysis the participation of the subject's own volition, though without its being clearly admitted by him. The distinction between a chance accident and deliberate self-destruction, which in practice is so often hard to draw, becomes even more dubious when looked at from an analytic point of view.

[1913, 2805]

But you will have a right to ask another question. If there is no objective verification of psycho-analysis, and no possibility of demonstrating it, how can one learn psycho-analysis at all, and convince oneself of the truth of its assertions? It is true that psycho-analysis cannot easily be learnt and there are not many people who have learnt it properly. But of course there is a practicable method none the less. One learns psycho-analysis on oneself, by studying one's own personality. This is not quite the same thing as what is called self-observation, but it can, if necessary, be subsumed under it. There are a whole number of very common and generally familiar mental phenomena which, after a little instruction in technique, can be made the subject of analysis upon oneself. In that way one acquires the desired sense of conviction of the reality of the processes described by analysis and of the correctness of its views. Nevertheless, there are definite limits to progress by this method. One advances much further if one is analysed oneself by a practised analyst and experiences the effects of analysis on one's own self, making use of the opportunity of picking up the subtler technique of the process from one's analyst. This excellent method is, of course, applicable only to a single person and never to a whole lecture room of students together.

[1916-1917, 3132]

(6) I have a particular reason for piling up instances of the use of symbols in dreams. At our first meeting I lamented the difficulty of providing demonstrations and so of carrying conviction in giving instruction in psycho-analysis. And I have no doubt that you have since come to agree with me. But the different theses of psycho-analysis are so intimately connected that conviction can easily be carried over from a single point to a larger part of the whole. It might be said of psycho-analysis that if anyone holds out a little finger to it it quickly grasps his whole hand. No one, even, who has accepted the explanation of parapraxes can logically withhold his belief in all the rest. A second, equally accessible position is offered by dream-symbolism. Here is the dream of an uneducated woman whose husband was a policeman and who had certainly never heard anything about dream-symbolism or psycho-analysis. Then judge for yourselves whether its explanation by the help of sexual symbols can be called arbitrary and forced:

[1916-1917, 3284]
The Interpretation of Parapraxes and Haphazard Acts. - It was a triumph for the interpretative art of psycho-analysis when it succeeded in demonstrating that certain common mental acts of normal people, for which no one had hitherto attempted to put forward a psychological explanation, were to be regarded in the same light as the symptoms of neurotics: that is to say, they had a meaning, which was unknown to the subject but which could easily be discovered by analytic means. The phenomena in question were such events as the temporary forgetting of familiar words and names, forgetting to carry out prescribed tasks, everyday slips of the tongue and of the pen, misreadings, losses and mislayings of objects, certain errors, instances of apparently accidental self-injury, and finally habitual movements carried out seemingly without intention or in play, tunes hummed 'thoughtlessly', and so on. All of these were shorn of their physiological explanation, if any such had ever been attempted, were shown to be strictly determined and were revealed as an expression of the subject's suppressed intentions or as a result of a clash between two intentions one of which was permanently or temporarily unconscious. The importance of this contribution to psychology was of many kinds. The range of mental determinism was extended by it in an unforeseen manner; the supposed gulf between normal and pathological mental events was narrowed; in many cases a useful insight was afforded into the play of mental forces that must be suspected to lie behind the phenomena. Finally, a class of material was brought to light which is calculated better than any other to stimulate a belief in the existence of unconscious mental acts even in people to whom the hypothesis of something at once mental and unconscious seems strange and even absurd. The study of one's own parapraxes and haphazard acts, for which most people have ample opportunities, is even to-day the best preparation for an approach to psycho-analysis. In analytic treatment, the interpretation of parapraxes retains a place as a means of uncovering the unconscious, alongside the immeasurably more important interpretation of associations.

[1923a, 3917]

All this sounds convincing and reasonable. Psycho-analysis has once more to meet the reproach that it makes hair-splitting complications in the simplest things and sees mysteries and problems where none exist, and that it does this by laying undue stress on insignificant and irrelevant details, such as occur every where, and making them the basis of the most far-reaching and strangest conclusions. It would be useless for us to point out that this rejection of our interpretation would do away with many striking analogies and break a number of subtle connections which we are able to demonstrate in this case. Our opponents will say that those analogies and connections do not in fact exist, but have been imported into the case by us with quite uncalled-for ingenuity.

[1923d, 4008]

If we are right in regarding our painter's bond with the Devil as a neurotic phantasy, there is no need for any further apology for considering it psycho-analytically. Even small indications have a meaning and importance, and quite specially when they are related to the conditions under which a neurosis originates. To be sure, it is as possible to overvalue as to undervalue them, and it is a matter of judgement how far one should go in exploiting them. But anyone who does not believe in psycho-analysis - or, for the matter of that, even in the Devil - must be left to make what he can of the painter's case, whether he is able to furnish an explanation of his own or whether he sees nothing in it that needs explaining.

[1923d, 4008]
I have dealt so exhaustively in these pages with this characteristic of dreams, which indeed provides the motive for their distortion, that I can pass at once from this topic to the problem that lies before us: Must one assume responsibility for the content of one's dreams? For the sake of completeness, it should, however, be added that dreams do not always offer immoral wish-fulfilments, but often energetic reactions against them in the form of 'punishment dreams'. In other words, the dream-censorship cannot only express itself in distortions and the generation of anxiety, but can go so far as to blot out the immoral subject-matter completely and replace it by something else that serves as an atonement, though it allows one to see what lies behind. But the problem of responsibility for the immoral content of dreams no longer exists for us as it formerly did for writers who knew nothing of latent dream-thoughts and the repressed part of our mental life. Obviously one must hold oneself responsible for the evil impulses of one's dreams. What else is one to do with them? Unless the content of the dream (rightly understood) is inspired by alien spirits, it is a part of my own being. If I seek to classify the impulses that are present in me according to social standards into good and bad, I must assume responsibility for both sorts; and if, in defence, I say that what is unknown, unconscious and repressed in me is not my 'ego', then I shall not be basing my position upon psycho-analysis, I shall not have accepted its conclusions - and I shall perhaps be taught better by the criticisms of my fellow-men, by the disturbances in my actions and the confusion of my feelings. I shall perhaps learn that what I am disavowing not only 'is' in me but sometimes 'acts' from out of me as well.

Evidence of its being of use for throwing light on other than pathological mental activity was early forthcoming in connection with two kinds of phenomena: with the very frequent parapraxes that occur in everyday life - such as forgetting things, slips of the tongue, and mislaying objects - and with the dreams dreamt by healthy and psychically normal people. Small failures of functioning, like the temporary forgetting of normally familiar proper names, slips of the tongue and of the pen, and so on, had hitherto not been considered worthy of any explanation at all or were supposed to be accounted for by conditions of fatigue, by distraction of the attention, etc. The present writer then showed from many examples, in his book *The Psychopathology of Everyday Life* (1901b), that events of this kind have a meaning, and arise owing to a conscious intention being interfered with by another, suppressed or actually unconscious one. As a rule, quick reflection or a short analysis is enough to reveal the interfering influence. Owing to the frequency of such parapraxes as slips of the tongue, it became easy for anyone to convince himself from his own experience of the existence of mental processes which are not conscious, but which are nevertheless operative and which at least find expression as inhibitions and modifications of other, intended acts.

[1925i, 4050]

[1924f, 4109]
In the same way that psycho-analysis makes use of dream-interpretation, it also profits by the study of the numerous little slips and mistakes which people make - symptomatic actions, as they are called. I investigated this subject in a series of papers which were published for the first time in book form in 1904 under the title of *The Psychopathology of Everyday Life*. In this widely circulated work I have pointed out that these phenomena are not accidental, that they require more than physiological explanations, that they have a meaning and can be interpreted, and that one is justified in inferring from them the presence of restrained or repressed impulses and intentions. But what constitutes the enormous importance of dream-interpretation, as well as of this latter study, is not the assistance they give to the work of analysis but another of their attributes. Previously psycho-analysis had only been concerned with solving pathological phenomena and in order to explain them it had often been driven into making assumptions whose comprehensiveness was out of all proportion to the importance of the actual material under consideration. But when it came to dreams, it was no longer dealing with a pathological symptom, but with a phenomenon of normal mental life which might occur in any healthy person. If dreams turned out to be constructed like symptoms, if their explanation required the same assumptions - the repression of impulses, substitutive formation, compromise-formation, the dividing of the conscious and the unconscious into various psychical systems - then psycho-analysis was no longer an auxiliary science in the field of psychopathology, it was rather the starting-point of a new and deeper science of the mind which would be equally indispensable for the understanding of the normal. Its postulates and findings could be carried over to other regions of mental happening; a path lay open to it that led far afield, into spheres of universal interest.

[1925d, 4222]
In the psychotherapeutic procedure which I employ for resolving and removing neurotic symptoms, I am very often faced with the task of discovering, from the patient's apparently casual utterances and associations, a thought-content which is at pains to remain concealed but which cannot nevertheless avoid unintentionally betraying its existence in a whole variety of ways. Slips of the tongue often perform a most valuable service here, as I could show by some highly convincing and at the same time very singular examples. Thus, for instance, a patient will be speaking of his aunt and, without noticing the slip, will consistently call her 'my mother'; or another will refer to her husband as her 'brother'. In this way they draw my attention to the fact that they have 'identified' these persons with one another - that they have put them into a series which implies a recurrence of the same type in their emotional life. To give another example: a young man of twenty introduced himself to me during my consulting hours in these words: 'I am the father of So-and-so who came to you for treatment. I beg your pardon, I meant to say I am his brother: he is four years older than I am.' I inferred that he intended this slip to express the view that, like his brother, he had fallen ill through the fault of his father; that, like his brother, he wished to be cured; but that his father was the one who most needed to be cured. - At other times an arrangement of words that sounds unusual, or an expression that seems forced, is enough to reveal that a repressed thought is participating in the patient's remarks, which had a different end in view.

[1901b, 1171]

The Interpretation of Parapraxes and Haphazard Acts. - It was a triumph for the interpretative art of psycho-analysis when it succeeded in demonstrating that certain common mental acts of normal people, for which no one had hitherto attempted to put forward a psychological explanation, were to be regarded in the same light as the symptoms of neurotics: that is to say, they had a meaning, which was unknown to the subject but which could easily be discovered by analytic means. The phenomena in question were such events as the temporary forgetting of familiar words and names, forgetting to carry out prescribed tasks, everyday slips of the tongue and of the pen, misreadings, losses and mislayings of objects, certain errors, instances of apparently accidental self-injury, and finally habitual movements carried out seemingly without intention or in play, tunes hummed 'thoughtlessly', and so on. All of these were shorn of their physiological explanation, if any such had ever been attempted, were shown to be strictly determined and were revealed as an expression of the subject's suppressed intentions or as a result of a clash between two intentions one of which was permanently or temporarily unconscious. The importance of this contribution to psychology was of many kinds. The range of mental determinism was extended by it in an unforeseen manner; the supposed gulf between normal and pathological mental events was narrowed; in many cases a useful insight was afforded into the play of mental forces that must be suspected to lie behind the phenomena. Finally, a class of material was brought to light which is calculated better than any other to stimulate a belief in the existence of unconscious mental acts even in people to whom the hypothesis of something at once mental and unconscious seems strange and even absurd. The study of one's own parapraxes and haphazard acts, for which most people have ample opportunities, is even today the best preparation for an approach to psycho-analysis. In analytic treatment, the interpretation of parapraxes retains a place as a means of uncovering the unconscious, alongside the immeasurably more important interpretation of associations.

[1923a, 3917]
In the same way that psycho-analysis makes use of dream-interpretation, it also profits by the study of the numerous little slips and mistakes which people make - symptomatic actions, as they are called. I investigated this subject in a series of papers which were published for the first time in book form in 1904 under the title of *The Psychopathology of Everyday Life*. In this widely circulated work I have pointed out that these phenomena are not accidental, that they require more than physiological explanations, that they have a meaning and can be interpreted, and that one is justified in inferring from them the presence of restrained or repressed impulses and intentions. Its postulates and findings could be carried over to other regions of mental happening; a path lay open to it that led far afield, into spheres of universal interest.

[1925d, 4222]

The method by which we strengthen the weakened ego has as a starting-point an extending of its self-knowledge. That is not, of course, the whole story but it is a first step. The loss of such knowledge signifies for the ego a surrender of power and influence; it is the first tangible sign that it is being hemmed in and hampered by the demands of the id and the super-ego. Accordingly, the first part of the help we have to offer is intellectual work on our side and encouragement to the patient to collaborate in it. This first kind of activity, as we know, is intended to pave the way to another, more difficult, task. We shall not lose sight of the dynamic element in this task, even during its preliminary stage. We gather the material for our work from a variety of sources - from what is conveyed to us by the information given us by the patient and by his free associations, from what he shows us in his transferences, from what we arrive at by interpreting his dreams and from what he betrays by his slips or *parapraxes*. All this material helps us to make constructions about what happened to him and has been forgotten as well as about what is happening in him now without his understanding it. But in all this we never fail to make a strict distinction between *our* knowledge and *his* knowledge. We avoid telling him at once things that we have often discovered at an early stage, and we avoid telling him the whole of what we think we have discovered. We reflect carefully over when we shall impart the knowledge of one of our constructions to him and we wait for what seems to us the suitable moment - which it is not always easy to decide. As a rule we put off telling him of a construction or explanation till he himself has so nearly arrived at it that only a single step remains to be taken, though that step is in fact the decisive synthesis. If we proceeded in another way and overwhelmed him with our interpretations before he was prepared for them, our information would either produce no effect or it would provoke a violent outbreak of *resistance* which would make the progress of our work more difficult or might even threaten to stop it altogether. But if we have prepared everything properly, it often happens that the patient will at once confirm our construction and himself recollect the internal or external event which he had forgotten. The more exactly the construction coincides with the details of what has been forgotten the easier will it be for him to assent. On that particular matter *our* knowledge will then have become *his* knowledge as well.

[1940a [1938], 4987]
(E) When I recently had occasion to report some examples of the forgetting of names, with their analyses, to a colleague with a philosophical education, he hastened to reply: 'That's all very well; but in my case the forgetting of names happens differently.' The matter can obviously not be dealt with as easily as this; I do not suppose that my colleague had ever before thought of analysing the forgetting of a name, nor could he say how it happened differently in his case. But his comment nevertheless touches on a problem which many people will be inclined to put in the foreground. Does the elucidation given here of parapraxes and chance actions apply quite generally or only in certain cases? and if the latter, what are the conditions under which it can be called in to explain phenomena that might also have been brought about in another way? In answering this question my experiences leave me in the lurch. I can but utter a warning against supposing that a connection of the kind here demonstrated is only rarely found; for every time I have made the test on myself or on my patients, a connection has been clearly shown to exist just as in the examples reported, or there have at least been good grounds for supposing that it did. It is not surprising if success in finding the hidden meaning of a symptomatic act is not achieved every time, for the magnitude of the internal resistances opposing the solution comes into account as a deciding factor. Equally, it is not possible to interpret every single dream of one's own or of one's patients; to prove that the theory holds good in general it is enough if one can penetrate a part of the way into the hidden connection. It often happens that a dream which proves refractory during an attempt to solve it the next day will allow its secret to be wrested from it a week or a month later, after a real change has come about in the meantime and has reduced the contending psychical values. The same applies to the solving of parapraxes and symptomatic acts. The example of misreading on page 1194 (‘Across Europe in a Tub’) gave me the opportunity of showing how a symptom that is at first insoluble becomes accessible to analysis when the real interest in the repressed thoughts has passed away.¹ As long as the possibility existed of my brother obtaining the envied title before me, this misreading resisted every one of my repeated efforts to analyse it; after it had turned out to be unlikely that he would be preferred to me in this way, the path that led to its solution was suddenly cleared. It would therefore be incorrect to maintain that all the cases which resist analysis are due to a mechanism other than the psychical mechanism disclosed here. Such an assumption would need more than negative evidence. Furthermore, the readiness to believe in a different explanation of parapraxes and symptomatic acts, which is probably to be found in all healthy people, is quite devoid of evidential value; it is obviously a manifestation of the same mental forces which produced the secret and which therefore also devote themselves to preserving it and resist its elucidation.

¹ [1901b, 1339]

On the other hand we must not overlook the fact that repressed thoughts and impulses certainly do not achieve expression in symptomatic acts and parapraxes by their own unaided efforts. The technical possibility for such side-slippery on the part of the innervations must be presented independently; this will then be readily exploited by the intention of the repressed to make itself felt consciously. In the case of verbal parapraxes, detailed investigations by philosophers and philologists have endeavoured to determine what are the structural and functional relations that put themselves at the service of such an intention. If we distinguish, among the determinants of parapraxes and symptomatic acts, between the unconscious motive on the one hand and the physiological and psycho-physical relations that come to meet it on the other, it remains an open question whether there are, within the range of normality, yet other factors that can - like the unconscious motive, and in place of it - create parapraxes and symptomatic acts along the lines of these relations. It is not my task to answer this question.

² [1901b, 1340]
Nor is it my purpose to exaggerate the differences, sufficiently large as they are, between the psycho-analytic and the popular view of parapraxes. I would rather call attention to cases in which these differences lose much of their sharpness. As regards the simplest and most inconspicuous examples of slips made by the tongue or the pen - in which, perhaps, words are merely contracted, or words and letters left out - the more complicated interpretations come to nothing. From the point of view of psycho-analysis we must maintain that some disturbance of intention has revealed its existence in these cases, but we cannot say from what the disturbance derived and what its aim was. In fact it has achieved nothing apart from demonstrating its existence. In such cases we can also see how a parapraxis is encouraged by phonetic resemblances and close psychological associations: this is a fact that we have never disputed. It is, however, a reasonable scientific demand that such rudimentary cases of slips of the tongue or slips of the pen should be judged on the basis of the more clearly marked cases, whose investigation yields such unambiguous conclusions as to the way in which parapraxes are caused.

[1901b, 1340]
Rank (1912 and 1915b) has also given attention to the very interesting relations between 'Parapraxes and Dreams', but they cannot be followed without a thorough analysis of the dream which is linked to the parapraxis. I once dreamt, as part of a longish dream, that I had lost my purse. In the morning while I was dressing I found that it was really missing. While undressing the night before I had the dream, I had forgotten to take it out of my trouser pocket and put it in its usual place. I was therefore not ignorant of my forgetfulness and it was probably meant to give expression to an unconscious thought which was prepared for making its appearance in the content of the dream.¹

¹ [Footnote added 1924:] It is not so rare an event for a parapraxis like losing or mislaying something to be undone by means of a dream - by one's learning in the dream where the missing object is to be found; but this has nothing about it in the nature of the occult, so long as dreamer and loser are the same person. A young lady writes: 'About four months ago at the bank I lost a very beautiful ring. I hunted in every nook and cranny of my room without finding it. A week ago I dreamt it was lying beside the cupboard by the radiator. Naturally the dream gave me no rest, and next morning I did in fact really find it in that very spot.' She is surprised at this incident, and maintains that it often happens that her thoughts and wishes are fulfilled in this way, but omits to ask herself what change had occurred in her life between the loss and the recovery of the ring.

(G) A few words should be said to indicate at least in what direction this wider context lies. The mechanism of parapraxes and chance actions, as we have come to know it by our employment of analysis, can be seen to correspond in its most essential points with the mechanism of dream-formation which I have discussed in the chapter on the 'dream-work' in my Interpretation of Dreams. In both cases we find condensations and compromise-formations (contaminations). We have the same situation: by unfamiliar paths, and by the way of external associations, unconscious thoughts find expression as modifications of other thoughts. The incongruities, absurdities and errors of the dream-content, which result in the dream being scarcely recognized as the product of psychical activity, originate in the same way, though it is true with a freer use of the means at hand, as our common mistakes in everyday life. In both cases the appearance of an incorrect function is explained by the peculiar mutual interference between two or several correct functions.

An important conclusion can be drawn from this conformity. The peculiar mode of working, whose most striking achievement we see in the content of dreams, cannot be attributed to the sleeping state of mental life if we possess such abundant evidence in the form of parapraxes that it operates during our waking life as well. The same connection also forbids our assuming that these psychical processes, which strike us as abnormal and strange, are determined by a deep-seated decay in mental activity or by pathological states of functioning.¹

(7) On the basis of these characteristics of dreams, we can return once more to a comparison between a dream and a parapraxis. In the latter we distinguished between a disturbing purpose and a disturbed one, and the parapraxis was a compromise between them. A dream can be fitted into the same pattern. The disturbed purpose can only be that of sleeping. We may replace the disturbing one by the psychical stimulus, or let us say by the wish which presses to be dealt with, since we have not learnt so far of any other psychical stimulus that disturbs sleep. Here the dream, too, is the result of a compromise. One sleeps, but one nevertheless experiences the removing of a wish; one satisfies a wish, but at the same time one continues to sleep. Both purposes are partly achieved and partly abandoned.
We have assumed of dreams of another sort, on the basis of various considerations and on the analogy of our views on parapraxes, that they are a distorted substitute for an unknown content, and that the first thing is to trace them back to it. Our immediate task, then, is an enquiry which will lead to an understanding of this distortion in dreams.
[1916-1917, 3232]
'There is nothing in fact to prevent us from assuming that both turns of phrase, the one about his five wits and the one about 'the even number five', played their separate parts in causing first a number, and then the mysterious five instead of the simple four, to be introduced into the sentence dealing with the straight limbs. But this fusion would certainly not have come about if, in the form that appeared in the slip of the tongue, it had not had a good meaning of its own - one expressing a cynical truth which could not of course be admitted to undisguised, coming as it did from a woman. - Finally we should not omit to draw attention to the fact that the lady's remark, as worded, could pass just as well for a capital joke as for an amusing slip of the tongue. It is simply a question of whether she spoke the words with a conscious or an unconscious intention. In our case the way the speaker behaved certainly ruled out any notion of conscious intention and excluded the idea of its being a joke.'

How closely a slip of the tongue can approximate to a joke is shown in the following case, reported by Rank (1913), in which the woman responsible for the slip actually ended by herself treating it as a joke and laughing at it.

(34) In the following example, too - supplied by Storfer - it might be thought that a joke was intended:

(35) The connection between jokes and slips of the tongue is also shown in the fact that in many cases a slip of the tongue is nothing other than an abbreviation:

When the linguistic material happens to be favourable, it often causes slips of the tongue to occur which have the positively shattering result of a revelation, or which produce the full comic effect of a joke. - This is the case in the following example observed and reported by Dr. Reitler:

(17) I have to thank Herr J. G., who also contributed an example mentioned above for the following account of a slip of the pen. In content it is identical with a notorious bad joke, but in this case the intention of making a joke could be definitely ruled out:

Karl Kraus was responsible for another successful condensation with slight modification. He wrote of a certain yellow-press journalist that he had travelled to one of the Balkan States by 'Orienterpresszug'.² There is no doubt that this word combines two others: 'Orientexpresszug [Orient Express]' and 'Erpressung [blackmail]'. Owing to the context, the element 'Erpressung' emerges only as a modification of the 'Orientexpresszug' - a word called for by the verb ['travelled']. This joke, which presents itself in the guise of a misprint, has yet another claim on our interest.
You will not be able to escape the resemblance of this example to a joke; and it has in fact often happened that a joke of the dreamer's has been regarded as a joke of the interpreter's. There are other instances in which it has been far from easy to decide whether what we are dealing with is a joke or a dream. But you will recall that the same doubt arose in the case of some parapraxes - slips of the tongue. A man reported as a dream of his that his uncle had given him a kiss while they were sitting in his auto (mobile). He himself very quickly added the interpretation: it meant 'auto-erotism' (a term from the theory of the libido, indicating satisfaction obtained without any outside object). Had the man set out, then, to have some fun with us and was he passing off a joke that had occurred to him as a dream? I think not; I believe he really dreamt it. But what is the origin of this puzzling similarity? This question once led me temporarily aside from my path by compelling me to make jokes themselves the subject of a detailed investigation. It was there shown how jokes originate: a preconscious train of thought is abandoned for a moment to be worked over in the unconscious, and from this it emerges as a joke. Under the influence of the unconscious it is subjected to the effects of the mechanisms that hold sway there - condensation and displacement - the same processes that we have found concerned in the dream-work; and it is to this common feature that is to be ascribed the similarity, when it occurs, between jokes and dreams. But the unintended 'dream-joke' brings none of the yield of pleasure of a true joke. You can learn why if you go more deeply into the study of jokes. A 'dream-joke' strikes us as a bad joke; it does not make us laugh, it leaves us cold.

[1916-1917, 3321]
'Few people can avoid feeling a twinge of resentment when they find that their name has been forgotten, particularly if it is by some one with whom they had hoped or expected it would be remembered. They instinctively realize that if they had made a greater impression on the person's mind he would certainly have remembered them again, for the name is an integral part of the personality. Similarly, few things are more flattering to most people than to find themselves addressed by name by a great personage where they could hardly have anticipated it. Napoleon, like most leaders of men, was a master of this art. In the midst of the disastrous Campaign of France, in 1814, he gave an amazing proof of his memory in this direction. When in a town near Craon he recollected that he had met the mayor, De Bussy, over twenty years ago in the La Fère regiment; the delighted De Bussy at once threw himself into his service with extraordinary zeal. Conversely there is no surer way of affronting some one than by pretending to forget his name; the insinuation is thus conveyed that the person is so unimportant in our eyes that we cannot be bothered to remember his name. This device is often exploited in literature. In Turgenev's *Smoke* the following passage occurs. "'So you still find Baden entertaining, M'sieu-Litvinov.' Ratmirov always uttered Litvinov's surname with hesitation, every time, as though he had forgotten it, and could not at once recall it. In this way, as well as by the lofty flourish of his hat in saluting him, he meant to insult his pride." The same author in his *Fathers and Sons* writes: "The Governor invited Kirsanov and Bazarov to his ball, and within a few minutes invited them a second time, regarding them as brothers, and calling them Kisarov." Here the forgetting that he had spoken to them, the mistake in the names, and the inability to distinguish between the two young men, constitute a culmination of disparagement. Falsification of a name has the same significance as forgetting it; it is only a step towards complete amnesia.'

[1901b, 1174]

¹ Slips of the tongue of this type are used, for instance, by Anzengruber in his *Der G'wissenswurm* to expose the character of the hypocritical legacy-hunter.

[1901b, 1176]

A good example of a slip of the tongue whose purpose is not so much to betray the speaker as to give the listener in the theatre his bearings, is to be found in *Wallenstein* (*Piccolomini*, Act I, Scene 5); and it shows us that the dramatist, who here availed himself of this device, was familiar with the mechanism and meaning of slips of the tongue. In the preceding scene Max Piccolomini has ardently espoused the Duke's cause, and has been passionately describing the blessings of peace, of which he has become aware on the course of a journey while escorting Wallenstein's daughter to the camp. As he leaves the stage, his father and Questenberg, the emissary from the court, are plunged in consternation. Scene 5 continues:

[1901b, 1185]

Another example in which a dramatist makes use of a slip of the tongue has been discovered by Otto Rank (1910) in Shakespeare. I quote Rank's account:

[1901b, 1186]

In view of the interest that is lent to our theory of slips of the tongue by support of this nature from great writers, I feel justified in citing a third such instance which has been reported by Ernest Jones (1911b, 496):

[1901b, 1187]

¹ [Footnote added 1920:] Other instances of slips of the tongue which the writer intends to be taken as having a meaning and usually as being self-revealing can be found in Shakespeare's *Richard II* (Act II, Scene 2), and in Schiller's *Don Carlos* (Act. II, Scene 8; a slip made by Princess Eboli). There would doubtless be no difficulty in extending this list.

[1901b, 1187]
Between 'slips of the pen' and 'forgetting' may be inserted the case of someone who forgets to append a signature. An unsigned cheque comes to the same thing as a forgotten cheque. For the significance of a forgetting of a similar kind I will cite a passage from a novel, which Dr. Hanns Sachs came upon:

[1901b, 1217]

I have already been able again and again to produce evidence that creative writers think of parapraxes as having a meaning and a motive, just as I am arguing here. We shall not be surprised, therefore, to see from a fresh example how a writer invests a clumsy movement with significance, too, and makes it foreshadow later events.

[1901b, 1256]

Stärcke (1916) has given an example of the way in which creative writers do not hesitate to put a bungled action in the place of an intentional action and to make it in this way the source of the gravest consequences:

[1901b, 1267]

The theme of the ring leaves one once again with the impression of how hard it is for a psycho-analyst to discover anything new that has not been known before by some creative writer. In Fontane's novel Vor dem Sturm Justizrat Turgany declares during a game of forfeits: 'You may be sure, ladies, that the deepest secrets of nature are revealed in the pledging of forfeits.' Among the examples he uses to support his claim there is one that deserves our special interest: 'I recall a professor's wife - she had reached the age of embonpoint - who again and again pulled off her wedding ring to offer it as a forfeit. Do not ask me to describe the happiness of her marriage.' He then went on: 'In the same company there was a gentleman who never tired of depositing his English pocket-knife, with its ten blades, corkscrew and flint and steel, in the ladies' laps, until the bladed monster, after tearing several silk dresses, finally disappeared amid general cries of indignation.'

[1901b, 1282]

Of all the writers who have from time to time passed comment on our minor symptomatic acts and parapraxes, or who have made use of them, none has understood their secret nature so clearly or exhibited them in so uncannily lifelike a manner as Strindberg - a man whose genius in recognizing such things was, it is true, assisted by grave mental abnormality. Dr. Karl Weiss of Vienna (1913) has drawn attention to the following passage in one of his works:

[1901b, 1288]

In the field of symptomatic acts, too, psycho-analytic observation must concede priority to imaginative writers. It can only repeat what they have said long ago. Wilhelm Stross has drawn my attention to the following passage in Laurence Sterne's celebrated humorous novel, Tristram Shandy (Volume VI, Chapter V):

[1901b, 1289]
(7) The local school-teacher at a summer resort, a quite poor but handsome young man, persisted in his courtship of the daughter of the proprietor of a villa, who came from the capital, until the girl fell passionately in love with him and even persuaded her family to give their approval to the marriage in spite of the differences in their social position and race. One day the teacher wrote a letter to his brother in which he said: ‘The girl is certainly no beauty; but she is very sweet, and it would be all right as far as that goes. But whether I shall be able to make up my mind to marry a Jewess I cannot yet tell you.’ This letter was received by his fiancée and it put an end to the engagement, while at the same time his brother was wondering at the protestations of love addressed to him. My informant assured me that this was an error and not a cunning device. I know of another case in which a lady who was dissatisfied with her old doctor but unwilling openly to get rid of him achieved her purpose by mixing up two letters. Here at least I can guarantee that it was error and not conscious cunning that made use of this *motif* which is such a familiar one in comedy.

[1901b, 1297]

The commonest motive for suppressing an intention, which has thereafter to be content with finding its expression in a parapraxis, turns out to be the avoidance of unpleasure. Thus, one obstinately forgets a proper name if one nourishes a secret grudge against its owner; one forgets to carry out an intention if one has in fact only formed it unwillingly - only, for instance, under the pressure of some convention; one loses an object, if one has quarrelled with someone of whom the object reminds one - with its original donor, for instance; one gets into the wrong train if one is making a journey unwillingly and would rather be somewhere else. This motive of avoiding unpleasure is seen most clearly where the forgetting of impressions and experiences is concerned - a fact which had already been observed by many writers before psycho-analysis existed. Memory shows its partiality by being ready to prevent the reproduction of impressions with a distressing affect, even though this purpose cannot be achieved in every case.

[1913j, 2804]

Nor is the intention to avoid unpleasure the only one which can find its outlet in parapraxes. In many cases analysis reveals other purposes which have been suppressed in the particular situation and which can only make themselves felt, so to say, as background disturbances. Thus a slip of the tongue will often serve to betray opinions which the speaker wishes to conceal from his interlocutor. Slips of the tongue have been understood in this sense by various great writers and employed for this purpose in their works. The loss of precious objects often turns out to be an act of sacrifice intended to avert some expected evil; and many other superstitions too survive in educated people in the form of parapraxes. The mislaying of objects means as a rule getting rid of them; damage is done to one’s possessions (ostensibly by accident) so as to make it necessary to acquire something better - and so on.

[1913j, 2805]
But before carrying out this intention I should like to invite you to follow me along another track. It has repeatedly happened that a creative writer has made use of a slip of the tongue or some other parapraxis as an instrument for producing an imaginative effect. This fact alone must prove to us that he regards the parapraxis - the slip of the tongue, for instance - as having a sense, since he has produced it deliberately. For what has happened is not that the author has made an accidental slip of the pen and has then allowed it to be used by one of his characters as a slip of the tongue; he intends to bring something to our notice by means of the slip of the tongue and we can enquire what that something is - whether perhaps he wants to suggest that the character in question is absent-minded and fatigued or is going to have an attack of migraine. If the author uses the slip as though it had a sense, we have no wish, of course, to exaggerate the importance of this. After all, a slip might in fact be without a sense, a chance psychical event, or it might have a sense in only quite rare cases, but the author would still retain his right to intellectualize it by furnishing it with a sense so as to employ it for his own purposes. Nor would it be surprising if we had more to learn about slips of the tongue from creative writers than from philologists and psychiatrists.

[1916-1917, 3146]

Since laymen have so little doubt about the sense of this forgetting of intentions, you will be the less surprised to find writers employing this sort of parapraxis in the same sense. Any of you who have seen or read Bernard Shaw's *Caesar and Cleopatra* will remember that in the last scene Caesar, as he is leaving Egypt, is haunted by the idea that there is something else he had intended to do but has forgotten. In the end it turns out what this was: he had forgotten to say good-bye to Cleopatra. The dramatist is seeking by this little contrivance to ascribe to the great Caesar a superiority which he did not in fact possess and which he never desired. For historical sources will tell you that Caesar made Cleopatra follow him to Rome, that she was living there with her little Caesarion when Caesar was murdered, and that she thereupon fled from the city.

[1916-1917, 3162]
The nature of the dream-work and the way in which it plays about with its material, the dream-thoughts, are instructively shown when we come to consider numbers and calculations that occur in dreams. Moreover, numbers in dreams are regarded superstitiously as being especially significant in regard to the future. I shall therefore select a few instances of this kind from my collection.

[1900a, 869]

(e) Dropping, knocking over and breaking objects are acts which seem to be used very often to express unconscious trains of thought, as analysis can occasionally demonstrate, but as may more frequently be guessed from the superstitious or facetious interpretations popularly connected with them. The interpretations attached to salt being spilt, a wine-glass being knocked over, a dropped knife sticking in the ground, etc., are well known. I shall not discuss till later the question of what claims such superstitious interpretations have to being taken seriously. Here I need only remark that individual clumsy actions do not by any means always have the same meaning, but serve as a method of representing one purpose or another according to circumstances.

[1901b, 1253]

Recently we passed through a period in my house during which an unusually large amount of glass and china crockery was broken; I myself was responsible for some of the damage. But the little psychical epidemic could easily be explained: these were the days before my eldest daughter's wedding. On such festive occasions it used to be the custom deliberately to break some utensil and at the same time utter a phrase to bring good luck. This custom may have the significance of a sacrifice and it may have another symbolic meaning as well.

[1901b, 1253]

We can also count as bungled actions cases of giving a beggar a gold piece instead of a copper or small silver coin. The explanation of such mistakes is easy. They are sacrificial acts designed to appease fate, to avert harm, and so on. If a devoted mother or aunt, directly before going for a walk in the course of which she displays unwilling generosity of this kind, is heard to express concern over a child's health, we can have no more doubts about the meaning of the apparently disagreeable accident. In this way our parapraxes make it possible for us to practise all those pious and superstitious customs that must shun the light of consciousness owing to opposition from our reason, which has now grown sceptical.

[1901b, 1255]

Chance actions and symptomatic acts occurring in matrimonial matters often have the most serious significance and might induce people who disregard the psychology of the unconscious to believe in omens. It is not a happy beginning when a young bride loses her wedding-ring on the honeymoon; but after all it is usually only mislaid and is soon found again. - I know a lady, now divorced from her husband, who in managing her money affairs frequently signed documents in her maiden name, many years before she in fact resumed it. - I was once the guest of a young married couple and heard the young woman laughingly describe her latest experience. The day after her return from the honeymoon she had called for her unmarried sister to go shopping with her as she used to do, while her husband went to his business. Suddenly she noticed a gentleman on the other side of the street, and nudging her sister had cried: 'Look, there goes Herr L.' She had forgotten that this gentleman had been her husband for some weeks. I felt a cold chill as I heard the story, but I did not dare to draw the inference. The little incident only occurred to my mind some years later when the marriage had come to a most unhappy end.

[1901b, 1260]
Another indication that we possess unconscious and displaced knowledge of the motivation in chance actions and parapraxes is to be found in the phenomenon of superstition. I will make my meaning clear by a discussion of the small experience that started me on these reflections.

I am therefore different from a superstitious person in the following way:

I do not believe that an event in whose occurrence my mental life plays no part can teach me any hidden thing about the future shape of reality; but I believe that an unintentional manifestation of my own mental activity does on the other hand disclose something hidden, though again it is something that belongs only to my mental life. I believe in external (real) chance, it is true, but not in internal (psychical) accidental events. With the superstitious person it is the other way round. He knows nothing of the motivation of his chance actions and parapraxes, and believes in psychical accidental events; and, on the other hand, he has a tendency to ascribe to external chance happenings a meaning which will become manifest in real events, and to regard such chance happenings as a means of expressing something that is hidden from him in the external world. The differences between myself and the superstitious person are two: first, he projects outwards a motivation which I look for within; secondly, he interprets chance as due to an event, while I trace it back to a thought. But what is hidden from him corresponds to what is unconscious for me, and the compulsion not to let chance count as chance but to interpret it is common to both of us.¹

¹ [Footnote added 1924:] At this point I may quote a neat example which Ossipow (1922) has used for discussing the difference between the superstitious, psycho-analytic and mystical point of view. He had been married in a small Russian provincial town and immediately afterwards started for Moscow with his young wife. At a station two hours before his destination he had a wish to go to the station exit and take a look at the town. The train was due to halt there long enough, as he thought, but when he returned a few minutes later it had already left with his young wife. When he told his old nurse at home of this accident she shook her head and declared: 'No good will come of this marriage.' At the time Ossipow laughed at this prophecy. But when, five months later, he was separated from his wife, he could not avoid in retrospect viewing his action in leaving the train as an 'unconscious protest' against his marriage. Years later, the town where this parapraxis happened took on a great importance for him, as a person lived there with whom fate later linked him closely. This person, and even the fact of this person's existence, had been completely unknown to him at the time. But the mystical explanation of his behaviour would be that he had left the Moscow train and his wife at that town because the future that was in store for him in relation to this other person was seeking to declare itself.
I assume that this conscious ignorance and unconscious knowledge of the motivation of accidental psychical events is one of the psychical roots of superstition. Because the superstitious person knows nothing of the motivation of his own chance actions, and because the fact of this motivation presses for a place in his field of recognition, he is forced to allocate it, by displacement, to the external world. If such a connection exists, it can hardly be limited to this single application. In point of fact I believe that a large part of the mythological view of the world, which extends a long way into the most modern religions, is nothing but psychology projected into the external world. The obscure recognition¹ (the endopsychic perception, as it were) of psychical factors and relations in the unconscious is mirrored - it is difficult to express it in other terms, and here the analogy with paranoia must come to our aid - in the construction of a supernatural reality, which is destined to be changed back once more by science into the psychology of the unconscious. One could venture to explain in this way the myths of paradise and the fall of man, of God, of good and evil, of immortality, and so on, and to transform metaphysics into metapsychology. The gap between the paranoic's displacement and that of the superstitious person is less wide than it appears at first sight. When human beings began to think, they were, as is well known, forced to explain the external world anthropomorphically by means of a multitude of personalities in their own image; chance events, which they interpreted superstitiously, were thus actions and manifestations of persons. They behaved, therefore, just like paranoics, who draw conclusions from insignificant signs given them by other people, and just like all normal people, who quite rightly base their estimate of their neighbours' characters on their chance and unintentional actions. It is only in our modern, scientific but as yet by no means perfected Weltanschauung that superstition seems so very much out of place; in the Weltanschauung of pre-scientific times and peoples it was justified and consistent. [1901b, 1328]

The Roman who gave up an important undertaking if he saw an ill-omened flight of birds was therefore in a relative sense justified; his behaviour was consistent with his premisses. But if he withdrew from the undertaking because he had stumbled on the threshold of his door ("un Romain retournerait") he was also in an absolute sense superior to us unbelievers; he was a better psychologist than we are striving to be. For his stumbling must have revealed to him the existence of a doubt, a counter-current at work within him, whose force might at the moment of execution subtract from the force of his intention. For we are only sure of complete success if all our mental forces are united in striving towards the desired goal. How did Schiller's Tell, who hesitated so long to shoot the apple on his son's head, answer the Governor's question why he had provided himself with a second arrow? [1901b, 1329]

(D) Anyone who has had the opportunity of studying the hidden mental impulses of human beings by means of psycho-analysis can also say something new about the quality of the unconscious motives that find expression in superstition. It can be recognized most clearly in neurotics suffering from obsessional thinking or obsessional states - people who are often of high intelligence - that superstition derives from suppressed hostile and cruel impulses. Superstition is in large part the expectation of trouble; and a person who has harboured frequent evil wishes against others, but has been brought up to be good and has therefore repressed such wishes into the unconscious, will be especially ready to expect punishment for his unconscious wickedness in the form of trouble threatening him from without. [1901b, 1330]
Though we admit that these remarks of ours in no way exhaust the psychology of superstition, we shall at least have to touch on the question of whether we are to deny entirely that superstition has any real roots: whether there are definitely no such things as true presentiments, prophetic dreams, telepathic experiences, manifestations of supernatural forces and the like. I am far from meaning to pass so sweeping a condemnation of these phenomena, of which so many detailed observations have been made even by men of outstanding intellect, and which it would be best to make the subject of further investigations. We may even hope that some portion of these observations will then be explained by our growing recognition of unconscious mental processes, without necessitating radical alterations in the views we hold today. If the existence of still other phenomena - those, for example, claimed by spiritualists - were to be established, we should merely set about modifying our 'laws' in the way demanded by the new discovery, without being shaken in our belief in the coherence of things in the world. [1901b, 1330]

Our patient was to a high degree superstitious, and this although he was a highly educated and enlightened man of considerable acumen, and although he was able at times to assure me that he did not believe a word of all this rubbish. Thus he was at once superstitious and not superstitious; and there was a clear distinction between his attitude and the superstition of uneducated people who feel themselves at one with their belief. He seemed to understand that his superstition was dependent upon his obsessional thinking, although at times he gave way to it completely. The meaning of this inconsistent and vacillating behaviour can be most easily grasped if it is regarded in the light of a hypothesis which I shall now proceed to mention. I did not hesitate to assume that the truth was not that the patient still had an open mind upon this subject, but that he had two separate and contradictory convictions upon it. His oscillation between these two views quite obviously depended upon his momentary attitude towards his obsessional disorder. As soon as he had got the better of one of these obsessions, he used to smile in a superior way at his own credulity, and no events then occurred that were calculated to shake his firmness; but the moment he came under the sway of another obsession which had not been cleared up - or, what amounts to the same thing, of a resistance - the strangest coincidences would happen, to support him in his credulous belief. [1909d, 2179]

His superstition was nevertheless that of an educated man, and he avoided such vulgar prejudices as being afraid of Friday or of the number thirteen, and so on. But he believed in premonitions and in prophetic dreams; he would constantly meet the very person of whom, for some inexplicable reason, he had just been thinking; or he would receive a letter from some one who had suddenly come into his mind after being forgotten for many years. At the same time he was honest enough - or rather, he was loyal enough to his official conviction - not to have forgotten instances in which he strangest forebodings had come to nothing. On one occasion, for instance, when he went away for his summer holidays, he had felt morally certain that he would never return to Vienna alive. He also admitted that the great majority of his premonitions related to things which had no special personal importance to him, and that, when he met an acquaintance of whom, until a few moments previously, he had not thought for a very long time, nothing further took place between himself and the miraculous apparition. And he naturally could not deny that all the important events of his life had occurred without his having had any premonition of them, and that, for instance, his father's death had taken him entirely by surprise. But arguments such as these had no effect upon the discrepancy in his convictions. They merely served to prove the obsessional nature of his superstitions, and that could already be inferred from the way in which they came and went with the increase and decrease of his resistance. [1909d, 2180]
I was not in a position, of course, to give a rational explanation of all the miraculous stories of his remoter past. But as regards the similar things that happened during the time of his treatment, I was able to prove to him that he himself invariably had a hand in the manufacture of these miracles, and I was able to point out to him the methods that he employed. He worked by means of peripheral vision and reading, forgetting, and, above all, errors of memory. In the end he used himself to help me in discovering the little sleight-of-hand tricks by which these wonders were performed. I may mention one interesting infantile root of his belief that forebodings and premonitions came true. It was brought to light by his recollection that very often, when a date was being fixed for something, his mother used to say: 'I shan't be able to on such-and-such a day. I shall have to stop in bed then.' And in fact when the day in question arrived she had invariably stayed in bed!

There can be no doubt that the patient felt a need for finding experiences of this kind to act as props for his superstition, and that it was for that reason that he occupied himself so much with the inexplicable coincidences of everyday life with which we are all familiar, and helped out their shortcomings with unconscious activity of his own. I have come across a similar need in many other obsessional patients and have suspected its presence in many more besides. It seems to me easily explicable in view of the psychological characteristics of the obsessional neurosis. In this disorder, as I have already explained (p. 2155), repression is effected not by means of amnesia but by a severance of causal connections brought about by a withdrawal of affect. These repressed connections appear to persist in some kind of shadowy form (which I have elsewhere compared to an endopsychic perception), and they are thus transferred, by a process of projection, into the external world, where they bear witness to what has been effaced from consciousness.

In bringing this paper to a close I may express a hope that, though my communication is incomplete in every sense, it may at least stimulate other workers to throw more light upon the obsessional neurosis by a deeper investigation of the subject. What is characteristic of this neurosis - what differentiates it from hysteria - is not, in my opinion, to be found in instinctual life but in the psychological field. I cannot take leave of my patient without putting on paper my impression that he had, as it were, disintegrated into three personalities: into one unconscious personality, that is to say, and into two preconscious ones between which his consciousness could oscillate. His unconscious comprised those of his impulses which had been suppressed at an early age and which might be described as passionate and evil impulses. In his normal state he was kind, cheerful, and sensible - an enlightened and superior kind of person - while in his third psychological organization he paid homage to superstition and asceticism. Thus he was able to have two different creeds and two different outlooks upon life. This second preconscious personality comprised chiefly the reaction-formations against his repressed wishes, and it was easy to foresee that it would have swallowed up the normal personality if the illness had lasted much longer. I have at present an opportunity of studying a lady suffering severely from obsessional acts. She has become similarly disintegrated into an easy-going and lively personality and into an exceedingly gloomy and ascetic one. She puts forward the first of them as her official ego, while in fact she is dominated by the second. Both of these psychical organizations have access to her consciousness, but behind her ascetic personality may be discerned the unconscious part of her being - quite unknown to her and composed of ancient and long-repressed wishful impulses.
If I judge my readers’ feelings aright, I think it is safe to say that in spite of all that they have now heard about taboo they still have very little idea of the meaning of the term or of what place to give it in their thoughts. This is no doubt due to the insufficiency of the information I have given them and to my having omitted to discuss the relation between taboo and superstition, the belief in spirits, and religion. On the other hand, I am afraid a more detailed account of what is known about taboo would have been even more confusing, and I can assure them that in fact the whole subject is highly obscure.

Let us now return to the animistic system with which we are dealing. The insight we have gained into other psychological systems enables us to conclude that with primitive man, too, ‘superstition’ need not be the only or the real reason for some particular custom or observance and does not excuse us from the duty of searching for its hidden motives. Under the domination of an animistic system it is inevitable that every observance and every activity shall have a systematic basis, which nowadays we describe as ‘superstitious’. ‘Superstition’ - like ‘anxiety’, ‘dreams’ and ‘demons’ - is one of those provisional psychological concepts which have crumbled under the impact of psycho-analytic research. Once we have penetrated behind these constructions, which are like screens erected as defences against correct understanding, we begin to realize that the mental life and cultural level of savages have not hitherto had all the recognition they deserve.

If we take instinctual repression as a measure of the level of civilization that has been reached, we shall have to admit that even under the animistic system advances and developments took place which are unjustly despised on account of their superstitious basis. When we are told that the warriors in a savage tribe practise the greatest continence and cleanliness when they go on the war-path, the explanation is put forward that their motive is ‘a fear lest the enemy should obtain the refuse of their persons, and thus be enabled to work their destruction by magic’ (Frazer, 1911b, 157); and an analogous superstitious reason could be suggested for their continence. None the less the fact remains that they have made an instinctual renunciation; and we can understand the position better if we suppose that the savage warrior submits to these restrictions as a counter-measure because he is on the point of yielding completely to the satisfaction of cruel and hostile impulses which are as a rule prohibited to him. The same is true of the numerous cases of sexual restrictions being imposed on anyone who is engaged on difficult or responsible work (ibid., 200 f.). Though the grounds alleged for these prohibitions may belong to a magical context, yet the fundamental idea of gaining greater strength by renouncing some instinctual satisfaction remains unmistakable; and the hygienic root of the prohibition which lies alongside its magical rationalization must not be overlooked. When the men of a savage tribe go out on an expedition to hunt, to fish, to fight or to gather precious plants, their wives left at home are subjected to many oppressive restrictions, to which the savages themselves ascribe a favourable influence, operating at a distance upon the success of the expedition. But it requires very little penetration to see that this factor which operates at a distance is nothing other than the absent men's longing thoughts of home, and that behind these disguises lies a sound piece of psychological insight that the men will only do their best if they feel completely secure about the women whom they have left behind them unguarded. Sometimes they will even themselves declare, without alleging any magical reasons, that a wife's infidelity in marriage will bring to nothing the efforts of an absent husband engaged on some responsible work.
The countless taboo regulations to which the women in savage communities are subject during menstruation are said to be due to a superstitious horror of blood, and this is no doubt in fact one of their determinants. But it would be wrong to overlook the possibility that in this case the horror of blood also serves aesthetic and hygienic purposes, which are obliged in every case to cloak themselves behind magical motives.

[1912-1913, 2740]

One further group of taboo observances, which have not hitherto been accounted for, deserve mention, since they admit of an explanation which is familiar to psycho-analysts. Among many savage peoples there is a prohibition against keeping sharp weapons or cutting instruments in a house. Frazer (1911b, 238) quotes a German superstition to the effect that a knife should not be left edge upwards, for fear that God and the angels might be injured on it. May we not recognize in this taboo a premonitory warning against possible 'symptomatic acts' in the execution of which a sharp weapon might be employed by unconscious evil impulses?

[1912-1913, 2740]

Nor is the intention to avoid unpleasure the only one which can find its outlet in parapraxes. In many cases analysis reveals other purposes which have been suppressed in the particular situation and which can only make themselves felt, so to say, as background disturbances. Thus a slip of the tongue will often serve to betray opinions which the speaker wishes to conceal from his interlocutor. Slips of the tongue have been understood in this sense by various great writers and employed for this purpose in their works. The loss of precious objects often turns out to be an act of sacrifice intended to avert some expected evil; and many other superstitions too survive in educated people in the form of parapraxes. The mislaying of objects means as a rule getting rid of them; damage is done to one's possessions (ostensibly by accident) so as to make it necessary to acquire something better - and so on.

[1913j, 2805]

¹ The same process is at the root of the familiar superstition that boasting is dangerous. 'How nice not to have had one of my headaches for so long.' But this is in fact the first announcement of an attack, of whose approach the subject is already sensible, although he is as yet unwilling to believe it.

[1925h, 4141]
But you may raise the question of why these people - both the ones who write books and the conversationalists - behave so badly; and you may incline to the view that the responsibility for this lies not only on them but also on psycho-analysis. I think so too. What you come upon as prejudice in literature and society is an after-effect of an earlier judgement - the judgement, namely, that was formed upon the young psycho-analysis by the representatives of official science. I once complained of this in a historical account I wrote, and I shall not do so again - perhaps that once was too often - but it is a fact that there was no violation of logic, and no violation of propriety and good taste, to which the scientific opponents of psycho-analysis did not give way at that time. The situation recalled what was actually put in practice in the Middle Ages when an evil-doer, or even a mere political opponent, was put in the pillory and given over to maltreatment by the mob. You may not realize clearly, perhaps, how far upwards in our society mob-characteristics extend, and what misconduct people will be guilty of when they feel themselves part of a crowd and relieved of personal responsibility. At the beginning of that time I was more or less alone and I soon saw that there was no future in polemics but that it was equally senseless to lament and to invoke the help of kindlier spirits, for there were not courts to which such appeals could be made. So I took another road. I made a first application of psycho-analysis by explaining to myself that this behaviour of the crowd was a manifestation of the same resistance which I had to struggle against in individual patients. I refrained from polemics myself and influenced my adherents, when little by little they appeared, in the same direction. This procedure was the right one. The interdict which lay upon psycho-analysis in those days has been lifted since then. But, just as an abandoned faith survives as a superstition, just as a theory which has been given up by science continues to exist as a popular belief, so the original outlawing of psycho-analysis by scientific circles persists to-day in the facetious contempt of the laymen who write books or make conversation. So this will no longer surprise you.

[1933a, 4739]

You know how hard it is for anything to die away when once it has achieved psychical expression. So you will not be surprised to hear that many of the utterances of animism have persisted to this day, for the most part as what we call superstition, alongside of and behind religion. But more than this, you will scarcely be able to reject a judgement that the philosophy of today has retained some essential features of the animistic mode of thought - the overvaluation of the magic of words and the belief that the real events in the world take the course which our thinking seeks to impose on them. It would seem, it is true, to be an animism without magical actions. On the other hand, we may suppose that even in those days there were ethics of some sort, precepts upon the mutual relations of men; but nothing suggests that they had any intimate connection with animistic beliefs. They were probably the direct expression of men's relative powers and of their practical needs.

[1933a, 4764]
There is, however, another angle from which we can approach this problem of the variability in the effect of analysis. We know that the first step towards attaining intellectual mastery of our environment is to discover generalizations, rules and laws which bring order into chaos. In doing this we simplify the world of phenomena; but we cannot avoid falsifying it, especially if we are dealing with processes of development and change. What we are concerned with is discerning a qualitative alteration, and as a rule in doing so we neglect, at any rate to begin with, a quantitative factor. In the real world, transitions and intermediate stages are far more common than sharply differentiated opposite states. In studying developments and changes we direct our attention solely to the outcome; we readily overlook the fact that such processes are usually more or less incomplete - that is to say, that they are in fact only partial alterations. A shrewd satirist of old Austria, Johann Nestroy, once said: 'Every step forward is only half as big as it looks at first.' It is tempting to attribute a quite general validity to this malicious dictum. There are nearly always residual phenomena, a partial hanging-back. When an open-handed Maecenas surprises us by some isolated trait of miserliness, or when a person who is consistently over-kind suddenly indulges in a hostile action, such 'residual phenomena' are invaluable for genetic research. They show us that these praiseworthy and precious qualities are based on compensation and overcompensation which, as was to have been expected, have not been absolutely and fully successful. Our first account of the development of the libido was that an original oral phase gave way to a sadistic-anal phase and that this was in turn succeeded by a phallic-genital one. Later research has not contradicted this view, but it has corrected it by adding that these replacements do not take place all of a sudden but gradually, so that portions of the earlier organization always persist alongside of the more recent one, and even in normal development the transformation is never complete and residues of earlier libidinal fixations may still be retained in the final configuration. The same thing is to be seen in quite other fields. Of all the erroneous and superstitious beliefs of mankind that have supposedly been surmounted there is not one whose residues do not live on among us to-day in the lower strata of civilized peoples or even in the highest strata of cultural society. What has once come to life clings tenaciously to its existence. One feels inclined to doubt sometimes whether the dragons of primaeval days are really extinct.

[1937c, 5025]
In some dreams of landscapes or other localities emphasis is laid in the dream itself on a convinced feeling of having been there once before. (Occurrences of 'déjà vu' in dreams have a special meaning.) These places are invariably the genitals of the dreamer's mother; there is indeed no other place about which one can assert with such conviction that one has been there once before.

[1900a, 856]

On one occasion only I was perplexed by an obsessional neurotic who told me a dream in which he was visiting a house that he had been in twice before. But this particular patient had told me a considerable time before of an episode during his sixth year. On one occasion he had been sharing his mother's bed and misused the opportunity by inserting his finger into her genitals while she was asleep.

[1900a, 856]

We must also include in the category of the miraculous and the 'uncanny' the peculiar feeling we have, in certain moments and situations, of having had exactly the same experience once before or of having once before been in the same place, though our efforts never succeed in clearly remembering the previous occasion that announces itself in this way. I am aware that I am merely following loose linguistic usage when I call what arises in a person at such moments a 'feeling'. What is no doubt in question is a judgement, and, more precisely, a perceptual judgement; but these cases have nevertheless a character quite of their own, and we must not leave out of account the fact that what is looked for is never remembered. I do not know whether this phenomenon of 'déjà vu' has ever been seriously offered in proof of an individual's previous psychical existence; but psychologists have certainly turned their attention to it and have endeavoured to solve the problem in a whole variety of speculative ways. None of the attempted explanations which they have brought forward seems to me to be correct, because none of them takes into consideration anything other than the concomitant manifestations and the conditions which favour the phenomenon. Those psychical processes which according to my observations are alone responsible for the explanation of 'déjà vu' - namely, unconscious phantasies - are still generally neglected by psychologists even to-day.

[1901b, 1335]

It is in my view wrong to call the feeling of having experienced something before an illusion. It is rather that at such moments something is really touched on which we have already experienced once before, only we cannot consciously remember it because it has never been conscious. To put it briefly, the feeling of 'déjà vu' corresponds to the recollection of an unconscious phantasy. There exist unconscious phantasies (or day-dreams) just as there exist conscious creations of the same kind which everybody knows from his own experience.

[1901b, 1335]
I know that the subject would merit the most exhaustive treatment; but I shall here do no more than give the analysis of a single case of ‘déjà vu’ where the feeling was characterized by especial intensity and persistence. A lady who is now thirty-seven claimed to have a most distinct memory of having at the age of twelve and a half paid her first visit to some school friends in the country. When she entered the garden, she had an immediate feeling of having been there before. This feeling was repeated when she went into the reception rooms, so that she felt she knew in advance what room would be the next one, what view there would be from it, and so on. But the possibility that this feeling of familiarity could have owed its origin to an earlier visit to the house and garden, perhaps one in her earliest childhood, was absolutely ruled out and was disproved as a result of her questioning her parents. The lady who reported this was not in search of any psychological explanation, but saw the occurrence of this feeling as a prophetic indication of the significance for her emotional life which these same school friends later acquired. However, a consideration of the circumstances in which the phenomenon occurred in her shows us the way to another view of the matter. At the time when she paid the visit she knew that these girls had an only brother, who was seriously ill. During the visit she actually set eyes on him, though he looked very ill and she said to herself that he would die soon. Now, her own only brother had been dangerously ill with diphtheria a few months earlier; during his illness she had spent several weeks away from her parents’ house, staying with a relative. She believed that her brother had been with her on this visit to the country; she even thought it had been his first considerable journey after his illness; but her memory was remarkably uncertain on these points while of all the other details, and in particular of the dress she was wearing that day, she had an ultra-clear picture. Anyone who is well-informed will find no difficulty in concluding from these hints that the expectation that her brother would die had at that time played an important part in the girl’s thoughts and either had never become conscious or, after the favourable termination of the illness, had succumbed to energetic repression. If things had turned out otherwise, she would have had to wear a different dress - mourning. She found an analogous situation in the home of her friends, whose only brother was in danger of dying soon, as in fact he did shortly after. She ought to have remembered consciously that she herself had lived through this situation a few months before: instead of remembering it - which was prevented by repression - she transferred her feeling of remembering something to her surroundings, the garden and the house, and fell a victim to the ‘fausse reconnaissance’ of having seen all this exactly the same once before. From the fact that repression occurred we may conclude that her former expectation of her brother’s death had not been far removed from a wishful phantasy. She would then have been the only child. In her later neurosis she suffered most severely from a fear of losing her parents, behind which, as usual, analysis was able to reveal the unconscious wish with the same content.
[1901b, 1336]

I have been able in a similar way to derive my own fleeting experiences of ‘déjà vu’ from the emotional constellation of the moment. ‘This would once more be an occasion for wakening the (unconscious and unknown) phantasy which was formed in me at this or that time as a wish to improve the situation.’ - This explanation of ‘déjà vu’ has so far been taken into consideration by only one observer. Dr. Ferenczi, to whom the third edition of this book is indebted for so many valuable contributions, writes to me on this subject as follows: ‘From my own case, as well as that of others, I have convinced myself that the unaccountable feeling of familiarity is to be traced to unconscious phantasies of which one is unconsciously reminded in a situation of the present time. With one of my patients what happened was apparently something different, but in reality it was quite analogous. This feeling returned to him very often, but it regularly proved to have originated from a forgotten (repressed) portion of a dream of the preceding night. It seems therefore that “déjà vu” can derive not only from day-dreams but from night-dreams as well.’
[1901b, 1337]
In 1913 I wrote a short paper describing another phenomenon that is very similar to 'déjà vu'. This is 'déjà raconté', the illusion of having already reported something of special interest when it comes up in the course of psycho-analytic treatment. On these occasions the patient maintains with every sign of subjective certainty that he has already recounted a particular memory a long time ago. The physician is however sure of the contrary and is as a rule able to convince the patient of his error. The explanation of this interesting parapraxis is probably that the patient has felt an urge to communicate this information and intended to do so, but has failed to carry it into effect, and that he now takes the memory of the former as a substitute for the latter, the carrying out of his intention.

[1901b, 1338]

A similar state of affairs, and probably also the same mechanism, is to be seen in what Ferenczi (1915) has called 'supposed' parapraxes. We believe there is something - some object - that we have forgotten or mislaid or lost; but we are able to convince ourselves we have done nothing of the kind and that everything is as it should be. For example, a woman patient returns to the doctor's room, giving as a reason that she wants to collect the umbrella she has left behind there; but the doctor sees that she is in fact holding it in her hand. There was therefore an impulse towards this parapraxis, and the impulse was sufficient to serve as a substitute for its actual execution. Except for this difference, the supposed parapraxis is equivalent to the real one. It is, however, what one might call cheaper.

[1901b, 1338]

The phenomenon presented by the patient in cases like this deserves to be called a 'fausse reconnaissance', and is completely analogous to what occurs in certain other cases and has been described as a 'déjà vu'. In these other cases the subject has a spontaneous feeling such as 'I've been in this situation before', or 'I've been through all this already', without ever being in a position to confirm his conviction by discovering an actual recollection of the previous occasion. This latter phenomenon, as is well known, has provoked a large number of attempts at explanation, which can be divided roughly into two groups.¹ One class of explanation looks upon the feeling which constitutes the phenomenon as deserving of credence, and assumes that something really has been remembered - the only question being what. The second and far larger class of explanation includes those which maintain, on the contrary, that what we have to deal with is an illusory memory, and that the problem is to discover how this paramnesic error can have arisen. This latter group comprises many widely different hypotheses. There is, for instance, the ancient view, ascribed to Pythagoras, that the phenomenon of déjà vu is evidence of the subject having had a former life; again, there is the hypothesis based on anatomy (put forward by Wigan in 1860) to the effect that the phenomenon is based on an absence of simultaneity in the functioning of the two cerebral hemispheres; and finally there are the purely psychological theories, supported by the majority of more recent authorities, which regard the déjà vu as an indication of an apperceptive weakness, and assign the responsibility for its occurrence to such causes as fatigue, exhaustion and distraction.

[1914a, 2837]

In 1904 Grasset put forward an explanation of the déjà vu which must be reckoned as one of the group which 'believes' in the phenomenon. He was of opinion that the phenomenon indicates that at some earlier time there has been an unconscious perception, which only now makes its way into consciousness under the influence of a new and similar impression. Several other authorities have agreed with this view, and have maintained that the basis of the phenomenon is the recollection of something that has been dreamed and then forgotten. In both cases it would be a question of the activation of an unconscious impression.

[1914a, 2838]
In 1907, in the second edition of my *Psychopathology of Everyday Life*, I proposed an exactly similar explanation for this form of apparent paramnesia without mentioning Grasset's paper or knowing of its existence. By way of excuse I may remark that I arrived at my conclusion as the result of a psycho-analytic investigation which I was able to make of an example of *déjà vu* in a female patient; it was extremely clear, although it had taken place some 28 years earlier. I shall not reproduce the little analysis in this place. It showed that the situation in which the *déjà vu* occurred was really calculated to revive the memory of an earlier experience of the patient's. The patient, who was at that time a twelve year-old child, was visiting a family in which there was a brother who was seriously ill and at the point of death; while her own brother had been in a similarly dangerous condition a few months earlier. But with the earlier of these two similar events there had been associated a phantasy that was incapable of entering consciousness - namely, a wish that her brother should die. Consequently, the analogy between the two cases could no become conscious. And the perception of it was replaced by the phenomenon of 'having been through it all before', the identity being displaced from the really common element on to the locality.

[1914a, 2838]

The name 'déjà vu' is, as we know, applied to a whole class of analogous phenomena, such as the 'déjà entendu', the 'déjà éprouvé' and the 'déjà senti'. The case which I am now about to report, as a single instance out of many similar ones, consists of a 'déjà raconte'; and it could be traced back to an unconscious resolution which was never carried out.

[1914a, 2839]

These derealizations are remarkable phenomena which are still little understood. They are spoken of as 'sensations', but they are obviously complicated processes, attached to particular mental contents and bound up with decisions made about those contents. They arise very frequently in certain mental diseases, but they are not unknown among normal people, just as hallucinations occasionally occur in the healthy. Nevertheless they are certainly failures in functioning and, like dreams, which, in spite of their regular occurrence in healthy people, serve us as models of psychological disorder, they are abnormal structures. These phenomena are to be observed in two forms: the subject feels either that a piece of reality or that a piece of his own self is strange to him. In the latter case we speak of 'depersonalizations'; derealizations and depersonalizations are intimately connected. There is another set of phenomena which may be regarded as their positive counterparts - what are known as 'fausse reconnaissance', 'déjà vu', 'déjà raconté' etc., illusions in which we seek to accept something as belonging to our ego, just as in the derealizations we are anxious to keep something out of us. A naïvely mystical and unpsychological attempt at explaining the phenomena of *déjà vu* endeavours to find evidence in it of a former existence of our mental self. Depersonalization leads us on to the extraordinary condition of *double conscience*, which is more correctly described as 'split personality'. But all of this is so obscure and has been so little mastered scientifically that I must refrain from talking about it any more to you.

[1936a, 4828]
In 1913 I wrote a short paper describing another phenomenon that is very similar to "déjà vu". This is "déjà raconté", the illusion of having already reported something of special interest when it comes up in the course of psycho-analytic treatment. On these occasions the patient maintains with every sign of subjective certainty that he has already recounted a particular memory a long time ago. The physician is however sure of the contrary and is as a rule able to convince the patient of his error. The explanation of this interesting parapraxis is probably that the patient has felt an urge to communicate this information and intended to do so, but has failed to carry it into effect, and that he now takes the memory of the former as a substitute for the latter, the carrying out of his intention.

[1901b, 1338]

A similar state of affairs, and probably also the same mechanism, is to be seen in what Ferenczi (1915) has called 'supposed' parapraxes. We believe there is something - some object - that we have forgotten or mislaid or lost; but we are able to convince ourselves we have done nothing of the kind and that everything is as it should be. For example, a woman patient returns to the doctor's room, giving as a reason that she wants to collect the umbrella she has left behind there; but the doctor sees that she is in fact holding it in her hand. There was therefore an impulse towards this parapraxis, and the impulse was sufficient to serve as a substitute for its actual execution. Except for this difference, the supposed parapraxis is equivalent to the real one. It is, however, what one might call cheaper.

[1901b, 1338]

It not infrequently happens in the course of an analytic treatment that the patient, after reporting some fact that he has remembered, will go on to say: 'But I've told you that already' - while the analyst himself feels sure that this is the first time he has heard the story. If the patient is contradicted upon the point, he will often protest with energy that he is perfectly certain he is right, that he is ready to swear to it, and so on; while the analyst's own conviction that what he has heard is new to him will become correspondingly stronger. To try to decide the dispute by shouting the patient down or by outvying him in protestations would be a most unpsychological proceeding. It is familiar ground that a sense of conviction of the accuracy of one's memory has no objective value; and, since one of the two persons concerned must necessarily be in the wrong, it may just as well be the physician as the patient who has fallen a victim to a paramnesia. The analyst will admit as much to the patient, will break off the argument, and will postpone a settlement of the point until some later occasion.

[1914a, 2836]

In a minority of cases the analyst himself will then recollect that he has already heard the piece of information under dispute, and will at the same time discover the subjective, and often far-fetched, reason which led to this temporary forgetfulness. But in the great majority of cases it is the patient who turns out to have been mistaken; and he can be brought to recognize the fact. The explanation of this frequent occurrence appears to be that the patient really had an intention of giving this information, that once or even several times he actually made some remark leading up to it, but that he was then prevented by resistance from carrying out his purpose, and afterwards confused a recollection of his intention with a recollection of its performance.

[1914a, 2836]
Leaving on one side any cases in which there may still be some element of doubt, I will now bring forward a few others which are of special theoretical interest. With certain people it happens, and may even happen repeatedly, that they cling with particular obstinacy to the assertion that they have already told the analyst this or that, when the nature of the circumstances and of the information in question makes it quite impossible that they can be right. For what they claim to have told the analyst already and what they claim to recognize as something old, which must be familiar to the analyst as well, turn out to be memories of the greatest importance to the analysis - confirmatory facts for which the analyst has long been waiting, or solutions which wind up a whole section of the work and which he would certainly have made the basis of an exhaustive discussion. In the face of these considerations the patient himself soon admits that his recollection must have deceived him, though he is unable to account for its definite character.

The phenomenon presented by the patient in cases like this deserves to be called a 'fausse reconnaissance', and is completely analogous to what occurs in certain other cases and has been described as a 'déjà vu'. In these other cases the subject has a spontaneous feeling such as 'I've been in this situation before', or 'I've been through all this already', without ever being in a position to confirm his conviction by discovering an actual recollection of the previous occasion. This latter phenomenon, as is well known, has provoked a large number of attempts at explanation, which can be divided roughly into two groups.¹ One class of explanation looks upon the feeling which constitutes the phenomenon as deserving of credence, and assumes that something really has been remembered - the only question being what. The second and far larger class of explanation includes those which maintain, on the contrary, that what we have to deal with is an illusory memory, and that the problem is to discover how this paramnesic error can have arisen. This latter group comprises many widely different hypotheses. There is, for instance, the ancient view, ascribed to Pythagoras, that the phenomenon of *déjà vu* is evidence of the subject having had a former life; again, there is the hypothesis based on anatomy (put forward by Wigan in 1860) to the effect that the phenomenon is based on an absence of simultaneity in the functioning of the two cerebral hemispheres; and finally there are the purely psychological theories, supported by the majority of more recent authorities, which regard the *déjà vu* as an indication of an apperceptive weakness, and assign the responsibility for its occurrence to such causes as fatigue, exhaustion and distraction.

The name 'déjà vu' is, as we know, applied to a whole class of analogous phenomena, such as the 'déjà entendu', the 'déjà éprouvé' and the 'déjà senti'. The case which I am now about to report, as a single instance out of many similar ones, consists of a 'déjà raconte'; and it could be traced back to an unconscious resolution which was never carried out.

It seems unnecessary to add anything in the way of an interpretation of this little occurrence, so far as it throws light upon the phenomenon of 'fausse reconnaissance'. As regards the subject-matter of the patient's vision, I may remark that, particularly in relation to the castration complex, similar hallucinatory falsifications are of not infrequent occurrence, and that they can just as easily serve the purpose of correcting unwelcome perceptions.
There is another kind of *fausse reconnaissance* which not infrequently makes its appearance at the close of a treatment, much to the physician’s satisfaction. After he has succeeded in forcing the repressed event (whether it was of a real or of a psychical nature) upon the patient’s acceptance in the teeth of all resistances, and has succeeded, as it were, in rehabilitating it - the patient may say: ‘*Now I feel as though I had known it all the time.*’ With this the work of the analysis has been completed.

[1914a, 2842]

These derealizations are remarkable phenomena which are still little understood. They are spoken of as ‘sensations’, but they are obviously complicated processes, attached to particular mental contents and bound up with decisions made about those contents. They arise very frequently in certain mental diseases, but they are not unknown among normal people, just as hallucinations occasionally occur in the healthy. Nevertheless they are certainly failures in functioning and, like dreams, which, in spite of their regular occurrence in healthy people, serve us as models of psychological disorder, they are abnormal structures. These phenomena are to be observed in two forms: the subject feels either that a piece of reality or that a piece of his own self is strange to him. In the latter case we speak of ‘depersonalizations’; derealizations and depersonalizations are intimately connected. There is another set of phenomena which may be regarded as their positive counterparts - what are known as ‘*fausse reconnaissance*, ’*déjà vu*, ’*déjà raconté*’ etc., illusions in which we seek to accept something as belonging to our ego, just as in the derealizations we are anxious to keep something out of us. A naïvely mystical and unpsychological attempt at explaining the phenomena of ‘*déjà vu*’ endeavours to find evidence in it of a former existence of our mental self. Depersonalization leads us on to the extraordinary condition of ‘*double conscience*’, which is more correctly described as ‘split personality’. But all of this is so obscure and has been so little mastered scientifically that I must refrain from talking about it any more to you.

[1936a, 4828]
In another instance it became apparent that, though the wish which instigated the dream was a present-day one, it had received a powerful reinforcement from memories that stretched far back into childhood. What I have in mind is a series of dreams which are based upon a longing to visit Rome. For a long time to come, no doubt, I shall have to continue to satisfy that longing in my dreams: for at the season of the year when it is possible for me to travel, residence in Rome must be avoided for reasons of health.¹ For instance, I dreamt once that I was looking out of a railway-carriage window at the Tiber and the Ponte Sant' Angelo. The train began to move off, and it occurred to me that I had not so much as set foot in the city. The view that I had seen in my dream was taken from a well-known engraving which I had caught sight of for a moment the day before in the sitting-room of one of my patients. Another time someone led me to the top of a hill and showed me Rome half-shrouded in mist; it was so far away that I was surprised at my view of it being so clear. There was more in the content of this dream than I feel prepared to detail; but the theme of 'the promised land seen from afar' was obvious in it. The town which I saw in this way for the first time, shrouded in mist, was - Lübeck, and the prototype of the hill was - at Gieichenberg. In a third dream I had at last got to Rome, as the dream itself informed me; but I was disappointed to find that the scenery was far from being of an urban character. There was a narrow stream of dark water; on one side of it were black cliffs and on the other meadows with big white flowers. I noticed a Herr Zucker (whom I knew slightly) and determined to ask him the way to the city. I was clearly making a vain attempt to see in my dream a city which I had never seen in my waking life. Breaking up the landscape in the dream into its elements, I found that the white flowers took me to Ravenna, which I have visited and which, for a time at least, superseded Rome as capital of Italy. In the marshes round Ravenna we found the loveliest water-lilies growing in black water. Because we had had such difficulty in picking them out of the water, the dream made them grow in meadows like the narcissi at our own Aussee. The dark cliff, so close to the water, reminded me vividly of the valley of the Tepli near Karlsbad. 'Karlsbad' enabled me to explain the curious detail of my having asked Herr Zucker the way. The material out of which the dream was woven included at this point two of those facetious Jewish anecdotes which contain so much profound and often bitter worldly wisdom and which we so greatly enjoy quoting in our talk and letters. Here is the first one: the 'constitution' story. An impecunious Jew had stowed himself away without a ticket in the fast train to Karlsbad. He was caught, and each time tickets were inspected he was taken out of the train and treated more and more severely. At one of the stations on his via dolorosa he met an acquaintance, who asked him where he was travelling to. 'To Karlsbad', was his reply, 'if my constitution can stand it.' My memory then passed on to another story: of a Jew who could not speak French and had been recommended when he was in Paris to ask the way to the rue Richelieu. Paris itself had for many long years been another goal of my longings; and the blissful feelings with which I first set foot on its pavement seemed to me a guarantee that others of my wishes would be fulfilled as well. 'Asking the way', moreover, was a direct allusion to Rome, since it is well known that all roads lead there. Again, the name Zucker was once more an allusion to Karlsbad; for we are in the habit of prescribing treatment there for anyone suffering from the constitutional complaint of diabetes. The instigation to this dream had been a proposal made by my friend in Berlin that we should meet in Prague at Easter. What we were going to discuss there would have included something with a further connection with 'sugar' and 'diabetes'.

[1900a, 679]
Goethe said of Lichtenberg: 'Where he makes a jest a problem lies concealed.' Similarly it can be said of the passages in my book that I have quoted here: where an error makes its appearance a repression lies behind it - or more correctly, an insincerity, a distortion, which is ultimately rooted in repressed material. In analysing the dreams reported there I was compelled, by the very nature of the themes to which the dream-thoughts related, on the one hand to break off the analysis at some point before it had been rounded off, and on the other hand to take the edge off some indiscreet detail by mild distortion. I could not do otherwise, and I had in fact no other choice if I wished to bring forward examples and evidence at all. My awkward position was a necessary result of the peculiar character of dreams, which consists in giving expression to repressed material - in other words, to material that is inadmissible to consciousness. (In spite of this it would seem that enough was still left to give offence to some sensitive souls.) I did not succeed, however, in carrying through the distortion or concealment of the thoughts, whose continuation was known to me, without leaving some trace of them behind. What I wanted to suppress often succeeded against my will in gaining access to what I had chosen to relate and appeared in it in the form of an error that I failed to notice. Moreover, the same theme is at the bottom of all the three examples I have given: the errors are derivatives of repressed thoughts connected with my dead father.

[1901b, 1293]

If, as has been assumed since the time of Aristotle, the purpose of drama is to arouse 'terror and pity' and so 'to purge the emotions', we can describe that purpose in rather more detail by saying that it is a question of opening up sources of pleasure or enjoyment in our emotional life, just as, in the case of intellectual activity, joking or fun open up similar sources, many of which that activity had made inaccessible. In this connection the prime factor is unquestionably the process of getting rid of one's own emotions by 'blowing off steam'; and the consequent enjoyment corresponds on the one hand to the relief produced by a thorough discharge and on the other hand, no doubt, to an accompanying sexual excitation; for the latter, as we may suppose, appears as a by-product whenever an affect is aroused, and gives people the sense, which they so much desire, of a raising of the potential of their psychical state. Being present as an interested spectator at a spectacle or play does for adults what play does for children, whose hesitant hopes of being able to do what grown-up people do are in that way gratified. The spectator is a person who experiences too little, who feels that he is a 'poor wretch to whom nothing of importance can happen', who has long been obliged to damp down, or rather displace, his ambition to stand in his own person at the hub of world affairs; he longs to feel and to act and to arrange things according to his desires - in short, to be a hero. And the playwright and actor enable him to do this by allowing him to identify himself with a hero. They spare him something, too. For the spectator knows quite well that actual heroic conduct such as this would be impossible for him without pains and sufferings and acute fears, which would almost cancel out the enjoyment. He knows, moreover, that he has only one life and that he might perhaps perish even in a single such struggle against adversity. Accordingly, his enjoyment is based on an illusion; that is to say, his suffering is mitigated by the certainty that, firstly, it is someone other than himself who is acting and suffering on the stage, and, secondly, that after all it is only a game, which can threaten no damage to his personal security. In these circumstances he can allow himself to enjoy being a 'great man', to give way without a qualm to such suppressed impulses as a craving for freedom in religious, political, social and sexual matters, and to 'blow off steam' in every direction in the various grand scenes that form part of the life represented on the stage.

[1942a [1905], 1607]
Anyone who has at any time had occasion to enquire from the literature of aesthetics and psychology what light can be thrown on the nature of jokes and on the position they occupy will probably have to admit that jokes have not received nearly as much philosophical consideration as they deserve in view of the part they play in our mental life. Only a small number of thinkers can be named who have entered at all deeply into the problems of jokes. Among those who have discussed jokes, however, are such famous names as those of the novelist Jean Paul (Richter) and of the philosophers Theodor Vischer, Kuno Fischer and Theodor Lipps. But even with these writers the subject of jokes lies in the background, while the main interest of their enquiry is turned to the more comprehensive and attractive problem of the comic.

A favourite definition of joking has long been the ability to find similarity between dissimilar things - that is, hidden similarities. Jean Paul has expressed this thought itself in a joking form: 'Joking is the disguised priest who weds every couple.' Vischer carries this further: 'He likes best to wed couples whose union their relatives frown upon.' Vischer objects, however, that there are jokes where there is no question of comparing - no question, therefore, of finding a similarity. So he, slightly diverging from Jean Paul, defines joking as the ability to bind into a unity, with surprising rapidity, several ideas which are in fact alien to one another both in their internal content and in the nexus to which they belong. Fischer, again, stresses the fact that in a large number of joking judgements *differences* rather than similarities are found, and Lipps points out that these definitions relate to joking as an ability possessed by the joker and not to the jokes which he makes.

If this last point is developed further, the contrast between 'sense and nonsense' becomes significant. 'What at one moment has seemed to us to have a meaning, we now see is completely meaningless. That is what, in this case, constitutes the comic process . . . A remark seems to us to be a joke, if we attribute a significance to it that has psychological necessity and, as soon as we have done so, deny it again. Various things can be understood by this "significance". We attach sense to a remark and know that logically it cannot have any. We discover truth in it, which nevertheless, according to the laws of experience or our general habits of thought, we cannot find in it. We grant it logical or practical consequences in excess of its true content, only to deny these consequences as soon as we have clearly recognized the nature of the remark. In every instance, the psychological process which the joking remark provokes in us, and on which the feeling of the comic rests, consists in the immediate transition, from this attaching of sense, from this discovering of truth, and from this granting of consequences, to the consciousness or impression of relative nothingness.' (Ibid., 85.)

Whether the one or the other of these two views seems to us to throw more light on the question, the discussion of bewilderment and enlightenment brings us closer to a particular discovery. For if the comic effect of Heine's 'famillionairely' depends on the solution of the apparently meaningless word, the 'joke' must no doubt be ascribed to the formation of that word and to the characteristics of the word thus formed.

Another peculiarity of jokes, quite unrelated to what we have just been considering, is recognized by all the authorities as essential to them. 'Brevity is the body and the soul of wit, it is its very self,' says Jean Paul (1804, Part II, Paragraph 42), merely modifying what the old chatterbox Polonius says in Shakespeare's *Hamlet* (II, 2):
In this connection the account given by Lipps (1898, 90) of the brevity of jokes is significant: 'A joke says what it has to say, not always in few words, but in too few words - that is, in words that are insufficient by strict logic or by common modes of thought and speech. It may even actually say what it has to say by not saying it.'

We have already learnt from the connection of jokes with caricature that they 'must bring forward something that is concealed or hidden' (Fischer, 1889, 51). I lay stress on this determinant once more, because it too has more to do with the nature of jokes than with their being part of the comic.

We should thus find no difficulty in indicating the aims of any new attempt to throw light on jokes. To be able to count on success, we should have either to approach the work from new angles or to endeavour to penetrate further by increased attention and deeper interest. We can resolve that we will at least not fail in this last respect. It is striking with what a small number of instances of jokes recognized as such the authorities are satisfied for the purposes of their enquiries, and how each of them takes the same ones over from his predecessors. We must not shirk the duty of analysing the same instances that have already served the classical authorities on jokes. But it is our intention to turn besides to fresh material so as to obtain a broader foundation for our conclusions. It is natural then that we should choose as the subjects of our investigation examples of jokes by which we ourselves have been most struck in the course of our lives and which have made us laugh the most.

Is the subject of jokes worth so much trouble? There can, I think, be no doubt of it. Leaving on one side the personal motives which make me wish to gain an insight into the problems of jokes and which will come to light in the course of these studies, I can appeal to the fact that there is an intimate connection between all mental happenings - a fact which guarantees that a psychological discovery even in a remote field will be of an unpredictable value in other fields. We may also bear in mind the peculiar and even fascinating charm exercised by jokes in our society. A new joke acts almost like an event of universal interest; it is passed from one person to another like the news of the latest victory. Even men of eminence who have thought it worth while to tell the story of their origins, of the cities and countries they have visited, and of the important people with whom they have associated, are not ashamed in their autobiographies to report their having heard some excellent joke.

Thus what we suspected to begin with seems to be confirmed: namely that tendentious jokes have sources of pleasure at their disposal besides those open to innocent jokes, in which all the pleasure is in some way linked to their technique. And we may also once more repeat that with tendentious jokes we are not in a position to distinguish by our feeling what part of the pleasure arises from the sources of their technique and what part from those of their purpose. Thus, strictly speaking, we do not know what we are laughing at. With all obscene jokes we are subject to glaring errors of judgement about the 'goodness' of jokes so far as this depends on formal determinants; the technique of such jokes is often quite wretched, but they have immense success in provoking laughter.

We know cases in the field of normal mental life in which situations analogous to the one we have just assumed produce similar results. One such case is that of jokes. The problems of psycho-analytic technique have compelled me to investigate the technique of making jokes. I will give you one example of this - incidentally, a joke in English.
The manifestations of a compulsion to repeat (which we have described as occurring in the early activities of infantile mental life as well as among the events of psycho-analytic treatment) exhibit to a high degree an instinctual character and, when they act in opposition to the pleasure principle, give the appearance of some 'daemonic' force at work. In the case of children's play we seemed to see that children repeat unpleasurable experiences for the additional reason that they can master a powerful impression far more thoroughly by being active than they could by merely experiencing it passively. Each fresh repetition seems to strengthen the mastery they are in search of. Nor can children have their pleasurable experiences repeated often enough, and they are inexorable in their insistence that the repetition shall be an identical one. This character trait disappears later on. If a joke is heard for a second time it produces almost no effect; a theatrical production never creates so great an impression the second time as the first; indeed, it is hardly possible to persuade an adult who has very much enjoyed reading a book to re-read it immediately. Novelty is always the condition of enjoyment. But children will never tire of asking an adult to repeat a game that he has shown them or played with them, till he is too exhausted to go on. And if a child has been told a nice story, he will insist on hearing it over and over again rather than a new one; and he will remorselessly stipulate that the repetition shall be an identical one and will correct any alterations of which the narrator may be guilty - though they may actually have been made in the hope of gaining fresh approval. None of this contradicts the pleasure principle; repetition, the re-experiencing of something identical, is clearly in itself a source of pleasure. In the case of a person in analysis, on the contrary, the compulsion to repeat the events of his childhood in the transference evidently disregards the pleasure principle in every way. The patient behaves in a purely infantile fashion and thus shows us that the repressed memory-traces of his primaevial experiences are not present in him in a bound state and are indeed in a sense incapable of obeying the secondary process. It is to this fact of not being bound, moreover, that they owe their capacity for forming, in conjunction with the residues of the previous day, a wishful phantasy that emerges in a dream. This same compulsion to repeat frequently meets us as an obstacle to our treatment when at the end of an analysis we try to induce the patient to detach himself completely from his physician. It may be presumed, too, that when people unfamiliar with analysis feel an obscure fear - a dread of rousing something that, so they feel, is better left sleeping - what they are afraid of at bottom is the emergence of this compulsion with its hint of possession by some 'daemonic' power.

I was able to show from a short story by W. Jensen called Gradiva, which has no particular merit in itself, that invented dreams can be interpreted in the same way as real ones and that the unconscious mechanisms familiar to us in the 'dream-work' are thus also operative in the processes of imaginative writing. My book on Jokes and their Relation to the Unconscious was a side-issue directly derived from The Interpretation of Dreams. The only friend of mine who was at that time interested in my work remarked to me that my interpretations of dreams often impressed him as being like jokes. In order to throw some light on this impression, I began to investigate jokes and found that their essence lay in the technical methods employed in them, and that these were the same as the means used in the 'dream-work' - that is to say, condensation, displacement, the representation of a thing by its opposite or by something very small, and so on. This led to an economic enquiry into the origin of the high degree of pleasure obtained from hearing a joke. And to this the answer was that it was due to the momentary suspension of the expenditure of energy upon maintaining repression, owing to the attraction exercised by the offer of a bonus of pleasure (fore-pleasure).
It is also characteristic of children that their two excretory needs are cathected with sexual interest. Later on, education draws a sharp distinction here, which is once more obliterated in the practice of joking. It may seem to us an unsavoury fact, but it takes quite a long time for children to develop feelings of disgust. This is not disputed even by people who insist otherwise on the seraphic purity of the child's mind.

[1926e, 4355]

It is now time to acquaint ourselves with a few of the characteristics of humour. Like jokes and the comic, humour has something liberating about it; but it also has something of grandeur and elevation, which is lacking in the other two ways of obtaining pleasure from intellectual activity. The grandeur in it clearly lies in the triumph of narcissism, the victorious assertion of the ego's invulnerability. The ego refuses to be distressed by the provocations of reality, to let itself be compelled to suffer. It insists that it cannot be affected by the traumas of the external world; it shows, in fact, that such traumas are no more than occasions for it to gain pleasure. This last feature is a quite essential element of humour. Let us suppose that the criminal who was being led to execution on Monday had said: 'It doesn't worry me. What does it matter, after all, if a fellow like me is hanged? The world won't come to an end because of it.' We should have to admit that such a speech does in fact display the same magnificent superiority over the real situation. It is wise and true; but it does not betray a trace of humour. Indeed, it is based on an appraisal of reality which runs directly counter to the appraisal made by humour. Humour is not resigned; it is rebellious. It signifies not only the triumph of the ego but also of the pleasure principle, which is able here to assert itself against the unkindness of the real circumstances.

[1927d, 4542]

These last two features - the rejection of the claims of reality and the putting through of the pleasure principle - bring humour near to the regressive or reactionary processes which engage our attention so extensively in psychopathology. Its fending off of the possibility of suffering places it among the great series of methods which the human mind has constructed in order to evade the compulsion to suffer - a series which begins with neurosis and culminates in madness and which includes intoxication, self-absorption and ecstasy. Thanks to this connection, humour possesses a dignity which is wholly lacking, for instance, in jokes, for jokes either serve simply to obtain a yield of pleasure or place the yield of pleasure that has been obtained in the service of aggression. In what, then, does the humorous attitude consist, an attitude by means of which a person refuses to suffer, emphasizes the invincibility of his ego by the real world, victoriously maintains the pleasure principle - and all this, in contrast to other methods having the same purposes, without overstepping the bounds of mental health? The two achievements seem incompatible.

[1927d, 4543]

I think, therefore, that the possibility I have suggested here, that in a particular situation the subject suddenly hypercathects his super-ego and then, proceeding from it, alters the reactions of the ego, is one which deserves to be retained. Moreover, what I have suggested about humour finds a remarkable analogy in the kindred field of jokes. As regards the origin of jokes I was led to assume that a preconscious thought is given over for a moment to unconscious revision. A joke is thus the contribution made to the comic by the unconscious. In just the same way, humour would be the contribution made to the comic through the agency of the super-ego.

[1927d, 4545]
I am well aware that these scanty extracts from the works of writers upon jokes cannot do them justice. In view of the difficulties standing in the way of my giving an unmistakably correct account of such complicated and subtle trains of thought, I cannot spare curious enquirers the labour of obtaining the information they desire from the original sources. But I am not sure that they will come back fully satisfied. The criteria and characteristics of jokes brought up by these authors and collected above - activity, relation to the content of our thoughts, the characteristic of playful judgement, the coupling of dissimilar things, contrasting ideas, 'sense in nonsense', the succession of bewilderment and enlightenment, the bringing forward of what is hidden, and the peculiar brevity of wit - all this, it is true, seems to us at first sight so very much to the point and so easily confirmed by instances that we cannot be in any danger of underrating such views. But they are *dijecta membra*, which we should like to see combined into an organic whole. When all is said and done, they contribute to our knowledge of jokes no more than would a series of anecdotes to the description of some personality of whom we have a right to ask for a biography. We are entirely without insight into the connection that presumably exists between the separate determinants - what, for instance, the brevity of a joke can have to do with its characteristic of being a playful judgement. We need to be told, further, whether a joke must satisfy all these determinants in order to be a proper joke, or need only satisfy some, and if so which can be replaced by others and which are indispensable. We should also wish to have a grouping and classification of jokes on the basis of the characteristics considered essential. The classification that we find in the literature rests on the one hand on the technical methods employed in them (e.g. punning or play upon words) and on the other hand on the use made of them in speech (e.g. jokes used for the purposes of caricature or of characterization, or joking snubs).
[1905c, 1620]

But here we may make a first stop and ask ourselves with what factor known to us from the literature of the subject this first finding of ours coincides, wholly or in part. Evidently with the factor of brevity, which Jean Paul describes as 'the soul of wit' (p. 1619 above). But brevity does not in itself constitute a joke, or otherwise every laconic remark would be one. The joke's brevity must be of a particular kind. It will be recalled that Lipps has tried to describe this particular brevity of jokes more precisely (p. 1619). Here our investigation contributes something and shows that the brevity of jokes is often the outcome of a particular process which has left behind in the wording of the joke a second trace - the formation of a substitute. By making use of the procedure of reduction, which seeks to undo the peculiar process of condensation, we also find, however, that the joke depends entirely on its verbal expression as established by the process of condensation. Our whole interest now turns, of course, to this strange process, which has hitherto scarcely been examined. Nor can we in the least understand how all that is valuable in a joke, the yield of pleasure that the joke brings us, can originate from that process.
[1905c, 1634]

But what is the technique of this joke? We see at once that the characteristic that we may have hoped to be able to prove was a universal one is absent on the very first fresh occasion. There is no omission here, and scarcely an abbreviation. The lady herself says straight out in the joke almost everything that we can attribute to her thoughts. 'You had raised my expectations about a relative of Jean-Jacques Rousseau - perhaps a spiritual relative - and here he is: a red-haired silly young man, a *roux et sot*.' It is true that I have been able to make an interpolation; but this attempt at a reduction has not got rid of the joke. It remains, and is attached to the identity of sound of the words
[1905c, 1635]
But before we accept the 'tendency to economy' as the most general characteristic of the technique of jokes and ask such questions as where it comes from, what it signifies and how the joke's yield of pleasure arises from it, we must find space for a doubt which has a right to be heard. It may be that every joke technique shows the tendency to save something in expression: but the relation is not reversible. Not every economy of expression, not every abbreviation, is on that account a joke as well. We reached this point once before, when we were still hoping to find the process of condensation in every joke, and raised the justifiable objection that a laconic remark is not enough to constitute a joke. There must therefore be some peculiar kind of abbreviation and economy on which the characteristic of being a joke depends; and until we know the nature of that peculiarity our discovery of the common element in the techniques of jokes brings us no nearer to a solution of our problem. And let us, further, have the courage to admit that the economies made by the joke-technique do not greatly impress us. They may remind us, perhaps, of the way in which some housewives economize when they spend time and money on a journey to a distant market because vegetables are to be had there a few farthings cheaper. What does a joke save by its technique? The putting together of a few new words, which would mostly have emerged without any trouble. Instead of that, it has to take the trouble to search out the one word which covers the two thoughts. Indeed, it must often first transform one of the thoughts into an unusual form which will provide a basis for its combination with the second thought. Would it not have been simpler, easier, and, in fact, more economical to have expressed the two thoughts as they happened to come, even if this involved no common form of expression? Is not the economy in words uttered more than balanced by the expenditure on intellectual effort? And who saves by that? Who gains by it?

Jokes are particularly apt to change one of the vowels in a word. Thus Hevesi (1888, 87) writes of an anti-Imperial Italian poet who was nevertheless obliged later to eulogize a German emperor in hexameters: 'Since he could not exterminate the Cäsaren [Caesars], he at least eliminated the Cäsuren [caesuras].

This is an opportunity for making a not unimportant admission. We are engaged in investigating the technique of jokes as shown in examples; and we should therefore be certain that the examples we have chosen are really genuine jokes. It is the case, however, that in a number of instances we are in doubt whether the particular example ought to be called a joke or not. We have no criterion at our disposal before our investigation has given us one. Linguistic usage is untrustworthy and itself needs to have its justification examined. In coming to our decision we can base ourselves on nothing but a certain 'feeling', which we may interpret as meaning that the decision is made in our judgement in accordance with particular criteria that are not yet accessible to our knowledge. In the case of our last example we must feel a doubt whether it should be represented as a joke, or perhaps as a 'sophistical' joke, or simply as a piece of sophistry. For the fact is that we do not yet know in what the characteristic of being a joke resides.

This is easy to see; but it is bound to have a confusing effect when we notice that these three stories have as much right to be called 'comic' as we had to produce them as 'jokes'. The uncovering of psychical automatism is one of the techniques of the comic, just as is any kind of revelation or self-betrayal. We suddenly find ourselves faced at this point with the problem of the relation of jokes to the comic which we intended to evade. (See the introduction.) Are these stories perhaps only 'comic' and not 'jokes'? Is the comic operating here by the same methods as jokes do? And, once again, what constitutes the peculiar characteristics of jokes?
There is another kind of indirect representation used by jokes, namely the ‘analogy’. We have kept it back so long because the consideration of it comes up against new difficulties, or makes particularly evident difficulties that we have already come up against in other connections. We have already admitted that in some of the examples we have examined we have not been able to banish a doubt as to whether they ought to be regarded as jokes at all; and in this uncertainty we have recognized that the foundations of our enquiry have been seriously shaken. But I am aware of this uncertainty in no other material more strongly or more frequently than in jokes of analogy. There is a feeling - and this is probably true of a large number of other people under the same conditions - which tells me ‘this is a joke, I can pronounce this to be a joke’ even before the hidden essential nature of jokes has been discovered. This feeling leaves me in the lurch most often in the case of joking analogies. If to begin with I unhesitatingly pronounce an analogy to be a joke, a moment later I seem to notice that the enjoyment it gives me is of a quality different from what I am accustomed to derive from a joke. And the circumstance that joking analogies are very seldom able to provoke the explosive laugh which signalizes a good joke makes it impossible for me to resolve the doubt in my usual way - by limiting myself to the best and most effective examples of a species.

In the face of this and many other examples, we can no longer dispute the fact that an analogy can in itself possess the characteristic of being a joke, without this impression being accounted for by a complication with one of the familiar joke techniques. But, that being so, we are completely at a loss to see what it is that determines the joking characteristic of analogies, since that characteristic certainly does not reside in analogy as a form of expression of thought or in the operation of making a comparison. All we can do is to include analogy among the species of ‘indirect representation’ used by the joke-technique and we must leave unresolved the problem which we have met with much more clearly in the case of analogies than in the methods of joking that we came across earlier. No doubt, moreover, there must be some special reason why the decision whether something is a joke or not offers greater difficulties in analogies than in other forms of expression.

This gap in our understanding gives us no grounds, however, for complaining that this first investigation has been without results. In view of the intimate connection which we must be prepared to attribute to the different characteristics of jokes, it would be imprudent to expect that we could completely explain one side of the problem before we have so much as cast a glance at the others. We shall no doubt have now to attack the problem from another direction.

This time we will not examine the technique of the joke; we propose to turn our attention to another factor, which is actually the most important one. When those of us present heard this improvised joke it gave us pleasure - which I can clearly recall - and made us laugh. In this instance, as in countless others, the hearers' feeling of pleasure cannot have arisen from the purpose of the joke or from its intellectual content; there is nothing left open to us but to bring that feeling of pleasure into connection with the technique of the joke. The technical methods of joking which we have earlier described - condensation, displacement, indirect representation and so on - thus possess the power of evoking a feeling of pleasure in the hearer, though we cannot in the least see how they may have acquired this power. In this simple way we arrive at the second thesis in our clarification of jokes; the first (p. 1623) asserted that the characteristic of jokes lay in their form of expression. Let us further reflect that this second thesis has in fact taught us nothing new. It merely isolates what was already included in an observation we had made earlier. It will be recalled that when we had succeeded in reducing a joke (that is, in replacing its form of expression by another one, while carefully preserving its sense) it had lost not only its character as a joke but also its power to make us laugh - our enjoyment of the joke.
This interpretation of the broker anecdotes may be carried further. It is true that there is no necessity for my entering into them, that I can content myself with regarding these anecdotes as 'Schwänke [funny stories]' and deny that they have the character of a joke. Thus jokes can also have a subjective determinant of this kind. Our attention has now been drawn to that possibility and we shall have to examine it later. It declares that only what I allow to be a joke is a joke. What is a joke to me may be merely a comic story to other people. But if a joke admits of this doubt, the reason can only be that it has a façade - in these instances a comic one - in the contemplation of which one person is satiated while another may try to peer behind it. A suspicion may arise, moreover, that this façade is intended to dazzle the examining eye and that these stories have therefore something to conceal.

In any case, if our marriage-broker anecdotes are jokes, they are all the better jokes because, thanks to their façade, they are in a position to conceal not only what they have to say but also the fact that they have something - forbidden - to say. The continuation of this interpretation - and this uncovers the hidden meaning and reveals these anecdotes with a comic façade as tendentious jokes - would be as follows. Anyone who has allowed the truth to slip out in an unguarded moment is in fact glad to be free of pretence. This is a correct and profound piece of psychological insight. Without this internal agreement no one lets himself be mastered by the automatism which in these cases brings the truth to light.¹ But this converts the laughable figure of the Schadchen into a sympathetic one, deserving of pity. How happy the man must be to be able at last to throw off the burden of pretence, since he makes use of the first chance of shouting out the very last scrap of truth! As soon as he sees that the case is lost, that the bride does not please the young man, he gladly betrays yet another concealed defect which has escaped notice, or he takes the opportunity of producing an argument that settles a detail in order to express his contempt for the people he is working for: 'I ask you - who would lend these people anything?' The whole of the ridicule in the anecdote now falls upon the parents, barely touched on in it, who think this swindle justified in order to get their daughter a husband, upon the pitiable position of girls who let themselves be married on such terms, and upon the disgracefulness of marriages contracted on such a basis. The marriage-broker is the right man to express such criticisms, for he knows most about these abuses; but he must not say them aloud, for he is a poor man whose existence depends on exploiting them. The popular mind, which created these stories, and others like them, is torn by a similar conflict; for it knows that the sacredness of marriages after they have been contracted is grievously affected by the thought of what happened at the time when they were arranged.

The preceding discussion has given us unawares an insight into the evolution or psychogenesis of jokes, which we will now examine more closely. We have made the acquaintance of preliminary stages of jokes, and their development into tendentious jokes will probably uncover fresh relations between the various characteristics of jokes. Before there is such a thing as a joke, there is something that we may describe as 'play' or as 'a jest'.
Well, something very simple and obvious, I should have thought. The multiple use of the same material is, after all, only a special case of condensation; play upon words is nothing other than a condensation without substitute-formation; condensation remains the wider category. All these techniques are dominated by a tendency to compression, or rather to saving. It all seems to be a question of economy. In Hamlet's words: 'Thrift, thrift, Horatio!'

Let us test this economy on the different examples. 'C'est le premier vol de l'aigle.' It is the eagle's first flight. Yes, but it is a thieving flight. Luckily for the existence of this joke, 'vol' means not only 'flight' but 'theft' as well. Has no condensation and economy been made? Most certainly. There has been a saving of the whole of the second thought and it has been dropped without leaving a substitute. The double meaning of the word 'vol' has made such a substitute unnecessary; or it would be equally true to say that the word 'vol' contains the substitute for the suppressed thought without any addition of change having to be made to the first one. That is the advantage of a double meaning.

Another example: 'Iron front - iron cash-box - Iron Crown'. What an extraordinary saving compared with an expression of the same thought in which 'iron' finds no place: 'With the help of the necessary boldness and lack of conscience it is not difficult to amass a large fortune, and for such services a title will of course be a suitable reward.'

Condensation, and therefore economy, is indeed quite unmistakably present in these examples. But it should be present in every example. Where is the economy hidden in such jokes as 'Rousseau - roux et sot' or 'Antigone - antik? oh nee', in which we first noticed the absence of condensation and which were our principal motive for putting forward the technique of the repeated use of the same material? It is true that here we should not find that condensation would meet the case; but if instead of it we take the more inclusive concept of economy, we can manage without difficulty. It is easy to point out what we save in the case of Rousseau, Antigone, etc. We save having to express a criticism or give shape to a judgement; both are already there in the name itself. In the example of 'Leidenschaft - Eifersucht [passion-jealousy]' we save ourselves the trouble of laboriously constructing a definition: 'Eifersucht, Leidenschaft - Eifer sucht [eagerness seeks], 'Leidenschaft' [causes pain]. We have only to add the linking words and there we have our definition ready made. The case is similar in all the other examples that have so far been analysed. Where there is least saving, as in Saphir's play upon words 'Sie kommen um Ihre 100 Dukaten', there is at any rate a saving of the necessity for framing a new wording for the reply; the wording of the question is sufficient for the answer. The saving is not much, but in it the joke lies. The multiple use of the same words for question and answer is certainly an 'economy'. Like Hamlet's view of the rapid sequence of his father's death and his mother's marriage:
But before we accept the 'tendency to economy' as the most general characteristic of the technique of jokes and ask such questions as where it comes from, what it signifies and how the joke's yield of pleasure arises from it, we must find space for a doubt which has a right to be heard. It may be that every joke technique shows the tendency to save something in expression: but the relation is not reversible. Not every economy of expression, not every abbreviation, is on that account a joke as well. We reached this point once before, when we were still hoping to find the process of condensation in every joke, and raised the justifiable objection that a laconic remark is not enough to constitute a joke. There must therefore be some peculiar kind of abbreviation and economy on which the characteristic of being a joke depends; and until we know the nature of that peculiarity our discovery of the common element in the techniques of jokes brings us no nearer to a solution of our problem. And let us, further, have the courage to admit that the economies made by the joke-technique do not greatly impress us. They may remind us, perhaps, of the way in which some housewives economize when they spend time and money on a journey to a distant market because vegetables are to be had there a few farthings cheaper. What does a joke save by its technique? The putting together of a few new words, which would mostly have emerged without any trouble. Instead of that, it has to take the trouble to search out the one word which covers the two thoughts. Indeed, it must often first transform one of the thoughts into an unusual form which will provide a basis for its combination with the second thought. Would it not have been simpler, easier, and, in fact, more economical to have expressed the two thoughts as they happened to come, even if this involved no common form of expression? Is not the economy in words uttered more than balanced by the expenditure on intellectual effort? And who saves by that? Who gains by it?

It cannot be denied that this representation by something small is related to the 'tendency to economy' which we were left with as the last common element after our investigation of verbal technique.

We shall scarcely be contradicting this statement of Fischer's - we shall perhaps be doing no more than translating his thoughts into our mode of expression - if we insist that the joking activity should not, after all, be described as pointless or aimless, since it has the unmistakable aim of evoking pleasure in its hearers. I doubt if we are in a position to undertake anything without having an intention in view. If we do not require our mental apparatus at the moment for supplying one of our indispensable satisfactions, we allow it itself to work in the direction of pleasure and we seek to derive pleasure from its own activity. I suspect that this is in general the condition that governs all aesthetic ideation, but I understand too little of aesthetics to try to enlarge on this statement. As regards joking, however, I can assert, on the basis of the two discoveries we have already made, that it is an activity which aims at deriving pleasure from mental processes, whether intellectual or otherwise. No doubt there are other activities which have the same aim. They are perhaps differentiated according to the fields of mental activity from which they seek to derive pleasure or perhaps according to the methods of which they make use. We cannot for the moment decide about this; but we hold firmly to the view that the joke technique and the tendency towards economy by which it is partly governed (p. 1647 ff.) have been brought into connection with the production of pleasure.

Here then we have once more come upon the principle of economy which we met first in discussing the technique of verbal jokes. But whereas in the earlier case we seemed to find the economy in the use of as few words as possible or of words as much alike as possible, we now have a suspicion of an economy in the far more comprehensive sense of psychical expenditure in general; and we must regard it as possible that a closer understanding of what is still the very obscure concept of 'psychical expenditure' may bring us nearer to the essential nature of jokes.
Let us now bring together those characteristics of jokes which can be referred to their formation in the unconscious. First and foremost there is the peculiar brevity of jokes - not, indeed, an essential, but an extremely distinctive feature. When we first came across it, we were inclined to regard it as an expression of the tendency to economy, but abandoned this view ourselves owing to obvious objections. It now seems to us rather a mark of the unconscious revision to which the joke-thought has been subjected. For we cannot connect what corresponds to it in dreams, condensation, with any factor other than localization in the unconscious; and we must suppose that the determinants for such condensations, which are absent in the preconscious, are present in the unconscious thought-process.¹ It is to be expected that in the process of condensation a few of the elements subjected to it will be lost, while others, which take over the cathetic energy of the former, will become intensified or over-intensified through the condensation. Thus the brevity of jokes, like that of dreams, would be a necessary concomitant of the condensations which occur in both of them - in both cases a result of the process of condensation. This origin would also account for the special character of the brevity of jokes, a character that cannot be further defined but which is felt as a striking one. [1905c, 1753]
This seems at first to be a striking and even a comic example of the genesis of hysterical symptoms through symbolization by means of a verbal expression. Closer examination of the circumstances, however, favours another view of the case. The patient had been suffering at the time from pains in the feet generally, and it was on their account that she had been confined to bed so long. All that could be claimed on behalf of symbolization was that the fear which overcame the patient, as she took her first steps, picked out from among all the pains that were troubling her at the time the one particular pain which was symbolically appropriate, the pain in her right heel, and developed it into a psychical pain and gave it special persistence.

[1895d, 162]

The processes of normal and pathological defence and the displacements in which they result are clearly of great importance. But to the best of my knowledge no study whatever has hitherto been made of them by psychologists; and it remains to be ascertained in what strata of psychical activity and under what conditions they come into operation. The reason for this neglect may well be that our mental life, so far as it is the object of our conscious internal perception, shows nothing of these processes, apart from instances which we classify as 'faulty reasoning' and some mental operations which aim at producing a comic effect. The assertion that a psychical intensity can be displaced from one presentation (which is then abandoned) on to another (which thenceforward plays the psychological part of the former one) is as bewildering to us as certain features of Greek mythology - as, for instance, when the gods are said to clothe someone with beauty as though it were with a veil, whereas we think only of a face transfigured by a change of expression.

[1899a, 491]

The assignment of the joke-work to the system of the unconscious has, I think, become of considerably greater importance to us now that it has enabled us to understand the fact that the techniques to which jokes admittedly cling are, on the other hand, not their exclusive property. Some doubts which we were obliged to hold over until later in our original examination of these techniques now find a comfortable solution. For that very reason another doubt that arises is all the more deserving of our consideration. This suggests that the undeniable relation of jokes to the unconscious is in fact only valid for certain categories of tendentious jokes, whereas we are prepared to extend it to every species and every developmental stage of jokes. We must not evade an examination of this objection.

[1905c, 1759]
Heymans and Lipps used this joke (which is admittedly an excellent and most amusing one) to illustrate their view that the comic effect of jokes is derived from 'bewilderment and illumination' (see above). We, however, will leave that question on one side and ask another: 'What is it that makes Hirsch-Hyacinth's remark into a joke?' There can be only two possible answers: either the thought expressed in the sentence possesses in itself the character of being a joke or the joke resides in the expression which the thought has been given in the sentence. In whichever of these directions the character of being a joke may lie, we will pursue it further and try to lay hands on it.

[1905c, 1622]

A thought can in general be expressed in various linguistic forms - in various words, that is - which can represent it with equal aptness. Hirsch-Hyacinth's remark presents his thought in a particular form of expression and, as it seems to us, a specially odd form and not the one which is most easily intelligible. Let us try to express the same thought as accurately as possible in other words. Lipps has already done so, and in that way has to some extent explained the poet's intention. He writes (1898, 87): 'Heine, as we understand it, means to say that his reception was on familiar terms - of the not uncommon kind, which does not as a rule gain in agreeableness from having a flavour of millionairedom about it.' We shall not be altering the sense of this if we give it another shape which perhaps fits better into Hirsch-Hyacinth's speech: 'Rothschild treated me quite as his equal, quite familiarly that is, so far as a millionaire can.' 'A rich man's condescension', we should add, 'always involves something not quite pleasant for whoever experiences it.'¹

[1905c, 1622]

Whether, now, we keep to the one or the other of the two equally valid texts of the thought, we can see that the question we asked ourselves is already decided. In this example the character of being a joke does not reside in the thought. What Heine has put into Hirsch-Hyacinth's mouth is a correct and acute observation, an observation of unmistakable bitterness, which is understandable in a poor man faced by such great wealth; but we should not venture to describe it as in the nature of a joke. If anyone is unable in considering the translation to get away from his recollection of the shape given to the thought by the poet, and thus feels that nevertheless the thought in itself is also in the nature of a joke, we can point to a sure criterion of the joking character having been lost in the translation. Hirsch-Hyacinth's remark made us laugh aloud, whereas its accurate translation by Lipps or our own version of it, though it may please us and make us reflect, cannot possibly raise a laugh.

[1905c, 1623]

But if what makes our example a joke is not anything that resides in its thought, we must look for it in the form, in the wording in which it is expressed. We have only to study the peculiarity of its form of expression to grasp what may be termed the verbal or expressive technique of this joke, something which must stand in an intimate relation with the essence of the joke, since, if it is replaced by something else, the character and effect of the joke disappear. Moreover, in attributing so much importance to the verbal form of jokes we are in complete agreement with the authorities. Thus Fischer (1889, 72) writes: 'It is in the first place its sheer form that makes a judgement into a joke, and we are reminded of a saying of Jean Paul's which, in a single aphorism, explains and exemplifies this precise characteristic of jokes - "Such is the victorious power of sheer position, whether among warriors or words."

[1905c, 1623]
In what, then, does the 'technique' of this joke consist? What has happened to the thought, as expressed, for instance, in our version, in order to turn it into a joke that made us laugh so heartily? Two things - as we learn by comparing our version with the poet's text. First, a considerable abbreviation has occurred. In order to express fully the thought contained in the joke, we were obliged to add to the words 'R. treated me quite as his equal, quite familiarly' a postscript which, reduced to its shortest terms, ran 'that is, so far as a millionaire can'. And even so we felt the need for a further explanatory sentence.¹ The poet puts it far more shortly: 'R. treated me quite as his equal - quite famillionairely.' In the joke, the whole limitation added by the second sentence to the first, which reports the familiar treatment, has disappeared.

² The two words are printed one in Roman and the other in Italic type, and the syllables common to them both are printed in thick type. The second 'l', which is scarcely pronounced, could of course be left out of account. It seems probable that the fact of the two words having several syllables in common offered the joke-technique the occasion for constructing the composite word.

But not quite without leaving a substitute from which we can reconstruct it. For a second change has also been made. The word 'familiär [familiarly]' in the unjoking expression of the thought has been transformed in the text of the joke into 'famillionär [famillionairly]'; and there can be no doubt that it is precisely on this verbal structure that the joke's character as a joke and its power to cause a laugh depend. The newly constructed word coincides in its earlier portion with the 'familiär' of the first sentence, and in its final syllables with the 'Millionär' of the second sentence. It stands, as it were, for the 'Millionär' portion of the second sentence and thus for the whole second sentence, and so puts us in a position to infer the second sentence that has been omitted in the text of the joke. It can be described as a 'composite structure' made up of the two components 'familiär' and 'Millionär', and it is tempting to give a diagrammatic picture of the way in which it is derived from those two words:

Let us now imagine that a compressing force is brought to bear on these sentences and that for some reason the second is the less resistant one. It is thereupon made to disappear, while its most important constituent, the word 'Millionär', which has succeeded in rebelling against being suppressed, is, as it were, pushed up against the first sentence, and fused with the element of that sentence which is so much like it - 'familiär'. And the chance possibility, which thus arises, of saving the essential part of the second sentence actually favours the dissolution of its other, less important, constituents. The joke is thus generated:
If we leave out of account any such compressing force, which indeed is unknown to us, the process by which the joke is formed - that is, the joke-technique - in this instance might be described as 'condensation accompanied by the formation of a substitute'; and in the present example the formation of the substitute consists in the making of a 'composite word'. This composite word 'famillionär', which is unintelligible in itself but is immediately understood in its context and recognized as being full of meaning, is the vehicle of the joke's laughter compelling effect - the mechanism of which, however, is not made in any way clearer by our discovery of the joke-technique. In what way can a linguistic process of condensation, accompanied by the formation of a substitute by means of a composite word, give us pleasure and make us laugh? This is evidently a different problem, whose treatment we may postpone till we have found a way of approaching it. For the present we will keep to the technique of jokes.

Our expectation that the technique of jokes cannot be a matter of indifference from the point of view of discovering their essence leads us at once to enquire whether there are other examples of jokes constructed like Heine's 'famillionär'. There are not very many of them, but nevertheless enough to make up a small group which are characterized by the formation of composite words. Heine himself has derived a second joke from the word 'Millionär' - copying from himself, as it were. In Chapter XIV of his 'Ideen' he speaks of a 'Millionär', which is an obvious combination of 'Millionär' and 'Narr'¹ and, just as in the first example, brings out a suppressed subsidiary thought.

Here are some other examples I have come upon. - There is a certain fountain [Brunnen] in Berlin, the erection of which brought the Chief Burgomaster Forckenbeck into much disfavour. The Berliners call it the 'Forckenbecken', and there is certainly a joke in this description, even though it was necessary to replace the word 'Brunnen' by its obsolete equivalent 'Becken' in order to combine it into a whole with the name of the Burgomaster. - The voice of Europe once made the cruel joke of changing a potentate's name from Leopold to Cleopold, on account of the relations he had at one time with a lady with the first name of Cleo. This undoubted product of condensation keeps alive an annoying allusion at the cost of a single letter. - Proper names in general fall easy victims to this kind of treatment by the joke-technique. There were in Vienna two brothers named Salinger, one of whom was a Börsensensal. This provided a handle for calling him 'Sensalinger', while his brother, to distinguish him, was given the unflattering name of 'Scheusalinger'² This was convenient, and certainly a joke; I cannot say whether it was justified. But jokes do not as a rule enquire much into that.

I have been told the following condensation joke. A young man who had hitherto led a gay life abroad paid a call, after a considerable absence, on a friend living here. The latter was surprised to see an Ehering [wedding-ring] on his visitor's hand, 'What?' he exclaimed, 'are you married?' 'Yes', was the reply, 'Trauring but true.'¹ The joke is an excellent one. The word 'Trauring' combines both components: 'Ehering' changed into 'Trauring' and the sentence 'traurig, aber wahr [sad but true]'. The effect of the joke is not interfered with by the fact that here the composite word is not, like 'famillionär', an unintelligible and otherwise non-existent structure, but one which coincides entirely with one of the two elements represented.
In order to discover the technique of this joke, we must apply to it the process of reduction which gets rid of the joke by changing the mode of expression and instead introducing the original complete meaning, which can be inferred with certainty from a good joke. Herr N.'s joke about the 'roter Fadian' proceeds from two components - a depreciatory judgement upon the writer and a recollection of the famous simile with which Goethe introduces the extracts 'From Ottillie's Diary' in the Wahlverwandtschaften.¹ The ill-tempered criticism may have run: 'So this is the person who is for ever and ever writing nothing but boring stories about Napoleon in Austria!' Now this remark is not in the least a joke. Nor is Goethe's pretty analogy a joke, and it is certainly not calculated to make us laugh. It is only when the two are brought into connection with each other and submitted to the peculiar process of condensation and fusion that a joke emerges - and a joke of the first order.²

² I need hardly point out how little this observation, which can invariably be made, fits in with the assertion that a joke is a playful judgement.

The linking of the disparaging judgement upon the boring historian with the pretty analogy in the Wahlverwandtschaften must have taken place (for reasons which I cannot yet make intelligible) in a less simple manner than in many similar cases. I shall try to represent what was probably the actual course of events by the following construction. First, the element of the constant recurrence of the same theme in the stories may have awoken a faint recollection in Herr N. of the familiar passage in the Wahlverwandtschaften, which is as a rule wrongly quoted: 'it runs like a roter Faden [scarlet thread].' The 'roter Faden' of the analogy now exercised a modifying influence of the expression of the first sentence, as a result of the chance circumstance that the person insulted was also rot [red] - that is to say had red hair. It may then have run: 'So it is that red person who writes the boring stories about Napoleon!' And now the process began which brought about the condensation of the two pieces. Under its pressure, which had found its first fulcrum in the sameness of the element 'rot', the 'boring' was assimilated to the 'Faden [thread]' and was changed into 'fad [dull]'; after this the two components were able to fuse together into the actual text of the joke, in which, in this case, the quotation has an almost greater share than the derogatory judgement, which was undoubtedly present alone to begin with.

In a later chapter I shall add a justification, but also a correction, to this account, when I come to analyse this joke from points of view other than purely formal ones. But whatever else about it may be in doubt, there can be no question that a condensation has taken place. The result of the condensation is, on the one hand, once again a considerable abbreviation; but on the other hand, instead of the formation of a striking composite word, there is an interpenetration of the constituents of the two components. It is true that 'roter Faden' would be capable of existing as a mere term of abuse; but in our instance it is certainly a product of condensation.

If at this point a reader should become indignant at a method of approach which threatens to ruin his enjoyment of jokes without being able to throw any light on the source of that enjoyment, I would beg him to be patient for the moment. At present we are only dealing with the technique of jokes; and the investigation even of this promises results, if we pursue it sufficiently far.
The analysis of the last example has prepared us to find that, if we meet with the process of condensation in still other examples, the substitute for what is suppressed may be not a composite structure, but some other alteration of the form of expression. We can learn what this other form of substitute may be from another of Herr N.'s jokes.

Neither of these sentences is a joke. They could be put together: 'I drove with that stupid ass X tête-à-tête', and that is not a joke either. The joke only arises if the 'stupid ass' is left out, and, as a substitute for it, the 't' in one 'tête' is turned into a 'b'. With this slight modification the suppressed 'ass' has nevertheless once more found expression. The technique of this group of jokes can be described as 'condensation accompanied by slight modification', and it may be suspected that the slighter the modification the better will be the joke.

¹ There is another factor operating in the technique of this joke which I reserve for later discussion. It concerns the actual nature of the modification (representation by the opposite or by something absurd). There is nothing to prevent the joke-technique from simultaneously employing several methods; but these we can only get to know one by one.

Karl Kraus was responsible for another successful condensation with slight modification. He wrote of a certain yellow-press journalist that he had travelled to one of the Balkan States by 'Orienterpresszug'.² There is no doubt that this word combines two others: 'Orientexpresszug [Orient Express]' and 'Erpressung [blackmail]'. Owing to the context, the element 'Erpressung' emerges only as a modification of the 'Orientexpresszug' - a word called for by the verb ['travelled']. This joke, which presents itself in the guise of a misprint, has yet another claim on our interest.

This series of examples could easily be further increased; but I do not think we require any fresh instances to enable us to grasp clearly the characteristics of the technique in this second group - condensation with modification. If we compare the second group with the first, whose technique consisted in condensation with the formation of composite words, we shall easily see that the difference between them is not an essential one and that the transitions between them are fluid. Both the formation of composite words and modification can be subsumed under the concept of the formation of substitutes; and, if we care to, we can also describe the formation of a composite word as a modification of the basic word by a second element.

But here we may make a first stop and ask ourselves with what factor known to us from the literature of the subject this first finding of ours coincides, wholly or in part. Evidently with the factor of brevity, which Jean Paul describes as 'the soul of wit' (p. 1619 above). But brevity does not in itself constitute a joke, or otherwise every laconic remark would be one. The joke's brevity must be of a particular kind. It will be recalled that Lipps has tried to describe this particular brevity of jokes more precisely (p. 1619). Here our investigation contributes something and shows that the brevity of jokes is often the outcome of a particular process which has left behind in the wording of the joke a second trace - the formation of a substitute. By making use of the procedure of reduction, which seeks to undo the peculiar process of condensation, we also find, however, that the joke depends entirely on its verbal expression as established by the process of condensation. Our whole interest now turns, of course, to this strange process, which has hitherto scarcely been examined. Nor can we in the least understand how all that is valuable in a joke, the yield of pleasure that the joke brings us, can originate from that process.

¹ There is another factor operating in the technique of this joke which I reserve for later discussion. It concerns the actual nature of the modification (representation by the opposite or by something absurd). There is nothing to prevent the joke-technique from simultaneously employing several methods; but these we can only get to know one by one.

By making use of the procedure of reduction, which seeks to undo the peculiar process of condensation, we also find, however, that the joke depends entirely on its verbal expression as established by the process of condensation. Our whole interest now turns, of course, to this strange process, which has hitherto scarcely been examined. Nor can we in the least understand how all that is valuable in a joke, the yield of pleasure that the joke brings us, can originate from that process.
Are processes similar to those which we have described here as the technique of jokes known already in any other field of mental events? They are - in a single field, and an apparently very remote one. In 1900 I published a book which, as its title (The Interpretation of Dreams) indicates, attempted to throw light on what is puzzling in dreams and to establish them as derivatives of our normal mental functioning. I found occasion there to contrast the manifest, and often strange, content of the dream with the latent, but perfectly logical, dream-thoughts from which the dream is derived; and I entered into an investigation of the processes which make the dream out of the latent dream-thoughts, as well as of the psychical forces which are involved in that transformation. To the totality of these transforming processes I gave the name of the 'dream-work'; and I have described as a part of this dream-work a process of condensation which shows the greatest similarity to the one found in the technique of jokes - which, like it, leads to abbreviation, and creates substitute-formations of the same character. Everyone will be familiar, from a recollection of his own dreams, with the composite structures both of people and of things which emerge in dreams. Indeed, dreams even construct them out of words, and they can then be dissected in analysis. (For instance, 'Autodidasker' = 'Autodidakt' + 'Lasker'.) On other occasions - much more often, in fact - what the work of condensation in dreams produces is not composite structures but pictures which exactly resemble one thing or one person except for an addition or alteration derived from another source - modifications, that is, just like those in Herr N.'s jokes. We cannot doubt that in both cases we are faced by the same psychical process, which we may recognize from its identical results. Such a far-reaching analogy between the technique of jokes and the dream-work will undoubtedly increase our interest in the former and raise an expectation in us that a comparison between jokes and dreams may help to throw light on jokes. But we will refrain from entering upon this task, for we must reflect that so far we have investigated the technique of only a very small number of jokes, so that we cannot tell whether the analogy by which we are proposing to be guided will in fact hold good. We will therefore turn away from the comparison with dreams and go back to the technique of jokes, though at this point we shall, as it were, be leaving a loose end to our enquiry, which at some later stage we may perhaps pick up once more.

The first thing that we want to learn is whether the process of condensation with substitute-formation is to be discovered in every joke, and can therefore be regarded as a universal characteristic of the technique of jokes.

But what is the technique of this joke? We see at once that the characteristic that we may have hoped to be able to prove was a universal one is absent on the very first fresh occasion. There is no omission here, and scarcely an abbreviation. The lady herself says straight out in the joke almost everything that we can attribute to her thoughts. 'You had raised my expectations about a relative of Jean-Jacques Rousseau - perhaps a spiritual relative - and here he is: a red-haired silly young man, a roux et sot.' It is true that I have been able to make an interpolation; but this attempt at a reduction has not got rid of the joke. It remains, and is attached to the identity of sound of the words

I can bring up a few examples which have an identical technique.

In all three of these examples, which should suffice for this species, we see the same joke-technique: in each of them a name is used twice, once as a whole and again divided up into its separate syllables, which, when they are thus separated, give another sense.
The multiple use of the same word, once as a whole and again in the syllables into which it falls, is the first instance we have come across of a technique differing from that of condensation. But the profusion of examples that have met us must convince us after a little reflection that the newly-discovered technique can scarcely be limited to this one method. There are a number of possible ways - how many it is as yet quite impossible to guess - in which the same word or the same verbal material can be put to multiple uses in one sentence. Are all these possibilities to be regarded as technical methods of making jokes? It seems to be so. And the examples of jokes which follow will prove it.

In the first place, one can take the same verbal material and merely make some alteration in its arrangement. The slighter the alteration - the more one has the impression of something different being said in the same words - the better is the joke technically.

A really diabolically ingenious joke! And achieved with such an economy of means! 'Earned a lot - lay by a bit [sich etwas zurückgelegt]; lain back a bit [sich etwas zurückgelegt] - earned a lot.' It is merely the inversion of these two phrases that distinguishes what is said about the husband from what is hinted about the wife. Here again, by the way, this is not the whole technique of the joke.

A wide field of play lies open to the technique of jokes if we extend the 'multiple use of the same material' to cover cases in which the word (or words) in which the joke resides may occur once unaltered but the second time with a slight modification. Here, for instance, is another of Herr N.'s jokes:

Here only a single letter is altered, whose modification could scarcely be noticed in careless speech. The example reminds us of Herr N.'s other modification jokes (on p. 1631 ff.), but the difference is that here there is no condensation; everything that has to be said is said in the joke itself: 'I know that earlier you were yourself a Jew; so I am surprised that you should speak ill of Jews.'

An admirable example of a modification joke of this kind is the well-known cry: 'Traduttore - Traditore!' The similarity, amounting almost to identity, of the two words represents most impressively the necessity which forces a translator into crimes against his original.

The variety of possible slight modifications in such jokes is so great that none of them exactly resembles another.

Here is a joke that is said to have been made during an examination in jurisprudence. The candidate had to translate a passage in the Corpus Juris: "Labeo ait" . . . I fall, says he. 'You fail, say I', replied the examiner, and the examination was at an end. Anyone who mistakes the name of the great jurist for a verbal form, and moreover one wrongly recalled, no doubt deserves nothing better. But the technique of the joke lies in the fact that almost the same words which proved the ignorance of the candidate were used to pronounce his punishment by the examiner. The joke is, moreover, an example of 'ready repartee', the technique of which, as we shall see, does not differ greatly from what we are illustrating here.
Words are a plastic material with which one can do all kinds of things. There are words which, when used in certain connections, have lost their original full meaning, but which regain it in other connections. A joke of Lichtenberg's carefully singles out circumstances in which the watered-down words are bound to regain their full meaning: [1905c, 1639]

There are, too, words in German that can be taken, according as they are 'full' or 'empty', in a different sense, and, indeed, in more than one. For there can be two different derivatives from the same stem, one of which has developed into a word with a full meaning and the other into a watered-down final syllable or suffix, both of which, however, are pronounced exactly the same. The identity of sound between a full word and a watered-down syllable may also be a chance one. In both cases the joke-technique can take advantage of the conditions thus prevailing in the linguistic material. [1905c, 1639]

This is undeniably in the nature of a joke, though not particularly effective as one. A quantity of factors are absent here which might mislead us in analysing other jokes so long as we examined each of those factors separately. The thought expressed in the wording is worthless; the definition it gives of jealousy is in any case thoroughly unsatisfactory. There is not a trace of 'sense in nonsense', of 'hidden meaning' or of 'bewilderment and illumination'. No efforts will reveal a 'contrast of ideas': a contrast between the words and what they mean can be found only with great difficulty. There is no sign of abbreviation; on the contrary, the wording gives an impression of prolixity. And yet it is a joke, and even a very perfect one. At the same time, its only striking characteristic is the one in the absence of which the joke disappears: the fact that here the same words are put to multiple uses. We can then choose whether to include this joke in the sub-class of those in which words are used first as a whole and then divided up (e.g. Rousseau or Antigone) or in the other sub-class in which the multiplicity is produced by the full or the watered-down meaning of the verbal constituents. Apart from this, only one other factor deserves notice from the point of view of the technique of jokes. We find here an unusual state of things established: a kind of 'unification' has taken place, since 'Eifersucht [jealousy]' is defined by means of its own name - by means of itself, as it were. This, as we shall see, is also a technique of jokes. These two factors, therefore, must in themselves be sufficient to give a remark the character of a joke. [1905c, 1640]

If now we enter still further into the variety of forms of the 'multiple use' of the same word, we suddenly notice that we have before us examples of 'double meaning' or 'play upon words' - forms which have long been generally known and recognized as a technique of jokes. Why have we taken the trouble to discover afresh what we might have gathered from the most superficial essay on jokes? To begin with, we can only plead in our own justification that we have nevertheless brought out another aspect of the same phenomenon of linguistic expression. What is supposed by the authorities to show the character of jokes as a kind of 'play' has been classified by us under the heading of 'multiple use'. [1905c, 1641]

The further cases of multiple use, which can also be brought together under the title of 'double meaning' as a new, third group, can easily be divided into sub-classes, which, it is true, cannot be separated from one another by essential distinctions any more than can the third group as a whole from the second. We find:
[1905c, 1641]

(a) Cases of the double meaning of a name and of a thing denoted by it. For instance: 'Discharge thyself of our company, Pistol!' (Shakespeare.) [1905c, 1641]
(c) Double meaning proper, or play upon words. This may be described as the ideal case of 'multiple use'. Here no violence is done to the word; it is not cut up into its separate syllables, it does not need to be subjected to any modification, it does not have to be transferred from the sphere it belongs to (the sphere of proper names, for instance) to another one. Exactly as it is and as it stands in the sentence, it is able, thanks to certain favourable circumstances, to express two different meanings.

[1905c, 1642]

Another good example of play upon words is told by the authorities (Heymans and Lipps) in a form which makes it unintelligible. Not long ago I came upon the correct version and setting of the anecdote in a collection of jokes which has not proved of much use apart from this.¹

[1905c, 1643]

We shall be giving ourselves practice, perhaps, in diagnostic differentiation if at this point we insert another well-known joke about professors. 'The distinction between Professors Ordinary [ordentlich] and Professors Extraordinary [ausserordentlich] is that the ordinary ones do nothing extraordinary and the extraordinary ones do nothing properly [ordentlich].' This, of course, is a play on the two meanings of the words 'ordentlich' and 'ausserordentlich': viz. on the one hand 'inside' and 'outside' the 'ordo (the Establishment)' and on the other hand 'efficient' and 'outstanding'. But the conformity between this joke and some others we have already met reminds us that here the 'multiple use' is far more noticeable than the 'double meaning'. All through the sentence we hear nothing but a constantly recurring 'ordentlich', sometimes in that form and sometimes modified in a negative sense. (Cf. p. 1639.) Moreover, the feat is again achieved here of defining a concept by means of its own wording (cf. the example of 'Eifersucht', p. 1640). or, more precisely, of defining (even if only negatively) two correlative concepts by means of one another, which produces an ingenious interlacement. Finally, the aspect of 'unification' can also be stressed here - the eliciting of a more intimate connection between the elements of the statement than one would have had a right to expect from their nature.

[1905c, 1644]

Another example of a play upon words may make the transition to a fresh sub-species of the technique of double meaning easier. The joking medical colleague already mentioned above (on p. 1640) was responsible for this joke at the time of the Dreyfus case: 'This girl reminds me of Dreyfus. The army doesn't believe in her innocence.'

[1905c, 1645]

The word 'innocence', on the double meaning of which the joke is constructed, has in the one context its usual meaning, with 'fault' or 'crime' as its opposite; but in the other context it has a sexual meaning, of which the opposite is 'sexual experience'. Now there are a very large number of similar examples of double meaning, in all of which the effect of the joke depends quite specially on the sexual meaning. For this group we may reserve the name of 'double entendre [Zweideutigkeit]'.
But if we compare this example of double meaning accompanied by *double entendre* with other examples, a distinction becomes evident which is not without its interest from the point of view of technique. In the 'innocence' joke, the one meaning of the word was just as obvious as the other; it would really be hard to decide whether its sexual or non-sexual meaning was the more usual and familiar. But it is otherwise with Spitzer': example. In this the commonplace meaning of the words 'sich etwas zurückgelegt' is by far the more prominent, whereas their sexual meaning is, as it were, covered and hidden and might even escape the notice of an unsuspecting person altogether. By way of a sharp contrast let us take another example of double meaning, in which no attempt is made at thus concealing the sexual meaning: for instance, Heine's description of the character of a complaisant lady: 'She could *abschlagen*¹ nothing except her own water.' This sounds like a piece of obscenity and hardly gives the impression of a joke.² This peculiarity, however, where in a case of double meaning the two meanings are not equally obvious, can also occur in jokes with no sexual reference - whether because one meaning is more usual than the other or because it is brought to the front by a connection with the other parts of the sentence. (Cf., for instance, 'C'est le premier vol de l'aigle'.) I propose to describe all these as 'double meaning with an allusion.'

² Cf. on this Fischer (1889, 86). He gives the name of 'Zweideutigkeit', which I have applied differently in the text, to jokes with a double meaning in which the two meanings are not equally prominent but in which one lies behind the other. Nomenclature of this kind is a matter of convention; linguistic usage has arrived at no firm decision.

We have already made the acquaintance of such a large number of different joke-techniques that I fear there is some danger of losing our grasp of them. Let us therefore try to summarize them:

I. Condensation:
   (a) with formation of composite word,
   (b) with modification.

II. Multiple use of the same material:
   (c) as a whole and in parts,
   (d) in a different order,
   (e) with slight modification,
   (f) of the same words full and empty.

III. Double meaning:
   (g) Meaning as a name and as a thing,
   (h) metaphorical and literal meanings,
   (i) double meaning proper (play upon words),
   (j) *double entendre*,
   (k) double meaning with an allusion.

[1905c, 1645]
This variety and number of techniques has a confusing effect. It might make us feel annoyed at having devoted ourselves to a consideration of the technical methods of jokes, and might make us suspect that after all we have exaggerated their importance as a means for discovering the essential nature of jokes. If only this convenient suspicion were not contradicted by the one incontestable fact that the joke invariably disappears as soon as we eliminate the operation of these techniques from its form of expression! So, in spite of everything, we are led to look for the unity in this multiplicity. It ought to be possible to bring all these techniques under a single heading. As we have already said, it is not difficult to unite the second and third groups. Double meaning (play upon words) is indeed only the ideal case of the multiple use of the same material. Of these the latter is evidently the more inclusive concept. The examples of dividing up, of re-arrangement of the same material and of multiple use with slight modification (c, d and e) might - though only with some difficulty - be brought under the concept of double meaning. But what is there in common between the technique of the first group (condensation with substitute formation) and that of the two others (multiple use of the same material)?

Well, something very simple and obvious, I should have thought. The multiple use of the same material is, after all, only a special case of condensation; play upon words is nothing other than a condensation without substitute-formation; condensation remains the wider category. All these techniques are dominated by a tendency to compression, or rather to saving. It all seems to be a question of economy. In Hamlet's words: 'Thrift, thrift, Horatio!'

Let us test this economy on the different examples. 'C'est le premier vol de l'aigle.' It is the eagle's first flight. Yes, but it is a thieving flight. Luckily for the existence of this joke, 'vol' means not only 'flight' but 'theft' as well. Has no condensation and economy been made? Most certainly. There has been a saving of the whole of the second thought and it has been dropped without leaving a substitute. The double meaning of the word 'vol' has made such a substitute unnecessary; or it would be equally true to say that the word 'vol' contains the substitute for the suppressed thought without any addition of change having to be made to the first one. That is the advantage of a double meaning.

Condensation, and therefore economy, is indeed quite unmistakably present in these examples. But it should be present in every example. Where is the economy hidden in such jokes as 'Rousseau - roux et sot' or 'Antigone - antik? oh nee', in which we first noticed the absence of condensation and which were our principal motive for putting forward the technique of the repeated use of the same material? It is true that here we should not find that condensation would meet the case; but if instead of it we take the more inclusive concept of economy, we can manage without difficulty. It is easy to point out what we save in the case of Rousseau, Antigone, etc. We save having to express a criticism or give shape to a judgement; both are already there in the name itself. In the example of 'Leidenschaft - Eifersucht [passion-jealousy]' we save ourselves the trouble of laboriously constructing a definition: 'Eifersucht, Leidenschaft - 'Eifer sucht ['eagerness seeks'], 'Leidenschaft' ['causes pain']. We have only to add the linking words and there we have our definition ready made. The case is similar in all the other examples that have so far been analysed. Where there is least saving, as in Saphir's play upon words 'Sie kommen um Ihre 100 Dukaten', there is at any rate a saving of the necessity for framing a new wording for the reply; the wording of the question is sufficient for the answer. The saving is not much, but in it the joke lies. The multiple use of the same words for question and answer is certainly an 'economy'. Like Hamlet's view of the rapid sequence of his father's death and his mother's marriage:
But before we accept the 'tendency to economy' as the most general characteristic of the technique of jokes and ask such questions as where it comes from, what it signifies and how the joke's yield of pleasure arises from it, we must find space for a doubt which has a right to be heard. It may be that every joke technique shows the tendency to save something in expression: but the relation is not reversible. Not every economy of expression, not every abbreviation, is on that account a joke as well. We reached this point once before, when we were still hoping to find the process of condensation in every joke, and raised the justifiable objection that a laconic remark is not enough to constitute a joke. There must therefore be some peculiar kind of abbreviation and economy on which the characteristic of being a joke depends; and until we know the nature of that peculiarity our discovery of the common element in the techniques of jokes brings us no nearer to a solution of our problem. And let us, further, have the courage to admit that the economies made by the joke-technique do not greatly impress us. They may remind us, perhaps, of the way in which some housewives economize when they spend time and money on a journey to a distant market because vegetables are to be had there a few farthings cheaper. What does a joke save by its technique? The putting together of a few new words, which would mostly have emerged without any trouble. Instead of that, it has to take the trouble to search out the one word which covers the two thoughts. Indeed, it must often first transform one of the thoughts into an unusual form which will provide a basis for its combination with the second thought. Would it not have been simpler, easier, and, in fact, more economical to have expressed the two thoughts as they happened to come, even if this involved no common form of expression? Is not the economy in words uttered more than balanced by the expenditure on intellectual effort? And who saves by that? Who gains by it?

We can evade these doubts provisionally if we transpose them to another place. Have we really already discovered all the kinds of joke-technique? It will certainly be more prudent to collect fresh examples and subject them to analysis.

We have in fact not yet considered a large - perhaps the most numerous - group of jokes, influenced, perhaps, by the contempt with which they are regarded. They are the kind which are generally known as 'Kalauer' ('calembourgs') ['puns'] and which pass as the lowest form of verbal joke, probably because they are the 'cheapest' - can be made with the least trouble. And they do in fact make the least demand on the technique of expression, just as the play upon words proper makes the highest. While in the latter the two meanings should find their expression in identically the same word, which on that account is usually said only once, it is enough for a pun if the two words expressing the two meanings recall each other by some vague similarity, whether they have a general similarity of structure or a rhyming assonance, or whether they share the same first few letters, and so on. A quantity of examples like this of what are not very appropriately described as 'Klangwitze [sound-jokes]' occur in the Capuchin monk's sermon in Wallenstein's Lager:

Jokes are particularly apt to change one of the vowels in a word. Thus Hevesi (1888, 87) writes of an anti-Imperial Italian poet who was nevertheless obliged later to eulogize a German emperor in hexameters: 'Since he could not exterminate the Cäsaren [Caesars], he at least eliminated the Cäsuren [caesuras].
Out of the profusion of puns at our disposal, it will perhaps be of special interest to bring up a really bad example, of which Heine is guilty. Having for a long time represented himself to his lady as an 'Indian prince', he throws off the mask and confesses: 'Madame, I have deceived you . . . I have no more ever been in Kalkutta [Calcutta] than the Kalkuttenbraten [roast Calcutta fowl] that I ate for luncheon yesterday.' The mistake in this joke clearly lies in the fact that the two similar words in it are not merely similar but actually identical. The bird which he had eaten roast is so called, because it comes, or is supposed to come, from the same Calcutta.

Fischer (1889, 78) has devoted much attention to these forms of joke, and tries to distinguish them sharply from 'play upon words'. 'A pun is a bad play upon words, since it plays upon the word not as a word but as a sound.' The play upon words, however, 'passes from the sound of the word to the word itself.' On the other hand, he classes such jokes as famillionär, Antigone (antik? oh nee), etc. among the 'sound jokes'. I see no necessity for following him in this. In a play upon words, in our view, the word is also only a sound-image, to which one meaning or another is attached. But here, too, linguistic usage makes no sharp distinctions; and if it treats 'puns' with contempt and 'play upon words' with a certain respect, these judgements of value seem to be determined by considerations other than technical ones. It is worth while paying attention to the kind of jokes that are told one as 'puns'. There are some people who, when they are in high spirits, can for considerable periods of time, answer every remark addressed to them with a pun. One of my friends, who is a model of discretion where his serious achievements in science are concerned, is apt to boast of this ability. When on one occasion he was holding the company breathless in this way and admiration was expressed for his staying power: 'Yes', he said 'I am lying here auf der Ka-Lauer.'² And when he was finally begged to stop, he agreed to on condition that he was appointed 'Poeta Ka-laureatus'. Both of these, however, are excellent jokes of condensation with formation of composite words. ('I am lying here auf der Lauer for making Kalauer [puns].')

In any case we can already gather from the disputes about the delimitation of puns and play upon words that the former will not be able to help us to discover a completely new joke technique. If, in the case of puns, we give up the claim for the use of the same material in more than one sense, nevertheless the accent falls on rediscovering what is familiar, on the correspondence between the two words that make up the pun; and consequently puns merely form a sub-species of the group which reaches its peak in the play upon words proper.

But there really are jokes whose technique resists almost any attempt to connect it with the groups that have so far been considered.

Where shall we look for the technique of this excellent joke? In a play upon words, thinks Fischer: 'Thus, for instance, the words "Golden Calf" can mean both Mammon and idolatry. In the one case the gold is the main thing and in the other the statue of the animal; it may also serve to characterize, in not precisely flattering terms, someone who has a great deal of money and very little sense.' (Loc. cit.) If we make the experiment of removing the expression 'Golden Calf', we certainly get rid of the joke at the same time. We make Soulié say: 'Look there! Look at the way the people are crowding round the stupid fellow simply because he's rich!' This is no longer a joke and Heine's reply is also made impossible.
If one laughs at a joke really heartily, one is not in precisely the best mood for investigating its technique. Hence some difficulties arise over making one's way into these analyses. 'It was a comical misunderstanding', we are inclined to say. Yes but what is the technique of the joke? Clearly the use of the word 'take' in two meanings. For one of the speakers 'take' was the colourless auxiliary; for the other it was the verb with its sense unwatered down. Thus it is a case of the same word used 'full' and 'empty' (Group II (f)). If we replace the expression 'taken a bath' by the equivalent and simpler "bathed", the joke vanishes. The reply no longer fits. Thus the joke is once again attached to the form of expression 'taken a bath'.

[1905c, 1653]

That is so. But nevertheless it seems as though in this case too the reduction has been applied at the wrong point. The joke lies not in the question but in the answer - the second question: 'What? is there one missing?' And this answer cannot be robbed of being a joke by any extension or modification, so long as its sense is not interfered with. We have an impression, too, that in the second Jew's reply the disregarding of the bath is more important than the misunderstanding of the word 'take'. But here once more we cannot see our way clearly, and we will look for a third example.

[1905c, 1653]

Here at last no more trace of a double meaning is to be found. Nor can the repetition of 'salmon mayonnaise' contain the joke's technique, for it is not 'multiple use' of the same material but a real repetition of identical material called for by the subject-matter of the anecdote. We may for a time be quite baffled by this analysis and may even think of taking refuge in denying that the anecdote - though it made us laugh - possesses the character of a joke.

[1905c, 1654]

What more is there deserving of comment in the impoverished person's reply? That it has been very markedly given the form of a logical argument. But quite unjustifiably, for the reply is in fact illogical. The man defends himself for having spent the money lent to him on a delicacy and asks, with an appearance of reason, when he is to eat salmon. But that is not the correct answer. His benefactor is not reproaching him with treating himself to salmon precisely on the day on which he borrowed the money; he is reminding him that in his circumstances he has no right to think of such delicacies at all. The impoverished bon vivant disregards this only possible meaning of the reproach, and answers another question as though he had misunderstood the reproach.

[1905c, 1654]

Can it be that the technique of this joke lies precisely in this diverting of the reply from the meaning of the reproach? If so, a similar change of standpoint, a similar shifting of the psychical emphasis, may perhaps be traceable in the two earlier examples, which we felt were akin to this one.

[1905c, 1654]

And, lo and behold! this suggestion is an easy success and in fact reveals the technique of those examples. Soulié pointed out to Heine that society in the nineteenth century worshipped the 'Golden Calf' just as did the Jews in the Wilderness. An appropriate answer by Heine might have been 'Yes, such is human nature; thousands of years have made no change in it' or something similar by way of assent. But Heine diverted his answer from the thought suggested to him and made no reply to it at all. He made use of the double meaning of which the phrase 'Golden Calf' is capable to branch off along a side-track. He caught hold of one component of the phrase, 'Calf', and replied, as though the emphasis in Soulié's remark had been upon it: 'Oh, he's not a calf any longer' . . etc.¹

[1905c, 1654]
Heine’s answer combines two joke-techniques: a diversion combined with an allusion. He did not say straight out: ‘He’s an ox.’

The diversion in the bath-joke is even plainer. This example calls for a graphic presentation:

This shifting of the emphasis is only made possible by the wording ‘taken a bath’. If it had run ‘have you bathed?’ no displacement would have been possible. The non-joking answer would then have been: ‘Bathed? What d’you mean? I don’t know what that is.’ But the technique of the joke lies in the displacement of the accent from ‘bath’ to ‘taken’.

This joke gives the same appearance of being logical that we saw in the ‘Salmon Mayonnaise’; but it is not a displacement joke. The reply was a direct one. The cynicism which was concealed in the former joke is openly admitted in this one: ‘Drinking is the most important thing for me.’ Actually the technique of this joke is extremely scanty and cannot explain its effectiveness. It consists simply in the rearrangement of the same material or, more precisely, in the reversal of the relation of means and ends between drinking and doing or getting tutoring.

As soon as my reduction ceases to emphasize this factor in its form of expression, the joke fades; for instance: ‘What a senseless suggestion! The important thing for me is the drinking, not the tutoring. After all, tutoring is only a means to enable me to go on drinking.’ So the joke did in fact depend on its form of expression.

In the bath-joke the dependence of the joke on its wording (‘Have you taken a bath?’) is unmistakable, and a change in it involves the disappearance of the joke. For in this case the technique is a more complicated one - a combination of double meaning (sub-species f) and displacement. The wording of the question admits a double meaning, and the joke is produced by the answer disregarding the meaning intended by the questioner and catching on to the subsidiary meaning. We are accordingly in a position to find a reduction which allows the double meaning of the wording to persist and yet destroys the joke; we can do this merely by undoing the displacement:

A precisely similar part is played by the double meaning in Heine’s joke about the ‘Golden Calf’. It enables the answer to make a diversion from the suggested train of thought (which is effected in the ‘Salmon Mayonnaise’ joke without any such assistance from the wording). In the reduction Soulié’s remark and Heine’s reply would perhaps run: ‘The way in which the people here are crowding round the man simply because he’s rich reminds one vividly of the worship of the Golden Calf.’ And Heine: ‘That he should be honoured in this way because of his wealth doesn’t strike me as the worst of it. In what you say you’re not putting enough stress on the fact that because of his wealth people forgive him his stupidity.’ In this way the double meaning would be retained but the displacement joke would be destroyed.
But at this point we must be prepared to meet an objection which will assert that these fine distinctions are seeking to tear apart what belongs together. Does not every double meaning give occasion for a displacement - for a diversion of the train of thought from one meaning to the other? And are we prepared, then, to allow 'double meaning' and 'displacement' to be set up as representatives of two quite different types of joke-technique? Well, it is true that this relation between double meaning and displacement does exist, but it has nothing to do with our distinguishing the different joke-techniques. In the case of double meaning a joke contains nothing other than a word capable of multiple interpretation, which allows the hearer to find the transition from one thought to another - a transition which, stretching a point, might be equated with a displacement. In the case of a displacement joke, however, the joke itself contains a train of thought in which a displacement of this kind has been accomplished. Here the displacement is part of the work which has created the joke; it is not part of the work necessary for understanding it. If this distinction is not clear to us, we have an unfailing means of bringing it tangibly before our eyes in our attempts at reduction. But there is one merit which we will not deny to this objection. It draws our attention to the necessity of not confusing the psychical processes involved in the construction of the joke (the 'joke-work') with the psychical processes involved in taking in the joke (the work of understanding). Our present enquiry is only concerned with the former.¹

[1905c, 1657]

Are there other examples of the displacement technique? They are not easy to find. A straightforward instance is afforded by the following joke, which moreover is not characterized by the appearance of logic which was so much overstressed in our model case:

[1905c, 1658]

Here the displacement leaps to the eye. The dealer obviously mentions the early hour of arriving at the provincial town simply in order to demonstrate the horse's capacity by an example. The customer disregards the animal's capacity, which he does not question, and merely enters into the data of the example that has been chosen. The reduction of this joke is accordingly easy to give.

[1905c, 1658]

Greater difficulties are presented by another example the technique of which is most obscure, but which can nevertheless be solved as double meaning combined with displacement. The joke describes the prevarication of a 'Schadchen' (a Jewish marriage-broker), and is thus one of a group with which we shall often be concerned.

[1905c, 1658]

The double meaning lies in the word 'living', and the displacement consists in the Schadchen shifting the meaning of the word from its ordinary sense, as a contrast to 'dead', to the sense which it has in the phrase 'that's not living'. In doing so he explains his former pronouncement retrospectively as having had a double meaning, though any such multiple meaning was decidedly remote in this particular case. So far the technique would seem similar to that in the 'Golden Calf' joke and the bath-joke. But here there is another factor to be considered which by its prominence interferes with our understanding of the technique. It might be described as a 'characterizing' joke: it seeks by an example to illustrate a marriage-broker's characteristic mixture of mendacious impudence and readiness of repartee. We shall find that this is only the outer shell, the façade, of the joke; its meaning - that is to say, its purpose - is something different. And we must postpone the attempt at a reduction of it.¹

[1905c, 1658]
The technique of the nonsensical jokes which we have so far considered really consists, therefore, in presenting something that is stupid and nonsensical, the sense of which lies in the revelation and demonstration of something else that is stupid and nonsensical.

'A well-known University teacher, who was in the habit of peppering his unattractive special subject with numerous jokes, was congratulated on the birth of his youngest child, who was granted to him when he had already reached an advanced age. "Yes", he replied to his well-wishers, "it is remarkable what human hands can accomplish." - This answer seems quite specially nonsensical and out of place. Children, after all, are regarded as a blessing of God, quite in contrast to human handiwork. But it soon occurs to us that after all the answer has a meaning and, at that, an obscene one. There is no question here of the happy father making himself out stupid in order to show that something or someone else is stupid. The apparently senseless answer makes a surprising, a bewildering impression on us, as the authorities would say. As we have seen they attribute the whole effect of jokes like this to an alternation between 'bewilderment and illumination'. We shall try later to form a judgement on this; for the moment we must be content to stress the fact that the technique of this joke lies in its presentation of something bewildering and nonsensical.

'We wondered how it is that cats have two holes cut in their skin precisely at the place where their eyes are.' To wonder about something that is in fact only the statement of an identity is undoubtedly a piece of stupidity. It reminds one of Michelet's exclamation¹ which was meant to be taken seriously, and which to the best of my recollection runs: 'How beautifully Nature has arranged it that as soon as a child comes into the world it finds a mother ready to take care of it!' Michelet's pronouncement is a real piece of stupidity, but Lichtenberg's is a joke which makes use of stupidity for some purpose and behind which something lies. But what? For the moment, we must admit, no answer can be given.

We have now already found from two groups of examples that the joke-work makes use of deviations from normal thinking - of displacement and absurdity - as technical methods for producing a joking form of expression. It is no doubt justifiable to expect that other kinds of faulty reasoning may find a similar use. And it is in fact possible to produce a few examples of the sort:

'This anecdote too has an appearance of logic about it, which, as we already know, is a suitable façade for a piece of faulty reasoning. The mistake evidently lies in the crafty customer's constructing a connection which did not exist between the giving back of the cake and the taking of the liqueur in its place. The episode in fact fell into two processes, which were independent of each other so far as the vendor was concerned and were substitutes for each other only from the point of view of the purchaser's intention. First he took the cake and gave it back, and therefore owed nothing for it; then he took the liqueur, and for it he owed payment. We might say that the customer used the relation 'in exchange for' with a double meaning. But it would be more correct to say that by means of a double meaning he constructed a connection which was not in reality valid.'¹

¹[1905c, 1660]

¹[1905c, 1661]
A similar nonsensical technique appears if a joke seeks to maintain a connection which seems to be excluded by the special conditions implied in its content. Such, for instance, is Lichtenberg's knife without a blade which has no handle. So, too, the joke repeated by Von Falke: 'Is this the place where the Duke of Wellington spoke those words?' - 'Yes, it is the place; but he never spoke the words.'

This is an opportunity for making a not unimportant admission. We are engaged in investigating the technique of jokes as shown in examples; and we should therefore be certain that the examples we have chosen are really genuine jokes. It is the case, however, that in a number of instances we are in doubt whether the particular example ought to be called a joke or not. We have no criterion at our disposal before our investigation has given us one. Linguistic usage is untrustworthy and itself needs to have its justification examined. In coming to our decision we can base ourselves on nothing but a certain 'feeling', which we may interpret as meaning that the decision is made in our judgement in accordance with particular criteria that are not yet accessible to our knowledge. In the case of our last example we must feel a doubt whether it should be represented as a joke, or perhaps as a 'sophistical' joke, or simply as a piece of sophistry. For the fact is that we do not yet know in what the characteristic of being a joke resides.

On the other hand, the next example, which exhibits a type of faulty reasoning that may be said to be complementary to the former instance, is an undoubted joke. It is once again a story of a marriage-broker:

The appearance of logic is very thin in this case, and no one will be ready to prefer an already 'accomplished misfortune' to one that is merely a possibility. The fault in this train of thought can be more easily shown in another example - a story which I cannot entirely divest of its dialect:

The faulty reasoning common to the last two examples is here undisguisedly admitted. The value of phantasy is exalted unduly in comparison with reality; a possibility is almost equated with an actual event. The distant look across the stretch of country separating Cracow and Lemberg would have been an impressive telepathic achievement if it had produced something that was true. But the disciple was not concerned with that. It might after all have possibly happened that the Rabbi in Lemberg had died at the moment at which the Cracow Rabbi announced his death; and the disciple displaced the emphasis from the condition subject to which the teacher's achievement deserved admiration on to an unconditional admiration of the achievement. 'In magnis rebus voluisse sat est' expresses a similar point of view. Just as in this example reality is disregarded in favour of possibility, so in the former one the marriage-broker suggests to the would-be bridegroom that the possibility of a woman being made lame by an accident should be regarded as something far more important than the question of whether she is really lame or not.
The same thing happens in all three cases. A person who has reacted in the same way several times in succession repeats this mode of expression on the next occasion, when it is unsuitable and defeats his own intentions. He neglects to adapt himself to the needs of the situation, by giving way to the automatic action of habit. Thus, in the first story the assistant forgets that he was brought along in order to prejudice the would-be bridegroom in favour of the proposed bride. And since to begin with he has performed his task and underlined the bride's advantages by repeating each one as it is brought forward, he goes on to underline her timidly admitted hump, which he should have minimized. The broker in the second story is so much fascinated by the enumeration of the bride's defects and infirmities that he completes the list out of his own knowledge, though that was certainly not his business or purpose. In the third story, finally, he allows himself to be so much carried away by his eagerness to convince the young man of the family's wealth that, in order to establish one confirmatory point, he brings up something that is bound to upset all his efforts. In every case automatic action triumphs over the expedient modification of thought and expression.

This is easy to see; but it is bound to have a confusing effect when we notice that these three stories have as much right to be called 'comic' as we had to produce them as 'jokes'. The uncovering of psychical automatism is one of the techniques of the comic, just as is any kind of revelation or self-betrayal. We suddenly find ourselves faced at this point with the problem of the relation of jokes to the comic which we intended to evade. (See the introduction.) Are these stories perhaps only 'comic' and not 'jokes'? Is the comic operating here by the same methods as jokes do? And, once again, what constitutes the peculiar characteristics of jokes?

We must keep to our view that the technique of this last group of jokes that we have examined lies in nothing else than in bringing forward 'faulty reasoning'. But we are obliged to admit that their examination has so far led us more into obscurity than understanding. Nevertheless we do not abandon our expectation that a more complete knowledge of the techniques of jokes will lead us to a result which can serve as a starting point for further discoveries.

The next examples of jokes, with which we shall pursue our enquiry, offer an easier task. Their technique, in particular, reminds us of what we already know.
These examples cannot fail to remind us of a group with which we have already dealt and which is distinguished by the 'multiple use of the same material'. The last example in particular will raise the question of why we did not include it in that group instead of introducing it here in a fresh connection. 'Experience' is once again described in its own terms, just as 'jealousy' was earlier (p. 1640). I should not be inclined to dispute this classification very seriously. But as regards the other two examples (which are of a similar nature), I think another factor is more striking and more important than the multiple use of the same words, in which in this case there is nothing that fringes on double meaning. I should like in particular to stress the fact that here new and unexpected unities are set up, relations of ideas to one another, definitions made mutually or by reference to a common third element. I should like to name this process 'unification'. It is clearly analogous to condensation by compression into the same words. Thus the two halves of human life are described by a mutual relation discovered to exist between them: in the first we wish the second would come and in the second we wish the first were back. Speaking more precisely, two very similar mutual relations have been chosen for representation. To the similarity of the relations there corresponds a similarity of the words, which may indeed remind us of the multiple use of the same material: 'wish . . . would come' - 'wish . . . back'. In Lichtenberg's joke January and the months contrasted with it are characterized by a (once again, modified) relation to a third element; these are the good wishes, which are received in the first month and not fulfilled in the remaining ones. Here the distinction from the multiple use of the same material (which approximates to double meaning) is very clear.¹

¹ In order to give a better description of 'unification' than the examples above allow of, I will make use of something I have already mentioned - namely the peculiar negative relation that holds between jokes and riddles, according to which the one conceals what the other exhibits. Many of the riddles with the production of which G. T. Fechner, the philosopher, passed his time when he was blind, are characterized by a high degree of unification, which lends them a special charm. Take, for instance, as a neat example, Riddle No. 203 (Dr. Mises' Rätselbüchlein, 4th edition, enlarged, N.D.):

Here is a neat example of a unification joke which needs no explanation:

This last example draws attention to the fact that it is essentially unification that lies at the bottom of jokes that can be described as 'ready repartees'. For repartee consists in the defence going to meet the aggression, in 'turning the tables on someone' or 'paying someone back in his own coin' - that is, in establishing an unexpected unity between attack and counter-attack. For instance:

In this excellent *tu quoque*, in which a nonsensical question is met by an equally impossible condition, there is another technical factor at work which would have been absent if the dyer had answered: 'No, your Highness. I'm afraid the horse wouldn't stand boiling.'
Unification has another, quite specially interesting technical instrument at its disposal: stringing things together with the conjunction ‘and’. If things are strung together in this way it implies that they are connected: we cannot help understanding it so. For instance, when Heine, speaking of the city of Göttingen in the *Harzreise*, remarks: ‘Speaking generally, the inhabitants of Göttingen are divided into students, professors, philistines and donkeys’, we take this grouping in precisely the sense which Heine emphasizes in an addition to the sentence: ‘and these four classes are anything but sharply divided.’ Or, again, when he speaks of the school in which he had to put up with ‘so much Latin, caning and Geography’, this series, which is made even more transparent by the position of the ‘caning’ between the two educational subjects, tells us that the unmistakable view taken by the schoolboys of the caning certainly extended to Latin and Geography was well.

[1905c, 1668]

We observed in the example of the Duke and the dyer that it would remain a joke by unification if the dyer had replied: ‘No, I'm afraid the horse wouldn't stand boiling.’ But his actual reply was: ‘Yes, your Highness, if he can stand boiling.’ The replacement of the really appropriate ‘no’ by a ‘yes’ constitutes a new technical method of joking, the employment of which we will pursue in some other examples.

[1905c, 1669]

‘Frederick the Great heard of a preacher in Silesia who had the reputation of being in contact with spirits. He sent for the man and received him with the question “You can conjure up spirits?” The reply was: “At your Majesty's command. But they don't come.”’ It is quite obvious here that the method used in the joke lay in nothing else than the replacing of the only possible answer ‘no’ by its opposite. In order to carry out the replacement, it was necessary to add a ‘but’ to the ‘yes’, so that ‘yes’ and ‘but’ are equivalent in sense to ‘no’.

[1905c, 1669]

This ‘representation by the opposite’, as we shall call it, serves the joke-work in various forms. In the next two examples it appears almost pure:

[1905c, 1669]

Here we have a representation of ugliness through resemblances to what is most beautiful. It is true that these resemblances can only exist in qualities that are expressed in terms with a double meaning or in unimportant details. This latter feature applies to our second example - 'The Great Spirit', by Lichtenberg:

[1905c, 1669]

Von Falke (1897, 271) brought home a particularly good example of representation by the opposite from a journey to Ireland, an example in which no use whatever is made of words with a double meaning. The scene was a wax-work show (as it might be, Madame Tussaud's). A guide was conducting a company of old and young visitors from figure to figure and commenting on them: 'This is the Duke of Wellington and his horse', he explained. Whereupon a young lady asked: 'Which is the Duke of Wellington and which is his horse?' 'Just as you like, my pretty child,' was the reply. 'You pays your money and you takes your choice.'

[1905c, 1670]
The reduction of this Irish joke would be: 'Shameless the things these wax-work people dare to offer the public! One can't distinguish between the horse and its rider! (Facetious exaggeration.) And that's what one pays one's money for!' This indignant exclamation is then dramatized, based on a small occurrence. In place of the public in general an individual lady appears and the figure of the rider is particularized: he must be the Duke of Wellington, who is so extremely popular in Ireland. But the shamelessness of the proprietor or guide, who takes money out of people's pockets and offers them nothing in return, is represented by the opposite - by a speech in which he boasts himself a conscientious man of business, who has nothing more closely at heart than regard for the rights which the public has acquired by its payment. And now we can see that the technique of this joke is not quite a simple one. In so far as it enables the swindler to insist on his conscientiousness it is a case of representation by the opposite; but in so far as it effects this on an occasion on which something quite different is demanded of him - so that he replies with business like respectability where what we expect of him is the identification of the figures - it is an instance of displacement. The technique of the joke lies in a combination of the two methods.

No great distance separates this example from a small group which might be described as 'overstatement' jokes. In these the 'yes' which would be in place in the reduction is replaced by a 'no', which, however, on account of its content, has the force of an intensified 'yes', and vice versa. A denial is a substitute for an overstated confirmation. Thus, for instance, in Lessing’s epigram:

'There are more things in heaven and earth than are dreamt of in your philosophy', said Prince Hamlet contemptuously. Lichtenberg knew that this condemnation is not nearly severe enough, for it does not take into account all the objections that can be made to philosophy. He therefore added what was missing: 'But there is much, too, in philosophy that is not to be found in heaven or earth.' His addition, it is true, emphasizes the way in which philosophy compensates us for the insufficiency for which Hamlet censures it. But this compensation implies another and still greater reproach.

Two Jewish jokes, though they are of a coarse type, are even clearer, since they are free from any trace of displacement:

The following example is an excellent 'overstatement' joke, which can easily be traced back to representation by the opposite:

The professor's thoughts during the royal applause could certainly not have been expressed unaltered: 'This makes it look as though I were taking off the poor fellows bad leg by royal command and only for the royal satisfaction. After all I really have other reasons for the operation.' But he then goes to the King and says: 'I have no reasons for carrying out an operation other than your Majesty's command. The applause you honoured me with has made me so happy that I only await your Majesty's orders to amputate the sound limb too.' In this way he succeeds in making himself understood by saying the opposite of what he thinks but must keep to himself. This opposite is an overstatement that cannot be believed.
As these examples show, representation by the opposite is an instrument of joke-technique that is used frequently and works powerfully. But there is something else that we should not overlook: namely that this technique is by no means peculiar to jokes. When Mark Antony, after he has made a long speech in the Forum and has reversed the emotional attitude of his audience round Caesar's corpse, finally exclaims once more:

[1905c, 1672]

Or when Simplicissimus describes a collection of incredible pieces of brutality and cynicism as the expressions of 'men of feeling'; this too is a representation by the opposite. But we call this 'irony' and no longer a joke. The only technique that characterizes irony is representation by the opposite. Moreover we read and hear of 'ironical jokes'. So it can no longer be doubted that technique alone is insufficient to characterize the nature of jokes. Something further is needed which we have not yet discovered. But on the other hand it remains an uncontradicted fact that if we undo the technique of a joke it disappears. For the time being we may find difficulty in thinking how these two fixed points that we have arrived at in explaining jokes can be reconciled.

[1905c, 1672]

If representation by the opposite is one of the technical methods of jokes, we can expect that jokes may also make use of its contrary - representation by something similar or akin. A further pursuit of our enquiry will in fact show us that this is the technique of a fresh and particularly comprehensive group of conceptual jokes. We shall describe the peculiarity of this technique far more appropriately if, instead of representation by something 'akin', we say by something 'correlated' or 'connected'. We will take our start, in fact, with this latter characteristic and illustrate it at once by an example.

[1905c, 1673]

The meaning of this remark is clear. It is once again a question of the representation of something that cannot be expressed directly. How does this 'indirect representation' come about? Starting from the representation in the joke, we trace the path backwards through a series of easily established associations and inferences.

[1905c, 1673]

We at once recall where we have already come across allusion - in connection, namely, with double meaning. When two meanings are expressed in one word and one of them is so much more frequent and usual that it occurs to us at once, while the second is more out of the way and therefore less prominent, we proposed to speak of this as 'double meaning with an allusion'. In a whole number of the examples we have already examined we remarked that the technique was not a simple one, and we now perceive that the 'allusion' was the complicating factor in them. (See, for instance, the inversion joke about the wife who has lain back a bit and so has been able to earn a lot or the nonsensical joke about the man who replied to congratulations on the birth of his youngest child by saying that it was remarkable what human hands could accomplish.)

[1905c, 1674]

In the American anecdote we now have before us an allusion without any double meaning, and we see that its characteristic is replacement by something linked to it in a conceptual connection. It may easily be guessed that the utilizable connection can be of more than one kind. In order not to lose ourselves in a maze of detail, we will discuss only the most marked variants and these only in a few examples.

[1905c, 1674]
The connection used for the replacement may be merely a resemblance in sound, so that this sub-species becomes analogous to puns among verbal jokes. Here, however, it is not the resemblance in sound between two words, but between whole sentences, characteristic phrases, and so on.

For instance, Lichtenberg coined the saying: 'New spas cure well', which at once reminds us of the proverb: 'New brooms sweep clean.' The two phrases share the first one and a half words and the last word, as well as the whole structure of the sentence. And there is no doubt that the sentence came into the witty philosopher's head as an imitation of the familiar proverb. Thus Lichtenberg's saying becomes an allusion to the proverb. By means of this allusion something is suggested that is not said straight out - namely that something else is responsible for the effects produced by spas besides the unvarying characteristics of thermal springs.

A similar technical solution applies to another jest [Scherz] or joke [Witz] of Lichtenberg's: 'A girl scarcely twelve Modi old.' This sounds like 'twelve Monden [moons]', i.e. months, and may originally have been a slip of the pen for the latter, which is a permissible expression in poetry. But it also makes good sense to use the changing fashion instead of the changing moon as a method of determining a woman's age.

The connection may also consist in similarity except for a 'slight modification'. So that this technique, too, is parallel to a verbal technique. Both species of joke make almost the same impression, but they can be better distinguished from each other if we consider the processes of the joke-work.

Or: 'Every fathom a queen', a modification of Shakespeare's familiar 'Every inch a king'. The allusion to this quotation was made with reference to an aristocratic and over-life-size lady. No very serious objection could really be made if anyone were to prefer to include this joke among the 'condensations accompanied by modifications as substitute'. (See 'tête-à-bête', p. 1631.)

A friend said of someone who had lofty views but was obstinate in the pursuit of his aims: 'Er hat ein Ideal vor dem Kopf.' The current phrase is: 'Ein Brett vor dem Kopf haben'. The modification alludes to this phrase and makes use of its meaning for its own purposes. Here, once more, the technique might be described as 'condensation with modification'.

It is almost impossible to distinguish between 'allusion by means of modification' and 'condensation with substitution', if the modification is limited to a change of letters. For instance: 'Dichteritiz' This allusion to the scourge of 'Diphteritis' represents authorship by unqualified persons as another public danger.

Negative particles make very neat allusions possible at the cost of slight alterations:
Finally, another kind of allusion consists in ‘omission’, which may be compared to condensation without the formation of a substitute. Actually, in every allusion something is omitted, viz. the train of thought leading to the allusion. It only depends on whether the more obvious thing is the gap in the wording of the allusion or the substitute which partly fills the gap. Thus a series of examples would lead us back from blatant omission to allusion proper.

[1905c, 1676]

Omission without a substitute is shown in the following example: There is a witty and pugnacious journalist in Vienna, whose biting invective has repeatedly led to his being physically maltreated by the subjects of his attacks. On one occasion, when a fresh misdeed on the part of one of his habitual opponents was being discussed, somebody exclaimed: 'If X hears of this, he'll get his ears boxed again.' The technique of this joke includes, in the first place, bewilderment at its apparent nonsense, since we cannot see how getting one's ears boxed can be an immediate consequence of having heard something. The absurdity of the remark disappears if we insert in the gap: 'he'll write such a scathing article upon the man that . . . etc.' Allusion by means of omission, combined with nonsense, are accordingly the technical methods used in this joke.

[1905c, 1677]

Allusion is perhaps the commonest and most easily manageable method of joking and is at the bottom of the majority of short-lived jokes which we are accustomed to weaving into our conversations and which will not bear being uprooted from their original soil and kept in isolation. But it precisely reminds us once more of the fact that had begun to puzzle us in our consideration of the technique of jokes. An allusion in itself does not constitute a joke; there are correctly constructed allusions which have no claim to such a character. Only allusions that possess that character can be described as jokes. So that the criterion of jokes, which we have pursued into their technique, eludes us there once again.

[1905c, 1679]

I have occasionally described allusion as ‘indirect representation’; and we may now observe that the various species of allusion, together with representation by the opposite and other techniques that have still to be mentioned, may be united into a single large group, for which ‘indirect representation’ would be the most comprehensive name. ‘Faulty reasoning’, 'unification’, 'indirect representation’ - these, then, are the headings under which we can classify those techniques of conceptual jokes which we have come to know.

[1905c, 1679]

If we examine our material further, we seem to recognize a fresh sub-species of indirect representation which can be precisely characterized but of which few examples can be adduced. This is representation by something small or very small - which performs the task of giving full expression to a whole characteristic by means of a tiny detail. This group can be brought under the classification of ‘allusion’, if we bear in mind that this smallness is related to what has to be represented, and can be seen to proceed from it. For instance:

[1905c, 1679]

It cannot be denied that this representation by something small is related to the 'tendency to economy' which we were left with as the last common element after our investigation of verbal technique.

[1905c, 1680]
This successful joke demonstrates two things from the example of the way in which the cries of pain uttered by an aristocratic lady in child-birth changed their character little by little. It shows how pain causes primitive nature to break through all the layers of education, and how an important decision can be properly made to depend on an apparently trivial phenomenon.

[1905c, 1680]

There is another kind of indirect representation used by jokes, namely the 'analogy'. We have kept it back so long because the consideration of it comes up against new difficulties, or makes particularly evident difficulties that we have already come up against in other connections. We have already admitted that in some of the examples we have examined we have not been able to banish a doubt as to whether they ought to be regarded as jokes at all; and in this uncertainty we have recognized that the foundations of our enquiry have been seriously shaken. But I am aware of this uncertainty in no other material more strongly or more frequently than in jokes of analogy. There is a feeling - and this is probably true of a large number of other people under the same conditions - which tells me 'this is a joke, I can pronounce this to be a joke' even before the hidden essential nature of jokes has been discovered. This feeling leaves me in the lurch most often in the case of joking analogies. If to begin with I unhesitatingly pronounce an analogy to be a joke, a moment later I seem to notice that the enjoyment it gives me is of a quality different from what I am accustomed to derive from a joke. And the circumstance that joking analogies are very seldom able to provoke the explosive laugh which signalizes a good joke makes it impossible for me to resolve the doubt in my usual way - by limiting myself to the best and most effective examples of a species.

[1905c, 1681]

No doubt that seems to be a joke; but on closer examination we, notice that the joking effect does not arise from the analogy itself but from a subsidiary characteristic. 'The torch of truth' is not a new analogy but one that has been common for a very long time and has become reduced to a cliché - as always happens when an analogy is lucky and accepted into linguistic usage. Though we scarcely notice the analogy any longer in the phrase 'the torch of truth', it is suddenly given back its full original force by Lichtenberg, since an addition is now made to the analogy and a consequence is drawn from it. But we are already familiar with a process like this of giving its full meaning to a watered-down expression as a technique of joking. It finds a place in the multiple use of the same material (p. 1639 f.). It might quite well be that the joking impression produced by Lichtenberg's remark arises only from its dependence on this joke-technique.

[1905c, 1682]

The same judgement may certainly apply as well to another joking analogy by the same author:

[1905c, 1682]

The comparison of reviews to a childish illness is founded in the first instance on the fact of being exposed to them shortly after first seeing the light of day. I cannot venture to decide whether up to this point the comparison has the character of a joke. But it is then carried further: it turns out that the subsequent fate of new books can be represented within the framework of the same analogy or through related analogies. A prolongation like this of an analogy is undoubtedly in the nature of a joke, but we already know what technique it has to thank for this - it is a case of unification, the making of an unsuspected connection. The character of the unification is not altered by the fact that here it consists in making an addition to a previous analogy.

[1905c, 1682]
In another group of analogies one is tempted to shift what is undoubtedly an impression that has the character of a joke on to another factor, which once again has in itself nothing to do with the nature of the analogy. These are analogies which contain a striking juxtaposition, often a combination that sounds absurd, or which are replaced by something of the sort as the outcome of the analogy. The majority of the Lichtenberg examples belong to this group.

'It is a pity that one cannot see the learned entrails of authors so as to discover what they have eaten.' The 'learned' entrails is a bewildering and indeed absurd epithet, which is only explained by the analogy. What if the impression of its being a joke were due entirely to the bewildering character of the juxtaposition? If so, it would correspond to a method of joking with which we are quite familiar - 'representation by absurdity'

Lichtenberg has used the same analogy between the ingestion of reading and instructive matter and the ingestion of physical nourishment for another joke:

Other analogies by the same author exhibit the same absurd, or at least remarkable, assignment of epithets, which, as we now begin to see, are the true vehicles of the joke:

'Moral backside' - the assignment of this remarkable epithet is the outcome of an analogy. But in addition, the analogy is continued further with an actual play upon words - 'need' - and a second even more unusual juxtaposition ('the breeches of respectability'), which is perhaps a joke in itself; for the breeches, since they are the breeches of respectability, themselves, as it were, become a joke. We need not be surprised, then, if the whole gives us the impression of being an analogy that is a very good joke. We begin to notice that we are inclined, quite generally, where a characteristic attaches only to a part of a whole, to extend it in our estimation to the whole itself. The 'breeches of respectability', incidentally, recall some similarly bewildering lines of Heine's:

There can be no doubt that these last two analogies have a characteristic that we do not find in every good (that is to say, in every apt) analogy. They are to a great degree 'debasing', as we might put it. They juxtapose something of a high category, something abstract (in these instances, 'respectability' and 'patience'), with something of a very concrete and even low kind ('breeches'). We shall have to consider in another connection whether this peculiarity has anything to do with the joke. Here we will try to analyse another example in which this disparaging characteristic is quite specially plain. Weinberl, the clerk in Nestroy's farce *Einen Jux will er sich machen* [*He wants to have a spree*], pictures to himself how one day, when he is a respectable old business man, he will remember the days of his youth: 'When the ice in front of the warehouse of memory has been hacked up like this in a friendly talk', he says, 'when the arched doorway of old times has been unlocked again and the showcase of the imagination is fully stocked with goods from the past. . . .' These are, to be sure, analogies between abstract and very commonplace concrete things; but the joke depends - whether entirely or in part - on the fact that a clerk is making use of analogies taken from the domain of his everyday activities. But the bringing of these abstractions into connection with the ordinary things with which his life is normally filled is an act of *unification.*
'The motives that lead us to do anything might be arranged like the thirty-two winds [= points of the compass] and might be given names in a similar way: for instance, "bread-bread fame" or "fame-fame-bread". As is so often the case with Lichtenberg's jokes, the impression of something apt, witty and shrewd is so prominent that our judgement upon the nature of what constitutes the joke is misled by it. If some amount of joke is admixed with the admirable meaning in a remark of this kind, we are probably led into declaring that the whole thing is an excellent joke. I should like, rather, to hazard the statement that everything in it that is really in the nature of a joke arises from our surprise at the strange combination 'bread bread-fame'. As a joke, therefore, it would be a 'representation by absurdity'.

A strange juxtaposition or the attribution of an absurd epithet can stand by itself as the outcome of an analogy:

'A zweischläfrige woman.' 'An einschläfriger church-pew.'¹ (Both by Lichtenberg.) Behind both these there is an analogy with a bed; in both of them, besides the 'bewilderment' the technical factor of 'allusion' is in operation - an allusion in one case to the sleepy effects of sermons and in the other to the inexhaustible topic of sexual relations.

So far we have found that whenever an analogy strikes us as being in the nature of a joke it owes this impression to the admixture of one of the joke-techniques that are familiar to us. But a few other examples seem at last to provide evidence that an analogy can in itself be a joke.

In the face of this and many other examples, we can no longer dispute the fact that an analogy can in itself possess the characteristic of being a joke, without this impression being accounted for by a complication with one of the familiar joke techniques. But, that being so, we are completely at a loss to see what it is that determines the joking characteristic of analogies, since that characteristic certainly does not reside in analogy as a form of expression of thought or in the operation of making a comparison. All we can do is to include analogy among the species of 'indirect representation' used by the joke-technique and we must leave unresolved the problem which we have met with much more clearly in the case of analogies than in the methods of joking that we came across earlier. No doubt, moreover, there must be some special reason why the decision whether something is a joke or not offers greater difficulties in analogies than in other forms of expression.

Or here is Heine:

'Her face resembled a palimpsest, on which, beneath the fresh black monastic manuscript of the text of a Church Father there lurk the half-obiterated lines of an ancient Greek love poem.'
Can we feel sure that none of the possible techniques of jokes has escaped our investigation? Of course not. But a continued examination of fresh material can convince us that we have got to know the commonest and most important technical methods of the joke-work - at all events as much as is required for forming a judgement on the nature of that psychical process. So far we have not arrived at any such judgement; but on the other hand we are now in possession of an important indication of the direction from which we may expect to receive further light upon the problem. The interesting processes of condensation accompanied by the formation of a substitute, which we have recognized as the core of the technique of verbal jokes, point towards the formation of dreams, in the mechanism of which the same psychical processes have been discovered. This is equally true, however, of the techniques of conceptual jokes - displacement, faulty reasoning, absurdity, indirect representation, representation by the opposite - which re-appear one and all in the technique of the dream-work. Displacement is responsible for the puzzling appearance of dreams, which prevents our recognizing that they are a continuation of our waking life. The use of absurdity and nonsense in dreams has cost them the dignity of being regarded as psychical products and has led the authorities to suppose that a disintegration of the mental activities and a cessation of criticism, morality and logic are necessary conditions of the formation of dreams. Representation by the opposite is so common in dreams that even the popular books of dream-interpretation, which are on a completely wrong tack, are in the habit of taking it into account. Indirect representation - the replacement of a dream-thought by an allusion, by something small, a symbolism akin to analogy - is precisely what distinguishes the mode of expression of dreams from that of our waking life.¹ So far-reaching an agreement between the methods of the joke-work and those of the dream-work can scarcely be a matter of chance. To demonstrate this agreement in detail and to examine its basis will be one of our later tasks.

¹[1905c, 1686]

'Not only did he disbelieve in ghosts; he was not even frightened of them.' Here the joke lies entirely in the nonsensical form of representation, which puts what is commonly thought less of into the comparative and uses the positive for what is regarded as more important. If this joking envelope is removed, we have: 'it is much easier to get rid of a fear of ghosts intellectually than to escape it when the occasion arises.' This is no longer in the least a joke, though it is a correct and still too little appreciated psychological discovery - the same one which Lessing expressed in a well-known sentence:

[1905c, 1689]

Moreover, the same thing is true of verbal jokes. When we are told that 'experience consists in experiencing what one does not wish to experience', we are bewildered and think we have learnt a new truth. It is a little time before we recognize under this disguise the platitude of 'Injury makes one wise'. (Fischer.) The apt way in which the joke succeeds in defining 'experience' almost purely by the use of the word 'to experience' deceives us into overvaluing the substance of the sentence. Just the same thing is true of Lichtenberg's 'January' joke of unification (p. 1667), which has nothing more to tell us than something we have already long known - that New Year's wishes come true as seldom as other wishes. So too in many similar cases.

[1905c, 1690]

And we find just the contrary with other jokes, in which the aptness and truth of the thought tricks us into calling the whole sentence a brilliant joke - whereas only the thought is brilliant and the joke's achievement is often feeble. Precisely in Lichtenberg's jokes the kernel of thought is frequently far more valuable than the joking envelope to which we unjustifiably extend our appreciation. Thus, for instance, the remark about the 'torch of truth' (p. 1682) is an analogy that scarcely amounts to a joke, but it is so apt that we are inclined to insist that the sentence is a particularly good joke.

[1905c, 1690]
Lichtenberg's jokes are outstanding above all on account of their intellectual content and the certainty with which they hit their mark. Goethe was quite right in saying of that author that in fact his joking and jesting ideas concealed problems; it would have been even more correct to say that they touch on the solution of problems. When, for instance, he remarked as a joke: 'He had read Homer so much that he always read "Agamemnon" instead of "angenommen" ' - the technique used is 'stupidity' plus 'similarity of sound' - Lichtenberg had discovered nothing less than the secret of misreading.¹

[1905c, 1690]

Similarly with a joke the technique of which struck us as most unsatisfactory (p. 1661): 'He wondered how it is that cats have two holes cut in their skin precisely at the place where their eyes are'. The stupidity that is paraded here is only apparent. In fact, behind this simple remark lies the great problem of teleology in the structure of animals. It was by no means so completely a matter of course that the palpebral fissure should open at the point at which the cornea is exposed, until the theory of evolution had thrown light on the coincidence.

[1905c, 1690]

We shall bear in mind the fact that we receive from joking remarks a total impression in which we are unable to separate the share taken by the thought content from the share taken by the joke-work. It may be that later on we shall find a still more significant parallel to this.

[1905c, 1690]

From the point of view of throwing theoretical light on the nature of jokes, innocent jokes are bound to be of more value to us than tendentious ones, and trivial jokes of more value than profound ones. Innocent and trivial jokes are likely to put the problem of jokes before us in its purest form, since with them we avoid the danger of being confused by their purpose or having our judgement misled by their good sense. On the basis of such material our discoveries can make fresh advances.

[1905c, 1691]

This time we will not examine the technique of the joke; we propose to turn our attention to another factor, which is actually the most important one. When those of us present heard this improvised joke it gave us pleasure - which I can clearly recall - and made us laugh. In this instance, as in countless others, the hearers' feeling of pleasure cannot have arisen from the purpose of the joke or from its intellectual content; there is nothing left open to us but to bring that feeling of pleasure into connection with the technique of the joke. The technical methods of joking which we have earlier described - condensation, displacement, indirect representation and so on - thus possess the power of evoking a feeling of pleasure in the hearer, though we cannot in the least see how they may have acquired this power. In this simple way we arrive at the second thesis in our clarification of jokes; the first (p. 1623) asserted that the characteristic of jokes lay in their form of expression. Let us further reflect that this second thesis has in fact taught us nothing new. It merely isolates what was already included in an observation we had made earlier. It will be recalled that when we had succeeded in reducing a joke (that is, in replacing its form of expression by another one, while carefully preserving its sense) it had lost not only its character as a joke but also its power to make us laugh - our enjoyment of the joke.

[1905c, 1692]
We shall scarcely be contradicting this statement of Fischer's - we shall perhaps be doing no more than translating his thoughts into our mode of expression - if we insist that the joking activity should not, after all, be described as pointless or aimless, since it has the unmistakable aim of evoking pleasure in its hearers. I doubt if we are in a position to undertake anything without having an intention in view. If we do not require our mental apparatus at the moment for supplying one of our indispensable satisfactions, we allow it itself to work in the direction of pleasure and we seek to derive pleasure from its own activity. I suspect that this is in general the condition that governs all aesthetic ideation, but I understand too little of aesthetics to try to enlarge on this statement. As regards joking, however, I can assert, on the basis of the two discoveries we have already made, that it is an activity which aims at deriving pleasure from mental processes, whether intellectual or otherwise. No doubt there are other activities which have the same aim. They are perhaps differentiated according to the fields of mental activity from which they seek to derive pleasure or perhaps according to the methods of which they make use. We cannot for the moment decide about this; but we hold firmly to the view that the joke technique and the tendency towards economy by which it is partly governed (p. 1647 ff.) have been brought into connection with the production of pleasure.

But before we set about solving the riddle of how the technical methods of the joke-work are able to excite pleasure in the hearer, we have to recall the fact that, with a view to simplification and greater perspicuity, we have left tendentious jokes entirely on one side. We must, after all, try to throw light on the question of what the purposes of jokes are, and how they serve those purposes.

Only when we rise to a society of a more refined education do the formal conditions for jokes play a part. The smut becomes a joke and is only tolerated when it has the character of a joke. The technical method which it usually employs is the allusion - that is, replacement by something small, something remotely connected, which the hearer reconstructs in his imagination into a complete and straightforward obscenity. The greater the discrepancy between what is given directly in the form of smut and what it necessarily calls up in the hearer, the more refined becomes the joke and the higher, too, it may venture to climb into good society. As can easily be shown from examples, smut which has the characteristics of a joke has at its disposal, apart from allusion, whether coarse or refined, all the other methods of verbal and conceptual jokes.

If in these cases the obstacle to the aggressiveness which the joke helped to evade was an internal one - an aesthetic objection to the invective - elsewhere it can be of a purely external sort. This was so in the case in which Serenissimus asked a stranger by whose similarity to his own person he had been struck: 'Was your mother in the Palace at one time?' and the repartee was: 'No, but my father was.' The person to whom the question was put would no doubt have liked to knock down the impertinent individual who dared by such an allusion to cast a slur on his beloved mother's memory. But the impertinent individual was Serenissimus, whom one may not knock down or even insult unless one is prepared to purchase that revenge at the price of one's whole existence. The insult must therefore, it would seem, be swallowed in silence. But fortunately a joke shows the way in which the insult may be safely avenged - by making use of the technical method of unification in order to take up the allusion and turn it back against the aggressor. Here the impression of a joke is so much determined by its purpose that, in face of the joking character of the rejoinder, we are inclined to forget that the question asked by the aggressor had itself the character of a joke with the technique of allusion.
Let us recall, too, what we observed while we were investigating the technique of jokes: that in jokes nonsense often replaces ridicule and criticism in the thoughts lying behind the joke. (In this respect, incidentally, the joke-work is doing the same thing as the dream-work.) Here we find the fact confirmed once again. That the ridicule and criticism are not directed against the figure of the broker, who only appears in the examples we have quoted as a whipping-boy, is shown by another class of jokes in which the marriage-broker is represented, on the contrary, as a superior person, whose dialectical powers prove sufficient to meet any difficulty. They are anecdotes with a logical instead of a comic façade - sophistical conceptual jokes. In one of them (p. 1664 f.) the broker succeeds in arguing away the bride's defect of being lame. It is at least a 'fait accompli'; another wife, with straight limbs, would on the contrary be in constant danger of falling down and breaking her leg, and this would be followed by illness, pains, and the expenses of treatment, all of which would be spared in the case of the woman who is lame already. Or there is another anecdote, in which he succeeds in repelling a whole series of complaints made by the suitor against the bride, meeting each one with good arguments until he replies to the last, which cannot be countered: 'What do you want? Isn't she to have a single fault?'; as though there were not necessarily something left over from the earlier objections. There is no difficulty in showing the weak spot in the argument in these two examples, and we did so in examining their technique. But what interests us now is something different. If the broker's speech is given such a marked appearance of logic which, on careful examination, is recognizable as being only an appearance, the truth behind it is that the joke declares the broker to be in the right; the thought does not venture to do so seriously but replaces the seriousness by the appearance which the joke presents. But here, as so often, a jest betrays something serious. We shall not be mistaken if we assume of all these anecdotes with a logical façade that they really mean what they assert for reasons that are intentionally faulty. It is only this employment of sophistry for the disguised representation of the truth that gives it the character of a joke, which is thus essentially dependent on its purpose. For what is hinted at in the two anecdotes is that it is really the suitor who is making himself ridiculous when he collects the bride's different advantages together with so much care, though all of them are weak, and when, in doing so, he forgets that he must be prepared to take as his wife a human being with her inevitable defects; while, on the other hand, the one characteristic that would make marriage with the woman's more or less imperfect personality tolerable - mutual attraction and readiness for affectionate adaptation - is quite left out of account in the whole transaction. [1905c, 1701]

The mockery directed at the suitor in these examples, in which the broker quite appropriately plays the part of a superior, is expressed much more plainly in other anecdotes. The plainer these stories are, the less joke-technique do they contain; they are, as it were, only marginal cases of jokes, with the technique of which they no longer have anything in common but the construction of a façade. But owing to their having the same purpose and to its being concealed behind the façade, they produce the complete effect of a joke. Moreover, the poverty of their technical methods explains how it is that many of these jokes cannot, without suffering damage, dispense with the element of dialect, which has an effect similar to the joke technique. [1905c, 1702]

A story of this sort, which, while possessing all the force of a tendentious joke, exhibits nothing of its technique, is the following: "The marriage-broker asked: "What do you require of your bride?" - Answer: "She must be beautiful, she must be rich, and educated." - "Very good", said the broker, "but I count that as making three matches."" Here the rebuke to the man is delivered openly, and is no longer clothed as a joke. [1905c, 1702]
In the examples we have considered hitherto, the disguised aggressiveness has been directed against people - in the broker jokes against everyone involved in the business of arranging a marriage: the bride and bridegroom and their parents. But the object of the joke's attack may equally well be institutions, people in their capacity as vehicles of institutions, dogmas of morality or religion, views of life which enjoy so much respect that objections to them can only be made under the mask of a joke and indeed of a joke concealed by its façade. Though the themes at which these tendentious jokes are aimed may be few, their forms and envelopes are very many and various. I think we shall do well to distinguish this class of tendentious joke by a special name. The appropriate name will emerge after we have interpreted a few examples of the class.

I may recall the two stories - one of the impoverished gourmet who was caught eating 'salmon mayonnaise' and the other of the dipsomaniac tutor - which we learnt to know as sophistical displacement jokes. I will now continue their interpretation. We have since heard that if an appearance of logic is tacked on to the façade of a story the thought would like to say seriously 'the man is right', but, owing to an opposing contradiction, does not venture to declare the man right except on a single point, on which it can easily be shown that he is wrong. The 'point' chosen is the correct compromise between his rightness and his wrongness; this, indeed, is no decision, but corresponds to the conflict within ourselves. The two anecdotes are simply epicurean. They say: 'Yes. The man is right. There is nothing higher than enjoyment and it is more or less a matter of indifference how one obtains it.' This sounds shockingly immoral and is no doubt not much better. But at bottom it is nothing other than the poet's 'Carpe diem', which appeals to the uncertainty of life and the unfruitfulness of virtuous renunciation. If the idea that the man in the 'salmon mayonnaise' joke was right has such a repellent effect on us, this is only because the truth is illustrated by an enjoyment of the lowest kind, which it seems to us we could easily do without. In reality each of us has had hours and times at which he has admitted the rightness of this philosophy of life and has reproached moral doctrine with only understanding how to demand without offering any compensation. Since we have ceased any longer to believe in the promise of a next world in which every renunciation will be rewarded by a satisfaction - there are, incidentally, very few pious people if we take renunciation as the sign of faith - 'Carpe diem' has become a serious warning. I will gladly put off satisfaction: but do I know whether I shall still be here tomorrow? 'Di doman' non c'è certezza.'¹

We have already discussed the complicated technique of this example: a bewildering and apparently impossible simile, which however, as we now see, is not in itself a joke; further, an allusion (a cab is a public vehicle); and, as its most powerful technical method, an omission which increases the unintelligibility. The simile may be worked out as follows. One marries in order to protect oneself against the temptations of sensuality, but it turns out nevertheless that marriage does not allow of the satisfaction of needs that are somewhat stronger than usual. In just the same way, one takes an umbrella with one to protect oneself from the rain and nevertheless gets wet in the rain. In both cases one must look around for a stronger protection: in the latter case one must take a public vehicle, and in the former a woman who is accessible in return for money. The joke has now been almost entirely replaced by a piece of cynicism. One does not venture to declare aloud and openly that marriage is not an arrangement calculated to satisfy a man's sexuality, unless one is driven to do so perhaps by the love of truth and eagerness for reform of a Christian von Ehrenfels.¹ The strength of this joke lies in the fact that nevertheless - in all kinds of roundabout ways - it has declared it.
This joke employs the technique of absurdity, since it makes the Schnorrer assert that the Baron gives him nothing at the very moment at which he is preparing to beg him for a gift. But the absurdity is only apparent. It is almost true that the rich man gives him nothing, since he is obliged by the Law to give him alms and should, strictly speaking, be grateful to him for giving him an opportunity for beneficence. The ordinary, middle-class view of charity is in conflict here with the religious one; it is in open rebellion against the religious one in the other story, of the Baron who, deeply moved by a Schnorrer's tale of woe, rang for his servants: 'Throw him out! he's breaking my heart!' This open revelation of its purpose constitutes once more a marginal case of a joke. It is only in the fact that they present the matter as applied to individual cases that these last stories differ from a complaint which is no longer a joke: 'There is really no advantage in being a rich man if one is a Jew. Other people's misery makes it impossible to enjoy one's own happiness.'

[1905c, 1707]

Other jokes, which are in the same sense cynical and which are not only Jewish anecdotes, attack religious dogmas and even the belief in God. The story of the Rabbi's 'Kück, the technique of which lay in the faulty thinking which equated phantasy and reality (another possible view was to regard it as a displacement), is a cynical or critical joke of this kind, directed against miracle-workers and certainly against the belief in miracles as well. Heine is said to have made a definitely blasphemous joke on his death-bed. When a friendly priest reminded him of God's mercy and gave him hope that God would forgive him his sins, he is said to have replied: 'Bien sûr qu'il me pardonnera: c'est son métier.' This is a disparaging comparison (technically perhaps only having the value of an allusion), since a 'métier', a trade or profession, is what a workman or a doctor has - and he has only a single métier. But the force of the joke lies in its purpose. What it means to say is nothing else than: 'Of course he'll forgive me. That's what he's there for, and that's the only reason I've taken him on (as one engages one's doctor or one's lawyer).' So in the dying man, as he lay there powerless, a consciousness stirred that he had created God and equipped him with power so as to make use of him when the occasion arose. What was supposed to be the created being revealed itself just before its annihilation as the creator.

[1905c, 1708]

This excellent story, which gives an impression of over-subtlety, evidently works by the technique of absurdity. The second Jew is reproached for lying because he says he is going to Cracow, which is in fact his destination! But the powerful technical method of absurdity is here linked with another technique, representation by the opposite, for, according to the uncontradicted assertion of the first Jew, the second is lying when he tells the truth and is telling the truth by means of a lie. But the more serious substance of the joke is the problem of what determines the truth. The joke, once again, is pointing to a problem and is making use of the uncertainty of one of our commonest concepts. Is it the truth if we describe things as they are without troubling to consider how our hearer will understand what we say? Or is this only jesuitical truth, and does not genuine truth consist in taking the hearer into account and giving him a faithful picture of our own knowledge? I think that jokes of this kind are sufficiently different from the rest to be given a special position. What they are attacking is not a person or an institution but the certainty of our knowledge itself, one of our speculative possessions. The appropriate name for them would therefore be 'sceptical' jokes.

[1905c, 1709]
Here then we have once more come upon the principle of economy which we met first in discussing the technique of verbal jokes. But whereas in the earlier case we seemed to find the economy in the use of as few words as possible or of words as much alike as possible, we now have a suspicion of an economy in the far more comprehensive sense of psychical expenditure in general; and we must regard it as possible that a closer understanding of what is still the very obscure concept of 'psychical expenditure' may bring us nearer to the essential nature of jokes. [1905c, 1711]

On the basis of suitable specimens of innocent jokes, in which there was no fear of our judgement being disturbed by their content or purpose, we were driven to conclude that the techniques of jokes are themselves sources of pleasure; and we shall now try to discover whether it may perhaps be possible to trace that pleasure back to economy in psychical expenditure. In one group of these jokes (play upon words) the technique consisted in focusing our psychical attitude upon the sound of the word instead of upon its meaning - in making the (acoustic) word presentation itself take the place of its significance as given by its relations to thing-presentations. It may really be suspected that in doing so we are bringing about a great relief in psychical work and that when we make serious use of words we are obliged to hold ourselves back with a certain effort from this comfortable procedure. We can observe how pathological states of thought-activity, in which the possibility of concentrating psychical expenditure on a particular point is probably restricted, do in fact give this sort of sound-presentation of the word greater prominence than its meaning, and that sufferers in such states proceed in their speech on the lines (as the formula runs) of the 'external' instead of the 'internal' associations of the word-presentation. We notice, too, that children, who, as we know, are in the habit of still treating words as things, tend to expect words that are the same or similar to have the same meaning behind them - which is a source of many mistakes that are laughed at by grown-up people. If, therefore, we derive unmistakable enjoyment in jokes from being transported by the use of the same or a similar word from one circle of ideas to another, remote one (in the 'Home-Roulard', for instance, from the kitchen to politics), this enjoyment is no doubt correctly to be attributed to economy in psychical expenditure. The pleasure in a joke arising from a 'short-circuit' like this seems to be the greater the more alien the two circles of ideas that are brought together by the same word - the further apart they are, and thus the greater the economy which the joke's technical method provides in the train of thought. We may notice, too, that here jokes are making use of a method of linking things up which is rejected and studiously avoided by serious thought.¹ [1905c, 1712]

In a second group of technical methods used in jokes - unification, similarity of sound, multiple use, modification of familiar phrases, allusions to quotations - we can single out as their common characteristic the fact that in each of them something familiar is rediscovered, where we might instead have expected something new. This rediscovery of what is familiar is pleasurable, and once more it is not difficult for us to recognize this pleasure as a pleasure in economy and to relate it to economy in psychical expenditure. [1905c, 1712]
If I may be allowed to anticipate the exposition in the text, I can at this point throw light on the condition which seems to determine whether a joke is to be called a 'good' or a 'bad' one. If, by means of a word with two meanings or a word that is only slightly modified, I take a short cut from one circle of ideas to another, and if there is not at the same time a link between those circles of ideas which has a significant sense, then I shall have made a 'bad' joke. In a bad joke like this the only existing link between the two disparate ideas is the one word - the 'point' of the joke. The example of 'Home-Roulard' quoted above is a joke of this kind. A 'good' joke, on the other hand, comes about when what children expect proves correct and the similarity between the words is shown to be really accompanied by another, important similarity in their sense. Such, for instance, is the example 'Traduttore - Traditore'. The two disparate ideas, which are here linked by an external association, are also united in a significant relation which indicates an essential kinship between them. The external association merely takes the place of the internal connection; it serves to make it clear. A 'translator' is not only called by a similar name to a 'traitor'; he actually in a kind of traitor and bears the name, as it were by right.

It is also generally acknowledged that rhymes, alliterations, refrains, and other forms of repeating similar verbal sounds which occur in verse, make use of the same source of pleasure - the rediscovery of something familiar. The 'sense of power' plays no perceptible part in these techniques, which show so much similarity to that of 'multiple use' in the case of jokes.

The 'rediscovery of what is familiar' is the basis for the use of another technical resource in jokes, which we have not yet mentioned. I refer to the factor of 'topicality', which is a fertile source of pleasure in a great many jokes and which explains a few of the peculiarities in the life-history of jokes. There are jokes which are completely independent of this condition, and in a monograph on jokes we are obliged to make almost exclusive use of examples of that kind. But we cannot forget that, in comparison with these perennial jokes, we have perhaps laughed even more heartily at others which it is difficult for us to use now because they would call for long commentaries and even with such help would not produce their original effect. These latter jokes contained allusions to people and events which at the time were 'topical', which had aroused general interest and still kept it alive. When this interest had ceased and the business in question had been settled, these jokes too lost a part of their pleasurable effect and indeed a very considerable part. For instance, the joke made by my friendly host when he called a pudding that was being served a 'Home-Roulard' does not seem to me to-day nearly so good as it did at the time when 'Home Rule' provided a standing head-line in the political columns of our daily papers. In attempting to estimate the merits of this joke I now attribute them to the fact that a single word has transported us, with the economy of a long detour in thought, from the circle of ideas of the kitchen to the remote one of politics. But at the time my account would have had to be different, and I should have said that this word transported us from the circle of ideas of the kitchen to that of politics, which was remote from it but was certain of our lively interest because we were constantly concerned with it. Another joke, 'This girl reminds me of Dreyfus; the army doesn't believe in her innocence', has also faded to-day, though its technical methods must have remained unaltered. The bewilderment caused by the comparison and the double-entendre in the word 'innocence' cannot compensate for the fact that the allusion, which at the time touched on an event cathected with fresh excitement, to-day recalls a question that is settled. Here is a joke which is still topical: 'The Crown Princess Louise approached the crematorium in Gotha with the question of how much a Verbrennung [cremation] costs. The management replied: "Five thousand marks normally; but we will only charge you three thousand as you have been durchgebrannt [literally 'been burnt through' - slang for 'eloped'] once already."' A joke like this sounds irresistible to-day; in a short time it will have sunk very considerably in our estimation; and some time later still, in spite of its good play upon words, it will lose its effect entirely, for it will be impossible to repeat it without adding a commentary to explain who Princess Louise was and the sense in which she was durchgebrannt.
Thus a great number of the jokes in circulation have a certain length of life: their life runs a
course made up of a period of flowering and a period of decay and it ends in complete oblivion.
The need which men feel for deriving pleasure from their processes of thought is therefore
constantly creating new jokes based on the new interests of the day. The vital force of topical
jokes is not their own; it is borrowed, by the method of allusion, from those other interests, the
expiry of which determines the fate of the joke as well. The factor of topicality is a source of
pleasure, ephemeral it is true but particularly abundant, which supplements the sources
inherent in the joke itself. It cannot be simply equated with the rediscovery of what is familiar. It
is concerned rather with a particular category of what is familiar, which must in addition possess
the characteristic of being fresh, recent and untouched by forgetting. In the formation of dreams,
too, we come across a special preference for what is recent and we cannot escape a suspicion
that association with what is recent is rewarded, and so facilitated, by a peculiar bonus of
pleasure.
[1905c, 1715]

Unification, which is after all no more than repetition in the sphere of thought-connections
instead of in that of subject-matter, was given special recognition by Fechner as a source of the
pleasure in jokes. He writes (Fechner, 1897, 1, Chapter XVII): ‘In my opinion the chief part in
the field we are now considering is played by the principle of the unified linking of multiplicities; it
requires support, however, from auxiliary determinants in order that the enjoyment which can be
derived from these cases, with its peculiar character, may be carried over the threshold.’¹
[1905c, 1715]

In all these cases of repeating the same connections or the same subject-matter in the words,
or of rediscovering what is familiar or recent, it seems impossible to avoid deriving the pleasure
felt in them from economy in psychical expenditure provided that this line of approach turns out
to be fruitful in throwing light on details and in arriving at new generalities. We are aware that we
have still to make it clear how the economy comes about and what the meaning is of the
expression ‘psychical expenditure’.
[1905c, 1715]

The third group of techniques of jokes - for the most part of conceptual jokes - which
comprises faulty thinking, displacements, absurdity, representation by the opposite, etc., may at
a first glance seem to bear a special impress and to betray no kinship with the techniques of
rediscovery of what is familiar or the replacement of object-associations by word-associations.
Nevertheless it is particularly easy here to bring into play the theory of economy or relief in
psychical expenditure.
[1905c, 1715]

It cannot be doubted that it is easier and more convenient to diverge from a line of thought we
have embarked on than to keep to it, to jumble up things that are different rather than to
contrast them - and, indeed, that it is specially convenient to admit as valid methods of
inference that are rejected by logic and, lastly, to put words or thoughts together without regard
to the condition that they ought also to make sense. This cannot be doubted; and these are
precisely the things that are done by the joke-techniques which we are discussing. But the
hypothesis that behaviour of this kind by the joke-work provides a source of pleasure will strike
us as strange, since apart from jokes all such inefficient intellectual functioning produces in us
nothing but unpleasurable defensive feelings.
[1905c, 1716]
'Pleasure in nonsense', as we may call it for short, is concealed in serious life to a vanishing point. In order to demonstrate it we must investigate two cases - one in which it is still visible and one in which it becomes visible again: the behaviour of a child in learning, and that of an adult in a toxically altered state of mind. [1905c, 1716]

During the period in which a child is learning how to handle the vocabulary of his mother-tongue, it gives him obvious pleasure to 'experiment with it in play', to use Groos's words. And he puts words together without regard to the condition that they should make sense, in order to obtain from them the pleasurable effect of rhythm or rhyme. Little by little he is forbidden this enjoyment, till all that remains permitted to him are significant combinations of words. But when he is older attempts still emerge at disregarding the restrictions that have been learnt on the use of words. Words are disfigured by particular little additions being made to them, their forms are altered by certain manipulations (e.g. by reduplications or 'Zittersprache'), or a private language may even be constructed for use among playmates. These attempts are found again among certain categories of mental patients. [1905c, 1716]

Whatever the motive may have been which led the child to begin these games, I believe that in his later development he gives himself up to them with the consciousness that they are nonsensical, and that he finds enjoyment in the attraction of what is forbidden by reason. He now uses games in order to withdraw from the pressure of critical reason. But there is far more potency in the restrictions which must establish themselves in the course of a child's education in logical thinking and in distinguishing between what is true and false in reality; and for this reason the rebellion against the compulsion of logic and reality is deep-going and long-lasting. Even the phenomena of imaginative activity must be included in this category. The power of criticism has increased so greatly in the later part of childhood and in the period of learning which extends over puberty that the pleasure in 'liberated nonsense' only seldom dares to show itself directly. One does not venture to say anything absurd. But the characteristic tendency of boys to do absurd or silly things seems to me to be directly derived from the pleasure in nonsense. In pathological cases we often see this tendency so far intensified that once more it dominates the schoolboy's talk and answers. I have been able to convince myself in the case of a few boys of secondary school age who had developed neuroses that the unconscious workings of their pleasure in the nonsense they produced played no less a part in their inefficiency than did their real ignorance. [1905c, 1717]

The *Bierschwefel* and the *Kneipzeitung* give evidence by their names to the fact that the criticism which has repressed pleasure in nonsense has already grown so powerful that it cannot be put aside even temporarily without toxic assistance. A change in mood is the most precious thing that alcohol achieves for mankind, and on that account this 'poison' is not equally indispensable for everyone. A cheerful mood, whether it is produced endogenously or toxically, reduces the inhibiting forces, criticism among them, and makes accessible once again sources of pleasure which were under the weight of suppression. It is most instructive to observe how the standards of joking sink as spirits rise. For high spirits replace jokes, just as jokes must try to replace high spirits, in which possibilities of enjoyment which are otherwise inhibited - among them the pleasure in nonsense - can come into their own: 'Mit wenig Witz und viel Behagen.'¹ Under the influence of alcohol the grown man once more becomes a child, who finds pleasure in having the course of his thoughts freely at his disposal without paying regard to the compulsion of logic. [1905c, 1718]
I hope I have now also shown that the absurdity-techniques of jokes are a source of pleasure. It need only be repeated that this pleasure arises from an economy in psychical expenditure or a relief from the compulsion of criticism.

If we look back once more at the three separate groups of joke-techniques, we see that the first and third of these groups - the replacement of thing-associations by word-associations and the use of absurdity - can be brought together as re-establishing old liberties and getting rid of the burden of intellectual upbringing; they are psychical reliefs, which can in a sense be contrasted with the economizing which constitutes the technique of the second group. Relief from psychical expenditure that is already there and economizing in psychical expenditure that is only about to be called for - from these two principles all the techniques of jokes, and accordingly all pleasure from these techniques, are derived. The two species of technique and of obtaining pleasure coincide - in the main at all events - with the distinction between verbal and conceptual jokes.

The preceding discussion has given us unawares an insight into the evolution or psychogenesis of jokes, which we will now examine more closely. We have made the acquaintance of preliminary stages of jokes, and their development into tendentious jokes will probably uncover fresh relations between the various characteristics of jokes. Before there is such a thing as a joke, there is something that we may describe as 'play' or as 'a jest'.

This play is brought to an end by the strengthening of a factor that deserves to be described as the critical faculty or reasonableness. The play is now rejected as being meaningless or actually absurd; as a result of criticism it becomes impossible. Now, too, there is no longer any question of deriving pleasure, except accidentally, from the sources of rediscovery of what is familiar, etc., unless it happens that the growing individual is overtaken by a pleasurable mood which, like the child's cheerfulness, lifts the critical inhibition. Only in such a case does the old game of getting pleasure become possible once more; but the individual does not want to wait for this to happen nor to renounce the pleasure that is familiar to him. He thus looks about for means of making himself independent of the pleasurable mood, and the further development towards jokes is governed by the two endeavours: to avoid criticism and to find a substitute for the mood.

And with this the second preliminary stage of jokes sets in - the jest. It is now a question of prolonging the yield of pleasure from play, but at the same time of silencing the objections raised by criticism which would not allow the pleasurable feeling to emerge. There is only one way of reaching this end: the meaningless combination of words or the absurd putting together of thoughts must nevertheless have a meaning. The whole ingenuity of the joke-work is summoned up in order to find words and aggregations of thoughts in which this condition is fulfilled. All the technical methods of jokes are already employed here - in jests; moreover linguistic usage draws no consistent line between a jest and a joke. What distinguishes a jest from a joke is that the meaning of the sentence which escapes criticism need not be valuable or new or even good; it need merely be permissible to say the thing in this way, even though it is unusual, unnecessary or useless to say it in this way. In jests what stands in the foreground is the satisfaction of having made possible what was forbidden by criticism.
I think now at length we see our way clearly. All through our consideration of the techniques of jokes we have been disturbed by the fact that they were not proper to jokes only; and yet the essence of jokes seemed to depend on them, since when they were got rid of by reduction the characteristics and the pleasure of the joke were lost. We now see that what we have described as the techniques of jokes - and we must in a certain sense continue to describe them so - are rather the sources from which jokes provide pleasure; and we feel that there is nothing strange in other procedures drawing from the same sources for the same end. The technique which is characteristic of jokes and peculiar to them, however, consists in their procedure for safeguarding the use of these methods of providing pleasure against the objections raised by criticism which would put an end to the pleasure. There is little that we can say in general about this procedure. The joke-work, as we have already remarked, shows itself in a choice of verbal material and conceptual situations which will allow the old play with words and thoughts to withstand the scrutiny of criticism; and with that end in view every peculiarity of vocabulary and every combination of thought-sequences must be exploited in the most ingenious possible way. We may be in a position later to characterize the joke-work by a particular property; for the moment it remains unexplained how the selection favourable for jokes can be made. The purpose and function of jokes, however - namely, the protection of sequences of words and thoughts from criticism - can already be seen in jests as their essential feature. Their function consists from the first in lifting internal inhibitions and in making sources of pleasure fertile which have been rendered inaccessible by those inhibitions; and we shall find that they remain loyal to this characteristic throughout their development.

We are also in a position now to assign its correct place to the factor of 'sense in nonsense' (cf. the introduction, p. 1618), to which the authorities attribute such great importance as a distinguishing mark of jokes and as an explanation of their pleasurable effect. The two fixed points in what determines the nature of jokes - their purpose of continuing pleasurable play and their effort to protect it from the criticism of reason immediately explain why an individual joke, though it may seem senseless from one point of view, must appear sensible, or at least allowable, from another. How it does so remains the affair of the joke-work; if it fails to do so, it is simply rejected as 'nonsense'. But there is no necessity for us to derive the pleasurable effect of jokes from the conflict between the feelings which arise (whether directly or along the path of 'bewilderment and enlightenment') from the simultaneous sense and nonsense of jokes. Nor have we any need to enter further into the question of how pleasure could arise from the alternation between 'thinking it senseless' and 'recognizing it as sensible'. The psychogenesis of jokes has taught us that the pleasure in a joke is derived from play with words or from the liberation of nonsense, and that the meaning of the joke is merely intended to protect that pleasure from being done away with by criticism.

[1905c, 1721]
In this way the problem of the essential character of jokes is already explained in jests. We may now turn to the further development of jests, to the point at which they reach their height in tendentious jokes. Jests still give the foremost place to the purpose of giving us enjoyment, and are content if what they say does not appear senseless or completely devoid of substance. If what a jest says possesses substance and value, it turns into a joke. A thought which would deserve our interest even if it were expressed in the most unpretentious form is now clothed in a form which must give us enjoyment on its own account.¹ A combination like this can certainly not, we must suppose, have come about unintentionally; and we must try to discover the intention underlying the construction of the joke. An observation which we made earlier (in passing, as it seemed) will put us on the track. We said above (p. 1691) that a good joke makes, as it were, a total impression of enjoyment on us, without our being able to decide at once what share of the pleasure arises from its joking form and what share from its apt thought-content. We are constantly making mistakes in this apportionment. Sometimes we over-estimate the goodness of the joke on account of our admiration of the thought it contains; another time, on the contrary, we over-estimate the value of the thought on account of the enjoyment given us by its joking envelope. We do not know what is giving us enjoyment and what we are laughing at. This uncertainty in our judgement, which must be assumed to be a fact, may have provided the motive for the construction of jokes in the proper sense of the word. The thought seeks to wrap itself in a joke because in that way it recommends itself to our attention and can seem more significant and more valuable, but above all because this wrapping bribes our powers of criticism and confuses them. We are inclined to give the thought the benefit of what has pleased us in the form of the joke; and we are no longer inclined to find anything wrong that has given us enjoyment and so to spoil the source of a pleasure. If the joke has made us laugh, moreover, a disposition most unfavourable for criticism will have been established in us; for in that case something will have forced us into the mood which play has previously sufficed to produce, and for which the joke has tried by every possible means to make itself a substitute. Even though we have earlier asserted that such jokes are to be described as innocent and not yet tendentious, we must not forget that strictly speaking only jests are non-tendentious - that is, serve solely the aim of producing pleasure. Jokes, even if the thought contained in them is non-tendentious and thus only serves theoretical intellectual interests, are in fact never non-tendentious. They pursue the second aim: to promote the thought by augmenting it and guarding it against criticism. Here they are once again expressing their original nature by setting themselves up against an inhibiting and restricting power - which is now the critical judgement.

[1905c, 1722]

¹ As an example which shows the difference between a jest and a joke proper we may take the excellent joking remark with which a member of the ‘Bürger’ Ministry in Austria answered a question about the cabinet’s solidarity: ‘How can we *einstehen* [stand up] for one another if we can’t *ausstehen* [stand] one another?’ Technique: use of the same material with slight (contrary) modification. Logical and apposite thought: there can be no solidarity without mutual understanding. The contrary nature of the modification (*ein [in] - aus [out]*) corresponds to the incompatibility asserted in the thought and serves as a representation of it.

[1905c, 1722]
In this survey of the achievements of tendentious jokes, most prominence has been assumed by - what is more easily seen - the effect of jokes on the person who hears them. More important, however, from the point of view of our understanding, are the functions accomplished by jokes in the mind of the person who makes them or, to put it in the only correct way, the person to whom they occur. We have already proposed - and here we have occasion to repeat the notion - that we should try to study the psychical phenomena of jokes with reference to their distribution between two people. We will make a provisional suggestion that the psychical process provoked by the joke in the hearer is in most cases modelled on that which occurs in its creator. The external obstacle which is to be overcome in the hearer corresponds to an internal inhibition in the maker of the joke. At least the expectation of an external obstacle is present in the latter as an inhibiting idea. In certain cases the internal obstacle which is overcome by the tendentious joke is obvious; in Herr N.'s jokes, for instance, we were able to assume (p. 1699) that not only did they make it possible for their hearers to enjoy aggressiveness in the form of insults, but that above all they made it possible for him to produce them. Among the various kinds of internal inhibition or suppression there is one which deserves our special interest, because it is the most far-reaching. It is given the name of 'repression', and is recognized by its function of preventing the impulses subjected to it, and their derivatives, from becoming conscious. Tendentious jokes, as we shall see, are able to release pleasure even from sources that have undergone repression. If, as has been suggested above, the overcoming of external obstacles can in this way be traced back to the overcoming of internal inhibitions and repressions, we may say that tendentious jokes exhibit the main characteristic of the joke-work - that of liberating pleasure by getting rid of inhibitions more clearly than any other of the developmental stages of jokes. Either they strengthen the purposes which they serve, by bringing assistance to them from impulses that are kept suppressed, or they put themselves entirely at the service of suppressed purposes.

[1905c, 1724]

An example will give us our bearings better than this schematic discussion. Let us assume that there is an urge to insult a certain person; but this is so strongly opposed by feelings of propriety or of aesthetic culture that the insult cannot take place. If, for instance, it were able to break through as a result of some change of emotional condition or mood, this break through by the insulting purpose would be felt subsequently with displeasure. Thus the insult does not take place. Let us now suppose, however, that the possibility is presented of deriving a good joke from the material of the words and thoughts used for the insult - the possibility, that is, of releasing pleasure from other sources which are not obstructed by the same suppression. This second development of pleasure could, nevertheless, not occur unless the insult were permitted; but as soon as the latter is permitted the new release of pleasure is also joined to it. Experience with tendentious jokes shows that in such circumstances the suppressed purpose can, with the assistance of the pleasure from the joke, gain sufficient strength to overcome the inhibition, which would otherwise be stronger than it. The insult takes place, because the joke is thus made possible. But the enjoyment obtained is not only that produced by the joke: it is incomparably greater. It is so much greater than the pleasure from the joke that we must suppose that the hitherto suppressed purpose has succeeded in making its way through, perhaps without any diminution whatever. It is in such circumstances that the tendentious joke is received with the heartiest laughter.

[1905c, 1726]

These extreme examples have an effect because they rouse the expectation of a joke, so that one tries to find a concealed sense behind the nonsense. But one finds none: they really are nonsense. The pretence makes it possible for a moment to liberate the pleasure in nonsense. These jokes are not entirely without a purpose; they are a 'take-in', and give the person who tells them a certain amount of pleasure in misleading and annoying his hearer. The latter then damps down his annoyance by determining to tell them himself later on.

[1905c, 1727]
Why is it, then, that I do not laugh at a joke of my own? And what part is played in this by the other person?
[1905c, 1732]

If the person in whom the joke is formed cannot laugh, this, as we have already said, points to a divergence from what happens in the third person that lies either in the lifting of the inhibitory cathexis or in the possibility of its discharge. But the first of these alternatives will not meet the case, as we shall see at once. The inhibitory cathexis must have been lifted in the first person as well, or otherwise no joke would have come about, since its formation was precisely in order to overcome a resistance of that kind; otherwise, too, it would be impossible for the first person to feel the pleasure in the joke which we have been obliged to trace back precisely to the lifting of the inhibition. All that remains, then, is the other alternative, namely that the first person cannot laugh, although he feels pleasure, because there is an interference with the possibility of discharge. An interference of this kind with the possibility of discharge, which is a necessary precondition of laughter, may arise from the liberated cathetic energy being immediately applied to some other endopsychic use. It is a good thing that our attention has been drawn to that possibility; and our interest in it will very soon be further engaged. Another condition, however, leading to the same result, may be realized in the first person of a joke. It is possible that no quota of energy at all that is capable of being manifested may be liberated, in spite of the lifting of the inhibitory cathexis. In the first person of a joke the joke-work is performed, which must correspond to a certain quota of new psychical expenditure. Thus the first person himself produces the force which lifts the inhibition. This no doubt results in a yield of pleasure for him, and even, in the case of tendentious jokes, a very considerable one, since the fore-pleasure obtained by the joke-work itself takes over the lifting of further inhibitions; but the expenditure on the joke-work is in every case deducted from the yield resulting from the lifting of the inhibition - an expenditure which is the same as the one which the hearer of the joke avoids. What I have just said may be confirmed by observing that a joke loses its effect of laughter even in the third person as soon as he is required to make an expenditure on intellectual work in connection with it. The allusions made in a joke must be obvious and the omissions easy to fill; an awakening of conscious intellectual interest usually makes the effect of the joke impossible. There is an important distinction here between jokes and riddles. Perhaps the psychical constellation during the joke-work is in general not favourable to the free discharge of what has been gained. We are not, it seems, in a position to see further on this point; we have been more successful in throwing light on one part of our problem - on why the third person laughs - than on its other part - on why the first person does not laugh.
[1905c, 1737]

Nevertheless, if we firmly accept these views on the determinants of laughter and on the psychical process in the third person, we are now in a position to give a satisfactory explanation of a whole number of peculiarities which jokes have been known to possess but which have not been understood. If a quota of cathetic energy capable of discharge is to be liberated in the third person, there are several conditions which must be fulfilled or which are desirable in order to act as encouragements: (1) It must be ensured that the third person is really making this cathetic expenditure. (2) It is necessary to guard against the cathetic expenditure, when it is liberated, finding some other psychical use instead of offering itself for motor discharge. (3) It cannot but be an advantage if the cathexis which is to be liberated in the third person is intensified before hand, raised to a greater height. All these aims are served by particular methods of the joke-work, which may be classed together as secondary or auxiliary techniques:
[1905c, 1738]
The second condition for making free discharge possible - that the liberated energy shall be prevented from being used in any other way - seems very much the more important. It provides the theoretical explanation of the uncertainty of the effect of jokes when the thoughts expressed in a joke arouse powerfully exciting ideas in the hearer; in that case the question whether the purposes of the joke agree with or contradict the circle of thoughts by which the hearer is dominated will decide whether his attention will remain with the joking process or be withdrawn from it. Of still greater theoretical interest, however, are a class of auxiliary techniques which clearly serve the end of entirely detaching the hearer's attention from the joking process, and of allowing that process to run its course automatically. I deliberately say 'automatically' and not 'unconsciously', because the latter description would be misleading. It is only a question here of holding back an increased cathexis of attention from the psychical process when the joke is heard; and the usefulness of these auxiliary techniques rightly leads us to suspect that precisely the cathexis of attention has a great share in the supervision and fresh employment of liberated cathetic energy.

It appears to be far from easy to avoid the endopsychic employment of cathexes that have become superfluous, for in our thought-processes we are constantly in the habit of displacing such cathexes from one path to another without losing any of their energy by discharge. Jokes make use of the following methods with that aim in view. Firstly, they try to keep their expression as short as possible, so as to offer fewer points of attack to the attention. Secondly, they observe the condition of being easy to understand (see above); as soon as they call for intellectual work which would demand a choice between different paths of thought, they would endanger their effect not only by the unavoidable expenditure of thought but also by the awakening of attention. But besides this they employ the device of distracting attention by putting forward something in the joke's form of expression which catches it, so that in the meantime the liberation of the inhibitory cathexis and its discharge may be completed without interruption. This aim is already fulfilled by the omissions in the joke's wording; they offer an incitement to filling up the gaps and in that way succeed in withdrawing the joking process from attention. Here the technique of riddles, which attract the attention, is, as it were, brought into the service of the joke-work. Far more effective even are the façades which we have found especially in some groups of tendentious jokes (p. 1699 ff.). The syllogistic façades admirably fulfil the aim of holding the attention by setting it a task. While we are beginning to wonder what was wrong with the reply, we are already laughing; our attention has been caught unawares and the discharge of the liberated inhibitory cathexis has been completed. The same is true of jokes with a comic façade, in which the comic comes to the help of the joke-technique. A comic façade encourages the effectiveness of a joke in more than one way; not only does it make the automatism of the joking process possible, by holding the attention, but it also facilitates the discharge by the joke, by sending on ahead a discharge of a comic kind. The comic is here operating exactly like a bribing fore-pleasure, and we can in this way understand how some jokes are able to renounce entirely the fore-pleasure produced by the ordinary methods of joking and make use only of the comic for fore-pleasure. Among the joke-techniques proper, it is in particular displacement and representation by something absurd which, apart from their other qualifications, give rise, too, to a distraction of the attention which is desirable for the automatic course of the joking process.¹

¹ [1905c, 1739]
I should like to discuss yet another interesting characteristic of joke-technique, in connection with an example of a displacement joke. Once when Gallmeyer, that actress of genius, was asked the unwelcome question 'Your age?' she is said to have replied 'in the tone of voice of a Gretchen and with her eyes bashfully cast down: "at Brünn."' This is a model displacement. When she was asked her age she replied by giving the place of her birth. She was thus anticipating the next question and was letting it be understood that she would be glad to know that this one question had been passed over. Yet we feel that in this instance the characteristic of jokes is not expressed in all its purity. It is too clear that the question is being evaded, the displacement is too obvious. Our attention understands at once that what is in question is an intentional displacement. In the other displacement jokes the displacement is disguised; our attention is held by the effort to detect it. In the displacement joke recorded on p. 1658, in the reply made to a recommendation of a riding horse 'What should I be doing in Pressburg at half-past six?' the displacement is also prominent. But to make up for this it has a confusing effect on the attention through its nonsensical nature, whereas in the actress's examination we are able to recognize her displacement-reply immediately. - [Added 1912] What are known as 'Scherzfragen [facetious questions]' deviate from jokes in another direction, though apart from this they may make use of the best techniques. Here is an example of one of them, which uses the technique of displacement: 'What is a cannibal who has eaten his father and his mother?' - 'An orphan.' - 'And if he, has eaten all his other relations as well?' - 'The sole heir.' - 'And where will a monster of that kind find sympathy?' - 'In the dictionary under "S."' 'Facetious questions' of this kind are not proper jokes because the joking answers that they call for cannot be guessed in the same way as are the allusions, omissions, etc. of jokes.

As we can already guess, and as we shall see more clearly later on, we have discovered in the condition of distracting the attention a by no means unessential feature of the psychical process in the hearer of a joke. In connection with this there are still other things that we can understand. Firstly, there is the question why we scarcely ever know what we are laughing at in a joke, though we can discover it by an analytic investigation. The laughter is in fact the product of an automatic process which is only made possible by our conscious attention's being kept away from it. Secondly, we are able to understand the peculiar fact about jokes that they only produce their full effect on the hearer if they are new to him, if they come as a surprise to him. This characteristic of jokes (which determines the shortness of their life and stimulates the constant production of new jokes) is evidently due to the fact that the very nature of surprising someone or taking him unawares implies that it cannot succeed a second time. When a joke is repeated, the attention is led back to the first occasion of hearing it as the memory of it arises. And from this we are carried on to an understanding of the urge to tell a joke one has heard to other people who have not yet heard it. One probably recovers from the impression the joke makes on a new-comer some of the possibility of enjoyment that has been lost owing to its lack of novelty. And it may be that it was an analogous motive that drove the creator of the joke in the first instance to tell it to someone else.

In the third place I shall bring forward - but this time not as necessary conditions but only as encouragements to the process of joking - the auxiliary technical methods of the joke-work which are calculated to increase the quota which obtains discharge and in that way intensify the effect of the joke. These, it is true, also for the most part increase the attention that is paid to the joke, but they make this effect innocuous once more by simultaneously holding it and inhibiting its mobility. Anything that provokes interest and bewilderment works in these two directions - thus, in particular, nonsense, and contradiction, too, the 'contrast of ideas' which some authorities have tried to make into the essential characteristic of jokes, but which I can only regard as a means of intensifying their effect. Anything that bewilders calls up in the hearer the state of distribution of energy which Lipps has called 'psychical damming up'; and he is no doubt also correct in supposing that the discharge is the more powerful, the higher was the preceding damming up. Lipps's account, it is true, does not relate specifically to jokes but to the comic in general; but we may regard it as most probable that in jokes, too, the discharge of an inhibitory cathexis is similarly increased by the height of the damming up.
It now begins to dawn on us that the technique of jokes is in general determined by two sorts of purposes - those that make the construction of the joke possible in the first person and those that are intended to guarantee the joke the greatest possible pleasurable effect on the third person. The Janus-like, two-way-facing character of jokes, which protects their original yield of pleasure from the attacks of critical reason, and the mechanism of fore-pleasure belong to the first of these purposes; the further complication of the technique by the conditions that have been enumerated in the present chapter takes place out of regard for the joke's third person. A joke is thus a double-dealing rascal who serves two masters at once. Everything in jokes that is aimed at gaining pleasure is calculated with an eye to the third person, as though there were internal and unsurmountable obstacles to it in the first person. And this gives us a full impression of how indispensable this third person is for the completion of the joking process. But whereas we have been able to obtain a fairly good insight into the nature of this process in the third person, the corresponding process in the first person seems still to be veiled in obscurity. Of the two questions we asked, 'Why are we unable to laugh at a joke we have made ourselves?' and 'Why are we driven to tell our own joke to someone else?', the first has so far evaded our reply. We can only suspect that there is an intimate connection between the two facts that have to be explained: that we are compelled to tell our joke to someone else because we are unable to laugh at it ourselves. Our insight into the conditions for obtaining and discharging pleasure which prevail in the third person enables us to infer as regards the first person that in him the conditions for discharge are lacking and those for obtaining pleasure only incompletely fulfilled. That being so, it cannot be disputed that we supplement our pleasure by attaining the laughter that is impossible for us by the roundabout path of the impression we have of the person who has been made to laugh. As Dugas has put it, we laugh as it were 'par ricochet [on the rebound]'. Laughter is among the highly infectious expressions of psychical states. When I make the other person laugh by telling him my joke, I am actually making use of him to arouse my own laughter; and one can in fact observe that a person who has begun by telling a joke with a serious face afterwards joins in the other person's laughter with a moderate laugh. Accordingly, telling my joke to another person would seem to serve several purposes: first, to give me objective certainty that the joke-work has been successful; secondly, to complete my own pleasure by a reaction from the other person upon myself; and thirdly - where it is a question of repeating a joke that one has not produced oneself - to make up for the loss of pleasure owing to the joke's lack of novelty.

[1905c, 1741]
At the conclusion of these discussions of the psychical processes in jokes in so far as they take place between two persons, we may glance back at the factor of economy, which has been in our mind as being of importance in arriving at a psychological view of jokes ever since our first explanation of their technique. We have long since abandoned the most obvious but simplest view of this economy - that it is a question of an avoidance of psychical expenditure in general, such as would be involved by the greatest possible restriction in the use of words and in the establishment of chains of thought. Even at that stage we told ourselves that being concise or laconic was not enough to make a joke. A joke's brevity is of a peculiar kind - 'joking' brevity. It is true that the original yield of pleasure, produced by playing with words and thoughts, was derived from mere economy in expenditure; but with the development of play into a joke the tendency to economy too must alter its aims, for the amount that would be saved by the use of the same word or the avoidance of a new way of joining ideas together would certainly count for nothing as compared with the immense expenditure on our intellectual activity. I may perhaps venture on a comparison between psychical economy and a business enterprise. So long as the turnover in the business is very small, the important thing is that outlay in general shall be kept low and administrative costs restricted to the minimum. Economy is concerned with the absolute height of expenditure. Later, when the business has expanded, the importance of the administrative cost diminishes; the height reached by the amount of expenditure is no longer of significance provided that the turnover and profits can be sufficiently increased. It would be niggling, and indeed positively detrimental, to be conservative over expenditure on the administration of the business. Nevertheless it would be wrong to assume that when expenditure was absolutely great there would be no room left for the tendency to economy. The mind of the manager, if it is inclined to economy, will now turn to economy over details. He will feel satisfaction if a piece of work can be carried out at smaller cost than previously, however small the saving may seem to be in comparison with the size of the total expenditure. In a quite analogous fashion, in our complex psychical business too, economy in detail remains a source of pleasure, as may be seen from everyday happenings. Anyone who used to have his room lighted by gas and has now had electricity installed will for quite a time be aware of a definite feeling of pleasure when he switches on the electric light; he will feel it as long as the memory is revived in him at that moment of the complicated manoeuvres that were necessary for lighting the gas. Similarly, the economies in psychical inhibitory expenditure brought about by a joke - though they are small in comparison with our total psychical expenditure - will remain a source of pleasure for us because they save us a particular expenditure which we have been accustomed to make and which we were already prepared to make on this occasion as well. The factor of the expenditure's being one that was expected and prepared for moves unmistakably into the foreground.

At the end of the chapter in which I was concerned with discovering the technique of jokes, I remarked (p. 1686 f.) that the processes of condensation, with or without the formation of substitutes, of representation by nonsense and by the opposite, of indirect representation, and so on, which, as we found, play a part in producing jokes, show a very far-reaching agreement with the processes of the 'dream-work'. I further promised on the one hand that we would study these similarities more closely and on the other hand that we would examine the common element in jokes and dreams which seems to be thus suggested. It would be much easier for me to carry out this comparison if I could assume that one of the two objects of comparison - the 'dream-work' - was already familiar to my readers. But it will probably be wiser not to make that assumption. I have an impression that my Interpretation of Dreams, published in 1900, provoked more 'bewilderment' than 'enlightenment' among my fellow-specialists; and I know that wider circles of readers have been content to reduce the contents of the book to a catch-word ('wish-fulfilment') which can be easily remembered and conveniently misused.
Before we examine this hypothesis in detail, we will consider an objection which might threaten our premiss. We have started from the fact that the techniques of jokes indicate the same processes that are known to us as peculiarities of the dream-work. Now it is easy to argue against this that we should not have described the techniques of jokes as condensation, displacement, etc., and should not have arrived at such far reaching conformities between the methods of representation in jokes and dreams, if our previous knowledge of the dream-work had not prejudiced our view of the technique of jokes; so that at bottom we are only finding in jokes a confirmation of the expectations with which we approached them from dreams. If this was the basis of the conformity, there would be no certain guarantee of its existence apart from our prejudice. Nor indeed have condensation, displacement and indirect representation been taken by any other author as explaining the forms of expression of jokes. This would be a possible objection, but not on that account a just one. It would be equally possible that it was indispensable for our views to be sharpened by a knowledge of the dream-work before we could recognize the real conformity. A decision will after all depend only on whether a critical examination can prove on the basis of individual examples that this view of the technique of jokes is a forced one in whose favour other more plausible and deeper-going views have been suppressed, or whether such an examination is obliged to admit that the expectations derived from dreams can really be confirmed in jokes. I am of the opinion that we have nothing to fear from such criticism and that our procedure of 'reduction' (p. 1629) has shown us reliably in what forms of expression to look for the techniques of jokes. And if we gave those techniques names which already anticipated the discovery of the conformity between joke-technique and dream-work, we had a perfect right to do so and it was in fact nothing more than an easily justifiable simplification.

[1905c, 1751]

There is another objection which would not affect our case so seriously but which is also not so open to a fundamental disproof. It might be said that, while it is true that these techniques of joking which fit in so well with our scheme deserve to be recognized, they are nevertheless not the only possible techniques of joking nor the only ones used in practice. It might be argued that under the influence of the model of the dream-work we have only looked for techniques of joking which fitted in with it, while others, overlooked by us, would have proved that this conformity was not invariably present. I really cannot venture to assert that I have succeeded in elucidating the technique of every joke in circulation; and I must therefore leave open the possibility that my enumeration of joke-techniques will show some incompleteness. But I have not intentionally excluded from discussion any kind of technique that was clear to me, and I can declare that the commonest, most important and most characteristic methods of joking have not escaped my attention.

[1905c, 1752]
Jokes possess yet another characteristic which fits satisfactorily into the view of the joke-work which we have derived from dreams. We speak, it is true, of 'making' a joke; but we are aware that when we do so our behaviour is different from what it is when we make a judgement or make an objection. A joke has quite outstandingly the characteristic of being a notion that has occurred to us 'involuntarily'. What happens is not that we know a moment beforehand what joke we are going to make, and that all it then needs is to be clothed in words. We have an indefinable feeling, rather, which I can best compare with an 'absence', a sudden release of intellectual tension, and then all at once the joke is there - as a rule ready-clothed in words. Some of the techniques of jokes can be employed apart from them in the expression of a thought - for instance, the techniques of analogy or allusion. I can deliberately decide to make an allusion. In such a case I begin by having a direct expression of my thought in my mind (in my inner ear); I inhibit myself from expressing it owing to a misgiving related to the external situation, and can almost be said to make up my mind to replace the direct expression by another form of indirect expression; and I then produce an allusion. But the allusion which arises in this way and which is formed under my continuous supervision is never a joke, however serviceable it may be in other ways. A joking allusion, on the other hand, emerges without my being able to follow these preparatory stages in my thoughts. I will not attach too much importance to this behaviour; it is scarcely decisive, though it agrees well with our hypothesis that in the formation of a joke one drops a train of thought for a moment and that it then suddenly emerges from the unconscious as a joke.

[1905c, 1752]

Jokes show a special way of behaving, too, in regard to association. Often they are not at the disposal of our memory when we want them; but at other times, to make up for this, they appear involuntarily, as it were, and at points in our train of thought where we cannot see their relevance. These, again, are only small features, but nevertheless indicate their origin from the unconscious.

[1905c, 1753]

¹ Apart from the dream-work and the technique of jokes, there is another kind of mental event in which I have been able to show that condensation is a regular and important process: namely the mechanism of normal (non-tendentious) forgetting. Unique impressions offer difficulties to forgetting; those that are analogous in any way are forgotten by being condensed in regard to their points of resemblance. Confusion between analogous impressions is one of the preliminary stages of forgetting.

[1905c, 1753]
Among the techniques common to jokes and dreams, representation by the opposite and the use of nonsense claim some amount of our interest. The former is one of the more effective methods employed in jokes, as may be seen among others by the examples of 'overstatement jokes' (p. 1670 f.). Incidentally, representation by the opposite is not able, like most other joke-techniques, to escape conscious attention. A person who tries to bring the joke-work into operation in himself as deliberately as possible - a professional wag - soon discovers as a rule that the easiest way of replying to an assertion by a joke is by asserting its contrary and by leaving it to the inspiration of the moment to get rid of the objection which his contradiction is likely to provoke, by giving what he has said a fresh interpretation. It may be that representation by the opposite owes the favour it enjoys to the fact that it forms the core of another pleasurable way of expressing a thought, which can be understood without any need for bringing in the unconscious. I am thinking of irony, which comes very close to joking and is counted among the sub-species of the comic. Its essence lies in saying the opposite of what one intends to convey to the other person, but in sparing him contradiction by making him understand - by one's tone of voice, by some accompanying gesture, or (where writing is concerned) by some small stylistic indications - that one means the opposite of what one says. Irony can only be employed when the other person is prepared to hear the opposite, so that he cannot fail to feel an inclination to contradict. As a result of this condition, irony is exposed particularly easily to the danger of being misunderstood. It brings the person who uses it the advantage of enabling him readily to evade the difficulties of direct expression, for instance in invectives. It produces comic pleasure in the hearer, probably because it stirs him into a contradictory expenditure of energy which is at once recognized as being unnecessary. A comparison like this between jokes and a closely related type of the comic may confirm our assumption that what is peculiar to jokes is their relation to the unconscious and that this may perhaps distinguish them from the comic as well.¹

Nonsense, absurdity, which appears so often in dreams and has brought them into so much undeserved contempt, never arises by chance through the ideational elements being jumbled together, but can always be shown to have been admitted by the dream-work intentionally and to be designed to represent embittered criticism and contemptuous contradiction in the dream-thoughts. Thus the absurdity in the content of the dream takes the place of the judgement 'this is a piece of nonsense' in the dream-thoughts. I laid great stress on the evidence of this in my Interpretation of Dreams because I thought that in this way I could make the most forcible attack on the error of believing that the dream is not a psychical phenomenon at all - an error which blocks the way to a knowledge of the unconscious. We have now learned, in the course of solving certain tendentious jokes (p. 1660 ff.), that nonsense in jokes is made to serve the same aims of representation. We know too that a senseless façade to a joke is particularly well suited to increase the hearer's psychical expenditure and so to raise the quota liberated for discharge by laughing. But besides this, it must not be forgotten that the nonsense in a joke is an end in itself, since the intention of recovering the old pleasure in nonsense is among the joke-work's motives. There are other ways of recovering the nonsense and of deriving pleasure from it: caricature, exaggeration, parody and travesty make use of them and so create 'comic nonsense'. If we submit these forms of expression to an analysis similar to the one we have applied to jokes, we shall find that in none of these cases is there any occasion for bringing in unconscious processes in our sense in order to explain them. We can now understand too how it is that the characteristic of being a joke can come as an extra addition to a caricature, exaggeration or parody; what makes this possible is a difference in the 'psychical scene of action'.²

¹ [1905c, 1757]

² [1905c, 1758]
The assignment of the joke-work to the system of the unconscious has, I think, become of considerably greater importance to us now that it has enabled us to understand the fact that the techniques to which jokes admittedly cling are, on the other hand, not their exclusive property. Some doubts which we were obliged to hold over until later in our original examination of these techniques now find a comfortable solution. For that very reason another doubt that arises is all the more deserving of our consideration. This suggests that the undeniable relation of jokes to the unconscious is in fact only valid for certain categories of tendentious jokes, whereas we are prepared to extend it to every species and every developmental stage of jokes. We must not evade an examination of this objection.

[1905c, 1759]

On such a foundation we cannot build a great deal. If we bring the various stages of the joke into relation to the mental states that are favourable to them we can perhaps proceed as follows. The jest springs from a cheerful mood, which seems to be characterized by an inclination to diminish mental cathexes. It already employs all the characteristic techniques of jokes and already fulfils their fundamental condition by selecting verbal material or connections of thoughts which will meet both the demands for a yield of pleasure and those made by rational criticism. We shall conclude that the lowering of the thought cathexis to the unconscious level, facilitated by the cheerful mood, is present already in jests. In the case of innocent jokes that are linked to the expression of a valuable thought, the encouraging effect of mood no longer applies. Here we must presume the occurrence of a special personal aptitude, which is manifested in the ease with which the preconscious cathexis is dropped and exchanged for a moment for the unconscious one. A purpose that is all the time on the watch for renewing the original yield of pleasure from jokes exercises a downward drag on the still unsettled preconscious expression of the thought. No doubt most people are capable of producing jests when they are in a cheerful mood; the aptitude for making jokes is present in only a few people independently of their mood. Lastly, the joke-work receives its most powerful stimulus when strong purposes reaching down into the unconscious are present, which represent a special aptitude for the production of jokes and which may explain to us how it is that the subjective determinants of jokes are so often fulfilled in neurotic people. Under the influence of strong purposes even those who otherwise have the least aptitude for it become capable of making jokes.

[1905c, 1760]
We have approached the problems of the comic in an unusual way. It seemed to us that jokes, which are ordinarily regarded as a sub-species of the comic, offer enough peculiarities to be attacked directly; thus we have avoided their relation to the more inclusive category of the comic so long as that was possible, though we have not failed to pick out en passant a few hints that might throw light on the comic. We have had no difficulty in discovering that socially the comic behaves differently from jokes. It can be content with two persons: a first who finds what is comic and a second in whom it is found. The third person, to whom the comic thing is told, intensifies the comic process but adds nothing new to it. In a joke this third person is indispensable for the completion of the pleasure-producing process; but on the other hand the second person may be absent, except where a tendentious, aggressive joke is concerned. A joke is made, the comic is found - and first and foremost in people, only by a subsequent transference in things, situations, and so on, as well. As regards jokes, we know that the sources of the pleasure that is to be fostered lie in the subject himself and not in outside people. We have seen, too, that jokes can sometimes re-open sources of the comic which have become inaccessible, and that the comic often serves as a façade for a joke and replaces the fore-pleasure which has otherwise to be produced by the familiar technique (p. 1739). None of this precisely suggests that the relations between jokes and the comic are very simple. On the other hand, the problems of the comic have proved so complicated and all the efforts of the philosophers at solving them have been so unsuccessful that we cannot hold out any prospect that we shall be able to master them in a sudden onslaught, as it were, by approaching them from the direction of jokes. Moreover, for our investigation of jokes we brought with us an instrument of which no one else had hitherto made use - a knowledge of the dream-work. We have no similar advantage at our command to help us to understand the comic, and we must therefore expect that we shall discover no more about the nature of the comic than what we have already found in jokes, in so far as they form part of the comic and possess in their own nature certain of its features unchanged or merely modified.

[1905c, 1762]

A three-and-a-half-year-old girl gave this warning to her brother: 'I say, don't eat so much of that pudding or you'll get ill and have to have some "Bubizin".' "Bubizin"? asked her mother, 'What's that?' 'When I was ill', answered the child in self-justification, 'I had to have some Medizin.' The child thought that what the doctor prescribed was called 'Mädi-zin' when it was for a 'Mädi' [little girl] and concluded that if it was for a 'Bubi' [little boy] it would be called 'Bubi-zin'. This is constructed like a verbal joke working with the technique of similarity of sound, and indeed it might have occurred as a real joke, in which case we should have greeted it, half-unwillingly, with a smile. As an example of naïveté it strikes us as quite excellent and it raises a laugh. What is it that makes the difference here between a joke and something naïve? Evidently not the wording or the technique, which would be the same for both possibilities, but a factor, rather, which at first sight seems quite remote from both of them. It is merely a question of whether we assume that the speaker has intended to make a joke or whether we suppose that he - the child - has tried in good faith to draw a serious conclusion on the basis of his uncorrected ignorance. Only the latter case is one of naïveté. Here for the first time our attention is drawn to the other person putting himself into the psychical process that occurs in the person who produces the remark.

[1905c, 1764]
Whereas it was a condition for the effectiveness of a joke that both persons should be subject to approximately the same inhibitions or internal resistances, it will be seen that it is a condition for the naïve that the one person should possess inhibitions which the other is without. The apprehension of the naïve lies with the person provided with inhibitions, and he alone obtains the yield of pleasure which the naïve brings about. We have come near to guessing that that pleasure arises from the lifting of inhibitions. Since the pleasure from jokes has the same origin - a core of verbal pleasure and pleasure from nonsense, and a casing of pleasure in the lifting of inhibitions or in the relief of psychical expenditure - this similar relation to inhibition explains the internal kinship between the naïve and jokes. In both of them the pleasure arises through the lifting of internal inhibition.

[1905c, 1765]

In discussing the techniques of jokes we found that giving free play to modes of thought which are usual in the unconscious but which can only be judged as examples of "faulty reasoning" in the conscious is the technical method adopted in many jokes; and about these, once again, we felt doubts whether they possessed the true character of jokes, so that we were inclined to classify them simply as comic stories. We were unable to reach a decision about our doubts because at the time we were ignorant of the essential characteristic of jokes. Subsequently, led by an analogy with the dream-work, we discovered that it lay in the compromise effected by the joke-work between the demands of reasonable criticism and the urge not to renounce the ancient pleasure in words and nonsense. What came about in this way as a compromise, when the preconscious start of the thought was left for a moment to unconscious revision, satisfied both claims in every instance, but presented itself to criticism in various forms and had to put up with various judgements at its hands. Sometimes a joke would succeed in slipping on the appearance of an insignificant but nevertheless permissible assertion, another time it would smuggle itself in as the expression of a valuable thought. But, in the marginal case of effecting a compromise, it would give up attempting to satisfy criticism. Boasting of the sources of pleasure at its command, it would appear before criticism as sheer nonsense and not be afraid to provoke contradiction from it; for the joke could reckon on the hearer straightening out the disfigurement in the form of its expression by unconscious revision and so giving it back its meaning.

[1905c, 1782]

In such cases the joke has another resource. The faulty reasoning, which it uses for its technique as one of the modes of thought of the unconscious, strikes criticism - even though not invariably so - as being comic. Consciously giving free play to unconscious modes of thought (which have been rejected as faulty) is a means of producing comic pleasure; and it is easy to understand this, since it certainly requires a greater expenditure of energy to establish a preconscious cathexis than to give free play to an unconscious one. When, on hearing a thought which has, as it were, been formed in the unconscious, we compare it with its correction, a difference in expenditure emerges for us from which comic pleasure arises. A joke which makes use of faulty reasoning like this for its technique, and therefore appears nonsensical, can thus produce a comic effect at the same time. If we fail to detect the joke, we are once again left with only the comic or funny story.

[1905c, 1783]
I set great store by clarifying this most delicate point in my arguments - the relation of jokes to the comic; and I will therefore supplement what I have said with a few negative statements. I may first draw attention to the fact that the instance of the convergence of jokes and the comic which I am dealing with here is not identical with the former one (p. 1781). It is true that the distinction is a rather narrow one, but it can be made with certainty. In the earlier case the comic arose from the uncovering of psychical automatism. This, however, is by no means peculiar to the unconscious alone, nor does it play any striking part in the technique of jokes. Unmasking only comes into relation with jokes accidentally, when it serves some other joke-technique, such as representation by the opposite. But in the case of giving free play to unconscious modes of thought the convergence of jokes and the comic is a necessary one, since the same method which is used here by the first person of the joke as a technique for releasing pleasure must from its very nature produce comic pleasure in the third person.

Telegram of congratulations to a gambler on his seventieth Birthday: 'Trente et quarante.'

Hevesi somewhere describes the process of tobacco manufacture: 'The bright yellow leaves . . . were dipped in a sauce and were sauced in this dip.' (Multiple use of the same material).

Madame de Maintenon was known as 'Madame de Maintenant'. (Modification of a name.)

Professor Kästner said to a prince who stood in front of a telescope during a demonstration: 'Your Highness, I know quite well that you are "durchläuchtig" [illustrious],¹ but you are not "durchsigtig" [transparent].''

During these enquiries into the relations between jokes and the comic the distinction has become plain to us which we must emphasize as the most important and which points at the same time to a main psychological characteristic of the comic. We found ourselves obliged to locate the pleasure in jokes in the unconscious; no reason is to be found for making the same localization in the case of the comic. On the contrary, all the analyses we have hitherto made have pointed to the source of comic pleasure being a comparison between two expenditures both of which must be ascribed to the preconscious. Jokes and the comic are distinguished first and foremost in their psychical localization; the joke, it may be said, is the contribution made to the comic from the realm of the unconscious.
A comparison can, however, as we have already seen, be in the nature of a joke, without a trace of comic admixture - precisely, that is, when it avoids degradation. Thus the comparison of truth with a torch that cannot be carried through a crowd without singeing someone's beard is purely in the nature of a joke, because it takes a watered-down turn of speech ('the torch of truth') at its full value, and it is not comic, because a torch as an object, though it is a concrete thing, is not without a certain distinction. But a comparison can just as easily be a joke and comic as well, and can be each independently of the other, since a comparison can be of help to certain techniques of jokes, such as unification or allusion. In this way Nestroy's comparison of memory to a 'warehouse' (p. 1683) is at once comic and a joke - the former because of the extraordinary degradation which the psychological concept has to put up with in being compared to a 'warehouse', and the latter because the person making use of the comparison is a clerk, who thus establishes in the comparison a quite unexpected unification between psychology and his profession. Heine's phrase 'till at last all the buttons burst on the breeches of my patience' seems at first sight to be no more than a remarkable example of a comically degrading comparison; but on further consideration we must also allow it the characteristics of a joke, since the comparison, as a means of allusion, impinges on the region of the obscene and so succeeds in liberating pleasure in the obscene. The same material, by what is admittedly not an entirely chance coincidence, provides us with a yield of pleasure which is simultaneously comic and of the character of a joke. If the conditions of the one favour the generation of the other, their union has a confusing effect on the 'feeling' which is supposed to tell us whether we are being offered a joke or something comic, and a decision can only be arrived at by an attentive investigation that has been freed from any predisposition to a particular kind of pleasure.
[1905c, 1788]

It is not difficult to answer. Let us recall that jokes present a double face to their hearer, force him to adopt two different views of them. In a nonsense joke, like the ones last mentioned, the one view, which only takes the wording into account, regards it as nonsense; the other view, following the hints that are given, passes through the hearer's unconscious and finds an excellent sense in it. In Wippchen's joke-like productions one face of the joke is blank, as though it were rudimentary: a Janus head but with only one face developed on it. If we allow the technique to lure us into the unconscious, we come upon nothing. The amalgamations lead us to no instance in which the two things that are amalgamated really yield a new meaning; if we attempt an analysis, they fall completely apart. The modifications and substitutions lead, as they do in jokes, to a usual and familiar wording; but the modification or substitution itself tells us nothing fresh and as a rule, indeed, nothing possible or serviceable. So that only the one view of these 'jokes' is left over - that they are nonsense. We can merely decide whether we choose to call such productions, which have freed themselves from one of the most essential characteristics of jokes, 'bad' jokes or not jokes at all.
[1905c, 1792]
(e) The comic is greatly interfered with if the situation from which it ought to develop gives rise to the same time to a release of strong affect. A discharge of the operative difference is as a rule out of the question in such a case. The affects, disposition and attitude of the individual in each particular case make it understandable that the comic emerges and vanishes according to the standpoint of each particular person, and that an absolute comic exists only in exceptional instances. The contingency or relativity of the comic is therefore far greater than that of a joke, which never happens of its own accord but is invariably made, and in which the conditions under which it can find acceptance can be observed at the time at which it is constructed. The generation of affect is the most intense of all the conditions that interfere with the comic and its importance in this respect has been nowhere overlooked.¹ For this reason it has been said that the comic feeling comes easiest in more or less indifferent cases where the feelings and interests are not strongly involved. Yet precisely in cases where there is a release of affect one can observe a particularly strong difference in expenditure bring about the automatism of release. When Colonel Butler answers Octavio's warnings by exclaiming 'with a bitter laugh': 'Thanks from the House of Austria!', his embitterment does not prevent his laughing. The laugh applies to his memory of the disappointment he believes he has suffered; and on the other hand the magnitude of the disappointment cannot be portrayed more impressively by the dramatist than by his showing it capable of forcing a laugh in the midst of the storm of feelings that have been released. I am inclined to think that this explanation would apply to every case in which laughter occurs in circumstances other than pleasurable ones and accompanied by intensely distressing or strained emotions.

[1905c, 1796]

On the whole humour is closer to the comic than to jokes. It shares with the former its psychical localization in the preconscious whereas jokes, as we have had to suppose, are formed as a compromise between the unconscious and the preconscious. On the other hand humour does not participate in a peculiar characteristic common to jokes and the comic, on which we have perhaps not yet laid sufficient stress. It is a necessary condition for generating the comic that we should be obliged, simultaneously or in rapid succession, to apply to one and the same act of ideation two different ideational methods, between which the 'comparison' is then made and the comic difference emerges. Differences in expenditure of this kind arise between that belongs to someone else and to oneself, between what is as usual and what has been changed, between what is expected and what happens.¹ In the case of jokes, the difference between two simultaneous methods of viewing things, which operate with a different expenditure, applies to the process in the person who hears the joke. One of these two views, following the hints contained in the joke, passes along the path of thought through the unconscious; the other stays on the surface and views the joke like any other wording that has emerged from the preconscious and become conscious. We should perhaps be justified in representing the pleasure from a joke that is heard as being derived from the difference between these two methods of viewing it.² Here we are saying of jokes what we described as their possessing a Janus head, while the relation between jokes and the comic had still to be cleared up.³

[1905c, 1808]

¹ Compare the use of 'representation by something very small' as a technique in making jokes. Cf. Jokes and their Relation to the Unconscious.
[1909d, 2188]
This is the anecdote.¹ Two not particularly scrupulous business men had succeeded, by dint of a series of highly risky enterprises, in amassing a large fortune, and they were now making efforts to push their way into good society. One method, which struck them as a likely one, was to have their portraits painted by the most celebrated and highly-paid artist in the city, whose pictures had an immense reputation. The precious canvases were shown for the first time at a large evening party, and the two hosts themselves led the most influential connoisseur and art critic up to the wall on which the portraits were hanging side by side. He studied the works for a long time, and then, shaking his head, as though there was something he had missed, pointed to the gap between the pictures and asked quietly: 'But where's the Saviour?'² I see you are all much amused at this joke. Let us now proceed to examine it. Clearly what the connoisseur meant to say was: 'You are a couple of rogues, like the two thieves between whom the Saviour was crucified.' But he did not say this. Instead he made a remark which seems at first sight strangely inappropriate and irrelevant, but which we recognize a moment later as an allusion to the insult that he had in mind and as a perfect substitute for it. We cannot expect to find in jokes all the characteristics that we have attributed to the ideas occurring to our patients, but we must stress the identity of the motive for the joke and for the idea. Why did the critic not tell the rogues straight out what he wanted to say? Because he had excellent counter-motives working against his desire to say it to their faces. There are risks attendant upon insulting people who are one’s hosts and who have at their command the fists of a large domestic staff. One might easily meet with the fate which I suggested in my last lecture as an analogy for repression. That was the reason why the critic did not express the insult he had in mind directly but in the form of an ‘allusion accompanied by omission’; and the same state of things is responsible for our patients’ producing a more or less distorted substitute instead of the forgotten idea we are in search of.

[1910a, 2218]
You will not be able to escape the resemblance of this example to a joke; and it has in fact often happened that a joke of the dreamer's has been regarded as a joke of the interpreter's. There are other instances in which it has been far from easy to decide whether what we are dealing with is a joke or a dream. But you will recall that the same doubt arose in the case of some parapraxes - slips of the tongue. A man reported as a dream of his that his uncle had given him a kiss while they were sitting in his auto (mobile). He himself very quickly added the interpretation: it meant 'auto-erotism' (a term from the theory of the libido, indicating satisfaction obtained without any outside object). Had the man set out, then, to have some fun with us and was he passing off a joke that had occurred to him as a dream? I think not; I believe he really dreamt it. But what is the origin of this puzzling similarity? This question once led me temporarily aside from my path by compelling me to make jokes themselves the subject of a detailed investigation. It was there shown how jokes originate: a preconscious train of thought is abandoned for a moment to be worked over in the unconscious, and from this it emerges as a joke. Under the influence of the unconscious it is subjected to the effects of the mechanisms that hold sway there - condensation and displacement - the same processes that we have found concerned in the dream-work; and it is to this common feature that is to be ascribed the similarity, when it occurs, between jokes and dreams. But the unintended 'dream-joke' brings none of the yield of pleasure of a true joke. You can learn why if you go more deeply into the study of jokes. A 'dream-joke' strikes us as a bad joke; it does not make us laugh, it leaves us cold.

[1916-1917, 3321]

I was able to show from a short story by W. Jensen called Gradiva, which has no particular merit in itself, that invented dreams can be interpreted in the same way as real ones and that the unconscious mechanisms familiar to us in the 'dream-work' are thus also operative in the processes of imaginative writing. My book on Jokes and their Relation to the Unconscious was a side-issue directly derived from The Interpretation of Dreams. The only friend of mine who was at that time interested in my work remarked to me that my interpretations of dreams often impressed him as being like jokes. In order to throw some light on this impression, I began to investigate jokes and found that their essence lay in the technical methods employed in them, and that these were the same as the means used in the 'dream-work' - that is to say, condensation, displacement, the representation of a thing by its opposite or by something very small, and so on. This led to an economic enquiry into the origin of the high degree of pleasure obtained from hearing a joke. And to this the answer was that it was due to the momentary suspension of the expenditure of energy upon maintaining repression, owing to the attraction exercised by the offer of a bonus of pleasure (fore-pleasure).

[1925d, 4239]

I think, therefore, that the possibility I have suggested here, that in a particular situation the subject suddenly hypercathects his super-ego and then, proceeding from it, alters the reactions of the ego, is one which deserves to be retained. Moreover, what I have suggested about humour finds a remarkable analogy in the kindred field of jokes. As regards the origin of jokes I was led to assume that a preconscious thought is given over for a moment to unconscious revision. A joke is thus the contribution made to the comic by the unconscious. In just the same way, *humour would be the contribution made to the comic through the agency of the super-ego.*

[1927d, 4545]
Thus we have attributed three qualities to psychical processes: they are either conscious, preconscious or unconscious. The division between the three classes of material which possess these qualities is neither absolute nor permanent. What is preconscious becomes conscious, as we have seen, without any assistance from us; what is unconscious can, through our efforts, be made conscious, and in the process we may have a feeling that we are often overcoming very strong resistances. When we attempt to do this with someone else, we should not forget that the conscious filling-in of the gaps in his perceptions - the construction we are presenting him with - does not mean as yet that we have made the unconscious material in question conscious to him. All that is true so far is that the material is present in him in two records, once in the conscious reconstruction he has been given, and besides this in its original unconscious state. Our continued efforts usually succeed eventually in making this unconscious material conscious to him himself, as a result of which the two records are brought to coincide. The amount of effort we have to use, by which we estimate the resistance against the material becoming conscious, varies in magnitude in individual cases. For instance, what comes about in an analytic treatment as a result of our efforts can also occur spontaneously: material which is ordinarily unconscious can transform itself into preconscious material and then becomes conscious - a thing that happens to a large extent in psychotic states. From this we infer that the maintenance of certain internal resistances is a *sine qua non* of normality. A relaxation of resistances such as this, with a consequent pushing forward of unconscious material, takes place regularly in the state of sleep, and thus brings about a necessary precondition for the construction of dreams. Conversely, preconscious material can become temporarily inaccessible and cut off by resistances, as happens when something is temporarily forgotten or escapes the memory; or a preconscious thought can even be temporarily put back into the unconscious state, as seems to be a precondition in the case of jokes. We shall see that a similar transformation back of preconscious material or processes into the unconscious state plays a great part in the causation of neurotic disorders.

[1940a [1938], 4970]
But at this point we must be prepared to meet an objection which will assert that these fine distinctions are seeking to tear apart what belongs together. Does not every double meaning give occasion for a displacement - for a diversion of the train of thought from one meaning to the other? And are we prepared, then, to allow ‘double meaning’ and ‘displacement’ to be set up as representatives of two quite different types of joke-technique? Well, it is true that this relation between double meaning and displacement does exist, but it has nothing to do with our distinguishing the different joke-techniques. In the case of double meaning a joke contains nothing other than a word capable of multiple interpretation, which allows the hearer to find the transition from one thought to another - a transition which, stretching a point, might be equated with a displacement. In the case of a displacement joke, however, the joke itself contains a train of thought in which a displacement of this kind has been accomplished. Here the displacement is part of the work which has created the joke; it is not part of the work necessary for understanding it. If this distinction is not clear to us, we have an unfailing means of bringing it tangibly before our eyes in our attempts at reduction. But there is one merit which we will not deny to this objection. It draws our attention to the necessity of not confusing the psychical processes involved in the construction of the joke (the ‘joke-work’) with the psychical processes involved in taking in the joke (the work of understanding). Our present enquiry is only concerned with the former.¹

We have now already found from two groups of examples that the joke-work makes use of deviations from normal thinking - of displacement and absurdity - as technical methods for producing a joking form of expression. It is no doubt justifiable to expect that other kinds of faulty reasoning may find a similar use. And it is in fact possible to produce a few examples of the sort:

The connection may also consist in similarity except for a ‘slight modification’. So that this technique, too, is parallel to a verbal technique. Both species of joke make almost the same impression, but they can be better distinguished from each other if we consider the processes of the joke-work.  

¹[1905c, 1657]
Can we feel sure that none of the possible techniques of jokes has escaped our investigation? Of course not. But a continued examination of fresh material can convince us that we have got to know the commonest and most important technical methods of the joke-work - at all events as much as is required for forming a judgement on the nature of that psychical process. So far we have not arrived at any such judgement; but on the other hand we are now in possession of an important indication of the direction from which we may expect to receive further light upon the problem. The interesting processes of condensation accompanied by the formation of a substitute, which we have recognized as the core of the technique of verbal jokes, point towards the formation of dreams, in the mechanism of which the same psychical processes have been discovered. This is equally true, however, of the techniques of conceptual jokes - displacement, faulty reasoning, absurdity, indirect representation, representation by the opposite - which reappear one and all in the technique of the dream-work. Displacement is responsible for the puzzling appearance of dreams, which prevents our recognizing that they are a continuation of our waking life. The use of absurdity and nonsense in dreams has cost them the dignity of being regarded as psychical products and has led the authorities to suppose that a disintegration of the mental activities and a cessation of criticism, morality and logic are necessary conditions of the formation of dreams. Representation by the opposite is so common in dreams that even the popular books of dream-interpretation, which are on a completely wrong tack, are in the habit of taking it into account. Indirect representation - the replacement of a dream-thought by an allusion, by something small, a symbolism akin to analogy - is precisely what distinguishes the mode of expression of dreams from that of our waking life.¹ So far-reaching an agreement between the methods of the joke-work and those of the dream-work can scarcely be a matter of chance. To demonstrate this agreement in detail and to examine its basis will be one of our later tasks.

[1905c, 1686]

We shall bear in mind the fact that we receive from joking remarks a total impression in which we are unable to separate the share taken by the thought content from the share taken by the joke-work. It may be that later on we shall find a still more significant parallel to this.

[1905c, 1690]

This time we will not examine the technique of the joke; we propose to turn our attention to another factor, which is actually the most important one. When those of us present heard this improvised joke it gave us pleasure - which I can clearly recall - and made us laugh. In this instance, as in countless others, the hearers' feeling of pleasure cannot have arisen from the purpose of the joke or from its intellectual content; there is nothing left open to us but to bring that feeling of pleasure into connection with the technique of the joke. The technical methods of joking which we have earlier described - condensation, displacement, indirect representation and so on - thus possess the power of evoking a feeling of pleasure in the hearer, though we cannot in the least see how they may have acquired this power. In this simple way we arrive at the second thesis in our clarification of jokes; the first (p. 1623) asserted that the characteristic of jokes lay in their form of expression. Let us further reflect that this second thesis has in fact taught us nothing new. It merely isolates what was already included in an observation we had made earlier. It will be recalled that when we had succeeded in reducing a joke (that is, in replacing its form of expression by another one, while carefully preserving its sense) it had lost not only its character as a joke but also its power to make us laugh - our enjoyment of the joke.

[1905c, 1692]

But before we set about solving the riddle of how the technical methods of the joke-work are able to excite pleasure in the hearer, we have to recall the fact that, with a view to simplification and greater perspicuity, we have left tendentious jokes entirely on one side. We must, after all, try to throw light on the question of what the purposes of jokes are, and how they serve those purposes.

[1905c, 1693]
It cannot be doubted that it is easier and more convenient to diverge from a line of thought we have embarked on than to keep to it, to jumble up things that are different rather than to contrast them - and, indeed, that it is *specially* convenient to admit as valid methods of inference that are rejected by logic and, lastly, to put words or thoughts together without regard to the condition that they ought also to make sense. This cannot be doubted; and these are precisely the things that are done by the joke-techniques which we are discussing. But the hypothesis that behaviour of this kind by the joke-work provides a source of pleasure will strike us as strange, since apart from jokes all such inefficient intellectual functioning produces in us nothing but unpleasurable defensive feelings.

[1905c, 1716]

And with this the second preliminary stage of jokes sets in - the *jest*. It is now a question of prolonging the yield of pleasure from play, but at the same time of silencing the objections raised by criticism which would not allow the pleasurable feeling to emerge. There is only one way of reaching this end: the meaningless combination of words or the absurd putting together of thoughts must nevertheless have a meaning. The whole ingenuity of the joke-work is summoned up in order to find words and aggregations of thoughts in which this condition is fulfilled. All the technical methods of jokes are already employed here - in jests; moreover linguistic usage draws no consistent line between a jest and a joke. What distinguishes a jest from a joke is that the meaning of the sentence which escapes criticism need not be valuable or new or even good; it need merely be *permissible* to say the thing in this way, even though it is unusual, unnecessary or useless to say it in this way. In jests what stands in the foreground is the satisfaction of having made possible what was forbidden by criticism.

[1905c, 1720]

I think now at length we see our way clearly. All through our consideration of the techniques of jokes we have been disturbed by the fact that they were not proper to jokes only; and yet the essence of jokes seemed to depend on them, since when they were got rid of by reduction the characteristics and the pleasure of the joke were lost. We now see that what we have described as the techniques of jokes - and we must in a certain sense continue to describe them so - are rather the sources from which jokes provide pleasure; and we feel that there is nothing strange in other procedures drawing from the same sources for the same end. The technique which is characteristic of jokes and peculiar to them, however, consists in their procedure for safeguarding the use of these methods of providing pleasure against the objections raised by criticism which would put an end to the pleasure. There is little that we can say in general about this procedure. The joke-work, as we have already remarked, shows itself in a choice of verbal material and conceptual situations which will allow the old play with words and thoughts to withstand the scrutiny of criticism; and with that end in view every peculiarity of vocabulary and every combination of thought-sequences must be exploited in the most ingenious possible way. We may be in a position later to characterize the joke-work by a particular property; for the moment it remains unexplained how the selection favourable for jokes can be made. The purpose and function of jokes, however - namely, the protection of sequences of words and thoughts from criticism - can already be seen in jests as their essential feature. Their function consists from the first in lifting internal inhibitions and in making sources of pleasure fertile which have been rendered inaccessible by those inhibitions; and we shall find that they remain loyal to this characteristic throughout their development.

[1905c, 1721]
<498>

We are also in a position now to assign its correct place to the factor of 'sense in nonsense'
(cf. the introduction, p. 1618), to which the authorities attribute such great importance as a
distinguishing mark of jokes and as an explanation of their pleasurable effect. The two fixed
points in what determines the nature of jokes - their purpose of continuing pleasurable play and
their effort to protect it from the criticism of reason immediately explain why an individual joke,
though it may seem senseless from one point of view, must appear sensible, or at least
allowable, from another. How it does so remains the affair of the joke-work; if it fails to do so, it
is simply rejected as 'nonsense'. But there is no necessity for us to derive the pleasurable effect
of jokes from the conflict between the feelings which arise (whether directly or along the path of
'bewilderment and enlightenment') from the simultaneous sense and nonsense of jokes. Nor
have we any need to enter further into the question of how pleasure could arise from the
alternation between 'thinking it senseless' and 'recognizing it as sensible'. The psychogenesis of
jokes has taught us that the pleasure in a joke is derived from play with words or from the
liberation of nonsense, and that the meaning of the joke is merely intended to protect that
pleasure from being done away with by criticism.
[1905c, 1721]
In this survey of the achievements of tendentious jokes, most prominence has been assumed
by - what is more easily seen - the effect of jokes on the person who hears them. More
important, however, from the point of view of our understanding, are the functions accomplished
by jokes in the mind of the person who makes them or, to put it in the only correct way, the
person to whom they occur. We have already proposed - and here we have occasion to repeat
the notion - that we should try to study the psychical phenomena of jokes with reference to their
distribution between two people. We will make a provisional suggestion that the psychical
process provoked by the joke in the hearer is in most cases modelled on that which occurs in its
creator. The external obstacle which is to be overcome in the hearer corresponds to an internal
inhibition in the maker of the joke. At the least the expectation of an external obstacle is present
in the latter as an inhibiting idea. In certain cases the internal obstacle which is overcome by the
tendentious joke is obvious; in Herr N.'s jokes, for instance, we were able to assume (p. 1699)
that not only did they make it possible for their hearers to enjoy aggressiveness in the form of
insults, but that above all they made it possible for him to produce them. Among the various
kinds of internal inhibition or suppression there is one which deserves our special interest,
because it is the most far-reaching. It is given the name of 'repression', and is recognized by its
function of preventing the impulses subjected to it, and their derivatives, from becoming
conscious. Tendentious jokes, as we shall see, are able to release pleasure even from sources
that have undergone repression. If, as has been suggested above, the overcoming of external
obstacles can in this way be traced back to the overcoming of internal inhibitions and
repressions, we may say that tendentious jokes exhibit the main characteristic of the joke-work that of liberating pleasure by getting rid of inhibitions more clearly than any other of the
developmental stages of jokes. Either they strengthen the purposes which they serve, by
bringing assistance to them from impulses that are kept suppressed, or they put themselves
entirely at the service of suppressed purposes.
[1905c, 1724]
Two facts in particular make this necessary. Although the joke-work is an excellent method of
getting pleasure out of psychical processes, it is nevertheless evident that not everyone is
equally capable of making use of that method, the joke-work is not at everyone's command, and
altogether only a few people have a plentiful amount of it; and these are distinguished by being
spoken of as having 'wit' [Witz]. 'Wit' appears in this connection as a special capacity - rather in
the class of the old mental 'faculties'; and it seems to emerge fairly independently of the others,
such as intelligence, imagination, memory, etc. We must therefore presume the presence in
these 'witty' people of special inherited dispositions or psychical determinants which permit or
favour the joke-work.
[1905c, 1728]


If the person in whom the joke is formed cannot laugh, this, as we have already said, points to a divergence from what happens in the third person that lies either in the lifting of the inhibitory cathexis or in the possibility of its discharge. But the first of these alternatives will not meet the case, as we shall see at once. The inhibitory cathexis must have been lifted in the first person as well, or otherwise no joke would have come about, since its formation was precisely in order to overcome a resistance of that kind; otherwise, too, it would be impossible for the first person to feel the pleasure in the joke which we have been obliged to trace back precisely to the lifting of the inhibition. All that remains, then, is the other alternative, namely that the first person cannot laugh, although he feels pleasure, because there is an interference with the possibility of discharge. An interference of this kind with the possibility of discharge, which is a necessary precondition of laughter, may arise from the liberated cathetic energy being immediately applied to some other endopsychic use. It is a good thing that our attention has been drawn to that possibility; and our interest in it will very soon be further engaged. Another condition, however, leading to the same result, may be realized in the first person of a joke. It is possible that no quota of energy at all that is capable of being manifested may be liberated, in spite of the lifting of the inhibitory cathexis. In the first person of a joke the joke-work is performed, which must correspond to a certain quota of new psychical expenditure. Thus the first person himself produces the force which lifts the inhibition. This no doubt results in a yield of pleasure for him, and even, in the case of tendentious jokes, a very considerable one, since the fore-pleasure obtained by the joke-work itself takes over the lifting of further inhibitions; but the expenditure on the joke-work is in every case deducted from the yield resulting from the lifting of the inhibition - an expenditure which is the same as the one which the hearer of the joke avoids. What I have just said may be confirmed by observing that a joke loses its effect of laughter even in the third person as soon as he is required to make an expenditure on intellectual work in connection with it. The allusions made in a joke must be obvious and the omissions easy to fill; an awakening of conscious intellectual interest usually makes the effect of the joke impossible. There is an important distinction here between jokes and riddles. Perhaps the psychical constellation during the joke-work is in general not favourable to the free discharge of what has been gained. We are not, it seems, in a position to see further on this point; we have been more successful in throwing light on one part of our problem - on why the third person laughs - than on its other part - on why the first person does not laugh.

[1905c, 1737]
It appears to be far from easy to avoid the endopsychic employment of cathexes that have become superfluous, for in our thought-processes we are constantly in the habit of displacing such cathexes from one path to another without losing any of their energy by discharge. Jokes make use of the following methods with that aim in view. Firstly, they try to keep their expression as short as possible, so as to offer fewer points of attack to the attention. Secondly, they observe the condition of being easy to understand (see above); as soon as they call for intellectual work which would demand a choice between different paths of thought, they would endanger their effect not only by the unavoidable expenditure of thought but also by the awakening of attention. But besides this they employ the device of distracting attention by putting forward something in the joke’s form of expression which catches it, so that in the meantime the liberation of the inhibitory cathexis and its discharge may be completed without interruption. This aim is already fulfilled by the omissions in the joke’s wording; they offer an incitement to filling up the gaps and in that way succeed in withdrawing the joking process from attention. Here the technique of riddles, which attract the attention, is, as it were, brought into the service of the joke-work. Far more effective even are the façades which we have found especially in some groups of tendentious jokes (p. 1699 ff.). The syllogistic façades admirably fulfill the aim of holding the attention by setting it a task. While we are beginning to wonder what was wrong with the reply, we are already laughing; our attention has been caught unawares and the discharge of the liberated inhibitory cathexis has been completed. The same is true of jokes with a comic façade, in which the comic comes to the help of the joke-technique. A comic façade encourages the effectiveness of a joke in more than one way; not only does it make the automatism of the joking process possible, by holding the attention, but it also facilitates the discharge by the joke, by sending on ahead a discharge of a comic kind. The comic is here operating exactly like a bribing fore-pleasure, and we can in this way understand how some jokes are able to renounce entirely the fore-pleasure produced by the ordinary methods of joking and make use only of the comic for fore-pleasure. Among the joke-techniques proper, it is in particular displacement and representation by something absurd which, apart from their other qualifications, give rise, too, to a distraction of the attention which is desirable for the automatic course of the joking process.¹

At the end of the chapter in which I was concerned with discovering the technique of jokes, I remarked (p. 1686 f.) that the processes of condensation, with or without the formation of substitutes, of representation by nonsense and by the opposite, of indirect representation, and so on, which, as we found, play a part in producing jokes, show a very far-reaching agreement with the processes of the ‘dream-work’. I further promised on the one hand that we would study these similarities more closely and on the other hand that we would examine the common element in jokes and dreams which seems to be thus suggested. It would be much easier for me to carry out this comparison if I could assume that one of the two objects of comparison - the ‘dream-work’ - was already familiar to my readers. But it will probably be wiser not to make that assumption. I have an impression that my Interpretation of Dreams, published in 1900, provoked more ‘bewilderment’ than ‘enlightenment’ among my fellow-specialists; and I know that wider circles of readers have been content to reduce the contents of the book to a catchword (‘wish-fulfilment’) which can be easily remembered and conveniently misused.

¹ [1905c, 1739]

² [1905c, 1744]
The dream-work, then - to which I return after this digression - submits the thought-material, which is brought forward in the optative mood, to a most strange revision. First, it takes the step from the optative to the present indicative; it replaces 'Oh! if only . . .' by 'It is'. The 'It is' is then given a hallucinatory representation; and this I have called the 'regression' in the dream-work - the path that leads from thoughts to perceptual images, or, to use the terminology of the still unknown topography of the mental apparatus (which is not to be taken anatomically), from the region of thought-structures to that of sensory perceptions. On this path, which is in the reverse direction to that taken by the course of development of mental complications, the dream-thoughts are given a pictorial character; and eventually a plastic situation is arrived at which is the core of the manifest 'dream-picture'. In order for it to be possible for the dream-thoughts to be represented in sensory form, their expression has to undergo far-reaching modifications. But while the thoughts are being changed back into sensory images still further alterations occur in them, some of which can be seen to be necessary while others are surprising. We can understand that, as a subsidiary result of regression, almost all the internal relations between the thoughts which linked them together will be lost in the manifest dream. The dream-work, as we might say, only undertakes to represent the raw material of the ideas and not the logical relations in which they stand to one another; or at all events it reserves the liberty to disregard the latter. On the other hand, there is another part of the dream-work which we cannot attribute to regression, to the change back into sensory images; and it is precisely this part which has an important bearing on our analogy with the formation of jokes. In the course of the dream-work the material of the dream-thoughts is subjected to a quite extraordinary compression or condensation. A starting point for it is provided by any common elements that may be present in the dream-thoughts, whether by chance or from the nature of their content. Since these are not as a rule sufficient for any considerable condensation, new artificial and transient common elements are created in the dream-work, and to this end there is actually a preference for the use of words the sound of which expresses different meanings. The newly-created common elements of condensation enter the manifest content of the dream as representatives of the dream-thoughts, so that an element in the dream corresponds to a nodal point or junction in the dream-thoughts, and, as compared with these latter, must quite generally be described as 'overdetermined'. The fact of condensation is the piece of the dream-work which can be most easily recognized; it is only necessary to compare the text of a dream as it is noted down with the record of the dream-thoughts arrived at by analysis in order to get a good impression of the extensiveness of dream-condensation.

[1905c, 1748]
Let us now recall what it was during our investigation of jokes that gave us occasion to think of dreams. We found that the characteristics and effects of jokes are linked with certain forms of expression or technical methods, among which the most striking are condensation, displacement and indirect representation. Processes, however, which lead to the same results - condensation, displacement and indirect representation - have become known to us as peculiarities of the dream-work. Does not this agreement suggest the conclusion that joke-work and dream-work must, at least in some essential respect, be identical? The dream-work has, I think, been revealed to us as regards its most important characteristics. Of the psychical processes in jokes the part that is hidden from us is precisely the one that may be compared to the dream-work - namely, what happens during the formation of a joke in the first person. Shall we not yield to the temptation to construct that process on the analogy of the formation of a dream? A few of the characteristics of dreams are so alien to jokes that the part of the dream-work corresponding to those characteristics cannot be transferred to the formation of jokes. There is no doubt that the regression of the train of thought to perception is absent in jokes. But the other two stages of dream-formation, the sinking of a preconscious thought into the unconscious and its unconscious revision, if they could be supposed to occur in joke-formation, would present the precise outcome that we can observe in jokes. Let us decide, then, to adopt the hypothesis that this is the way in which jokes are formed in the first person: a preconscious thought is given over for a moment to unconscious revision and the outcome of this is at once grasped by conscious perception.

Before we examine this hypothesis in detail, we will consider an objection which might threaten our premiss. We have started from the fact that the techniques of jokes indicate the same processes that are known to us as peculiarities of the dream-work. Now it is easy to argue against this that we should not have described the techniques of jokes as condensation, displacement, etc., and should not have arrived at such far reaching conformities between the methods of representation in jokes and dreams, if our previous knowledge of the dream-work had not prejudiced our view of the technique of jokes; so that at bottom we are only finding in jokes a confirmation of the expectations with which we approached them from dreams. If this was the basis of the conformity, there would be no certain guarantee of its existence apart from our prejudice. Nor indeed have condensation, displacement and indirect representation been taken by any other author as explaining the forms of expression of jokes. This would be a possible objection, but not on that account a just one. It would be equally possible that it was indispensable for our views to be sharpened by a knowledge of the dream-work before we could recognize the real conformity. A decision will after all depend only on whether a critical examination can prove on the basis of individual examples that this view of the technique of jokes is a forced one in whose favour other more plausible and deeper-going views have been suppressed, or whether such an examination is obliged to admit that the expectations derived from dreams can really be confirmed in jokes. I am of the opinion that we have nothing to fear from such criticism and that our procedure of 'reduction' (p. 1629) has shown us reliably in what forms of expression to look for the techniques of jokes. And if we gave those techniques names which already anticipated the discovery of the conformity between joke-technique and dream-work, we had a perfect right to do so and it was in fact nothing more than an easily justifiable simplification.

[1905c, 1750]
Jokes possess yet another characteristic which fits satisfactorily into the view of the joke-work which we have derived from dreams. We speak, it is true, of 'making' a joke; but we are aware that when we do so our behaviour is different from what it is when we make a judgement or make an objection. A joke has quite outstandingly the characteristic of being a notion that has occurred to us 'involuntarily'. What happens is not that we know a moment beforehand what joke we are going to make, and that all it then needs is to be clothed in words. We have an indefinable feeling, rather, which I can best compare with an 'absence', a sudden release of intellectual tension, and then all at once the joke is there - as a rule ready-clothed in words. Some of the techniques of jokes can be employed apart from them in the expression of a thought - for instance, the techniques of analogy or allusion. I can deliberately decide to make an allusion. In such a case I begin by having a direct expression of my thought in my mind (in my inner ear); I inhibit myself from expressing it owing to a misgiving related to the external situation, and can almost be said to make up my mind to replace the direct expression by another form of indirect expression; and I then produce an allusion. But the allusion which arises in this way and which is formed under my continuous supervision is never a joke, however serviceable it may be in other ways. A joking allusion, on the other hand, emerges without my being able to follow these preparatory stages in my thoughts. I will not attach too much importance to this behaviour; it is scarcely decisive, though it agrees well with our hypothesis that in the formation of a joke one drops a train of thought for a moment and that it then suddenly emerges from the unconscious as a joke.

Jokes show a special way of behaving, too, in regard to association. Often they are not at the disposal of our memory when we want them; but at other times, to make up for this, they appear involuntarily, as it were, and at points in our train of thought where we cannot see their relevance. These, again, are only small features, but nevertheless indicate their origin from the unconscious.

Let us now bring together those characteristics of jokes which can be referred to their formation in the unconscious. First and foremost there is the peculiar brevity of jokes - not, indeed, an essential, but an extremely distinctive feature. When we first came across it, we were inclined to regard it as an expression of the tendency to economy, but abandoned this view ourselves owing to obvious objections. It now seems to us rather a mark of the unconscious revision to which the joke-thought has been subjected. For we cannot connect what corresponds to it in dreams, condensation, with any factor other than localization in the unconscious; and we must suppose that the determinants for such condensations, which are absent in the preconscious, are present in the unconscious thought-process.¹ It is to be expected that in the process of condensation a few of the elements subjected to it will be lost, while others, which take over the cathectic energy of the former, will become intensified or over-intensified through the condensation. Thus the brevity of jokes, like that of dreams, would be a necessary concomitant of the condensations which occur in both of them - in both cases a result of the process of condensation. This origin would also account for the special character of the brevity of jokes, a character that cannot be further defined but which is felt as a striking one.

¹ Apart from the dream-work and the technique of jokes, there is another kind of mental event in which I have been able to show that condensation is a regular and important process: namely the mechanism of normal (non-tendentious) forgetting. Unique impressions offer difficulties to forgetting; those that are analogous in any way are forgotten by being condensed in regard to their points of resemblance. Confusion between analogous impressions is one of the preliminary stages of forgetting.
We have entered so closely, in connection with the processes of condensation, into the importance of the analogy between jokes and dreams that we may be briefer in what follows. As we know, the displacements in the dream-work point to the operation of the censorship of conscious thinking, and accordingly, when we come across displacement among the techniques of jokes, we shall be inclined to suppose that an inhibitory force plays a part in the formation of jokes as well. And we already know that this is quite generally the case. The effort made by jokes to recover the old pleasure in nonsense or the old pleasure in words finds itself inhibited in normal moods by objections raised by critical reason; and in every individual case this has to be overcome. But the manner in which the joke-work accomplishes this task shows a sweeping distinction between jokes and dreams. In the dream-work it is habitually accomplished by displacements, by the selection of ideas which are sufficiently remote from the objectionable one for the censorship to allow them to pass, but which are nevertheless derivatives of that idea and have taken over its psychical cathexis by means of a complete transference. For this reason displacements are never absent in a dream and are far more comprehensive.

All these methods of displacement appear too as techniques of joking. But when they appear, they usually respect the limits imposed on their employment in conscious thinking; and they may be altogether absent, although jokes too have invariably a task to accomplish of dealing with an inhibition. We can understand the subordinate place taken by displacements in the joke-work when we recall that jokes always have another technique at their command for keeping off inhibition and indeed that we have found nothing more characteristic of them than precisely this technique. For jokes do not, like dreams, create compromises; they do not evade the inhibition, but they insist on maintaining play with words or with nonsense unaltered. They restrict themselves, however, to a choice of occasions in which this play or this nonsense can at the same time appear allowable (in jests) or sensible (in jokes), thanks to the ambiguity of words and the multiplicity of conceptual relations. Nothing distinguishes jokes more clearly from all other psychical structures than this double-sidedness and this duplicity in speech. From this point of view at least the authorities come closest to an understanding of the nature of jokes when they lay stress on 'sense in nonsense'.

The abundant and unrestrained use in the dream-work of indirect representation, of displacements, and especially of allusions, has a result which I mention not for its own importance but because it became my subjective reason for taking up the problem of jokes. If one gives an account to an uninformed or unaccustomed person of a dream-analysis, in which are set out, therefore, the strange processes of allusions and displacements - processes so obnoxious to waking life - of which the dream-work has made use, the reader receives an uncomfortable impression and declares that these interpretations are 'in the nature of a joke'. But he clearly does not regard them as successful jokes, but as forced, and in some way violating the rules of jokes. It is easy to explain this impression. It arises from the fact that the dream-work operates by the same methods as jokes, but in its use of them it transgresses the limits that are respected by jokes. We shall presently learn that, as a result of the part played by the third person, jokes are bound by a certain condition which does not apply to dreams.
The assignment of the joke-work to the system of the unconscious has, I think, become of considerably greater importance to us now that it has enabled us to understand the fact that the techniques to which jokes admittedly cling are, on the other hand, not their exclusive property. Some doubts which we were obliged to hold over until later in our original examination of these techniques now find a comfortable solution. For that very reason another doubt that arises is all the more deserving of our consideration. This suggests that the undeniable relation of jokes to the unconscious is in fact only valid for certain categories of tendentious jokes, whereas we are prepared to extend it to every species and every developmental stage of jokes. We must not evade an examination of this objection.

[1905c, 1759]

It can be assumed with certainty that jokes are formed in the unconscious when it is a question of jokes in the service of unconscious purposes or of purposes reinforced by the unconscious - that is, of most 'cynical' jokes. For in such cases the unconscious purpose drags the preconscious thought down into the unconscious and there gives it a new shape - a process to which the study of the psychology of the neuroses has taught us numerous analogies. In the case, however, of tendentious jokes of other kinds, of innocent jokes and of jests, this downward dragging force seems absent and the relation of jokes to the unconscious is accordingly called in question.

[1905c, 1759]

But let us now consider the case in which a thought, not worthless in itself, arises in the course of a train of thought and is expressed as a joke. In order to enable this thought to be turned into a joke, it is clearly necessary to select from among the possible forms of expression the precise one which brings along with it a yield of verbal pleasure. We know from self-observation that this selection is not made by conscious attention; but it will certainly help the selection if the cathexis of the preconscious thought is reduced to an unconscious one, for, as we have learnt from the dream-work, the connecting paths which start out from words are in the unconscious treated in the same way as connections between things. An unconscious cathexis offers far more favourable conditions for selecting the expression. Moreover, we can immediately assume that the possible form of expression that involves a yield of verbal pleasure exercises the same downward drag on the still unsettled wording of the preconscious thought as did the unconscious purpose in the earlier case. To meet the simpler case of the jest, we may suppose that an intention which is all the time on the look-out to achieve a yield of verbal pleasure grasps the occasion offered in the preconscious for dragging the cathetic process down into the unconscious according to the familiar pattern.

[1905c, 1759]

I should be very glad if it were possible for me on the one hand to give a clearer exposition of this single decisive point in my view of jokes and on the other hand to reinforce it with conclusive arguments. But in fact what I am faced with here is not a two-fold failure but one and the same failure. I cannot give a clearer exposition because I have no further proof of my view. I arrived at it on the basis of a study of the technique and of a comparison with the dream-work, and on no other basis; and I then found that on the whole it fits in excellently with the characteristics of jokes. Thus this view has been arrived at by inference; and if from an inference of this kind one is led, not to a familiar region, but on the contrary, to one that is alien and new to one's thought, one calls the inference a 'hypothesis' and rightly refuses to regard the relation of the hypothesis to the material from which it was inferred as a 'proof' of it. It can only be regarded as 'proved' if it is reached by another path as well and if it can be shown to be the nodal point of still other connections. But proof of this sort is not to be had, in view of the fact that our knowledge of unconscious processes has scarcely begun. In the realization that we are standing upon ground which has never before been trodden, we are thus content, from our point of observation, to take one single, short and uncertain step forward into the unexplored region.

[1905c, 1760]
With this last contribution, however, which explains, even though still only hypothetically, the joke-work in the first person, our interest in jokes is, strictly speaking, at an end. It remains for us to make a further short comparison between jokes and the better-known dream; and we may expect that, apart from the single conformity we have already considered, two such dissimilar mental functions will only reveal differences. The most important difference lies in their social behaviour. A dream is a completely asocial mental product; it has nothing to communicate to anyone else; it arises within the subject as a compromise between the mental forces struggling in him, it remains unintelligible to the subject himself and is for that reason totally uninteresting to other people. Not only does it not need to set any store by intelligibility, it must actually avoid being understood, for otherwise it would be destroyed; it can only exist in masquerade. For that reason it can without hindrance make use of the mechanism that dominates unconscious mental processes, to the point of a distortion which can no longer be set straight. A joke, on the other hand, is the most social of all the mental functions that aim at a yield of pleasure. It often calls for three persons and its completion requires the participation of someone else in the mental process it starts. The condition of intelligibility is, therefore, binding on it; it may only make use of possible distortion in the unconscious through condensation and displacement up to the point at which it can be set straight by the third person’s understanding. Moreover, jokes and dreams have grown up in quite different regions of mental life and must be allotted to points in the psychological system far remote from each other. A dream still remains a wish, even though one that has been made unrecognizable; a joke is developed play. Dreams, in spite of all their practical nonentity, retain their connection with the major interests of life; they seek to fulfil needs by the regressive detour of hallucination, and they are permitted to occur for the sake of the one need that is active during the night - the need to sleep. Jokes, on the other hand, seek to gain a small yield of pleasure from the mere activity, untrammelled by needs, of our mental apparatus. Later they try to catch hold of that pleasure as a by-product during the activity of that apparatus and thus arrive secondarily at not unimportant functions directed to the external world. Dreams serve predominantly for the avoidance of unpleasure, jokes for the attainment of pleasure; but all our mental activities converge in these two aims.

[1905c, 1761]
We have approached the problems of the comic in an unusual way. It seemed to us that jokes, which are ordinarily regarded as a sub-species of the comic, offer enough peculiarities to be attacked directly; thus we have avoided their relation to the more inclusive category of the comic so long as that was possible, though we have not failed to pick out en passant a few hints that might throw light on the comic. We have had no difficulty in discovering that socially the comic behaves differently from jokes. It can be content with two persons: a first who finds what is comic and a second in whom it is found. The third person, to whom the comic thing is told, intensifies the comic process but adds nothing new to it. In a joke this third person is indispensable for the completion of the pleasure-producing process; but on the other hand the second person may be absent, except where a tendentious, aggressive joke is concerned. A joke is made, the comic is found - and first and foremost in people, only by a subsequent transference in things, situations, and so on, as well. As regards jokes, we know that the sources of the pleasure that is to be fostered lie in the subject himself and not in outside people. We have seen, too, that jokes can sometimes re-open sources of the comic which have become inaccessible, and that the comic often serves as a façade for a joke and replaces the fore-pleasure which has otherwise to be produced by the familiar technique (p. 1739). None of this precisely suggests that the relations between jokes and the comic are very simple. On the other hand, the problems of the comic have proved so complicated and all the efforts of the philosophers at solving them have been so unsuccessful that we cannot hold out any prospect that we shall be able to master them in a sudden onslaught, as it were, by approaching them from the direction of jokes. Moreover, for our investigation of jokes we brought with us an instrument of which no one else had hitherto made use - a knowledge of the dream-work. We have no similar advantage at our command to help us to understand the comic, and we must therefore expect that we shall discover no more about the nature of the comic than what we have already found in jokes, in so far as they form part of the comic and possess in their own nature certain of its features unchanged or merely modified.

[1905c, 1762]

In discussing the techniques of jokes we found that giving free play to modes of thought which are usual in the unconscious but which can only be judged as examples of 'faulty reasoning' in the conscious is the technical method adopted in many jokes; and about these, once again, we felt doubts whether they possessed the true character of jokes, so that we were inclined to classify them simply as comic stories. We were unable to reach a decision about our doubts because at the time we were ignorant of the essential characteristic of jokes. Subsequently, led by an analogy with the dream-work, we discovered that it lay in the compromise effected by the joke-work between the demands of reasonable criticism and the urge not to renounce the ancient pleasure in words and nonsense. What came about in this way as a compromise, when the preconscious start of the thought was left for a moment to unconscious revision, satisfied both claims in every instance, but presented itself to criticism in various forms and had to put up with various judgements at its hands. Sometimes a joke would succeed in slipping on the appearance of an insignificant but nevertheless permissible assertion, another time it would smuggle itself in as the expression of a valuable thought. But, in the marginal case of effecting a compromise, it would give up attempting to satisfy criticism. Boasting of the sources of pleasure at its command, it would appear before criticism as sheer nonsense and not be afraid to provoke contradiction from it; for the joke could reckon on the hearer straightening out the disfigurement in the form of its expression by unconscious revision and so giving it back its meaning.

[1905c, 1782]
You will not be able to escape the resemblance of this example to a joke; and it has in fact often happened that a joke of the dreamer's has been regarded as a joke of the interpreter's. There are other instances in which it has been far from easy to decide whether what we are dealing with is a joke or a dream. But you will recall that the same doubt arose in the case of some parapraxes - slips of the tongue. A man reported as a dream of his that his uncle had given him a kiss while they were sitting in his auto (mobile). He himself very quickly added the interpretation: it meant 'auto-erotism' (a term from the theory of the libido, indicating satisfaction obtained without any outside object). Had the man set out, then, to have some fun with us and was he passing off a joke that had occurred to him as a dream? I think not; I believe he really dreamt it. But what is the origin of this puzzling similarity? This question once led me temporarily aside from my path by compelling me to make jokes themselves the subject of a detailed investigation. It was there shown how jokes originate: a preconscious train of thought is abandoned for a moment to be worked over in the unconscious, and from this it emerges as a joke. Under the influence of the unconscious it is subjected to the effects of the mechanisms that hold sway there - condensation and displacement - the same processes that we have found concerned in the dream-work; and it is to this common feature that is to be ascribed the similarity, when it occurs, between jokes and dreams. But the unintended 'dream-joke' brings none of the yield of pleasure of a true joke. You can learn why if you go more deeply into the study of jokes. A 'dream-joke' strikes us as a bad joke; it does not make us laugh, it leaves us cold.

[1916-1917, 3321]

I was able to show from a short story by W. Jensen called Gradiva, which has no particular merit in itself, that invented dreams can be interpreted in the same way as real ones and that the unconscious mechanisms familiar to us in the 'dream-work' are thus also operative in the processes of imaginative writing. My book on Jokes and their Relation to the Unconscious was a side-issue directly derived from The Interpretation of Dreams. The only friend of mine who was at that time interested in my work remarked to me that my interpretations of dreams often impressed him as being like jokes. In order to throw some light on this impression, I began to investigate jokes and found that their essence lay in the technical methods employed in them, and that these were the same as the means used in the 'dream-work' - that is to say, condensation, displacement, the representation of a thing by its opposite or by something very small, and so on. This led to an economic enquiry into the origin of the high degree of pleasure obtained from hearing a joke. And to this the answer was that it was due to the momentary suspension of the expenditure of energy upon maintaining repression, owing to the attraction exercised by the offer of a bonus of pleasure (fore-pleasure).

[1925d, 4239]
The ideas which transfer their intensities to each other stand in the loosest mutual relations. They are linked by associations of a kind that is scorned by our normal thinking and relegated to the use of jokes. In particular, we find associations based on homonyms and verbal similarities treated as equal in value to the rest. [1900a, 1023]

Whether the one or the other of these two views seems to us to throw more light on the question, the discussion of bewilderment and enlightenment brings us closer to a particular discovery. For if the comic effect of Heine's 'famillionairely' depends on the solution of the apparently meaningless word, the 'joke' must no doubt be ascribed to the formation of that word and to the characteristics of the word thus formed. [1905c, 1619]

In what, then, does the 'technique' of this joke consist? What has happened to the thought, as expressed, for instance, in our version, in order to turn it into a joke that made us laugh so heartily? Two things - as we learn by comparing our version with the poet's text. First, a considerable abbreviation has occurred. In order to express fully the thought contained in the joke, we were obliged to add to the words 'R. treated me quite as his equal, quite familiarly' a postscript which, reduced to its shortest terms, ran 'that is, so far as a millionaire can'. And even so we felt the need for a further explanatory sentence.¹ The poet puts it far more shortly: 'R. treated me quite as his equal - quite famillionairely.' In the joke, the whole limitation added by the second sentence to the first, which reports the familiar treatment, has disappeared. [1905c, 1624]

The process which has converted the thought into a joke can then be represented in the following manner, which may at first sight seem fantastic, but nevertheless produces precisely the outcome that is really before us: [1905c, 1625]

Let us now imagine that a compressing force is brought to bear on these sentences and that for some reason the second is the less resistant one. It is thereupon made to disappear, while its most important constituent, the word 'Millionär', which has succeeded in rebelling against being suppressed, is, as it were, pushed up against the first sentence, and fused with the element of that sentence which is so much like it - 'familiär'. And the chance possibility, which thus arises, of saving the essential part of the second sentence actually favours the dissolution of its other, less important, constituents. The joke is thus generated: [1905c, 1625]

If we leave out of account any such compressing force, which indeed is unknown to us, the process by which the joke is formed - that is, the joke-technique - in this instance might be described as 'condensation accompanied by the formation of a substitute'; and in the present example the formation of the substitute consists in the making of a 'composite word'. This composite word 'famillionär', which is unintelligible in itself but is immediately understood in its context and recognized as being full of meaning, is the vehicle of the joke's laughter compelling effect - the mechanism of which, however, is not made in any way clearer by our discovery of the joke-technique. In what way can a linguistic process of condensation, accompanied by the formation of a substitute by means of a composite word, give us pleasure and make us laugh? This is evidently a different problem, whose treatment we may postpone till we have found a way of approaching it. For the present we will keep to the technique of jokes. [1905c, 1625]
But here we may make a first stop and ask ourselves with what factor known to us from the literature of the subject this first finding of ours coincides, wholly or in part. Evidently with the factor of brevity, which Jean Paul describes as 'the soul of wit' (p. 1619 above). But brevity does not in itself constitute a joke, or otherwise every laconic remark would be one. The joke's brevity must be of a particular kind. It will be recalled that Lipps has tried to describe this particular brevity of jokes more precisely (p. 1619). Here our investigation contributes something and shows that the brevity of jokes is often the outcome of a particular process which has left behind in the wording of the joke a second trace - the formation of a substitute. By making use of the procedure of reduction, which seeks to undo the peculiar process of condensation, we also find, however, that the joke depends entirely on its verbal expression as established by the process of condensation. Our whole interest now turns, of course, to this strange process, which has hitherto scarcely been examined. Nor can we in the least understand how all that is valuable in a joke, the yield of pleasure that the joke brings us, can originate from that process.

[1905c, 1634]

Are processes similar to those which we have described here as the technique of jokes known already in any other field of mental events? They are - in a single field, and an apparently very remote one. In 1900 I published a book which, as its title (The Interpretation of Dreams) indicates, attempted to throw light on what is puzzling in dreams and to establish them as derivatives of our normal mental functioning. I found occasion there to contrast the manifest, and often strange, content of the dream with the latent, but perfectly logical, dream-thoughts from which the dream is derived; and I entered into an investigation of the processes which make the dream out of the latent dream-thoughts, as well as of the psychical forces which are involved in that transformation. To the totality of these transforming processes I gave the name of the 'dream-work'; and I have described as a part of this dream-work a process of condensation which shows the greatest similarity to the one found in the technique of jokes - which, like it, leads to abbreviation, and creates substitute-formations of the same character. Everyone will be familiar, from a recollection of his own dreams, with the composite structures both of people and of things which emerge in dreams. Indeed, dreams even construct them out of words, and they can then be dissected in analysis. (For instance, 'Autodidasker' = 'Autodidakt' + 'Lasker'.) On other occasions - much more often, in fact - what the work of condensation in dreams produces is not composite structures but pictures which exactly resemble one thing or one person except for an addition or alteration derived from another source - modifications, that is, just like those in Herr N.'s jokes. We cannot doubt that in both cases we are faced by the same psychical process, which we may recognize from its identical results. Such a far-reaching analogy between the technique of jokes and the dream-work will undoubtedly increase our interest in the former and raise an expectation in us that a comparison between jokes and dreams may help to throw light on jokes. But we will refrain from entering upon this task, for we must reflect that so far we have investigated the technique of only a very small number of jokes, so that we cannot tell whether the analogy by which we are proposing to be guided will in fact hold good. We will therefore turn away from the comparison with dreams and go back to the technique of jokes, though at this point we shall, as it were, be leaving a loose end to our enquiry, which at some later stage we may perhaps pick up once more.

[1905c, 1634]
Can we feel sure that none of the possible techniques of jokes has escaped our investigation? Of course not. But a continued examination of fresh material can convince us that we have got to know the commonest and most important technical methods of the joke-work - at all events as much as is required for forming a judgement on the nature of that psychical process. So far we have not arrived at any such judgement; but on the other hand we are now in possession of an important indication of the direction from which we may expect to receive further light upon the problem. The interesting processes of condensation accompanied by the formation of a substitute, which we have recognized as the core of the technique of verbal jokes, point towards the formation of dreams, in the mechanism of which the same psychical processes have been discovered. This is equally true, however, of the techniques of conceptual jokes - displacement, faulty reasoning, absurdity, indirect representation, representation by the opposite - which re-appear one and all in the technique of the dream-work. Displacement is responsible for the puzzling appearance of dreams, which prevents our recognizing that they are a continuation of our waking life. The use of absurdity and nonsense in dreams has cost them the dignity of being regarded as psychical products and has led the authorities to suppose that a disintegration of the mental activities and a cessation of criticism, morality and logic are necessary conditions of the formation of dreams. Representation by the opposite is so common in dreams that even the popular books of dream-interpretation, which are on a completely wrong tack, are in the habit of taking it into account. Indirect representation - the replacement of a dream-thought by an allusion, by something small, a symbolism akin to analogy - is precisely what distinguishes the mode of expression of dreams from that of our waking life.¹ So far-reaching an agreement between the methods of the joke-work and those of the dream-work can scarcely be a matter of chance. To demonstrate this agreement in detail and to examine its basis will be one of our later tasks.

[1905c, 1686]

This time we will not examine the technique of the joke; we propose to turn our attention to another factor, which is actually the most important one. When those of us present heard this improvised joke it gave us pleasure - which I can clearly recall - and made us laugh. In this instance, as in countless others, the hearers' feeling of pleasure cannot have arisen from the purpose of the joke or from its intellectual content; there is nothing left open to us but to bring that feeling of pleasure into connection with the technique of the joke. The technical methods of joking which we have earlier described - condensation, displacement, indirect representation and so on - thus possess the power of evoking a feeling of pleasure in the hearer, though we cannot in the least see how they may have acquired this power. In this simple way we arrive at the second thesis in our clarification of jokes; the first (p. 1623) asserted that the characteristic of jokes lay in their form of expression. Let us further reflect that this second thesis has in fact taught us nothing new. It merely isolates what was already included in an observation we had made earlier. It will be recalled that when we had succeeded in reducing a joke (that is, in replacing its form of expression by another one, while carefully preserving its sense) it had lost not only its character as a joke but also its power to make us laugh - our enjoyment of the joke.

[1905c, 1692]
At the end of the chapter in which I was concerned with discovering the technique of jokes, I remarked (p. 1686 f.) that the processes of condensation, with or without the formation of substitutes, of representation by nonsense and by the opposite, of indirect representation, and so on, which, as we found, play a part in producing jokes, show a very far-reaching agreement with the processes of the 'dream-work'. I further promised on the one hand that we would study these similarities more closely and on the other hand that we would examine the common element in jokes and dreams which seems to be thus suggested. It would be much easier for me to carry out this comparison if I could assume that one of the two objects of comparison - the 'dream-work' - was already familiar to my readers. But it will probably be wiser not to make that assumption. I have an impression that my Interpretation of Dreams, published in 1900, provoked more 'bewilderment' than 'enlightenment' among my fellow-specialists; and I know that wider circles of readers have been content to reduce the contents of the book to a catch-word ('wish-fulfilment') which can be easily remembered and conveniently misused.

[1905c, 1744]

Let us now recall what it was during our investigation of jokes that gave us occasion to think of dreams. We found that the characteristics and effects of jokes are linked with certain forms of expression or technical methods, among which the most striking are condensation, displacement and indirect representation. Processes, however, which lead to the same results - condensation, displacement and indirect representation - have become known to us as peculiarities of the dream-work. Does not this agreement suggest the conclusion that joke-work and dream-work must, at least in some essential respect, be identical? The dream-work has, I think, been revealed to us as regards its most important characteristics. Of the psychical processes in jokes the part that is hidden from us is precisely the one that may be compared to the dream-work - namely, what happens during the formation of a joke in the first person. Shall we not yield to the temptation to construct that process on the analogy of the formation of a dream? A few of the characteristics of dreams are so alien to jokes that the part of the dream-work corresponding to those characteristics cannot be transferred to the formation of jokes. There is no doubt that the regression of the train of thought to perception is absent in jokes. But the other two stages of dream-formation, the sinking of a preconscious thought into the unconscious and its unconscious revision, if they could be supposed to occur in joke-formation, would present the precise outcome that we can observe in jokes. Let us decide, then, to adopt the hypothesis that this is the way in which jokes are formed in the first person: a preconscious thought is given over for a moment to unconscious revision and the outcome of this is at once grasped by conscious perception.

[1905c, 1750]
Before we examine this hypothesis in detail, we will consider an objection which might threaten our premiss. We have started from the fact that the techniques of jokes indicate the same processes that are known to us as peculiarities of the dream-work. Now it is easy to argue against this that we should not have described the techniques of jokes as condensation, displacement, etc., and should not have arrived at such far reaching conformities between the methods of representation in jokes and dreams, if our previous knowledge of the dream-work had not prejudiced our view of the technique of jokes; so that at bottom we are only finding in jokes a confirmation of the expectations with which we approached them from dreams. If this was the basis of the conformity, there would be no certain guarantee of its existence apart from our prejudice. Nor indeed have condensation, displacement and indirect representation been taken by any other author as explaining the forms of expression of jokes. This would be a possible objection, but not on that account a just one. It would be equally possible that it was indispensable for our views to be sharpened by a knowledge of the dream-work before we could recognize the real conformity. A decision will after all depend only on whether a critical examination can prove on the basis of individual examples that this view of the technique of jokes is a forced one in whose favour other more plausible and deeper-going views have been suppressed, or whether such an examination is obliged to admit that the expectations derived from dreams can really be confirmed in jokes. I am of the opinion that we have nothing to fear from such criticism and that our procedure of ‘reduction’ (p. 1629) has shown us reliably in what forms of expression to look for the techniques of jokes. And if we gave those techniques names which already anticipated the discovery of the conformity between joke-technique and dream-work, we had a perfect right to do so and it was in fact nothing more than an easily justifiable simplification.

[1905c, 1751]

With this last contribution, however, which explains, even though still only hypothetically, the joke-work in the first person, our interest in jokes is, strictly speaking, at an end. It remains for us to make a further short comparison between jokes and the better-known dream; and we may expect that, apart from the single conformity we have already considered, two such dissimilar mental functions will only reveal differences. The most important difference lies in their social behaviour. A dream is a completely asocial mental product; it has nothing to communicate to anyone else; it arises within the subject as a compromise between the mental forces struggling in him, it remains unintelligible to the subject himself and is for that reason totally uninteresting to other people. Not only does it not need to set any store by intelligibility, it must actually avoid being understood, for otherwise it would be destroyed; it can only exist in masquerade. For that reason it can without hindrance make use of the mechanism that dominates unconscious mental processes, to the point of a distortion which can no longer be set straight. A joke, on the other hand, is the most social of all the mental functions that aim at a yield of pleasure. It often calls for three persons and its completion requires the participation of someone else in the mental process it starts. The condition of intelligibility is, therefore, binding on it; it may only make use of possible distortion in the unconscious through condensation and displacement up to the point at which it can be set straight by the third person’s understanding. Moreover, jokes and dreams have grown up in quite different regions of mental life and must be allotted to points in the psychological system far remote from each other. A dream still remains a wish, even though one that has been made unrecognizable; a joke is developed play. Dreams, in spite of all their practical nonentity, retain their connection with the major interests of life; they seek to fulfill needs by the regressive detour of hallucination, and they are permitted to occur for the sake of the one need that is active during the night - the need to sleep. Jokes, on the other hand, seek to gain a small yield of pleasure from the mere activity, untrammelled by needs, of our mental apparatus. Later they try to catch hold of that pleasure as a by-product during the activity of that apparatus and thus arrive secondarily at not unimportant functions directed to the external world. Dreams serve predominantly for the avoidance of unpleasure, jokes for the attainment of pleasure; but all our mental activities converge in these two aims.

[1905c, 1761]
The cathetic intensities are much more mobile. By the process of displacement one idea may surrender to another its whole quota of cathexis; by the process of condensation it may appropriate the whole cathexis of several other ideas. I have proposed to regard these two processes as distinguishing marks of the so-called primary psychical process. In the system Pcs. the secondary process¹ is dominant. When a primary process is allowed to take its course in connection with elements belonging to the system Pcs., it appears 'comic' and excites laughter.

[1915e, 3009]

You will not be able to escape the resemblance of this example to a joke; and it has in fact often happened that a joke of the dreamer’s has been regarded as a joke of the interpreter’s. There are other instances in which it has been far from easy to decide whether what we are dealing with is a joke or a dream. But you will recall that the same doubt arose in the case of some parapraxes - slips of the tongue. A man reported as a dream of his that his uncle had given him a kiss while they were sitting in his auto (mobile). He himself very quickly added the interpretation: it meant ‘auto-erotism’ (a term from the theory of the libido, indicating satisfaction obtained without any outside object). Had the man set out, then, to have some fun with us and was he passing off a joke that had occurred to him as a dream? I think not; I believe he really dreamt it. But what is the origin of this puzzling similarity? This question once led me temporarily aside from my path by compelling me to make jokes themselves the subject of a detailed investigation. It was there shown how jokes originate: a preconscious train of thought is abandoned for a moment to be worked over in the unconscious, and from this it emerges as a joke. Under the influence of the unconscious it is subjected to the effects of the mechanisms that hold sway there - condensation and displacement - the same processes that we have found concerned in the dream-work; and it is to this common feature that is to be ascribed the similarity, when it occurs, between jokes and dreams. But the unintended ‘dream-joke’ brings none of the yield of pleasure of a true joke. You can learn why if you go more deeply into the study of jokes. A ‘dream-joke’ strikes us as a bad joke; it does not make us laugh, it leaves us cold.

[1916-1917, 3321]
Whether the one or the other of these two views seems to us to throw more light on the question, the discussion of bewilderment and enlightenment brings us closer to a particular discovery. For if the comic effect of Heine's 'famillionairely' depends on the solution of the apparently meaningless word, the 'joke' must no doubt be ascribed to the formation of that word and to the characteristics of the word thus formed.

[1905c, 1619]

In what, then, does the 'technique' of this joke consist? What has happened to the thought, as expressed, for instance, in our version, in order to turn it into a joke that made us laugh so heartily? Two things - as we learn by comparing our version with the poet's text. First, a considerable abbreviation has occurred. In order to express fully the thought contained in the joke, we were obliged to add to the words 'R. treated me quite as his equal, quite familiarly' a postscript which, reduced to its shortest terms, ran 'that is, so far as a millionaire can'. And even so we felt the need for a further explanatory sentence.¹ The poet puts it far more shortly: 'R. treated me quite as his equal - quite famillionairely.' In the joke, the whole limitation added by the second sentence to the first, which reports the familiar treatment, has disappeared.

[1905c, 1624]

Let us now imagine that a compressing force is brought to bear on these sentences and that for some reason the second is the less resistant one. It is thereupon made to disappear, while its most important constituent, the word 'Millionär', which has succeeded in rebelling against being suppressed, is, as it were, pushed up against the first sentence, and fused with the element of that sentence which is so much like it - 'familiär'. And the chance possibility, which thus arises, of saving the essential part of the second sentence actually favours the dissolution of its other, less important, constituents. The joke is thus generated:

[1905c, 1625]

If we leave out of account any such compressing force, which indeed is unknown to us, the process by which the joke is formed - that is, the joke-technique - in this instance might be described as 'condensation accompanied by the formation of a substitute'; and in the present example the formation of the substitute consists in the making of a 'composite word'. This composite word 'famillionär', which is unintelligible in itself but is immediately understood in its context and recognized as being full of meaning, is the vehicle of the joke's laughter compelling effect - the mechanism of which, however, is not made in any way clearer by our discovery of the joke-technique. In what way can a linguistic process of condensation, accompanied by the formation of a substitute by means of a composite word, give us pleasure and make us laugh? This is evidently a different problem, whose treatment we may postpone till we have found a way of approaching it. For the present we will keep to the technique of jokes.

[1905c, 1625]

I have been told the following condensation joke. A young man who had hitherto led a gay life abroad paid a call, after a considerable absence, on a friend living here. The latter was surprised to see an Ehering [wedding-ring] on his visitor's hand, 'What?' he exclaimed, 'are you married?' 'Yes', was the reply, 'Trauring but true.'¹ The joke is an excellent one. The word 'Trauring' combines both components: 'Ehering' changed into 'Trauring' and the sentence 'traurig, aber wahr [sad but true]'. The effect of the joke is not interfered with by the fact that here the composite word is not, like 'famillionär', an unintelligible and otherwise non-existent structure, but one which coincides entirely with one of the two elements represented.

[1905c, 1627]
In order to discover the technique of this joke, we must apply to it the process of reduction which gets rid of the joke by changing the mode of expression and instead introducing the original complete meaning, which can be inferred with certainty from a good joke. Herr N.'s joke about the 'roter Faden' proceeds from two components - a depreciatory judgement upon the writer and a recollection of the famous simile with which Goethe introduces the extracts 'From Ottilie's Diary' in the Wahlverwandtschaften.¹ The ill-tempered criticism may have run: 'So this is the person who is for ever and ever writing nothing but boring stories about Napoleon in Austria!' Now this remark is not in the least a joke. Nor is Goethe's pretty analogy a joke, and it is certainly not calculated to make us laugh. It is only when the two are brought into connection with each other and submitted to the peculiar process of condensation and fusion that a joke emerges - and a joke of the first order.²

² I need hardly point out how little this observation, which can invariably be made, fits in with the assertion that a joke is a playful judgement.

The linking of the disparaging judgement upon the boring historian with the pretty analogy in the Wahlverwandtschaften must have taken place (for reasons which I cannot yet make intelligible) in a less simple manner than in many similar cases. I shall try to represent what was probably the actual course of events by the following construction. First, the element of the constant recurrence of the same theme in the stories may have awoken a faint recollection in Herr N. of the familiar passage in the Wahlverwandtschaften, which is as a rule wrongly quoted: 'it runs like a roter Faden [scarlet thread].' The 'roter Faden' of the analogy now exercised a modifying influence of the expression of the first sentence, as a result of the chance circumstance that the person insulted was also rot [red] - that is to say had red hair. It may then have run: 'So it is that red person who writes the boring stories about Napoleon!' And now the process began which brought about the condensation of the two pieces. Under its pressure, which had found its first fulcrum in the sameness of the element 'rot', the 'boring' was assimilated to the 'Faden [thread]' and was changed into 'fad [dull]'; after this the two components were able to fuse together into the actual text of the joke, in which, in this case, the quotation has an almost greater share than the derogatory judgement, which was undoubtedly present alone to begin with.

In a later chapter I shall add a justification, but also a correction, to this account, when I come to analyse this joke from points of view other than purely formal ones. But whatever else about it may be in doubt, there can be no question that a condensation has taken place. The result of the condensation is, on the one hand, once again a considerable abbreviation; but on the other hand, instead of the formation of a striking composite word, there is an interpenetration of the constituents of the two components. It is true that 'roter Faden' would be capable of existing as a mere term of abuse; but in our instance it is certainly a product of condensation.

The analysis of the last example has prepared us to find that, if we meet with the process of condensation in still other examples, the substitute for what is suppressed may be not a composite structure, but some other alteration of the form of expression. We can learn what this other form of substitute may be from another of Herr N.'s jokes.
Neither of these sentences is a joke. They could be put together: 'I drove with that stupid ass X tête-à-tête', and that is not a joke either. The joke only arises if the 'stupid ass' is left out, and, as a substitute for it, the 't' in one 'tête' is turned into a 'b'. With this slight modification the suppressed 'ass' has nevertheless once more found expression. The technique of this group of jokes can be described as 'condensation accompanied by slight modification', and it may be suspected that the slighter the modification the better will be the joke.

[1905c, 1631]

Another, very well-known joke of Herr N.'s offers a neat example of condensation with slight modification. He remarked of a personage in public life: 'he has a great future behind him.' The man to whom this joke referred was comparatively young, and he had seemed destined by his birth, education and personal qualities to succeed in the future to the leadership of a great political party and to enter the government at its head. But times changed; the party became inadmissible as a government, and it could be foreseen that the man who had been predestined to be its leader would come to nothing as well. The shortest reduced version by which this joke could be replaced would run: 'The man has had a great future before him, but he has it no longer.' Instead of the 'had' and the second clause, there was merely the small change made in the principal clause of replacing 'before' by its contrary, 'behind'.¹

[1905c, 1632]

Karl Kraus was responsible for another successful condensation with slight modification. He wrote of a certain yellow-press journalist that he had travelled to one of the Balkan States by 'Orienterpresszug'.² There is no doubt that this word combines two others: 'Orientexpresszug [Orient Express]' and 'Erpressung [blackmail]'. Owing to the context, the element 'Erpressung' emerges only as a modification of the 'Orientexpresszug' - a word called for by the verb ['travelled']. This joke, which presents itself in the guise of a misprint, has yet another claim on our interest.

[1905c, 1633]

This series of examples could easily be further increased; but I do not think we require any fresh instances to enable us to grasp clearly the characteristics of the technique in this second group - condensation with modification. If we compare the second group with the first, whose technique consisted in condensation with the formation of composite words, we shall easily see that the difference between them is not an essential one and that the transitions between them are fluid. Both the formation of composite words and modification can be subsumed under the concept of the formation of substitutes; and, if we care to, we can also describe the formation of a composite word as a modification of the basic word by a second element.

[1905c, 1633]

But here we may make a first stop and ask ourselves with what factor known to us from the literature of the subject this first finding of ours coincides, wholly or in part. Evidently with the factor of brevity, which Jean Paul describes as 'the soul of wit' (p. 1619 above). But brevity does not in itself constitute a joke, or otherwise every laconic remark would be one. The joke's brevity must be of a particular kind. It will be recalled that Lipps has tried to describe this particular brevity of jokes more precisely (p. 1619). Here our investigation contributes something and shows that the brevity of jokes is often the outcome of a particular process which has left behind in the wording of the joke a second trace - the formation of a substitute. By making use of the procedure of reduction, which seeks to undo the peculiar process of condensation, we also find, however, that the joke depends entirely on its verbal expression as established by the process of condensation. Our whole interest now turns, of course, to this strange process, which has hitherto scarcely been examined. Nor can we in the least understand how all that is valuable in a joke, the yield of pleasure that the joke brings us, can originate from that process.

[1905c, 1634]
Are processes similar to those which we have described here as the technique of jokes known already in any other field of mental events? They are - in a single field, and an apparently very remote one. In 1900 I published a book which, as its title (*The Interpretation of Dreams*) indicates, attempted to throw light on what is puzzling in dreams and to establish them as derivatives of our normal mental functioning. I found occasion there to contrast the *manifest*, and often strange, *content of the dream* with the *latent*, but perfectly logical, *dream-thoughts* from which the dream is derived; and I entered into an investigation of the processes which make the dream out of the latent dream-thoughts, as well as of the psychical forces which are involved in that transformation. To the totality of these transforming processes I gave the name of the ‘dream-work’; and I have described as a part of this dream-work a process of condensation which shows the greatest similarity to the one found in the technique of jokes - which, like it, leads to abbreviation, and creates substitute- formations of the same character. Everyone will be familiar, from a recollection of his own dreams, with the composite structures both of people and of things which emerge in dreams. Indeed, dreams even construct them out of words, and they can then be dissected in analysis. (For instance, ‘Autodidasker’ = ‘Autodidakt’ + ‘Lasker’.) On other occasions - much more often, in fact - what the work of condensation in dreams produces is not composite structures but pictures which exactly resemble one thing or one person except for an addition or alteration derived from another source - modifications, that is, just like those in Herr N.’s jokes. We cannot doubt that in both cases we are faced by the same psychical process, which we may recognize from its identical results. Such a far-reaching analogy between the technique of jokes and the dream-work will undoubtedly increase our interest in the former and raise an expectation in us that a comparison between jokes and dreams may help to throw light on jokes. But we will refrain from entering upon this task, for we must reflect that so far we have investigated the technique of only a very small number of jokes, so that we cannot tell whether the analogy by which we are proposing to be guided will in fact hold good. We will therefore turn away from the comparison with dreams and go back to the technique of jokes, though at this point we shall, as it were, be leaving a loose end to our enquiry, which at some later stage we may perhaps pick up once more.

The first thing that we want to learn is whether the process of condensation with substitute-formation is to be discovered in every joke, and can therefore be regarded as a universal characteristic of the technique of jokes.

But what is the technique of this joke? We see at once that the characteristic that we may have hoped to be able to prove was a universal one is absent on the very first fresh occasion. There is no omission here, and scarcely an abbreviation. The lady herself says straight out in the joke almost everything that we can attribute to her thoughts. ‘You had raised my expectations about a relative of Jean-Jacques Rousseau - perhaps a spiritual relative - and here he is: a red-haired silly young man, a *roux et sot*.’ It is true that I have been able to make an interpolation; but this attempt at a reduction has not got rid of the joke. It remains, and is attached to the identity of sound of the words.

The multiple use of the same word, once as a whole and again in the syllables into which it falls, is the first instance we have come across of a technique differing from that of condensation. But the profusion of examples that have met us must convince us after a little reflection that the newly-discovered technique can scarcely be limited to this one method. There are a number of possible ways - how many it is as yet quite impossible to guess - in which the same word or the same verbal material can be put to multiple uses in one sentence. Are all these possibilities to be regarded as technical methods of making jokes? It seems to be so. And the examples of jokes which follow will prove it.
Well, something very simple and obvious, I should have thought. The multiple use of the same material is, after all, only a special case of condensation; play upon words is nothing other than a condensation without substitute-formation; condensation remains the wider category. All these techniques are dominated by a tendency to compression, or rather to saving. It all seems to be a question of economy. In Hamlet's words: 'Thrift, thrift, Horatio!'

Let us test this economy on the different examples. 'C'est le premier vol de l'aigle.' It is the eagle's first flight. Yes, but it is a thieving flight. Luckily for the existence of this joke, 'vol' means not only 'flight' but 'theft' as well. Has no condensation and economy been made? Most certainly. There has been a saving of the whole of the second thought and it has been dropped without leaving a substitute. The double meaning of the word 'vol' has made such a substitute unnecessary; or it would be equally true to say that the word 'vol' contains the substitute for the suppressed thought without any addition of change having to be made to the first one. That is the advantage of a double meaning.

Another example: 'Iron front - iron cash-box - Iron Crown'. What an extraordinary saving compared with an expression of the same thought in which 'iron' finds no place: 'With the help of the necessary boldness and lack of conscience it is not difficult to amass a large fortune, and for such services a title will of course be a suitable reward.'

Condensation, and therefore economy, is indeed quite unmistakably present in these examples. But it should be present in every example. Where is the economy hidden in such jokes as 'Rousseau - roux et sot' or 'Antigone - antik? oh nee', in which we first noticed the absence of condensation and which were our principal motive for putting forward the technique of the repeated use of the same material? It is true that here we should not find that condensation would meet the case; but if instead of it we take the more inclusive concept of economy, we can manage without difficulty. It is easy to point out what we save in the case of Rousseau, Antigone, etc. We save having to express a criticism or give shape to a judgement; both are already there in the name itself. In the example of 'Leidenschaft - Eifersucht [passion-jealousy] we save ourselves the trouble of laboriously constructing a definition: 'Eifersucht, Leidenschaft - Eifer sucht ['eagerness seeks'], 'Leidenschaft' ['causes pain']. We have only to add the linking words and there we have our definition ready made. The case is similar in all the other examples that have so far been analysed. Where there is least saving, as in Saphir's play upon words 'Sie kommen um Ihre 100 Dukaten', there is at any rate a saving of the necessity for framing a new wording for the reply; the wording of the question is sufficient for the answer. The saving is not much, but in it the joke lies. The multiple use of the same words for question and answer is certainly an 'economy'. Like Hamlet's view of the rapid sequence of his father's death and his mother's marriage:
But before we accept the 'tendency to economy' as the most general characteristic of the technique of jokes and ask such questions as where it comes from, what it signifies and how the joke's yield of pleasure arises from it, we must find space for a doubt which has a right to be heard. It may be that every joke technique shows the tendency to save something in expression: but the relation is not reversible. Not every economy of expression, not every abbreviation, is on that account a joke as well. We reached this point once before, when we were still hoping to find the process of condensation in every joke, and raised the justifiable objection that a laconic remark is not enough to constitute a joke. There must therefore be some peculiar kind of abbreviation and economy on which the characteristic of being a joke depends; and until we know the nature of that peculiarity our discovery of the common element in the techniques of jokes brings us no nearer to a solution of our problem. And let us, further, have the courage to admit that the economies made by the joke-technique do not greatly impress us. They may remind us, perhaps, of the way in which some housewives economize when they spend time and money on a journey to a distant market because vegetables are to be had there a few farthings cheaper. What does a joke save by its technique? The putting together of a few new words, which would mostly have emerged without any trouble. Instead of that, it has to take the trouble to search out the one word which covers the two thoughts. Indeed, it must often first transform one of the thoughts into an unusual form which will provide a basis for its combination with the second thought. Would it not have been simpler, easier, and, in fact, more economical to have expressed the two thoughts as they happened to come, even if this involved no common form of expression? Is not the economy in words uttered more than balanced by the expenditure on intellectual effort? And who saves by that? Who gains by it?

[1905c, 1649]

A friend said of someone who had lofty views but was obstinate in the pursuit of his aims: 'Er hat ein Ideal vor dem Kopf.' The current phrase is: 'Ein Brett vor dem Kopf haben'. The modification alludes to this phrase and makes use of its meaning for its own purposes. Here, once more, the technique might be described as 'condensation with modification'.

[1905c, 1676]

It is almost impossible to distinguish between 'allusion by means of modification' and 'condensation with substitution', if the modification is limited to a change of letters. For instance: 'Dichteritis'! This allusion to the scourge of 'Diphtheritis' represents authorship by unqualified persons as another public danger.

[1905c, 1676]

Finally, another kind of allusion consists in 'omission', which may be compared to condensation without the formation of a substitute. Actually, in every allusion something is omitted, viz. the train of thought leading to the allusion. It only depends on whether the more obvious thing is the gap in the wording of the allusion or the substitute which partly fills the gap. Thus a series of examples would lead us back from blatant omission to allusion proper.

[1905c, 1676]
Can we feel sure that none of the possible techniques of jokes has escaped our investigation? Of course not. But a continued examination of fresh material can convince us that we have got to know the commonest and most important technical methods of the joke-work - at all events as much as is required for forming a judgement on the nature of that psychical process. So far we have not arrived at any such judgement; but on the other hand we are now in possession of an important indication of the direction from which we may expect to receive further light upon the problem. The interesting processes of condensation accompanied by the formation of a substitute, which we have recognized as the core of the technique of verbal jokes, point towards the formation of dreams, in the mechanism of which the same psychical processes have been discovered. This is equally true, however, of the techniques of conceptual jokes - displacement, faulty reasoning, absurdity, indirect representation, representation by the opposite - which re-appear one and all in the technique of the dream-work. Displacement is responsible for the puzzling appearance of dreams, which prevents our recognizing that they are a continuation of our waking life. The use of absurdity and nonsense in dreams has cost them the dignity of being regarded as psychical products and has led the authorities to suppose that a disintegration of the mental activities and a cessation of criticism, morality and logic are necessary conditions of the formation of dreams. Representation by the opposite is so common in dreams that even the popular books of dream-interpretation, which are on a completely wrong tack, are in the habit of taking it into account. Indirect representation - the replacement of a dream-thought by an allusion, by something small, a symbolism akin to analogy - is precisely what distinguishes the mode of expression of dreams from that of our waking life.¹ So far-reaching an agreement between the methods of the joke-work and those of the dream-work can scarcely be a matter of chance. To demonstrate this agreement in detail and to examine its basis will be one of our later tasks.

[1905c, 1686]

This time we will not examine the technique of the joke; we propose to turn our attention to another factor, which is actually the most important one. When those of us present heard this improvised joke it gave us pleasure - which I can clearly recall - and made us laugh. In this instance, as in countless others, the hearers' feeling of pleasure cannot have arisen from the purpose of the joke or from its intellectual content; there is nothing left open to us but to bring that feeling of pleasure into connection with the technique of the joke. The technical methods of joking which we have earlier described - condensation, displacement, indirect representation and so on - thus possess the power of evoking a feeling of pleasure in the hearer, though we cannot in the least see how they may have acquired this power. In this simple way we arrive at the second thesis in our clarification of jokes; the first (p. 1623) asserted that the characteristic of jokes lay in their form of expression. Let us further reflect that this second thesis has in fact taught us nothing new. It merely isolates what was already included in an observation we had made earlier. It will be recalled that when we had succeeded in reducing a joke (that is, in replacing its form of expression by another one, while carefully preserving its sense) it had lost not only its character as a joke but also its power to make us laugh - our enjoyment of the joke.

[1905c, 1692]
Let us now recall what it was during our investigation of jokes that gave us occasion to think of dreams. We found that the characteristics and effects of jokes are linked with certain forms of expression or technical methods, among which the most striking are condensation, displacement and indirect representation. Processes, however, which lead to the same results - condensation, displacement and indirect representation - have become known to us as peculiarities of the dream-work. Does not this agreement suggest the conclusion that joke-work and dream-work must, at least in some essential respect, be identical? The dream-work has, I think, been revealed to us as regards its most important characteristics. Of the psychical processes in jokes the part that is hidden from us is precisely the one that may be compared to the dream-work - namely, what happens during the formation of a joke in the first person. Shall we not yield to the temptation to construct that process on the analogy of the formation of a dream? A few of the characteristics of dreams are so alien to jokes that the part of the dream-work corresponding to those characteristics cannot be transferred to the formation of jokes. There is no doubt that the regression of the train of thought to perception is absent in jokes. But the other two stages of dream-formation, the sinking of a preconscious thought into the unconscious and its unconscious revision, if they could be supposed to occur in joke-formation, would present the precise outcome that we can observe in jokes. Let us decide, then, to adopt the hypothesis that this is the way in which jokes are formed in the first person: a preconscious thought is given over for a moment to unconscious revision and the outcome of this is at once grasped by conscious perception.

Let us now bring together those characteristics of jokes which can be referred to their formation in the unconscious. First and foremost there is the peculiar brevity of jokes - not, indeed, an essential, but an extremely distinctive feature. When we first came across it, we were inclined to regard it as an expression of the tendency to economy, but abandoned this view ourselves owing to obvious objections. It now seems to us rather a mark of the unconscious revision to which the joke-thought has been subjected. For we cannot connect what corresponds to it in dreams, condensation, with any factor other than localization in the unconscious; and we must suppose that the determinants for such condensations, which are absent in the preconscious, are present in the unconscious thought-process.¹ It is to be expected that in the process of condensation a few of the elements subjected to it will be lost, while others, which take over the cathetic energy of the former, will become intensified or over-intensified through the condensation. Thus the brevity of jokes, like that of dreams, would be a necessary concomitant of the condensations which occur in both of them - in both cases a result of the process of condensation. This origin would also account for the special character of the brevity of jokes, a character that cannot be further defined but which is felt as a striking one.

¹ Apart from the dream-work and the technique of jokes, there is another kind of mental event in which I have been able to show that condensation is a regular and important process: namely the mechanism of normal (non-tendentious) forgetting. Unique impressions offer difficulties to forgetting; those that are analogous in any way are forgotten by being condensed in regard to their points of resemblance. Confusion between analogous impressions is one of the preliminary stages of forgetting.

[1905c, 1750]
In an earlier passage (p. 1715) we regarded one of the outcomes of condensation - multiple use of the same material, play upon words, and similarity of sound - as a localized economy, and the pleasure produced by an (innocent) joke as derived from that economy, and later we inferred that the original intention of jokes was to obtain a yield of pleasure of this kind from words - a thing which had been permitted at the stage of play but had been dammed up by rational criticism in the course of intellectual development. We have now adopted the hypothesis that condensations of this kind, such as serve the technique of jokes, arise automatically, without any particular intention, during thought-processes in the unconscious. Have we not before us here two different views of the same fact which seem incompatible with each other? I do not think so. It is true that they are two different views, and that they need to be brought into harmony with each other; but they are not contradictory. One of them is merely foreign to the other; and when we have established a connection between them, we shall probably have made some advance in knowledge. The fact that such condensations are sources for a yield of pleasure is far from incompatible with the hypothesis that conditions for their production are easily found in the unconscious. We can, on the contrary, see a reason for the plunge into the unconscious in the circumstance that the pleasure-yielding condensations of which jokes are in need arise there easily. There are, moreover, two other factors which at a first glance seem to be completely foreign to each other and to have come together as though by some undesired chance, but which on deeper investigation turn out to be intimately linked and indeed essentially one. I have in mind the two assertions that, on the one hand, jokes during their development at the stage of play (that is, during the childhood of reason) are able to bring about these pleasurable condensations and that, on the other hand, at higher stages they accomplish the same effect by plunging the thought into the unconscious. For the infantile is the source of the unconscious, and the unconscious thought-processes are none other than those - the one and only ones - produced in early childhood. The thought which, with the intention of constructing a joke, plunges into the unconscious is merely seeking there for the ancient dwelling-place of its former play with words. Thought is put back for a moment to the stage of childhood so as once more to gain possession of the childish source of pleasure. If we did not already know it from research into the psychology of the neuroses, we should be led by jokes to a suspicion that the strange unconscious revision is nothing else than the infantile type of thought-activity. It is merely that it is not very easy for us to catch a glimpse in children of this infantile way of thinking, with its peculiarities that are retained in the unconscious of adults, because it is for the most part corrected, as it were, in statu nascendi. But in a number of cases we succeed in doing so, and we then laugh at the children's 'silliness'. Any uncovering of unconscious material of this kind strikes us in general as 'comic'.¹

I was able to show from a short story by W. Jensen called Gradiva, which has no particular merit in itself, that invented dreams can be interpreted in the same way as real ones and that the unconscious mechanisms familiar to us in the 'dream-work' are thus also operative in the processes of imaginative writing. My book on Jokes and their Relation to the Unconscious was a side-issue directly derived from The Interpretation of Dreams. The only friend of mine who was at that time interested in my work remarked to me that my interpretations of dreams often impressed him as being like jokes. In order to throw some light on this impression, I began to investigate jokes and found that their essence lay in the technical methods employed in them, and that these were the same as the means used in the 'dream-work' - that is to say, condensation, displacement, the representation of a thing by its opposite or by something very small, and so on. This led to an economic enquiry into the origin of the high degree of pleasure obtained from hearing a joke. And to this the answer was that it was due to the momentary suspension of the expenditure of energy upon maintaining repression, owing to the attraction exercised by the offer of a bonus of pleasure (fore-pleasure).
But at this point we must be prepared to meet an objection which will assert that these fine distinctions are seeking to tear apart what belongs together. Does not every double meaning give occasion for a displacement - for a diversion of the train of thought from one meaning to the other? And are we prepared, then, to allow 'double meaning' and 'displacement' to be set up as representatives of two quite different types of joke-technique? Well, it is true that this relation between double meaning and displacement does exist, but it has nothing to do with our distinguishing the different joke-techniques. In the case of double meaning a joke contains nothing other than a word capable of multiple interpretation, which allows the hearer to find the transition from one thought to another - a transition which, stretching a point, might be equated with a displacement. In the case of a displacement joke, however, the joke itself contains a train of thought in which a displacement of this kind has been accomplished. Here the displacement is part of the work which has created the joke; it is not part of the work necessary for understanding it. If this distinction is not clear to us, we have an unfailing means of bringing it tangibly before our eyes in our attempts at reduction. But there is one merit which we will not deny to this objection. It draws our attention to the necessity of not confusing the psychical processes involved in the construction of the joke (the 'joke-work') with the psychical processes involved in taking in the joke (the work of understanding). Our present enquiry is only concerned with the former.¹

Are there other examples of the displacement technique? They are not easy to find. A straightforward instance is afforded by the following joke, which moreover is not characterized by the appearance of logic which was so much overstressed in our model case:

Here the displacement leaps to the eye. The dealer obviously mentions the early hour of arriving at the provincial town simply in order to demonstrate the horse's capacity by an example. The customer disregards the animal's capacity, which he does not question, and merely enters into the data of the example that has been chosen. The reduction of this joke is accordingly easy to give.

Let us start once more from that highly instructive example 'Salmon Mayonnaise'. It, too, presented us with a façade, in which a striking parade of logical thinking was exhibited; and we learnt from analysing it that this logic was used to conceal a piece of faulty reasoning - namely, a displacement of the train of thought. This may serve to remind us, if only by means of a contrasting connection, of other jokes which, quite the other way, undisguisedly exhibit a piece of nonsense or stupidity. We shall be curious to learn what may be the technique of such jokes.

We have now already found from two groups of examples that the joke-work makes use of deviations from normal thinking - of displacement and absurdity - as technical methods for producing a joking form of expression. It is no doubt justifiable to expect that other kinds of faulty reasoning may find a similar use. And it is in fact possible to produce a few examples of the sort:

Two Jewish jokes, though they are of a coarse type, are even clearer, since they are free from any trace of displacement:
Can we feel sure that none of the possible techniques of jokes has escaped our investigation? Of course not. But a continued examination of fresh material can convince us that we have got to know the commonest and most important technical methods of the joke-work - at all events as much as is required for forming a judgement on the nature of that psychical process. So far we have not arrived at any such judgement; but on the other hand we are now in possession of an important indication of the direction from which we may expect to receive further light upon the problem. The interesting processes of condensation accompanied by the formation of a substitute, which we have recognized as the core of the technique of verbal jokes, point towards the formation of dreams, in the mechanism of which the same psychical processes have been discovered. This is equally true, however, of the techniques of conceptual jokes - displacement, faulty reasoning, absurdity, indirect representation, representation by the opposite - which reappear one and all in the technique of the dream-work. Displacement is responsible for the puzzling appearance of dreams, which prevents our recognizing that they are a continuation of our waking life. The use of absurdity and nonsense in dreams has cost them the dignity of being regarded as psychical products and has led the authorities to suppose that a disintegration of the mental activities and a cessation of criticism, morality and logic are necessary conditions of the formation of dreams. Representation by the opposite is so common in dreams that even the popular books of dream-interpretation, which are on a completely wrong tack, are in the habit of taking it into account. Indirect representation - the replacement of a dream-thought by an allusion, by something small, a symbolism akin to analogy - is precisely what distinguishes the mode of expression of dreams from that of our waking life.¹ So far-reaching an agreement between the methods of the joke-work and those of the dream-work can scarcely be a matter of chance. To demonstrate this agreement in detail and to examine its basis will be one of our later tasks.

¹ This time we will not examine the technique of the joke; we propose to turn our attention to another factor, which is actually the most important one. When those of us present heard this improvised joke it gave us pleasure - which I can clearly recall - and made us laugh. In this instance, as in countless others, the hearers' feeling of pleasure cannot have arisen from the purpose of the joke or from its intellectual content; there is nothing left open to us but to bring that feeling of pleasure into connection with the technique of the joke. The technical methods of joking which we have earlier described - condensation, displacement, indirect representation and so on - thus possess the power of evoking a feeling of pleasure in the hearer, though we cannot in the least see how they may have acquired this power. In this simple way we arrive at the second thesis in our clarification of jokes; the first (p. 1623) asserted that the characteristic of jokes lay in their form of expression. Let us further reflect that this second thesis has in fact taught us nothing new. It merely isolates what was already included in an observation we had made earlier. It will be recalled that when we had succeeded in reducing a joke (that is, in replacing its form of expression by another one, while carefully preserving its sense) it had lost not only its character as a joke but also its power to make us laugh - our enjoyment of the joke.

² The third group of techniques of jokes - for the most part of conceptual jokes - which comprises faulty thinking, displacements, absurdity, representation by the opposite, etc., may at a first glance seem to bear a special impress and to betray no kinship with the techniques of rediscovery of what is familiar or the replacement of object-associations by word-associations. Nevertheless it is particularly easy here to bring into play the theory of economy or relief in psychical expenditure.
I should like to discuss yet another interesting characteristic of joke-technique, in connection with an example of a displacement joke. Once when Gallmeyer, that actress of genius, was asked the unwelcome question 'Your age?' she is said to have replied 'in the tone of voice of a Gretchen and with her eyes bashfully cast down: "at Brünn."' This is a model displacement. When she was asked her age she replied by giving the place of her birth. She was thus anticipating the next question and was letting it be understood that she would be glad to know that this one question had been passed over. Yet we feel that in this instance the characteristic of jokes is not expressed in all its purity. It is too clear that the question is being evaded, the displacement is too obvious. Our attention understands at once that what is in question is an intentional displacement. In the other displacement jokes the displacement is disguised; our attention is held by the effort to detect it. In the displacement joke recorded on p. 1658, in the reply made to a recommendation of a riding horse 'What should I be doing in Pressburg at half-past six?' the displacement is also prominent. But to make up for this it has a confusing effect on the attention through its nonsensical nature, whereas in the actress's examination we are able to recognize her displacement-reply immediately. - [Added 1912] What are known as 'Scherzfragen [facetious questions]' deviate from jokes in another direction, though apart from this they may make use of the best techniques. Here is an example of one of them, which uses the technique of displacement: 'What is a cannibal who has eaten his father and his mother?' - 'An orphan.' - 'And if he, has eaten all his other relations as well?' - 'The sole heir.' - 'And where will a monster of that kind find sympathy?' - 'In the dictionary under "S". ' 'Facetious questions' of this kind are not proper jokes because the joking answers that they call for cannot be guessed in the same way as are the allusions, omissions, etc. of jokes.

[1905c, 1739]

Let us now recall what it was during our investigation of jokes that gave us occasion to think of dreams. We found that the characteristics and effects of jokes are linked with certain forms of expression or technical methods, among which the most striking are condensation, displacement and indirect representation. Processes, however, which lead to the same results - condensation, displacement and indirect representation - have become known to us as peculiarities of the dream-work. Does not this agreement suggest the conclusion that joke-work and dream-work must, at least in some essential respect, be identical? The dream-work has, I think, been revealed to us as regards its most important characteristics. Of the psychical processes in jokes the part that is hidden from us is precisely the one that may be compared to the dream-work - namely, what happens during the formation of a joke in the first person. Shall we not yield to the temptation to construct that process on the analogy of the formation of a dream? A few of the characteristics of dreams are so alien to jokes that the part of the dream-work corresponding to those characteristics cannot be transferred to the formation of jokes. There is no doubt that the regression of the train of thought to perception is absent in jokes. But the other two stages of dream-formation, the sinking of a preconscious thought into the unconscious and its unconscious revision, if they could be supposed to occur in joke-formation, would present the precise outcome that we can observe in jokes. Let us decide, then, to adopt the hypothesis that this is the way in which jokes are formed in the first person: a preconscious thought is given over for a moment to unconscious revision and the outcome of this is at once grasped by conscious perception.

[1905c, 1750]
We have entered so closely, in connection with the processes of condensation, into the importance of the analogy between jokes and dreams that we may be briefer in what follows. As we know, the displacements in the dream-work point to the operation of the censorship of conscious thinking, and accordingly, when we come across displacement among the techniques of jokes, we shall be inclined to suppose that an inhibitory force plays a part in the formation of jokes as well. And we already know that this is quite generally the case. The effort made by jokes to recover the old pleasure in nonsense or the old pleasure in words finds itself inhibited in normal moods by objections raised by critical reason; and in every individual case this has to be overcome. But the manner in which the joke-work accomplishes this task shows a sweeping distinction between jokes and dreams. In the dream-work it is habitually accomplished by displacements, by the selection of ideas which are sufficiently remote from the objectionable one for the censorship to allow them to pass, but which are nevertheless derivatives of that idea and have taken over its psychical cathexis by means of a complete transference. For this reason displacements are never absent in a dream and are far more comprehensive.

All these methods of displacement appear too as techniques of joking. But when they appear, they usually respect the limits imposed on their employment in conscious thinking; and they may be altogether absent, although jokes too have invariably a task to accomplish of dealing with an inhibition. We can understand the subordinate place taken by displacements in the joke-work when we recall that jokes always have another technique at their command for keeping off inhibition and indeed that we have found nothing more characteristic of them than precisely this technique. For jokes do not, like dreams, create compromises; they do not evade the inhibition, but they insist on maintaining play with words or with nonsense unaltered. They restrict themselves, however, to a choice of occasions in which this play or this nonsense can at the same time appear allowable (in jests) or sensible (in jokes), thanks to the ambiguity of words and the multiplicity of conceptual relations. Nothing distinguishes jokes more clearly from all other psychical structures than this double-sidedness and this duplicity in speech. From this point of view at least the authorities come closest to an understanding of the nature of jokes when they lay stress on 'sense in nonsense'.

In view of the universal predominance in jokes of this peculiar technique for overcoming their inhibitions, it might be thought superfluous for them ever to make use in particular cases of the technique of displacement. But, on the one hand, certain species of that technique remain of value to jokes as aims and as sources of pleasure - for instance, displacement proper (diversion of thoughts), which indeed partakes of the nature of nonsense. On the other hand, it should not be forgotten that the highest stage of jokes, tendentious jokes, often have to overcome two kinds of inhibition, those opposed to the joke itself and those opposed to its purpose (p. 1696), and that allusions and displacements are well qualified to make this latter task possible.
We can gain some information about humorous displacement if we look at it in the light of a defensive process. Defensive processes are the psychical correlative of the flight reflex and perform the task of preventing the generation of unpleasure from internal sources. In fulfilling this task they serve mental events as an automatic regulation, which in the end, incidentally, turns out to be detrimental and has to be subjected to conscious thinking. I have indicated one particular form of this defence, repression that has failed, as the operative mechanism for the development of psychoneuroses. Humour can be regarded as the highest of these defensive processes. It scorns to withdraw the ideational content bearing the distressing affect from conscious attention as repression does, and thus surmounts the automatism of defence. It brings this about by finding a means of withdrawing the energy from the release of unpleasure that is already in preparation and of transforming it, by discharge, into pleasure. It is even conceivable that once again it may be a connection with the infantile that puts the means for achieving this at its disposal. Only in childhood have there been distressing affects at which the adult would smile to-day - just as he laughs, as a humorist, at his present distressing affects. The exaltation of his ego, to which the humorous displacement bears witness, and of which the translation would no doubt be 'I am too big (too fine) to be distressed by these things', might well be derived from his comparing his present ego with his childish one. This view is to some extent supported by the part played by the infantile in neurotic processes of repression. [1905c, 1807]

Displacement of accent is unheard-of as a method of expressing thoughts. We sometimes make use of it in waking thought in order to produce a comic effect. I can perhaps call up the impression it produces of going astray if I recall an anecdote. There was a blacksmith in a village, who had committed a capital offence. The Court decided that the crime must be punished; but as the blacksmith was the only one in the village and was indispensable, and as on the other hand there were three tailors living there, one of them was hanged instead. [1916-1917, 3266]

I was able to show from a short story by W. Jensen called Gradiva, which has no particular merit in itself, that invented dreams can be interpreted in the same way as real ones and that the unconscious mechanisms familiar to us in the 'dream-work' are thus also operative in the processes of imaginative writing. My book on Jokes and their Relation to the Unconscious was a side-issue directly derived from The Interpretation of Dreams. The only friend of mine who was at that time interested in my work remarked to me that my interpretations of dreams often impressed him as being like jokes. In order to throw some light on this impression, I began to investigate jokes and found that their essence lay in the technical methods employed in them, and that these were the same as the means used in the 'dream-work' - that is to say, condensation, displacement, the representation of a thing by its opposite or by something very small, and so on. This led to an economic enquiry into the origin of the high degree of pleasure obtained from hearing a joke. And to this the answer was that it was due to the momentary suspension of the expenditure of energy upon maintaining repression, owing to the attraction exercised by the offer of a bonus of pleasure (fore-pleasure). [1925d, 4239]
Still more remarkable is the other process - displacement or shifting of accent - which in conscious thinking we come across only as faulty reasoning or as means for a joke. The different ideas in the dream-thoughts are, indeed, not all of equal value; they are cathedected with quotas of affect of varying magnitude and are correspondingly judged to be important and deserving of interest to a greater or less degree. In the dream-work these ideas are separated from the affects attaching to them. The affects are dealt with independently; they may be displaced on to something else, they may be retained, they may undergo alterations, or they may not appear in the dream at all. The importance of the ideas that have been stripped of their affect returns in the dream as sensory strength in the dream-pictures; but we observe that this accent has passed over from important elements to indifferent ones. Thus something that played only a minor part in the dream-thoughts seems to be pushed into the foreground in the dream as the main thing, while, on the contrary, what was the essence of the dream-thoughts finds only passing and indistinct representation in the dream. No other part of the dream-work is so much responsible for making the dream strange and incomprehensible to the dreamer. Displacement is the principal means used in the dream-distortion to which the dream-thoughts must submit under the influence of the censorship.
[1933a, 4633]
The power which makes it difficult or impossible for women, and to a lesser degree for men as well, to enjoy undisguised obscenity is termed by us 'repression'; and we recognize in it the same psychical process which, in cases of serious illness, keeps whole complexes of impulses, together with their derivatives, away from consciousness, and which has turned out to be the main factor in the causation of what are known as psycho-neuroses. It is our belief that civilization and higher education have a large influence in the development of repression, and we suppose that, under such conditions, the psychical organization undergoes an alteration (that can also emerge as an inherited disposition) as a result of which what was formerly felt as agreeable now seems unacceptable and is rejected with all possible psychical force. The repressive activity of civilization brings it about that primary possibilities of enjoyment, which have now, however, been repudiated by the censorship in us, are lost to us. But to the human psyche all renunciation is exceedingly difficult, and so we find that tendentious jokes provide a means of undoing the renunciation and retrieving what was lost. When we laugh at a refined obscene joke, we are laughing at the same thing that makes a peasant laugh at a coarse piece of smut. In both cases the pleasure springs from the same source. We, however, could never bring ourselves to laugh at the coarse smut; we should feel ashamed or it would seem to us disgusting. We can only laugh when a joke has come to our help.

[1905c, 1697]
Only when we rise to a society of a more refined education do the formal conditions for jokes play a part. The smut becomes a joke and is only tolerated when it has the character of a joke. The technical method which it usually employs is the allusion - that is, replacement by something small, something remotely connected, which the hearer reconstructs in his imagination into a complete and straightforward obscenity. The greater the discrepancy between what is given directly in the form of smut and what it necessarily calls up in the hearer, the more refined becomes the joke and the higher, too, it may venture to climb into good society. As can easily be shown from examples, smut which has the characteristics of a joke has at its disposal, apart from allusion, whether coarse or refined, all the other methods of verbal and conceptual jokes.

[1905c, 1696]

And here at last we can understand what it is that jokes achieve in the service of their purpose. They make possible the satisfaction of an instinct (whether lustful or hostile) in the face of an obstacle that stands in its way. They circumvent this obstacle and in that way draw pleasure from a source which the obstacle had made inaccessible. The obstacle standing in the way is in reality nothing other than women's incapacity to tolerate undisguised sexuality, an incapacity correspondingly increased with a rise in the educational and social level. The woman who is thought of as having been present in the initial situation is afterwards retained as though she were still present, or in her absence her influence still has an intimidating effect on the men. We can observe how men of a higher class are at once induced, when they are in the company of girls of an inferior class, to reduce their smutty jokes to the level of simple smut.

[1905c, 1697]

The power which makes it difficult or impossible for women, and to a lesser degree for men as well, to enjoy undisguised obscenity is termed by us 'repression'; and we recognize in it the same psychical process which, in cases of serious illness, keeps whole complexes of impulses, together with their derivatives, away from consciousness, and which has turned out to be the main factor in the causation of what are known as psycho-neuroses. It is our belief that civilization and higher education have a large influence in the development of repression, and we suppose that, under such conditions, the psychical organization undergoes an alteration (that can also emerge as an inherited disposition) as a result of which what was formerly felt as agreeable now seems unacceptable and is rejected with all possible psychical force. The repressive activity of civilization brings it about that primary possibilities of enjoyment, which have now, however, been repudiated by the censorship in us, are lost to us. But to the human psyche all renunciation is exceedingly difficult, and so we find that tendentious jokes provide a means of undoing the renunciation and retrieving what was lost. When we laugh at a refined obscene joke, we are laughing at the same thing that makes a peasant laugh at a coarse piece of smut. In both cases the pleasure springs from the same source. We, however, could never bring ourselves to laugh at the coarse smut; we should feel ashamed or it would seem to us disgusting. We can only laugh when a joke has come to our help.

[1905c, 1697]
We have entered so closely, in connection with the processes of condensation, into the importance of the analogy between jokes and dreams that we may be briefer in what follows. As we know, the displacements in the dream-work point to the operation of the censorship of conscious thinking, and accordingly, when we come across displacement among the techniques of jokes, we shall be inclined to suppose that an inhibitory force plays a part in the formation of jokes as well. And we already know that this is quite generally the case. The effort made by jokes to recover the old pleasure in nonsense or the old pleasure in words finds itself inhibited in normal moods by objections raised by critical reason; and in every individual case this has to be overcome. But the manner in which the joke-work accomplishes this task shows a sweeping distinction between jokes and dreams. In the dream-work it is habitually accomplished by displacements, by the selection of ideas which are sufficiently remote from the objectionable one for the censorship to allow them to pass, but which are nevertheless derivatives of that idea and have taken over its psychical cathexis by means of a complete transference. For this reason displacements are never absent in a dream and are far more comprehensive.
[1905c, 1755]
The meaning of this remark is clear. It is once again a question of the representation of something that cannot be expressed directly. How does this 'indirect representation' come about? Starting from the representation in the joke, we trace the path backwards through a series of easily established associations and inferences.

For instance, Lichtenberg coined the saying: 'New spas cure well', which at once reminds us of the proverb: 'New brooms sweep clean.' The two phrases share the first one and a half words and the last word, as well as the whole structure of the sentence.¹ And there is no doubt that the sentence came into the witty philosopher's head as an imitation of the familiar proverb. Thus Lichtenberg's saying becomes an allusion to the proverb. By means of this allusion something is suggested that is not said straight out - namely that something else is responsible for the effects produced by spas besides the unvarying characteristics of thermal springs.

Heine's 'Bäder von Lucca' contains a regular wasp's nest of the most stinging allusions and makes the most ingenious use of this form of joke for polemical purposes (against Count Platen). Long before the reader can suspect what is afoot, there are foreshadowings of a particular theme, peculiarly ill-adapted for direct representation, by allusions to material of the most varied kind, - for instance, in Hirsch-Hyacinth's verbal contortions: 'You are too stout and I am too thin; you have a good deal of imagination and I have all the more business sense; I am a practicus and you are a diarrheticus; in short you are my complete antipodex.' - 'Venus Urinia' - 'the stout Gudel von Dreckwall' of Hamburg, and so on. In what follows, the events described by the author take a turn which seems at first merely to display his mischievous spirit but soon reveals its symbolic relation to his polemical purpose and at the same time shows itself as allusive. Eventually the attack on Platen bursts out, and thenceforward allusions to the theme (with which we have already been made acquainted) of the Count's love for men gushes out and overflows in every sentence of Heine's attack on his opponent's talents and character. For instance:

I have occasionally described allusion as 'indirect representation'; and we may now observe that the various species of allusion, together with representation by the opposite and other techniques that have still to be mentioned, may be united into a single large group, for which 'indirect representation' would be the most comprehensive name. 'Faulty reasoning', 'unification', 'indirect representation' - these, then, are the headings under which we can classify those techniques of conceptual jokes which we have come to know.

If we examine our material further, we seem to recognize a fresh sub-species of indirect representation which can be precisely characterized but of which few examples can be adduced. This is representation by something small or very small - which performs the task of giving full expression to a whole characteristic by means of a tiny detail. This group can be brought under the classification of 'allusion', if we bear in mind that this smallness is related to what has to be represented, and can be seen to proceed from it. For instance:
There is another kind of indirect representation used by jokes, namely the ‘analogy’. We have kept it back so long because the consideration of it comes up against new difficulties, or makes particularly evident difficulties that we have already come up against in other connections. We have already admitted that in some of the examples we have examined we have not been able to banish a doubt as to whether they ought to be regarded as jokes at all; and in this uncertainty we have recognized that the foundations of our enquiry have been seriously shaken. But I am aware of this uncertainty in no other material more strongly or more frequently than in jokes of analogy. There is a feeling - and this is probably true of a large number of other people under the same conditions - which tells me ‘this is a joke, I can pronounce this to be a joke’ even before the hidden essential nature of jokes has been discovered. This feeling leaves me in the lurch most often in the case of joking analogies. If to begin with I unhesitatingly pronounce an analogy to be a joke, a moment later I seem to notice that the enjoyment it gives me is of a quality different from what I am accustomed to derive from a joke. And the circumstance that joking analogies are very seldom able to provoke the explosive laugh which signalizes a good joke makes it impossible for me to resolve the doubt in my usual way - by limiting myself to the best and most effective examples of a species.

[1905c, 1681]

In the face of this and many other examples, we can no longer dispute the fact that an analogy can in itself possess the characteristic of being a joke, without this impression being accounted for by a complication with one of the familiar joke techniques. But, that being so, we are completely at a loss to see what it is that determines the joking characteristic of analogies, since that characteristic certainly does not reside in analogy as a form of expression of thought or in the operation of making a comparison. All we can do is to include analogy among the species of ‘indirect representation’ used by the joke-technique and we must leave unresolved the problem which we have met with much more clearly in the case of analogies than in the methods of joking that we came across earlier. No doubt, moreover, there must be some special reason why the decision whether something is a joke or not offers greater difficulties in analogies than in other forms of expression.

[1905c, 1685]
Can we feel sure that none of the possible techniques of jokes has escaped our investigation? Of course not. But a continued examination of fresh material can convince us that we have got to know the commonest and most important technical methods of the joke-work - at all events as much as is required for forming a judgement on the nature of that psychical process. So far we have not arrived at any such judgement; but on the other hand we are now in possession of an important indication of the direction from which we may expect to receive further light upon the problem. The interesting processes of condensation accompanied by the formation of a substitute, which we have recognized as the core of the technique of verbal jokes, point towards the formation of dreams, in the mechanism of which the same psychical processes have been discovered. This is equally true, however, of the techniques of conceptual jokes - displacement, faulty reasoning, absurdity, indirect representation, representation by the opposite - which re-appear one and all in the technique of the dream-work. Displacement is responsible for the puzzling appearance of dreams, which prevents our recognizing that they are a continuation of our waking life. The use of absurdity and nonsense in dreams has cost them the dignity of being regarded as psychical products and has led the authorities to suppose that a disintegration of the mental activities and a cessation of criticism, morality and logic are necessary conditions of the formation of dreams. Representation by the opposite is so common in dreams that even the popular books of dream-interpretation, which are on a completely wrong tack, are in the habit of taking it into account. Indirect representation - the replacement of a dream-thought by an allusion, by something small, a symbolism akin to analogy - is precisely what distinguishes the mode of expression of dreams from that of our waking life.¹ So far-reaching an agreement between the methods of the joke-work and those of the dream-work can scarcely be a matter of chance. To demonstrate this agreement in detail and to examine its basis will be one of our later tasks.

[1905c, 1686]

This time we will not examine the technique of the joke; we propose to turn our attention to another factor, which is actually the most important one. When those of us present heard this improvised joke it gave us pleasure - which I can clearly recall - and made us laugh. In this instance, as in countless others, the hearers' feeling of pleasure cannot have arisen from the purpose of the joke or from its intellectual content; there is nothing left open to us but to bring that feeling of pleasure into connection with the technique of the joke. The technical methods of joking which we have earlier described - condensation, displacement, indirect representation and so on - thus possess the power of evoking a feeling of pleasure in the hearer, though we cannot in the least see how they may have acquired this power. In this simple way we arrive at the second thesis in our clarification of jokes; the first (p. 1623) asserted that the characteristic of jokes lay in their form of expression. Let us further reflect that this second thesis has in fact taught us nothing new. It merely isolates what was already included in an observation we had made earlier. It will be recalled that when we had succeeded in reducing a joke (that is, in replacing its form of expression by another one, while carefully preserving its sense) it had lost not only its character as a joke but also its power to make us laugh - our enjoyment of the joke.

[1905c, 1692]

Only when we rise to a society of a more refined education do the formal conditions for jokes play a part. The smut becomes a joke and is only tolerated when it has the character of a joke. The technical method which it usually employs is the allusion - that is, replacement by something small, something remotely connected, which the hearer reconstructs in his imagination into a complete and straightforward obscenity. The greater the discrepancy between what is given directly in the form of smut and what it necessarily calls up in the hearer, the more refined becomes the joke and the higher, too, it may venture to climb into good society. As can easily be shown from examples, smut which has the characteristics of a joke has at its disposal, apart from allusion, whether coarse or refined, all the other methods of verbal and conceptual jokes.

[1905c, 1696]
And here at last we can understand what it is that jokes achieve in the service of their purpose. They make possible the satisfaction of an instinct (whether lustful or hostile) in the face of an obstacle that stands in its way. They circumvent this obstacle and in that way draw pleasure from a source which the obstacle had made inaccessible. The obstacle standing in the way is in reality nothing other than women's incapacity to tolerate undisguised sexuality, an incapacity correspondingly increased with a rise in the educational and social level. The woman who is thought of as having been present in the initial situation is afterwards retained as though she were still present, or in her absence her influence still has an intimidating effect on the men. We can observe how men of a higher class are at once induced, when they are in the company of girls of an inferior class, to reduce their smutty jokes to the level of simple smut.

If in these cases the obstacle to the aggressiveness which the joke helped to evade was an internal one - an aesthetic objection to the invective - elsewhere it can be of a purely external sort. This was so in the case in which Serenissimus asked a stranger by whose similarity to his own person he had been struck: 'Was your mother in the Palace at one time?' and the repartee was: 'No, but my father was.' The person to whom the question was put would no doubt have liked to knock down the impertinent individual who dared by such an allusion to cast a slur on his beloved mother's memory. But the impertinent individual was Serenissimus, whom one may not knock down or even insult unless one is prepared to purchase that revenge at the price of one's whole existence. The insult must therefore, it would seem, be swallowed in silence. But fortunately a joke shows the way in which the insult may be safely avenged - by making use of the technical method of unification in order to take up the allusion and turn it back against the aggressor. Here the impression of a joke is so much determined by its purpose that, in face of the joking character of the rejoinder, we are inclined to forget that the question asked by the aggressor had itself the character of a joke with the technique of allusion.

Let us now recall what it was during our investigation of jokes that gave us occasion to think of dreams. We found that the characteristics and effects of jokes are linked with certain forms of expression or technical methods, among which the most striking are condensation, displacement and indirect representation. Processes, however, which lead to the same results - condensation, displacement and indirect representation - have become known to us as peculiarities of the dream-work. Does not this agreement suggest the conclusion that joke-work and dream-work must, at least in some essential respect, be identical? The dream-work has, I think, been revealed to us as regards its most important characteristics. Of the psychical processes in jokes the part that is hidden from us is precisely the one that may be compared to the dream-work - namely, what happens during the formation of a joke in the first person. Shall we not yield to the temptation to construct that process on the analogy of the formation of a dream? A few of the characteristics of dreams are so alien to jokes that the part of the dream-work corresponding to those characteristics cannot be transferred to the formation of jokes. There is no doubt that the regression of the train of thought to perception is absent in jokes. But the other two stages of dream-formation, the sinking of a preconscious thought into the unconscious and its unconscious revision, if they could be supposed to occur in joke-formation, would present the precise outcome that we can observe in jokes. Let us decide, then, to adopt the hypothesis that this is the way in which jokes are formed in the first person: a preconscious thought is given over for a moment to unconscious revision and the outcome of this is at once grasped by conscious perception.
Among the techniques common to jokes and dreams, representation by the opposite and the use of nonsense claim some amount of our interest. The former is one of the more effective methods employed in jokes, as may be seen among others by the examples of 'overstatement jokes' ([1670 f.]). Incidentally, representation by the opposite is not able, like most other joke-techniques, to escape conscious attention. A person who tries to bring the joke-work into operation in himself as deliberately as possible - a professional wag - soon discovers as a rule that the easiest way of replying to an assertion by a joke is by asserting its contrary and by leaving it to the inspiration of the moment to get rid of the objection which his contradiction is likely to provoke, by giving what he has said a fresh interpretation. It may be that representation by the opposite owes the favour it enjoys to the fact that it forms the core of another pleasurable way of expressing a thought, which can be understood without any need for bringing in the unconscious. I am thinking of irony, which comes very close to joking and is counted among the sub-species of the comic. Its essence lies in saying the opposite of what one intends to convey to the other person, but in sparing him contradiction by making him understand - by one's tone of voice, by some accompanying gesture, or (where writing is concerned) by some small stylistic indications - that one means the opposite of what one says. Irony can only be employed when the other person is prepared to hear the opposite, so that he cannot fail to feel an inclination to contradict. As a result of this condition, irony is exposed particularly easily to the danger of being misunderstood. It brings the person who uses it the advantage of enabling him readily to evade the difficulties of direct expression, for instance in invectives. It produces comic pleasure in the hearer, probably because it stirs him into a contradictory expenditure of energy which is at once recognized as being unnecessary. A comparison like this between jokes and a closely related type of the comic may confirm our assumption that what is peculiar to jokes is their relation to the unconscious and that this may perhaps distinguish them from the comic as well.¹

[1905c, 1757]

In the dream-work, representation by the opposite plays a far greater part even than in jokes. Dreams are not merely fond of representing two contraries by one and the same composite structure, but they so often change something in the dream-thoughts into its opposite that this leads to a great difficulty in the work of interpretation. 'There is no way of deciding at a first glance whether any element that admits of a contrary is present in the dream-thoughts as a positive or as a negative.'²

[1905c, 1757]
Nonsense, absurdity, which appears so often in dreams and has brought them into so much undeserved contempt, never arises by chance through the ideational elements being jumbled together, but can always be shown to have been admitted by the dream-work intentionally and to be designed to represent embittered criticism and contemptuous contradiction in the dream-thoughts. Thus the absurdity in the content of the dream takes the place of the judgement 'this is a piece of nonsense' in the dream-thoughts. I laid great stress on the evidence of this in my Interpretation of Dreams because I thought that in this way I could make the most forcible attack on the error of believing that the dream is not a psychical phenomenon at all - an error which blocks the way to a knowledge of the unconscious. We have now learned, in the course of solving certain tendentious jokes (p. 1660 ff.), that nonsense in jokes is made to serve the same aims of representation. We know too that a senseless façade to a joke is particularly well suited to increase the hearer's psychical expenditure and so to raise the quota liberated for discharge by laughing. But besides this, it must not be forgotten that the nonsense in a joke is an end in itself, since the intention of recovering the old pleasure in nonsense is among the joke-work's motives. There are other ways of recovering the nonsense and of deriving pleasure from it: caricature, exaggeration, parody and travesty make use of them and so create 'comic nonsense'. If we submit these forms of expression to an analysis similar to the one we have applied to jokes, we shall find that in none of these cases is there any occasion for bringing in unconscious processes in our sense in order to explain them. We can now understand too how it is that the characteristic of being a joke can come as an extra addition to a caricature, exaggeration or parody; what makes this possible is a difference in the 'psychical scene of action'.²

I have already asserted that obsessional thoughts have undergone a distortion similar to that undergone by dream-thoughts before they become the manifest content of a dream. The technique of this distortion may therefore be of interest to us, and there should be nothing to prevent our exhibiting its various modes by means of a series of obsessions which have been translated and made clear. But here again the conditions governing the publication of this case make it impossible for me to give more than a few specimens. Not all of the patient's obsessions were so complicated in their structure and so difficult to solve as the great rat idea. In some of the others a very simple technique was employed - namely, that of distortion by omission or ellipsis. This technique is pre-eminently applicable to jokes, but in our present case, too, it did useful work as a means of protecting things from being understood.

² An example from another of my works, Jokes and their Relation to the Unconscious, will recall to the reader the manner in which this elliptical technique is employed in making jokes: 'There is a witty and pugnacious journalist in Vienna, whose biting invective has repeatedly led to his being physically maltreated by the subjects of his attacks. On one occasion, when a fresh misdeed on the part of one of his habitual opponents was being discussed, somebody exclaimed: "If X hears of this, he'll get his ears boxed again." . . . The apparent absurdity of this remark disappears if between the two clauses we insert the words: "he'll write such a scathing article upon the man, that, etc."' - This elliptical joke, we may note, is similar in its content, as well as in its form, to the first example quoted in the text.
This is the anecdote.¹ Two not particularly scrupulous business men had succeeded, by dint
of a series of highly risky enterprises, in amassing a large fortune, and they were now making
efforts to push their way into good society. One method, which struck them as a likely one, was
to have their portraits painted by the most celebrated and highly-paid artist in the city, whose
pictures had an immense reputation. The precious canvases were shown for the first time at a
large evening party, and the two hosts themselves led the most influential connoisseur and art
critic up to the wall on which the portraits were hanging side by side. He studied the works for a
long time, and then, shaking his head, as though there was something he had missed, pointed
to the gap between the pictures and asked quietly: 'But where's the Saviour?'² I see you are all
much amused at this joke. Let us now proceed to examine it. Clearly what the connoisseur
meant to say was: 'You are a couple of rogues, like the two thieves between whom the Saviour
was crucified.' But he did not say this. Instead he made a remark which seems at first sight
strangely inappropriate and irrelevant, but which we recognize a moment later as an allusion to
the insult that he had in mind and as a perfect substitute for it. We cannot expect to find in jokes
all the characteristics that we have attributed to the ideas occurring to our patients, but we must
stress the identity of the motive for the joke and for the idea. Why did the critic not tell the
rogues straight out what he wanted to say? Because he had excellent counter-motives working
against his desire to say it to their faces. There are risks attendant upon insulting people who
are one's hosts and who have at their command the fists of a large domestic staff. One might
easily meet with the fate which I suggested in my last lecture as an analogy for repression. That
was the reason why the critic did not express the insult he had in mind directly but in the form of
an 'allusion accompanied by omission'; and the same state of things is responsible for our
patients' producing a more or less distorted substitute instead of the forgotten idea we are in
search of.
[1910a, 2218]
If at this point a reader should become indignant at a method of approach which threatens to ruin his enjoyment of jokes without being able to throw any light on the source of that enjoyment, I would beg him to be patient for the moment. At present we are only dealing with the technique of jokes; and the investigation even of this promises results, if we pursue it sufficiently far.

But here we may make a first stop and ask ourselves with what factor known to us from the literature of the subject this first finding of ours coincides, wholly or in part. Evidently with the factor of brevity, which Jean Paul describes as ‘the soul of wit’ (p. 1619 above). But brevity does not in itself constitute a joke, or otherwise every laconic remark would be one. The joke’s brevity must be of a particular kind. It will be recalled that Lipps has tried to describe this particular brevity of jokes more precisely (p. 1619). Here our investigation contributes something and shows that the brevity of jokes is often the outcome of a particular process which has left behind in the wording of the joke a second trace - the formation of a substitute. By making use of the procedure of reduction, which seeks to undo the peculiar process of condensation, we also find, however, that the joke depends entirely on its verbal expression as established by the process of condensation. Our whole interest now turns, of course, to this strange process, which has hitherto scarcely been examined. Nor can we in the least understand how all that is valuable in a joke, the yield of pleasure that the joke brings us, can originate from that process.

But before we accept the ‘tendency to economy’ as the most general characteristic of the technique of jokes and ask such questions as where it comes from, what it signifies and how the joke’s yield of pleasure arises from it, we must find space for a doubt which has a right to be heard. It may be that every joke technique shows the tendency to save something in expression: but the relation is not reversible. Not every economy of expression, not every abbreviation, is on that account a joke as well. We reached this point once before, when we were still hoping to find the process of condensation in every joke, and raised the justifiable objection that a laconic remark is not enough to constitute a joke. There must therefore be some peculiar kind of abbreviation and economy on which the characteristic of being a joke depends; and until we know the nature of that peculiarity our discovery of the common element in the techniques of jokes brings us no nearer to a solution of our problem. And let us, further, have the courage to admit that the economies made by the joke-technique do not greatly impress us. They may remind us, perhaps, of the way in which some housewives economize when they spend time and money on a journey to a distant market because vegetables are to be had there a few farthings cheaper. What does a joke save by its technique? The putting together of a few new words, which would mostly have emerged without any trouble. Instead of that, it has to take the trouble to search out the one word which covers the two thoughts. Indeed, it must often first transform one of the thoughts into an unusual form which will provide a basis for its combination with the second thought. Would it not have been simpler, easier, and, in fact, more economical to have expressed the two thoughts as they happened to come, even if this involved no common form of expression? Is not the economy in words uttered more than balanced by the expenditure on intellectual effort? And who saves by that? Who gains by it?
This time we will not examine the technique of the joke; we propose to turn our attention to another factor, which is actually the most important one. When those of us present heard this improvised joke it gave us pleasure - which I can clearly recall - and made us laugh. In this instance, as in countless others, the hearers' feeling of pleasure cannot have arisen from the purpose of the joke or from its intellectual content; there is nothing left open to us but to bring that feeling of pleasure into connection with the technique of the joke. The technical methods of joking which we have earlier described - condensation, displacement, indirect representation and so on - thus possess the power of evoking a feeling of pleasure in the hearer, though we cannot in the least see how they may have acquired this power. In this simple way we arrive at the second thesis in our clarification of jokes; the first (p. 1623) asserted that the characteristic of jokes lay in their form of expression. Let us further reflect that this second thesis has in fact taught us nothing new. It merely isolates what was already included in an observation we had made earlier. It will be recalled that when we had succeeded in reducing a joke (that is, in replacing its form of expression by another one, while carefully preserving its sense) it had lost not only its character as a joke but also its power to make us laugh - our enjoyment of the joke.

We shall scarcely be contradicting this statement of Fischer's - we shall perhaps be doing no more than translating his thoughts into our mode of expression - if we insist that the joking activity should not, after all, be described as pointless or aimless, since it has the unmistakable aim of evoking pleasure in its hearers. I doubt if we are in a position to undertake anything without having an intention in view. If we do not require our mental apparatus at the moment for supplying one of our indispensable satisfactions, we allow it itself to work in the direction of pleasure and we seek to derive pleasure from its own activity. I suspect that this is in general the condition that governs all aesthetic ideation, but I understand too little of aesthetics to try to enlarge on this statement. As regards joking, however, I can assert, on the basis of the two discoveries we have already made, that it is an activity which aims at deriving pleasure from mental processes, whether intellectual or otherwise. No doubt there are other activities which have the same aim. They are perhaps differentiated according to the fields of mental activity from which they seek to derive pleasure or perhaps according to the methods of which they make use. We cannot for the moment decide about this; but we hold firmly to the view that the joke technique and the tendency towards economy by which it is partly governed (p. 1647 ff.) have been brought into connection with the production of pleasure.

But before we set about solving the riddle of how the technical methods of the joke-work are able to excite pleasure in the hearer, we have to recall the fact that, with a view to simplification and greater perspicuity, we have left tendentious jokes entirely on one side. We must, after all, try to throw light on the question of what the purposes of jokes are, and how they serve those purposes.

There is, first and foremost, one observation which warns us not to leave tendentious jokes on one side in our investigation of the origin of the pleasure we take in jokes. The pleasurable effect of innocent jokes is as a rule a moderate one; a clear sense of satisfaction, a slight smile, is as a rule all it can achieve in its hearers. And it may be that a part even of this effect is to be attributed to the joke's intellectual content, as we have seen from suitable examples (p. 1690). A non-tendentious joke scarcely ever achieves the sudden burst of laughter which makes tendentious ones so irresistible. Since the technique of both can be the same, a suspicion may be aroused in us that tendentious jokes, by virtue of their purpose, must have sources of pleasure at their disposal to which innocent jokes have no access.
Thus what we suspected to begin with seems to be confirmed: namely that tendentious jokes have sources of pleasure at their disposal besides those open to innocent jokes, in which all the pleasure is in some way linked to their technique. And we may also once more repeat that with tendentious jokes we are not in a position to distinguish by our feeling what part of the pleasure arises from the sources of their technique and what part from those of their purpose. Thus, strictly speaking, we do not know what we are laughing at. With all obscene jokes we are subject to glaring errors of judgement about the 'goodness' of jokes so far as this depends on formal determinants; the technique of such jokes is often quite wretched, but they have immense success in provoking laughter.

[1905c, 1697]

In the course of our discussion of the purposes of jokes we have perhaps thrown light on a number of questions and have certainly come upon plenty of suggestions for further enquiries. But the findings of this chapter combine with those of the last one to present us with a difficult problem. If it is correct to say that the pleasure provided by jokes depends on the one hand on their technique and on the other hand on their purpose, from what common point of view can such different sources of the pleasure in jokes be brought together?

[1905c, 1709]

We can now start out from an assured knowledge of the sources of the peculiar pleasure given us by jokes. We are aware that we may be deceived into confusing our enjoyment of the intellectual content of what is stated with the pleasure proper to jokes; but we know that that pleasure itself has at bottom two sources - the technique and the purposes of jokes. What we now want to discover is the way in which the pleasure arises from these sources, the mechanism of the pleasurable effect.

[1905c, 1710]

We shall, I think, find the explanation we are in search of far easier from tendentious jokes than from innocent ones. We will therefore begin with the former.

[1905c, 1710]

The pleasure in the case of a tendentious joke arises from a purpose being satisfied whose satisfaction would otherwise not have taken place. That a satisfaction such as this is a source of pleasure calls for no further remark. But the manner in which a joke leads to this satisfaction is linked with particular conditions, from which we may perhaps arrive at some further information. Two cases are to be distinguished here. The simpler one is where the satisfaction of the purpose is opposed by an external obstacle which is evaded by the joke. We found this, for instance, in the reply received by Serenissimus to his question of whether the mother of the man he was speaking to had ever lived in the Palace and in the critic's rejoinder to the two rich rascals who showed him their portraits: 'But where's the Saviour?' In the former case the purpose was to answer one insult by another, and in the latter it was to hand across an insult instead of the assessment that had been asked for. What opposed the purpose were purely external factors - the powerful position of the people at whom the insults were directed. It may nevertheless strike us that, however much these and analogous jokes of a tendentious nature may satisfy us, they are not able to provoke much laughter.

[1905c, 1710]

A certain lack of clarity which we have been unable to overcome in our handling of the mechanism of pleasure in tendentious jokes may be taken as an appropriate punishment for our having tried to clear up the more complex problem before the simpler one, tendentious jokes before innocent ones. We take note of the fact that 'economy in expenditure on inhibition or suppression' appears to be the secret of the pleasurable effect of tendentious jokes, and pass on to the mechanism of pleasure in innocent jokes.

[1905c, 1712]
On the basis of suitable specimens of innocent jokes, in which there was no fear of our judgement being disturbed by their content or purpose, we were driven to conclude that the techniques of jokes are themselves sources of pleasure; and we shall now try to discover whether it may perhaps be possible to trace that pleasure back to economy in psychical expenditure. In one group of these jokes (play upon words) the technique consisted in focusing our psychical attitude upon the sound of the word instead of upon its meaning - in making the (acoustic) word presentation itself take the place of its significance as given by its relations to thing-presentations. It may really be suspected that in doing so we are bringing about a great relief in psychical work and that when we make serious use of words we are obliged to hold ourselves back with a certain effort from this comfortable procedure. We can observe how pathological states of thought-activity, in which the possibility of concentrating psychical expenditure on a particular point is probably restricted, do in fact give this sort of sound-presentation of the word greater prominence than its meaning, and that sufferers in such states proceed in their speech on the lines (as the formula runs) of the 'external' instead of the 'internal' associations of the word-presentation. We notice, too, that children, who, as we know, are in the habit of still treating words as things, tend to expect words that are the same or similar to have the same meaning behind them - which is a source of many mistakes that are laughed at by grown-up people. If, therefore, we derive unmistakable enjoyment in jokes from being transported by the use of the same or a similar word from one circle of ideas to another, remote one (in the 'Home-Roulard', for instance, from the kitchen to politics), this enjoyment is no doubt correctly to be attributed to economy in psychical expenditure. The pleasure in a joke arising from a 'short-circuit' like this seems to be the greater the more alien the two circles of ideas that are brought together by the same word - the further apart they are, and thus the greater the economy which the joke's technical method provides in the train of thought. We may notice, too, that here jokes are making use of a method of linking things up which is rejected and studiously avoided by serious thought.

[1905c, 1712]

In a second group of technical methods used in jokes - unification, similarity of sound, multiple use, modification of familiar phrases, allusions to quotations - we can single out as their common characteristic the fact that in each of them something familiar is rediscovered, where we might instead have expected something new. This rediscovery of what is familiar is pleasurable, and once more it is not difficult for us to recognize this pleasure as a pleasure in economy and to relate it to economy in psychical expenditure.

[1905c, 1712]

It seems to be generally agreed that the rediscovery of what is familiar, 'recognition', is pleasurable. Groos (1899, 153) writes: 'Recognition is always, unless it is too much mechanized (as, for instance, in dressing, . . .), linked with feelings of pleasure. The mere quality of familiarity is easily accompanied by the quiet sense of comfort which Faust felt when, after an uncanny encounter, he entered his study once again . . . If the act of recognition thus gives rise to pleasure, we might expect that men would hit on the idea of exercising this capacity for its own sake - that is, would experiment with it in play. And in fact Aristotle regarded joy in recognition as the basis of the enjoyment of art, and it cannot be disputed that this principle should not be overlooked, even if it does not possess such far-reaching significance as Aristotle attributes to it.'

[1905c, 1713]
Groos goes on to discuss games whose characteristic lies in the fact that they intensify the joy in recognition by putting obstacles in its way - that is to say, by creating a 'psychical damming up', which is got rid of by the act of recognition. His attempt at an explanation, however, abandons the hypothesis that recognition is pleasurable in itself, since, by referring to these games, he is tracing back the enjoyment of recognition to a joy in power, a joy in the overcoming of a difficulty. I regard the latter factor as secondary, and I see no reason to depart from the simpler view that recognition is pleasurable in itself i.e., through relieving psychical expenditure - and that the games founded on this pleasure make use of the mechanism of damming up only in order to increase the amount of such pleasure.

It is also generally acknowledged that rhymes, alliterations, refrains, and other forms of repeating similar verbal sounds which occur in verse, make use of the same source of pleasure - the rediscovery of something familiar. The 'sense of power' plays no perceptible part in these techniques, which show so much similarity to that of 'multiple use' in the case of jokes.

In view of the close connection between recognizing and remembering, it is not rash to suppose that there may also be a pleasure in remembering - that the act of remembering is in itself accompanied by a feeling of pleasure of similar origin. Groos seems not to be averse to such a hypothesis, but he derives it once again from the 'sense of power', to which he attributes (wrongly, in my view) the chief reason for enjoyment in almost all games.
The ‘rediscovery of what is familiar’ is the basis for the use of another technical resource in jokes, which we have not yet mentioned. I refer to the factor of ‘topicality’, which is a fertile source of pleasure in a great many jokes and which explains a few of the peculiarities in the life-history of jokes. There are jokes which are completely independent of this condition, and in a monograph on jokes we are obliged to make almost exclusive use of examples of that kind. But we cannot forget that, in comparison with these perennial jokes, we have perhaps laughed even more heartily at others which it is difficult for us to use now because they would call for long commentaries and even with such help would not produce their original effect. These latter jokes contained allusions to people and events which at the time were ‘topical’, which had aroused general interest and still kept it alive. When this interest had ceased and the business in question had been settled, these jokes too lost a part of their pleasurable effect and indeed a very considerable part. For instance, the joke made by my friendly host when he called a pudding that was being served a ‘Home-Roulard’ does not seem to me to-day nearly so good as it did at the time when ‘Home Rule’ provided a standing head-line in the political columns of our daily papers. In attempting to estimate the merits of this joke I now attribute them to the fact that a single word has transported us, with the economy of a long detour in thought, from the circle of ideas of the kitchen to the remote one of politics. But at the time my account would have had to be different, and I should have said that this word transported us from the circle of ideas of the kitchen to that of politics, which was remote from it but was certain of our lively interest because we were constantly concerned with it. Another joke, ‘This girl reminds me of Dreyfus; the army doesn’t believe in her innocence’, has also faded to-day, though its technical methods must have remained unaltered. The bewilderment caused by the comparison and the double-entendre in the word ‘innocence’ cannot compensate for the fact that the allusion, which at the time touched on an event cathected with fresh excitement, to-day recalls a question that is settled. Here is a joke which is still topical: ‘The Crown Princess Louise approached the crematorium in Gotha with the question of how much a Verbrennung [cremation] costs. The management replied: “Five thousand marks normally; but we will only charge you three thousand as you have been durchgebrannt [literally ‘been burnt through’ - slang for ‘eloped’] once already.” A joke like this sounds irresistible to-day; in a short time it will have sunk very considerably in our estimation; and some time later still, in spite of its good play upon words, it will lose its effect entirely, for it will be impossible to repeat it without adding a commentary to explain who Princess Louise was and the sense in which she was durchgebrannt.

Thus a great number of the jokes in circulation have a certain length of life: their life runs a course made up of a period of flowering and a period of decay and it ends in complete oblivion. The need which men feel for deriving pleasure from their processes of thought is therefore constantly creating new jokes based on the new interests of the day. The vital force of topical jokes is not their own; it is borrowed, by the method of allusion, from those other interests, the expiry of which determines the fate of the joke as well. The factor of topicality is a source of pleasure, ephemeral it is true but particularly abundant, which supplements the sources inherent in the joke itself. It cannot be simply equated with the rediscovery of what is familiar. It is concerned rather with a particular category of what is familiar, which must in addition possess the characteristic of being fresh, recent and untouched by forgetting. In the formation of dreams, too, we come across a special preference for what is recent and we cannot escape a suspicion that association with what is recent is rewarded, and so facilitated, by a peculiar bonus of pleasure.
In all these cases of repeating the same connections or the same subject-matter in the words, or of rediscovering what is familiar or recent, it seems impossible to avoid deriving the pleasure felt in them from economy in psychical expenditure provided that this line of approach turns out to be fruitful in throwing light on details and in arriving at new generalities. We are aware that we have still to make it clear how the economy comes about and what the meaning is of the expression 'psychical expenditure'.

[1905c, 1715]

The third group of techniques of jokes - for the most part of conceptual jokes - which comprises faulty thinking, displacements, absurdity, representation by the opposite, etc., may at a first glance seem to bear a special impress and to betray no kinship with the techniques of rediscovery of what is familiar or the replacement of object-associations by word-associations. Nevertheless it is particularly easy here to bring into play the theory of economy or relief in psychical expenditure.

[1905c, 1715]

It cannot be doubted that it is easier and more convenient to diverge from a line of thought we have embarked on than to keep to it, to jumble up things that are different rather than to contrast them - and, indeed, that it is specially convenient to admit as valid methods of inference that are rejected by logic and, lastly, to put words or thoughts together without regard to the condition that they ought also to make sense. This cannot be doubted; and these are precisely the things that are done by the joke-techniques which we are discussing. But the hypothesis that behaviour of this kind by the joke-work provides a source of pleasure will strike us as strange, since apart from jokes all such inefficient intellectual functioning produces in us nothing but unpleasurable defensive feelings.

[1905c, 1716]

‘Pleasure in nonsense’, as we may call it for short, is concealed in serious life to a vanishing point. In order to demonstrate it we must investigate two cases - one in which it is still visible and one in which it becomes visible again: the behaviour of a child in learning, and that of an adult in a toxically altered state of mind.

[1905c, 1716]

Whatever the motive may have been which led the child to begin these games, I believe that in his later development he gives himself up to them with the consciousness that they are nonsensical, and that he finds enjoyment in the attraction of what is forbidden by reason. He now uses games in order to withdraw from the pressure of critical reason. But there is far more potency in the restrictions which must establish themselves in the course of a child's education in logical thinking and in distinguishing between what is true and false in reality; and for this reason the rebellion against the compulsion of logic and reality is deep-going and long-lasting. Even the phenomena of imaginative activity must be included in this category. The power of criticism has increased so greatly in the later part of childhood and in the period of learning which extends over puberty that the pleasure in 'liberated nonsense' only seldom dares to show itself directly. One does not venture to say anything absurd. But the characteristic tendency of boys to do absurd or silly things seems to me to be directly derived from the pleasure in nonsense. In pathological cases we often see this tendency so far intensified that once more it dominates the schoolboy's talk and answers. I have been able to convince myself in the case of a few boys of secondary school age who had developed neuroses that the unconscious workings of their pleasure in the nonsense they produced played no less a part in their inefficiency than did their real ignorance.

[1905c, 1717]
Nor, later on, does the University student cease these demonstrations against the compulsion of logic and reality, the dominance of which, however, he feels growing ever more intolerant and unrestricted. A large amount of student 'rags' are a part of this reaction. For man is a 'tireless pleasure-seeker' - I forget where I came across this happy expression - and any renunciation of a pleasure he has once enjoyed comes hard to him. With the cheerful nonsense of his Bierschwefel,¹ for instance, the student tries to rescue his pleasure in freedom of thinking, of which he is being more and more deprived by the schooling of academic instruction. Much later still, indeed, when as a grown man he meets others in scientific congresses and once more feels himself a learner, after the meeting is over there comes the Kneipzeitung,² which distorts the new discoveries into nonsense, and offers him a compensation for the fresh addition to his intellectual inhibition.

[1905c, 1717]

The Bierschwefel and the Kneipzeitung give evidence by their names to the fact that the criticism which has repressed pleasure in nonsense has already grown so powerful that it cannot be put aside even temporarily without toxic assistance. A change in mood is the most precious thing that alcohol achieves for mankind, and on that account this 'poison' is not equally indispensable for everyone. A cheerful mood, whether it is produced endogenously or toxically, reduces the inhibiting forces, criticism among them, and makes accessible once again sources of pleasure which were under the weight of suppression. It is most instructive to observe how the standards of joking sink as spirits rise. For high spirits replace jokes, just as jokes must try to replace high spirits, in which possibilities of enjoyment which are otherwise inhibited - among them the pleasure in nonsense - can come into their own: 'Mit wenig Witz und viel Behagen.'¹ Under the influence of alcohol the grown man once more becomes a child, who finds pleasure in having the course of his thoughts freely at his disposal without paying regard to the compulsion of logic.

[1905c, 1718]

I hope I have now also shown that the absurdity-techniques of jokes are a source of pleasure. It need only be repeated that this pleasure arises from an economy in psychical expenditure or a relief from the compulsion of criticism.

[1905c, 1718]

If we look back once more at the three separate groups of joke-techniques, we see that the first and third of these groups - the replacement of thing-associations by word-associations and the use of absurdity - can be brought together as re-establishing old liberties and getting rid of the burden of intellectual upbringing; they are psychical reliefs, which can in a sense be contrasted with the economizing which constitutes the technique of the second group. Relief from psychical expenditure that is already there and economizing in psychical expenditure that is only about to be called for - from these two principles all the techniques of jokes, and accordingly all pleasure from these techniques, are derived. The two species of technique and of obtaining pleasure coincide - in the main at all events - with the distinction between verbal and conceptual jokes.

[1905c, 1718]
Play - let us keep to that name - appears in children while they are learning to make use of words and to put thoughts together. This play probably obeys one of the instincts which compel children to practise their capacities (Groos). In doing so they come across pleasurable effects, which arise from a repetition of what is similar, a rediscovery of what is familiar, similarity of sound, etc., and which are to be explained as unsuspected economies in psychical expenditure. It is not to be wondered at that these pleasurable effects encourage children in the pursuit of play and cause them to continue it without regard for the meaning of words or the coherence of sentences. Play with words and thoughts, motivated by certain pleasurable effects of economy, would thus be the first stage of jokes.

This play is brought to an end by the strengthening of a factor that deserves to be described as the critical faculty or reasonableness. The play is now rejected as being meaningless or actually absurd; as a result of criticism it becomes impossible. Now, too, there is no longer any question of deriving pleasure, except accidentally, from the sources of rediscovery of what is familiar, etc., unless it happens that the growing individual is overtaken by a pleasurable mood which, like the child’s cheerfulness, lifts the critical inhibition. Only in such a case does the old game of getting pleasure become possible once more; but the individual does not want to wait for this to happen nor to renounce the pleasure that is familiar to him. He thus looks about for means of making himself independent of the pleasurable mood, and the further development towards jokes is governed by the two endeavours: to avoid criticism and to find a substitute for the mood.

I think now at length we see our way clearly. All through our consideration of the techniques of jokes we have been disturbed by the fact that they were not proper to jokes only; and yet the essence of jokes seemed to depend on them, since when they were got rid of by reduction the characteristics and the pleasure of the joke were lost. We now see that what we have described as the techniques of jokes - and we must in a certain sense continue to describe them so - are rather the sources from which jokes provide pleasure; and we feel that there is nothing strange in other procedures drawing from the same sources for the same end. The technique which is characteristic of jokes and peculiar to them, however, consists in their procedure for safeguarding the use of these methods of providing pleasure against the objections raised by criticism which would put an end to the pleasure. There is little that we can say in general about this procedure. The joke-work, as we have already remarked, shows itself in a choice of verbal material and conceptual situations which will allow the old play with words and thoughts to withstand the scrutiny of criticism; and with that end in view every peculiarity of vocabulary and every combination of thought-sequences must be exploited in the most ingenious possible way. We may be in a position later to characterize the joke-work by a particular property; for the moment it remains unexplained how the selection favourable for jokes can be made. The purpose and function of jokes, however - namely, the protection of sequences of words and thoughts from criticism - can already be seen in jests as their essential feature. Their function consists from the first in lifting internal inhibitions and in making sources of pleasure fertile which have been rendered inaccessible by those inhibitions; and we shall find that they remain loyal to this characteristic throughout their development.
We are also in a position now to assign its correct place to the factor of 'sense in nonsense' (cf. the introduction, p. 1618), to which the authorities attribute such great importance as a distinguishing mark of jokes and as an explanation of their pleasurable effect. The two fixed points in what determines the nature of jokes - their purpose of continuing pleasurable play and their effort to protect it from the criticism of reason immediately explain why an individual joke, though it may seem senseless from one point of view, must appear sensible, or at least allowable, from another. How it does so remains the affair of the joke-work; if it fails to do so, it is simply rejected as 'nonsense'. But there is no necessity for us to derive the pleasurable effect of jokes from the conflict between the feelings which arise (whether directly or along the path of 'bewilderment and enlightenment') from the simultaneous sense and nonsense of jokes. Nor have we any need to enter further into the question of how pleasure could arise from the alternation between 'thinking it senseless' and 'recognizing it as sensible'. The psychogenesis of jokes has taught us that the pleasure in a joke is derived from play with words or from the liberation of nonsense, and that the meaning of the joke is merely intended to protect that pleasure from being done away with by criticism.

[1905c, 1721]

An examination of the determinants of laughing will perhaps lead us to a plainer idea of what happens when a joke affords assistance against suppression. Even now, however, we can see that the case of tendentious jokes is a special case of the 'principle of assistance'. A possibility of generating pleasure supervenes in a situation in which another possibility of pleasure is obstructed so that, as far as the latter alone is concerned, no pleasure would arise. The result is a generation of pleasure far greater than that offered by the supervening possibility. This has acted, as it were, as an incentive bonus with the assistance of the offer of a small amount of pleasure, a much greater one, which would otherwise have been hard to achieve, has been gained. I have good reason to suspect that this principle corresponds with an arrangement that holds good in many widely separated departments of mental life and it will, I think, be expedient to describe the pleasure that serves to initiate the large release of pleasure as 'fore-pleasure', and the principle as the 'fore-pleasure principle'.

[1905c, 1726]

We are now able to state the formula for the mode of operation of tendentious jokes. They put themselves at the service of purposes in order that, by means of using the pleasure from jokes as a fore-pleasure, they may produce new pleasure by lifting suppressions and repressions. If now we survey the course of development of the joke, we may say that from its beginning to its perfecting it remains true to its essential nature. It begins as play, in order to derive pleasure from the free use of words and thoughts. As soon as the strengthening of reasoning puts an end to this play with words as being senseless, and with thoughts as being nonsensical, it changes into a jest, in order that it may retain these sources of pleasure and be able to achieve fresh pleasure from the liberation of nonsense. Next, as a joke proper, but still a non-tendentious one, it gives its assistance to thoughts and strengthens them against the challenge of critical judgement, a process in which the 'principle of confusion of sources of pleasure' is of use to it. And finally it comes to the help of major purposes which are combating suppression, in order to lift their internal inhibitions by the 'principle of fore-pleasure'. Reason, critical judgement, suppression - these are the forces against which it fights in succession; it holds fast to the original sources of verbal pleasure and, from the stage of the jest onwards, opens new sources of pleasure for itself by lifting inhibitions. The pleasure that it produces, whether it is pleasure in play or pleasure in lifting inhibitions, can invariably be traced back to economy in psychical expenditure, provided that this view does not contradict the essential nature of pleasure and that it proves itself fruitful in other directions.¹

[1905c, 1727]
The importance which our views attach to the factor of 'sense in nonsense' might lead to a demand that every joke must be a nonsense joke. But this is not necessary, because it is only playing with thoughts that inevitably leads to nonsense; the other source of pleasure in jokes, playing with words, only gives that impression occasionally and does not invariably provoke the implied criticism. The twofold root of the pleasure in jokes - from playing with words and playing with thoughts, which corresponds to the very important distinction between verbal and conceptual jokes - makes it perceptibly more difficult to arrive at a concise formulation of general statements about jokes. Playing with words produces manifest pleasure as a result of the factors that have been enumerated above (recognition, and so on), and is consequently only to a small degree liable to suppression. Playing with thoughts cannot have its motive in this kind of pleasure; it meets with very energetic suppression, and the pleasure which it can yield is only pleasure in the lifting of an inhibition. It can accordingly be said that the pleasure in jokes exhibits a core of original pleasure in play and a casing of pleasure in lifting inhibitions. - We naturally do not perceive that our pleasure in a nonsense joke arises from our having succeeded in liberating a piece of nonsense in spite of its suppression; whereas we see directly that playing with words has given us pleasure. - The nonsense that still remains in a conceptual joke acquires secundarily the function of increasing our attention by bewildering us. It serves as a means of intensifying the effect of the joke, but only when it acts obtrusively, so that the bewildermant can hurry ahead of the understanding by a perceptible moment of time. The examples on p. 1659 ff. have shown that in addition to this, nonsense in a joke can be used to represent a judgement contained in the thought. But this, too, is not the primary significance of nonsense in jokes.

[1905c, 1727]

In laughter, therefore, on our hypothesis, the conditions are present under which a sum of psychical energy which has hitherto been used for cathexis is allowed free discharge. And since laughter - not all laughter, it is true, but certainly laughter at a joke - is an indication of pleasure, we shall be inclined to relate this pleasure to the lifting of the cathexis which has previously been present. If we see that the hearer of a joke laughs but that its creator cannot laugh, this may amount to telling us that in the hearer a cathectic expenditure has been lifted and discharged, while in the construction of the joke there have been obstacles either to the lifting or to the possibility of discharge. The psychical process in the hearer, the joke's third person, can scarcely be more aptly described than by stressing the fact that he has bought the pleasure of the joke with very small expenditure on his own part. He might be said to have been presented with it. The words of the joke he hears necessarily bring about in him the idea or train of thought to the construction of which great internal inhibitions were opposed in him too. He would have had to make an effort of his own in order to bring it about spontaneously as the first person, he would have had to use at least as much psychical expenditure on doing so as would correspond to the strength of the inhibition, suppression or repression of the idea. He has saved this psychical expenditure. On the basis of our earlier discussions (p. 1711) we should say that his pleasure corresponds to this economy. Our insight into the mechanism of laughter leads us rather to say that, owing to the introduction of the proscribed idea by means of an auditory perception, the cathectic energy used for the inhibition has now suddenly become superfluous and has been lifted, and is therefore now ready to be discharged by laughter. The two ways of expressing the facts amount to the same thing in essentials, since the expenditure economized corresponds exactly to the inhibition that has become superfluous. But the second method of expression is the more illuminating, since it allows us to say that the hearer of the joke laughs with the quota of psychical energy which has become free through the lifting of the inhibitory cathexis; we might say that he laughs this quota off.

[1905c, 1736]
If the person in whom the joke is formed cannot laugh, this, as we have already said, points to a divergence from what happens in the third person that lies either in the lifting of the inhibitory cathexis or in the possibility of its discharge. But the first of these alternatives will not meet the case, as we shall see at once. The inhibitory cathexis must have been lifted in the first person as well, or otherwise no joke would have come about, since its formation was precisely in order to overcome a resistance of that kind; otherwise, too, it would be impossible for the first person to feel the pleasure in the joke which we have been obliged to trace back precisely to the lifting of the inhibition. All that remains, then, is the other alternative, namely that the first person cannot laugh, although he feels pleasure, because there is an interference with the possibility of discharge. An interference of this kind with the possibility of discharge, which is a necessary precondition of laughter, may arise from the liberated cathetic energy being immediately applied to some other endopsychic use. It is a good thing that our attention has been drawn to that possibility; and our interest in it will very soon be further engaged. Another condition, however, leading to the same result, may be realized in the first person of a joke. It is possible that no quota of energy at all that is capable of being manifested may be liberated, in spite of the lifting of the inhibitory cathexis. In the first person of a joke the joke-work is performed, which must correspond to a certain quota of new psychical expenditure. Thus the first person himself produces the force which lifts the inhibition. This no doubt results in a yield of pleasure for him, and even, in the case of tendentious jokes, a very considerable one, since the fore-pleasure obtained by the joke-work itself takes over the lifting of further inhibitions; but the expenditure on the joke-work is in every case deducted from the yield resulting from the lifting of the inhibition - an expenditure which is the same as the one which the hearer of the joke avoids. What I have just said may be confirmed by observing that a joke loses its effect of laughter even in the third person as soon as he is required to make an expenditure on intellectual work in connection with it. The allusions made in a joke must be obvious and the omissions easy to fill; an awakening of conscious intellectual interest usually makes the effect of the joke impossible. There is an important distinction here between jokes and riddles. Perhaps the psychical constellation during the joke-work is in general not favourable to the free discharge of what has been gained. We are not, it seems, in a position to see further on this point; we have been more successful in throwing light on one part of our problem - on why the third person laughs - than on its other part - on why the first person does not laugh.

[1905c, 1737]
It now begins to dawn on us that the technique of jokes is in general determined by two sorts of purposes - those that make the construction of the joke possible in the first person and those that are intended to guarantee the joke the greatest possible pleasurable effect on the third person. The Janus-like, two-way-facing character of jokes, which protects their original yield of pleasure from the attacks of critical reason, and the mechanism of fore-pleasure belong to the first of these purposes; the further complication of the technique by the conditions that have been enumerated in the present chapter takes place out of regard for the joke's third person. A joke is thus a double-dealing rascal who serves two masters at once. Everything in jokes that is aimed at gaining pleasure is calculated with an eye to the third person, as though there were internal and unsurmountable obstacles to it in the first person. And this gives us a full impression of how indispensable this third person is for the completion of the joking process. But whereas we have been able to obtain a fairly good insight into the nature of this process in the third person, the corresponding process in the first person seems still to be veiled in obscurity. Of the two questions we asked, 'Why are we unable to laugh at a joke we have made ourselves?' and 'Why are we driven to tell our own joke to someone else?', the first has so far evaded our reply. We can only suspect that there is an intimate connection between the two facts that have to be explained: that we are compelled to tell our joke to someone else because we are unable to laugh at it ourselves. Our insight into the conditions for obtaining and discharging pleasure which prevail in the third person enables us to infer as regards the first person that in him the conditions for discharge are lacking and those for obtaining pleasure only incompletely fulfilled. That being so, it cannot be disputed that we supplement our pleasure by attaining the laughter that is impossible for us by the roundabout path of the impression we have of the person who has been made to laugh. As Dugas has put it, we laugh as it were 'par ricochet [on the rebound]'. Laughter is among the highly infectious expressions of psychical states. When I make the other person laugh by telling him my joke, I am actually making use of him to arouse my own laughter; and one can in fact observe that a person who has begun by telling a joke with a serious face afterwards joins in the other person's laughter with a moderate laugh. Accordingly, telling my joke to another person would seem to serve several purposes: first, to give me objective certainty that the joke-work has been successful; secondly, to complete my own pleasure by a reaction from the other person upon myself; and thirdly - where it is a question of repeating a joke that one has not produced oneself - to make up for the loss of pleasure owing to the joke's lack of novelty. [1905c, 1741]
At the conclusion of these discussions of the psychical processes in jokes in so far as they take place between two persons, we may glance back at the factor of economy, which has been in our mind as being of importance in arriving at a psychological view of jokes ever since our first explanation of their technique. We have long since abandoned the most obvious but simplest view of this economy - that it is a question of an avoidance of psychical expenditure in general, such as would be involved by the greatest possible restriction in the use of words and in the establishment of chains of thought. Even at that stage we told ourselves that being concise or laconic was not enough to make a joke. A joke’s brevity is of a peculiar kind - ‘joking’ brevity. It is true that the original yield of pleasure, produced by playing with words and thoughts, was derived from mere economy in expenditure; but with the development of play into a joke the tendency to economy too must alter its aims, for the amount that would be saved by the use of the same word or the avoidance of a new way of joining ideas together would certainly count for nothing as compared with the immense expenditure on our intellectual activity. I may perhaps venture on a comparison between psychical economy and a business enterprise. So long as the turnover in the business is very small, the important thing is that outlay in general shall be kept low and administrative costs restricted to the minimum. Economy is concerned with the absolute height of expenditure. Later, when the business has expanded, the importance of the administrative cost diminishes; the height reached by the amount of expenditure is no longer of significance provided that the turnover and profits can be sufficiently increased. It would be niggling, and indeed positively detrimental, to be conservative over expenditure on the administration of the business. Nevertheless it would be wrong to assume that when expenditure was absolutely great there would be no room left for the tendency to economy. The mind of the manager, if it is inclined to economy, will now turn to economy over details. He will feel satisfaction if a piece of work can be carried out at smaller cost than previously, however small the saving may seem to be in comparison with the size of the total expenditure. In a quite analogous fashion, in our complex psychical business too, economy in detail remains a source of pleasure, as may be seen from everyday happenings. Anyone who used to have his room lighted by gas and has now had electricity installed will for quite a time be aware of a definite feeling of pleasure when he switches on the electric light; he will feel it as long as the memory is revived in him at that moment of the complicated manoeuvres that were necessary for lighting the gas. Similarly, the economies in psychical inhibitory expenditure brought about by a joke - though they are small in comparison with our total psychical expenditure - will remain a source of pleasure for us because they save us a particular expenditure which we have been accustomed to make and which we were already prepared to make on this occasion as well. The factor of the expenditure’s being one that was expected and prepared for moves unmistakably into the foreground.

[1905c, 1742]

A localized economy, such as we have just been considering, will not fail to give us momentary pleasure; but it will not bring a lasting relief so long as what has been saved at this point can be put to use elsewhere. It is only if this disposal elsewhere can be avoided that this specialized economy is transformed into a general relief of psychical expenditure. Thus, as we come to a better understanding of the psychical processes of jokes, the factor of relief takes the place of economy. It is obvious that the former gives a greater feeling of pleasure. The process in the joke's first person produces pleasure by lifting inhibition and diminishing local expenditure; but it seems not to come to rest until, through the intermediary of the interpolated third person, it achieves general relief through discharge.

[1905c, 1743]
Nonsense, absurdity, which appears so often in dreams and has brought them into so much undeserved contempt, never arises by chance through the ideational elements being jumbled together, but can always be shown to have been admitted by the dream-work intentionally and to be designed to represent embittered criticism and contemptuous contradiction in the dream-thoughts. Thus the absurdity in the content of the dream takes the place of the judgement ‘this is a piece of nonsense’ in the dream-thoughts. I laid great stress on the evidence of this in my Interpretation of Dreams because I thought that in this way I could make the most forcible attack on the error of believing that the dream is not a psychical phenomenon at all - an error which blocks the way to a knowledge of the unconscious. We have now learned, in the course of solving certain tendentious jokes (p. 1660 ff.), that nonsense in jokes is made to serve the same aims of representation. We know too that a senseless façade to a joke is particularly well suited to increase the hearer's psychical expenditure and so to raise the quota liberated for discharge by laughing. But besides this, it must not be forgotten that the nonsense in a joke is an end in itself, since the intention of recovering the old pleasure in nonsense is among the joke-work's motives. There are other ways of recovering the nonsense and of deriving pleasure from it: caricature, exaggeration, parody and travesty make use of them and so create 'comic nonsense'. If we submit these forms of expression to an analysis similar to the one we have applied to jokes, we shall find that in none of these cases is there any occasion for bringing in unconscious processes in our sense in order to explain them. We can now understand too how it is that the characteristic of being a joke can come as an extra addition to a caricature, exaggeration or parody; what makes this possible is a difference in the 'psychical scene of action'.²

[1905c, 1758]

Whereas it was a condition for the effectiveness of a joke that both persons should be subject to approximately the same inhibitions or internal resistances, it will be seen that it is a condition for the naïve that the one person should possess inhibitions which the other is without. The apprehension of the naïve lies with the person provided with inhibitions, and he alone obtains the yield of pleasure which the naïve brings about. We have come near to guessing that that pleasure arises from the lifting of inhibitions. Since the pleasure from jokes has the same origin - a core of verbal pleasure and pleasure from nonsense, and a casing of pleasure in the lifting of inhibitions or in the relief of psychical expenditure - this similar relation to inhibition explains the internal kinship between the naïve and jokes. In both of them the pleasure arises through the lifting of internal inhibition.

[1905c, 1765]

The psychical process in the receptive person, however, is as much more complicated in the case of the naïve as it is simplified in comparison with jokes in the productive person. (In the case of the naïve, incidentally, our own self invariably coincides with the receptive person, while in the case of jokes we may equally occupy the position of the productive one.) When the receptive person hears something naïve, it must on the one hand affect him like a joke - and our examples give evidence precisely of this - for, as with a joke, the lifting of the censorship is made possible for him by no more than the effort of listening. But only a part of the pleasure created by the naïve can be explained in this way; and even this might be endangered in certain instances - for example, at hearing a naïve piece of smut. We might react to this at once with the same indignation that might be felt against a real piece of smut, if it were not that another factor spares us this indignation and at the same time offers us the more important part of our pleasure in the naïve. This other factor is the condition already mentioned that, in order to recognize the naïve, we must know that the internal inhibition is absent in the producing person. Only when this is certain do we laugh instead of being indignant. Thus we take the producing person's psychical state into consideration, put ourselves into it and try to understand it by comparing it with our own. It is these processes of empathy and comparison that result in the economy in expenditure which we discharge by laughing.

[1905c, 1765]
It would be possible to prefer a simpler account - that our indignation is made superfluous by the fact that the other person has had no need to overcome a resistance; in that case the laughter would occur at the cost of the economy in indignation. In order to discourage this view, which is on the whole misleading, I will make a sharper distinction between two cases which I have treated together above. The naïve which we come across can either be in the nature of a joke, as it was in our examples, or in the nature of smut (or of what is in general objectionable); and the latter will occur especially when it is expressed not in speech but in action. This second alternative is really misleading: one could suppose, as far as it is concerned, that the pleasure arises from the economized and transformed indignation. But the first alternative throws more light on things. A naïve remark - e.g. 'Bubizin' - can in itself act like a minor joke and give no cause for indignation. This alternative is certainly the less frequent; but it is the purer and by far the more instructive. In so far as what we are concerned with is the fact that the child has seriously and without arrière pensée believed that the syllable 'Medi' in 'Medizin' is identical with her own name 'Mädi', our pleasure in what we hear receives an increase which has no longer anything to do with pleasure in a joke. We now look at what has been said from two points of view - once in the way it happened in the child and once in the way it would have happened to us; and in making this comparison we see that the child has found an identity and that she has overcome a barrier that exists for us; and we then seem to go further and say to ourselves: 'If you choose to understand what you've heard, you can economize the expenditure on keeping up this barrier.' The expenditure liberated in a comparison like this is the source of pleasure in the naïve and it is discharged by laughter; and it is, incidentally, the same pleasure that we should otherwise have transformed into indignation, if this had not been excluded by our understanding of the producing person and, in this case, by the nature of what was said as well. But if we take the instance of a naïve joke as a model for the other alternative, of something naïve that is objectionable, we shall see that there too the economy in inhibition can arise directly from the comparison, that there is no necessity for us to assume an indignation that begins and is then stifled, and that this indignation in fact only corresponds to using the liberated expenditure in another way - against which in the case of jokes complicated protective arrangements were necessary.

[1905c, 1766]

This comparison, and this economy in expenditure by putting oneself into the mental process of the producing person, can only claim to be of significance for the naïve, however, if it is not in it alone that they are found. A suspicion occurs to us, in fact, that this mechanism, which is wholly alien to jokes, may be a part and perhaps an essential part of the psychical process in the comic. Looked at from this point of view - and this is undoubtedly the most important aspect of the naïve - the naïve thus presents itself as a species of the comic. The extra element in our examples of naïve speeches that is added to the pleasure of a joke is 'comic' pleasure. We should be inclined to assume of it quite generally that it arises from expenditure economized in a comparison of someone else's remarks with our own. But since this leads us to far-reaching considerations, we will first conclude our discussion of the naïve. The naïve, then, would be a species of the comic in so far as its pleasure springs from the difference in expenditure which arises in trying to understand someone else; and it would approach the joke in being subject to the condition that the expenditure economized in the comparison must be an inhibitory expenditure.¹

[1905c, 1767]
Let us hastily add a few points of agreement and of difference between the concepts that we have just reached and those which have long been familiar in the psychology of the comic. The putting of oneself in the other person's place and trying to understand him is clearly nothing other than the 'comic lending' which since Jean Paul has played a part in the analysis of the comic; the 'comparing' of someone else's mental process with one's own corresponds to the 'psychological contrast' which we can at last find a place for here, after not knowing what to do with it in jokes. But we differ in our explanation of comic pleasure from many authorities who regard it as arising from the oscillation of attention backwards and forwards between contrasting ideas. A mechanism of pleasure like this would seem incomprehensible to us;² but we may point out that in a comparison between contrasts a difference in expenditure occurs which, if it is not used for some other purpose, becomes capable of discharge and may thus become a source of pleasure.

[1905c, 1767]

In such cases the joke has another resource. The faulty reasoning, which it uses for its technique as one of the modes of thought of the unconscious, strikes criticism - even though not invariably so - as being comic. Consciously giving free play to unconscious modes of thought (which have been rejected as faulty) is a means of producing comic pleasure; and it is easy to understand this, since it certainly requires a greater expenditure of energy to establish a preconscious cathexis than to give free play to an unconscious one. When, on hearing a thought which has, as it were, been formed in the unconscious, we compare it with its correction, a difference in expenditure emerges for us from which comic pleasure arises. A joke which makes use of faulty reasoning like this for its technique, and therefore appears nonsensical, can thus produce a comic effect at the same time. If we fail to detect the joke, we are once again left with only the comic or funny story.

[1905c, 1783]
There is no need to apologize for this digression, since the relation of jokes to the comic was the reason for our being forced into an investigation of the comic. But it is certainly time we returned to our previous topic - the discussion of the methods which serve for making things comic. We considered caricature and unmasking first, because we can derive some indications from these two for the analysis of the comic of mimicry. As a rule, no doubt, mimicry is permeated with caricature - the exaggeration of traits that are not otherwise striking -, and it also involves the characteristic of degradation. But this does not seem to exhaust its nature. It cannot be disputed that it is in itself an extraordinarily fertile source of comic pleasure, for we laugh particularly at the faithfulness of a piece of mimicry. It is not easy to give a satisfactory explanation of this unless one is prepared to adopt the view held by Bergson (1900), which approximates the comic of mimicry to the comic due to the discovery of psychical automatism. Bergson's opinion is that everything in a living person that makes one think of an inanimate mechanism has a comic effect. His formula for this runs 'mécanisation de la vie'. He explains the comic of mimicry by starting out from a problem raised by Pascal in his Pensées of why it is that one laughs when one compares two similar faces neither of which has a comic effect by itself. 'What is living should never, according to our expectation, be repeated exactly the same. When we find such a repetition we always suspect some mechanism lying behind the living thing.' When one sees two faces that resemble each other closely, one thinks of two impressions from the same mould or of some similar mechanical procedure. In short, the cause of laughter in such cases would be the divergence of the living from the inanimate, or, as we might say, the degradation of the living to the inanimate (ibid., 35). If, moreover, we were to accept these plausible suggestions of Bergson's, we should not find it difficult to include his view under our own formula. Experience has taught us that every living thing is different from every other and calls for a kind of expenditure by our understanding; and we find ourselves disappointed if, as a result of complete conformity or deceptive mimicry, we need make no fresh expenditure. But we are disappointed in the sense of a relief, and the expenditure on expectation which has become superfluous is discharged by laughter. The same formula would also cover all the cases which Bergson considers of comic rigidity ('raideur'), of professional customs, fixed ideas, and turns of speech repeated on every possible occasion. All these cases would go back to a comparison between the expenditure on expectation and the expenditure actually required for an understanding of something that has remained the same; and the larger amount needed for expectation would be based on observation of the multiplicity and plasticity of living things. In the case of mimicry, accordingly, the source of the comic pleasure would be not the comic of situation but of expectation.

[1905c, 1786]

Here we are reminded of a problem whose consideration we have postponed. Difference in expenditure is undoubtedly the basic determining condition of comic pleasure; but observation shows that this difference does not invariably give rise to pleasure. What further conditions must be present or what disturbances must be kept back, in order that comic pleasure may actually arise from the difference in expenditure? Before we turn to answering this question, we will conclude this discussion with a clear assertion that the comic of speech does not coincide with jokes, and that jokes must therefore be something other than the comic of speech.

[1905c, 1793]
Every theory of the comic is objected to by its critics on the score that its definition overlooks what is essential to the comic; ‘The comic is based on a contrast between ideas.’ ‘Yes, in so far as the contrast has a comic and not some other effect.’ ‘The feeling of the comic arises from the disappointment of an expectation.’ ‘Yes, unless the disappointment is in fact a distressing one.’

No doubt the objections are justified; but we shall be over-estimating them if we conclude from them that the essential feature of the comic has hitherto escaped detection. What impairs the universal validity of these definitions are conditions which are indispensable for the generating of comic pleasure; but we do not need to look for the essence of the comic in them. In any case, it will only become easy for us to dismiss the objections and throw light on the contradictions to the definitions of the comic if we suppose that the origin of comic pleasure lies in a comparison of the difference between two expenditures. Comic pleasure and the effect by which it is known - laughter - can only come about if this difference is unutilizable and capable of discharge. We obtain no pleasurable effect but at most a transient sense of pleasure in which the characteristic of being comic does not emerge, if the difference is put to another use as soon as it is recognized. Just as special contrivances have to be adopted in the case of jokes in order to prevent the use elsewhere of the expenditure that is recognized as superfluous, so, too, comic pleasure can only appear in circumstances that guarantee this same condition. For this reason occasions on which these differences in expenditure occur in our ideational life are uncommonly numerous, but the occasions on which the comic emerges from those differences are relatively quite rare.

[1905c, 1794]

We have seen that the release of distressing affects is the greatest obstacle to the emergence of the comic. As soon as the aimless movement does damage, or the stupidity leads to mischief, or the disappointment causes pain, the possibility of a comic effect is at an end. This is true, at all events, for a person who cannot ward off such unpleasure, who is himself its victim or is obliged to have a share in it; whereas a person who is not concerned shows by his demeanour that the situation involved contains everything that is required for a comic effect. Now humour is a means of obtaining pleasure in spite of the distressing affects that interfere with it; it acts as a substitute for the generation of these affects, it puts itself in their place. The conditions for its appearance are given if there is a situation in which, according to our usual habits, we should be tempted to release a distressing affect and if motives then operate upon us which suppress that affect in statu nascendi. In the cases that have just been mentioned the person who is the victim of the injury, pain, and so on, might obtain humorous pleasure, while the unconcerned person laughs from comic pleasure. The pleasure of humour, if this is so, comes about - we cannot say otherwise - at the cost of a release of affect that does not occur: it arises from an economy in the expenditure of affect.

[1905c, 1803]

This is humour on the grand scale, and if when we hear it we do not laugh, that is because our admiration covers the humorous pleasure. In the case of the rogue who refuses to catch cold on the way to execution we laugh heartily. The situation that ought to drive the criminal to despair might rouse intense pity in us; but that pity is inhibited because we understand that he, who is more closely concerned, makes nothing of the situation. As a result of this understanding, the expenditure on the pity, which was already prepared, becomes unutilizable and we laugh it off. We are, as it were, infected by the rogue’s indifference - though we notice that it has cost him a great expenditure of psychical work.

[1905c, 1805]
We can accept this formula without question, since it leads to nothing that would contradict our earlier discussions. The difference between the two expenditures must in essence come down to the inhibitory expenditure that is saved. The lack of this economy in inhibition in the case of the comic, and the absence of quantitative contrast in the case of jokes, would determine the distinction between the comic feeling and the impression of a joke, in spite of their agreeing in the characteristic of using two kinds of ideational activity for the same view.

We are now at the end of our task, having reduced the mechanism of humorous pleasure to a formula analogous to those for comic pleasure and for jokes. The pleasure in jokes has seemed to us to arise from an economy in expenditure upon inhibition, the pleasure in the comic from an economy in expenditure upon ideation (upon cathexis) and the pleasure in humour from an economy in expenditure upon feeling. In all three modes of working of our mental apparatus the pleasure is derived from an economy. All three are agreed in representing methods of regaining from mental activity a pleasure which has in fact been lost through the development of that activity. For the euphoria which we endeavour to reach by these means is nothing other than the mood of a period of life in which we were accustomed to deal with our psychical work in general with a small expenditure of energy - the mood of our childhood, when we were ignorant of the comic, when we were incapable of jokes and when we had no need of humour to make us feel happy in our life.

Another advantage of a wider character is presented in particular by erotic jokes, in the strict sense, just as it is by jokes in general. I have shown in my study of jokes that the revelation of what is normally the repressed unconscious element in the mind can, under certain provisions, become a source of pleasure and thus a technique for the construction of jokes. In psycho-analysis to-day we describe a congeries of ideas and its associated affect as a 'complex'; and we are prepared to assert that many of the most admired jokes are 'complexive jokes' and that they owe their exhilarating and cheerful effect to the ingenious uncovering of what are as a rule repressed complexes. It would carry me too far afield if I were to bring forward instances here in proof of this thesis, but I can assert that the outcome of such an examination of the evidence is that the jokes, both erotic and of other sorts, which are in popular circulation provide an excellent auxiliary means of investigating the unconscious human mind - in the same way as do dreams, myths and legends, with the exploitation of which psycho-analysis is already actively engaged.

Psycho-analysis has taught us that in the very earliest period of childhood faeces is a highly prized substance, in relation to which coprophilic instincts find satisfaction. With the repression of these instincts, which is accelerated as much as possible by up-bringing, this substance falls into contempt and then serves conscious purposes as a means of expressing disdain and scorn. Certain forms of mental activity such as joking are still able to make the obstructed source of pleasure accessible for a brief moment, and thus show how much of the esteem in which human beings once held their faeces still remains preserved in the unconscious. The most important residue of this former esteem is, however, that all the interest which the child has had in faeces is transferred in the adult on to another material which he learns in life to set above almost everything else - gold.¹ How old this connection between excrement and gold is can be seen from an observation by Jeremias:² gold, according to ancient oriental mythology, is the excrement of hell.³

¹ [1957a [1911], 2528]
The same result as follows from an increase or a decrease in the degree of distortion may also be achieved at the other end of the apparatus, so to speak, by a modification in the condition for the production of pleasure and unpleasure. Special techniques have been evolved, with the purpose of bringing about such changes in the play of mental forces that what would otherwise give rise to unpleasure may on this occasion result in pleasure; and, whenever a technical device of this sort comes into operation, the repression of an instinctual representative which would otherwise be repudiated is lifted. These techniques have till now only been studied in any detail in jokes. As a rule the repression is only temporarily lifted and is promptly re-instated.

[1915d, 2981]

In this place I shall only follow up one of the consequences which seem possible from this point of view, thus resuming the discussion of a problem which I was obliged to leave unsolved elsewhere.¹ Each of the mental differentiations that we have become acquainted with represents a fresh aggravation of the difficulties of mental functioning, increases its instability, and may become the starting-point for its breakdown, that is, for the onset of a disease. Thus, by being born we have made the step from an absolutely self-sufficient narcissism to the perception of a changing external world and the beginnings of the discovery of objects. And with this is associated the fact that we cannot endure the new state of things for long, that we periodically revert from it, in our sleep, to our former condition of absence of stimulation and avoidance of objects. It is true, however, that in this we are following a hint from the external world, which, by means of the periodical change of day and night, temporarily withdraws the greater part of the stimuli that affect us. The second example of such a step, pathologically more important, is subject to no such qualification. In the course of development we have effected a separation of our mental existence into a coherent ego and into an unconscious and repressed portion which is left outside it; and we know that the stability of this new acquisition is exposed to constant shocks. In dreams and in neuroses what is thus excluded knocks for admission at the gates, guarded though they are by resistances; and in our waking health we make use of special artifices for allowing what is repressed to circumvent the resistances and for receiving it temporarily into our ego to the increase of our pleasure. Jokes and humour, and to some extent the comic in general, may be regarded in this light. Everyone acquainted with the psychology of the neuroses will think of similar examples of less importance; but I hasten on to the application I have in view.

[1921c, 3821]

I was able to show from a short story by W. Jensen called Gradiva, which has no particular merit in itself, that invented dreams can be interpreted in the same way as real ones and that the unconscious mechanisms familiar to us in the 'dream-work' are thus also operative in the processes of imaginative writing. My book on Jokes and their Relation to the Unconscious was a side-issue directly derived from The Interpretation of Dreams. The only friend of mine who was at that time interested in my work remarked to me that my interpretations of dreams often impressed him as being like jokes. In order to throw some light on this impression, I began to investigate jokes and found that their essence lay in the technical methods employed in them, and that these were the same as the means used in the 'dream-work' - that is to say, condensation, displacement, the representation of a thing by its opposite or by something very small, and so on. This led to an economic enquiry into the origin of the high degree of pleasure obtained from hearing a joke. And to this the answer was that it was due to the momentary suspension of the expenditure of energy upon maintaining repression, owing to the attraction exercised by the offer of a bonus of pleasure (fore-pleasure).

[1925d, 4239]
In the most favourable cases the generation of unpleasure ceases along with the withdrawal of cathexis from the transference thoughts in the Pcs.; and this outcome signifies that the intervention of the unpleasure principle has served a useful purpose. But it is another matter when the repressed unconscious wish receives an organic reinforcement, which it passes on to its transference thoughts; in that way it may place them in a position to make an attempt at forcing their way through with their excitation, even if they have lost their cathexis from the Pcs. There then follows a defensive struggle - for the Pcs. in turn reinforces its opposition to the repressed thoughts (i.e. produces an 'anticathexis') - and thereafter the transference thoughts, which are the vehicles of the unconscious wish, force their way through in some form of compromise which is reached by the production of a symptom. But from the moment at which the repressed thoughts are strongly cathected by the unconscious wishful impulse and, on the other hand, abandoned by the preconscious cathexis, they become subject to the primary psychical process and their one aim is motor discharge or, if the path is open, hallucinatory revival of the desired perceptual identity. We have already found empirically that the irrational processes which we have described are only carried out with thoughts that are under repression. We can now see our way a little further into the whole position. The irrational processes which occur in the psychical apparatus are the primary ones. They appear wherever ideas are abandoned by the preconscious cathexis, are left to themselves and can become charged with the uninhibited energy from the unconscious which is striving to find an outlet. Some other observations lend support to the view that these processes which are described as irrational are not in fact falsifications of normal processes - intellectual errors - but are modes of activity of the psychical apparatus that have been freed from an inhibition. Thus we find that the transition from preconscious excitation to movement is governed by the same processes, and that the linking of preconscious ideas to words may easily exhibit the same displacements and confusions, which are then attributed to inattention. Evidence, finally, of the increase in activity which becomes necessary when these primary modes of functioning are inhibited is to be found in the fact that we produce a comic effect, that is, a surplus of energy which has to be discharged in laughter, if we allow these modes of thinking to force their way through into consciousness.

[1900a, 1032]

I was able recently to throw light upon another instance, in a quite different department of mental life, of a slight feeling of pleasure similarly making possible the attainment of a greater resultant pleasure, and thus operating as an 'incentive bonus'. In the same connection I was also able to go more deeply into the nature of pleasure.¹

[1905d, 1527]

¹ See my volume on Jokes and their Relation to the Unconscious which appeared in 1905. The 'fore-pleasure' attained by the technique of joking is used in order to liberate a greater pleasure derived from the removal of internal inhibitions.

[1905d, 1527]
This comparison, and this economy in expenditure by putting oneself into the mental process of the producing person, can only claim to be of significance for the naïve, however, if it is not in it alone that they are found. A suspicion occurs to us, in fact, that this mechanism, which is wholly alien to jokes, may be a part and perhaps an essential part of the psychical process in the comic. Looked at from this point of view - and this is undoubtedly the most important aspect of the naïve - the naïve thus presents itself as a species of the comic. The extra element in our examples of naïve speeches that is added to the pleasure of a joke is 'comic' pleasure. We should be inclined to assume of it quite generally that it arises from expenditure economized in a comparison of someone else's remarks with our own. But since this leads us to far-reaching considerations, we will first conclude our discussion of the naïve. The naïve, then, would be a species of the comic in so far as its pleasure springs from the difference in expenditure which arises in trying to understand someone else; and it would approach the joke in being subject to the condition that the expenditure economized in the comparison must be an inhibitory expenditure.¹

[1905c, 1767]

I was able to show from a short story by W. Jensen called Gradiva, which has no particular merit in itself, that invented dreams can be interpreted in the same way as real ones and that the unconscious mechanisms familiar to us in the 'dream-work' are thus also operative in the processes of imaginative writing. My book on Jokes and their Relation to the Unconscious was a side-issue directly derived from The Interpretation of Dreams. The only friend of mine who was at that time interested in my work remarked to me that my interpretations of dreams often impressed him as being like jokes. In order to throw some light on this impression, I began to investigate jokes and found that their essence lay in the technical methods employed in them, and that these were the same as the means used in the 'dream-work' - that is to say, condensation, displacement, the representation of a thing by its opposite or by something very small, and so on. This led to an economic enquiry into the origin of the high degree of pleasure obtained from hearing a joke. And to this the answer was that it was due to the momentary suspension of the expenditure of energy upon maintaining repression, owing to the attraction exercised by the offer of a bonus of pleasure (fore-pleasure).

[1925d, 4239]
A certain lack of clarity which we have been unable to overcome in our handling of the mechanism of pleasure in tendentious jokes may be taken as an appropriate punishment for our having tried to clear up the more complex problem before the simpler one, tendentious jokes before innocent ones. We take note of the fact that 'economy in expenditure on inhibition or suppression' appears to be the secret of the pleasurable effect of tendentious jokes, and pass on to the mechanism of pleasure in innocent jokes.

On the basis of suitable specimens of innocent jokes, in which there was no fear of our judgement being disturbed by their content or purpose, we were driven to conclude that the techniques of jokes are themselves sources of pleasure; and we shall now try to discover whether it may perhaps be possible to trace that pleasure back to economy in psychical expenditure. In one group of these jokes (play upon words) the technique consisted in focusing our psychical attitude upon the sound of the word instead of upon its meaning - in making the (acoustic) word presentation itself take the place of its significance as given by its relations to thing-presentations. It may really be suspected that in doing so we are bringing about a great relief in psychical work and that when we make serious use of words we are obliged to hold ourselves back with a certain effort from this comfortable procedure. We can observe how pathological states of thought-activity, in which the possibility of concentrating psychical expenditure on a particular point is probably restricted, do in fact give this sort of sound-presentation of the word greater prominence than its meaning, and that sufferers in such states proceed in their speech on the lines (as the formula runs) of the 'external' instead of the 'internal' associations of the word-presentation. We notice, too, that children, who, as we know, are in the habit of still treating words as things, tend to expect words that are the same or similar to have the same meaning behind them - which is a source of many mistakes that are laughed at by grown-up people. If, therefore, we derive unmistakable enjoyment in jokes from being transported by the use of the same or a similar word from one circle of ideas to another, remote one (in the 'Home-Roulard', for instance, from the kitchen to politics), this enjoyment is no doubt correctly to be attributed to economy in psychical expenditure. The pleasure in a joke arising from a 'short-circuit' like this seems to be the greater the more alien the two circles of ideas that are brought together by the same word - the further apart they are, and thus the greater the economy which the joke's technical method provides in the train of thought. We may notice, too, that here jokes are making use of a method of linking things up which is rejected and studiously avoided by serious thought.¹

In a second group of technical methods used in jokes - unification, similarity of sound, multiple use, modification of familiar phrases, allusions to quotations - we can single out as their common characteristic the fact that in each of them something familiar is rediscovered, where we might instead have expected something new. This rediscovery of what is familiar is pleasurable, and once more it is not difficult for us to recognize this pleasure as a pleasure in economy and to relate it to economy in psychical expenditure.
It seems to be generally agreed that the rediscovery of what is familiar, 'recognition', is pleasurable. Groos (1899, 153) writes: 'Recognition is always, unless it is too much mechanized (as, for instance, in dressing, . . .), linked with feelings of pleasure. The mere quality of familiarity is easily accompanied by the quiet sense of comfort which Faust felt when, after an uncanny encounter, he entered his study once again . . . If the act of recognition thus gives rise to pleasure, we might expect that men would hit on the idea of exercising this capacity for its own sake - that is, would experiment with it in play. And in fact Aristotle regarded joy in recognition as the basis of the enjoyment of art, and it cannot be disputed that this principle should not be overlooked, even if it does not possess such far-reaching significance as Aristotle attributes to it.'

Groos goes on to discuss games whose characteristic lies in the fact that they intensify the joy in recognition by putting obstacles in its way - that is to say, by creating a 'psychical damming up', which is got rid of by the act of recognition. His attempt at an explanation, however, abandons the hypothesis that recognition is pleasurable in itself, since, by referring to these games, he is tracing back the enjoyment of recognition to a joy in power, a joy in the overcoming of a difficulty. I regard the latter factor as secondary, and I see no reason to depart from the simpler view that recognition is pleasurable in itself i.e., through relieving psychical expenditure - and that the games founded on this pleasure make use of the mechanism of damming up only in order to increase the amount of such pleasure.

It is also generally acknowledged that rhymes, alliterations, refrains, and other forms of repeating similar verbal sounds which occur in verse, make use of the same source of pleasure - the rediscovery of something familiar. The 'sense of power' plays no perceptible part in these techniques, which show so much similarity to that of 'multiple use' in the case of jokes.

In view of the close connection between recognizing and remembering, it is not rash to suppose that there may also be a pleasure in remembering - that the act of remembering is in itself accompanied by a feeling of pleasure of similar origin. Groos seems not to be averse to such a hypothesis, but he derives it once again from the 'sense of power', to which he attributes (wrongly, in my view) the chief reason for enjoyment in almost all games.
The ‘rediscovery of what is familiar’ is the basis for the use of another technical resource in jokes, which we have not yet mentioned. I refer to the factor of ‘topicality’, which is a fertile source of pleasure in a great many jokes and which explains a few of the peculiarities in the life-history of jokes. There are jokes which are completely independent of this condition, and in a monograph on jokes we are obliged to make almost exclusive use of examples of that kind. But we cannot forget that, in comparison with these perennial jokes, we have perhaps laughed even more heartily at others which it is difficult for us to use now because they would call for long commentaries and even with such help would not produce their original effect. These latter jokes contained allusions to people and events which at the time were ‘topical’, which had aroused general interest and still kept it alive. When this interest had ceased and the business in question had been settled, these jokes too lost a part of their pleasurable effect and indeed a very considerable part. For instance, the joke made by my friendly host when he called a pudding that was being served a ‘Home-Roulard’ does not seem to me to-day nearly so good as it did at the time when ‘Home Rule’ provided a standing head-line in the political columns of our daily papers. In attempting to estimate the merits of this joke I now attribute them to the fact that a single word has transported us, with the economy of a long detour in thought, from the circle of ideas of the kitchen to the remote one of politics. But at the time my account would have had to be different, and I should have said that this word transported us from the circle of ideas of the kitchen to that of politics, which was remote from it but was certain of our lively interest because we were constantly concerned with it. Another joke, ‘This girl reminds me of Dreyfus; the army doesn’t believe in her innocence’, has also faded to-day, though its technical methods must have remained unaltered. The bewilderment caused by the comparison and the double-entendre in the word ‘innocence’ cannot compensate for the fact that the allusion, which at the time touched on an event cathected with fresh excitement, to-day recalls a question that is settled. Here is a joke which is still topical: ‘The Crown Princess Louise approached the crematorium in Gotha with the question of how much a Verbrennung [cremation] costs. The management replied: “Five thousand marks normally; but we will only charge you three thousand as you have been durchgebrannt [literally ‘been burnt through’ - slang for ‘eloped’] once already.’ A joke like this sounds irresistible to-day; in a short time it will have sunk very considerably in our estimation; and some time later still, in spite of its good play upon words, it will lose its effect entirely, for it will be impossible to repeat it without adding a commentary to explain who Princess Louise was and the sense in which she was durchgebrannt.

[1905c, 1714]

Thus a great number of the jokes in circulation have a certain length of life: their life runs a course made up of a period of flowering and a period of decay and it ends in complete oblivion. The need which men feel for deriving pleasure from their processes of thought is therefore constantly creating new jokes based on the new interests of the day. The vital force of topical jokes is not their own; it is borrowed, by the method of allusion, from those other interests, the expiry of which determines the fate of the joke as well. The factor of topicality is a source of pleasure, ephemeral it is true but particularly abundant, which supplements the sources inherent in the joke itself. It cannot be simply equated with the rediscovery of what is familiar. It is concerned rather with a particular category of what is familiar, which must in addition possess the characteristic of being fresh, recent and untouched by forgetting. In the formation of dreams, too, we come across a special preference for what is recent and we cannot escape a suspicion that association with what is recent is rewarded, and so facilitated, by a peculiar bonus of pleasure.

[1905c, 1715]
In all these cases of repeating the same connections or the same subject-matter in the words, or of rediscovering what is familiar or recent, it seems impossible to avoid deriving the pleasure felt in them from economy in psychical expenditure provided that this line of approach turns out to be fruitful in throwing light on details and in arriving at new generalities. We are aware that we have still to make it clear how the economy comes about and what the meaning is of the expression 'psychical expenditure'.

[1905c, 1715]

The third group of techniques of jokes - for the most part of conceptual jokes - which comprises faulty thinking, displacements, absurdity, representation by the opposite, etc., may at a first glance seem to bear a special impress and to betray no kinship with the techniques of rediscovery of what is familiar or the replacement of object-associations by word-associations. Nevertheless it is particularly easy here to bring into play the theory of economy or relief in psychical expenditure.

[1905c, 1715]

During the period in which a child is learning how to handle the vocabulary of his mother-tongue, it gives him obvious pleasure to 'experiment with it in play', to use Groos's words. And he puts words together without regard to the condition that they should make sense, in order to obtain from them the pleasurable effect of rhythm or rhyme. Little by little he is forbidden this enjoyment, till all that remains permitted to him are significant combinations of words. But when he is older attempts still emerge at disregarding the restrictions that have been learnt on the use of words. Words are disfigured by particular little additions being made to them, their forms are altered by certain manipulations (e.g. by reduplications or 'Zittersprache'), or a private language may even be constructed for use among playmates. These attempts are found again among certain categories of mental patients.

[1905c, 1716]
In an earlier passage (p. 1715) we regarded one of the outcomes of condensation - multiple use of the same material, play upon words, and similarity of sound - as a localized economy, and the pleasure produced by an (innocent) joke as derived from that economy, and later we inferred that the original intention of jokes was to obtain a yield of pleasure of this kind from words - a thing which had been permitted at the stage of play but had been dammed up by rational criticism in the course of intellectual development. We have now adopted the hypothesis that condensations of this kind, such as serve the technique of jokes, arise automatically, without any particular intention, during thought-processes in the unconscious.

Have we not before us here two different views of the same fact which seem incompatible with each other? I do not think so. It is true that they are two different views, and that they need to be brought into harmony with each other; but they are not contradictory. One of them is merely foreign to the other; and when we have established a connection between them, we shall probably have made some advance in knowledge. The fact that such condensations are sources for a yield of pleasure is far from incompatible with the hypothesis that conditions for their production are easily found in the unconscious. We can, on the contrary, see a reason for the plunge into the unconscious in the circumstance that the pleasure-yielding condensations of which jokes are in need arise there easily. There are, moreover, two other factors which at a first glance seem to be completely foreign to each other and to have come together as though by some undesired chance, but which on deeper investigation turn out to be intimately linked and indeed essentially one. I have in mind the two assertions that, on the one hand, jokes during their development at the stage of play (that is, during the childhood of reason) are able to bring about these pleasurable condensations and that, on the other hand, at higher stages they accomplish the same effect by plunging the thought into the unconscious. For the infantile is the source of the unconscious, and the unconscious thought-processes are none other than those - the one and only ones - produced in early childhood. The thought which, with the intention of constructing a joke, plunges into the unconscious is merely seeking there for the ancient dwelling-place of its former play with words. Thought is put back for a moment to the stage of childhood so as once more to gain possession of the childish source of pleasure. If we did not already know it from research into the psychology of the neuroses, we should be led by jokes to a suspicion that the strange unconscious revision is nothing else than the infantile type of thought-activity. It is merely that it is not very easy for us to catch a glimpse in children of this infantile way of thinking, with its peculiarities that are retained in the unconscious of adults, because it is for the most part corrected, as it were, in statu nascendi. But in a number of cases we succeed in doing so, and we then laugh at the children's 'silliness'. Any uncovering of unconscious material of this kind strikes us in general as 'comic'.¹

[1905c, 1754]

It can be assumed with certainty that jokes are formed in the unconscious when it is a question of jokes in the service of unconscious purposes or of purposes reinforced by the unconscious - that is, of most 'cynical' jokes. For in such cases the unconscious purpose drags the preconscious thought down into the unconscious and there gives it a new shape - a process to which the study of the psychology of the neuroses has taught us numerous analogies. In the case, however, of tendentious jokes of other kinds, of innocent jokes and of jests, this downward dragging force seems absent and the relation of jokes to the unconscious is accordingly called in question.

[1905c, 1759]
On such a foundation we cannot build a great deal. If we bring the various stages of the joke into relation to the mental states that are favourable to them we can perhaps proceed as follows. The jest springs from a cheerful mood, which seems to be characterized by an inclination to diminish mental cathexes. It already employs all the characteristic techniques of jokes and already fulfills their fundamental condition by selecting verbal material or connections of thoughts which will meet both the demands for a yield of pleasure and those made by rational criticism. We shall conclude that the lowering of the thought cathexis to the unconscious level, facilitated by the cheerful mood, is present already in jests. In the case of innocent jokes that are linked to the expression of a valuable thought, the encouraging effect of mood no longer applies. Here we must presume the occurrence of a special personal aptitude, which is manifested in the ease with which the preconscious cathexis is dropped and exchanged for a moment for the unconscious one. A purpose that is all the time on the watch for renewing the original yield of pleasure from jokes exercises a downward drag on the still unsettled preconscious expression of the thought. No doubt most people are capable of producing jests when they are in a cheerful mood; the aptitude for making jokes is present in only a few people independently of their mood. Lastly, the joke-work receives its most powerful stimulus when strong purposes reaching down into the unconscious are present, which represent a special aptitude for the production of jokes and which may explain to us how it is that the subjective determinants of jokes are so often fulfilled in neurotic people. Under the influence of strong purposes even those who otherwise have the least aptitude for it become capable of making jokes.

[1905c, 1760]
There is, first and foremost, one observation which warns us not to leave tendentious jokes on one side in our investigation of the origin of the pleasure we take in jokes. The pleasurable effect of innocent jokes is as a rule a moderate one; a clear sense of satisfaction, a slight smile, is as a rule all it can achieve in its hearers. And it may be that a part even of this effect is to be attributed to the joke's intellectual content, as we have seen from suitable examples (p. 1690). A non-tendentious joke scarcely ever achieves the sudden burst of laughter which makes tendentious ones so irresistible. Since the technique of both can be the same, a suspicion may be aroused in us that tendentious jokes, by virtue of their purpose, must have sources of pleasure at their disposal to which innocent jokes have no access.

And here at last we can understand what it is that jokes achieve in the service of their purpose. They make possible the satisfaction of an instinct (whether lustful or hostile) in the face of an obstacle that stands in its way. They circumvent this obstacle and in that way draw pleasure from a source which the obstacle had made inaccessible. The obstacle standing in the way is in reality nothing other than women's incapacity to tolerate undisguised sexuality, an incapacity correspondingly increased with a rise in the educational and social level. The woman who is thought of as having been present in the initial situation is afterwards retained as though she were still present, or in her absence her influence still has an intimidating effect on the men. We can observe how men of a higher class are at once induced, when they are in the company of girls of an inferior class, to reduce their smutty jokes to the level of simple smut.

The power which makes it difficult or impossible for women, and to a lesser degree for men as well, to enjoy undisguised obscenity is termed by us 'repression'; and we recognize in it the same psychical process which, in cases of serious illness, keeps whole complexes of impulses, together with their derivatives, away from consciousness, and which has turned out to be the main factor in the causation of what are known as psycho-neuroses. It is our belief that civilization and higher education have a large influence in the development of repression, and we suppose that, under such conditions, the psychical organization undergoes an alteration (that can also emerge as an inherited disposition) as a result of which what was formerly felt as agreeable now seems unacceptable and is rejected with all possible psychical force. The repressive activity of civilization brings it about that primary possibilities of enjoyment, which have now, however, been repudiated by the censorship in us, are lost to us. But to the human psyche all renunciation is exceedingly difficult, and so we find that tendentious jokes provide a means of undoing the renunciation and retrieving what was lost. When we laugh at a refined obscene joke, we are laughing at the same thing that makes a peasant laugh at a coarse piece of smut. In both cases the pleasure springs from the same source. We, however, could never bring ourselves to laugh at the coarse smut; we should feel ashamed or it would seem to us disgusting. We can only laugh when a joke has come to our help.

Thus what we suspected to begin with seems to be confirmed: namely that tendentious jokes have sources of pleasure at their disposal besides those open to innocent jokes, in which all the pleasure is in some way linked to their technique. And we may also once more repeat that with tendentious jokes we are not in a position to distinguish by our feeling what part of the pleasure arises from the sources of their technique and what part from those of their purpose. Thus, strictly speaking, we do not know what we are laughing at. With all obscene jokes we are subject to glaring errors of judgement about the 'goodness' of jokes so far as this depends on formal determinants; the technique of such jokes is often quite wretched, but they have immense success in provoking laughter.
Here, from the outset, we come upon the same situation. Since our individual childhood, and, similarly, since the childhood of human civilization, hostile impulses against our fellow men have been subject to the same restrictions, the same progressive repression, as our sexual urges. We have not yet got so far as to be able to love our enemies or to offer our left cheek after being struck on the right. Furthermore, all moral rules for the restriction of active hatred give the clearest evidence to this day that they were originally framed for a small society of fellow clansmen. In so far as we are all able to feel that we are members of one people, we allow ourselves to disregard most of these restrictions in relation to a foreign people. Nevertheless, within our own circle we have made some advances in the control of hostile impulses. As Lichtenberg puts it in drastic terms: 'Where we now say "Excuse me!" we used to give a box on the ears.' Brutal hostility, forbidden by law, has been replaced by verbal invective; and a better knowledge of the interlinking of human impulses is more and more robbing us - by its consistent 'tout comprendre c'est tout pardonner' - of the capacity for feeling angry with a fellow man who gets in our way. Though as children we are still endowed with a powerful inherited disposition to hostility, we are later taught by a higher personal civilization that it is an unworthy thing to use abusive language; and even where fighting has in itself remained permissible, the number of things which may not be employed as methods of fighting has extraordinarily increased. Since we have been obliged to renounce the expression of hostility by deeds - held back by the passionless third person, in whose interest it is that personal security shall be preserved - we have, just as in the case of sexual aggressiveness, developed a new technique of invective, which aims at enlisting this third person against our enemy. By making our enemy small, inferior, despicable or comic, we achieve in a roundabout way the enjoyment of overcoming him - to which the third person, who has made no efforts, bears witness by his laughter.  

[1905c, 1697]

We are now prepared to realize the part played by jokes in hostile aggressiveness. A joke will allow us to exploit something ridiculous in our enemy which we could not, on account of obstacles in the way, bring forward openly or consciously; once again, then, the joke will evade restrictions and open sources of pleasure that have become inaccessible. It will further bribe the hearer with its yield of pleasure into taking sides with us without any very close investigation, just as on other occasions we ourselves have often been bribed by an innocent joke into over estimating the substance of a statement expressed jokingly. This is brought out with perfect aptitude in the common phrase 'die Lacher auf seine Seite ziehen [to bring the laughers over to our side]'  

[1905c, 1698]
Let us, for instance, consider Herr N.'s jokes, which were scattered over the last chapter. They are all of them pieces of invective. It is as though Herr N. wanted to exclaim aloud: 'The Minister for Agriculture is himself an ox!' 'Don't talk to me about * * * *! He's bursting with vanity!' 'I've never in my life read anything more boring than this historian's essays on Napoleon in Austria!' But the high position he occupies makes it impossible for him to give out his judgements in that form. They therefore bring in a joke to their help, and this in turn guarantees them a reception with the hearer which they would never have found in a non-joking form, in spite of the truth they might contain. One of these jokes is particularly instructive - the one about the 'red Fadian', perhaps the most impressive of all of them. What is there about it that makes us laugh and diverts our interest so completely from the question of whether or not an injustice has been done to the poor author? The joking form, of course - that is to say, the joke; but what is there about it that we are laughing at? No doubt at the person himself, who is introduced to us as the 'red Fadian', and in particular at his having red hair. Educated people have broken themselves of the habit of laughing at physical defects, and moreover they do not include having red hair among the laughable physical failings. But there is no doubt that it is so regarded by schoolboys and the common people - and this is still true even at the level of education of certain municipal and parliamentary representatives. And now Herr N. has made it possible in the most ingenious manner for us, grown-up and sensitive people, to laugh like the schoolboys at the historian X's red hair. This was certainly not Herr N.'s intention; but it is most doubtful whether a person who gives free play to a joke must necessarily know its precise intention.

If in these cases the obstacle to the aggressiveness which the joke helped to evade was an internal one - an aesthetic objection to the invective - elsewhere it can be of a purely external sort. This was so in the case in which Serenissimus asked a stranger by whose similarity to his own person he had been struck: 'Was your mother in the Palace at one time?' and the repartee was: 'No, but my father was.' The person to whom the question was put would no doubt have liked to knock down the impertinent individual who dared by such an allusion to cast a slur on his beloved mother's memory. But the impertinent individual was Serenissimus, whom one may not knock down or even insult unless one is prepared to purchase that revenge at the price of one's whole existence. The insult must therefore, it would seem, be swallowed in silence. But fortunately a joke shows the way in which the insult may be safely avenged - by making use of the technical method of unification in order to take up the allusion and turn it back against the aggressor. Here the impression of a joke is so much determined by its purpose that, in face of the joking character of the rejoinder, we are inclined to forget that the question asked by the aggressor had itself the character of a joke with the technique of allusion.

The pleasure in the case of a tendentious joke arises from a purpose being satisfied whose satisfaction would otherwise not have taken place. That a satisfaction such as this is a source of pleasure calls for no further remark. But the manner in which a joke leads to this satisfaction is linked with particular conditions, from which we may perhaps arrive at some further information. Two cases are to be distinguished here. The simpler one is where the satisfaction of the purpose is opposed by an external obstacle which is evaded by the joke. We found this, for instance, in the reply received by Serenissimus to his question of whether the mother of the man he was speaking to had ever lived in the Palace and in the critic's rejoinder to the two rich rascals who showed him their portraits: 'But where's the Saviour?' In the former case the purpose was to answer one insult by another, and in the latter it was to hand across an insult instead of the assessment that had been asked for. What opposed the purpose were purely external factors - the powerful position of the people at whom the insults were directed. It may nevertheless strike us that, however much these and analogous jokes of a tendentious nature may satisfy us, they are not able to provoke much laughter.

[1905c, 1698]

[1905c, 1699]

[1905c, 1710]
It is otherwise when what stands in the way of the direct realization of the purpose is not an external factor but an internal obstacle, when an internal impulse opposes the purpose. This condition would seem, on our hypothesis, to be fulfilled in the jokes of Herr N., in whom a strong inclination to invective is held in check by a highly developed aesthetic culture. By the help of a joke, this internal resistance is overcome in the particular case and the inhibition lifted. By that means, as in the instance of the external obstacle, the satisfaction of the purpose is made possible and its suppression, together with the 'psychical damming-up' that this would involve, is avoided. To that extent the mechanism of the generation of pleasure would be the same in the two cases.

Nevertheless, we are inclined here to go more deeply into the distinctions between the psychological situation in the cases of an external and an internal obstacle, for we have a suspicion that the removal of an internal obstacle may make an incomparably higher contribution to the pleasure. But I suggest that at this point we should exercise moderation and be satisfied for the moment with establishing what remains the essential point for us. The cases of an external and an internal obstacle differ only in the fact that in the latter an already existing inhibition is lifted and that in the former the erection of a new one is avoided. That being so, we shall not be relying too much on speculation if we assert that both for erecting and for maintaining a psychical inhibition some 'psychical expenditure' is required. And, since we know that in both cases of the use of tendentious jokes pleasure is obtained, it is therefore plausible to suppose that this yield of pleasure corresponds to the psychical expenditure that is saved.

Here then we have once more come upon the principle of economy which we met first in discussing the technique of verbal jokes. But whereas in the earlier case we seemed to find the economy in the use of as few words as possible or of words as much alike as possible, we now have a suspicion of an economy in the far more comprehensive sense of psychical expenditure in general; and we must regard it as possible that a closer understanding of what is still the very obscure concept of 'psychical expenditure' may bring us nearer to the essential nature of jokes.

A certain lack of clarity which we have been unable to overcome in our handling of the mechanism of pleasure in tendentious jokes may be taken as an appropriate punishment for our having tried to clear up the more complex problem before the simpler one, tendentious jokes before innocent ones. We take note of the fact that 'economy in expenditure on inhibition or suppression' appears to be the secret of the pleasurable effect of tendentious jokes, and pass on to the mechanism of pleasure in innocent jokes.
On the basis of suitable specimens of innocent jokes, in which there was no fear of our judgement being disturbed by their content or purpose, we were driven to conclude that the techniques of jokes are themselves sources of pleasure; and we shall now try to discover whether it may perhaps be possible to trace that pleasure back to economy in psychical expenditure. In one group of these jokes (play upon words) the technique consisted in focusing our psychical attitude upon the sound of the word instead of upon its meaning - in making the (acoustic) word presentation itself take the place of its significance as given by its relations to thing-presentations. It may really be suspected that in doing so we are bringing about a great relief in psychical work and that when we make serious use of words we are obliged to hold ourselves back with a certain effort from this comfortable procedure. We can observe how pathological states of thought-activity, in which the possibility of concentrating psychical expenditure on a particular point is probably restricted, do in fact give this sort of sound-presentation of the word greater prominence than its meaning, and that sufferers in such states proceed in their speech on the lines (as the formula runs) of the 'external' instead of the 'internal' associations of the word-presentation. We notice, too, that children, who, as we know, are in the habit of still treating words as things, tend to expect words that are the same or similar to have the same meaning behind them - which is a source of many mistakes that are laughed at by grown-up people. If, therefore, we derive unmistakable enjoyment in jokes from being transported by the use of the same or a similar word from one circle of ideas to another, remote one (in the 'Home-Roulard', for instance, from the kitchen to politics), this enjoyment is no doubt correctly to be attributed to economy in psychical expenditure. The pleasure in a joke arising from a 'short-circuit' like this seems to be the greater the more alien the two circles of ideas that are brought together by the same word - the further apart they are, and thus the greater the economy which the joke's technical method provides in the train of thought. We may notice, too, that here jokes are making use of a method of linking things up which is rejected and studiously avoided by serious thought.¹

[1905c, 1712]
In this way the problem of the essential character of jokes is already explained in jests. We may now turn to the further development of jests, to the point at which they reach their height in tendentious jokes. Jests still give the foremost place to the purpose of giving us enjoyment, and are content if what they say does not appear senseless or completely devoid of substance. If what a jest says possesses substance and value, it turns into a joke. A thought which would deserve our interest even if it were expressed in the most unpretentious form is now clothed in a form which must give us enjoyment on its own account.¹ A combination like this can certainly not, we must suppose, have come about unintentionally; and we must try to discover the intention underlying the construction of the joke. An observation which we made earlier (in passing, as it seemed) will put us on the track. We said above (p. 1691) that a good joke makes, as it were, a total impression of enjoyment on us, without our being able to decide at once what share of the pleasure arises from its joking form and what share from its apt thought-content. We are constantly making mistakes in this apportionment. Sometimes we overestimate the goodness of the joke on account of our admiration of the thought it contains; another time, on the contrary, we over-estimate the value of the thought on account of the enjoyment given us by its joking envelope. We do not know what is giving us enjoyment and what we are laughing at. This uncertainty in our judgement, which must be assumed to be a fact, may have provided the motive for the construction of jokes in the proper sense of the word. The thought seeks to wrap itself in a joke because in that way it recommends itself to our attention and can seem more significant and more valuable, but above all because this wrapping bribes our powers of criticism and confuses them. We are inclined to give the thought the benefit of what has pleased us in the form of the joke; and we are no longer inclined to find anything wrong that has given us enjoyment and so to spoil the source of a pleasure. If the joke has made us laugh, moreover, a disposition most unfavourable for criticism will have been established in us; for in that case something will have forced us into the mood which play has previously sufficed to produce, and for which the joke has tried by every possible means to make itself a substitute. Even though we have earlier asserted that such jokes are to be described as innocent and not yet tendentious, we must not forget that strictly speaking only jests are non-tendentious - that is, serve solely the aim of producing pleasure. Jokes, even if the thought contained in them is non-tendentious and thus only serves theoretical intellectual interests, are in fact never non-tendentious. They pursue the second aim: to promote the thought by augmenting it and guarding it against criticism. Here they are once again expressing their original nature by setting themselves up against an inhibiting and restricting power - which is now the critical judgement.

¹[1905c, 1722]
In this survey of the achievements of tendentious jokes, most prominence has been assumed by - what is more easily seen - the effect of jokes on the person who hears them. More important, however, from the point of view of our understanding, are the functions accomplished by jokes in the mind of the person who makes them or, to put it in the only correct way, the person to whom they occur. We have already proposed - and here we have occasion to repeat the notion - that we should try to study the psychical phenomena of jokes with reference to their distribution between two people. We will make a provisional suggestion that the psychical process provoked by the joke in the hearer is in most cases modelled on that which occurs in its creator. The external obstacle which is to be overcome in the hearer corresponds to an internal inhibition in the maker of the joke. At the least the expectation of an external obstacle is present in the latter as an inhibiting idea. In certain cases the internal obstacle which is overcome by the tendentious joke is obvious; in Herr N.’s jokes, for instance, we were able to assume (p. 1699) that not only did they make it possible for their hearers to enjoy aggressiveness in the form of insults, but that above all they made it possible for him to produce them. Among the various kinds of internal inhibition or suppression there is one which deserves our special interest, because it is the most far-reaching. It is given the name of 'repression', and is recognized by its function of preventing the impulses subjected to it, and their derivatives, from becoming conscious. Tendentious jokes, as we shall see, are able to release pleasure even from sources that have undergone repression. If, as has been suggested above, the overcoming of external obstacles can in this way be traced back to the overcoming of internal inhibitions and repressions, we may say that tendentious jokes exhibit the main characteristic of the joke-work - that of liberating pleasure by getting rid of inhibitions more clearly than any other of the developmental stages of jokes. Either they strengthen the purposes which they serve, by bringing assistance to them from impulses that are kept suppressed, or they put themselves entirely at the service of suppressed purposes.

We may be ready to admit that this is what tendentious jokes achieve; yet we must bear in mind that we do not understand how they are able to put these achievements into effect. Their power lies in the yield of pleasure which they draw from the sources of play upon words and of liberated nonsense; but if we are to judge by the impressions gained from non-tendentious jests, we cannot possibly think the amount of this pleasure great enough to attribute to it the strength to lift deeply-rooted inhibitions and repressions. What we have before us here is in fact no simple effect of force but a more complex situation of release. Instead of setting out the long detour by which I reached an understanding of this situation, I will try to give a short synthetic exposition of it.

The case of tendentious jokes is a special one among these possibilities. An impulse or urge is present which seeks to release pleasure from a particular source and, if it were allowed free play, would release it. Besides this, another urge is present which works against this generation of pleasure - inhibits it, that is, or suppresses it. The suppressing current must, as the outcome shows, be a certain amount stronger than the suppressed one, which, however, is not on that account abolished. Now let us suppose that yet another urge makes its appearance which would release pleasure through the same process, though from other sources, and which thus operates in the same sense as the suppressed urge. What can the result be in such a case?
An example will give us our bearings better than this schematic discussion. Let us assume that there is an urge to insult a certain person; but this is so strongly opposed by feelings of propriety or of aesthetic culture that the insult cannot take place. If, for instance, it were able to break through as a result of some change of emotional condition or mood, this break through by the insulting purpose would be felt subsequently with unpleasure. Thus the insult does not take place. Let us now suppose, however, that the possibility is presented of deriving a good joke from the material of the words and thoughts used for the insult - the possibility, that is, of releasing pleasure from other sources which are not obstructed by the same suppression. This second development of pleasure could, nevertheless, not occur unless the insult were permitted; but as soon as the latter is permitted the new release of pleasure is also joined to it. Experience with tendentious jokes shows that in such circumstances the suppressed purpose can, with the assistance of the pleasure from the joke, gain sufficient strength to overcome the inhibition, which would otherwise be stronger than it. The insult takes place, because the joke is thus made possible. But the enjoyment obtained is not only that produced by the joke: it is incomparably greater. It is so much greater than the pleasure from the joke that we must suppose that the hitherto suppressed purpose has succeeded in making its way through, perhaps without any diminution whatever. It is in such circumstances that the tendentious joke is received with the heartiest laughter.

[1905c, 1726]

An examination of the determinants of laughing will perhaps lead us to a plainer idea of what happens when a joke affords assistance against suppression. Even now, however, we can see that the case of tendentious jokes is a special case of the 'principle of assistance'. A possibility of generating pleasure supervenes in a situation in which another possibility of pleasure is obstructed so that, as far as the latter alone is concerned, no pleasure would arise. The result is a generation of pleasure far greater than that offered by the supervening possibility. This has acted, as it were, as an *incentive bonus* with the assistance of the offer of a small amount of pleasure, a much greater one, which would otherwise have been hard to achieve, has been gained. I have good reason to suspect that this principle corresponds with an arrangement that holds good in many widely separated departments of mental life and it will, I think, be expedient to describe the pleasure that serves to initiate the large release of pleasure as 'fore-pleasure', and the principle as the 'fore-pleasure principle'.

[1905c, 1726]

Let us take the second question first. In the case of the comic, two persons are in general concerned: besides myself, the person in whom I find something comic. If inanimate things seem to me comic, that is on account of a kind of personification which is not of rare occurrence in our ideational life. The comic process is content with these two persons: the self and the person who is the object; a third person may come into it, but is not essential. Joking as a *play* with one's own words and thoughts is to begin with without a person as an object. But already at the preliminary stage of the *jest*, if it has succeeded in making play and nonsense safe from the protests of reason, it demands another person to whom it can communicate its result. But this second person in the case of jokes does not correspond to the person who is the object, but to the *third* person, the 'other' person in the case of the comic. It seems as though in the case of a jest the other person has the decision passed over to him on whether the joke-work has succeeded in its task - as though the self did not feel certain in its judgement on the point. Innocent jokes, too, jokes that serve to reinforce a thought, require another person to test whether they have attained their aim. If a joke enters the service of the purpose of exposing or of a hostile purpose, it may be described as a psychical process between three persons, who are the same as in the case of the comic, though the part played by the third person is different; the psychical process in jokes is accomplished between the first person (the self) and the third (the outside person) and not, as in the case of the comic, between the self and the person who is the object.

[1905c, 1732]
It appears to be far from easy to avoid the endopsychic employment of cathexes that have become superfluous, for in our thought-processes we are constantly in the habit of displacing such cathexes from one path to another without losing any of their energy by discharge. Jokes make use of the following methods with that aim in view. Firstly, they try to keep their expression as short as possible, so as to offer fewer points of attack to the attention. Secondly, they observe the condition of being easy to understand (see above); as soon as they call for intellectual work which would demand a choice between different paths of thought, they would endanger their effect not only by the unavoidable expenditure of thought but also by the awakening of attention. But besides this they employ the device of distracting attention by putting forward something in the joke's form of expression which catches it, so that in the meantime the liberation of the inhibitory cathexis and its discharge may be completed without interruption. This aim is already fulfilled by the omissions in the joke's wording; they offer an incitement to filling up the gaps and in that way succeed in withdrawing the joking process from attention. Here the technique of riddles, which attract the attention, is, as it were, brought into the service of the joke-work. Far more effective even are the façades which we have found especially in some groups of tendentious jokes (p. 1699 ff.). The syllogistic façades admirably fulfil the aim of holding the attention by setting it a task. While we are beginning to wonder what was wrong with the reply, we are already laughing; our attention has been caught unawares and the discharge of the liberated inhibitory cathexis has been completed. The same is true of jokes with a comic façade, in which the comic comes to the help of the joke-technique. A comic façade encourages the effectiveness of a joke in more than one way; not only does it make the automatism of the joking process possible, by holding the attention, but it also facilitates the discharge by the joke, by sending on ahead a discharge of a comic kind. The comic is here operating exactly like a bribing fore-pleasure, and we can in this way understand how some jokes are able to renounce entirely the fore-pleasure produced by the ordinary methods of joking and make use only of the comic for fore-pleasure. Among the joke-techniques proper, it is in particular displacement and representation by something absurd which, apart from their other qualifications, give rise, too, to a distraction of the attention which is desirable for the automatic course of the joking process.¹

In view of the universal predominance in jokes of this peculiar technique for overcoming their inhibitions, it might be thought superfluous for them ever to make use in particular cases of the technique of displacement. But, on the one hand, certain species of that technique remain of value to jokes as aims and as sources of pleasure - for instance, displacement proper (diversion of thoughts), which indeed partakes of the nature of nonsense. On the other hand, it should not be forgotten that the highest stage of jokes, tendentious jokes, often have to overcome two kinds of inhibition, those opposed to the joke itself and those opposed to its purpose (p. 1696), and that allusions and displacements are well qualified to make this latter task possible.

It can be assumed with certainty that jokes are formed in the unconscious when it is a question of jokes in the service of unconscious purposes or of purposes reinforced by the unconscious - that is, of most 'cynical' jokes. For in such cases the unconscious purpose drags the preconscious thought down into the unconscious and there gives it a new shape - a process to which the study of the psychology of the neuroses has taught us numerous analogies. In the case, however, of tendentious jokes of other kinds, of innocent jokes and of jests, this downward dragging force seems absent and the relation of jokes to the unconscious is accordingly called in question.
On such a foundation we cannot build a great deal. If we bring the various stages of the joke into relation to the mental states that are favourable to them we can perhaps proceed as follows. The *jest* springs from a cheerful mood, which seems to be characterized by an inclination to diminish mental cathexes. It already employs all the characteristic techniques of jokes and already fulfils their fundamental condition by selecting verbal material or connections of thoughts which will meet both the demands for a yield of pleasure and those made by rational criticism. We shall conclude that the lowering of the thought cathexis to the unconscious level, facilitated by the cheerful mood, is present already in jests. In the case of *innocent jokes* that are linked to the expression of a valuable thought, the encouraging effect of mood no longer applies. Here we must presume the occurrence of a special *personal aptitude*, which is manifested in the ease with which the preconscious cathexis is dropped and exchanged for a moment for the unconscious one. A purpose that is all the time on the watch for renewing the original yield of pleasure from jokes exercises a downward drag on the still unsettled preconscious expression of the thought. No doubt most people are capable of producing jests when they are in a cheerful mood; the aptitude for making *jokes* is present in only a few people independently of their mood. Lastly, the joke-work receives its most powerful stimulus when strong purposes reaching down into the unconscious are present, which represent a special aptitude for the production of jokes and which may explain to us how it is that the subjective determinants of jokes are so often fulfilled in neurotic people. Under the influence of strong purposes even those who otherwise have the least aptitude for it become capable of making jokes.

[1905c, 1760]
Or when *Simplicissimus* describes a collection of incredible pieces of brutality and cynicism as the expressions of 'men of feeling', this too is a representation by the opposite. But we call this 'irony' and no longer a joke. The only technique that characterizes irony is representation by the opposite. Moreover we read and hear of 'ironical jokes'. So it can no longer be doubted that technique alone is insufficient to characterize the nature of jokes. Something further is needed which we have not yet discovered. But on the other hand it remains an uncontradicted fact that if we undo the technique of a joke it disappears. For the time being we may find difficulty in thinking how these two fixed points that we have arrived at in explaining jokes can be reconciled.

The meaning of this remark is clear. It is once again a question of the representation of something that cannot be expressed directly. How does this 'indirect representation' come about? Starting from the representation in the joke, we trace the path backwards through a series of easily established associations and inferences.

And here at last we can understand what it is that jokes achieve in the service of their purpose. They make possible the satisfaction of an instinct (whether lustful or hostile) in the face of an obstacle that stands in its way. They circumvent this obstacle and in that way draw pleasure from a source which the obstacle had made inaccessible. The obstacle standing in the way is in reality nothing other than women's incapacity to tolerate undisguised sexuality, an incapacity correspondingly increased with a rise in the educational and social level. The woman who is thought of as having been present in the initial situation is afterwards retained as though she were still present, or in her absence her influence still has an intimidating effect on the men. We can observe how men of a higher class are at once induced, when they are in the company of girls of an inferior class, to reduce their smutty jokes to the level of simple smut.

The prevention of invective or of insulting rejoinders by external circumstances is such a common case that tendentious jokes are especially favoured in order to make aggressiveness or criticism possible against persons in exalted positions who claim to exercise authority. The joke then represents a rebellion against that authority, a liberation from its pressure. The charm of caricatures lies in this same factor: we laugh at them even if they are unsuccessful simply because we count rebellion against authority as a merit.

If we bear in mind the fact that tendentious jokes are so highly suitable for attacks on the great, the dignified and the mighty, who are protected by internal inhibitions and external circumstances from direct disparagement, we shall be obliged to take a special view of certain groups of jokes which seem to be concerned with inferior and powerless people. I am thinking of the anecdotes about marriage-brokers, some of which we became acquainted with in the course of our investigation of the various techniques of conceptual jokes. In a few of them, for instance in the examples 'She's deaf as well' and 'Who would lend these people anything?', the broker is laughed at for his improvidence and thoughtlessness and he becomes comic because the truth escapes him as it were automatically. But does what we have learnt of the nature of tendentious jokes on the one hand and on the other hand our great enjoyment of these stories fit in with the paltriness of the people whom these jokes seem to laugh at? Are they worthy opponents of the jokes? Is it not rather the case that the jokes only put forward the marriage-brokers in order to strike at something more important? Is it not a case of saying one thing and meaning another? It is really not possible to reject this view.
In any case, if our marriage-broker anecdotes are jokes, they are all the better jokes because, thanks to their façade, they are in a position to conceal not only what they have to say but also the fact that they have something - forbidden - to say. The continuation of this interpretation - and this uncovers the hidden meaning and reveals these anecdotes with a comic façade as tendentious jokes - would be as follows. Anyone who has allowed the truth to slip out in an unguarded moment is in fact glad to be free of pretence. This is a correct and profound piece of psychological insight. Without this internal agreement no one lets himself be mastered by the automatism which in these cases brings the truth to light.¹ But this converts the laughable figure of the Schadchen into a sympathetic one, deserving of pity. How happy the man must be to be able at last to throw off the burden of pretence, since he makes use of the first chance of shouting out the very last scrap of truth! As soon as he sees that the case is lost, that the bride does not please the young man, he gladly betrays yet another concealed defect which has escaped notice, or he takes the opportunity of producing an argument that settles a detail in order to express his contempt for the people he is working for: 'I ask you - who would lend these people anything?' The whole of the ridicule in the anecdote now falls upon the parents, barely touched on in it, who think this swindle justified in order to get their daughter a husband, upon the pitiable position of girls who let themselves be married on such terms, and upon the disgracefulness of marriages contracted on such a basis. The marriage-broker is the right man to express such criticisms, for he knows most about these abuses; but he must not say them aloud, for he is a poor man whose existence depends on exploiting them. The popular mind, which created these stories, and others like them, is torn by a similar conflict; for it knows that the sacredness of marriages after they have been contracted is grievously affected by the thought of what happened at the time when they were arranged.

[1905c, 1700]

In the examples we have considered hitherto, the disguised aggressiveness has been directed against people - in the broker jokes against everyone involved in the business of arranging a marriage: the bride and bridegroom and their parents. But the object of the joke's attack may equally well be institutions, people in their capacity as vehicles of institutions, dogmas of morality or religion, views of life which enjoy so much respect that objections to them can only be made under the mask of a joke and indeed of a joke concealed by its façade. Though the themes at which these tendentious jokes are aimed may be few, their forms and envelopes are very many and various. I think we shall do well to distinguish this class of tendentious joke by a special name. The appropriate name will emerge after we have interpreted a few examples of the class.

[1905c, 1702]

We have already discussed the complicated technique of this example: a bewildering and apparently impossible simile, which however, as we now see, is not in itself a joke; further, an allusion (a cab is a public vehicle); and, as its most powerful technical method, an omission which increases the unintelligibility. The simile may be worked out as follows. One marries in order to protect oneself against the temptations of sensuality, but it turns out nevertheless that marriage does not allow of the satisfaction of needs that are somewhat stronger than usual. In just the same way, one takes an umbrella with one to protect oneself from the rain and nevertheless gets wet in the rain. In both cases one must look around for a stronger protection: in the latter case one must take a public vehicle, and in the former a woman who is accessible in return for money. The joke has now been almost entirely replaced by a piece of cynicism. One does not venture to declare aloud and openly that marriage is not an arrangement calculated to satisfy a man's sexuality, unless one is driven to do so perhaps by the love of truth and eagerness for reform of a Christian von Ehrenfels.¹ The strength of this joke lies in the fact that nevertheless - in all kinds of roundabout ways - it has declared it.

[1905c, 1705]
This, the first use of jokes that goes beyond the production of pleasure, points the way to their further uses. A joke is now seen to be a psychical factor possessed of power: its weight, thrown into one scale or the other, can be decisive. The major purposes and instincts of mental life employ it for their own ends. The originally non-tendentious joke, which began as play, is secondarily brought into relation with purposes from which nothing that takes form in the mind can ultimately keep away. We know already what it is able to achieve in the service of the purpose of exposure, and of hostile, cynical and sceptical purposes. In the case of obscene jokes, which are derived from smut, it turns the third person who originally interfered with the sexual situation into an ally, before whom the woman must feel shame, by bribing him with the gift of its yield of pleasure. In the case of aggressive purposes it employs the same method in order to turn the hearer, who was indifferent to begin with, into a co-hater or co-despiser, and creates for the enemy a host of opponents where at first there was only one. In the first case it overcomes the inhibitions of shame and respectability by means of the bonus of pleasure which it offers; in the second it upsets the critical judgement which would otherwise have examined the dispute. In the third and fourth cases, in the service of cynical and sceptical purposes, it shatters respect for institutions and truths in which the hearer has believed, on the one hand by reinforcing the argument, but on the other by practising a new species of attack. Where argument tries to draw the hearer's criticism over on to its side, the joke endeavours to push the criticism out of sight. There is no doubt that the joke has chosen the method which is psychologically the more effective.

[1905c, 1723]

In this survey of the achievements of tendentious jokes, most prominence has been assumed by - what is more easily seen - the effect of jokes on the person who hears them. More important, however, from the point of view of our understanding, are the functions accomplished by jokes in the mind of the person who makes them or, to put it in the only correct way, the person to whom they occur. We have already proposed - and here we have occasion to repeat the notion - that we should try to study the psychical phenomena of jokes with reference to their distribution between two people. We will make a provisional suggestion that the psychical process provoked by the joke in the hearer is in most cases modelled on that which occurs in its creator. The external obstacle which is to be overcome in the hearer corresponds to an internal inhibition in the maker of the joke. At the least the expectation of an external obstacle is present in the latter as an inhibiting idea. In certain cases the internal obstacle which is overcome by the tendentious joke is obvious; in Herr N.'s jokes, for instance, we were able to assume (p. 1699) that not only did they make it possible for their hearers to enjoy aggressiveness in the form of insults, but that above all they made it possible for him to produce them. Among the various kinds of internal inhibition or suppression there is one which deserves our special interest, because it is the most far-reaching. It is given the name of 'repression', and is recognized by its function of preventing the impulses subjected to it, and their derivatives, from becoming conscious. Tendentious jokes, as we shall see, are able to release pleasure even from sources that have undergone repression. If, as has been suggested above, the overcoming of external obstacles can in this way be traced back to the overcoming of internal inhibitions and repressions, we may say that tendentious jokes exhibit the main characteristic of the joke-work - that of liberating pleasure by getting rid of inhibitions more clearly than any other of the developmental stages of jokes. Either they strengthen the purposes which they serve, by bringing assistance to them from impulses that are kept suppressed, or they put themselves entirely at the service of suppressed purposes.

[1905c, 1724]
An example will give us our bearings better than this schematic discussion. Let us assume that there is an urge to insult a certain person; but this is so strongly opposed by feelings of propriety or of aesthetic culture that the insult cannot take place. If, for instance, it were able to break through as a result of some change of emotional condition or mood, this break through by the insulting purpose would be felt subsequently with unpleasure. Thus the insult does not take place. Let us now suppose, however, that the possibility is presented of deriving a good joke from the material of the words and thoughts used for the insult - the possibility, that is, of releasing pleasure from other sources which are not obstructed by the same suppression. This second development of pleasure could, nevertheless, not occur unless the insult were permitted; but as soon as the latter is permitted the new release of pleasure is also joined to it. Experience with tendentious jokes shows that in such circumstances the suppressed purpose can, with the assistance of the pleasure from the joke, gain sufficient strength to overcome the inhibition, which would otherwise be stronger than it. The insult takes place, because the joke is thus made possible. But the enjoyment obtained is not only that produced by the joke: it is incomparably greater. It is so much greater than the pleasure from the joke that we must suppose that the hitherto suppressed purpose has succeeded in making its way through, perhaps without any diminution whatever. It is in such circumstances that the tendentious joke is received with the heartiest laughter.

[1905c, 1726]

There are also a whole number of cynical jokes and anecdotes which reveal the same tendency - such, for instance, as the words attributed to a husband: 'If one of us two dies, I shall move to Paris.' Such cynical jokes would not be possible unless they contained an unacknowledged truth which could not be admitted if it were expressed seriously and without disguise. In jest - it is well known - one may even tell the truth.

[1915b, 3090]

In this place I shall only follow up one of the consequences which seem possible from this point of view, thus resuming the discussion of a problem which I was obliged to leave unsolved elsewhere.¹ Each of the mental differentiations that we have become acquainted with represents a fresh aggravation of the difficulties of mental functioning, increases its instability, and may become the starting-point for its breakdown, that is, for the onset of a disease. Thus, by being born we have made the step from an absolutely self-sufficient narcissism to the perception of a changing external world and the beginnings of the discovery of objects. And with this is associated the fact that we cannot endure the new state of things for long, that we periodically revert from it, in our sleep, to our former condition of absence of stimulation and avoidance of objects. It is true, however, that in this we are following a hint from the external world, which, by means of the periodical change of day and night, temporarily withdraws the greater part of the stimuli that affect us. The second example of such a step, pathologically more important, is subject to no such qualification. In dreams and in neuroses what is thus excluded knocks for admission at the gates, guarded though they are by resistances; and in our waking health we make use of special artifices for allowing what is repressed to circumvent the resistances and for receiving it temporarily into our ego to the increase of our pleasure. Jokes and humour, and to some extent the comic in general, may be regarded in this light. Everyone acquainted with the psychology of the neuroses will think of similar examples of less importance; but I hasten on to the application I have in view.

[1921c, 3821]
We have already learnt from the connection of jokes with caricature that they 'must bring forward something that is concealed or hidden' (Fischer, 1889, 51). I lay stress on this determinant once more, because it too has more to do with the nature of jokes than with their being part of the comic.

[1905c, 1619]

And here at last we can understand what it is that jokes achieve in the service of their purpose. They make possible the satisfaction of an instinct (whether lustful or hostile) in the face of an obstacle that stands in its way. They circumvent this obstacle and in that way draw pleasure from a source which the obstacle had made inaccessible. The obstacle standing in the way is in reality nothing other than women's incapacity to tolerate undisguised sexuality, an incapacity correspondingly increased with a rise in the educational and social level. The woman who is thought of as having been present in the initial situation is afterwards retained as though she were still present, or in her absence her influence still has an intimidating effect on the men. We can observe how men of a higher class are at once induced, when they are in the company of girls of an inferior class, to reduce their smutty jokes to the level of simple smut.

[1905c, 1697]

The power which makes it difficult or impossible for women, and to a lesser degree for men as well, to enjoy undisguised obscenity is termed by us 'repression'; and we recognize in it the same psychical process which, in cases of serious illness, keeps whole complexes of impulses, together with their derivatives, away from consciousness, and which has turned out to be the main factor in the causation of what are known as psycho-neuroses. It is our belief that civilization and higher education have a large influence in the development of repression, and we suppose that, under such conditions, the psychical organization undergoes an alteration (that can also emerge as an inherited disposition) as a result of which what was formerly felt as agreeable now seems unacceptable and is rejected with all possible psychical force. The repressive activity of civilization brings it about that primary possibilities of enjoyment, which have now, however, been repudiated by the censorship in us, are lost to us. But to the human psyche all renunciation is exceedingly difficult, and so we find that tendentious jokes provide a means of undoing the renunciation and retrieving what was lost. When we laugh at a refined obscene joke, we are laughing at the same thing that makes a peasant laugh at a coarse piece of smut. In both cases the pleasure springs from the same source. We, however, could never bring ourselves to laugh at the coarse smut; we should feel ashamed or it would seem to us disgusting. We can only laugh when a joke has come to our help.

[1905c, 1697]

If in these cases the obstacle to the aggressiveness which the joke helped to evade was an internal one - an aesthetic objection to the invective - elsewhere it can be of a purely external sort. This was so in the case in which Serenissimus asked a stranger by whose similarity to his own person he had been struck: 'Was your mother in the Palace at one time?' and the repartee was: 'No, but my father was.' The person to whom the question was put would no doubt have liked to knock down the impertinent individual who dared by such an allusion to cast a slur on his beloved mother's memory. But the impertinent individual was Serenissimus, whom one may not knock down or even insult unless one is prepared to purchase that revenge at the price of one's whole existence. The insult must therefore, it would seem, be swallowed in silence. But fortunately a joke shows the way in which the insult may be safely avenged - by making use of the technical method of unification in order to take up the allusion and turn it back against the aggressor. Here the impression of a joke is so much determined by its purpose that, in face of the joking character of the rejoinder, we are inclined to forget that the question asked by the aggressor had itself the character of a joke with the technique of allusion.

[1905c, 1699]
And with this the second preliminary stage of jokes sets in - the *jest*. It is now a question of prolonging the yield of pleasure from play, but at the same time of silencing the objections raised by criticism which would not allow the pleasurable feeling to emerge. There is only one way of reaching this end: the meaningless combination of words or the absurd putting together of thoughts must nevertheless have a meaning. The whole ingenuity of the joke-work is summoned up in order to find words and aggregations of thoughts in which this condition is fulfilled. All the technical methods of jokes are already employed here - in jests; moreover linguistic usage draws no consistent line between a jest and a joke. What distinguishes a jest from a joke is that the meaning of the sentence which escapes criticism need not be valuable or new or even good; it need merely be *permissible* to say the thing in this way, even though it is unusual, unnecessary or useless to say it in this way. In jests what stands in the foreground is the satisfaction of having made possible what was forbidden by criticism.

The importance which our views attach to the factor of 'sense in nonsense' might lead to a demand that every joke must be a nonsense joke. But this is not necessary, because it is only playing with *thoughts* that inevitably leads to nonsense; the other source of pleasure in jokes, playing with *words*, only gives that impression occasionally and does not invariably provoke the implied criticism. The twofold root of the pleasure in jokes - from playing with words and playing with thoughts, which corresponds to the very important distinction between verbal and conceptual jokes - makes it perceptibly more difficult to arrive at a concise formulation of general statements about jokes. Playing with words produces manifest pleasure as a result of the factors that have been enumerated above (recognition, and so on), and is consequently only to a small degree liable to suppression. Playing with thoughts cannot have its motive in this kind of pleasure; it meets with very energetic suppression, and the pleasure which it can yield is only pleasure in the lifting of an inhibition. It can accordingly be said that the pleasure in jokes exhibits a core of original pleasure in play and a casing of pleasure in lifting inhibitions. - We naturally do not perceive that our pleasure in a nonsense joke arises from our having succeeded in liberating a piece of nonsense in spite of its suppression; whereas we see directly that playing with words has given us pleasure. - The nonsense that still remains in a conceptual joke acquires secondarily the function of increasing our attention by bewildering us. It serves as a means of intensifying the effect of the joke, but only when it acts obtrusively, so that the bewilderment can hurry ahead of the understanding by a perceptible moment of time. The examples on p. 1659 ff. have shown that in addition to this, nonsense in a joke can be used to represent a judgement contained in the thought. But this, too, is not the primary significance of nonsense in jokes.
In this place I shall only follow up one of the consequences which seem possible from this point of view, thus resuming the discussion of a problem which I was obliged to leave unsolved elsewhere.¹ Each of the mental differentiations that we have become acquainted with represents a fresh aggravation of the difficulties of mental functioning, increases its instability, and may become the starting-point for its breakdown, that is, for the onset of a disease. Thus, by being born we have made the step from an absolutely self-sufficient narcissism to the perception of a changing external world and the beginnings of the discovery of objects. And with this is associated the fact that we cannot endure the new state of things for long, that we periodically revert from it, in our sleep, to our former condition of absence of stimulation and avoidance of objects. It is true, however, that in this we are following a hint from the external world, which, by means of the periodical change of day and night, temporarily withdraws the greater part of the stimuli that affect us. The second example of such a step, pathologically more important, is subject to no such qualification. In the course of development we have effected a separation of our mental existence into a coherent ego and into an unconscious and repressed portion which is left outside it; and we know that the stability of this new acquisition is exposed to constant shocks. In dreams and in neuroses what is thus excluded knocks for admission at the gates, guarded though they are by resistances; and in our waking health we make use of special artifices for allowing what is repressed to circumvent the resistances and for receiving it temporarily into our ego to the increase of our pleasure. Jokes and humour, and to some extent the comic in general, may be regarded in this light. Everyone acquainted with the psychology of the neuroses will think of similar examples of less importance; but I hasten on to the application I have in view.

[1921c, 3821]

I was able to show from a short story by W. Jensen called Gradiva, which has no particular merit in itself, that invented dreams can be interpreted in the same way as real ones and that the unconscious mechanisms familiar to us in the 'dream-work' are thus also operative in the processes of imaginative writing. My book on Jokes and their Relation to the Unconscious was a side-issue directly derived from The Interpretation of Dreams. The only friend of mine who was at that time interested in my work remarked to me that my interpretations of dreams often impressed him as being like jokes. In order to throw some light on this impression, I began to investigate jokes and found that their essence lay in the technical methods employed in them, and that these were the same as the means used in the 'dream-work' - that is to say, condensation, displacement, the representation of a thing by its opposite or by something very small, and so on. This led to an economic enquiry into the origin of the high degree of pleasure obtained from hearing a joke. And to this the answer was that it was due to the momentary suspension of the expenditure of energy upon maintaining repression, owing to the attraction exercised by the offer of a bonus of pleasure (fore-pleasure).

[1925d, 4239]
The power which makes it difficult or impossible for women, and to a lesser degree for men as well, to enjoy undisguised obscenity is termed by us 'repression'; and we recognize in it the same psychical process which, in cases of serious illness, keeps whole complexes of impulses, together with their derivatives, away from consciousness, and which has turned out to be the main factor in the causation of what are known as psycho-neuroses. It is our belief that civilization and higher education have a large influence in the development of repression, and we suppose that, under such conditions, the psychical organization undergoes an alteration (that can also emerge as an inherited disposition) as a result of which what was formerly felt as agreeable now seems unacceptable and is rejected with all possible psychical force. The repressive activity of civilization brings it about that primary possibilities of enjoyment, which have now, however, been repudiated by the censorship in us, are lost to us. But to the human psyche all renunciation is exceedingly difficult, and so we find that tendentious jokes provide a means of undoing the renunciation and retrieving what was lost. When we laugh at a refined obscene joke, we are laughing at the same thing that makes a peasant laugh at a coarse piece of smut. In both cases the pleasure springs from the same source. We, however, could never bring ourselves to laugh at the coarse smut; we should feel ashamed or it would seem to us disgusting. We can only laugh when a joke has come to our help.

[1905c, 1697]

If in these cases the obstacle to the aggressiveness which the joke helped to evade was an internal one - an aesthetic objection to the invective - elsewhere it can be of a purely external sort. This was so in the case in which Serenissimus asked a stranger by whose similarity to his own person he had been struck: 'Was your mother in the Palace at one time?' and the repartee was: 'No, but my father was.' The person to whom the question was put would no doubt have liked to knock down the impertinent individual who dared by such an allusion to cast a slur on his beloved mother's memory. But the impertinent individual was Serenissimus, whom one may not knock down or even insult unless one is prepared to purchase that revenge at the price of one's whole existence. The insult must therefore, it would seem, be swallowed in silence. But fortunately a joke shows the way in which the insult may be safely avenged - by making use of the technical method of unification in order to take up the allusion and turn it back against the aggressor. Here the impression of a joke is so much determined by its purpose that, in face of the joking character of the rejoinder, we are inclined to forget that the question asked by the aggressor had itself the character of a joke with the technique of allusion.

[1905c, 1699]

The prevention of invective or of insulting rejoinders by external circumstances is such a common case that tendentious jokes are especially favoured in order to make aggressiveness or criticism possible against persons in exalted positions who claim to exercise authority. The joke then represents a rebellion against that authority, a liberation from its pressure. The charm of caricatures lies in this same factor: we laugh at them even if they are unsuccessful simply because we count rebellion against authority as a merit.

[1905c, 1699]
In any case, if our marriage-broker anecdotes are jokes, they are all the better jokes because, thanks to their façade, they are in a position to conceal not only what they have to say but also the fact that they have something - forbidden - to say. The continuation of this interpretation - and this uncovers the hidden meaning and reveals these anecdotes with a comic façade as tendentious jokes - would be as follows. Anyone who has allowed the truth to slip out in an unguarded moment is in fact glad to be free of pretence. This is a correct and profound piece of psychological insight. Without this internal agreement no one lets himself be mastered by the automatism which in these cases brings the truth to light.¹ But this converts the laughable figure of the Schadchen into a sympathetic one, deserving of pity. How happy the man must be to be able at last to throw off the burden of pretence, since he makes use of the first chance of shouting out the very last scrap of truth! As soon as he sees that the case is lost, that the bride does not please the young man, he gladly betrays yet another concealed defect which has escaped notice, or he takes the opportunity of producing an argument that settles a detail in order to express his contempt for the people he is working for: 'I ask you - who would lend these people anything?' The whole of the ridicule in the anecdote now falls upon the parents, barely touched on in it, who think this swindle justified in order to get their daughter a husband, upon the pitiable position of girls who let themselves be married on such terms, and upon the disgracefulness of marriages contracted on such a basis. The marriage-broker is the right man to express such criticisms, for he knows most about these abuses; but he must not say them aloud, for he is a poor man whose existence depends on exploiting them. The popular mind, which created these stories, and others like them, is torn by a similar conflict; for it knows that the sacredness of marriages after they have been contracted is grievously affected by the thought of what happened at the time when they were arranged.

¹[1905c, 1700]

In the examples we have considered hitherto, the disguised aggressiveness has been directed against people - in the broker jokes against everyone involved in the business of arranging a marriage: the bride and bridegroom and their parents. But the object of the joke’s attack may equally well be institutions, people in their capacity as vehicles of institutions, dogmas of morality or religion, views of life which enjoy so much respect that objections to them can only be made under the mask of a joke and indeed of a joke concealed by its façade. Though the themes at which these tendentious jokes are aimed may be few, their forms and envelopes are very many and various. I think we shall do well to distinguish this class of tendentious joke by a special name. The appropriate name will emerge after we have interpreted a few examples of the class.

[1905c, 1702]
I may recall the two stories - one of the impoverished gourmet who was caught eating 'salmon mayonnaise' and the other of the dipsomaniac tutor - which we learnt to know as sophistical displacement jokes. I will now continue their interpretation. We have since heard that if an appearance of logic is tacked on to the façade of a story the thought would like to say seriously 'the man is right', but, owing to an opposing contradiction, does not venture to declare the man right except on a single point, on which it can easily be shown that he is wrong. The 'point' chosen is the correct compromise between his rightness and his wrongness; this, indeed, is no decision, but corresponds to the conflict within ourselves. The two anecdotes are simply epicurean. They say: 'Yes. The man is right. There is nothing higher than enjoyment and it is more or less a matter of indifference how one obtains it.' This sounds shockingly immoral and is no doubt not much better. But at bottom it is nothing other than the poet's 'Carpe diem', which appeals to the uncertainty of life and the unfruitfulness of virtuous renunciation. If the idea that the man in the 'salmon mayonnaise' joke was right has such a repelling effect on us, this is only because the truth is illustrated by an enjoyment of the lowest kind, which it seems to us we could easily do without. In reality each of us has had hours and times at which he has admitted the rightness of this philosophy of life and has reproached moral doctrine with only understanding how to demand without offering any compensation. Since we have ceased any longer to believe in the promise of a next world in which every renunciation will be rewarded by a satisfaction - there are, incidentally, very few pious people if we take renunciation as the sign of faith - 'Carpe diem' has become a serious warning. I will gladly put off satisfaction: but do I know whether I shall still be here tomorrow? 'Di doman' non c'è certezza.'¹

We have already discussed the complicated technique of this example: a bewildering and apparently impossible simile, which however, as we now see, is not in itself a joke; further, an allusion (a cab is a public vehicle); and, as its most powerful technical method, an omission which increases the unintelligibility. The simile may be worked out as follows. One marries in order to protect oneself against the temptations of sensuality, but it turns out nevertheless that marriage does not allow of the satisfaction of needs that are somewhat stronger than usual. In just the same way, one takes an umbrella with one to protect oneself from the rain and nevertheless gets wet in the rain. In both cases one must look around for a stronger protection: in the latter case one must take a public vehicle, and in the former a woman who is accessible in return for money. The joke has now been almost entirely replaced by a piece of cynicism. One does not venture to declare aloud and openly that marriage is not an arrangement calculated to satisfy a man's sexuality, unless one is driven to do so perhaps by the love of truth and eagerness for reform of a Christian von Ehrenfels.¹ The strength of this joke lies in the fact that nevertheless - in all kinds of roundabout ways - it has declared it.

The pleasure in the case of a tendentious joke arises from a purpose being satisfied whose satisfaction would otherwise not have taken place. That a satisfaction such as this is a source of pleasure calls for no further remark. But the manner in which a joke leads to this satisfaction is linked with particular conditions, from which we may perhaps arrive at some further information. Two cases are to be distinguished here. The simpler one is where the satisfaction of the purpose is opposed by an external obstacle which is evaded by the joke. We found this, for instance, in the reply received by Serenissimus to his question of whether the mother of the man he was speaking to had ever lived in the Palace and in the critic's rejoinder to the two rich rascals who showed him their portraits: 'But where's the Saviour?' In the former case the purpose was to answer one insult by another, and in the latter it was to hand across an insult instead of the assessment that had been asked for. What opposed the purpose were purely external factors - the powerful position of the people at whom the insults were directed. It may nevertheless strike us that, however much these and analogous jokes of a tendentious nature may satisfy us, they are not able to provoke much laughter.

¹[1905c, 1703]

¹[1905c, 1705]

¹[1905c, 1710]
It is otherwise when what stands in the way of the direct realization of the purpose is not an external factor but an internal obstacle, when an internal impulse opposes the purpose. This condition would seem, on our hypothesis, to be fulfilled in the jokes of Herr N., in whom a strong inclination to invective is held in check by a highly developed aesthetic culture. By the help of a joke, this internal resistance is overcome in the particular case and the inhibition lifted. By that means, as in the instance of the external obstacle, the satisfaction of the purpose is made possible and its suppression, together with the 'psychical damming-up' that this would involve, is avoided. To that extent the mechanism of the generation of pleasure would be the same in the two cases.

Nevertheless, we are inclined here to go more deeply into the distinctions between the psychological situation in the cases of an external and an internal obstacle, for we have a suspicion that the removal of an internal obstacle may make an incomparably higher contribution to the pleasure. But I suggest that at this point we should exercise moderation and be satisfied for the moment with establishing what remains the essential point for us. The cases of an external and an internal obstacle differ only in the fact that in the latter an already existing inhibition is lifted and that in the former the erection of a new one is avoided. That being so, we shall not be relying too much on speculation if we assert that both for erecting and for maintaining a psychical inhibition some 'psychical expenditure' is required. And, since we know that in both cases of the use of tendentious jokes pleasure is obtained, it is therefore plausible to suppose that this yield of pleasure corresponds to the psychical expenditure that is saved.

[1905c, 1711]
In this way the problem of the essential character of jokes is already explained in jests. We may now turn to the further development of jests, to the point at which they reach their height in tendentious jokes. Jests still give the foremost place to the purpose of giving us enjoyment, and are content if what they say does not appear senseless or completely devoid of substance. If what a jest says possesses substance and value, it turns into a joke. A thought which would deserve our interest even if it were expressed in the most unpretentious form is now clothed in a form which must give us enjoyment on its own account.¹ A combination like this can certainly not, we must suppose, have come about unintentionally; and we must try to discover the intention underlying the construction of the joke. An observation which we made earlier (in passing, as it seemed) will put us on the track. We said above (p. 1691) that a good joke makes, as it were, a total impression of enjoyment on us, without our being able to decide at once what share of the pleasure arises from its joking form and what share from its apt thought-content. We are constantly making mistakes in this apportionment. Sometimes we over-estimate the goodness of the joke on account of our admiration of the thought it contains; another time, on the contrary, we over-estimate the value of the thought on account of the enjoyment given us by its joking envelope. We do not know what is giving us enjoyment and what we are laughing at. This uncertainty in our judgement, which must be assumed to be a fact, may have provided the motive for the construction of jokes in the proper sense of the word. The thought seeks to wrap itself in a joke because in that way it recommends itself to our attention and can seem more significant and more valuable, but above all because this wrapping bribes our powers of criticism and confuses them. We are inclined to give the thought the benefit of what has pleased us in the form of the joke; and we are no longer inclined to find anything wrong that has given us enjoyment and so to spoil the source of a pleasure. If the joke has made us laugh, moreover, a disposition most unfavourable for criticism will have been established in us; for in that case something will have forced us into the mood which play has previously sufficed to produce, and for which the joke has tried by every possible means to make itself a substitute. Even though we have earlier asserted that such jokes are to be described as innocent and not yet tendentious, we must not forget that strictly speaking only jests are non-tendentious - that is, serve solely the aim of producing pleasure. Jokes, even if the thought contained in them is non-tendentious and thus only serves theoretical intellectual interests, are in fact never non-tendentious. They pursue the second aim: to promote the thought by augmenting it and guarding it against criticism. Here they are once again expressing their original nature by setting themselves up against an inhibiting and restricting power - which is now the critical judgement.

[1905c, 1722]
We are now able to state the formula for the mode of operation of tendentious jokes. They put themselves at the service of purposes in order that, by means of using the pleasure from jokes as a fore-pleasure, they may produce new pleasure by lifting suppressions and repressions. If now we survey the course of development of the joke, we may say that from its beginning to its perfecting it remains true to its essential nature. It begins as play, in order to derive pleasure from the free use of words and thoughts. As soon as the strengthening of reasoning puts an end to this play with words as being senseless, and with thoughts as being nonsensical, it changes into a jest, in order that it may retain these sources of pleasure and be able to achieve fresh pleasure from the liberation of nonsense. Next, as a joke proper, but still a non-tendentious one, it gives its assistance to thoughts and strengthens them against the challenge of critical judgement, a process in which the 'principle of confusion of sources of pleasure' is of use to it. And finally it comes to the help of major purposes which are combating suppression, in order to lift their internal inhibitions by the 'principle of fore-pleasure'. Reason, critical judgement, suppression - these are the forces against which it fights in succession; it holds fast to the original sources of verbal pleasure and, from the stage of the jest onwards, opens new sources of pleasure for itself by lifting inhibitions. The pleasure that it produces, whether it is pleasure in play or pleasure in lifting inhibitions, can invariably be traced back to economy in psychical expenditure, provided that this view does not contradict the essential nature of pleasure and that it proves itself fruitful in other directions.¹

[1905c, 1727]

A more transparent case is offered, once more, by the Jewish jokes, which, as I have already mentioned (p. 1705), are ordinarily made by Jews themselves, while the anecdotes about them from other sources scarcely ever rise above the level of comic stories or of brutal derision. What determines their participating in the jokes themselves seems to be the same as in the case of Heine's 'famillionairely' joke; and its significance seems to lie in the fact that the person concerned finds criticism or aggressiveness difficult so long as they are direct, and possible only along circuitous paths.

[1905c, 1730]

Other subjective factors which determine or favour the joke-work are less wrapped in obscurity. The motive force for the production of innocent jokes is not infrequently an ambitious urge to show one's cleverness, to display oneself - an instinct that may be equated with exhibitionism in the sexual field. The presence of numerous inhibited instincts, whose suppression has retained a certain degree of instability, will provide the most favourable disposition for the production of tendentious jokes. Thus individual components of a person's sexual constitution in particular, can appear as motives for the construction of a joke. A whole class of obscene jokes allows one to infer the presence of a concealed inclination to exhibitionism in their inventors; aggressive tendentious jokes succeed best in people in whose sexuality a powerful sadistic component is demonstrable, which is more or less inhibited in real life.

[1905c, 1731]
In laughter, therefore, on our hypothesis, the conditions are present under which a sum of psychical energy which has hitherto been used for cathexis is allowed free discharge. And since laughter - not all laughter, it is true, but certainly laughter at a joke - is an indication of pleasure, we shall be inclined to relate this pleasure to the lifting of the cathexis which has previously been present. If we see that the hearer of a joke laughs but that its creator cannot laugh, this may amount to telling us that in the hearer a cathetic expenditure has been lifted and discharged, while in the construction of the joke there have been obstacles either to the lifting or to the possibility of discharge. The psychical process in the hearer, the joke's third person, can scarcely be more aptly described than by stressing the fact that he has bought the pleasure of the joke with very small expenditure on his own part. He might be said to have been presented with it. The words of the joke he hears necessarily bring about in him the idea or train of thought to the construction of which great internal inhibitions were opposed in him too. He would have had to make an effort of his own in order to bring it about spontaneously as the first person, he would have had to use at least as much psychical expenditure on doing so as would correspond to the strength of the inhibition, suppression or repression of the idea. He has saved this psychical expenditure. On the basis of our earlier discussions (p. 1711) we should say that his pleasure corresponds to this economy. Our insight into the mechanism of laughter leads us rather to say that, owing to the introduction of the proscribed idea by means of an auditory perception, the cathetic energy used for the inhibition has now suddenly become superfluous and has been lifted, and is therefore now ready to be discharged by laughter. The two ways of expressing the facts amount to the same thing in essentials, since the expenditure economized corresponds exactly to the inhibition that has become superfluous. But the second method of expression is the more illuminating, since it allows us to say that the hearer of the joke laughs with the quota of psychical energy which has become free through the lifting of the inhibitory cathexis; we might say that he laughs this quota off.
[1905c, 1736]
This interpretation of the broker anecdotes may be carried further. It is true that there is no *necessity* for my entering into them, that I can content myself with regarding these anecdotes as 'Schwänke [funny stories]' and deny that they have the character of a joke. Thus jokes can also have a subjective determinant of this kind. Our attention has now been drawn to that possibility and we shall have to examine it later. It declares that only what I allow to be a joke *is* a joke. What is a joke to me may be merely a comic story to other people. But if a joke admits of this doubt, the reason can only be that it has a façade - in these instances a comic one - in the contemplation of which one person is satiated while another may try to peer behind it. A suspicion may arise, moreover, that this façade is intended to dazzle the examining eye and that these stories have therefore something to conceal.

[1905c, 1699]

In any case, if our marriage-broker anecdotes are jokes, they are all the better jokes because, thanks to their façade, they are in a position to conceal not only what they have to say but also the fact that they have something - forbidden - to say. The continuation of this interpretation - and this uncovers the hidden meaning and reveals these anecdotes with a comic façade as tendentious jokes - would be as follows. Anyone who has allowed the truth to slip out in an unguarded moment is in fact glad to be free of pretence. This is a correct and profound piece of psychological insight. Without this internal agreement no one lets himself be mastered by the automatism which in these cases brings the truth to light.¹ But this converts the laughable figure of the *Schadchen* into a sympathetic one, deserving of pity. How happy the man must be to be able at last to throw off the burden of pretence, since he makes use of the first chance of shouting out the very last scrap of truth! As soon as he sees that the case is lost, that the bride does not please the young man, he gladly betrays yet another concealed defect which has escaped notice, or he takes the opportunity of producing an argument that settles a detail in order to express his contempt for the people he is working for: 'I ask you - who would lend these people anything?' The whole of the ridicule in the anecdote now falls upon the parents, barely touched on in it, who think this swindle justified in order to get their daughter a husband, upon the pitiable position of girls who let themselves be married on such terms, and upon the disgracefulness of marriages contracted on such a basis. The marriage-broker is the right man to express such criticisms, for he knows most about these abuses; but he must not say them aloud, for he is a poor man whose existence depends on exploiting them. The popular mind, which created these stories, and others like them, is torn by a similar conflict; for it knows that the sacredness of marriages after they have been contracted is grievously affected by the thought of what happened at the time when they were arranged.

[1905c, 1700]
Our expectation that the technique of jokes cannot be a matter of indifference from the point of view of discovering their essence leads us at once to enquire whether there are other examples of jokes constructed like Heine's 'Famillionär'. There are not very many of them, but nevertheless enough to make up a small group which are characterized by the formation of composite words. Heine himself has derived a second joke from the word 'Millionär' - copying from himself, as it were. In Chapter XIV of his 'Ideen' he speaks of a 'Millionart', which is an obvious combination of 'Millionär' and 'Narr' and, just as in the first example, brings out a suppressed subsidiary thought.

[1905c, 1626]

Here are some other examples I have come upon. - There is a certain fountain [Brunnen] in Berlin, the erection of which brought the Chief Burgomaster Forckenbeck into much disfavour. The Berliners call it the 'Forckenbecken', and there is certainly a joke in this description, even though it was necessary to replace the word 'Brunnen' by its obsolete equivalent 'Becken' in order to combine it into a whole with the name of the Burgomaster. - The voice of Europe once made the cruel joke of changing a potentate's name from Leopold to Cleopold, on account of the relations he had at one time with a lady with the first name of Cleo. This undoubted product of condensation keeps alive an annoying allusion at the cost of a single letter. - Proper names in general fall easy victims to this kind of treatment by the joke-technique. There were in Vienna two brothers named Salinger, one of whom was a Börsensensal. This provided a handle for calling him 'Sensalinger', while his brother, to distinguish him, was given the unflattering name of 'Scheusalinger'. This was convenient, and certainly a joke; I cannot say whether it was justified. But jokes do not as a rule enquire much into that.

[1905c, 1626]

By the nomenclature of the authorities this would be classed as a 'Klangwitz',² and one of an inferior sort, with a play upon a proper name - not unlike the joke, for instance, in the Capuchin monk's sermon in Wallensteins Lager, which, as is well known, is modelled on the style of Abraham a Santa Clara:

[1905c, 1635]

We have in fact not yet considered a large - perhaps the most numerous - group of jokes, influenced, perhaps, by the contempt with which they are regarded. They are the kind which are generally known as 'Kalauer' ('calembourgs') ['puns'] and which pass as the lowest form of verbal joke, probably because they are the 'cheapest' - can be made with the least trouble. And they do in fact make the least demand on the technique of expression, just as the play upon words proper makes the highest. While in the latter the two meanings should find their expression in identically the same word, which on that account is usually said only once, it is enough for a pun if the two words expressing the two meanings recall each other by some vague similarity, whether they have a general similarity of structure or a rhyming assonance, or whether they share the same first few letters, and so on. A quantity of examples like this of what are not very appropriately described as 'Klangwitz [sound-jokes]' occur in the Capuchin monk's sermon in Wallensteins Lager:

[1905c, 1650]

But there really are jokes whose technique resists almost any attempt to connect it with the groups that have so far been considered.

[1905c, 1652]
But at this point we must be prepared to meet an objection which will assert that these fine
distinctions are seeking to tear apart what belongs together. Does not every double meaning
give occasion for a displacement - for a diversion of the train of thought from one meaning to
the other? And are we prepared, then, to allow 'double meaning' and 'displacement' to be set up
as representatives of two quite different types of joke-technique? Well, it is true that this relation
between double meaning and displacement does exist, but it has nothing to do with our
distinguishing the different joke-techniques. In the case of double meaning a joke contains
nothing other than a word capable of multiple interpretation, which allows the hearer to find the
transition from one thought to another - a transition which, stretching a point, might be equated
with a displacement. In the case of a displacement joke, however, the joke itself contains a
train of thought in which a displacement of this kind has been accomplished. Here the
displacement is part of the work which has created the joke; it is not part of the work necessary
for understanding it. If this distinction is not clear to us, we have an unfailing means of bringing it
tangibly before our eyes in our attempts at reduction. But there is one merit which we will not
deny to this objection. It draws our attention to the necessity of not confusing the psychical
processes involved in the construction of the joke (the 'joke-work') with the psychical processes
involved in taking in the joke (the work of understanding). Our present enquiry is only concerned
with the former.¹
[1905c, 1657]

The double meaning lies in the word 'living', and the displacement consists in the Schadchen
shifting the meaning of the word from its ordinary sense, as a contrast to 'dead', to the sense
which it has in the phrase 'that's not living'. In doing so he explains his former pronouncement
retrospectively as having had a double meaning, though any such multiple meaning was
decidedly remote in this particular case. So far the technique would seem similar to that in the
'Golden Calf' joke and the bath-joke. But here there is another factor to be considered which by
its prominence interferes with our understanding of the technique. It might be described as a
'characterizing' joke: it seeks by an example to illustrate a marriage-broker's characteristic
mixture of mendacious impudence and readiness of repartee. We shall find that this is only the
outer shell, the façade, of the joke; its meaning - that is to say, its purpose - is something
different. And we must postpone the attempt at a reduction of it.¹
[1905c, 1658]

After these complicated examples, which have been so hard to analyse, it will be with
satisfaction that we are able to turn once more to an example which can be recognized as a
perfectly straightforward and transparent sample of a displacement joke:
[1905c, 1658]

'A Schnorrer [someone who is reluctant to part with his own money] approached a wealthy
baron with a request for the grant of some assistance for his journey to Ostend. The doctors, he
said, had recommended him sea-bathing to restore his health. "Very well", said the rich man,
"I'll give you something towards it. But must you go precisely to Ostend, which is the most
expensive of all sea-bathing resorts?" - "Herr Baron", was the reproachful reply, "I consider
nothing too expensive for my health." This is no doubt a correct point of view, but not correct for
a petitioner. The answer is given from the point of view of a rich man. The Schnorrer behaves
as though it was his own money that he was to sacrifice for his health, as though the money and
the health were the concern of the same person.
[1905c, 1658]
Let us start once more from that highly instructive example 'Salmon Mayonnaise'. It, too, presented us with a façade, in which a striking parade of logical thinking was exhibited; and we learnt from analysing it that this logic was used to conceal a piece of faulty reasoning - namely, a displacement of the train of thought. This may serve to remind us, if only by means of a contrasting connection, of other jokes which, quite the other way, undisguisedly exhibit a piece of nonsense or stupidity. We shall be curious to learn what may be the technique of such jokes.
[1905c, 1659]

I will begin with the most forcible and at the same time the plainest example of the whole group. Once again it is a Jewish joke:
[1905c, 1659]

This advice, which may raise a hearty laugh, is obvious nonsense. Cannons are not to be bought and an individual cannot make himself independent as a military unit - set himself up in business, as it were. But it is impossible to doubt for a moment that the advice is not mere nonsense but joking nonsense - an excellent joke. How then is the nonsense turned into a joke?
[1905c, 1659]

Not much reflection is needed. We can infer from the authorities' comments indicated above in the introduction that there is sense behind joking nonsense such as this, and that it is this sense that makes the nonsense into a joke. The sense in our example is easy to find. The officer who gives Artilleryman Itzig this nonsensical advice is only making himself out stupid to show Itzig how stupidly he himself is behaving. He is copying Itzig: 'I'll give you some advice that's as stupid as you are.' He enters into Itzig's stupidity and makes it clear to him by taking it as the basis of a suggestion which would fit in with Itzig's wishes: if Itzig possessed a cannon of his own and carried out military duties on his own account, how useful his intelligence and ambition would be to him! In what good order he would keep his cannon and how familiar he would make himself with its mechanism so as to meet the competition of the other possessors of cannons!
[1905c, 1659]

I will interrupt the analysis of this example, to point out the same sense in nonsense in a shorter and simpler, though less glaring, case of a nonsensical joke:
[1905c, 1659]

This modern addition to an ancient saw is an evident piece of nonsense, made sillier by the ostensibly cautious 'scarcely'. But the addition is attached to the original statement as an indisputably correct limitation, and is thus able to open our eyes to the fact that this solemnly accepted piece of wisdom is itself not much better than a piece of nonsense. Anyone who is not born is not a mortal man at all, and there is no good and no best for him. Thus the nonsense in the joke serves to uncover and demonstrate another piece of nonsense, just as in the example of Artilleryman Itzig.
[1905c, 1659]

And here I can add a third instance, which, from its content, would scarcely deserve the lengthy description that it requires, but which once again exemplifies with special clarity the use of nonsense in a joke to demonstrate another piece of nonsense.
[1905c, 1660]

The technique of the nonsensical jokes which we have so far considered really consists, therefore, in presenting something that is stupid and nonsensical, the sense of which lies in the revelation and demonstration of something else that is stupid and nonsensical.
[1905c, 1660]
Has this use of absurdity in joke technique always the same significance? Here is one more example which gives an affirmative reply:
[1905c, 1661]

Other examples, however, can teach us that absurdity is very often used in joke-technique without serving the purpose of demonstrating another piece of nonsense:
[1905c, 1661]

'A well-known University teacher, who was in the habit of peppering his unattractive special subject with numerous jokes, was congratulated on the birth of his youngest child, who was granted to him when he had already reached an advanced age. "Yes", he replied to his well-wishers, "it is remarkable what human hands can accomplish." - This answer seems quite specially nonsensical and out of place. Children, after all, are regarded as a blessing of God, quite in contrast to human handiwork. But it soon occurs to us that after all the answer has a meaning and, at that, an obscene one. There is no question here of the happy father making himself out stupid in order to show that something or someone else is stupid. The apparently senseless answer makes a surprising, a bewildering impression on us, as the authorities would say. As we have seen they attribute the whole effect of jokes like this to an alternation between 'bewilderment and illumination'. We shall try later to form a judgement on this; for the moment we must be content to stress the fact that the technique of this joke lies in its presentation of something bewildering and nonsensical.
[1905c, 1661]

'He wondered how it is that cats have two holes cut in their skin precisely at the place where their eyes are.' To wonder about something that is in fact only the statement of an identity is undoubtedly a piece of stupidity. It reminds one of Michelet's exclamation¹ which was meant to be taken seriously, and which to the best of my recollection runs: 'How beautifully Nature has arranged it that as soon as a child comes into the world it finds a mother ready to take care of it!' Michelet's pronouncement is a real piece of stupidity, but Lichtenberg's is a joke which makes use of stupidity for some purpose and behind which something lies. But what? For the moment, we must admit, no answer can be given.
[1905c, 1661]

This is an opportunity for making a not unimportant admission. We are engaged in investigating the technique of jokes as shown in examples; and we should therefore be certain that the examples we have chosen are really genuine jokes. It is the case, however, that in a number of instances we are in doubt whether the particular example ought to be called a joke or not. We have no criterion at our disposal before our investigation has given us one. Linguistic usage is untrustworthy and itself needs to have its justification examined. In coming to our decision we can base ourselves on nothing but a certain 'feeling', which we may interpret as meaning that the decision is made in our judgement in accordance with particular criteria that are not yet accessible to our knowledge. In the case of our last example we must feel a doubt whether it should be represented as a joke, or perhaps as a 'sophistical' joke, or simply as a piece of sophistry. For the fact is that we do not yet know in what the characteristic of being a joke resides.
[1905c, 1663]

On the other hand, the next example, which exhibits a type of faulty reasoning that may be said to be complementary to the former instance, is an undoubted joke. It is once again a story of a marriage-broker.
[1905c, 1663]
The same omission is the core of another piece of sophistry which has been much laughed over, but whose right to be called a joke might be doubted:
[1905c, 1664]

We find another piece of sophistry in the following marriage broker story:
[1905c, 1664]

This group of 'sophistical' pieces of faulty reasoning is resembled by another interesting group in which the faulty reasoning can be described as 'automatic'. It may be due to no more than a whim of chance that all the examples that I shall bring forward of this new group are once more Schadchen stories:
[1905c, 1665]

This is easy to see; but it is bound to have a confusing effect when we notice that these three stories have as much right to be called 'comic' as we had to produce them as 'jokes'. The uncovering of psychical automatism is one of the techniques of the comic, just as is any kind of revelation or self-betrayal. We suddenly find ourselves faced at this point with the problem of the relation of jokes to the comic which we intended to evade. (See the introduction.) Are these stories perhaps only 'comic' and not 'jokes'? Is the comic operating here by the same methods as jokes do? And, once again, what constitutes the peculiar characteristics of jokes?
[1905c, 1666]

Here is a neat example of a unification joke which needs no explanation:
[1905c, 1668]

This last example draws attention to the fact that it is essentially unification that lies at the bottom of jokes that can be described as 'ready repartees'. For repartee consists in the defence going to meet the aggression, in 'turning the tables on someone' or 'paying someone back in his own coin' - that is, in establishing an unexpected unity between attack and counter-attack. For instance:
[1905c, 1668]

No great distance separates this example from a small group which might be described as 'overstatement' jokes. In these the 'yes' which would be in place in the reduction is replaced by a 'no', which, however, on account of its content, has the force of an intensified 'yes', and vice versa. A denial is a substitute for an overstated confirmation. Thus, for instance, in Lessing's epigram:¹
[1905c, 1671]

The following example is an excellent 'overstatement' joke, which can easily be traced back to representation by the opposite:
[1905c, 1671]

Or when Simplicissimus describes a collection of incredible pieces of brutality and cynicism as the expressions of 'men of feeling', this too is a representation by the opposite. But we call this 'irony' and no longer a joke. The only technique that characterizes irony is representation by the opposite. Moreover we read and hear of 'ironical jokes'. So it can no longer be doubted that technique alone is insufficient to characterize the nature of jokes. Something further is needed which we have not yet discovered. But on the other hand it remains an uncontradicted fact that if we undo the technique of a joke it disappears. For the time being we may find difficulty in thinking how these two fixed points that we have arrived at in explaining jokes can be reconciled.
[1905c, 1672]
If representation by the opposite is one of the technical methods of jokes, we can expect that jokes may also make use of its contrary - representation by something similar or akin. A further pursuit of our enquiry will in fact show us that this is the technique of a fresh and particularly comprehensive group of conceptual jokes. We shall describe the peculiarity of this technique far more appropriately if, instead of representation by something 'akin', we say by something 'correlated' or 'connected'. We will take our start, in fact, with this latter characteristic and illustrate it at once by an example.

We at once recall where we have already come across allusion - in connection, namely, with double meaning. When two meanings are expressed in one word and one of them is so much more frequent and usual that it occurs to us at once, while the second is more out of the way and therefore less prominent, we proposed to speak of this as 'double meaning with an allusion'. In a whole number of the examples we have already examined we remarked that the technique was not a simple one, and we now perceive that the 'allusion' was the complicating factor in them. (See, for instance, the inversion joke about the wife who has lain back a bit and so has been able to earn a lot or the nonsensical joke about the man who replied to congratulations on the birth of his youngest child by saying that it was remarkable what human hands could accomplish.)

The connection used for the replacement may be merely a resemblance in sound, so that this sub-species becomes analogous to puns among verbal jokes. Here, however, it is not the resemblance in sound between two words, but between whole sentences, characteristic phrases, and so on.

A similar technical solution applies to another jest [Scherz] or joke [Witz] of Lichtenberg's: 'A girl scarcely twelve Moden old.' This sounds like 'twelve Monden [moons]', i.e. months, and may originally have been a slip of the pen for the latter, which is a permissible expression in poetry. But it also makes good sense to use the changing fashion instead of the changing moon as a method of determining a woman's age.

The connection may also consist in similarity except for a 'slight modification'. So that this technique, too, is parallel to a verbal technique. Both species of joke make almost the same impression, but they can be better distinguished from each other if we consider the processes of the joke-work.

Here is an example of a verbal joke or pun of this kind: Marie Wilt was a great singer, famous, however, for the compass not only of her voice. She suffered the humiliation of having the title of a play based on Jules Verne's well-known novel used as an allusion to her misshapen figure: 'Round the Wilt in 80 Days'.

Or: 'Every fathom a queen', a modification of Shakespeare's familiar 'Every inch a king'. The allusion to this quotation was made with reference to an aristocratic and over-life-size lady. No very serious objection could really be made if anyone were to prefer to include this joke among the 'condensations accompanied by modifications as substitute'. (See 'tête-à-bête', p. 1631.)
There is still quite a marked gap to be seen in our next example, though it is a genuine and correct allusive joke. After an artists' carnival in Vienna a jest-book was circulated, in which, among others, the following highly remarkable epigram appeared:

[1905c, 1677]

Heine's 'Bäder von Lucca' contains a regular wasp's next of the most stinging allusions and makes the most ingenious use of this form of joke for polemical purposes (against Count Platen). Long before the reader can suspect what is afoot, there are foreshadowings of a particular theme, peculiarly ill-adapted for direct representation, by allusions to material of the most varied kind, - for instance, in Hirsch-Hyacinth's verbal contortions: 'You are too stout and I am too thin; you have a good deal of imagination and I have all the more business sense; I am a practicus and you are a diarrheticus; in short you are my complete antipodex.' - 'Venus Urinia' - 'the stout Gudel von Dreckwall' of Hamburg, and so on. In what follows, the events described by the author take a turn which seems at first merely to display his mischievous spirit but soon reveals its symbolic relation to his polemical purpose and at the same time shows itself as allusive. Eventually the attack on Platen bursts out, and thenceforward allusions to the theme (with which we have already been made acquainted) of the Count's love for men gushes out and overflows in every sentence of Heine's attack on his opponent's talents and character. For instance:

[1905c, 1678]

There is another kind of indirect representation used by jokes, namely the 'analogy'. We have kept it back so long because the consideration of it comes up against new difficulties, or makes particularly evident difficulties that we have already come up against in other connections. We have already admitted that in some of the examples we have examined we have not been able to banish a doubt as to whether they ought to be regarded as jokes at all; and in this uncertainty we have recognized that the foundations of our enquiry have been seriously shaken. But I am aware of this uncertainty in no other material more strongly or more frequently than in jokes of analogy. There is a feeling - and this is probably true of a large number of other people under the same conditions - which tells me 'this is a joke, I can pronounce this to be a joke' even before the hidden essential nature of jokes has been discovered. This feeling leaves me in the lurch most often in the case of joking analogies. If to begin with I unhesitatingly pronounce an analogy to be a joke, a moment later I seem to notice that the enjoyment it gives me is of a quality different from what I am accustomed to derive from a joke. And the circumstance that joking analogies are very seldom able to provoke the explosive laugh which signalizes a good joke makes it impossible for me to resolve the doubt in my usual way - by limiting myself to the best and most effective examples of a species.

[1905c, 1681]

It is easy to demonstrate that there are remarkably fine and effective examples of analogies that do not in the least strike us as being jokes. The fine analogy between the tenderness in Ottlie's diary and the scarlet thread of the English navy (p. 1629 n.) is one such. And I cannot refrain from quoting in the same sense another one, which I am never tired of admiring and the effect of which I have not grown out of. It is the analogy with which Ferdinand Lassalle ended one of his celebrated speeches for the defence ('Science and the Workers'): 'Upon a man such as I have shown you this one to be, who has devoted his life to the watchword "Science and the Workers", being convicted, if it were his lot, would make no more impression than would the bursting of a retort upon a chemist deep in his scientific experiments. As soon as the interruption is past, with a slight frown over the rebelliousness of his material, he will quietly pursue his researches and his labours.'

[1905c, 1681]
A rich selection of apt and joking analogies are to be found among Lichtenberg's writings (the second volume of the Göttingen edition of 1853), and it is from there that I shall take the material for our investigation.

No doubt that seems to be a joke; but on closer examination we, notice that the joking effect does not arise from the analogy itself but from a subsidiary characteristic. 'The torch of truth' is not a new analogy but one that has been common for a very long time and has become reduced to a *cliché* - as always happens when an analogy is lucky and accepted into linguistic usage. Though we scarcely notice the analogy any longer in the phrase 'the torch of truth', it is suddenly given back its full original force by Lichtenberg, since an addition is now made to the analogy and a consequence is drawn from it. But we are already familiar with a process like this of giving its full meaning to a watered-down expression as a technique of joking. It finds a place in the multiple use of the same material (p. 1639 f.). It might quite well be that the joking impression produced by Lichtenberg's remark arises only from its dependence on this joke-technique.

The same judgement may certainly apply as well to another joking analogy by the same author:

To describe a man of learning as a great light, a *lumen mondi*, has long ceased to be an effective analogy, whether or not it originally had an effect as a joke. But the analogy is refreshed, it is given back its full force, if a modification is derived from it and a second, new, analogy is thus obtained from it. The way in which this second analogy comes about seems to be what determines the joke, not the two analogies themselves. This would be an instance of the same joke-technique as in the example of the torch.

The comparison of reviews to a childish illness is founded in the first instance on the fact of being exposed to them shortly after first seeing the light of day. I cannot venture to decide whether up to this point the comparison has the character of a joke. But it is then carried further: it turns out that the subsequent fate of new books can be represented within the framework of the same analogy or through related analogies. A prolongation like this of an analogy is undoubtedly in the nature of a joke, but we already know what technique it has to thank for this - it is a case of unification, the making of an unsuspected connection. The character of the unification is not altered by the fact that here it consists in making an addition to a previous analogy.

In another group of analogies one is tempted to shift what is undoubtedly an impression that has the character of a joke on to another factor, which once again has in itself nothing to do with the nature of the analogy. These are analogies which contain a striking juxtaposition, often a combination that sounds absurd, or which are replaced by something of the sort as the outcome of the analogy. The majority of the Lichtenberg examples belong to this group.
'Moral backside' - the assignment of this remarkable epithet is the outcome of an analogy. But in addition, the analogy is continued further with an actual play upon words - 'need' - and a second even more unusual juxtaposition ('the breeches of respectability'), which is perhaps a joke in itself; for the breeches, since they are the breeches of respectability, themselves, as it were, become a joke. We need not be surprised, then, if the whole gives us the impression of being an analogy that is a very good joke. We begin to notice that we are inclined, quite generally, where a characteristic attaches only to a part of a whole, to extend it in our estimation to the whole itself. The 'breeches of respectability', incidentally, recall some similarly bewildering lines of Heine's:

[1905c, 1683]

There can be no doubt that these last two analogies have a characteristic that we do not find in every good (that is to say, in every apt) analogy. They are to a great degree 'debasing', as we might put it. They juxtapose something of a high category, something abstract (in these instances, 'respectability' and 'patience'), with something of a very concrete and even low kind ('breeches'). We shall have to consider in another connection whether this peculiarity has anything to do with the joke. Here we will try to analyse another example in which this disparaging characteristic is quite specially plain. Weinberl, the clerk in Nestroy's farce *Einen Jux will er sich machen* [*He wants to have a spree*], pictures to himself how one day, when he is a respectable old business man, he will remember the days of his youth: 'When the ice in front of the warehouse of memory has been hacked up like this in a friendly talk', he says, 'when the arched doorway of old times has been unlocked again and the showcase of the imagination is fully stocked with goods from the past. . . .' These are, to be sure, analogies between abstract and very commonplace concrete things; but the joke depends - whether entirely or in part - on the fact that a clerk is making use of analogies taken from the domain of his everyday activities. But the bringing of these abstractions into connection with the ordinary things with which his life is normally filled is an act of *unification*.

[1905c, 1683]

'The motives that lead us to do anything might be arranged like the thirty-two winds [= points of the compass] and might be given names in a similar way: for instance, "bread-bread fame" or "fame-fame-bread". As is so often the case with Lichtenberg's jokes, the impression of something apt, witty and shrewd is so prominent that our judgement upon the nature of what constitutes the joke is misled by it. If some amount of joke is admixed with the admirable meaning in a remark of this kind, we are probably led into declaring that the whole thing is an excellent joke. I should like, rather, to hazard the statement that everything in it that is really in the nature of a joke arises from our surprise at the strange combination 'bread bread-fame'. As a joke, therefore, it would be a 'representation by absurdity'.

[1905c, 1684]

A strange juxtaposition or the attribution of an absurd epithet can stand by itself as the outcome of an analogy:

[1905c, 1684]
In the face of this and many other examples, we can no longer dispute the fact that an analogy can in itself possess the characteristic of being a joke, without this impression being accounted for by a complication with one of the familiar joke techniques. But, that being so, we are completely at a loss to see what it is that determines the joking characteristic of analogies, since that characteristic certainly does not reside in analogy as a form of expression of thought or in the operation of making a comparison. All we can do is to include analogy among the species of 'indirect representation' used by the joke-technique and we must leave unresolved the problem which we have met with much more clearly in the case of analogies than in the methods of joking that we came across earlier. No doubt, moreover, there must be some special reason why the decision whether something is a joke or not offers greater difficulties in analogies than in other forms of expression.

Or here is Heine:

'Her face resembled a palimpsest, on which, beneath the fresh black monastic manuscript of the text of a Church Father there lurk the half-obliterated lines of an ancient Greek love poem.'

When at the end of my last chapter I wrote down Heine's comparison of a catholic priest to an employee in a wholesale business and of a protestant one to a retail merchant, I was aware of an inhibition which was trying to induce me not to make use of the analogy. I told myself that among my readers there would probably be a few who felt respect not only for religion but for its governors and assistants. Such readers would merely be indignant about the analogy and would get into an emotional state which would deprive them of all interest in deciding whether the analogy had the appearance of being a joke on its own account or as a result of something extra added to it. With other analogies - for instance, the neighbouring one of the agreeable moonlight which a particular philosophy throws over things - there seemed to be no need for worry about the disturbing effect they might have on a section of my readers. The most pious man would remain in a state of mind in which he could form a judgement on our problem.

Since we have already divided jokes into 'verbal' and 'conceptual' jokes according to the material handled by their technique, it devolves on us now to examine the relation between that classification and the new one that we are introducing. The relation between verbal and conceptual jokes on the one hand and abstract and tendentious jokes on the other is not one of mutual influence; they are two wholly independent classifications of joking products. Some people may perhaps have gained an impression that innocent jokes are predominantly verbal jokes, but that the more complex technique of conceptual jokes is mostly employed for definite purposes. But there are innocent jokes that work with play upon words and similarity of sound, and equally innocent ones that employ all the methods of conceptual jokes. And it is just as easy to show that a tendentious joke need be nothing other than a verbal joke as regards its technique. For instance, jokes that 'play about' with proper names often have an insulting and wounding purpose, though, needless to say, they are verbal jokes. But the most innocent of all jokes are once more verbal jokes; for instance, the *Schüttelreime*, which have recently become so popular and in which the multiple use of the same material with a modification entirely peculiar to it constitutes the technique:

Good examples of abstract or innocent conceptual jokes are to be found in plenty among the Lichtenberg analogies, with some of which we have already become acquainted. I add a few more:

[1905c, 1685]
I may take the opportunity that this affords of getting rid of what is nevertheless a possible misunderstanding. For 'innocent' or 'abstract' jokes are far from having the same meaning as jokes that are 'trivial' or 'lacking in substance'; they merely connote the opposite of the 'tendentious' jokes that will be discussed presently. As our last example shows, an innocent - that is, a non-tendentious - joke may also be of great substance it may assert something of value. But the substance of a joke is independent of the joke and is the substance of the thought which is here, by means of a special arrangement, expressed as a joke. No doubt, just as watch-makers usually provide a particularly good movement with a similarly valuable case, so it may happen with jokes that the best achievements in the way of jokes are used as an envelope for thoughts of the greatest substance.

[1905c, 1689]

If now we draw a sharp distinction in the case of conceptual jokes between the substance of the thought and the joking envelope, we shall reach a discovery which may throw light of much of our uncertainty in judging jokes. For it turns out - and this is a surprising thing - that our enjoyment of a joke is based on a combined impression of its substance and of its effectiveness as a joke and that we let ourselves be deceived by the one factor over the amount of the other. Only after the joke has been reduced do we become aware of this false judgement.

[1905c, 1689]

Moreover, the same thing is true of verbal jokes. When we are told that 'experience consists in experiencing what one does not wish to experience', we are bewildered and think we have learnt a new truth. It is a little time before we recognize under this disguise the platitude of 'injury makes one wise'. (Fischer.) The apt way in which the joke succeeds in defining 'experience' almost purely by the use of the word 'to experience' deceives us into overvaluing the substance of the sentence. Just the same thing is true of Lichtenberg's 'January' joke of unification (p. 1667), which has nothing more to tell us than something we have already long known - that New Year's wishes come true as seldom as other wishes. So too in many similar cases.

[1905c, 1690]

And we find just the contrary with other jokes, in which the aptness and truth of the thought tricks us into calling the whole sentence a brilliant joke - whereas only the thought is brilliant and the joke's achievement is often feeble. Precisely in Lichtenberg's jokes the kernel of thought is frequently far more valuable than the joking envelope to which we unjustifiably extend our appreciation. Thus, for instance, the remark about the 'torch of truth' (p. 1682) is an analogy that scarcely amounts to a joke, but it is so apt that we are inclined to insist that the sentence is a particularly good joke.

[1905c, 1690]

Lichtenberg's jokes are outstanding above all on account of their intellectual content and the certainty with which they hit their mark. Goethe was quite right in saying of that author that in fact his joking and jesting ideas concealed problems; it would have been even more correct to say that they touch on the solution of problems. When, for instance, he remarked as a joke: 'He had read Homer so much that he always read "Agamemnon" instead of "angenommen"' - the technique used is 'stupidity' plus 'similarity of sound' - Lichtenberg had discovered nothing less than the secret of misreading.¹

[1905c, 1690]
Similarly with a joke the technique of which struck us as most unsatisfactory (p. 1661): 'He wondered how it is that cats have two holes cut in their skin precisely at the place where their eyes are'. The stupidity that is paraded here is only apparent. In fact, behind this simple remark lies the great problem of teleology in the structure of animals. It was by no means so completely a matter of course that the palpebral fissure should open at the point at which the cornea is exposed, until the theory of evolution had thrown light on the coincidence.

[1905c, 1690]

We shall bear in mind the fact that we receive from joking remarks a total impression in which we are unable to separate the share taken by the thought content from the share taken by the joke-work. It may be that later on we shall find a still more significant parallel to this.

[1905c, 1690]

From the point of view of throwing theoretical light on the nature of jokes, innocent jokes are bound to be of more value to us than tendentious ones, and trivial jokes of more value than profound ones. Innocent and trivial jokes are likely to put the problem of jokes before us in its purest form, since with them we avoid the danger of being confused by their purpose or having our judgement misled by their good sense. On the basis of such material our discoveries can make fresh advances.

[1905c, 1691]

I will select the most innocent possible example of a verbal joke:

[1905c, 1691]

Since, however, doubts arise in me after all as to whether I have a right to describe this joke as being non-tendentious, I will replace it by another one which is extremely simple and should really not be open to that objection.

[1905c, 1691]

The purposes of jokes can easily be reviewed. Where a joke is not an aim in itself - that is, where it is not an innocent one - there are only two purposes that it may serve, and these two can themselves be subsumed under a single heading. It is either a *hostile* joke (serving the purpose of aggressiveness, satire, or defence) or an *obscene* joke (serving the purpose of exposure). It must be repeated in advance that the technical species of the joke - whether it is a verbal or a conceptual joke - bears no relation to these two purposes.

[1905c, 1693]

It is a much lengthier business to show the way in which jokes serve these two purposes. In this investigation I should prefer to deal first not with the hostile jokes but with the exposing jokes. It is true that these have been far more rarely deemed worthy of investigation, as though aversion to the thing itself had here been transferred to the discussion of it. But we will not allow ourselves to be disconcerted by this, for we shall immediately come upon a marginal case of joking which promises to bring us enlightenment on more than one obscurity.

[1905c, 1694]
Only when we rise to a society of a more refined education do the formal conditions for jokes play a part. The smut becomes a joke and is only tolerated when it has the character of a joke. The technical method which it usually employs is the allusion - that is, replacement by something small, something remotely connected, which the hearer reconstructs in his imagination into a complete and straightforward obscenity. The greater the discrepancy between what is given directly in the form of smut and what it necessarily calls up in the hearer, the more refined becomes the joke and the higher, too, it may venture to climb into good society. As can easily be shown from examples, smut which has the characteristics of a joke has at its disposal, apart from allusion, whether coarse or refined, all the other methods of verbal and conceptual jokes.

[1905c, 1696]

Thus what we suspected to begin with seems to be confirmed: namely that tendentious jokes have sources of pleasure at their disposal besides those open to innocent jokes, in which all the pleasure is in some way linked to their technique. And we may also once more repeat that with tendentious jokes we are not in a position to distinguish by our feeling what part of the pleasure arises from the sources of their technique and what part from those of their purpose. Thus, strictly speaking, we do not know what we are laughing at. With all obscene jokes we are subject to glaring errors of judgement about the 'goodness' of jokes so far as this depends on formal determinants; the technique of such jokes is often quite wretched, but they have immense success in provoking laughter.

[1905c, 1697]

In any case, if our marriage-broker anecdotes are jokes, they are all the better jokes because, thanks to their façade, they are in a position to conceal not only what they have to say but also the fact that they have something - forbidden - to say. The continuation of this interpretation - and this uncovers the hidden meaning and reveals these anecdotes with a comic façade as tendentious jokes - would be as follows. Anyone who has allowed the truth to slip out in an unguarded moment is in fact glad to be free of pretence. This is a correct and profound piece of psychological insight. Without this internal agreement no one lets himself be mastered by the automatism which in these cases brings the truth to light.¹ But this converts the laughable figure of the Schadchen into a sympathetic one, deserving of pity. How happy the man must be to be able at last to throw off the burden of pretence, since he makes use of the first chance of shouting out the very last scrap of truth! As soon as he sees that the case is lost, that the bride does not please the young man, he gladly betrays yet another concealed defect which has escaped notice, or he takes the opportunity of producing an argument that settles a detail in order to express his contempt for the people he is working for: 'I ask you - who would lend these people anything?' The whole of the ridicule in the anecdote now falls upon the parents, barely touched on in it, who think this swindle justified in order to get their daughter a husband, upon the pitiable position of girls who let themselves be married on such terms, and upon the disgracefulness of marriages contracted on such a basis. The marriage-broker is the right man to express such criticisms, for he knows most about these abuses; but he must not say them aloud, for he is a poor man whose existence depends on exploiting them. The popular mind, which created these stories, and others like them, is torn by a similar conflict; for it knows that the sacredness of marriages after they have been contracted is grievously affected by the thought of what happened at the time when they were arranged.

[1905c, 1700]
Let us recall, too, what we observed while we were investigating the technique of jokes: that in jokes nonsense often replaces ridicule and criticism in the thoughts lying behind the joke. (In this respect, incidentally, the joke-work is doing the same thing as the dream-work.) Here we find the fact confirmed once again. That the ridicule and criticism are not directed against the figure of the broker, who only appears in the examples we have quoted as a whipping-boy, is shown by another class of jokes in which the marriage-broker is represented, on the contrary, as a superior person, whose dialectical powers prove sufficient to meet any difficulty. They are anecdotes with a logical instead of a comic façade - sophistical conceptual jokes. In one of them (p. 1664 f.) the broker succeeds in arguing away the bride's defect of being lame. It is at least a 'fait accompli'; another wife, with straight limbs, would on the contrary be in constant danger of falling down and breaking her leg, and this would be followed by illness, pains, and the expenses of treatment, all of which would be spared in the case of the woman who is lame already. Or there is another anecdote, in which he succeeds in repelling a whole series of complaints made by the suitor against the bride, meeting each one with good arguments till he replies to the last, which cannot be countered: 'What do you want? Isn't she to have a single fault?', as though there were not necessarily something left over from the earlier objections. There is no difficulty in showing the weak spot in the argument in these two examples, and we did so in examining their technique. But what interests us now is something different. If the broker's speech is given such a marked appearance of logic which, on careful examination, is recognizable as being only an appearance, the truth behind it is that the joke declares the broker to be in the right; the thought does not venture to do so seriously but replaces the seriousness by the appearance which the joke presents. But here, as so often, a jest betrays something serious. We shall not be mistaken if we assume of all these anecdotes with a logical façade that they really mean what they assert for reasons that are intentionally faulty. It is only this employment of sophistry for the disguised representation of the truth that gives it the character of a joke, which is thus essentially dependent on its purpose. For what is hinted at in the two anecdotes is that it is really the suitor who is making himself ridiculous when he collects the bride's different advantages together with so much care, though all of them are weak, and when, in doing so, he forgets that he must be prepared to take as his wife a human being with her inevitable defects; while, on the other hand, the one characteristic that would make marriage with the woman's more or less imperfect personality tolerable - mutual attraction and readiness for affectionate adaptation - is quite left out of account in the whole transaction.

In the examples we have considered hitherto, the disguised aggressiveness has been directed against people - in the broker jokes against everyone involved in the business of arranging a marriage: the bride and bridegroom and their parents. But the object of the joke's attack may equally well be institutions, people in their capacity as vehicles of institutions, dogmas of morality or religion, views of life which enjoy so much respect that objections to them can only be made under the mask of a joke and indeed of a joke concealed by its façade. Though the themes at which these tendentious jokes are aimed may be few, their forms and envelopes are very many and various. I think we shall do well to distinguish this class of tendentious joke by a special name. The appropriate name will emerge after we have interpreted a few examples of the class.
I may recall the two stories - one of the impoverished *gourmet* who was caught eating 'salmon mayonnaise' and the other of the dipsomaniac tutor - which we learnt to know as sophistical displacement jokes. I will now continue their interpretation. We have since heard that if an appearance of logic is tacked on to the façade of a story the thought would like to say seriously 'the man is right', but, owing to an opposing contradiction, does not venture to declare the man right except on a single point, on which it can easily be shown that he is wrong. The 'point' chosen is the correct compromise between his rightness and his wrongness; this, indeed, is no decision, but corresponds to the conflict within ourselves. The two anecdotes are simply epicurean. They say: 'Yes. The man is right. There is nothing higher than enjoyment and it is more or less a matter of indifference how one obtains it.' This sounds shockingly immoral and is no doubt not much better. But at bottom it is nothing other than the poet's *Carpe diem*, which appeals to the uncertainty of life and the unfruitfulness of virtuous renunciation. If the idea that the man in the 'salmon mayonnaise' joke was right has such a repellent effect on us, this is only because the truth is illustrated by an enjoyment of the lowest kind, which it seems to us we could easily do without. In reality each of us has had hours and times at which he has admitted the rightness of this philosophy of life and has reproached moral doctrine with only understanding how to demand without offering any compensation. Since we have ceased any longer to believe in the promise of a next world in which every renunciation will be rewarded by a satisfaction - there are, incidentally, very few pious people if we take renunciation as the sign of faith - *Carpe diem* has become a serious warning. I will gladly put off satisfaction: but do I know whether I shall still be here tomorrow? *Di doman' non c'è certezza.*¹

We now know the name that must be given to jokes like those that we have last interpreted. They are *cynical* jokes and what they disguise are cynicisms.

Among the institutions which cynical jokes are in the habit of attacking none is more important or more strictly guarded by moral regulations but at the same time more inviting to attack than the institution of marriage, at which, accordingly, the majority of cynical jokes are aimed. There is no more personal claim than that for sexual freedom and at no point has civilization tried to exercise severer suppression than in the sphere of sexuality. A single example will be enough for our purposes - the one mentioned on p. 1678, *An Entry in Prince Carnival's Album*:

We have already discussed the complicated technique of this example: a bewildering and apparently impossible simile, which however, as we now see, is not in itself a joke; further, an allusion (a cab is a public vehicle); and, as its most powerful technical method, an omission which increases the unintelligibility. The simile may be worked out as follows. One marries in order to protect oneself against the temptations of sensuality, but it turns out nevertheless that marriage does not allow of the satisfaction of needs that are somewhat stronger than usual. In just the same way, one takes an umbrella with one to protect oneself from the rain and nevertheless gets wet in the rain. In both cases one must look around for a stronger protection: in the latter case one must take a public vehicle, and in the former a woman who is accessible in return for money. The joke has now been almost entirely replaced by a piece of cynicism. One does not venture to declare aloud and openly that marriage is not an arrangement calculated to satisfy a man's sexuality, unless one is driven to do so perhaps by the love of truth and eagerness for reform of a Christian von Ehrenfels.¹ The strength of this joke lies in the fact that nevertheless - in all kinds of roundabout ways - it has declared it.

¹[1905c, 1703]

[1905c, 1704]

[1905c, 1704]

[1905c, 1705]
A particularly favourable occasion for tendentious jokes is presented when the intended rebellious criticism is directed against the subject himself, or, to put it more cautiously, against someone in whom the subject has a share - a collective person, that is (the subject's own nation, for instance). The occurrence of self-criticism as a determinant may explain how it is that a number of the most apt jokes (of which we have given plenty of instances) have grown up on the soil of Jewish popular life. They are stories created by Jews and directed against Jewish characteristics. The jokes made about Jews by foreigners are for the most part brutal comic stories in which a joke is made unnecessary by the fact that Jews are regarded by foreigners as comic figures. The Jewish jokes which originate from Jews admit this too; but they know their real faults as well as the connection between them and their good qualities, and the share which the subject has in the person found fault with creates the subjective determinant (usually so hard to arrive at) of the joke-work. Incidentally, I do not know whether there are many other instances of a people making fun to such a degree of its own character.

[1905c, 1705]

'The Schnorrer begged the Baron for some money for a journey to Ostend; his doctor had recommended sea-bathing for his troubles. The Baron thought Ostend was a particularly expensive resort; a cheaper one would do equally well. The Schnorrer, however, rejected the proposal with the words: "Herr Baron, I consider nothing too expensive for my health."' This is an excellent displacement joke which we might have taken as a model for that class.¹ The Baron evidently wants to save his money, but the Schnorrer answers as though the Baron's money was his own, which he may then quite well value less than his health. Here we are expected to laugh at the impertinence of the demand; but it is rarely that these jokes are not equipped with a façade to mislead the understanding. The truth that lies behind is that the Schnorrer, who in his thoughts treats the rich man's money as his own, has actually, according to the sacred ordinances of the Jews, almost a right to make this confusion. The indignation raised by this joke is of course directed against a Law which is highly oppressive even to pious people.

[1905c, 1706]

Other stories, which are once again technically frontier cases of jokes, give evidence of a profoundly pessimistic cynicism. For instance:

[1905c, 1707]

It is on account of the allusion made by these pessimistic stories to the manifold and hopeless miseries of the Jews that I must class them with tendentious jokes.

[1905c, 1708]
Other jokes, which are in the same sense cynical and which are not only Jewish anecdotes, attack religious dogmas and even the belief in God. The story of the Rabbi's 'Kück', the technique of which lay in the faulty thinking which equated phantasy and reality (another possible view was to regard it as a displacement), is a cynical or critical joke of this kind, directed against miracle-workers and certainly against the belief in miracles as well. Heine is said to have made a definitely blasphemous joke on his death-bed. When a friendly priest reminded him of God's mercy and gave him hope that God would forgive him his sins, he is said to have replied: 'Bien sûr qu'il me pardonnera: c'est son métier.'¹ This is a disparaging comparison (technically perhaps only having the value of an allusion), since a 'métier', a trade or profession, is what a workman or a doctor has - and he has only a single métier. But the force of the joke lies in its purpose. What it means to say is nothing else than: 'Of course he'll forgive me. That's what he's there for, and that's the only reason I've taken him on (as one engages one's doctor or one's lawyer).' So in the dying man, as he lay there powerless, a consciousness stirred that he had created God and equipped him with power so as to make use of him when the occasion arose. What was supposed to be the created being revealed itself just before its annihilation as the creator.

[1905c, 1708]

This excellent story, which gives an impression of over-subtlety, evidently works by the technique of absurdity. The second Jew is reproached for lying because he says he is going to Cracow, which is in fact his destination! But the powerful technical method of absurdity is here linked with another technique, representation by the opposite, for, according to the uncontradicted assertion of the first Jew, the second is lying when he tells the truth and is telling the truth by means of a lie. But the more serious substance of the joke is the problem of what determines the truth. The joke, once again, is pointing to a problem and is making use of the uncertainty of one of our commonest concepts. Is it the truth if we describe things as they are without troubling to consider how our hearer will understand what we say? Or is this only jesuitical truth, and does not genuine truth consist in taking the hearer into account and giving him a faithful picture of our own knowledge? I think that jokes of this kind are sufficiently different from the rest to be given a special position. What they are attacking is not a person or an institution but the certainty of our knowledge itself, one of our speculative possessions. The appropriate name for them would therefore be 'sceptical' jokes.

[1905c, 1709]

We shall, I think, find the explanation we are in search of far easier from tendentious jokes than from innocent ones. We will therefore begin with the former.

[1905c, 1710]

Here then we have once more come upon the principle of economy which we met first in discussing the technique of verbal jokes. But whereas in the earlier case we seemed to find the economy in the use of as few words as possible or of words as much alike as possible, we now have a suspicion of an economy in the far more comprehensive sense of psychical expenditure in general; and we must regard it as possible that a closer understanding of what is still the very obscure concept of 'psychical expenditure' may bring us nearer to the essential nature of jokes.

[1905c, 1711]

A certain lack of clarity which we have been unable to overcome in our handling of the mechanism of pleasure in tendentious jokes may be taken as an appropriate punishment for our having tried to clear up the more complex problem before the simpler one, tendentious jokes before innocent ones. We take note of the fact that 'economy in expenditure on inhibition or suppression' appears to be the secret of the pleasurable effect of tendentious jokes, and pass on to the mechanism of pleasure in innocent jokes.

[1905c, 1712]
On the basis of suitable specimens of innocent jokes, in which there was no fear of our judgement being disturbed by their content or purpose, we were driven to conclude that the techniques of jokes are themselves sources of pleasure; and we shall now try to discover whether it may perhaps be possible to trace that pleasure back to economy in psychical expenditure. In one group of these jokes (play upon words) the technique consisted in focusing our psychical attitude upon the sound of the word instead of upon its meaning - in making the (acoustic) word presentation itself take the place of its significance as given by its relations to thing-presentations. It may really be suspected that in doing so we are bringing about a great relief in psychical work and that when we make serious use of words we are obliged to hold ourselves back with a certain effort from this comfortable procedure. We can observe how pathological states of thought-activity, in which the possibility of concentrating psychical expenditure on a particular point is probably restricted, do in fact give this sort of sound-presentation of the word greater prominence than its meaning, and that sufferers in such states proceed in their speech on the lines (as the formula runs) of the 'external' instead of the 'internal' associations of the word-presentation. We notice, too, that children, who, as we know, are in the habit of still treating words as things, tend to expect words that are the same or similar to have the same meaning behind them - which is a source of many mistakes that are laughed at by grown-up people. If, therefore, we derive unmistakable enjoyment in jokes from being transported by the use of the same or a similar word from one circle of ideas to another, remote one (in the 'Home-Roulard', for instance, from the kitchen to politics), this enjoyment is no doubt correctly to be attributed to economy in psychical expenditure. The pleasure in a joke arising from a 'short-circuit' like this seems to be the greater the more alien the two circles of ideas that are brought together by the same word - the further apart they are, and thus the greater the economy which the joke's technical method provides in the train of thought. We may notice, too, that here jokes are making use of a method of linking things up which is rejected and studiously avoided by serious thought.¹

¹ If I may be allowed to anticipate the exposition in the text, I can at this point throw light on the condition which seems to determine whether a joke is to be called a 'good' or a 'bad' one. If, by means of a word with two meanings or a word that is only slightly modified, I take a short cut from one circle of ideas to another, and if there is not at the same time a link between those circles of ideas which has a significant sense, then I shall have made a 'bad' joke. In a bad joke like this the only existing link between the two disparate ideas is the one word - the 'point' of the joke. The example of 'Home-Roulard' quoted above is a joke of this kind. A 'good' joke, on the other hand, comes about when what children expect proves correct and the similarity between the words is shown to be really accompanied by another, important similarity in their sense. Such, for instance, is the example 'Traduttore - Traditore'. The two disparate ideas, which are here linked by an external association, are also united in a significant relation which indicates an essential kinship between them. The external association merely takes the place of the internal connection; it serves to point it out or make it clear. A 'translator' is not only called by a similar name to a 'traitor'; he actually in a kind of traitor and bears the name, as it were by right.

The distinction that is here developed coincides with the one which is to be introduced later between a 'jest' and a 'joke'. But it would be unjust to exclude examples like 'Home-Roulard' from the discussion of the nature of jokes. As soon as we take into consideration the peculiar pleasure derived from jokes, we find that the 'bad' jokes are by no means bad as jokes - that is, unsuitable for producing pleasure.
The 'rediscovery of what is familiar' is the basis for the use of another technical resource in jokes, which we have not yet mentioned. I refer to the factor of 'topicality', which is a fertile source of pleasure in a great many jokes and which explains a few of the peculiarities in the life-history of jokes. There are jokes which are completely independent of this condition, and in a monograph on jokes we are obliged to make almost exclusive use of examples of that kind. But we cannot forget that, in comparison with these perennial jokes, we have perhaps laughed even more heartily at others which it is difficult for us to use now because they would call for long commentaries and even with such help would not produce their original effect. These latter jokes contained allusions to people and events which at the time were 'topical', which had aroused general interest and still kept it alive. When this interest had ceased and the business in question had been settled, these jokes too lost a part of their pleasurable effect and indeed a very considerable part. For instance, the joke made by my friendly host when he called a pudding that was being served a 'Home-Roulard' does not seem to me to-day nearly so good as it did at the time when 'Home Rule' provided a standing head-line in the political columns of our daily papers. In attempting to estimate the merits of this joke I now attribute them to the fact that a single word has transported us, with the economy of a long detour in thought, from the circle of ideas of the kitchen to the remote one of politics. But at the time my account would have had to be different, and I should have said that this word transported us from the circle of ideas of the kitchen to that of politics, which was remote from it but was certain of our lively interest because we were constantly concerned with it. Another joke, 'This girl reminds me of Dreyfus; the army doesn't believe in her innocence', has also faded to-day, though its technical methods must have remained unaltered. The bewilderment caused by the comparison and the double-entendre in the word 'innocence' cannot compensate for the fact that the allusion, which at the time touched on an event cathected with fresh excitement, to-day recalls a question that is settled. Here is a joke which is still topical: 'The Crown Princess Louise approached the crematorium in Gotha with the question of how much a Verbrennung [cremation] costs. The management replied: "Five thousand marks normally; but we will only charge you three thousand as you have been durchgebrannt [literally 'been burnt through' - slang for 'eloped'] once already." A joke like this sounds irresistible to-day; in a short time it will have sunk very considerably in our estimation; and some time later still, in spite of its good play upon words, it will lose its effect entirely, for it will be impossible to repeat it without adding a commentary to explain who Princess Louise was and the sense in which she was durchgebrannt.

Thus a great number of the jokes in circulation have a certain length of life: their life runs a course made up of a period of flowering and a period of decay and it ends in complete oblivion. The need which men feel for deriving pleasure from their processes of thought is therefore constantly creating new jokes based on the new interests of the day. The vital force of topical jokes is not their own; it is borrowed, by the method of allusion, from those other interests, the expiry of which determines the fate of the joke as well. The factor of topicality is a source of pleasure, ephemeral it is true but particularly abundant, which supplements the sources inherent in the joke itself. It cannot be simply equated with the rediscovery of what is familiar. It is concerned rather with a particular category of what is familiar, which must in addition possess the characteristic of being fresh, recent and untouched by forgetting. In the formation of dreams, too, we come across a special preference for what is recent and we cannot escape a suspicion that association with what is recent is rewarded, and so facilitated, by a peculiar bonus of pleasure.
The third group of techniques of jokes - for the most part of conceptual jokes - which comprises faulty thinking, displacements, absurdity, representation by the opposite, etc., may at a first glance seem to bear a special impress and to betray no kinship with the techniques of rediscovery of what is familiar or the replacement of object-associations by word-associations. Nevertheless it is particularly easy here to bring into play the theory of economy or relief in psychical expenditure.

[1905c, 1715]

If we look back once more at the three separate groups of joke-techniques, we see that the first and third of these groups - the replacement of thing-associations by word-associations and the use of absurdity - can be brought together as re-establishing old liberties and getting rid of the burden of intellectual upbringing; they are psychical reliefs, which can in a sense be contrasted with the economizing which constitutes the technique of the second group. Relief from psychical expenditure that is already there and economizing in psychical expenditure that is only about to be called for - from these two principles all the techniques of jokes, and accordingly all pleasure from these techniques, are derived. The two species of technique and of obtaining pleasure coincide - in the main at all events - with the distinction between verbal and conceptual jokes.

[1905c, 1718]

The preceding discussion has given us unawares an insight into the evolution or psychogenesis of jokes, which we will now examine more closely. We have made the acquaintance of preliminary stages of jokes, and their development into tendentious jokes will probably uncover fresh relations between the various characteristics of jokes. Before there is such a thing as a joke, there is something that we may describe as 'play' or as 'a jest'.

[1905c, 1719]

¹ Nonsense jokes, which have not had due attention paid to them in my account, deserve some supplementary consideration.

[1905c, 1727]

[Added 1912:] A number of productions resembling jokes can be classed alongside of nonsense jokes. There is no appropriate name for them, but they might well be described as 'idiocy masquerading as a joke'. There are countless numbers of them, and I will only select two samples:

[1905c, 1727]

The species of humour are extraordinarily variegated according to the nature of the emotion which is economized in favour of the humour: pity, anger, pain, tenderness, and so on. Their number seems to remain uncompleted because the kingdom of humour is constantly being enlarged whenever an artist or writer succeeds in submitting some hitherto unconquered emotions to the control of humour, in making them, by devices like those in the examples we have given, into sources of humorous pleasure. The artists in Simplicissimus, for instance, have had astonishing results in achieving humour at the cost of horror and disgust. The forms in which humour is manifested are, moreover, determined by two peculiarities which are connected with the conditions under which it is generated. Humour may, in the first place, appear merged with a joke or some other species of the comic; in that case its task is to get rid of a possibility implicit in the situation that an affect may be generated which would interfere with the pleasurable outcome. In the second place, it may stop this generating of an affect entirely or only partially; this last is actually the commoner case since it is easier to bring about, and it produces the various forms of 'broken' humour - the humour that smiles through tears. It withdraws a part of its energy from the affect and in exchange gives it a tinge of humour.

[1905c, 1806]
Intestinal disorders set in very early with him, and especially in the form which is the most frequent and, among children, the most normal - namely, incontinence. We shall certainly be right, however, in rejecting a pathological explanation of these earliest occurrences, and in regarding them only as evidence of the patient's intention not to let himself be disturbed or checked in the pleasure attached to the function of evacuation. He found a great deal of enjoyment (such as would tally with the natural coarseness of many classes of society, though not of his) in anal jokes and exhibitions, and this enjoyment had been retained by him until after the beginning of his later illness.

[1918b, 3558]
Our expectation that the technique of jokes cannot be a matter of indifference from the point of view of discovering their essence leads us at once to enquire whether there are other examples of jokes constructed like Heine's 'famillionär'. There are not very many of them, but nevertheless enough to make up a small group which are characterized by the formation of composite words. Heine himself has derived a second joke from the word 'Millionär' - copying from himself, as it were. In Chapter XIV of his 'Ideen' he speaks of a 'Millionär', which is an obvious combination of 'Millionär' and 'Narr' and, just as in the first example, brings out a suppressed subsidiary thought.

Here are some other examples I have come upon. - There is a certain fountain [Brunnen] in Berlin, the erection of which brought the Chief Burgomaster Forckenbeck into much disfavour. The Berliners call it the 'Forckenbecken', and there is certainly a joke in this description, even though it was necessary to replace the word 'Brunnen' by its obsolete equivalent 'Becken' in order to combine it into a whole with the name of the Burgomaster. - The voice of Europe once made the cruel joke of changing a potentate's name from Leopold to Cleopold, on account of the relations he had at one time with a lady with the first name of Cleo. This undoubted product of condensation keeps alive an annoying allusion at the cost of a single letter. - Proper names in general fall easy victims to this kind of treatment by the joke-technique. There were in Vienna two brothers named Salinger, one of whom was a Börsensensal. This provided a handle for calling him 'Sensalinger', while his brother, to distinguish him, was given the unflattering name of 'Scheusalinger'. This was convenient, and certainly a joke; I cannot say whether it was justified. But jokes do not as a rule enquire much into that.

I have been told the following condensation joke. A young man who had hitherto led a gay life abroad paid a call, after a considerable absence, on a friend living here. The latter was surprised to see an Ehering [wedding-ring] on his visitor's hand, 'What?' he exclaimed, 'are you married?' 'Yes', was the reply, 'Trauring but true.'¹ The joke is an excellent one. The word 'Trauring' combines both components: 'Ehering' changed into 'Trauring' and the sentence 'traurig, aber wahr [sad but true]'. The effect of the joke is not interfered with by the fact that here the composite word is not, like 'famillionär', an unintelligible and otherwise non-existent structure, but one which coincides entirely with one of the two elements represented.

I owe a few examples in foreign languages, which show the same mechanism of condensation as our 'famillionär', to an excellent discussion of the same subject in English by A. A. Brill (1911).

But the best example of a joke of this group originated from one of the leading men in Austria, who, after important scientific and public work, now fills one of the highest offices in the State. I have ventured to make use of the jokes which are ascribed to him, and all of which in fact bear the same impress, as material for these researches,¹ above all because it would have been hard to find any better.

Herr N.'s attention was drawn one day to the figure of a writer who had become well-known from a series of undeniably boring essays which he had contributed to a Vienna daily paper. All of these essays dealt with small episodes in the relations of the first Napoleon with Austria. The author had red hair. As soon as Herr N. heard his name mentioned he asked: 'Is not that the roter Fadian² that runs through the story of the Napoleonids?'
In order to discover the technique of this joke, we must apply to it the process of reduction which gets rid of the joke by changing the mode of expression and instead introducing the original complete meaning, which can be inferred with certainty from a good joke. Herr N.'s joke about the 'roter Fadian' proceeds from two components - a depreciatory judgement upon the writer and a recollection of the famous simile with which Goethe introduces the extracts 'From Ottillie's Diary' in the Wahlverwandtschaften.¹ The ill-tempered criticism may have run: 'So this is the person who is for ever and ever writing nothing but boring stories about Napoleon in Austria!' Now this remark is not in the least a joke. Nor is Goethe's pretty analogy a joke, and it is certainly not calculated to make us laugh. It is only when the two are brought into connection with each other and submitted to the peculiar process of condensation and fusion that a joke emerges - and a joke of the first order.²

² I need hardly point out how little this observation, which can invariably be made, fits in with the assertion that a joke is a playful judgement.

The linking of the disparaging judgement upon the boring historian with the pretty analogy in the Wahlverwandtschaften must have taken place (for reasons which I cannot yet make intelligible) in a less simple manner than in many similar cases. I shall try to represent what was probably the actual course of events by the following construction. First, the element of the constant recurrence of the same theme in the stories may have awoken a faint recollection in Herr N. of the familiar passage in the Wahlverwandtschaften, which is as a rule wrongly quoted: 'it runs like a roter Faden [scarlet thread].' The 'roter Faden' of the analogy now exercised a modifying influence of the expression of the first sentence, as a result of the chance circumstance that the person insulted was also rot [red] - that is to say had red hair. It may then have run: 'So it is that red person who writes the boring stories about Napoleon!' And now the process began which brought about the condensation of the two pieces. Under its pressure, which had found its first fulcrum in the sameness of the element 'rot', the 'boring' was assimilated to the 'Faden [thread]' and was changed into 'fad [dull]'; after this the two components were able to fuse together into the actual text of the joke, in which, in this case, the quotation has an almost greater share than the derogatory judgement, which was undoubtedly present alone to begin with.

In a later chapter I shall add a justification, but also a correction, to this account, when I come to analyse this joke from points of view other than purely formal ones. But whatever else about it may be in doubt, there can be no question that a condensation has taken place. The result of the condensation is, on the one hand, once again a considerable abbreviation; but on the other hand, instead of the formation of a striking composite word, there is an interpenetration of the constituents of the two components. It is true that 'roter Faden' would be capable of existing as a mere term of abuse; but in our instance it is certainly a product of condensation.

The analysis of the last example has prepared us to find that, if we meet with the process of condensation in still other examples, the substitute for what is suppressed may be not a composite structure, but some other alteration of the form of expression. We can learn what this other form of substitute may be from another of Herr N.'s jokes.
Neither of these sentences is a joke. They could be put together: 'I drove with that stupid ass X tête-à-tête', and that is not a joke either. The joke only arises if the 'stupid ass' is left out, and, as a substitute for it, the 't' in one 'tête' is turned into a 'b'. With this slight modification the suppressed 'ass' has nevertheless once more found expression. The technique of this group of jokes can be described as 'condensation accompanied by slight modification', and it may be suspected that the slighter the modification the better will be the joke.

[1905c, 1631]

Another, very well-known joke of Herr N.'s offers a neat example of condensation with slight modification. He remarked of a personage in public life: 'he has a great future behind him.' The man to whom this joke referred was comparatively young, and he had seemed destined by his birth, education and personal qualities to succeed in the future to the leadership of a great political party and to enter the government at its head. But times changed; the party became inadmissible as a government, and it could be foreseen that the man who had been predestined to be its leader would come to nothing as well. The shortest reduced version by which this joke could be replaced would run: 'The man has had a great future before him, but he has it no longer.' Instead of the 'had' and the second clause, there was merely the small change made in the principal clause of replacing 'before' by its contrary, 'behind'.¹

[1905c, 1632]

Karl Kraus was responsible for another successful condensation with slight modification. He wrote of a certain yellow-press journalist that he had travelled to one of the Balkan States by 'Orienterpresszug'.² There is no doubt that this word combines two others: 'Orientexpresszug [Orient Express]' and 'Erpressung [blackmail]'. Owing to the context, the element 'Erpressung' emerges only as a modification of the 'Orientexpresszug' - a word called for by the verb ['travelled']. This joke, which presents itself in the guise of a misprint, has yet another claim on our interest.

[1905c, 1633]

This series of examples could easily be further increased; but I do not think we require any fresh instances to enable us to grasp clearly the characteristics of the technique in this second group - condensation with modification. If we compare the second group with the first, whose technique consisted in condensation with the formation of composite words, we shall easily see that the difference between them is not an essential one and that the transitions between them are fluid. Both the formation of composite words and modification can be subsumed under the concept of the formation of substitutes; and, if we care to, we can also describe the formation of a composite word as a modification of the basic word by a second element.

[1905c, 1633]

The first thing that we want to learn is whether the process of condensation with substitute-formation is to be discovered in every joke, and can therefore be regarded as a universal characteristic of the technique of jokes.

[1905c, 1635]

But what is the technique of this joke? We see at once that the characteristic that we may have hoped to be able to prove was a universal one is absent on the very first fresh occasion. There is no omission here, and scarcely an abbreviation. The lady herself says straight out in the joke almost everything that we can attribute to her thoughts. 'You had raised my expectations about a relative of Jean-Jacques Rousseau - perhaps a spiritual relative - and here he is: a red-haired silly young man, a roux et sot.' It is true that I have been able to make an interpolation; but this attempt at a reduction has not got rid of the joke. It remains, and is attached to the identity of sound of the words

[1905c, 1635]
The multiple use of the same word, once as a whole and again in the syllables into which it falls, is the first instance we have come across of a technique differing from that of condensation. But the profusion of examples that have met us must convince us after a little reflection that the newly-discovered technique can scarcely be limited to this one method. There are a number of possible ways - how many it is as yet quite impossible to guess - in which the same word or the same verbal material can be put to multiple uses in one sentence. Are all these possibilities to be regarded as technical methods of making jokes? It seems to be so. And the examples of jokes which follow will prove it. [1905c, 1637]

This 'representation by the opposite', as we shall call it, serves the joke-work in various forms. In the next two examples it appears almost pure: [1905c, 1669]

The production of composite structures like these must be of great importance to the dream-work, since we can show that, where in the first instance the common elements necessary for them were missing, they are deliberately introduced - for instance, through the choice of the words by which a thought is expressed. We have already come across condensations and composite structures of this sort. They played a part in the production of some slips of the tongue. You will recall the young man who offered to 'begleitdigen' ['begleiten (accompany) + 'beleidigen (insult)'] a lady. Moreover, there are jokes of which the technique is based on a condensation like this. But apart from these cases, it may be said that the process is something quite unusual and strange. It is true that counterparts to the construction of these composite figures are to be found in some creations of our imagination, which is ready to combine into a unity components of things that do not belong together in our experience - in the centaurs, for instance, and the fabulous beasts which appear in ancient mythology or in Böcklin's pictures. The 'creative' imagination, indeed, is quite incapable of inventing anything; it can only combine components that are strange to one another. But the remarkable thing about the procedure of the dream-work lies in what follows. The material offered to the dream-work consists of thoughts - a few of which may be objectionable and unacceptable, but which are correctly constructed and expressed. The dream-work puts these thoughts into another form, and it is a strange and incomprehensible fact that in making this translation (this rendering, as it were, into another script or language) these methods of merging or combining are brought into use. After all, a translation normally endeavours to preserve the distinctions made in the text and particularly to keep things that are similar separate. The dream-work, quite the contrary, tries to condense two different thoughts by seeking out (like a joke) an ambiguous word in which the two thoughts may come together. We need not try to understand this feature all at once, but it may become important for our appreciation of the dream-work. [1916-1917, 3264]
I am well aware that these scanty extracts from the works of writers upon jokes cannot do them justice. In view of the difficulties standing in the way of my giving an unmistakably correct account of such complicated and subtle trains of thought, I cannot spare curious enquirers the labour of obtaining the information they desire from the original sources. But I am not sure that they will come back fully satisfied. The criteria and characteristics of jokes brought up by these authors and collected above - activity, relation to the content of our thoughts, the characteristic of playful judgement, the coupling of dissimilar things, contrasting ideas, 'sense in nonsense', the succession of bewilderment and enlightenment, the bringing forward of what is hidden, and the peculiar brevity of wit - all this, it is true, seems to us at first sight so very much to the point and so easily confirmed by instances that we cannot be in any danger of underrating such views. But they are *djecta membra*, which we should like to see combined into an organic whole. When all is said and done, they contribute to our knowledge of jokes no more than would a series of anecdotes to the description of some personality of whom we have a right to ask for a biography. We are entirely without insight into the connection that presumably exists between the separate determinants - what, for instance, the brevity of a joke can have to do with its characteristic of being a playful judgement. We need to be told, further, whether a joke must satisfy *all* these determinants in order to be a proper joke, or need only satisfy *some*, and if so which can be replaced by others and which are indispensable. We should also wish to have a grouping and classification of jokes on the basis of the characteristics considered essential. The classification that we find in the literature rests on the one hand on the technical methods employed in them (e.g. punning or play upon words) and on the other hand on the use made of them in speech (e.g. jokes used for the purposes of caricature or of characterization, or joking snubs).

But if what makes our example a joke is not anything that resides in its thought, we must look for it in the form, in the wording in which it is expressed. We have only to study the peculiarity of its form of expression to grasp what may be termed the verbal or expressive technique of this joke, something which must stand in an intimate relation with the essence of the joke, since, if it is replaced by something else, the character and effect of the joke disappear. Moreover, in attributing so much importance to the verbal form of jokes we are in complete agreement with the authorities. Thus Fischer (1889, 72) writes: 'It is in the first place its sheer form that makes a judgement into a joke, and we are reminded of a saying of Jean Paul's which, in a single aphorism, explains and exemplifies this precise characteristic of jokes - “Such is the victorious power of sheer position, whether among warriors or words.”'

But not quite without leaving a substitute from which we can reconstruct it. For a second change has also been made. The word ‘familiär [familiarly]’ in the unjoking expression of the thought has been transformed in the text of the joke into ‘famillionär [famillionairly]’; and there can be no doubt that it is precisely on this verbal structure that the joke’s character as a joke and its power to cause a laugh depend. The newly constructed word coincides in its earlier portion with the ‘familiär’ of the first sentence, and in its final syllables with the ‘Millionär’ of the second sentence. It stands, as it were, for the ‘Millionär’ portion of the second sentence and thus for the whole second sentence, and so puts us in a position to infer the second sentence that has been omitted in the text of the joke. It can be described as a ‘composite structure’ made up of the two components ‘familiär’ and ‘Millionär’, and it is tempting to give a diagrammatic picture of the way in which it is derived from those two words:²

---

¹ [Footnote added 1909:] See my volume on jokes (1905c) and the discussion there of the use of 'verbal bridges' in the solution of neurotic symptoms.

² [1905c, 1620]
Let us now imagine that a compressing force is brought to bear on these sentences and that for some reason the second is the less resistant one. It is thereupon made to disappear, while its most important constituent, the word 'Millionär', which has succeeded in rebelling against being suppressed, is, as it were, pushed up against the first sentence, and fused with the element of that sentence which is so much like it - 'familiär'. And the chance possibility, which thus arises, of saving the essential part of the second sentence actually favours the dissolution of its other, less important, constituents. The joke is thus generated:

If we leave out of account any such compressing force, which indeed is unknown to us, the process by which the joke is formed - that is, the joke-technique - in this instance might be described as 'condensation accompanied by the formation of a substitute'; and in the present example the formation of the substitute consists in the making of a 'composite word'. This composite word 'famillionär', which is unintelligible in itself but is immediately understood in its context and recognized as being full of meaning, is the vehicle of the joke's laughter compelling effect - the mechanism of which, however, is not made in any way clearer by our discovery of the joke-technique. In what way can a linguistic process of condensation, accompanied by the formation of a substitute by means of a composite word, give us pleasure and make us laugh? This is evidently a different problem, whose treatment we may postpone till we have found a way of approaching it. For the present we will keep to the technique of jokes.

What besides? Fresh attempts at reduction can teach me that the joke remains resistant until the name 'Rousseau' is replaced by another. If, for instance, I put 'Racine' instead of it, the lady's criticism, which remains just as possible as before, loses every trace of being a joke. I now know where I have to look for the technique of this joke, though I may still hesitate over formulating it. I will try this: the technique of the joke lies in the fact that one and the same word - the name - appears in it used in two ways, once as a whole, and again cut up into its separate syllables like a charade.

An Italian lady is said to have revenged herself for a tactless remark of the first Napoleon's with a joke having this same technique of the double use of a word. At a court ball, he said to her, pointing to her fellow countrymen: 'Tutti gli Italiani danzano si male.' To which she made the quick repartee: 'Non tutti, ma buona parte.'¹ (Brill, 1911.)

In all three of these examples, which should suffice for this species, we see the same joke-technique: in each of them a name is used twice, once as a whole and again divided up into its separate syllables, which, when they are thus separated, give another sense.¹

The multiple use of the same word, once as a whole and again in the syllables into which it falls, is the first instance we have come across of a technique differing from that of condensation. But the profusion of examples that have met us must convince us after a little reflection that the newly-discovered technique can scarcely be limited to this one method. There are a number of possible ways - how many it is as yet quite impossible to guess - in which the same word or the same verbal material can be put to multiple uses in one sentence. Are all these possibilities to be regarded as technical methods of making jokes? It seems to be so. And the examples of jokes which follow will prove it.
In the first place, one can take the same verbal material and merely make some alteration in its arrangement. The slighter the alteration - the more one has the impression of something different being said in the same words - the better is the joke technically.
[1905c, 1638]

A wide field of play lies open to the technique of jokes if we extend the 'multiple use of the same material' to cover cases in which the word (or words) in which the joke resides may occur once unaltered but the second time with a slight modification. Here, for instance, is another of Herr N.'s jokes:
[1905c, 1638]

Here only a single letter is altered, whose modification could scarcely be noticed in careless speech. The example reminds us of Herr N.'s other modification jokes (on p. 1631 ff.), but the difference is that here there is no condensation; everything that has to be said is said in the joke itself: 'I know that earlier you were yourself a Jew; so I am surprised that you should speak ill of Jews.'
[1905c, 1638]

Here is a joke that is said to have been made during an examination in jurisprudence. The candidate had to translate a passage in the Corpus Juris: "Labeo ait" . . . I fall, says he. 'You fail, say I', replied the examiner, and the examination was at an end. Anyone who mistakes the name of the great jurist for a verbal form, and moreover one wrongly recalled, no doubt deserves nothing better. But the technique of the joke lies in the fact that almost the same words which proved the ignorance of the candidate were used to pronounce his punishment by the examiner. The joke is, moreover, an example of 'ready repartee', the technique of which, as we shall see, does not differ greatly from what we are illustrating here.
[1905c, 1639]

Words are a plastic material with which one can do all kinds of things. There are words which, when used in certain connections, have lost their original full meaning, but which regain it in other connections. A joke of Lichtenberg's carefully singles out circumstances in which the watered-down words are bound to regain their full meaning:
[1905c, 1639]

There are, too, words in German that can be taken, according as they are 'full' or 'empty', in a different sense, and, indeed, in more than one. For there can be two different derivatives from the same stem, one of which has developed into a word with a full meaning and the other into a watered-down final syllable or suffix, both of which, however, are pronounced exactly the same. The identity of sound between a full word and a watered-down syllable may also be a chance one. In both cases the joke-technique can take advantage of the conditions thus prevailing in the linguistic material.
[1905c, 1639]
This is undeniably in the nature of a joke, though not particularly effective as one. A quantity of factors are absent here which might mislead us in analysing other jokes so long as we examined each of those factors separately. The thought expressed in the wording is worthless; the definition it gives of jealousy is in any case thoroughly unsatisfactory. There is not a trace of 'sense in nonsense', of 'hidden meaning' or of 'bewilderment and illumination'. No efforts will reveal a 'contrast of ideas': a contrast between the words and what they mean can be found only with great difficulty. There is no sign of abbreviation; on the contrary, the wording gives an impression of prolixity. And yet it is a joke, and even a very perfect one. At the same time, its only striking characteristic is the one in the absence of which the joke disappears: the fact that here the same words are put to multiple uses. We can then choose whether to include this joke in the sub-class of those in which words are used first as a whole and then divided up (e.g. Rousseau or Antigone) or in the other sub-class in which the multiplicity is produced by the full or the watered-down meaning of the verbal constituents. Apart from this, only one other factor deserves notice from the point of view of the technique of jokes. We find here an unusual state of things established: a kind of 'unification' has taken place, since 'Eifersucht [jealousy]' is defined by means of its own name - by means of itself, as it were. This, as we shall see, is also a technique of jokes. These two factors, therefore, must in themselves be sufficient to give a remark the character of a joke.
[1905c, 1640]

If now we enter still further into the variety of forms of the 'multiple use' of the same word, we suddenly notice that we have before us examples of 'double meaning' or 'play upon words' - forms which have long been generally known and recognized as a technique of jokes. Why have we taken the trouble to discover afresh what we might have gathered from the most superficial essay on jokes? To begin with, we can only plead in our own justification that we have nevertheless brought out another aspect of the same phenomenon of linguistic expression. What is supposed by the authorities to show the character of jokes as a kind of 'play' has been classified by us under the heading of 'multiple use'.
[1905c, 1641]

The further cases of multiple use, which can also be brought together under the title of 'double meaning' as a new, third group, can easily be divided into sub-classes, which, it is true, cannot be separated from one another by essential distinctions any more than can the third group as a whole from the second. We find:
[1905c, 1641]

(a) Cases of the double meaning of a name and of a thing denoted by it. For instance: 'Discharge thyself of our company, Pistol!' (Shakespeare.)
[1905c, 1641]

(c) Double meaning proper, or play upon words. This may be described as the ideal case of 'multiple use'. Here no violence is done to the word; it is not cut up into its separate syllables, it does not need to be subjected to any modification, it does not have to be transferred from the sphere it belongs to (the sphere of proper names, for instance) to another one. Exactly as it is and as it stands in the sentence, it is able, thanks to certain favourable circumstances, to express two different meanings.
[1905c, 1642]

Another good example of play upon words is told by the authorities (Heymans and Lipps) in a form which makes it unintelligible. Not long ago I came upon the correct version and setting of the anecdote in a collection of jokes which has not proved of much use apart from this.
[1905c, 1643]
We shall be giving ourselves practice, perhaps, in diagnostic differentiation if at this point we insert another well-known joke about professors. 'The distinction between Professors Ordinary [ordentlich] and Professors Extraordinary [ausserordentlich] is that the ordinary ones do nothing extraordinary and the extraordinary ones do nothing properly [ordentlich].' This, of course, is a play on the two meanings of the words 'ordentlich' and 'ausserordentlich': viz. on the one hand 'inside' and 'outside' the 'ordo (the Establishment)' and on the other hand 'efficient' and 'outstanding'. But the conformity between this joke and some others we have already met reminds us that here the 'multiple use' is far more noticeable than the 'double meaning'. All through the sentence we hear nothing but a constantly recurring 'ordentlich', sometimes in that form and sometimes modified in a negative sense. (Cf. p. 1639.) Moreover, the feat is again achieved here of defining a concept by means of its own wording (cf. the example of 'Eifersucht', p. 1640), or, more precisely, of defining (even if only negatively) two correlative concepts by means of one another, which produces an ingenious interlacement. Finally, the aspect of 'unification' can also be stressed here - the eliciting of a more intimate connection between the elements of the statement than one would have had a right to expect from their nature.

Another example of a play upon words may make the transition to a fresh sub-species of the technique of double meaning easier. The joking medical colleague already mentioned above (on p. 1640) was responsible for this joke at the time of the Dreyfus case: 'This girl reminds me of Dreyfus. The army doesn't believe in her innocence.'

The word 'innocence', on the double meaning of which the joke is constructed, has in the one context its usual meaning, with 'fault' or 'crime' as its opposite; but in the other context it has a sexual meaning, of which the opposite is 'sexual experience'. Now there are a very large number of similar examples of double meaning, in all of which the effect of the joke depends quite specially on the sexual meaning. For this group we may reserve the name of 'double entendre [Zweideutigkeit]'.

We have in fact not yet considered a large - perhaps the most numerous - group of jokes, influenced, perhaps, by the contempt with which they are regarded. They are the kind which are generally known as 'Kalauer ('calembourgs') ['puns'] and which pass as the lowest form of verbal joke, probably because they are the 'cheapest' - can be made with the least trouble. And they do in fact make the least demand on the technique of expression, just as the play upon words proper makes the highest. While in the latter the two meanings should find their expression in identically the same word, which on that account is usually said only once, it is enough for a pun if the two words expressing the two meanings recall each other by some vague similarity, whether they have a general similarity of structure or a rhyming assonance, or whether they share the same first few letters, and so on. A quantity of examples like this of what are not very appropriately described as 'Klangwitze [sound-jokes]' occur in the Capuchin monk's sermon in Wallensteins Lager:

Jokes are particularly apt to change one of the vowels in a word. Thus Hevesi (1888, 87) writes of an anti-Imperial Italian poet who was nevertheless obliged later to eulogize a German emperor in hexameters: 'Since he could not exterminate the Cäsaren [Caesars], he at least eliminated the Cäsuren [caesuras].

[1905c, 1644]

[1905c, 1645]

[1905c, 1650]

[1905c, 1651]
Out of the profusion of puns at our disposal, it will perhaps be of special interest to bring up a really bad example, of which Heine is guilty. Having for a long time represented himself to his lady as an 'Indian prince', he throws off the mask and confesses: 'Madame, I have deceived you . . . I have no more ever been in Kalkutta [Calcutta] than the Kalkuttenbraten [roast Calcutta fowl] that I ate for luncheon yesterday.' The mistake in this joke clearly lies in the fact that the two similar words in it are not merely similar but actually identical. The bird which he had eaten roast is so called, because it comes, or is supposed to come, from the same Calcutta.

Fischer (1889, 78) has devoted much attention to these forms of joke, and tries to distinguish them sharply from 'play upon words'. 'A pun is a bad play upon words, since it plays upon the word not as a word but as a sound.' The play upon words, however, 'passes from the sound of the word to the word itself.' On the other hand, he classes such jokes as famillionär, Antigone (antik? oh nee), etc. among the 'sound jokes'. I see no necessity for following him in this. In a play upon words, in our view, the word is also only a sound-image, to which one meaning or another is attached. But here, too, linguistic usage makes no sharp distinctions; and if it treats 'puns' with contempt and 'play upon words' with a certain respect, these judgements of value seem to be determined by considerations other than technical ones. It is worth while paying attention to the kind of jokes that are told one as 'puns'. There are some people who, when they are in high spirits, can for considerable periods of time, answer every remark addressed to them with a pun. One of my friends, who is a model of discretion where his serious achievements in science are concerned, is apt to boast of this ability. When on one occasion he was holding the company breathless in this way and admiration was expressed for his staying power: 'Yes', he said 'I am lying here auf der Ka-Lauer.'² And when he was finally begged to stop, he agreed to on condition that he was appointed 'Poeta Ka-laureatus'. Both of these, however, are excellent jokes of condensation with formation of composite words. ('I am lying here auf der Lauer for making Kalauer [puns].')

In any case we can already gather from the disputes about the delimitation of puns and play upon words that the former will not be able to help us to discover a completely new joke technique. If, in the case of puns, we give up the claim for the use of the same material in more than one sense, nevertheless the accent falls on rediscovering what is familiar, on the correspondence between the two words that make up the pun; and consequently puns merely form a sub-species of the group which reaches its peak in the play upon words proper.

We at once recall where we have already come across allusion - in connection, namely, with double meaning. When two meanings are expressed in one word and one of them is so much more frequent and usual that it occurs to us at once, while the second is more out of the way and therefore less prominent, we proposed to speak of this as 'double meaning with an allusion'. In a whole number of the examples we have already examined we remarked that the technique was not a simple one, and we now perceive that the 'allusion' was the complicating factor in them. (See, for instance, the inversion joke about the wife who has lain back a bit and so has been able to earn a lot or the nonsensical joke about the man who replied to congratulations on the birth of his youngest child by saying that it was remarkable what human hands could accomplish.)
In the American anecdote we now have before us an allusion without any double meaning, and we see that its characteristic is replacement by something linked to it in a conceptual connection. It may easily be guessed that the utilizable connection can be of more than one kind. In order not to lose ourselves in a maze of detail, we will discuss only the most marked variants and these only in a few examples.

The connection used for the replacement may be merely a resemblance in sound, so that this sub-species becomes analogous to puns among verbal jokes. Here, however, it is not the resemblance in sound between two words, but between whole sentences, characteristic phrases, and so on.

Here is an example of a verbal joke or pun of this kind: Marie Wilt was a great singer, famous, however, for the compass not only of her voice. She suffered the humiliation of having the title of a play based on Jules Verne's well-known novel used as an allusion to her misshapen figure: 'Round the Wilt in 80 Days'.²

The mockery directed at the suitor in these examples, in which the broker quite appropriately plays the part of a superior, is expressed much more plainly in other anecdotes. The plainer these stories are, the less joke-technique do they contain; they are, as it were, only marginal cases of jokes, with the technique of which they no longer have anything in common but the construction of a façade. But owing to their having the same purpose and to its being concealed behind the facade, they produce the complete effect of a joke. Moreover, the poverty of their technical methods explains how it is that many of these jokes cannot, without suffering damage, dispense with the element of dialect, which has an effect similar to the joke technique.

²[1905c, 1674]

²[1905c, 1675]
On the basis of suitable specimens of innocent jokes, in which there was no fear of our judgement being disturbed by their content or purpose, we were driven to conclude that the techniques of jokes are themselves sources of pleasure; and we shall now try to discover whether it may perhaps be possible to trace that pleasure back to economy in psychical expenditure. In one group of these jokes (play upon words) the technique consisted in focusing our psychical attitude upon the sound of the word instead of upon its meaning - in making the (acoustic) word presentation itself take the place of its significance as given by its relations to thing-presentations. It may really be suspected that in doing so we are bringing about a great relief in psychical work and that when we make serious use of words we are obliged to hold ourselves back with a certain effort from this comfortable procedure. We can observe how pathological states of thought-activity, in which the possibility of concentrating psychical expenditure on a particular point is probably restricted, do in fact give this sort of sound-presentation of the word greater prominence than its meaning, and that sufferers in such states proceed in their speech on the lines (as the formula runs) of the 'external' instead of the 'internal' associations of the word-presentation. We notice, too, that children, who, as we know, are in the habit of still treating words as things, tend to expect words that are the same or similar to have the same meaning behind them - which is a source of many mistakes that are laughed at by grown-up people. If, therefore, we derive unmistakable enjoyment in jokes from being transported by the use of the same or a similar word from one circle of ideas to another, remote one (in the 'Home-Roulard', for instance, from the kitchen to politics), this enjoyment is no doubt correctly to be attributed to economy in psychical expenditure. The pleasure in a joke arising from a 'short-circuit' like this seems to be the greater the more alien the two circles of ideas that are brought together by the same word - the further apart they are, and thus the greater the economy which the joke's technical method provides in the train of thought. We may notice, too, that here jokes are making use of a method of linking things up which is rejected and studiously avoided by serious thought.

[1905c, 1712]
The 'rediscovery of what is familiar' is the basis for the use of another technical resource in jokes, which we have not yet mentioned. I refer to the factor of 'topicality', which is a fertile source of pleasure in a great many jokes and which explains a few of the peculiarities in the life-history of jokes. There are jokes which are completely independent of this condition, and in a monograph on jokes we are obliged to make almost exclusive use of examples of that kind. But we cannot forget that, in comparison with these perennial jokes, we have perhaps laughed even more heartily at others which it is difficult for us to use now because they would call for long commentaries and even with such help would not produce their original effect. These latter jokes contained allusions to people and events which at the time were 'topical', which had aroused general interest and still kept it alive. When this interest had ceased and the business in question had been settled, these jokes too lost a part of their pleasurable effect and indeed a very considerable part. For instance, the joke made by my friendly host when he called a pudding that was being served a 'Home-Roulard' does not seem to me to-day nearly so good as it did at the time when 'Home Rule' provided a standing head-line in the political columns of our daily papers. In attempting to estimate the merits of this joke I now attribute them to the fact that a single word has transported us, with the economy of a long detour in thought, from the circle of ideas of the kitchen to the remote one of politics. But at the time my account would have had to be different, and I should have said that this word transported us from the circle of ideas of the kitchen to that of politics, which was remote from it but was certain of our lively interest because we were constantly concerned with it. Another joke, 'This girl reminds me of Dreyfus; the army doesn't believe in her innocence,' has also faded to-day, though its technical methods must have remained unaltered. The bewilderment caused by the comparison and the double entendre in the word 'innocence' cannot compensate for the fact that the allusion, which at the time touched on an event cathected with fresh excitement, to-day recalls a question that is settled. Here is a joke which is still topical: 'The Crown Princess Louise approached the crematorium in Gotha with the question of how much a Verbrennung [cremation] costs. The management replied: "Five thousand marks normally; but we will only charge you three thousand as you have been durchgebrannt [literally 'been burnt through' - slang for 'eloped'] once already.' A joke like this sounds irresistible to-day; in a short time it will have sunk very considerably in our estimation; and some time later still, in spite of its good play upon words, it will lose its effect entirely, for it will be impossible to repeat it without adding a commentary to explain who Princess Louise was and the sense in which she was durchgebrannt.
[1905c, 1714]
I think now at length we see our way clearly. All through our consideration of the techniques of jokes we have been disturbed by the fact that they were not proper to jokes only; and yet the essence of jokes seemed to depend on them, since when they were got rid of by reduction the characteristics and the pleasure of the joke were lost. We now see that what we have described as the techniques of jokes - and we must in a certain sense continue to describe them so - are rather the sources from which jokes provide pleasure; and we feel that there is nothing strange in other procedures drawing from the same sources for the same end. The technique which is characteristic of jokes and peculiar to them, however, consists in their procedure for safeguarding the use of these methods of providing pleasure against the objections raised by criticism which would put an end to the pleasure. There is little that we can say in general about this procedure. The joke-work, as we have already remarked, shows itself in a choice of verbal material and conceptual situations which will allow the old play with words and thoughts to withstand the scrutiny of criticism; and with that end in view every peculiarity of vocabulary and every combination of thought-sequences must be exploited in the most ingenious possible way. We may be in a position later to characterize the joke-work by a particular property; for the moment it remains unexplained how the selection favourable for jokes can be made. The purpose and function of jokes, however - namely, the protection of sequences of words and thoughts from criticism - can already be seen in jests as their essential feature. Their function consists from the first in lifting internal inhibitions and in making sources of pleasure fertile which have been rendered inaccessible by those inhibitions; and we shall find that they remain loyal to this characteristic throughout their development.

We are also in a position now to assign its correct place to the factor of 'sense in nonsense' (cf. the introduction, p. 1618), to which the authorities attribute such great importance as a distinguishing mark of jokes and as an explanation of their pleasurable effect. The two fixed points in what determines the nature of jokes - their purpose of continuing pleasurable play and their effort to protect it from the criticism of reason immediately explain why an individual joke, though it may seem senseless from one point of view, must appear sensible, or at least allowable, from another. How it does so remains the affair of the joke-work; if it fails to do so, it is simply rejected as 'nonsense'. But there is no necessity for us to derive the pleasurable effect of jokes from the conflict between the feelings which arise (whether directly or along the path of 'bewilderment and enlightenment') from the simultaneous sense and nonsense of jokes. Nor have we any need to enter further into the question of how pleasure could arise from the alternation between 'thinking it senseless' and 'recognizing it as sensible'. The psychogenesis of jokes has taught us that the pleasure in a joke is derived from play with words or from the liberation of nonsense, and that the meaning of the joke is merely intended to protect that pleasure from being done away with by criticism.

We may be ready to admit that this is what tendentious jokes achieve; yet we must bear in mind that we do not understand how they are able to put these achievements into effect. Their power lies in the yield of pleasure which they draw from the sources of play upon words and of liberated nonsense; but if we are to judge by the impressions gained from non-tendentious jests, we cannot possibly think the amount of this pleasure great enough to attribute to it the strength to lift deeply-rooted inhibitions and repressions. What we have before us here is in fact no simple effect of force but a more complex situation of release. Instead of setting out the long detour by which I reached an understanding of this situation, I will try to give a short synthetic exposition of it.
We are now able to state the formula for the mode of operation of tendentious jokes. They put themselves at the service of purposes in order that, by means of using the pleasure from jokes as a fore-pleasure, they may produce new pleasure by lifting suppressions and repressions. If now we survey the course of development of the joke, we may say that from its beginning to its perfecting it remains true to its essential nature. It begins as play, in order to derive pleasure from the free use of words and thoughts. As soon as the strengthening of reasoning puts an end to this play with words as being senseless, and with thoughts as being nonsensical, it changes into a jest, in order that it may retain these sources of pleasure and be able to achieve fresh pleasure from the liberation of nonsense. Next, as a joke proper, but still a non-tendentious one, it gives its assistance to thoughts and strengthens them against the challenge of critical judgement, a process in which the 'principle of confusion of sources of pleasure' is of use to it. And finally it comes to the help of major purposes which are combating suppression, in order to lift their internal inhibitions by the 'principle of fore-pleasure'. Reason, critical judgement, suppression - these are the forces against which it fights in succession; it holds fast to the original sources of verbal pleasure and, from the stage of the jest onwards, opens new sources of pleasure for itself by lifting inhibitions. The pleasure that it produces, whether it is pleasure in play or pleasure in lifting inhibitions, can invariably be traced back to economy in psychical expenditure, provided that this view does not contradict the essential nature of pleasure and that it proves itself fruitful in other directions.¹

[1905c, 1727]

The importance which our views attach to the factor of 'sense in nonsense' might lead to a demand that every joke must be a nonsense joke. But this is not necessary, because it is only playing with thoughts that inevitably leads to nonsense; the other source of pleasure in jokes, playing with words, only gives that impression occasionally and does not invariably provoke the implied criticism. The twofold root of the pleasure in jokes - from playing with words and playing with thoughts, which corresponds to the very important distinction between verbal and conceptual jokes - makes it perceptibly more difficult to arrive at a concise formulation of general statements about jokes. Playing with words produces manifest pleasure as a result of the factors that have been enumerated above (recognition, and so on), and is consequently only to a small degree liable to suppression. Playing with thoughts cannot have its motive in this kind of pleasure; it meets with very energetic suppression, and the pleasure which it can yield is only pleasure in the lifting of an inhibition. It can accordingly be said that the pleasure in jokes exhibits a core of original pleasure in play and a casing of pleasure in lifting inhibitions. - We naturally do not perceive that our pleasure in a nonsense joke arises from our having succeeded in liberating a piece of nonsense in spite of its suppression; whereas we see directly that playing with words has given us pleasure. - The nonsense that still remains in a conceptual joke acquires secondarily the function of increasing our attention by bewildering us. It serves as a means of intensifying the effect of the joke, but only when it acts obtrusively, so that the bewilderment can hurry ahead of the understanding by a perceptible moment of time. The examples on p. 1659 ff. have shown that in addition to this, nonsense in a joke can be used to represent a judgement contained in the thought. But this, too, is not the primary significance of nonsense in jokes. [1905c, 1727]
Let us take the second question first. In the case of the comic, two persons are in general concerned: besides myself, the person in whom I find something comic. If inanimate things seem to me comic, that is on account of a kind of personification which is not of rare occurrence in our ideational life. The comic process is content with these two persons: the self and the person who is the object; a third person may come into it, but is not essential. Joking as a play with one’s own words and thoughts is to begin with without a person as an object. But already at the preliminary stage of the jest, if it has succeeded in making play and nonsense safe from the protests of reason, it demands another person to whom it can communicate its result. But this second person in the case of jokes does not correspond to the person who is the object, but to the third person, the ‘other’ person in the case of the comic. It seems as though in the case of a jest the other person has the decision passed over to him on whether the joke-work has succeeded in its task - as though the self did not feel certain in its judgement on the point. Innocent jokes, too, jokes that serve to reinforce a thought, require another person to test whether they have attained their aim. If a joke enters the service of the purpose of exposing or of a hostile purpose, it may be described as a psychical process between three persons, who are the same as in the case of the comic, though the part played by the third person is different; the psychical process in jokes is accomplished between the first person (the self) and the third (the outside person) and not, as in the case of the comic, between the self and the person who is the object.

[1905c, 1732]
At the conclusion of these discussions of the psychical processes in jokes in so far as they take place between two persons, we may glance back at the factor of economy, which has been in our mind as being of importance in arriving at a psychological view of jokes ever since our first explanation of their technique. We have long since abandoned the most obvious but simplest view of this economy - that it is a question of an avoidance of psychical expenditure in general, such as would be involved by the greatest possible restriction in the use of words and in the establishment of chains of thought. Even at that stage we told ourselves that being concise or laconic was not enough to make a joke. A joke’s brevity is of a peculiar kind - ‘joking’ brevity. It is true that the original yield of pleasure, produced by playing with words and thoughts, was derived from mere economy in expenditure; but with the development of play into a joke the tendency to economy too must alter its aims, for the amount that would be saved by the use of the same word or the avoidance of a new way of joining ideas together would certainly count for nothing as compared with the immense expenditure on our intellectual activity. I may perhaps venture on a comparison between psychical economy and a business enterprise. So long as the turnover in the business is very small, the important thing is that outlay in general shall be kept low and administrative costs restricted to the minimum. Economy is concerned with the absolute height of expenditure. Later, when the business has expanded, the importance of the administrative cost diminishes; the height reached by the amount of expenditure is no longer of significance provided that the turnover and profits can be sufficiently increased. It would be niggling, and indeed positively detrimental, to be conservative over expenditure on the administration of the business. Nevertheless it would be wrong to assume that when expenditure was absolutely great there would be no room left for the tendency to economy. The mind of the manager, if it is inclined to economy, will now turn to economy over details. He will feel satisfaction if a piece of work can be carried out at smaller cost than previously, however small the saving may seem to be in comparison with the size of the total expenditure. In a quite analogous fashion, in our complex psychical business too, economy in detail remains a source of pleasure, as may be seen from everyday happenings. Anyone who used to have his room lighted by gas and has now had electricity installed will for quite a time be aware of a definite feeling of pleasure when he switches on the electric light; he will feel it as long as the memory is revived in him at that moment of the complicated manoeuvres that were necessary for lighting the gas. Similarly, the economies in psychical inhibitory expenditure brought about by a joke - though they are small in comparison with our total psychical expenditure - will remain a source of pleasure for us because they save us a particular expenditure which we have been accustomed to make and which we were already prepared to make on this occasion as well. The factor of the expenditure’s being one that was expected and prepared for moves unmistakably into the foreground.

[1905c, 1742]
In an earlier passage (p. 1715) we regarded one of the outcomes of condensation - multiple use of the same material, play upon words, and similarity of sound - as a localized economy, and the pleasure produced by an (innocent) joke as derived from that economy, and later we inferred that the original intention of jokes was to obtain a yield of pleasure of this kind from words - a thing which had been permitted at the stage of play but had been dammed up by rational criticism in the course of intellectual development. We have now adopted the hypothesis that condensations of this kind, such as serve the technique of jokes, arise automatically, without any particular intention, during thought-processes in the unconscious.

Have we not before us here two different views of the same fact which seem incompatible with each other? I do not think so. It is true that they are two different views, and that they need to be brought into harmony with each other; but they are not contradictory. One of them is merely foreign to the other; and when we have established a connection between them, we shall probably have made some advance in knowledge. The fact that such condensations are sources for a yield of pleasure is far from incompatible with the hypothesis that conditions for their production are easily found in the unconscious. We can, on the contrary, see a reason for the plunge into the unconscious in the circumstance that the pleasure-yielding condensations of which jokes are in need arise there easily. There are, moreover, two other factors which at a first glance seem to be completely foreign to each other and to have come together as though by some undesired chance, but which on deeper investigation turn out to be intimately linked and indeed essentially one. I have in mind the two assertions that, on the one hand, jokes during their development at the stage of play (that is, during the childhood of reason) are able to bring about these pleasurable condensations and that, on the other hand, at higher stages they accomplish the same effect by plunging the thought into the unconscious. For the infantile is the source of the unconscious, and the unconscious thought-processes are none other than those - the one and only ones - produced in early childhood. The thought which, with the intention of constructing a joke, plunges into the unconscious is merely seeking there for the ancient dwelling-place of its former play with words. Thought is put back for a moment to the stage of childhood so as once more to gain possession of the childish source of pleasure. If we did not already know it from research into the psychology of the neuroses, we should be led by jokes to a suspicion that the strange unconscious revision is nothing else than the infantile type of thought-activity. It is merely that it is not very easy for us to catch a glimpse in children of this infantile way of thinking, with its peculiarities that are retained in the unconscious of adults, because it is for the most part corrected, as it were, in statu nascendi. But in a number of cases we succeed in doing so, and we then laugh at the children's 'silliness'. Any uncovering of unconscious material of this kind strikes us in general as 'comic'.¹

All these methods of displacement appear too as techniques of joking. But when they appear, they usually respect the limits imposed on their employment in conscious thinking; and they may be altogether absent, although jokes too have invariably a task to accomplish of dealing with an inhibition. We can understand the subordinate place taken by displacements in the joke-work when we recall that jokes always have another technique at their command for keeping off inhibition and indeed that we have found nothing more characteristic of them than precisely this technique. For jokes do not, like dreams, create compromises; they do not evade the inhibition, but they insist on maintaining play with words or with nonsense unaltered. They restrict themselves, however, to a choice of occasions in which this play or this nonsense can at the same time appear allowable (in jests) or sensible (in jokes), thanks to the ambiguity of words and the multiplicity of conceptual relations. Nothing distinguishes jokes more clearly from all other psychical structures than this double-sidedness and this duplicity in speech. From this point of view at least the authorities come closest to an understanding of the nature of jokes when they lay stress on 'sense in nonsense'.

¹[1905c, 1754]
In my description I shall, as I have already said, content myself with the briefest possible summary of the circumstances. Obviously the first problem to be solved was why the two speeches of the Czech captain - his rat story, and his request to the patient that he should pay back the money to Lieutenant A. - should have had such an agitating effect on him and should have provoked such violently pathological reactions. The presumption was that it was a question of 'complexive sensitiveness', and that the speeches had jarred upon certain hyperaesthetic spots in his unconscious. And so it proved to be. As always happened with the patient in connection with military matters, he had been in a state of unconscious identification with his father, who had seen many years' service and had been full of stories of his soldiering days. Now it happened by chance - for chance may play a part in the formation of a symptom, just as the wording may help in the making of a joke - that one of his father's little adventures had an important element in common with the captain's request. His father, in his capacity as non-commissioned officer, had control over a small sum of money and had on one occasion lost it at cards. (Thus he had been a 'Spielratte'.¹) He would have found himself in a serious position if one of his comrades had not advanced him the amount. After he had left the army and become well-off, he had tried to find this friend in need so as to pay him back the money, but had not managed to trace him. The patient was uncertain whether he had ever succeeded in returning the money. The recollection of this sin of his father's youth was painful to him, for, in spite of appearances, his unconscious was filled with hostile strictures upon his father's character. The captain's words, 'You must pay back the 3.80 kronen to Lieutenant A.', had sounded to his ears like an allusion to this unpaid debt of his father's.

[1909d, 2164]
One of the complications in the technique of this example lies in the fact that the modification by which the omitted insult is replaced must be described as an *allusion* to the latter, since it only leads to it by a process of inference. For another factor that complicates the technique here, see below.

[1905c, 1631]

We can guess from the question 'Where's the Saviour: Where's the picture of the Saviour?' that the sight of the two pictures had reminded the speaker of a similar sight, familiar to him, as to us, which however, included an element that was missing here - the picture of the Saviour between two other pictures. There is only one such situation: Christ hanging between the two thieves. The missing element is brought into prominence by the joke. The similarity lies in the pictures, hanging to the right and left of the Saviour, which the joke passes over; it can only consist in the fact that the pictures hanging on the walls are pictures of thieves. What the critic wanted to say but could not say was: 'You are a couple of rascals' or, in greater detail: 'What do I care about your pictures? You are a couple of rascals - I know that!' And he did in fact end by saying it by means of a few associations and inferences, using the method which we speak of as an 'allusion'.

[1905c, 1674]

We at once recall where we have already come across allusion - in connection, namely, with double meaning. When two meanings are expressed in one word and one of them is so much more frequent and usual that it occurs to us at once, while the second is more out of the way and therefore less prominent, we proposed to speak of this as 'double meaning with an allusion'. In a whole number of the examples we have already examined we remarked that the technique was not a simple one, and we now perceive that the 'allusion' was the complicating factor in them. (See, for instance, the inversion joke about the wife who has lain back a bit and so has been able to earn a lot or the nonsensical joke about the man who replied to congratulations on the birth of his youngest child by saying that it was remarkable what human hands could accomplish.)

[1905c, 1674]

In the American anecdote we now have before us an allusion without any double meaning, and we see that its characteristic is replacement by something linked to it in a conceptual connection. It may easily be guessed that the utilizable connection can be of more than one kind. In order not to lose ourselves in a maze of detail, we will discuss only the most marked variants and these only in a few examples.

[1905c, 1674]

For instance, Lichtenberg coined the saying: 'New spas cure well', which at once reminds us of the proverb: 'New brooms sweep clean.' The two phrases share the first one and a half words and the last word, as well as the whole structure of the sentence. And there is no doubt that the sentence came into the witty philosopher's head as an imitation of the familiar proverb. Thus Lichtenberg's saying becomes an allusion to the proverb. By means of this allusion something is suggested that is not said straight out - namely that something else is responsible for the effects produced by spas besides the unvarying characteristics of thermal springs.

[1905c, 1675]

A similar technical solution applies to another jest [Scherz] or joke [Witz] of Lichtenberg's: 'A girl scarcely twelve *Monden* old.' This sounds like 'twelve *Monden* [moons]', i.e. months, and may originally have been a slip of the pen for the latter, which is a permissible expression in poetry. But it also makes good sense to use the changing fashion instead of the changing moon as a method of determining a woman's age.

[1905c, 1675]
Or: 'Every fathom a queen', a modification of Shakespeare's familiar 'Every inch a king'. The allusion to this quotation was made with reference to an aristocratic and over-life-size lady. No very serious objection could really be made if anyone were to prefer to include this joke among the 'condensations accompanied by modifications as substitute'. (See 'tête-à-bête', p. 1631.)

A friend said of someone who had lofty views but was obstinate in the pursuit of his aims: 'Er hat ein Ideal vor dem Kopf.' The current phrase is: 'Ein Brett vor dem Kopf haben'. The modification alludes to this phrase and makes use of its meaning for its own purposes. Here, once more, the technique might be described as 'condensation with modification'.

It is almost impossible to distinguish between 'allusion by means of modification' and 'condensation with substitution', if the modification is limited to a change of letters. For instance: 'Dichteritis'¹ This allusion to the scourge of 'Diphtheritis' represents authorship by unqualified persons as another public danger.

Negative particles make very neat allusions possible at the cost of slight alterations:

Finally, another kind of allusion consists in 'omission', which may be compared to condensation without the formation of a substitute. Actually, in every allusion something is omitted, viz. the train of thought leading to the allusion. It only depends on whether the more obvious thing is the gap in the wording of the allusion or the substitute which partly fills the gap. Thus a series of examples would lead us back from blatant omission to allusion proper.

Omission without a substitute is shown in the following example: There is a witty and pugnacious journalist in Vienna, whose biting invective has repeatedly led to his being physically maltreated by the subjects of his attacks. On one occasion, when a fresh misdeed on the part of one of his habitual opponents was being discussed, somebody exclaimed: 'If X hears of this, he'll get his ears boxed again.' The technique of this joke includes, in the first place, bewilderment at its apparent nonsense, since we cannot see how getting one's ears boxed can be an immediate consequence of having heard something. The absurdity of the remark disappears if we insert in the gap: 'he'll write such a scathing article upon the man that . . . etc.' Allusion by means of omission, combined with nonsense, are accordingly the technical methods used in this joke.

'He praises himself so much that the price of fumigating candles is going up.' (Heine.) This gap is easy to fill. What is omitted has been replaced by an inference, which then leads back to what has been omitted, in the form of an allusion: 'self-praise stinks.'

These examples leave us in no doubt that here the omission forms part of the allusion.

There is still quite a marked gap to be seen in our next example, though it is a genuine and correct allusive joke. After an artists' carnival in Vienna a jest-book was circulated, in which, among others, the following highly remarkable epigram appeared:
Heine’s ‘Bäder von Lucca’ contains a regular wasp’s nest of the most stinging allusions and makes the most ingenious use of this form of joke for polemical purposes (against Count Platen). Long before the reader can suspect what is afoot, there are foreshadowings of a particular theme, peculiarly ill-adapted for direct representation, by allusions to material of the most varied kind, - for instance, in Hirsch-Hyacinth’s verbal contortions: ‘You are too stout and I am too thin; you have a good deal of imagination and I have all the more business sense; I am a practicus and you are a diarrheticus; in short you are my complete antipodex.’ - ‘Venus Urinia’ - ‘the stout Gudel von Dreckwall’ of Hamburg, and so on. In what follows, the events described by the author take a turn which seems at first merely to display his mischievous spirit but soon reveals its symbolic relation to his polemical purpose and at the same time shows itself as allusive. Eventually the attack on Platen bursts out, and thenceforward allusions to the theme (with which we have already been made acquainted) of the Count’s love for men gushes out and overflows in every sentence of Heine’s attack on his opponent’s talents and character. For instance:

Allusion is perhaps the commonest and most easily manageable method of joking and is at the bottom of the majority of short-lived jokes which we are accustomed to weaving into our conversations and which will not bear being uprooted from their original soil and kept in isolation. But it precisely reminds us once more of the fact that had begun to puzzle us in our consideration of the technique of jokes. An allusion in itself does not constitute a joke; there are correctly constructed allusions which have no claim to such a character. Only allusions that possess that character can be described as jokes. So that the criterion of jokes, which we have pursued into their technique, eludes us there once again.

I have occasionally described allusion as ‘indirect representation’; and we may now observe that the various species of allusion, together with representation by the opposite and other techniques that have still to be mentioned, may be united into a single large group, for which ‘indirect representation’ would be the most comprehensive name. ‘Faulty reasoning’, ‘unification’, ‘indirect representation’ - these, then, are the headings under which we can classify those techniques of conceptual jokes which we have come to know.

If we examine our material further, we seem to recognize a fresh sub-species of indirect representation which can be precisely characterized but of which few examples can be adduced. This is representation by something small or very small - which performs the task of giving full expression to a whole characteristic by means of a tiny detail. This group can be brought under the classification of ‘allusion’, if we bear in mind that this smallness is related to what has to be represented, and can be seen to proceed from it. For instance:

Only when we rise to a society of a more refined education do the formal conditions for jokes play a part. The smut becomes a joke and is only tolerated when it has the character of a joke. The technical method which it usually employs is the allusion - that is, replacement by something small, something remotely connected, which the hearer reconstructs in his imagination into a complete and straightforward obscenity. The greater the discrepancy between what is given directly in the form of smut and what it necessarily calls up in the hearer, the more refined becomes the joke and the higher, too, it may venture to climb into good society. As can easily be shown from examples, smut which has the characteristics of a joke has at its disposal, apart from allusion, whether coarse or refined, all the other methods of verbal and conceptual jokes.
We have already discussed the complicated technique of this example: a bewildering and apparently impossible simile, which however, as we now see, is not in itself a joke; further, an allusion (a cab is a public vehicle); and, as its most powerful technical method, an omission which increases the unintelligibility. The simile may be worked out as follows. One marries in order to protect oneself against the temptations of sensuality, but it turns out nevertheless that marriage does not allow of the satisfaction of needs that are somewhat stronger than usual. In just the same way, one takes an umbrella with one to protect oneself from the rain and nevertheless gets wet in the rain. In both cases one must look around for a stronger protection: in the latter case one must take a public vehicle, and in the former a woman who is accessible in return for money. The joke has now been almost entirely replaced by a piece of cynicism. One does not venture to declare aloud and openly that marriage is not an arrangement calculated to satisfy a man's sexuality, unless one is driven to do so perhaps by the love of truth and eagerness for reform of a Christian von Ehrenfels.¹ The strength of this joke lies in the fact that nevertheless - in all kinds of roundabout ways - it has declared it.

[1905c, 1705]

It is on account of the allusion made by these pessimistic stories to the manifold and hopeless miseries of the Jews that I must class them with tendentious jokes.

[1905c, 1708]

The 'rediscovery of what is familiar' is the basis for the use of another technical resource in jokes, which we have not yet mentioned. I refer to the factor of 'topicality', which is a fertile source of pleasure in a great many jokes and which explains a few of the peculiarities in the life-history of jokes. There are jokes which are completely independent of this condition, and in a monograph on jokes we are obliged to make almost exclusive use of examples of that kind. But we cannot forget that, in comparison with these perennial jokes, we have perhaps laughed even more heartily at others which it is difficult for us to use now because they would call for long commentaries and even with such help would not produce their original effect. These latter jokes contained allusions to people and events which at the time were 'topical', which had aroused general interest and still kept it alive. When this interest had ceased and the business in question had been settled, these jokes too lost a part of their pleasurable effect and indeed a very considerable part. For instance, the joke made by my friendly host when he called a pudding that was being served a 'Home-Roulard' does not seem to me to-day nearly so good as it did at the time when 'Home Rule' provided a standing head-line in the political columns of our daily papers. In attempting to estimate the merits of this joke I now attribute them to the fact that a single word has transported us, with the economy of a long detour in thought, from the circle of ideas of the kitchen to the remote one of politics. But at the time my account would have had to be different, and I should have said that this word transported us from the circle of ideas of the kitchen to that of politics, which was remote from it but was certain of our lively interest because we were constantly concerned with it. Another joke, 'This girl reminds me of Dreyfus; the army doesn't believe in her innocence', has also faded to-day, though its technical methods must have remained unaltered. The bewilderment caused by the comparison and the double-entendre in the word 'innocence' cannot compensate for the fact that the allusion, which at the time touched on an event cathected with fresh excitement, to-day recalls a question that is settled. Here is a joke which is still topical: 'The Crown Princess Louise approached the crematorium in Gotha with the question of how much a Verbrennung [cremation] costs. The management replied: "Five thousand marks normally; but we will only charge you three thousand as you have been durchgebrannt [literally 'been burnt through' - slang for 'eloped'] once already." A joke like this sounds irresistible to-day; in a short time it will have sunk very considerably in our estimation; and some time later still, in spite of its good play upon words, it will lose its effect entirely, for it will be impossible to repeat it without adding a commentary to explain who Princess Louise was and the sense in which she was durchgebrannt.

[1905c, 1714]
Thus a great number of the jokes in circulation have a certain length of life: their life runs a
course made up of a period of flowering and a period of decay and it ends in complete oblivion.
The need which men feel for deriving pleasure from their processes of thought is therefore
constantly creating new jokes based on the new interests of the day. The vital force of topical
jokes is not their own; it is borrowed, by the method of allusion, from those other interests, the
expiry of which determines the fate of the joke as well. The factor of topicality is a source of
pleasure, ephemeral it is true but particularly abundant, which supplements the sources
inherent in the joke itself. It cannot be simply equated with the rediscovery of what is familiar. It
is concerned rather with a particular category of what is familiar, which must in addition possess
the characteristic of being fresh, recent and untouched by forgetting. In the formation of dreams,
too, we come across a special preference for what is recent and we cannot escape a suspicion
that association with what is recent is rewarded, and so facilitated, by a peculiar bonus of
pleasure.

This is the anecdote.¹ Two not particularly scrupulous business men had succeeded, by dint
of a series of highly risky enterprises, in amassing a large fortune, and they were now making
efforts to push their way into good society. One method, which struck them as a likely one, was
to have their portraits painted by the most celebrated and highly-paid artist in the city, whose
pictures had an immense reputation. The precious canvases were shown for the first time at a
large evening party, and the two hosts themselves led the most influential connoisseur and art
critic up to the wall on which the portraits were hanging side by side. He studied the works for a
long time, and then, shaking his head, as though there was something he had missed, pointed
to the gap between the pictures and asked quietly: ‘But where’s the Saviour?’² I see you are all
much amused at this joke. Let us now proceed to examine it. Clearly what the connoisseur
meant to say was: ‘You are a couple of rogues, like the two thieves between whom the Saviour
was crucified.’ But he did not say this. Instead he made a remark which seems at first sight
strangely inappropriate and irrelevant, but which we recognize a moment later as an
allusion

to

the insult that he had in mind and as a perfect substitute for it. We cannot expect to find in jokes
all the characteristics that we have attributed to the ideas occurring to our patients, but we must
stress the identity of the motive for the joke and for the idea. Why did the critic not tell the
rogues straight out what he wanted to say? Because he had excellent counter-motives working
against his desire to say it to their faces. There are risks attendant upon insulting people who
are one’s hosts and who have at their command the fists of a large domestic staff. One might
easily meet with the fate which I suggested in my last lecture as an analogy for repression. That
was the reason why the critic did not express the insult he had in mind directly but in the form of
an ‘allusion accompanied by omission’; and the same state of things is responsible for our
patients’ producing a more or less distorted substitute instead of the forgotten idea we are in
search of.

[1905c, 1715]

[1910a, 2218]
Replacing something by an allusion to it is a process familiar in our waking thought as well, but there is a difference. In waking thought the allusion must be easily intelligible, and the substitute must be related in its subject-matter to the genuine thing it stands for. Jokes, too, often make use of allusion. They drop the precondition of there being an association in subject matter, and replace it by unusual external associations such as similarity of sound, verbal ambiguity, and so on. But they retain the precondition of intelligibility: a joke would lose all its efficiency if the path back from the allusion to the genuine thing could not be followed easily. The allusions employed for displacement in dreams have set themselves free from both of these restrictions. They are connected with the element they replace by the most external and remote relations and are therefore unintelligible; and when they are undone, their interpretation gives the impression of being a bad joke or of an arbitrary and forced explanation dragged in by the hair of its head. For the dream-censorship only gains its end if it succeeds in making it impossible to find the path back from the allusion to the genuine thing.
[1916-1917, 3266]
If the account I have given in this short discussion of the symbolic mode of expression in
dreams appears incomplete, I can justify my neglect by drawing attention to one of the most
important pieces of knowledge that we possess on this subject. Dream-symbolism extends far
beyond dreams: it is not peculiar to dreams, but exercises a similar dominating influence on
representation in fairy-tales, myths and legends, in jokes and in folk-lore. It enables us to trace
the intimate connections between dreams and these latter productions. We must not suppose
that dream-symbolism is a creation of the dream-work; it is in all probability a characteristic of
the unconscious thinking which provides the dream-work with the material for condensation,
displacement and dramatization.¹

[1901a, 1097]
We shall scarcely be contradicting this statement of Fischer's - we shall perhaps be doing no
more than translating his thoughts into our mode of expression - if we insist that the joking
activity should not, after all, be described as pointless or aimless, since it has the unmistakable
aim of evoking pleasure in its hearers. I doubt if we are in a position to undertake anything
without having an intention in view. If we do not require our mental apparatus at the moment for
supplying one of our indispensable satisfactions, we allow it itself to work in the direction of
pleasure and we seek to derive pleasure from its own activity. I suspect that this is in general
the condition that governs all aesthetic ideation, but I understand too little of aesthetics to try to
enlarge on this statement. As regards joking, however, I can assert, on the basis of the two
discoveries we have already made, that it is an activity which aims at deriving pleasure from
mental processes, whether intellectual or otherwise. No doubt there are other activities which
have the same aim. They are perhaps differentiated according to the fields of mental activity
from which they seek to derive pleasure or perhaps according to the methods of which they
make use. We cannot for the moment decide about this; but we hold firmly to the view that the
joke technique and the tendency towards economy by which it is partly governed (p. 1647 ff.)
have been brought into connection with the production of pleasure.
[1905c, 1692]

But before we set about solving the riddle of how the technical methods of the joke-work are
able to excite pleasure in the hearer, we have to recall the fact that, with a view to simplification
and greater perspicuity, we have left tendentious jokes entirely on one side. We must, after all,
try to throw light on the question of what the purposes of jokes are, and how they serve those
purposes.
[1905c, 1693]

There is, first and foremost, one observation which warns us not to leave tendentious jokes on
one side in our investigation of the origin of the pleasure we take in jokes. The pleasurable
effect of innocent jokes is as a rule a moderate one; a clear sense of satisfaction, a slight smile,
is as a rule all it can achieve in its hearers. And it may be that a part even of this effect is to be
attributed to the joke's intellectual content, as we have seen from suitable examples (p. 1690).
A non-tendentious joke scarcely ever achieves the sudden burst of laughter which makes
tendentious ones so irresistible. Since the technique of both can be the same, a suspicion may
be aroused in us that tendentious jokes, by virtue of their purpose, must have sources of
pleasure at their disposal to which innocent jokes have no access.
[1905c, 1693]

The purposes of jokes can easily be reviewed. Where a joke is not an aim in itself - that is,
where it is not an innocent one - there are only two purposes that it may serve, and these two
can themselves be subsumed under a single heading. It is either a hostile joke (serving the
purpose of aggressiveness, satire, or defence) or an obscene joke (serving the purpose of
exposure). It must be repeated in advance that the technical species of the joke - whether it is a
verbal or a conceptual joke - bears no relation to these two purposes.
[1905c, 1693]
And here at last we can understand what it is that jokes achieve in the service of their purpose. They make possible the satisfaction of an instinct (whether lustful or hostile) in the face of an obstacle that stands in its way. They circumvent this obstacle and in that way draw pleasure from a source which the obstacle had made inaccessible. The obstacle standing in the way is in reality nothing other than women's incapacity to tolerate undisguised sexuality, an incapacity correspondingly increased with a rise in the educational and social level. The woman who is thought of as having been present in the initial situation is afterwards retained as though she were still present, or in her absence her influence still has an intimidating effect on the men. We can observe how men of a higher class are at once induced, when they are in the company of girls of an inferior class, to reduce their smutty jokes to the level of simple smut.

[1905c, 1697]

We will now examine the question of whether jokes play the same part in the service of a hostile purpose.

[1905c, 1697]

Let us, for instance, consider Herr N.'s jokes, which were scattered over the last chapter. They are all of them pieces of invective. It is as though Herr N. wanted to exclaim aloud: 'The Minister for Agriculture is himself an ox!' 'Don't talk to me about * * * *! He's bursting with vanity!' 'I've never in my life read anything more boring than this historian's essays on Napoleon in Austria!' But the high position he occupies makes it impossible for him to give out his judgements in that form. They therefore bring in a joke to their help, and this in turn guarantees them a reception with the hearer which they would never have found in a non-joking form, in spite of the truth they might contain. One of these jokes is particularly instructive - the one about the 'red Fadian', perhaps the most impressive of all of them. What is there about it that makes us laugh and diverts our interest so completely from the question of whether or not an injustice has been done to the poor author? The joking form, of course - that is to say, the joke; but what is there about it that we are laughing at? No doubt at the person himself, who is introduced to us as the 'red Fadian', and in particular at his having red hair. Educated people have broken themselves of the habit of laughing at physical defects, and moreover they do not include having red hair among the laughable physical failings. But there is no doubt that it is so regarded by schoolboys and the common people - and this is still true even at the level of education of certain municipal and parliamentary representatives. And now Herr N. has made it possible in the most ingenious manner for us, grown-up and sensitive people, to laugh like the schoolboys at the historian X's red hair. This was certainly not Herr N.'s intention; but it is most doubtful whether a person who gives free play to a joke must necessarily know its precise intention.

[1905c, 1698]

In the course of our discussion of the purposes of jokes we have perhaps thrown light on a number of questions and have certainly come upon plenty of suggestions for further enquiries. But the findings of this chapter combine with those of the last one to present us with a difficult problem. If it is correct to say that the pleasure provided by jokes depends on the one hand on their technique and on the other hand on their purpose, from what common point of view can such different sources of the pleasure in jokes be brought together?

[1905c, 1709]
In this place I shall only follow up one of the consequences which seem possible from this point of view, thus resuming the discussion of a problem which I was obliged to leave unsolved elsewhere.¹ Each of the mental differentiations that we have become acquainted with represents a fresh aggravation of the difficulties of mental functioning, increases its instability, and may become the starting-point for its breakdown, that is, for the onset of a disease. Thus, by being born we have made the step from an absolutely self-sufficient narcissism to the perception of a changing external world and the beginnings of the discovery of objects. And with this is associated the fact that we cannot endure the new state of things for long, that we periodically revert from it, in our sleep, to our former condition of absence of stimulation and avoidance of objects. It is true, however, that in this we are following a hint from the external world, which, by means of the periodical change of day and night, temporarily withdraws the greater part of the stimuli that affect us. The second example of such a step, pathologically more important, is subject to no such qualification. In the course of development we have effected a separation of our mental existence into a coherent ego and into an unconscious and repressed portion which is left outside it; and we know that the stability of this new acquisition is exposed to constant shocks. In dreams and in neuroses what is thus excluded knocks for admission at the gates, guarded though they are by resistances; and in our waking health we make use of special artifices for allowing what is repressed to circumvent the resistances and for receiving it temporarily into our ego to the increase of our pleasure. Jokes and humour, and to some extent the comic in general, may be regarded in this light. Everyone acquainted with the psychology of the neuroses will think of similar examples of less importance; but I hasten on to the application I have in view.

[1921c, 3821]
The purposes of jokes can easily be reviewed. Where a joke is not an aim in itself - that is, where it is not an innocent one - there are only two purposes that it may serve, and these two can themselves be subsumed under a single heading. It is either a **hostile** joke (serving the purpose of aggressiveness, satire, or defence) or an **obscene** joke (serving the purpose of exposure). It must be repeated in advance that the technical species of the joke - whether it is a verbal or a conceptual joke - bears no relation to these two purposes.

[1905c, 1693]

It is a much lengthier business to show the way in which jokes serve these two purposes. In this investigation I should prefer to deal first not with the hostile jokes but with the exposing jokes. It is true that these have been far more rarely deemed worthy of investigation, as though aversion to the thing itself had here been transferred to the discussion of it. But we will not allow ourselves to be disconcerted by this, for we shall immediately come upon a marginal case of joking which promises to bring us enlightenment on more than one obscurity,

[1905c, 1694]

We know what is meant by 'smut': the intentional bringing into prominence of sexual facts and relations by speech. This definition, however, is no more valid than other definitions. In spite of this definition, a lecture on the anatomy of the sexual organs or the physiology of procreation need not have a single point of contact with smut. It is a further relevant fact that smut is directed to a particular person, by whom one is sexually excited and who, on hearing it, is expected to become aware of the speaker's excitement and as a result to become sexually excited in turn. Instead of this excitement the other person may be led to feel shame or embarrassment, which is only a reaction against the excitement and, in a roundabout way, is an admission of it. Smut is thus originally directed towards women and may be equated with attempts at seduction. If a man in a company of men enjoys telling or listening to smut, the original situation, which owing to social inhibitions cannot be realized, is at the same time imagined. A person who laughs at smut that he hears is laughing as though he were the spectator of an act of sexual aggression.

[1905c, 1694]

The sexual material which forms the content of smut includes more than what is peculiar to each sex; it also includes what is common to both sexes and to which the feeling of shame extends - that is to say, what is excremental in the most comprehensive sense. This is, however, the sense covered by sexuality in childhood, an age at which there is, as it were, a cloaca within which what is sexual and what is excremental are barely or not at all distinguished.1 Throughout the whole range of the psychology of the neuroses, what is sexual includes what is excremental, and is understood in the old, infantile, sense.

[1905c, 1694]

Smut is like an exposure of the sexually different person to whom it is directed. By the utterance of the obscene words it compels the person who is assailed to imagine the part of the body or the procedure in question and shows her that the assailant is himself imagining it. It cannot be doubted that the desire to see what is sexual exposed is the original motive of smut.

[1905c, 1695]
It can only help to clarify things if at this point we go back to fundamental facts. A desire to see the organs peculiar to each sex exposed is one of the original components of our libido. It may itself be a substitute for something earlier and go back to a hypothetical primary desire to touch the sexual parts. As so often, looking has replaced touching.¹ The libido for looking and touching is present in everyone in two forms, active and passive, male and female; and, according to the preponderance of the sexual character, one form or the other predominates. It is easy to observe the inclination to self-exposure in young children. In cases in which the germ of this inclination escapes its usual fate of being buried and suppressed, it develops in men into the familiar perversion known as exhibitionism. In women the inclination to passive exhibitionism is almost invariably buried under the imposing reactive function of sexual modesty, but not without a loophole being left for it in relation to clothes. I need only hint at the elasticity and variability in the amount of exhibitionism that women are permitted to retain in accordance with differing convention and circumstances.

[1905c, 1695]

In men a high degree of this trend persists as a portion of their libido, and it serves to introduce the sexual act. When this urge makes itself felt at the first approach to a woman, it must make use of words, for two reasons; firstly, to announce itself to her, and secondly, because if the idea is aroused by speech it may induce a corresponding excitement in the woman herself and may awaken an inclination in her to passive exhibitionism. A wooing speech like this is not yet smut, but it passes over into it. If the woman's readiness emerges quickly the obscene speech has a short life; it yields at once to a sexual action. It is otherwise if quick readiness on the woman's part is not to be counted on, and if in place of it defensive reactions appear. In that case the sexually exciting speech becomes an aim in itself in the shape of smut. Since the sexual aggressiveness is held up in its advance towards the act, it pauses at the evocation of the excitement and derives pleasure from the signs of it in the woman. In so doing, the aggressiveness is no doubt altering its character as well, just as any libidinal impulse will if it is met by an obstacle. It becomes positively hostile and cruel, and it thus summons to its help against the obstacle the sadistic components of the sexual instinct.

[1905c, 1695]

The woman's inflexibility is therefore the first condition for the development of smut, although, to be sure, it seems merely to imply a postponement and does not indicate that further efforts will be in vain. The ideal case of a resistance of this kind on the woman's part occurs if another man is present at the same time - a third person -, for in that case an immediate surrender by the woman is as good as out of the question. This third person soon acquires the greatest importance in the development of the smut; to begin with, however, the presence of the woman is not to be overlooked. Among country people or in inns of the humbler sort it will be noticed that it is not until the entrance of the barmaid or the innkeeper's wife that smuttiness starts up. Only at higher social levels is the opposite found, and the presence of a woman brings the smut to an end. The men save up this kind of entertainment, which originally presupposed the presence of a woman who was feeling ashamed, till they are 'alone together'. So that gradually, in place of the woman, the onlooker, now the listener, becomes the person to whom the smut is addressed, and owing to this transformation it is already near to assuming the character of a joke.

[1905c, 1695]

From this point onwards our attention will be drawn to two factors: the part played by the third person, the listener, and the conditions governing the subject-matter of the smut itself.

[1905c, 1695]
Generally speaking, a tendentious joke calls for three people: in addition to the one who makes the joke, there must be a second who is taken as the object of the hostile or sexual aggressiveness, and a third in whom the joke’s aim of producing pleasure is fulfilled. We shall have later to examine the deeper reasons for this state of things; for the moment let us keep to the fact to which this testifies - namely that it is not the person who makes the joke who laughs at it and who therefore enjoys its pleasurable effect, but the inactive listener. In the case of smut the three people are in the same relation. The course of events may be thus described. When the first person finds his libidinal impulse inhibited by the woman, he develops a hostile trend against that second person and calls on the originally interfering third person as his ally. Through the first person's smutty speech the woman is exposed before the third, who, as listener, has now been bribed by the effortless satisfaction of his own libido.

It is remarkable how universally popular a smutty interchange of this kind is among the common people and how it unfailingly produces a cheerful mood. But it also deserves to be noticed that in this complicated procedure, which involves so many of the characteristics of tendentious jokes, none of the formal requirements which characterize jokes are made of the smut itself. The uttering of an undisguised indecency gives the first person enjoyment and makes the third person laugh.

Only when we rise to a society of a more refined education do the formal conditions for jokes play a part. The smut becomes a joke and is only tolerated when it has the character of a joke. The technical method which it usually employs is the allusion - that is, replacement by something small, something remotely connected, which the hearer reconstructs in his imagination into a complete and straightforward obscenity. The greater the discrepancy between what is given directly in the form of smut and what it necessarily calls up in the hearer, the more refined becomes the joke and the higher, too, it may venture to climb into good society. As can easily be shown from examples, smut which has the characteristics of a joke has at its disposal, apart from allusion, whether coarse or refined, all the other methods of verbal and conceptual jokes.

And here at last we can understand what it is that jokes achieve in the service of their purpose. They make possible the satisfaction of an instinct (whether lustful or hostile) in the face of an obstacle that stands in its way. They circumvent this obstacle and in that way draw pleasure from a source which the obstacle had made inaccessible. The obstacle standing in the way is in reality nothing other than women's incapacity to tolerate undisguised sexuality, an incapacity correspondingly increased with a rise in the educational and social level. The woman who is thought of as having been present in the initial situation is afterwards retained as though she were still present, or in her absence her influence still has an intimidating effect on the men. We can observe how men of a higher class are at once induced, when they are in the company of girls of an inferior class, to reduce their smutty jokes to the level of simple smut.
The power which makes it difficult or impossible for women, and to a lesser degree for men as well, to enjoy undisguised obscenity is termed by us 'repression'; and we recognize in it the same psychical process which, in cases of serious illness, keeps whole complexes of impulses, together with their derivatives, away from consciousness, and which has turned out to be the main factor in the causation of what are known as psycho-neuroses. It is our belief that civilization and higher education have a large influence in the development of repression, and we suppose that, under such conditions, the psychical organization undergoes an alteration (that can also emerge as an inherited disposition) as a result of which what was formerly felt as agreeable now seems unacceptable and is rejected with all possible psychical force. The repressive activity of civilization brings it about that primary possibilities of enjoyment, which have now, however, been repudiated by the censorship in us, are lost to us. But to the human psyche all renunciation is exceedingly difficult, and so we find that tendentious jokes provide a means of undoing the renunciation and retrieving what was lost. When we laugh at a refined obscene joke, we are laughing at the same thing that makes a peasant laugh at a coarse piece of smut. In both cases the pleasure springs from the same source. We, however, could never bring ourselves to laugh at the coarse smut; we should feel ashamed or it would seem to us disgusting. We can only laugh when a joke has come to our help.

[1905c, 1697]

Thus what we suspected to begin with seems to be confirmed: namely that tendentious jokes have sources of pleasure at their disposal besides those open to innocent jokes, in which all the pleasure is in some way linked to their technique. And we may also once more repeat that with tendentious jokes we are not in a position to distinguish by our feeling what part of the pleasure arises from the sources of their technique and what part from those of their purpose. Thus, strictly speaking, we do not know what we are laughing at. With all obscene jokes we are subject to glaring errors of judgement about the 'goodness' of jokes so far as this depends on formal determinants; the technique of such jokes is often quite wretched, but they have immense success in provoking laughter.

[1905c, 1697]

We will now examine the question of whether jokes play the same part in the service of a hostile purpose.

[1905c, 1697]
Here, from the outset, we come upon the same situation. Since our individual childhood, and, similarly, since the childhood of human civilization, hostile impulses against our fellow men have been subject to the same restrictions, the same progressive repression, as our sexual urges. We have not yet got so far as to be able to love our enemies or to offer our left cheek after being struck on the right. Furthermore, all moral rules for the restriction of active hatred give the clearest evidence to this day that they were originally framed for a small society of fellow clansmen. In so far as we are all able to feel that we are members of one people, we allow ourselves to disregard most of these restrictions in relation to a foreign people. Nevertheless, within our own circle we have made some advances in the control of hostile impulses. As Lichtenberg puts it in drastic terms: 'Where we now say "Excuse me!" we used to give a box on the ears.' Brutal hostility, forbidden by law, has been replaced by verbal invective; and a better knowledge of the interlinking of human impulses is more and more robbing us - by its consistent 'tout comprendre c'est tout pardonner' - of the capacity for feeling angry with a fellow man who gets in our way. Though as children we are still endowed with a powerful inherited disposition to hostility, we are later taught by a higher personal civilization that it is an unworthy thing to use abusive language; and even where fighting has in itself remained permissible, the number of things which may not be employed as methods of fighting has extraordinarily increased. Since we have been obliged to renounce the expression of hostility by deeds - held back by the passionless third person, in whose interest it is that personal security shall be preserved - we have, just as in the case of sexual aggressiveness, developed a new technique of invective, which aims at enlisting this third person against our enemy. By making our enemy small, inferrior, despicable or comic, we achieve in a roundabout way the enjoyment of overcoming him - to which the third person, who has made no efforts, bears witness by his laughter.

We are now prepared to realize the part played by jokes in hostile aggressiveness. A joke will allow us to exploit something ridiculous in our enemy which we could not, on account of obstacles in the way, bring forward openly or consciously; once again, then, the joke will evade restrictions and open sources of pleasure that have become inaccessible. It will further bribe the hearer with its yield of pleasure into taking sides with us without any very close investigation, just as on other occasions we ourselves have often been bribed by an innocent joke into over estimating the substance of a statement expressed jokingly. This is brought out with perfect aptitude in the common phrase 'die Lacher auf seine Seite ziehen [to bring the laughers over to our side].
Let us, for instance, consider Herr N.'s jokes, which were scattered over the last chapter. They are all of them pieces of invective. It is as though Herr N. wanted to exclaim aloud: 'The Minister for Agriculture is himself an ox!' 'Don't talk to me about * * *! He's bursting with vanity!' 'I've never in my life read anything more boring than this historian's essays on Napoleon in Austria!' But the high position he occupies makes it impossible for him to give out his judgements in that form. They therefore bring in a joke to their help, and this in turn guarantees them a reception with the hearer which they would never have found in a non-joking form, in spite of the truth they might contain. One of these jokes is particularly instructive - the one about the 'red Fadian', perhaps the most impressive of all of them. What is there about it that makes us laugh and diverts our interest so completely from the question of whether or not an injustice has been done to the poor author? The joking form, of course - that is to say, the joke; but what is there about it that we are laughing at? No doubt at the person himself, who is introduced to us as the 'red Fadian', and in particular at his having red hair. Educated people have broken themselves of the habit of laughing at physical defects, and moreover they do not include having red hair among the laughable physical failings. But there is no doubt that it is so regarded by schoolboys and the common people - and this is still true even at the level of education of certain municipal and parliamentary representatives. And now Herr N. has made it possible in the most ingenious manner for us, grown-up and sensitive people, to laugh like the schoolboys at the historian X's red hair. This was certainly not Herr N.'s intention; but it is most doubtful whether a person who gives free play to a joke must necessarily know its precise intention.

If in these cases the obstacle to the aggressiveness which the joke helped to evade was an internal one - an aesthetic objection to the invective - elsewhere it can be of a purely external sort. This was so in the case in which Serenissimus asked a stranger by whose similarity to his own person he had been struck: 'Was your mother in the Palace at one time?' and the repartee was: 'No, but my father was.' The person to whom the question was put would no doubt have liked to knock down the impertinent individual who dared by such an allusion to cast a slur on his beloved mother's memory. But the impertinent individual was Serenissimus, whom one may not knock down or even insult unless one is prepared to purchase that revenge at the price of one's whole existence. The insult must therefore, it would seem, be swallowed in silence. But fortunately a joke shows the way in which the insult may be safely avenged - by making use of the technical method of unification in order to take up the allusion and turn it back against the aggressor. Here the impression of a joke is so much determined by its purpose that, in face of the joking character of the rejoinder, we are inclined to forget that the question asked by the aggressor had itself the character of a joke with the technique of allusion.

The prevention of invective or of insulting rejoinders by external circumstances is such a common case that tendentious jokes are especially favoured in order to make aggressiveness or criticism possible against persons in exalted positions who claim to exercise authority. The joke then represents a rebellion against that authority, a liberation from its pressure. The charm of caricatures lies in this same factor: we laugh at them even if they are unsuccessful simply because we count rebellion against authority as a merit.
If we bear in mind the fact that tendentious jokes are so highly suitable for attacks on the
great, the dignified and the mighty, who are protected by internal inhibitions and external
circumstances from direct disparagement, we shall be obliged to take a special view of certain
groups of jokes which seem to be concerned with inferior and powerless people. I am thinking
of the anecdotes about marriage-brokers, some of which we became acquainted with in the
course of our investigation of the various techniques of conceptual jokes. In a few of them, for
instance in the examples 'She's deaf as well' and 'Who would lend these people anything?', the
broker is laughed at for his improvidence and thoughtlessness and he becomes comic because
the truth escapes him as it were automatically. But does what we have learnt of the nature of
tendentious jokes on the one hand and on the other hand our great enjoyment of these stories
fit in with the paltriness of the people whom these jokes seem to laugh at? Are they worthy
opponents of the jokes? Is it not rather the case that the jokes only put forward the marriage-
brokers in order to strike at something more important? Is it not a case of saying one thing and
meaning another? It is really not possible to reject this view.

This interpretation of the broker anecdotes may be carried further. It is true that there is no
necessity for my entering into them, that I can content myself with regarding these anecdotes as
'Schwänke [funny stories]' and deny that they have the character of a joke. Thus jokes can also
have a subjective determinant of this kind. Our attention has now been drawn to that possibility
and we shall have to examine it later. It declares that only what I allow to be a joke is a joke.
What is a joke to me may be merely a comic story to other people. But if a joke admits of this
doubt, the reason can only be that it has a façade - in these instances a comic one - in the
contemplation of which one person is satiated while another may try to peer behind it. A
suspicion may arise, moreover, that this façade is intended to dazzle the examining eye and
that these stories have therefore something to conceal.

In any case, if our marriage-broker anecdotes are jokes, they are all the better jokes because,
thanks to their façade, they are in a position to conceal not only what they have to say but also
the fact that they have something - forbidden - to say. The continuation of this interpretation -
and this uncovers the hidden meaning and reveals these anecdotes with a comic façade as
tendentious jokes - would be as follows. Anyone who has allowed the truth to slip out in an
unguarded moment is in fact glad to be free of pretence. This is a correct and profound piece of
psychological insight. Without this internal agreement no one lets himself be mastered by the
automatism which in these cases brings the truth to light.¹ But this converts the laughable figure
of the Schadchen into a sympathetic one, deserving of pity. How happy the man must be to be
able at last to throw off the burden of pretence, since he makes use of the first chance of
shouting out the very last scrap of truth! As soon as he sees that the case is lost, that the bride
does not please the young man, he gladly betrays yet another concealed defect which has
escaped notice, or he takes the opportunity of producing an argument that settles a detail in
order to express his contempt for the people he is working for: 'I ask you - who would lend these
people anything?' The whole of the ridicule in the anecdote now falls upon the parents, barely
touched on in it, who think this swindle justified in order to get their daughter a husband, upon
the pitiable position of girls who let themselves be married on such terms, and upon the
disgracefulness of marriages contracted on such a basis. The marriage-broker is the right man
to express such criticisms, for he knows most about these abuses; but he must not say them
aloud, for he is a poor man whose existence depends on exploiting them. The popular mind,
which created these stories, and others like them, is torn by a similar conflict; for it knows that
the sacredness of marriages after they have been contracted is grievously affected by the
thought of what happened at the time when they were arranged.

[1905c, 1699]
Let us recall, too, what we observed while we were investigating the technique of jokes: that in jokes nonsense often replaces ridicule and criticism in the thoughts lying behind the joke. (In this respect, incidentally, the joke-work is doing the same thing as the dream-work.) Here we find the fact confirmed once again. That the ridicule and criticism are not directed against the figure of the broker, who only appears in the examples we have quoted as a whipping-boy, is shown by another class of jokes in which the marriage-broker is represented, on the contrary, as a superior person, whose dialectical powers prove sufficient to meet any difficulty. They are anecdotes with a logical instead of a comic façade - sophistical conceptual jokes. In one of them (p. 1664 f.) the broker succeeds in arguing away the bride's defect of being lame. It is at least a "fait accompli"; another wife, with straight limbs, would on the contrary be in constant danger of falling down and breaking her leg, and this would be followed by illness, pains, and the expenses of treatment, all of which would be spared in the case of the woman who is lame already. Or there is another anecdote, in which he succeeds in repelling a whole series of complaints made by the suitor against the bride, meeting each one with good arguments till he replies to the last, which cannot be countered: 'What do you want? Isn't she to have a single fault?', as though there were not necessarily something left over from the earlier objections. There is no difficulty in showing the weak spot in the argument in these two examples, and we did so in examining their technique. But what interests us now is something different. If the broker's speech is given such a marked appearance of logic which, on careful examination, is recognizable as being only an appearance, the truth behind it is that the joke declares the broker to be in the right; the thought does not venture to do so seriously but replaces the seriousness by the appearance which the joke presents. But here, as so often, a jest betrays something serious. We shall not be mistaken if we assume of all these anecdotes with a logical façade that they really mean what they assert for reasons that are intentionally faulty. It is only this employment of sophistry for the disguised representation of the truth that gives it the character of a joke, which is thus essentially dependent on its purpose. For what is hinted at in the two anecdotes is that it is really the suitor who is making himself ridiculous when he collects the bride's different advantages together with so much care, though all of them are weak, and when, in doing so, he forgets that he must be prepared to take as his wife a human being with her inevitable defects; while, on the other hand, the one characteristic that would make marriage with the woman's more or less imperfect personality tolerable - mutual attraction and readiness for affectionate adaptation - is quite left out of account in the whole transaction. [1905c, 1701]

The mockery directed at the suitor in these examples, in which the broker quite appropriately plays the part of a superior, is expressed much more plainly in other anecdotes. The plainer these stories are, the less joke-technique do they contain; they are, as it were, only marginal cases of jokes, with the technique of which they no longer have anything in common but the construction of a façade. But owing to their having the same purpose and to its being concealed behind the facade, they produce the complete effect of a joke. Moreover, the poverty of their technical methods explains how it is that many of these jokes cannot, without suffering damage, dispense with the element of dialect, which has an effect similar to the joke technique. [1905c, 1702]

A story of this sort, which, while possessing all the force of a tendentious joke, exhibits nothing of its technique, is the following: "The marriage-broker asked: "What do you require of your bride?" - Answer: "She must be beautiful, she must be rich, and educated." - "Very good", said the broker, "but I count that as making three matches." Here the rebuke to the man is delivered openly, and is no longer clothed as a joke. [1905c, 1702]
In the examples we have considered hitherto, the disguised aggressiveness has been
directed against people - in the broker jokes against everyone involved in the business of
arranging a marriage: the bride and bridegroom and their parents. But the object of the joke’s
attack may equally well be institutions, people in their capacity as vehicles of institutions,
dogmas of morality or religion, views of life which enjoy so much respect that objections to them
can only be made under the mask of a joke and indeed of a joke concealed by its façade.
Though the themes at which these tendentious jokes are aimed may be few, their forms and
envelopes are very many and various. I think we shall do well to distinguish this class of
tendentious joke by a special name. The appropriate name will emerge after we have
interpreted a few examples of the class.

[1905c, 1702]

I will gladly renounce all the methods of satisfaction proscribed by society, but am I certain
that society will reward this renunciation by offering me one of the permitted methods - even
after a certain amount of postponement? What these jokes whisper may be said aloud: that the
wishes and desires of men have a right to make themselves acceptable alongside of exacting
and ruthless morality. And in our days it has been said in forceful and stirring sentences that this
morality is only a selfish regulation laid down by the few who are rich and powerful and who can
satisfy their wishes at any time without any postponement. So long as the art of healing has not
gone further in making our life safe and so long as social arrangements do no more to make it
more enjoyable, so long will it be impossible to stifle the voice within us that rebels against the
demands of morality. Every honest man will end by making this admission, at least to himself.
The decision in this conflict can only be reached by the roundabout path of fresh insight. One
must bind one’s own life to that of others so closely and be able to identify oneself with others
so intimately that the brevity of one’s own life can be overcome; and one must not fulfil the
demands of one’s own needs illegitimately, but must leave them unfulfilled, because only the
continuance of so many unfulfilled demands can develop the power to change the order of
society. But not every personal need can be postponed in this way and transferred to other
people, and there is no general and final solution of the conflict.

[1905c, 1704]

We now know the name that must be given to jokes like those that we have last interpreted.
They are cynical jokes and what they disguise are cynicisms.

[1905c, 1704]

Among the institutions which cynical jokes are in the habit of attacking none is more important
or more strictly guarded by moral regulations but at the same time more inviting to attack than
the institution of marriage, at which, accordingly, the majority of cynical jokes are aimed. There
is no more personal claim than that for sexual freedom and at no point has civilization tried to
exercise severer suppression than in the sphere of sexuality. A single example will be enough
for our purposes - the one mentioned on p. 1678, ‘An Entry in Prince Carnival’s Album’:

[1905c, 1704]
A particularly favourable occasion for tendentious jokes is presented when the intended rebellious criticism is directed against the subject himself, or, to put it more cautiously, against someone in whom the subject has a share - a collective person, that is (the subject's own nation, for instance). The occurrence of self-criticism as a determinant may explain how it is that a number of the most apt jokes (of which we have given plenty of instances) have grown up on the soil of Jewish popular life. They are stories created by Jews and directed against Jewish characteristics. The jokes made about Jews by foreigners are for the most part brutal comic stories in which a joke is made unnecessary by the fact that Jews are regarded by foreigners as comic figures. The Jewish jokes which originate from Jews admit this too; but they know their real faults as well as the connection between them and their good qualities, and the share which the subject has in the person found fault with creates the subjective determinant (usually so hard to arrive at) of the joke-work. Incidentally, I do not know whether there are many other instances of a people making fun to such a degree of its own character.

[1905c, 1705]

This joke employs the technique of absurdity, since it makes the *Schnorrer* assert that the Baron gives him nothing at the very moment at which he is preparing to beg him for a gift. But the absurdity is only apparent. It is almost true that the rich man gives him nothing, since he is obliged by the Law to give him alms and should, strictly speaking, be grateful to him for giving him an opportunity for beneficence. The ordinary, middle-class view of charity is in conflict here with the religious one; it is in open rebellion against the religious one in the other story, of the Baron who, deeply moved by a *Schnorrer's* tale of woe, rang for his servants: 'Throw him out! He's breaking my heart!' This open revelation of its purpose constitutes once more a marginal case of a joke. It is only in the fact that they present the matter as applied to individual cases that these last stories differ from a complaint which is no longer a joke: 'There is really no advantage in being a rich man if one is a Jew. Other people's misery makes it impossible to enjoy one's own happiness.'

[1905c, 1707]

It is on account of the allusion made by these pessimistic stories to the manifold and hopeless miseries of the Jews that I must class them with tendentious jokes.

[1905c, 1708]

Other jokes, which are in the same sense cynical and which are not only Jewish anecdotes, attack religious dogmas and even the belief in God. The story of the Rabbi's 'Kück, the technique of which lay in the faulty thinking which equated phantasy and reality (another possible view was to regard it as a displacement), is a cynical or critical joke of this kind, directed against miracle-workers and certainly against the belief in miracles as well. Heine is said to have made a definitely blasphemous joke on his death-bed. When a friendly priest reminded him of God's mercy and gave him hope that God would forgive him his sins, he is said to have replied: 'Bien sûr qu'il me pardonnera: c'est son métier.'¹ This is a disparaging comparison (technically perhaps only having the value of an allusion), since a 'métier', a trade or profession, is what a workman or a doctor has - and he has only a single métier. But the force of the joke lies in its purpose. What it means to say is nothing else than: 'Of course he'll forgive me. That's what he's there for, and that's the only reason I've taken him on (as one engages one's doctor or one's lawyer).’ So in the dying man, as he lay there powerless, a consciousness stirred that he had created God and equipped him with power so as to make use of him when the occasion arose. What was supposed to be the created being revealed itself just before its annihilation as the creator.

[1905c, 1708]
To the classes of tendentious jokes that we have considered so far -
exposing or obscene jokes,
aggressive (hostile) jokes,
cynical (critical, blasphemous) jokes -
I should like to add another, the fourth and rarest, the nature of which can be illustrated by a

good example:
[1905c, 1709]

This excellent story, which gives an impression of over-subtlety, evidently works by the

technique of absurdity. The second Jew is reproached for lying because he says he is going to

Cracow, which is in fact his destination! But the powerful technical method of absurdity is here

linked with another technique, representation by the opposite, for, according to the

uncontradicted assertion of the first Jew, the second is lying when he tells the truth and is telling

the truth by means of a lie. But the more serious substance of the joke is the problem of what
determines the truth. The joke, once again, is pointing to a problem and is making use of the
uncertainty of one of our commonest concepts. Is it the truth if we describe things as they are
without troubling to consider how our hearer will understand what we say? Or is this only
jesuitical truth, and does not genuine truth consist in taking the hearer into account and giving
him a faithful picture of our own knowledge? I think that jokes of this kind are sufficiently
different from the rest to be given a special position. What they are attacking is not a person or
an institution but the certainty of our knowledge itself, one of our speculative possessions. The
appropriate name for them would therefore be 'sceptical' jokes.
[1905c, 1709]

We shall, I think, find the explanation we are in search of far easier from tendentious jokes
than from innocent ones. We will therefore begin with the former.
[1905c, 1710]

The pleasure in the case of a tendentious joke arises from a purpose being satisfied whose
satisfaction would otherwise not have taken place. That a satisfaction such as this is a source of
pleasure calls for no further remark. But the manner in which a joke leads to this satisfaction is
linked with particular conditions, from which we may perhaps arrive at some further information.
Two cases are to be distinguished here. The simpler one is where the satisfaction of the
purpose is opposed by an external obstacle which is evaded by the joke. We found this, for
instance, in the reply received by Serenissimus to his question of whether the mother of the
man he was speaking to had ever lived in the Palace and in the critic's rejoinder to the two rich
rascals who showed him their portraits: 'But where's the Saviour?' In the former case the
purpose was to answer one insult by another, and in the latter it was to hand across an insult
instead of the assessment that had been asked for. What opposed the purpose were purely
external factors - the powerful position of the people at whom the insults were directed. It may
nevertheless strike us that, however much these and analogous jokes of a tendentious nature
may satisfy us, they are not able to provoke much laughter.
[1905c, 1710]

It is otherwise when what stands in the way of the direct realization of the purpose is not an
external factor but an internal obstacle, when an internal impulse opposes the purpose. This
condition would seem, on our hypothesis, to be fulfilled in the jokes of Herr N., in whom a strong
inclination to invective is held in check by a highly developed aesthetic culture. By the help of a
joke, this internal resistance is overcome in the particular case and the inhibition lifted. By that
means, as in the instance of the external obstacle, the satisfaction of the purpose is made
possible and its suppression, together with the 'psychical damming-up' that this would involve, is
avoided. To that extent the mechanism of the generation of pleasure would be the same in the
two cases.
[1905c, 1711]
Nevertheless, we are inclined here to go more deeply into the distinctions between the psychological situation in the cases of an external and an internal obstacle, for we have a suspicion that the removal of an internal obstacle may make an incomparably higher contribution to the pleasure. But I suggest that at this point we should exercise moderation and be satisfied for the moment with establishing what remains the essential point for us. The cases of an external and an internal obstacle differ only in the fact that in the latter an already existing inhibition is lifted and that in the former the erection of a new one is avoided. That being so, we shall not be relying too much on speculation if we assert that both for erecting and for maintaining a psychical inhibition some ‘psychical expenditure’ is required. And, since we know that in both cases of the use of tendentious jokes pleasure is obtained, it is therefore plausible to suppose that this yield of pleasure corresponds to the psychical expenditure that is saved. [1905c, 1711]

Here then we have once more come upon the principle of economy which we met first in discussing the technique of verbal jokes. But whereas in the earlier case we seemed to find the economy in the use of as few words as possible or of words as much alike as possible, we now have a suspicion of an economy in the far more comprehensive sense of psychical expenditure in general; and we must regard it as possible that a closer understanding of what is still the very obscure concept of ‘psychical expenditure’ may bring us nearer to the essential nature of jokes. [1905c, 1711]

This, the first use of jokes that goes beyond the production of pleasure, points the way to their further uses. A joke is now seen to be a psychical factor possessed of power: its weight, thrown into one scale or the other, can be decisive. The major purposes and instincts of mental life employ it for their own ends. The originally non-tendentious joke, which began as play, is secondarily brought into relation with purposes from which nothing that takes form in the mind can ultimately keep away. We know already what it is able to achieve in the service of the purpose of exposure, and of hostile, cynical and sceptical purposes. In the case of obscene jokes, which are derived from smut, it turns the third person who originally interfered with the sexual situation into an ally, before whom the woman must feel shame, by bribing him with the gift of its yield of pleasure. In the case of aggressive purposes it employs the same method in order to turn the hearer, who was indifferent to begin with, into a co-hater or co-despiser, and creates for the enemy a host of opponents where at first there was only one. In the first case it overcomes the inhibitions of shame and respectability by means of the bonus of pleasure which it offers; in the second it upsets the critical judgement which would otherwise have examined the dispute. In the third and fourth cases, in the service of cynical and sceptical purposes, it shatters respect for institutions and truths in which the hearer has believed, on the one hand by reinforcing the argument, but on the other by practising a new species of attack. Where argument tries to draw the hearer’s criticism over on to its side, the joke endeavours to push the criticism out of sight. There is no doubt that the joke has chosen the method which is psychologically the more effective. [1905c, 1723]
We are now able to state the formula for the mode of operation of tendentious jokes. They put themselves at the service of purposes in order that, by means of using the pleasure from jokes as a fore-pleasure, they may produce new pleasure by lifting suppressions and repressions. If now we survey the course of development of the joke, we may say that from its beginning to its perfecting it remains true to its essential nature. It begins as play, in order to derive pleasure from the free use of words and thoughts. As soon as the strengthening of reasoning puts an end to this play with words as being senseless, and with thoughts as being nonsensical, it changes into a jest, in order that it may retain these sources of pleasure and be able to achieve fresh pleasure from the liberation of nonsense. Next, as a joke proper, but still a non-tendentious one, it gives its assistance to thoughts and strengthens them against the challenge of critical judgement, a process in which the 'principle of confusion of sources of pleasure' is of use to it. And finally it comes to the help of major purposes which are combating suppression, in order to lift their internal inhibitions by the 'principle of fore-pleasure'. Reason, critical judgement, suppression - these are the forces against which it fights in succession; it holds fast to the original sources of verbal pleasure and, from the stage of the jest onwards, opens new sources of pleasure for itself by lifting inhibitions. The pleasure that it produces, whether it is pleasure in play or pleasure in lifting inhibitions, can invariably be traced back to economy in psychical expenditure, provided that this view does not contradict the essential nature of pleasure and that it proves itself fruitful in other directions.¹

[1905c, 1727]

Intestinal disorders set in very early with him, and especially in the form which is the most frequent and, among children, the most normal - namely, incontinence. We shall certainly be right, however, in rejecting a pathological explanation of these earliest occurrences, and in regarding them only as evidence of the patient's intention not to let himself be disturbed or checked in the pleasure attached to the function of evacuation. He found a great deal of enjoyment (such as would tally with the natural coarseness of many classes of society, though not of his) in anal jokes and exhibitions, and this enjoyment had been retained by him until after the beginning of his later illness.

[1918b, 3558]

It is also characteristic of children that their two excretory needs are cathected with sexual interest. Later on, education draws a sharp distinction here, which is once more obliterated in the practice of joking. It may seem to us an unsavoury fact, but it takes quite a long time for children to develop feelings of disgust. This is not disputed even by people who insist otherwise on the seraphic purity of the child's mind.

[1926e, 4355]
The preceding discussion has given us unawares an insight into the evolution or psychogenesis of jokes, which we will now examine more closely. We have made the acquaintance of preliminary stages of jokes, and their development into tendentious jokes will probably uncover fresh relations between the various characteristics of jokes. Before there is such a thing as a joke, there is something that we may describe as 'play' or as 'a jest'.
[1905c, 1719]

Play - let us keep to that name - appears in children while they are learning to make use of words and to put thoughts together. This play probably obeys one of the instincts which compel children to practise their capacities (Groos). In doing so they come across pleasurable effects, which arise from a repetition of what is similar, a rediscovery of what is familiar, similarity of sound, etc., and which are to be explained as unsuspected economies in psychical expenditure. It is not to be wondered at that these pleasurable effects encourage children in the pursuit of play and cause them to continue it without regard for the meaning of words or the coherence of sentences. Play with words and thoughts, motivated by certain pleasurable effects of economy, would thus be the first stage of jokes.
[1905c, 1719]

This play is brought to an end by the strengthening of a factor that deserves to be described as the critical faculty or reasonableness. The play is now rejected as being meaningless or actually absurd; as a result of criticism it becomes impossible. Now, too, there is no longer any question of deriving pleasure, except accidentally, from the sources of rediscovery of what is familiar, etc., unless it happens that the growing individual is overtaken by a pleasurable mood which, like the child's cheerfulness, lifts the critical inhibition. Only in such a case does the old game of getting pleasure become possible once more; but the individual does not want to wait for this to happen nor to renounce the pleasure that is familiar to him. He thus looks about for means of making himself independent of the pleasurable mood, and the further development towards jokes is governed by the two endeavours: to avoid criticism and to find a substitute for the mood.
[1905c, 1719]
It might seem superfluous to talk about the motives of jokes, since the aim of getting pleasure must be recognized as a sufficient motive for the joke-work. But on the one hand the possibility cannot be excluded of other motives as well having a share in the production of jokes, and on the other hand, bearing in mind some familiar experiences, we must raise the general question of the subjective determinants of jokes.

[1905c, 1728]

Two facts in particular make this necessary. Although the joke-work is an excellent method of getting pleasure out of psychical processes, it is nevertheless evident that not everyone is equally capable of making use of that method, the joke-work is not at everyone's command, and altogether only a few people have a plentiful amount of it; and these are distinguished by being spoken of as having 'wit' [Witz]. 'Wit' appears in this connection as a special capacity - rather in the class of the old mental 'faculties'; and it seems to emerge fairly independently of the others, such as intelligence, imagination, memory, etc. We must therefore presume the presence in these 'witty' people of special inherited dispositions or psychical determinants which permit or favour the joke-work.

[1905c, 1728]

Heine puts this remark into the mouth of a comic character, Hirsch-Hyacinth, a Hamburg lottery-agent, extractor of corns and professional valuer, the valet of the aristocratic Baron Cristoforo Gumpelino (formerly Gumpel). The poet evidently takes the greatest satisfaction in this creation of his, for he makes Hirsch-Hyacinth into a great talker and gives him the most amusing and plain-spoken speeches, and even lets him display the practical philosophy of a Sancho Panza. It is a pity that Heine, who seems to have had no taste for dramatic construction, dropped this delightful character so soon. There are not a few passages in which the poet himself seems to be speaking, under a thing disguise, through the mouth of Hirsch-Hyacinth, and it soon becomes a certainty that this character is only a self-parody. Hirsch explains his reasons for having given up his former name and why he now calls himself 'Hyacinth'. He goes on: 'There's the further advantage that I already have an "H" on my signet, so that I don't need to have a new one cut.' But Heine himself effected the same economy when, at his baptism, he changed his first name from 'Harry' to 'Heinrich'. Everyone, too, who is familiar with the poet's biography, will recall that Heine had an uncle of the same name in Hamburg (a place which provides another connection with the figure of Hirsch-Hyacinth) who, as the rich man of the family, played a large part in his life. This uncle was also called 'Salomon', just like the old Rothschild who treated Hirsch so famillionairely. What seemed in Hirsch-Hyacinth's mouth no more than a jest soon reveals a background of serious bitterness if we ascribe it to the nephew, Harry-Heinrich. After all, he was one of the family, and we know that he had a burning wish to marry a daughter of this uncle's; but his cousin rejected him, and his uncle always treated him a little famillionairely, as a poor relation. His rich cousins in Hamburg never took him seriously. I recall a story told by an old aunt of my own, who had married into the Heine family, how one day, when she was an attractive young woman, she found sitting next her at the family dinner-table a person who struck her as uninviting and whom the rest of the company treated contemptuously. She herself felt no reason to be any more affable towards him. It was only many years later that she realized that this negligent and neglected cousin had been the poet Heinrich Heine. There is not a little evidence to show how much Heine suffered both in his youth and later from this rejection by his rich relations. It was from the soil of this subjective emotion that the 'famillionairely' joke sprang.

[1905c, 1729]
The presence of similar subjective determinants may be suspected in some other of the great scoffer's jokes; but I know of no other one in which this can be demonstrated so convincingly. For this reason it is not easy to try to make any more definite statement about the nature of these personal determinants. Indeed, we shall be disinclined in general to claim such complicated determinants for the origin of every individual joke. Nor are the jokes produced by other famous men any more easily accessible to our examination. We get an impression that the subjective determinants of the joke-work are often not far removed from those of neurotic illness - when we learn, for instance, of Lichtenberg that he was a severely hypochondriacal man, with all kinds of eccentricities. The great majority of jokes, and especially those that are constantly being newly produced in connection with the events of the day, are circulated anonymously; one would be curious to learn from what sort of people such productions originate. If one has occasion as doctor to make the acquaintance of one of those people who, though not remarkable in other ways, are well known in their circle as jokers and the originators of many viable jokes, one may be surprised to discover that the joker is a disunited personality, disposed to neurotic disorders. The insufficiency of documentary evidence, however, will certainly prevent our setting up a hypothesis that a psychoneurotic constitution of this kind is a habitual or necessary subjective condition for the construction of jokes.

[1905c, 1730]

Other subjective factors which determine or favour the joke-work are less wrapped in obscurity. The motive force for the production of innocent jokes is not infrequently an ambitious urge to show one's cleverness, to display oneself - an instinct that may be equated with exhibitionism in the sexual field. The presence of numerous inhibited instincts, whose suppression has retained a certain degree of instability, will provide the most favourable disposition for the production of tendentious jokes. Thus individual components of a person's sexual constitution in particular, can appear as motives for the construction of a joke. A whole class of obscene jokes allows one to infer the presence of a concealed inclination to exhibitionism in their inventors; aggressive tendentious jokes succeed best in people in whose sexuality a powerful sadistic component is demonstrable, which is more or less inhibited in real life.

[1905c, 1731]

The second fact which makes an enquiry into the subjective determination of jokes necessary is the generally recognized experience that no one can be content with having made a joke for himself alone. An urge to tell the joke to someone is inextricably bound up with the joke-work; indeed, this urge is so strong that often enough it is carried through in disregard of serious misgivings. In the case of the comic as well, telling it to someone else produces enjoyment; but the demand is not peremptory. If one comes across something comic, one can enjoy it by oneself. A joke, on the contrary, must be told to someone else. The psychical process of constructing a joke seems not to be completed when the joke occurs to one: something remains over which seeks, by communicating the idea, to bring the unknown process of constructing the joke to a conclusion.

[1905c, 1731]

Jokes are confronted by subjective determinants in the case of the third person too, and these may make their aim of producing pleasurable excitation unattainable. As Shakespeare (Love's Labour Lost, V, 2) reminds us:

[1905c, 1732]
A person who is dominated by a mood concerned with serious thoughts is not fitted to confirm the fact that a jest has succeeded in rescuing the verbal pleasure. He must himself be in a cheerful or at least in an indifferent state of feeling in order to act as the jest’s third person. The same obstacle applies to innocent and to tendentious jokes; but in the latter there is a further obstacle in the form of opposition to the purpose which the joke is trying to serve. The third person cannot be ready to laugh at an excellent obscene joke if the exposure applies to a highly respected relative of his own; before a gathering of priests and ministers no one would venture to produce Heine’s comparison of catholic and protestant clerics to retail tradesmen and employees of a wholesale business; and an audience composed of my opponent’s devoted friends would receive my most successful pieces of joking invective against him not as jokes but as invective, and would meet them with indignation and not with pleasure. Some degree of benevolence or a kind of neutrality, an absence of any factor that could provoke feelings opposed to the purpose of the joke, is an indispensable condition if the third person is to collaborate in the completion of the process of making the joke.

[1905c, 1733]

Where there are no such obstacles to the operation of the joke, the phenomenon which is now the subject of our enquiry emerges: the pleasure which the joke has produced is more evident in the third person than in the creator of the joke. We must be content to say more ‘evident’ where we should be inclined to ask whether the hearer’s pleasure is not more ‘intense’ than that of the maker of the joke, since we naturally have no means of measuring and comparing. We see, however, that the hearer gives evidence of his pleasure with a burst of laughter, after the first person has as a rule produced the joke with a tensely serious look. If I repeat a joke that I have heard myself, I must, if I am not to spoil its effect, behave in telling it exactly like the person who made it. The question now arises whether we can draw any conclusions about the psychical process of constructing jokes from this factor of laughing at jokes.

[1905c, 1733]
If the person in whom the joke is formed cannot laugh, this, as we have already said, points to a
divergence from what happens in the third person that lies either in the lifting of the inhibitory
cathexis or in the possibility of its discharge. But the first of these alternatives will not meet the
case, as we shall see at once. The inhibitory cathexis must have been lifted in the first person as
well, or otherwise no joke would have come about, since its formation was precisely in order to
overcome a resistance of that kind; otherwise, too, it would be impossible for the first person to
feel the pleasure in the joke which we have been obliged to trace back precisely to the lifting of
the inhibition. All that remains, then, is the other alternative, namely that the first person cannot
laugh, although he feels pleasure, because there is an interference with the possibility of
discharge. An interference of this kind with the possibility of discharge, which is a necessary
precondition of laughter, may arise from the liberated cathectic energy being immediately applied
to some other endopsychic use. It is a good thing that our attention has been drawn to that
possibility; and our interest in it will very soon be further engaged. Another condition, however,
leading to the same result, may be realized in the first person of a joke. It is possible that no
quota of energy at all that is capable of being manifested may be liberated, in spite of the lifting of
the inhibitory cathexis. In the first person of a joke the joke-work is performed, which must
correspond to a certain quota of new psychical expenditure. Thus the first person himself
produces the force which lifts the inhibition. This no doubt results in a yield of pleasure for him,
and even, in the case of tendentious jokes, a very considerable one, since the fore-pleasure
obtained by the joke-work itself takes over the lifting of further inhibitions; but the expenditure on
the joke-work is in every case deducted from the yield resulting from the lifting of the inhibition -
an expenditure which is the same as the one which the hearer of the joke avoids. What I have
just said may be confirmed by observing that a joke loses its effect of laughter even in the third
person as soon as he is required to make an expenditure on intellectual work in connection with
it. The allusions made in a joke must be obvious and the omissions easy to fill; an awakening of
conscious intellectual interest usually makes the effect of the joke impossible. There is an
important distinction here between jokes and riddles. Perhaps the psychical constellation during
the joke-work is in general not favourable to the free discharge of what has been gained. We are
not, it seems, in a position to see further on this point; we have been more successful in throwing
light on one part of our problem - on why the third person laughs - than on its other part - on why
the first person does not laugh.

The first of these conditions lays down one of the necessary qualifications of the third person as
hearer of the joke. It is essential that he should be in sufficient psychical accord with the first
person to possess the same internal inhibitions, which the joke-work has overcome in the latter. A
person who is responsive to smut will be unable to derive any pleasure from witty jokes of
exposure; Herr N.'s attacks will not be understood by uneducated people who are accustomed to
give free play to their desire to insult. Thus every joke calls for a public of its own and laughing at
the same jokes is evidence of far reaching psychical conformity. Here moreover we have arrived
at a point which enables us to guess still more precisely what takes place in the third person. He
must be able as a matter of habit to erect in himself the same inhibition which the first person's
joke has overcome, so that, as soon as he hears the joke, the readiness for this inhibition will
compulsively or automatically awaken. This readiness for inhibition, which I must regard as a real
expenditure, analogous to mobilization in military affairs, will at the same moment be recognized
as superfluous or too late, and so be discharged in statu nascendi by laughter.¹

¹[1905c, 1737]
The second condition for making free discharge possible - that the liberated energy shall be prevented from being used in any other way - seems very much the more important. It provides the theoretical explanation of the uncertainty of the effect of jokes when the thoughts expressed in a joke arouse powerfully exciting ideas in the hearer; in that case the question whether the purposes of the joke agree with or contradict the circle of thoughts by which the hearer is dominated will decide whether his attention will remain with the joking process or be withdrawn from it. Of still greater theoretical interest, however, are a class of auxiliary techniques which clearly serve the end of entirely detaching the hearer’s attention from the joking process, and of allowing that process to run its course automatically. I deliberately say ‘automatically’ and not ‘unconsciously’, because the latter description would be misleading. It is only a question here of holding back an increased cathexis of attention from the psychical process when the joke is heard; and the usefulness of these auxiliary techniques rightly leads us to suspect that precisely the cathexis of attention has a great share in the supervision and fresh employment of liberated cathetic energy.

[1905c, 1738]

On such a foundation we cannot build a great deal. If we bring the various stages of the joke into relation to the mental states that are favourable to them we can perhaps proceed as follows. The jest springs from a cheerful mood, which seems to be characterized by an inclination to diminish mental cathexes. It already employs all the characteristic techniques of jokes and already fulfils their fundamental condition by selecting verbal material or connections of thoughts which will meet both the demands for a yield of pleasure and those made by rational criticism. We shall conclude that the lowering of the thought cathexis to the unconscious level, facilitated by the cheerful mood, is present already in jests. In the case of innocent jokes that are linked to the expression of a valuable thought, the encouraging effect of mood no longer applies. Here we must presume the occurrence of a special personal aptitude, which is manifested in the ease with which the preconscious cathexis is dropped and exchanged for a moment for the unconscious one. A purpose that is all the time on the watch for renewing the original yield of pleasure from jokes exercises a downward drag on the still unsettled preconscious expression of the thought. No doubt most people are capable of producing jests when they are in a cheerful mood; the aptitude for making jokes is present in only a few people independently of their mood. Lastly, the joke-work receives its most powerful stimulus when strong purposes reaching down into the unconscious are present, which represent a special aptitude for the production of jokes and which may explain to us how it is that the subjective determinants of jokes are so often fulfilled in neurotic people. Under the influence of strong purposes even those who otherwise have the least aptitude for it become capable of making jokes.

[1905c, 1760]
Where there are no such obstacles to the operation of the joke, the phenomenon which is now the subject of our enquiry emerges: the pleasure which the joke has produced is more evident in the third person than in the creator of the joke. We must be content to say more ‘evident’ where we should be inclined to ask whether the hearer’s pleasure is not more ‘intense’ than that of the maker of the joke, since we naturally have no means of measuring and comparing. We see, however, that the hearer gives evidence of his pleasure with a burst of laughter, after the first person has as a rule produced the joke with a tensely serious look. If I repeat a joke that I have heard myself, I must, if I am not to spoil its effect, behave in telling it exactly like the person who made it. The question now arises whether we can draw any conclusions about the psychical process of constructing jokes from this factor of laughing at jokes.
[1905c, 1733]

It cannot be our design to consider at this point all that has been propounded and published on the nature of laughter. We may well be deterred from any such plan by the remarks with which Dugas, a pupil of Ribot's, prefaces his book *La psychologie du rire* (1902, 1): 'Il n'est pas de fait plus banal et plus étudié que le rire; il n'en est pas qui ait eu le don d'exciter davantage la curiosité du vulgaire et celle des philosophes; il n'en est pas sur lequel on ait receuilli plus d'observations et bâti plus de théories, et avec cela il n'en est pas qui demeure plus inexpliqué. On serait tenté de dire avec les sceptiques qu'il faut être content de rire et de ne pas chercher à savoir pourquoi on rit, d'autant que peut-être la réflexion tue le rire, et qu'il serait alors contradictoire qu'elle en découvrît les causes.'¹

¹ 'There is no action that is more commonplace or that has been more widely studied than laughter. There is none that has succeeded more in exciting the curiosity both of ordinary people and of philosophers. There is none on which more observations have been collected and more theories built. But at the same time there is none that remains more unexplained. It would be tempting to say with the sceptics that we must be content to laugh and not try to know why we laugh, since it may be that reflection kills laughter and it would thus be a contradiction to think that it could discover its causes.'
[1905c, 1733]

On the other hand we shall not miss the opportunity of making use for our purposes of an opinion on the mechanism of laughter which fits in excellently with our own line of thought. I have in mind the attempt at an explanation made by Herbert Spencer in his essay on ‘The Physiology of Laughter’ (1860). According to Spencer, laughter is a phenomenon of the discharge of mental excitation and a proof that the psychical employment of this excitation has suddenly come up against an obstacle. He describes the psychological situation which ends in laughter in the following words: ‘Laughter naturally results only when consciousness is unawares transferred from great things to small - only when there is what we may call a descending incongruity.’¹

¹ Various points in this definition would call for detailed examination in an investigation of comic pleasure; this has already been undertaken by other authors and in any case does not concern us here. - I do not think Spencer has been happy in his explanation of why the discharge takes the particular paths whose excitation produces the somatic picture of laughter. The theme of the physiological explanation of laughter - that is, the tracing back or interpretation of the muscular actions characteristic of laughter - has been treated at length both before and since Darwin, but has still not been finally cleared up. I have one contribution to make to this theme. So far as I know, the grimace characteristic of smiling, which twists up the corners of the mouth, appears first in an infant at the breast when it is satisfied and satiated and lets go of the breast as it falls asleep. Here it is a genuine expression of the emotions, for it corresponds to a decision to take no more nourishment, and represents as it were an ‘enough’ or rather a ‘more than enough’. This original meaning of pleasurable satiety may have brought the smile, which is after all the basic phenomenon of laughter, into its later relation with pleasurable processes of discharge.
[1905c, 1734]
In a quite similar sense French authors (e.g. Dugas) describe laughter as a 'détente', a phenomenon of relaxation of tension. So too the formula proposed by Bain - 'laughter a release from constraint' - seems to me to diverge from Spencer's view much less than some authorities would have us believe.

[1905c, 1735]

Nevertheless, we feel a need to modify Spencer's notion, in part to give a more definite form to the ideas contained in it and in part to change them. We should say that laughter arises if a quota of psychical energy which has earlier been used for the cathexis of particular psychical paths has become unusable, so that it can find free discharge. We are well aware what 'evil looks' we are inviting with such a hypothesis; but we will venture to quote in our defence an apposite sentence from Lipps's book *Komik und Humor* (1898, 71), from which illumination is to be derived on more subjects than that of the comic and humour: 'Finally, specific psychological problems always lead fairly deep into psychology, so that at bottom no psychological problem can be treated in isolation.' The concepts of 'psychical energy' and 'discharge' and the treatment of psychical energy as a quantity have become habitual in my thoughts since I began to arrange the facts of psychopathology philosophically; and already in my *Interpretation of Dreams* (1900a) I tried (in the same sense as Lipps) to establish the fact that what are 'really psychically effective' are psychical processes which are unconscious in themselves, not the contents of consciousness.¹ It is only when I speak of the 'cathexis of psychical paths' that I seem to depart from the analogies commonly used by Lipps. My experiences of the displaceability of psychical energy along certain paths of association, and of the almost indestructible persistence of the traces of psychical processes, have in fact suggested to me an attempt at picturing the unknown in some such way. To avoid misunderstanding, I must add that I am making no attempt to proclaim that the cells and nerve fibres, or the systems of neurones which are taking their place to-day, are these psychical paths, even though it would have to be possible in some manner which cannot yet be indicated to represent such paths by organic elements of the nervous system.

[1905c, 1735]
In laughter, therefore, on our hypothesis, the conditions are present under which a sum of psychical energy which has hitherto been used for cathexis is allowed free discharge. And since laughter - not all laughter, it is true, but certainly laughter at a joke - is an indication of pleasure, we shall be inclined to relate this pleasure to the lifting of the cathexis which has previously been present. If we see that the hearer of a joke laughs but that its creator cannot laugh, this may amount to telling us that in the hearer a cathetic expenditure has been lifted and discharged, while in the construction of the joke there have been obstacles either to the lifting or to the possibility of discharge. The psychical process in the hearer, the joke's third person, can scarcely be more aptly described than by stressing the fact that he has bought the pleasure of the joke with very small expenditure on his own part. He might be said to have been presented with it. The words of the joke he hears necessarily bring about in him the idea or train of thought to the construction of which great internal inhibitions were opposed in him too. He would have had to make an effort of his own in order to bring it about spontaneously as the first person, he would have had to use at least as much psychical expenditure on doing so as would correspond to the strength of the inhibition, suppression or repression of the idea. He has saved this psychical expenditure. On the basis of our earlier discussions (p. 1711) we should say that his pleasure corresponds to this economy. Our insight into the mechanism of laughter leads us rather to say that, owing to the introduction of the proscribed idea by means of an auditory perception, the cathetic energy used for the inhibition has now suddenly become superfluous and has been lifted, and is therefore now ready to be discharged by laughter. The two ways of expressing the facts amount to the same thing in essentials, since the expenditure economized corresponds exactly to the inhibition that has become superfluous. But the second method of expression is the more illuminating, since it allows us to say that the hearer of the joke laughs with the quota of psychical energy which has become free through the lifting of the inhibitory cathexis; we might say that he laughs this quota off.

Nevertheless, if we firmly accept these views on the determinants of laughter and on the psychical process in the third person, we are now in a position to give a satisfactory explanation of a whole number of peculiarities which jokes have been known to possess but which have not been understood. If a quota of cathetic energy capable of discharge is to be liberated in the third person, there are several conditions which must be fulfilled or which are desirable in order to act as encouragements: (1) It must be ensured that the third person is really making this cathetic expenditure. (2) It is necessary to guard against the cathetic expenditure, when it is liberated, finding some other psychical use instead of offering itself for motor discharge. (3) It cannot but be an advantage if the cathexis which is to be liberated in the third person is intensified before hand, raised to a greater height. All these aims are served by particular methods of the joke-work, which may be classed together as secondary or auxiliary techniques.
The first of these conditions lays down one of the necessary qualifications of the third person as hearer of the joke. It is essential that he should be in sufficient psychical accord with the first person to possess the same internal inhibitions, which the joke-work has overcome in the latter. A person who is responsive to smut will be unable to derive any pleasure from witty jokes of exposure; Herr N.'s attacks will not be understood by uneducated people who are accustomed to give free play to their desire to insult. Thus every joke calls for a public of its own and laughing at the same jokes is evidence of far reaching psychical conformity. Here moreover we have arrived at a point which enables us to guess still more precisely what takes place in the third person. He must be able as a matter of habit to erect in himself the same inhibition which the first person's joke has overcome, so that, as soon as he hears the joke, the readiness for this inhibition will compulsively or automatically awaken. This readiness for inhibition, which I must regard as a real expenditure, analogous to mobilization in military affairs, will at the same moment be recognized as superfluous or too late, and so be discharged in statu nascendi by laughter.¹

As we can already guess, and as we shall see more clearly later on, we have discovered in the condition of distracting the attention a by no means unessential feature of the psychical process in the hearer of a joke. In connection with this there are still other things that we can understand. Firstly, there is the question why we scarcely ever know what we are laughing at in a joke, though we can discover it by an analytic investigation. The laughter is in fact the product of an automatic process which is only made possible by our conscious attention's being kept away from it. Secondly, we are able to understand the peculiar fact about jokes that they only produce their full effect on the hearer if they are new to him, if they come as a surprise to him. This characteristic of jokes (which determines the shortness of their life and stimulates the constant production of new jokes) is evidently due to the fact that the very nature of surprising someone or taking him unawares implies that it cannot succeed a second time. When a joke is repeated, the attention is led back to the first occasion of hearing it as the memory of it arises. And from this we are carried on to an understanding of the urge to tell a joke one has heard to other people who have not yet heard it. One probably recovers from the impression the joke makes on a new-comer some of the possibility of enjoyment that has been lost owing to its lack of novelty. And it may be that it was an analogous motive that drove the creator of the joke in the first instance to tell it to someone else.

¹[1905c, 1738]
It now begins to dawn on us that the technique of jokes is in general determined by two sorts of purposes - those that make the construction of the joke possible in the first person and those that are intended to guarantee the joke the greatest possible pleasurable effect on the third person. The Janus-like, two-way-facing character of jokes, which protects their original yield of pleasure from the attacks of critical reason, and the mechanism of fore-pleasure belong to the first of these purposes; the further complication of the technique by the conditions that have been enumerated in the present chapter takes place out of regard for the joke's third person. A joke is thus a double-dealing rascal who serves two masters at once. Everything in jokes that is aimed at gaining pleasure is calculated with an eye to the third person, as though there were internal and unsurmountable obstacles to it in the first person. And this gives us a full impression of how indispensable this third person is for the completion of the joking process. But whereas we have been able to obtain a fairly good insight into the nature of this process in the third person, the corresponding process in the first person seems still to be veiled in obscurity. Of the two questions we asked, 'Why are we unable to laugh at a joke we have made ourselves?' and 'Why are we driven to tell our own joke to someone else?', the first has so far evaded our reply. We can only suspect that there is an intimate connection between the two facts that have to be explained: that we are compelled to tell our joke to someone else because we are unable to laugh at it ourselves. Our insight into the conditions for obtaining and discharging pleasure which prevail in the third person enables us to infer as regards the first person that in him the conditions for discharge are lacking and those for obtaining pleasure only incompletely fulfilled. That being so, it cannot be disputed that we supplement our pleasure by attaining the laughter that is impossible for us by the roundabout path of the impression we have of the person who has been made to laugh. As Dugas has put it, we laugh as it were *par ricochet* [on the rebound]. Laughter is among the highly infectious expressions of psychical states. When I make the other person laugh by telling him my joke, I am actually making use of him to arouse my own laughter; and one can in fact observe that a person who has begun by telling a joke with a serious face afterwards joins in the other person's laughter with a moderate laugh. Accordingly, telling my joke to another person would seem to serve several purposes: first, to give me objective certainty that the joke-work has been successful; secondly, to complete my own pleasure by a reaction from the other person upon myself; and thirdly - where it is a question of repeating a joke that one has not produced oneself - to make up for the loss of pleasure owing to the joke's lack of novelty.

[1905c, 1741]

The psychical process in the receptive person, however, is as much more complicated in the case of the naïve as it is simplified in comparison with jokes in the productive person. (In the case of the naïve, incidentally, our own self invariably coincides with the receptive person, while in the case of jokes we may equally occupy the position of the productive one.) When the receptive person hears something naïve, it must on the one hand affect him like a joke - and our examples give evidence precisely of this - for, as with a joke, the lifting of the censorship is made possible for him by no more than the effort of listening. But only a part of the pleasure created by the naïve can be explained in this way; and even this might be endangered in certain instances - for example, at hearing a naïve piece of smut. We might react to this at once with the same indignation that might be felt against a real piece of smut, if it were not that another factor spares us this indignation and at the same time offers us the more important part of our pleasure in the naïve. This other factor is the condition already mentioned that, in order to recognize the naïve, we must know that the internal inhibition is absent in the producing person. Only when this is certain do we laugh instead of being indignant. Thus we take the producing person's psychical state into consideration, put ourselves into it and try to understand it by comparing it with our own. It is these processes of empathy and comparison that result in the economy in expenditure which we discharge by laughing.

[1905c, 1765]
It would be possible to prefer a simpler account - that our indignation is made superfluous by the fact that the other person has had no need to overcome a resistance; in that case the laughter would occur at the cost of the economy in indignation. In order to discourage this view, which is on the whole misleading, I will make a sharper distinction between two cases which I have treated together above. The naïve which we come across can either be in the nature of a joke, as it was in our examples, or in the nature of smut (or of what is in general objectionable); and the latter will occur especially when it is expressed not in speech but in action. This second alternative is really misleading: one could suppose, as far as it is concerned, that the pleasure arises from the economized and transformed indignation. But the first alternative throws more light on things. A naïve remark - e.g. 'Bubizin' - can in itself act like a minor joke and give no cause for indignation. This alternative is certainly the less frequent; but it is the purer and by far the more instructive. In so far as what we are concerned with is the fact that the child has seriously and without arrrière pensée believed that the syllable 'Medi' in 'Medizin' is identical with her own name 'Mädi', our pleasure in what we hear receives an increase which has no longer anything to do with pleasure in a joke. We now look at what has been said from two points of view - once in the way it happened in the child and once in the way it would have happened to us; and in making this comparison we see that the child has found an identity and that she has overcome a barrier that exists for us; and we then seem to go further and say to ourselves: 'If you choose to understand what you've heard, you can economize the expenditure on keeping up this barrier.' The expenditure liberated in a comparison like this is the source of pleasure in the naïve and it is discharged by laughter; and it is, incidentally, the same pleasure that we should otherwise have transformed into indignation, if this had not been excluded by our understanding of the producing person and, in this case, by the nature of what was said as well. But if we take the instance of a naïve joke as a model for the other alternative, of something naïve that is objectionable, we shall see that there too the economy in inhibition can arise directly from the comparison, that there is no necessity for us to assume an indignation that begins and is then stifled, and that this indignation in fact only corresponds to using the liberated expenditure in another way - against which in the case of jokes complicated protective arrangements were necessary.

[1905c, 1766]
But there are yet other means of making things comic which deserve special consideration and also indicate in part fresh sources of comic pleasure. Among these, for instance, is mimicry, which gives quite extraordinary pleasure to the hearer and makes its object comic even if it is still far from the exaggeration of a caricature. It is much easier to find a reason for the comic effect of caricature than for that of mere mimicry. Caricature, parody and travesty (as well as their practical counterpart, unmasking) are directed against people and objects which lay claim to authority and respect, which are in some sense ‘sublime’. They are procedures for Herabsetzung, as the apt German expression has it.¹ What is sublime is something large in the figurative, psychical sense; and I should like to suggest, or rather to repeat my suggestion, that, like what is somatically large, it is represented by an increased expenditure. It requires little observation to establish that when I speak of something sublime I innervate my speech in a different way, I make different facial expressions, and I try to bring the whole way in which I hold myself into harmony with the dignity of what I am having an idea of. I impose a solemn restraint upon myself - not very different from what I should adopt if I were to enter the presence of an exalted personality, a monarch, or a prince of science. I shall hardly be wrong in assuming that this different innervation in my ideational mimetics corresponds to an increased expenditure. The third instance of an increased expenditure of this kind is no doubt to be found when I proceed in abstract trains of thought instead of in the habitual concrete and plastic ones. When, therefore, the procedures that I have discussed for the degradation of the sublime allow me to have an idea of it as though it were something commonplace, in whose presence I need not pull myself together but may, to use the military formula, ‘stand easy’, I am being spared the increased expenditure of the solemn restraint; and the comparison between this new ideational method (instigated by empathy) and the previously habitual one, which is simultaneously trying to establish itself - this comparison once again creates the difference in expenditure which can be discharged by laughter.

[1905c, 1779]
There is no need to apologize for this digression, since the relation of jokes to the comic was the reason for our being forced into an investigation of the comic. But it is certainly time we returned to our previous topic - the discussion of the methods which serve for making things comic. We considered caricature and unmasking first, because we can derive some indications from these two for the analysis of the comic of *mimicry*. As a rule, no doubt, mimicry is permeated with caricature - the exaggeration of traits that are not otherwise striking -, and it also involves the characteristic of degradation. But this does not seem to exhaust its nature. It cannot be disputed that it is in itself an extraordinarily fertile source of comic pleasure, for we laugh particularly at the *faithfulness* of a piece of mimicry. It is not easy to give a satisfactory explanation of this unless one is prepared to adopt the view held by Bergson (1900), which approximates the comic of mimicry to the comic due to the discovery of psychical automatism. Bergson's opinion is that everything in a living person that makes one think of an inanimate mechanism has a comic effect. His formula for this runs *mécanisation de la vie*. He explains the comic of mimicry by starting out from a problem raised by Pascal in his *Pensées* of why it is that one laughs when one compares two similar faces neither of which has a comic effect by itself. 'What is living should never, according to our expectation, be repeated exactly the same. When we find such a repetition we always suspect some mechanism lying behind the living thing.' When one sees two faces that resemble each other closely, one thinks of two impressions from the same mould or of some similar mechanical procedure. In short, the cause of laughter in such cases would be the divergence of the living from the inanimate, or, as we might say, the degradation of the living to the inanimate (ibid., 35). If, moreover, we were to accept these plausible suggestions of Bergson's, we should not find it difficult to include his view under our own formula. Experience has taught us that every living thing is different from every other and calls for a kind of expenditure by our understanding; and we find ourselves disappointed if, as a result of complete conformity or deceptive mimicry, we need make no fresh expenditure. But we are disappointed in the sense of a relief, and the expenditure on expectation which has become superfluous is discharged by laughter. The same formula would also cover all the cases which Bergson considers of comic rigidity ('raideur'), of professional customs, fixed ideas, and turns of speech repeated on every possible occasion. All these cases would go back to a comparison between the expenditure on expectation and the expenditure actually required for an understanding of something that has remained the same; and the larger amount needed for expectation would be based on observation of the multiplicity and plasticity of living things. In the case of mimicry, accordingly, the source of the comic pleasure would be not the comic of situation but of expectation.

[1905c, 1786]
In this place I shall only follow up one of the consequences which seem possible from this point of view, thus resuming the discussion of a problem which I was obliged to leave unsolved elsewhere.¹ Each of the mental differentiations that we have become acquainted with represents a fresh aggravation of the difficulties of mental functioning, increases its instability, and may become the starting-point for its breakdown, that is, for the onset of a disease. Thus, by being born we have made the step from an absolutely self-sufficient narcissism to the perception of a changing external world and the beginnings of the discovery of objects. And with this is associated the fact that we cannot endure the new state of things for long, that we periodically revert from it, in our sleep, to our former condition of absence of stimulation and avoidance of objects. It is true, however, that in this we are following a hint from the external world, which, by means of the periodical change of day and night, temporarily withdraws the greater part of the stimuli that affect us. The second example of such a step, pathologically more important, is subject to no such qualification. In the course of development we have effected a separation of our mental existence into a coherent ego and into an unconscious and repressed portion which is left outside it; and we know that the stability of this new acquisition is exposed to constant shocks. In dreams and in neuroses what is thus excluded knocks for admission at the gates, guarded though they are by resistances; and in our waking health we make use of special artifices for allowing what is repressed to circumvent the resistances and for receiving it temporarily into our ego to the increase of our pleasure. Jokes and humour, and to some extent the comic in general, may be regarded in this light. Everyone acquainted with the psychology of the neuroses will think of similar examples of less importance; but I hasten on to the application I have in view.

In my volume on Jokes and their Relation to the Unconscious (1905c), I in fact considered humour only from the economic point of view. My object was to discover the source of the pleasure obtained from humour, and I think I was able to show that the yield of humorous pleasure arises from an economy in expenditure upon feeling.

There are two ways in which the humorous process can take place. It may take place in regard to a single person, who himself adopts the humorous attitude, while a second person plays the part of the spectator who derives enjoyment from it; or it may take place between two persons, of whom one takes no part at all in the humorous process, but is made the object of humorous contemplation by the other. When, to take the crudest example, a criminal who was being led out to the gallows on a Monday remarked: 'Well, the week's beginning nicely', he was producing the humour himself; the humorous process is completed in his own person and obviously affords him a certain sense of satisfaction. I, the non-participating listener, am affected as it were at long-range by this humorous production of the criminal's; I feel, like him, perhaps, the yield of humorous pleasure.

We have an instance of the second way in which humour arises when a writer or a narrator describes the behaviour of real or imaginary people in a humorous manner. There is no need for those people to display any humour themselves; the humorous attitude is solely the business of the person who is taking them as his object; and, as in the former instance, the reader or hearer shares in the enjoyment of the humour. To sum up, then, we can say that the humorous attitude - whatever it may consist in - can be directed either towards the subject's own self or towards other people; it is to be assumed that it brings a yield of pleasure to the person who adopts it, and a similar yield of pleasure falls to the share of the non-participating onlooker.
We shall best understand the genesis of the yield of humorous pleasure if we consider the process in the listener before whom someone else produces humour. He sees this other person in a situation which leads the listener to expect that the other will produce the signs of an affect - that he will get angry, complain, express pain, be frightened or horrified or perhaps even in despair; and the onlooker or listener is prepared to follow his lead and to call up the same emotional impulses in himself. But this emotional expectancy is disappointed; the other person expresses no affect, but makes a jest. The expenditure on feeling that is economized turns into humorous pleasure in the listener.

It is easy to get so far. But we soon tell ourselves that it is the process which takes place in the other person - the 'humorist' - that merits the greater attention. There is no doubt that the essence of humour is that one spares oneself the affects to which the situation would naturally give rise and dismisses the possibility of such expressions of emotion with a jest. As far as this goes, the process in the humorist must tally with the process in the hearer - or, to put it more correctly, the process in the hearer must have copied the one in the humorist. But how does the latter bring about the mental attitude which makes a release of affect superfluous? What are the dynamics of his adoption of the 'humorous attitude'? Clearly, the solution of the problem is to be sought in the humorist; in the hearer we must assume that there is only an echo, a copy, of this unknown process.

It is now time to acquaint ourselves with a few of the characteristics of humour. Like jokes and the comic, humour has something liberating about it; but it also has something of grandeur and elevation, which is lacking in the other two ways of obtaining pleasure from intellectual activity. The grandeur in it clearly lies in the triumph of narcissism, the victorious assertion of the ego's invulnerability. The ego refuses to be distressed by the provocations of reality, to let itself be compelled to suffer. It insists that it cannot be affected by the traumas of the external world; it shows, in fact, that such traumas are no more than occasions for it to gain pleasure. This last feature is a quite essential element of humour. Let us suppose that the criminal who was being led to execution on Monday had said: 'It doesn't worry me. What does it matter, after all, if a fellow like me is hanged? The world won't come to an end because of it.' We should have to admit that such a speech does in fact display the same magnificent superiority over the real situation. It is wise and true; but it does not betray a trace of humour. Indeed, it is based on an appraisal of reality which runs directly counter to the appraisal made by humour. Humour is not resigned; it is rebellious. It signifies not only the triumph of the ego but also of the pleasure principle, which is able here to assert itself against the unkindness of the real circumstances.

These last two features - the rejection of the claims of reality and the putting through of the pleasure principle - bring humour near to the regressive or reactionary processes which engage our attention so extensively in psychopathology. Its fending off of the possibility of suffering places it among the great series of methods which the human mind has constructed in order to evade the compulsion to suffer - a series which begins with neurosis and culminates in madness and which includes intoxication, self-absorption and ecstasy. Thanks to this connection, humour possesses a dignity which is wholly lacking, for instance, in jokes, for jokes either serve simply to obtain a yield of pleasure or place the yield of pleasure that has been obtained in the service of aggression. In what, then, does the humorous attitude consist, an attitude by means of which a person refuses to suffer, emphasizes the invincibility of his ego by the real world, victoriously maintains the pleasure principle - and all this, in contrast to other methods having the same purposes, without overstepping the bounds of mental health? The two achievements seem incompatible.
If we turn to the situation in which one person adopts a humorous attitude towards others, a view which I have already put forward tentatively in my book on jokes will at once suggest itself. This is that the subject is behaving towards them as an adult does towards a child when he recognizes and smiles at the triviality of interests and sufferings which seem so great to it. Thus the humorist would acquire his superiority by assuming the role of the grown-up and identifying himself to some extent with his father, and reducing the other people to being children. This view probably covers the facts, but it hardly seems a conclusive one. One asks oneself what it is that makes the humorist arrogate this role to himself.

But we must recall the other, probably more primary and important, situation of humour, in which a person adopts a humorous attitude towards himself in order to ward off possible suffering. Is there any sense in saying that someone is treating himself like a child and is at the same time playing the part of a superior adult towards that child?

This not very plausible idea receives strong support, I think, if we consider what we have learned from pathological observations on the structure of the ego. This ego is not a simple entity. It harbours within it, as its nucleus, a special agency the super-ego. Sometimes it is merged with the super-ego so that we cannot distinguish between them, whereas in other circumstances it is sharply differentiated from it. Genetically the super-ego is the heir to the parental agency. It often keeps the ego in strict dependence and still really treats it as the parents, or the father, once treated the child, in its early years. We obtain a dynamic explanation of the humorous attitude, therefore, if we assume that it consists in the humorist's having withdrawn the psychical accent from his ego and having transposed it on to his super-ego. To the super-ego, thus inflated, the ego can appear tiny and all its interests trivial; and, with this new distribution of energy, it may become an easy matter for the super-ego to suppress the ego's possibilities of reacting.

I think, therefore, that the possibility I have suggested here, that in a particular situation the subject suddenly hypercathects his super-ego and then, proceeding from it, alters the reactions of the ego, is one which deserves to be retained. Moreover, what I have suggested about humour finds a remarkable analogy in the kindred field of jokes. As regards the origin of jokes I was led to assume that a preconscious thought is given over for a moment to unconscious revision. A joke is thus the contribution made to the comic by the unconscious. In just the same way, humour would be the contribution made to the comic through the agency of the super-ego.

In other connections we knew the super-ego as a severe master. It will be said that it accords ill with such a character that the super-ego should condescend to enabling the ego to obtain a small yield of pleasure. It is true that humorous pleasure never reaches the intensity of the pleasure in the comic or in jokes, that it never finds vent in hearty laughter. It is also true that, in bringing about the humorous attitude, the super-ego is actually repudiating reality and serving an illusion. But (without rightly knowing why) we regard this less intense pleasure as having a character of very high value; we feel it to be especially liberating and elevating. Moreover, the jest made by humour is not the essential thing. It has only the value of a preliminary. The main thing is the intention which humour carries out, whether it is acting in relation to the self or other people. It means: 'Look! here is the world, which seems so dangerous! It is nothing but a game for children - just worth making a jest about!'
If it is really the super-ego which, in humour, speaks such kindly words of comfort to the intimidated ego, this will teach us that we have still a great deal to learn about the nature of the super-ego. Furthermore, not everyone is capable of the humorous attitude. It is a rare and precious gift, and many people are even without the capacity to enjoy humorous pleasure that is presented to them. And finally, if the super-ego tries, by means of humour, to console the ego and protect it from suffering, this does not contradict its origin in the parental agency. [1927d, 4545]
This is easy to see; but it is bound to have a confusing effect when we notice that these three stories have as much right to be called 'comic' as we had to produce them as 'jokes'. The uncovering of psychical automatism is one of the techniques of the comic, just as is any kind of revelation or self-betrayal. We suddenly find ourselves faced at this point with the problem of the relation of jokes to the comic which we intended to evade. (See the introduction.) Are these stories perhaps only 'comic' and not 'jokes'? Is the comic operating here by the same methods as jokes do? And, once again, what constitutes the peculiar characteristics of jokes?

[1905c, 1666]

It is as though (Lipps comments), the Müh [trouble, to-do] were an instrument like the fork. We have a feeling, however, that these lines, though they are very comic, are far from being a joke, while Heine's list undoubtedly is one. We may perhaps recall these examples later, when we need no longer evade the problem of the relation between the comic and jokes.

[1905c, 1668]

The second fact which makes an enquiry into the subjective determination of jokes necessary is the generally recognized experience that no one can be content with having made a joke for himself alone. An urge to tell the joke to someone is inextricably bound up with the joke-work; indeed, this urge is so strong that often enough it is carried through in disregard of serious misgivings. In the case of the comic as well, telling it to someone else produces enjoyment; but the demand is not peremptory. If one comes across something comic, one can enjoy it by oneself. A joke, on the contrary, must be told to someone else. The psychical process of constructing a joke seems not to be completed when the joke occurs to one: something remains over which seeks, by communicating the idea, to bring the unknown process of constructing the joke to a conclusion.

[1905c, 1731]

We cannot in the first instance guess what the basis may be of this urge to communicate the joke. But we can see another peculiarity in jokes which distinguishes them from the comic. If I come across something comic, I myself can laugh heartily at it, though it is true that I am also pleased if I can make someone else laugh by telling it to him. But I myself cannot laugh at a joke that has occurred to me, that I have made, in spite of the unmistakable enjoyment that the joke gives me. It is possible that my need to communicate the joke to someone else is in some way connected with the laughter produced by it, which is denied to me but is manifest in the other person.

[1905c, 1731]
Let us take the second question first. In the case of the comic, two persons are in general concerned: besides myself, the person in whom I find something comic. If inanimate things seem to me comic, that is on account of a kind of personification which is not of rare occurrence in our ideational life. The comic process is content with these two persons: the self and the person who is the object; a third person may come into it, but is not essential. Joking as a play with one’s own words and thoughts is to begin with without a person as an object. But already at the preliminary stage of the jest, if it has succeeded in making play and nonsense safe from the protests of reason, it demands another person to whom it can communicate its result. But this second person in the case of jokes does not correspond to the person who is the object, but to the third person, the ‘other’ person in the case of the comic. It seems as though in the case of a jest the other person has the decision passed over to him on whether the joke-work has succeeded in its task - as though the self did not feel certain in its judgement on the point. Innocent jokes, too, jokes that serve to reinforce a thought, require another person to test whether they have attained their aim. If a joke enters the service of the purpose of exposing or of a hostile purpose, it may be described as a psychical process between three persons, who are the same as in the case of the comic, though the part played by the third person is different; the psychical process in jokes is accomplished between the first person (the self) and the third (the outside person) and not, as in the case of the comic, between the self and the person who is the object.

[1905c, 1732]

It appears to be far from easy to avoid the endopsychic employment of cathexes that have become superfluous, for in our thought-processes we are constantly in the habit of displacing such cathexes from one path to another without losing any of their energy by discharge. Jokes make use of the following methods with that aim in view. Firstly, they try to keep their expression as short as possible, so as to offer fewer points of attack to the attention. Secondly, they observe the condition of being easy to understand (see above); as soon as they call for intellectual work which would demand a choice between different paths of thought, they would endanger their effect not only by the unavoidable expenditure of thought but also by the awakening of attention. But besides this they employ the device of distracting attention by putting forward something in the joke’s form of expression which catches it, so that in the meantime the liberation of the inhibitory cathexis and its discharge may be completed without interruption. This aim is already fulfilled by the omissions in the joke’s wording; they offer an incitement to filling up the gaps and in that way succeed in withdrawing the joking process from attention. Here the technique of riddles, which attract the attention, is, as it were, brought into the service of the joke-work. Far more effective even are the façades which we have found especially in some groups of tendentious jokes (p. 1699 ff.). The syllogistic façades admirably fulfil the aim of holding the attention by setting it a task. While we are beginning to wonder what was wrong with the reply, we are already laughing; our attention has been caught unawares and the discharge of the liberated inhibitory cathexis has been completed. The same is true of jokes with a comic façade, in which the comic comes to the help of the joke-technique. A comic façade encourages the effectiveness of a joke in more than one way; not only does it make the automatism of the joking process possible, by holding the attention, but it also facilitates the discharge by the joke, by sending on ahead a discharge of a comic kind. The comic is here operating exactly like a bribing fore-pleasure, and we can in this way understand how some jokes are able to renounce entirely the fore-pleasure produced by the ordinary methods of joking and make use only of the comic for fore-pleasure. Among the joke-techniques proper, it is in particular displacement and representation by something absurd which, apart from their other qualifications, give rise, too, to a distraction of the attention which is desirable for the automatic course of the joking process.¹

[1905c, 1739]
In the third place I shall bring forward - but this time not as necessary conditions but only as 
encouragements to the process of joking - the auxiliary technical methods of the joke-work 
which are calculated to increase the quota which obtains discharge and in that way intensify the 
effect of the joke. These, it is true, also for the most part increase the attention that is paid to the 
joke, but they make this effect innocuous once more by simultaneously holding it and inhibiting 
its mobility. Anything that provokes interest and bewildermens works in these two directions - 
thus, in particular, nonsense, and contradiction, too, the 'contrast of ideas' which some 
authorities have tried to make into the essential characteristic of jokes, but which I can only 
regard as a means of intensifying their effect. Anything that bewilders calls up in the hearer the 
state of distribution of energy which Lipps has called 'psychical damming up'; and he is no doubt 
also correct in supposing that the discharge is the more powerful, the higher was the preceding 
damming up. Lipps's account, it is true, does not relate specifically to jokes but to the comic in 
general; but we may regard it as most probable that in jokes, too, the discharge of an inhibitory 
cathexis is similarly increased by the height of the damming up.

[1905c, 1740]

In an earlier passage (p. 1715) we regarded one of the outcomes of condensation - multiple 
use of the same material, play upon words, and similarity of sound - as a localized economy, 
and the pleasure produced by an (innocent) joke as derived from that economy, and later we 
inferrted that the original intention of jokes was to obtain a yield of pleasure of this kind from 
words - a thing which had been permitted at the stage of play but had been dammed up by 
rational criticism in the course of intellectual development. We have now adopted the 
hypothesis that condensations of this kind, such as serve the technique of jokes, arise 
automatically, without any particular intention, during thought-processes in the unconscious. 
Have we not before us here two different views of the same fact which seem incompatible with 
each other? I do not think so. It is true that they are two different views, and that they need to be 
brought into harmony with each other; but they are not contradictory. One of them is merely 
foreign to the other; and when we have established a connection between them, we shall 
probably have made some advance in knowledge. The fact that such condensations are 
Sources for a yield of pleasure is far from incompatible with the hypothesis that conditions for 
their production are easily found in the unconscious. We can, on the contrary, see a reason for 
the plunge into the unconscious in the circumstance that the pleasure-yielding condensations of 
which jokes are in need arise there easily. There are, moreover, two other factors which at a 
first glance seem to be completely foreign to each other and to have come together as though 
by some undesired chance, but which on deeper investigation turn out to be intimately linked 
and indeed essentially one. I have in mind the two assertions that, on the one hand, jokes 
during their development at the stage of play (that is, during the childhood of reason) are able to 
bring about these pleasurable condensations and that, on the other hand, at higher stages they 
accomplish the same effect by plunging the thought into the unconscious. For the infantile is the 
source of the unconscious, and the unconscious thought-processes are none other than those - 
the one and only ones - produced in early childhood. The thought which, with the intention of 
constructing a joke, plunges into the unconscious is merely seeking there for the ancient 
dwelling-place of its former play with words. Thought is put back for a moment to the stage of 
childhood so as once more to gain possession of the childish source of pleasure. If we did not 
already know it from research into the psychology of the neuroses, we should be led by jokes to 
a suspicion that the strange unconscious revision is nothing else than the infantile type of 
thought-activity. It is merely that it is not very easy for us to catch a glimpse in children of this 
infantile way of thinking, with its peculiarities that are retained in the unconscious of adults, 
because it is for the most part corrected, as it were, in statu nascendi. But in a number of cases 
we succeed in doing so, and we then laugh at the children's 'silliness'. Any uncovering of 
unconscious material of this kind strikes us in general as 'comic'.¹

[1905c, 1754]
Among the techniques common to jokes and dreams, representation by the opposite and the use of nonsense claim some amount of our interest. The former is one of the more effective methods employed in jokes, as may be seen among others by the examples of 'overstatement jokes' (p. 1670 f.). Incidentally, representation by the opposite is not able, like most other joke-techniques, to escape conscious attention. A person who tries to bring the joke-work into operation in himself as deliberately as possible - a professional wag - soon discovers as a rule that the easiest way of replying to an assertion by a joke is by asserting its contrary and by leaving it to the inspiration of the moment to get rid of the objection which his contradiction is likely to provoke, by giving what he has said a fresh interpretation. It may be that representation by the opposite owes the favour it enjoys to the fact that it forms the core of another pleasurable way of expressing a thought, which can be understood without any need for bringing in the unconscious. I am thinking of irony, which comes very close to joking and is counted among the sub-species of the comic. Its essence lies in saying the opposite of what one intends to convey to the other person, but in sparing him contradiction by making him understand - by one's tone of voice, by some accompanying gesture, or (where writing is concerned) by some small stylistic indications - that one means the opposite of what one says. Irony can only be employed when the other person is prepared to hear the opposite, so that he cannot fail to feel an inclination to contradict. As a result of this condition, irony is exposed particularly easily to the danger of being misunderstood. It brings the person who uses it the advantage of enabling him readily to evade the difficulties of direct expression, for instance in invectives. It produces comic pleasure in the hearer, probably because it stirs him into a contradictory expenditure of energy which is at once recognized as being unnecessary. A comparison like this between jokes and a closely related type of the comic may confirm our assumption that what is peculiar to jokes is their relation to the unconscious and that this may perhaps distinguish them from the comic as well.¹

¹ The characteristic of the comic which is described as its 'dryness' depends likewise on the distinction between a statement and the gestures (in the widest sense of the word) accompanying it.

[1905c, 1757]
We have approached the problems of the comic in an unusual way. It seemed to us that jokes, which are ordinarily regarded as a sub-species of the comic, offer enough peculiarities to be attacked directly; thus we have avoided their relation to the more inclusive category of the comic so long as that was possible, though we have not failed to pick out en passant a few hints that might throw light on the comic. We have had no difficulty in discovering that socially the comic behaves differently from jokes. It can be content with two persons: a first who finds what is comic and a second in whom it is found. The third person, to whom the comic thing is told, intensifies the comic process but adds nothing new to it. In a joke this third person is indispensable for the completion of the pleasure-producing process; but on the other hand the second person may be absent, except where a tendentious, aggressive joke is concerned. A joke is made, the comic is found - and first and foremost in people, only by a subsequent transference in things, situations, and so on, as well. As regards jokes, we know that the sources of the pleasure that is to be fostered lie in the subject himself and not in outside people. We have seen, too, that jokes can sometimes re-open sources of the comic which have become inaccessible, and that the comic often serves as a façade for a joke and replaces the fore-pleasure which has otherwise to be produced by the familiar technique (p. 1739). None of this precisely suggests that the relations between jokes and the comic are very simple. On the other hand, the problems of the comic have proved so complicated and all the efforts of the philosophers at solving them have been so unsuccessful that we cannot hold out any prospect that we shall be able to master them in a sudden onslaught, as it were, by approaching them from the direction of jokes. Moreover, for our investigation of jokes we brought with us an instrument of which no one else had hitherto made use - a knowledge of the dream-work. We have no similar advantage at our command to help us to understand the comic, and we must therefore expect that we shall discover no more about the nature of the comic than what we have already found in jokes, in so far as they form part of the comic and possess in their own nature certain of its features unchanged or merely modified.

[1905c, 1762]

The type of the comic which stands nearest to jokes is the naïve. Like the comic in general, the naïve is 'found' and not, like a joke, 'made'. Indeed, the naïve cannot be made at all, whereas alongside the pure comic we have to take into account the case in which something is made comic - an evocation of the comic. The naïve must arise, without our taking any part in it, in the remarks and actions of other people, who stand in the position of the second person in the comic or in jokes. The naïve occurs if someone completely disregards an inhibition because it is not present in him - if, therefore, he appears to overcome it without any effort. It is a condition for the naïve's producing its effect that we should know that the person concerned does not possess the inhibition; otherwise we call him not naïve but impudent. We do not laugh at him but are indignant at him. The effect produced by the naïve is irresistible, and seems simple to understand. An inhibitory expenditure which we usually make suddenly becomes unutilizable owing to our hearing the naïve remark, and it is discharged by laughter. There is no need here for the attention to be distracted, probably because the lifting of the inhibition occurs directly and not through the intermediary of an operation that has been provoked. In this we are behaving like the third person in a joke, who is presented with the economy in inhibition without any effort on his own part.

[1905c, 1763]
In view of the insight we have gained into the genesis of inhibitions from following the course of development from play to jokes, it will not surprise us to find that the naïve occurs far the most often in children, and is then carried over to uneducated adults, whom we may regard as childish so far as their intellectual development is concerned. Naïve remarks are, of course, better suited for comparison with jokes than naïve actions, since remarks and not actions are the usual form in which jokes are expressed. It is illuminating to find that naïve remarks like those made by children may also be described as 'naïve jokes'. The conformity between jokes and naivété, as well as the reasons for their dissimilarity, will be made clearer to us by a few examples.

[1905c, 1763]

We can illustrate from these examples the position occupied by the naïve between jokes and the comic. The naïve (in speech) agrees with jokes as regards wording and content: it brings about a misuse of words, a piece of nonsense, or a piece of smut. But the psychical process in the first person, who produces it, which raised so many interesting and puzzling questions for us in regard to jokes, is here completely absent. A naïve person thinks he has used his means of expression and trains of thought normally and simply, and he has no arrière pensée in mind; nor does he derive any yield of pleasure from producing something naïve. None of the characteristics of the naïve exist except in the apprehension of the person who hears it - a person who coincides with the third person in jokes. Moreover the person who produces it does so without any effort. The complicated technique, which in jokes is designed to paralyse the inhibition arising from rational criticism, is absent in him; he does not possess this inhibition as yet, so that he can produce nonsense and smut directly and without compromise. In that respect the naïve is a marginal case of the joke; it arises if in the formula for the construction of jokes we reduce the value of the censorship to zero.

[1905c, 1765]
It would be possible to prefer a simpler account - that our indignation is made superfluous by the fact that the other person has had no need to overcome a resistance; in that case the laughter would occur at the cost of the economy in indignation. In order to discourage this view, which is on the whole misleading, I will make a sharper distinction between two cases which I have treated together above. The naïve which we come across can either be in the nature of a joke, as it was in our examples, or in the nature of smut (or of what is in general objectionable); and the latter will occur especially when it is expressed not in speech but in action. This second alternative is really misleading: one could suppose, as far as it is concerned, that the pleasure arises from the economized and transformed indignation. But the first alternative throws more light on things. A naïve remark - e.g. 'Bubizin' - can in itself act like a minor joke and give no cause for indignation. This alternative is certainly the less frequent; but it is the purer and by far the more instructive. In so far as what we are concerned with is the fact that the child has seriously and without arrière pensée believed that the syllable 'Medi' in 'Medizin' is identical with her own name 'Mädi', our pleasure in what we hear receives an increase which has no longer anything to do with pleasure in a joke. We now look at what has been said from two points of view - once in the way it happened in the child and once in the way it would have happened to us; and in making this comparison we see that the child has found an identity and that she has overcome a barrier that exists for us; and we then seem to go further and say to ourselves: 'If you choose to understand what you've heard, you can economize the expenditure on keeping up this barrier.' The expenditure liberated in a comparison like this is the source of pleasure in the naïve and it is discharged by laughter; and it is, incidentally, the same pleasure that we should otherwise have transformed into indignation, if this had not been excluded by our understanding of the producing person and, in this case, by the nature of what was said as well. But if we take the instance of a naïve joke as a model for the other alternative, of something naïve that is objectionable, we shall see that there too the economy in inhibition can arise directly from the comparison, that there is no necessity for us to assume an indignation that begins and is then stifled, and that this indignation in fact only corresponds to using the liberated expenditure in another way - against which in the case of jokes complicated protective arrangements were necessary.

[1905c, 1766]

This comparison, and this economy in expenditure by putting oneself into the mental process of the producing person, can only claim to be of significance for the naïve, however, if it is not in it alone that they are found. A suspicion occurs to us, in fact, that this mechanism, which is wholly alien to jokes, may be a part and perhaps an essential part of the psychical process in the comic. Looked at from this point of view - and this is undoubtedly the most important aspect of the naïve - the naïve thus presents itself as a species of the comic. The extra element in our examples of naïve speeches that is added to the pleasure of a joke is 'comic' pleasure. We should be inclined to assume of it quite generally that it arises from expenditure economized in a comparison of someone else's remarks with our own. But since this leads us to far-reaching considerations, we will first conclude our discussion of the naïve. The naïve, then, would be a species of the comic in so far as its pleasure springs from the difference in expenditure which arises in trying to understand someone else; and it would approach the joke in being subject to the condition that the expenditure economized in the comparison must be an inhibitory expenditure.¹

[1905c, 1767]
Let us hastily add a few points of agreement and of difference between the concepts that we have just reached and those which have long been familiar in the psychology of the comic. The putting of oneself in the other person's place and trying to understand him is clearly nothing other than the 'comic lending' which since Jean Paul has played a part in the analysis of the comic; the 'comparing' of someone else's mental process with one's own corresponds to the 'psychological contrast' which we can at last find a place for here, after not knowing what to do with it in jokes. But we differ in our explanation of comic pleasure from many authorities who regard it as arising from the oscillation of attention backwards and forwards between contrasting ideas. A mechanism of pleasure like this would seem incomprehensible to us;² but we may point out that in a comparison between contrasts a difference in expenditure occurs which, if it is not used for some other purpose, becomes capable of discharge and may thus become a source of pleasure.

¹ In what I have written, I have all the time identified the naïve with the naïve-comic, which is certainly not in every case admissible. But it is enough for our purposes to study the character of the naïve in 'naïve jokes' and in 'naïve smut'. Any further investigation would imply an intention on my part of using this as a basis for my explanation of the comic.

² [1905c, 1767]

It is only with misgivings that I venture to approach the problem of the comic itself. It would be presumptuous to expect that my efforts would be able to make any decisive contribution to its solution when the works of a great number of eminent thinkers have failed to produce a wholly satisfactory explanation. My intention is in fact no more than to pursue the lines of thought that have proved valuable with jokes a short distance further into the sphere of the comic.

[1905c, 1768]
This irregular survey of the occurrences of the comic will already show us that a very extensive field of origin is to be ascribed to it and that such specialized conditions as we found, for instance, in the naïve are not to be expected in it. In order to get on the track of the determining condition that is valid for the comic, the most important thing is the choice of an introductory case. We shall choose the comic of movement, because we recollect that the most primitive kind of stage performance - the pantomime - uses that method for making us laugh. The answer to the question of why we laugh at the clown's movements is that they seem to us extravagant and inexpedient. We are laughing at an expenditure that is too large. Let us look now for the determining condition outside the comic that is artificially constructed - where it can be found unintended. A child's movements do not seem to us comic, although he kicks and jumps about. On the other hand, it is comic where a child who is learning to write follows the movements of his pen with his tongue stuck out; in these associated motions we see an unnecessary expenditure of movement which we should spare ourselves if we were carrying out the same activity. Similarly, other such associated motions, or merely exaggerated expressive movements, seem to us comic in adults too. Pure examples of this species of the comic are to be seen, for instance, in the movements of someone playing skittles who, after he has released the ball, follows its course as though he could still continue to direct it. Thus, too, all grimaces are comic which exaggerate the normal expression of the emotions, even if they are produced involuntarily as in sufferers from St. Vitus's dance (chorea). And in the same way, the passionate movements of a modern conductor seem comic to any unmusical person who cannot understand their necessity. Indeed, it is from this comic of movement that the comic of bodily shapes and facial features branches off; for these are regarded as though they were the outcome of an exaggerated or pointless movement. Staring eyes, a hooked nose hanging down to the mouth, ears sticking out, a hump-back - all such things probably only produce a comic effect in so far as movements are imagined which would be necessary to bring about these features; and here the nose, the ears and other parts of the body are imagined as more movable than they are in reality. There is no doubt that it is comic if someone can 'waggle his ears', and it would certainly be still more comic if he could move his nose up and down. A good deal of the comic effect produced on us by animals comes from our perceiving in them movements such as these which we cannot imitate ourselves.

[1905c, 1769]

But how is it that we laugh when we have recognized that some other person's movements are exaggerated and inexpedient? By making a comparison, I believe, between the movement I observe in the other person and the one that I should have carried out myself in his place. The two things compared must of course be judged by the same standard, and this standard is my expenditure of innervation, which is linked to my idea of the movement in both of the two cases. This statement calls for elucidation and expansion.

[1905c, 1770]

But how is the quantitative factor - the greater or lesser size - of the perceived movement to be given expression in the idea? And if there can be no representation of quantity in the idea, which is made up of qualities, how can I distinguish the ideas of movements of different sizes? - how can I make the comparison on which everything here depends? The way is pointed out by physiology, for it teaches us that even during the process of ideation innervations run out to the muscles, though these, it is true, correspond to a very modest expenditure of energy. Now it becomes very plausible to suppose that this innervatory energy that accompanies the process of ideation is used to represent the quantitative factor of the idea: that it is larger when there is an idea of a large movement than when it is a question of a small one. Thus the idea of the larger movement would in this case in fact be the larger one - that is, it would be the idea accompanied by the larger expenditure of energy.

[1905c, 1771]
Are we to suppose, then, that this need for mimetics is only aroused by the requirements of communicating something, in spite of the fact that a good part of this method of representation altogether escapes the hearer's attention? On the contrary, I believe that these mimetics exist, even if with less liveliness, quite apart from any communication, that they occur as well when the subject is forming an idea of something for his own private benefit and is thinking of something pictorially, and that he then expresses 'large' and 'small' in his own body just as he does in speech, at all events by a change in the innervation of his features and sense organs. I can even believe that the somatic innervation which is commensurate with the content of what he is having an idea of may have been the beginning and origin of mimetics for purposes of communication; it only needed to be intensified and made noticeable to other people in order to be able to serve that end. If I support the view that to the 'expression of the emotions', which is well known as the physical concomitant of mental processes, there should be added the 'expression of the ideational content', I can see quite clearly that my remarks relating to the category of large and small do not exhaust the subject. I might myself add a variety of points even before arriving at the phenomena of tension by which a person indicates somatically the concentration of his attention and the level of abstraction at which his thinking is at the moment proceeding. I regard the matter as a really important one, and I believe that if ideational mimetics are followed up, they may be as useful in other branches of aesthetics as they are here for an understanding of the comic.

[1905c, 1772]

To return now to the comic of movement. When, I repeat, a particular movement is perceived, the impulsion is given to forming an idea of it by means of a certain expenditure of energy. In 'trying to understand', therefore, in apperceiving this movement, I make a certain expenditure, and in this portion of the mental process I behave exactly as though I were putting myself in the place of the person I am observing. But at the same moment, probably, I bear in mind the aim of this movement, and my earlier experience enables me to estimate the scale of expenditure required for reaching that aim. In doing so I disregard the person whom I am observing and behave as though I myself wanted to reach the aim of the movement. These two possibilities in my imagination amount to a comparison between the observed movement and my own. If the other person's movement is exaggerated and inexpedient, my increased expenditure in order to understand it is inhibited in statu nascendi, as it were in the act of being mobilized; it is declared superfluous and is free for use elsewhere or perhaps for discharge by laughter. This would be the way in which, other circumstances being favourable, pleasure in a comic movement is generated - an innervatory expenditure which has become an unusable surplus when a comparison is made with a movement of one's own.

[1905c, 1773]
The comic that is found in someone else's intellectual and mental characteristics is evidently once again the outcome of a comparison between him and my own self, though, curiously enough, a comparison which has as a rule produced the opposite result to that in the case of a comic movement or action. In this latter case it was comic if the other person had made a greater expenditure than I thought I should need. In the case of a mental function, on the contrary, it becomes comic if the other person has spared himself expenditure which I regard as indispensable (for nonsense and stupidity are inefficiencies of function). In the former case I laugh because he has taken too much trouble, in the latter because he has taken too little. The comic effect apparently depends, therefore, on the difference between the two cathectic expenditures - one's own and the other person's as estimated by 'empathy' - and not on which of the two the difference favours. But this peculiarity, which at first sight confuses our judgement, vanishes when we bear in mind that a restriction of our muscular work and an increase of our intellectual work fit in with the course of our personal development towards a higher level of civilization. By raising our intellectual expenditure we can achieve the same result with a diminished expenditure on our movements. Evidence of this cultural success is provided by our machines.¹

[1905c, 1774]

The origin of comic pleasure which has been discussed here - its derivation from a comparison of another person with our self, from the difference between our own psychical expenditure and the other person's as estimated by empathy - is probably the most important genetically. It is certain, however, that it has not remained the only one. We have learnt at one time or other to disregard this comparison between the other person and ourself and to derive the pleasurable difference from the one side only, whether from the empathy or from the processes in ourself - which proves that the feeling of superiority bears no essential relation to comic pleasure. A comparison is indispensable for the generation of this pleasure. We find that it is made between two cathectic expenditures that occur in rapid succession and are concerned with the same function, and these expenditures are either brought about in us through empathy into someone else or, without any such relation, are discovered in our own mental processes. [1905c, 1775]

The other source of the comic, which we find in the transformations of our own cathexes, lies in our relations with the future, which we are accustomed to anticipate with our expectant ideas. I assume that a quantitatively definite expenditure underlies each of our ideas - an expenditure which, in the event of a disappointment, is therefore diminished by a definite difference. Here I may once again recall the remarks I made earlier on 'ideational mimetics'. But it seems to me to be easier to prove a real mobilization of cathectic energy in the case of expectation. It is quite obviously true of a number of cases that motor preparations are what form the expression of expectation - above all in all cases in which the expected event makes demands on my motility - and that these preparations can be at once determined quantitatively. If I am expecting to catch a ball which is being thrown to me, I put my body into tensions which will enable it to meet the impact of the ball; and, should the ball when it is caught turn out to be too light, my superfluous movements make me comic to the spectators. I have let myself be enticed by my expectation into an exaggerated expenditure of movement. The same is true if, for instance, I lift a fruit which I have judged to be heavy out of a basket, but which, to my disappointment, turns out to be a sham one, hollow and made of wax. My hand, by jumping up, betrays the fact that I had prepared an innervation too large for the purpose - and I am laughed at for it. There is at least one case in which the expenditure on expectation can be directly demonstrated measurably by physiological experiments on animals. In Pavlov's experiments on salivary secretions, various kinds of food are set before dogs in whom a salivary fistula has been opened; the amounts of saliva secreted then vary according to whether the experimental conditions confirm or disappoint the dogs' expectations of being fed with the food set before them. [1905c, 1776]
Even when what is expected makes demands on my sense organs and not on my motility, I may assume that the expectation is expressed in a certain motor expenditure towards making the senses tense and towards holding back other impressions that are not expected; and, in general, I may regard an attitude of attention as being a motor function equivalent to a certain expenditure. I may further take it as a premiss that the preparatory activity of expectation will not be independent of the magnitude of the impression that is expected, but that I shall represent its largeness or smallness mimetically by a larger or smaller preparatory expenditure, as in the case of making a communication and in the case of thinking unaccompanied by expectation. The expenditure on expectation is, however, put together from several components, and in the case of my disappointment, too, various points will be involved - not only whether what happens is perceptually greater or smaller than what is expected, but also whether it is worthy of the great interest which I had expended on the expectation. In this way I shall perhaps be led to take into account, besides the expenditure on the representation of large and small (the ideational mimetics), the expenditure on tightening the attention (the expenditure on expectation), and beyond this in other cases the expenditure on abstraction. But these other kinds of expenditure can easily be traced back to that on large and small, since what is more interesting, more sublime and even more abstract are only special cases, with particular qualities, of what is larger. If we consider in addition that, according to Lipps and other writers, quantitative (and not qualitative) contrast is to be regarded primarily as the source of comic pleasure, we shall on the whole feel glad that we chose the comic of movement as the starting-point of our enquiry.

[1905c, 1777]

Mankind have not been content to enjoy the comic where they have come upon it in their experience; they have also sought to bring it about intentionally, and we can learn more about the nature of the comic if we study the means which serve to make things comic. First and foremost, it is possible to produce the comic in relation to oneself in order to amuse other people - for instance, by making oneself out clumsy or stupid. In that way one produces a comic effect exactly as though one really were these things, by fulfilling the condition of the comparison which leads to the difference in expenditure. But one does not in this way make oneself ridiculous or contemptible, but may in some circumstances even achieve admiration. The feeling of superiority does not arise in the other person if he knows that one has only been pretending; and this affords fresh evidence of the fundamental independence of the comic from the feeling of superiority.

[1905c, 1778]
But there are yet other means of making things comic which deserve special consideration and also indicate in part fresh sources of comic pleasure. Among these, for instance, is mimicry, which gives quite extraordinary pleasure to the hearer and makes its object comic even if it is still far from the exaggeration of a caricature. It is much easier to find a reason for the comic effect of caricature than for that of mere mimicry. Caricature, parody and travesty (as well as their practical counterpart, unmasking) are directed against people and objects which lay claim to authority and respect, which are in some sense 'sublime'. They are procedures for *Herabsetzung*, as the apt German expression has it.¹ What is sublime is something large in the figurative, psychical sense; and I should like to suggest, or rather to repeat my suggestion, that, like what is somatically large, it is represented by an increased expenditure. It requires little observation to establish that when I speak of something sublime I innervate my speech in a different way, I make different facial expressions, and I try to bring the whole way in which I hold myself into harmony with the dignity of what I am having an idea of. I impose a solemn restraint upon myself - not very different from what I should adopt if I were to enter the presence of an exalted personality, a monarch, or a prince of science. I shall hardly be wrong in assuming that this different innervation in my ideational mimetics corresponds to an increased expenditure. The third instance of an increased expenditure of this kind is no doubt to be found when I proceed in abstract trains of thought instead of in the habitual concrete and plastic ones. When, therefore, the procedures that I have discussed for the degradation of the sublime allow me to have an idea of it as though it were something commonplace, in whose presence I need not pull myself together but may, to use the military formula, 'stand easy', I am being spared the increased expenditure of the solemn restraint; and the comparison between this new ideational method (instigated by empathy) and the previously habitual one, which is simultaneously trying to establish itself - this comparison once again creates the difference in expenditure which can be discharged by laughter.

[1905c, 1779]

*Parody* and *travesty* achieve the degradation of something exalted in another way: by destroying the unity that exists between people's characters as we know them and their speeches and actions, by replacing either the exalted figures or their utterances by inferior ones. They are distinguished from caricature in this, but not in the mechanism of their production of comic pleasure. The same mechanism is also used for *unmasking*, which only applies where someone has seized dignity and authority by a deception and these have to be taken from him in reality. We have already met with a few examples of the comic effect of unmasking in jokes - for instance, in the story of the aristocratic lady who, at the first onset of her labour-pains, exclaimed 'Ah! mon Dieu!' but whom the doctor would not assist till she cried out 'Aa-ee, aa-ee!'. Having come to know the characteristics of the comic, we can no longer dispute that this anecdote is in fact an example of comic unmasking and has no justifiable claim to be called a joke. It only recalls jokes by its setting and by the technical method of *'representation by something very small'* - in this case the patient's cry, which is found sufficient to establish the indication for treatment. It nevertheless remains true that our linguistic sense, if we call on it for a decision, raises no objection to our calling a story like this a joke. We may explain this by reflecting that linguistic usage is not based on the scientific insight into the nature of jokes that we have arrived at in this laborious investigation. Since one of the functions of jokes is to make hidden sources of comic pleasure accessible once more (p. 1698), any device that brings to light something that is not manifestly comic may, by a loose analogy, be termed a joke. This applies preferably, however, to unmasking as well as to other methods of making people comic.¹

[1905c, 1780]
Under the heading of 'unmasking' we may also include a procedure for making things comic with which we are already acquainted - the method of degrading the dignity of individuals by directing attention to the frailties which they share with all humanity, but in particular the dependence of their mental functions on bodily needs. The unmasking is equivalent here to an admonition: such and such a person, who is admired as a demigod, is after all only human like you and me. Here, too, are to be placed the efforts at laying bare the monotonous psychical automatism that lies behind the wealth and apparent freedom of psychical functions. We came across examples of 'unmasking' of this kind in the marriage-broker jokes, and felt a doubt at the time whether these anecdotes have a right to be counted as jokes. We are now able to decide with greater certainty that the anecdote of the echo who reinforced all the assertions of the marriage-broker and finally confirmed his admission that the bride had a hump with the exclamation 'And what a hump!' - that this anecdote is essentially a comic story, an example of the unmasking of a psychical automatism. Here, however, the comic story is only serving as a façade. For anyone who will attend to the hidden meaning of the marriage-broker anecdotes, the whole thing remains an admirably staged joke; anyone who does not penetrate so far is left with a comic story. The same thing applies to the other joke, about the marriage-broker who, in order to answer an objection, ended by confessing the truth with a cry of 'But I ask you, who would lend such people anything?'. Here again we have a comic unmasking as the façade for a joke, though in this instance the characteristic of a joke is much more unmistakable, since the marriage-broker's remark is at the same time a representation by the opposite. In trying to prove that the people are rich he at the same time proves that they are not rich, but very poor. Here a joke and the comic are combined, and teach us that the same remark can be both things at once.

[1905c, 1781]

In such cases the joke has another resource. The faulty reasoning, which it uses for its technique as one of the modes of thought of the unconscious, strikes criticism - even though not invariably so - as being comic. Consciously giving free play to unconscious modes of thought (which have been rejected as faulty) is a means of producing comic pleasure; and it is easy to understand this, since it certainly requires a greater expenditure of energy to establish a preconscious cathexis than to give free play to an unconscious one. When, on hearing a thought which has, as it were, been formed in the unconscious, we compare it with its correction, a difference in expenditure emerges for us from which comic pleasure arises. A joke which makes use of faulty reasoning like this for its technique, and therefore appears nonsensical, can thus produce a comic effect at the same time. If we fail to detect the joke, we are once again left with only the comic or funny story.

[1905c, 1783]
The story of the borrowed kettle which had a hole in it when it was given back (p. 1664) is an excellent example of the purely comic effect of giving free play to the unconscious mode of thought. It will be recalled that the borrower, when he was questioned, replied firstly that he had not borrowed a kettle at all, secondly that it had had a hole in it already when he borrowed it, and thirdly that he had given it back undamaged and without a hole. This mutual cancelling-out by several thoughts, each of which is in itself valid, is precisely what does not occur in the unconscious. In dreams, in which the modes of thought of the unconscious are actually manifest, there is accordingly no such thing as an 'either-or',¹ only a simultaneous juxtaposition. In the example of a dream, which, in spite of its complication, I chose in my Interpretation of Dreams as a specimen of the work of interpretation, I tried to rid myself of the reproach of having failed to relieve a patient of her pains by psychical treatment. My reasons were: (1) that she herself was responsible for her illness because she would not accept my solution, (2) that her pains were of organic origin and were therefore no concern of mine, (3) that her pains were connected with her widowhood, for which I was evidently not responsible and (4) that her pains were due to an injection from a contaminated syringe, which had been given her by someone else. All these reasons stood side by side, as though they were not mutually exclusive. I was obliged to replace the 'and' of the dream by an 'either-or' in order to escape a charge of nonsense. [1905c, 1784]

There is a similar comic story of a Hungarian village in which the blacksmith had been guilty of a capital offence. The burgomaster, however, decided that as a penalty a tailor should be hanged and not the blacksmith, because there were two tailors in the village but no second blacksmith, and the crime must be expiated. A displacement of this kind from the figure of the guilty person to another naturally contradicts every law of conscious logic but by no means the mode of thought of the unconscious. I do not hesitate to call this story comic, and yet I have included the one about the kettle among the jokes. I will now admit that this latter story too is far more correctly described as 'comic' rather than as a joke. But I now understand how it is that my feeling, which is as a rule so sure, can leave me in doubt as to whether this story is comic or a joke. This is a case in which I cannot come to a decision on the basis of my feeling - when, that is, the comic arises from the uncovering of a mode of thought that is exclusively proper to the unconscious. A story like this may be comic and a joke at the same time; but it will give me the impression of being a joke, even if it is merely comic, because the use of the faulty reasoning of the unconscious reminds me of jokes, just as did the manoeuvres for uncovering what is not manifestly comic (p. 1781).
[1905c, 1784]

Since we derive comic pleasure in general from a comparison, it is incumbent on us to examine the comic of comparison itself; and this, indeed, serves as a method of making things comic. Our interest in this question will be increased when we recall that in the case of analogies, too, we often found that our 'feeling' left us in the lurch as to whether something was to be called a joke or merely comic (p. 1680 f.). [1905c, 1787]
The subject would, it must be admitted, deserve more careful treatment than our interests can devote to it. The main attribute that we enquire after in an analogy is whether it is apt - that is, whether it draws attention to a conformity which is really present in two different objects. The original pleasure in rediscovering the same thing (Groos, 1899, 153) is not the only motive that favours the use of analogies; there is the further fact that analogies are capable of a use which brings with it a relief of intellectual work - if, that is to say, one follows the usual practice of comparing what is less known with what is better known or the abstract with the concrete, and by the comparison elucidates what is more unfamiliar or more difficult. Every such comparison, especially of something abstract with something concrete, involves a certain degradation and a certain economy in expenditure on abstraction (in the sense of ideational mimetics), but this is of course not sufficient to allow the characteristic of the comic to come clearly into prominence. It does not emerge suddenly but gradually from the pleasure of the relief brought about by the comparison. There are plenty of cases which merely fringe on the comic and in which doubt might be felt whether they show the characteristic of the comic. The comparison becomes undoubtedly comic if there is a rise in the level of difference between the expenditure on abstraction in the two things that are being compared, if something serious and unfamiliar, especially if it is of an intellectual or moral nature, is brought into comparison with something commonplace and inferior. The previous pleasure of the relief and the contribution from the determinants of ideational mimetics may perhaps explain the gradual transition, conditioned by quantitative factors, from general pleasure to comic pleasure during the comparison. I shall no doubt avoid misunderstandings if I stress the fact that I do not trace the comic pleasure in analogies to the contrast between the two things compared but to the difference between the two expenditures on abstraction. When an unfamiliar thing that is hard to take in, a thing that is abstract and in fact sublime in an intellectual sense, is alleged to tally with something familiar and inferior, in imagining which there is a complete absence of any expenditure on abstraction, then that abstract thing is itself unmasked as something equally inferior. The comic of comparison is thus reduced to a case of degradation.

Rudimentary jokes of this kind undoubtedly produce a comic effect, which we can account for in more than one way. Either the comic arises from the uncovering of the modes of thought of the unconscious, as in cases we considered earlier, or the pleasure comes from the comparison with a complete joke. Nothing prevents our supposing that both these ways of generating comic pleasure converge here. It is not impossible that here the inadequacy of support from a joke is precisely what makes the nonsense into comic nonsense.

There is still less difficulty in understanding the case of the involuntary comic of speech, which we can find realized as often as we please in, for instance, the poems of Friederike Kempner (1891):
There is nothing here to make us think of jokes. But there is no doubt that it is the inadequacy of these 'poems' that makes them comic - the quite extraordinary clumsiness of their expression, which is linked with the tritest or most journalistic turns of phrase, the simple-minded limitation of their thought, the absence of any trace of poetic matter or form. In spite of all this, however, it is not obvious why we find Kempner's poems comic. We find many similar products nothing but shockingly bad; they do not make us laugh but annoy us. But it is precisely the greatness of the distance that separates them from what we expect of a poem that imposes the comic view on us; if this difference struck us as smaller we should be more inclined to criticize than to laugh. Furthermore, the comic effect of Kempner's poems is assured by a subsidiary circumstance - the authoress's unmistakably good intentions and a peculiar sincerity of feeling which disarms our ridicule or our annoyance and which we sense behind her helpless phrases.
[1905c, 1793]

Now that we are on the point of approaching an answer to our last question, as to the necessary conditions for the generating of comic pleasure from the difference in expenditure, we may allow ourselves a relief which cannot fail to give us pleasure. An accurate reply to the question would be identical with an exhaustive account of the nature of the comic, for which we can claim neither capacity nor authority. We shall once more be content to throw light on the problem of the comic only so far as it contrasts clearly with the problem of jokes.
[1905c, 1794]

Every theory of the comic is objected to by its critics on the score that its definition overlooks what is essential to the comic; 'The comic is based on a contrast between ideas.' 'Yes, in so far as the contrast has a comic and not some other effect.' 'The feeling of the comic arises from the disappointment of an expectation.' 'Yes, unless the disappointment is in fact a distressing one.' No doubt the objections are justified; but we shall be over-estimating them if we conclude from them that the essential feature of the comic has hitherto escaped detection. What impairs the universal validity of these definitions are conditions which are indispensable for the generating of comic pleasure; but we do not need to look for the essence of the comic in them. In any case, it will only become easy for us to dismiss the objections and throw light on the contradictions to the definitions of the comic if we suppose that the origin of comic pleasure lies in a comparison of the difference between two expenditures. Comic pleasure and the effect by which it is known - laughter - can only come about if this difference is unutilizable and capable of discharge. We obtain no pleasurable effect but at most a transient sense of pleasure in which the characteristic of being comic does not emerge, if the difference is put to another use as soon as it is recognized. Just as special contrivances have to be adopted in the case of jokes in order to prevent the use elsewhere of the expenditure that is recognized as superfluous, so, too, comic pleasure can only appear in circumstances that guarantee this same condition. For this reason occasions on which these differences in expenditure occur in our ideational life are uncommonly numerous, but the occasions on which the comic emerges from those differences are relatively quite rare.
[1905c, 1794]
Two observations force themselves on anyone who studies even cursorily the conditions for
the generation of the comic from difference in expenditure. Firstly, there are cases in which the
comic appears habitually and as though by force of necessity, and on the contrary others in
which it seems entirely dependent on the circumstances and on the standpoint of the observer.
But secondly, unusually large differences very often break through unfavourable conditions, so
that the comic feeling emerges in spite of them. In connection with the first of these points it
would be possible to set up two classes - the inevitably comic and the occasionally comic -
though one must be prepared from the first to renounce the notion of finding the inevitability of
the comic in the first class free from exceptions. It would be tempting to enquire into the
determining conditions for the two classes.
[1905c, 1795]

(a) The most favourable condition for the production of comic pleasure is a generally cheerful
mood in which one is 'inclined to laugh'. In a toxic mood of cheerfulness almost everything
seems comic, probably by comparison with the expenditure in a normal state. Indeed, jokes, the
comic and all similar methods of getting pleasure from mental activity are no more than ways of
regaining this cheerful mood - this euphoria - from a single point of approach, when it is not
present as a general disposition of the psyche.
[1905c, 1795]

(e) The comic is greatly interfered with if the situation from which it ought to develop gives rise
at the same time to a release of strong affect. A discharge of the operative difference is as a
rule out of the question in such a case. The affects, disposition and attitude of the individual in
each particular case make it understandable that the comic emerges and vanishes according to
the standpoint of each particular person, and that an absolute comic exists only in exceptional
instances. The contingency or relativity of the comic is therefore far greater than that of a joke,
which never happens of its own accord but is invariably made, and in which the conditions
under which it can find acceptance can be observed at the time at which it is constructed. The
generation of affect is the most intense of all the conditions that interfere with the comic and its
importance in this respect has been nowhere overlooked.¹ For this reason it has been said that
the comic feeling comes easiest in more or less indifferent cases where the feelings and
interests are not strongly involved. Yet precisely in cases where there is a release of affect one
can observe a particularly strong difference in expenditure bring about the automatism of
release. When Colonel Butler answers Octavio's warnings by exclaiming 'with a bitter laugh':
'Thanks from the House of Austria!', his embitterment does not prevent his laughing. The laugh
applies to his memory of the disappointment he believes he has suffered; and on the other hand
the magnitude of the disappointment cannot be portrayed more impressively by the dramatist
than by his showing it capable of forcing a laugh in the midst of the storm of feelings that have
been released. I am inclined to think that this explanation would apply to every case in which
laughter occurs in circumstances other than pleasurable ones and accompanied by intensely
distressing or strained emotions.
[1905c, 1796]
An invitation to us to look for an understanding of the comic in its psychogenesis is also to be found, surprisingly enough, in Bergson’s charming and lively volume *Le rire*. We have already made the acquaintance of Bergson’s formulas for grasping the characteristics of the comic: ‘mécanisation de la vie’, ‘substitution quelconque de l’artificial au naturel’.¹ He proceeds by a plausible train of thought from automatism to automata, and tries to trace back a number of comic effects to the faded recollection of a children’s toy. In this connection he reaches for a moment a point of view, which, it is true, he soon abandons: he endeavours to explain the comic as an after-effect of the joys of childhood. ‘Peut-être même devrions-nous pousser la simplification plus loin encore, remonter à nos souvenirs les plus anciens, chercher dans les jeux qui amusèrent l’enfant la première ébauche des combinaisons qui font rire l’homme . . . Trop souvent surtout nous méconnaissons ce qu’il y a d’encore enfantin, pour ainsi dire, dans la plupart de nos émotions joyeuses.’ (Bergson, 1900, 68 ff.)² Since we have traced back jokes to children’s play with words and thoughts which has been frustrated by rational criticism we cannot help feeling tempted to investigate the infantile roots which Bergson suspects in the case of the comic as well.

[1905c, 1798]

And, in fact, if we examine the relation of the comic to the child we come upon a whole number of connections which seem promising. Children themselves do not strike us as in any way comic, though their nature fulfils all the conditions which, if we compare it with our own nature, yield a comic difference: the excessive expenditure on movement as well as the small intellectual expenditure, the domination of the mental functions by the bodily ones, and other features. A child only produces a comic effect on us when he conducts himself not as a child but as a serious adult, and he produces it then in the same way as other people who disguise themselves. But so long as he retains his childish nature the perception of him affords us a pure pleasure, perhaps one that reminds us slightly of the comic. We call him naïve, in so far as he shows us his lack of inhibition, and we describe as naïvely comic those of his utterances which in another person we should have judged obscenities or jokes.

[1905c, 1799]

On the other hand, children are without a feeling for the comic. This assertion seems to say no more than that the comic feeling, like such a number of other things, only starts at some point in the course of mental development; and this would be by no means surprising, especially as it has to be admitted that the feeling already emerges clearly at an age which has to be counted as part of childhood. But it can nevertheless be shown that the assertion that children lack the feeling of the comic contains more than something self-evident. In the first place, it is easy to see that it could not be otherwise if our view is correct which derives the comic feeling from a difference in expenditure that arises in the course of understanding another person. Let us once again take the comic of movement as an example. The comparison which provides the difference runs (stated in conscious formulas): ‘That is how he does it’ and ‘This is how I should do it, how I did it’. But a child is without the standard contained in the second sentence; he understands simply by mimicry: he does it in just the same way. The child’s upbringing presents him with a standard: ‘this is how you ought to do it.’ If he now makes use of this standard in making the comparison, he will easily conclude: ‘he did not do it right’ and ‘I can do it better’. In this case he laughs at the other person, he laughs at him in the feeling of his own superiority. There is nothing to prevent our deriving this laughter too from a difference in expenditure; but on the analogy of the cases of laughing at people that we have come across we may infer that the comic feeling is not present in a child’s superior laughter. It is a laughter of pure pleasure. In our own case when we have a clear judgement of our own superiority, we merely smile instead of laughing, or, if we laugh, we can nevertheless distinguish this becoming conscious of our superiority from the comic that makes us laugh.

[1905c, 1799]
It is probably right to say that children laugh from pure pleasure in a variety of circumstances that we feel as 'comic' and cannot find the motive for, whereas a child's motives are clear and can be stated. For instance, if someone slips in the street and falls down we laugh because the impression - we do not know why - is comic. A child laughs in the same case from a feeling of superiority or from Schadenfreude: 'You've fallen down, I haven't.' Certain motives for pleasure in children seem to be lost to us adults, and instead in the same circumstances we have the 'comic' feeling as a substitute for the lost one.

If one might generalize, it would seem most attractive to place the specific characteristic of the comic which we are in search of in an awakening of the infantile - to regard the comic as the regained 'lost laughter of childhood'. One could then say: 'I laugh at a difference in expenditure between another person and myself, every time I rediscover the child in him.' Or, put more exactly, the complete comparison which leads to the comic would run: 'That is how he does it - I do it in another way - he does it as I used to do it as a child.'

Thus the laughter would always apply to the comparison between the adult's ego and the child's ego. Even the lack of uniformity in the comic difference - the fact that what seems to me comic is sometimes a greater and sometimes a smaller expenditure - would fit in with the infantile determinant; actually what is comic is invariably on the infantile side.

This is not contradicted by the fact that, when children themselves are the object of the comparison, they do not give me a comic impression but a purely pleasurable one; nor is it contradicted because the comparison with the infantile only produces a comic effect if any other use of the difference is avoided. For these are matters concerned with the conditions governing discharge. Whatever brings a psychical process into connection with others operates against the discharge of the surplus cathexis and puts it to some other use; whatever isolates a psychical act encourages discharge. A conscious attitude to children as objects of comparison therefore makes impossible the discharge that is necessary for comic pleasure. Only when the cathexis is preconscious is there an approximation to an isolation such as, incidentally, we may ascribe to the mental processes in children as well. The addition to the comparison ('I did it like that as a child too') from which the comic effect is derived would thus only come into consideration, as far as differences of medium magnitude are concerned, if no other nexus could gain control over the liberated surplus.

If we pursue our attempt to discover the essence of the comic in a preconscious link with the infantile, we must go a step further than Bergson and admit that a comparison need not, in order to produce the comic, arouse old childish pleasures and childish play; it will be enough for it to touch upon childish nature in general, and perhaps even on childish suffering. Here we shall be parting from Bergson but remaining in agreement with ourselves if we connect comic pleasure not with recollected pleasure but once more with a comparison. It may be that cases of the former kind may coincide with the invariably and irresistibly comic.

Let us at this point review the scheme which we drew up earlier of the various comic possibilities. We remarked that the comic difference was found either
(a) by a comparison between another person and oneself, or
(b) by a comparison entirely within the other person, or
(c) by a comparison entirely within oneself.
We found relatively great difficulties in understanding the comic of mimicry so long as we left the infantile factor out of account. But mimicry is the child's best art and the driving motive of most of his games. A child's ambition aims far less at excelling among his equals than at mimicking the grown-ups. The relation of children to adults is also the basis of the comic of degradation, which corresponds to the condescension shown by adults in their attitude to the life of children. There is little that gives children greater pleasure than when a grown-up lets himself down to their level, renounces his oppressive superiority and plays with them as an equal. This relief, which gives the child pure pleasure, becomes in adults, in the form of degradation, a means of making things comic and a source of comic pleasure. As regards unmasking, we know that it goes back to degradation.

We come up against the most difficulties in finding the infantile basis of the third case, the comic of expectation, which no doubt explains why those authorities who have put this case first in their discussion of the comic have found no occasion for taking account of the infantile factor in the comic. The comic of expectation is no doubt the remotest in children; the capacity to grasp it is the latest to appear. In most of the instances which seem comic to an adult a child would probably feel only disappointment. We might, however, take the child's power of blissful expectation and credulity as a basis for understanding how we appear to ourselves comic 'as a child' when we meet with a comic disappointment.

What we have said would seem to suggest a certain probability for a translation of the comic feeling that might run; 'Those things are comic which are not proper for an adult.' Nevertheless I do not feel bold enough, in virtue of my whole attitude to the problem of the comic, to defend this last assertion with as much seriousness as my earlier ones. I am unable to decide whether degradation to being a child is only a special case of comic degradation, or whether everything comic is based fundamentally on degradation to being a child.¹

An enquiry which deals with the comic, however cursorily, would be seriously incomplete if it did not find room for at least a few remarks about humour. The essential kinship between the two is so little open to doubt that an attempt at explaining the comic is bound to make at least some contribution to an understanding of humour. However much that is pertinent and impressive may have been brought forward in the appreciation of humour (which, itself one of the highest psychical achievements, enjoys the particular favour of thinkers), yet we cannot evade an attempt at giving expression to its nature by an approach to the formulas for jokes and for the comic.
We have seen that the release of distressing affects is the greatest obstacle to the emergence of the comic. As soon as the aimless movement does damage, or the stupidity leads to mischief, or the disappointment causes pain, the possibility of a comic effect is at an end. This is true, at all events, for a person who cannot ward off such unpleasure, who is himself its victim or is obliged to have a share in it; whereas a person who is not concerned shows by his demeanour that the situation involved contains everything that is required for a comic effect. Now humour is a means of obtaining pleasure in spite of the distressing affects that interfere with it; it acts as a substitute for the generation of these affects, it puts itself in their place. The conditions for its appearance are given if there is a situation in which, according to our usual habits, we should be tempted to release a distressing affect and if motives then operate upon us which suppress that affect in statu nascendi. In the cases that have just been mentioned the person who is the victim of the injury, pain, and so on, might obtain humorous pleasure, while the unconcerned person laughs from comic pleasure. The pleasure of humour, if this is so, comes about - we cannot say otherwise - at the cost of a release of affect that does not occur: it arises from an economy in the expenditure of affect.

[1905c, 1803]

The ingenious knight Don Quixote de la Mancha is, on the contrary, a figure who possesses no humour himself but who with his seriousness offers us a pleasure which could be called humorous, though its mechanism shows an important divergence from that of humour. Don Quixote is originally a purely comic figure, a big child; the phantasies from his books of chivalry have gone to his head. It is well known that to begin with the author intended nothing else of him and that his creation gradually grew far beyond its creator's first intentions. But after the author had equipped this ridiculous figure with the deepest wisdom and the noblest purposes and had made him into the symbolic representative of an idealism which believes in the realization of its aims and takes duties seriously and takes promises literally, this figure ceased to have a comic effect. Just as in other cases humorous pleasure arises from the prevention of an emotion, so it does here from the interference with comic pleasure. But it is clear that these examples have already carried us a long way from the simple cases of humour.

[1905c, 1805]

The species of humour are extraordinarily variegated according to the nature of the emotion which is economized in favour of the humour: pity, anger, pain, tenderness, and so on. Their number seems to remain uncompleted because the kingdom of humour is constantly being enlarged whenever an artist or writer succeeds in submitting some hitherto unconquered emotions to the control of humour, in making them, by devices like those in the examples we have given, into sources of humorous pleasure. The artists in Simplicissimus, for instance, have had astonishing results in achieving humour at the cost of horror and disgust. The forms in which humour is manifested are, moreover, determined by two peculiarities which are connected with the conditions under which it is generated. Humour may, in the first place, appear merged with a joke or some other species of the comic; in that case its task is to get rid of a possibility implicit in the situation that an affect may be generated which would interfere with the pleasurable outcome. In the second place, it may stop this generating of an affect entirely or only partially; this last is actually the commoner case since it is easier to bring about, and it produces the various forms of 'broken' humour - the humour that smiles through tears. It withdraws a part of its energy from the affect and in exchange gives it a tinge of humour.

[1905c, 1806]
On the whole humour is closer to the comic than to jokes. It shares with the former its psychical localization in the preconscious whereas jokes, as we have had to suppose, are formed as a compromise between the unconscious and the preconscious. On the other hand humour does not participate in a peculiar characteristic common to jokes and the comic, on which we have perhaps not yet laid sufficient stress. It is a necessary condition for generating the comic that we should be obliged, *simultaneously or in rapid succession*, to apply to one and the same act of ideation two different ideational methods, between which the 'comparison' is then made and the comic difference emerges. Differences in expenditure of this kind arise between that belongs to someone else and to oneself, between what is as usual and what has been changed, between what is expected and what happens.¹ In the case of jokes, the difference between two simultaneous methods of viewing things, which operate with a different expenditure, applies to the process in the person who hears the joke. One of these two views, following the hints contained in the joke, passes along the path of thought through the unconscious; the other stays on the surface and views the joke like any other wording that has emerged from the preconscious and become conscious. We should perhaps be justified in representing the pleasure from a joke that is heard as being derived from the difference between these two methods of viewing it.² Here we are saying of jokes what we described as their possessing a Janus head, while the relation between jokes and the comic had still to be cleared up.³

¹ If we are prepared to do a little violence to the concept of 'expectation', we can, following Lipps, include a very large region of the comic under the comic of expectation. But what are probably the most basic instances of the comic, those arising from a comparison between someone else's expenditure and one's own, would be the very ones that fitted in least easily to this grouping.

² We are now at the end of our task, having reduced the mechanism of humorous pleasure to a formula analogous to those for comic pleasure and for jokes. The pleasure in jokes has seemed to us to arise from an economy in expenditure upon inhibition, the pleasure in the comic from an economy in expenditure upon ideation (upon cathexis) and the pleasure in humour from an economy in expenditure upon feeling. In all three modes of working of our mental apparatus the pleasure is derived from an economy. All three are agreed in representing methods of regaining from mental activity a pleasure which has in fact been lost through the development of that activity. For the euphoria which we endeavour to reach by these means is nothing other than the mood of a period of life in which we were accustomed to deal with our psychical work in general with a small expenditure of energy - the mood of our childhood, when we were ignorant of the comic, when we were incapable of jokes and when we had no need of humour to make us feel happy in our life.
In this place I shall only follow up one of the consequences which seem possible from this point of view, thus resuming the discussion of a problem which I was obliged to leave unsolved elsewhere.¹ Each of the mental differentiations that we have become acquainted with represents a fresh aggravation of the difficulties of mental functioning, increases its instability, and may become the starting-point for its breakdown, that is, for the onset of a disease. Thus, by being born we have made the step from an absolutely self-sufficient narcissism to the perception of a changing external world and the beginnings of the discovery of objects. And with this is associated the fact that we cannot endure the new state of things for long, that we periodically revert from it, in our sleep, to our former condition of absence of stimulation and avoidance of objects. It is true, however, that in this we are following a hint from the external world, which, by means of the periodical change of day and night, temporarily withdraws the greater part of the stimuli that affect us. The second example of such a step, pathologically more important, is subject to no such qualification. In the course of development we have effected a separation of our mental existence into a coherent ego and into an unconscious and repressed portion which is left outside it; and we know that the stability of this new acquisition is exposed to constant shocks. In dreams and in neuroses what is thus excluded knocks for admission at the gates, guarded though they are by resistances; and in our waking health we make use of special artifices for allowing what is repressed to circumvent the resistances and for receiving it temporarily into our ego to the increase of our pleasure. Jokes and humour, and to some extent the comic in general, may be regarded in this light. Everyone acquainted with the psychology of the neuroses will think of similar examples of less importance; but I hasten on to the application I have in view.

It is now time to acquaint ourselves with a few of the characteristics of humour. Like jokes and the comic, humour has something liberating about it; but it also has something of grandeur and elevation, which is lacking in the other two ways of obtaining pleasure from intellectual activity. The grandeur in it clearly lies in the triumph of narcissism, the victorious assertion of the ego's invulnerability. The ego refuses to be distressed by the provocations of reality, to let itself be compelled to suffer. It insists that it cannot be affected by the traumas of the external world; it shows, in fact, that such traumas are no more than occasions for it to gain pleasure. This last feature is a quite essential element of humour. Let us suppose that the criminal who was being led to execution on Monday had said: 'It doesn't worry me. What does it matter, after all, if a fellow like me is hanged? The world won't come to an end because of it.' We should have to admit that such a speech does in fact display the same magnificent superiority over the real situation. It is wise and true; but it does not betray a trace of humour. Indeed, it is based on an appraisal of reality which runs directly counter to the appraisal made by humour. Humour is not resigned; it is rebellious. It signifies not only the triumph of the ego but also of the pleasure principle, which is able here to assert itself against the unkindness of the real circumstances.

I think, therefore, that the possibility I have suggested here, that in a particular situation the subject suddenly hypercathects his super-ego and then, proceeding from it, alters the reactions of the ego, is one which deserves to be retained. Moreover, what I have suggested about humour finds a remarkable analogy in the kindred field of jokes. As regards the origin of jokes I was led to assume that a preconscious thought is given over to a moment to unconscious revision. A joke is thus the contribution made to the comic by the unconscious. In just the same way, *humour would be the contribution made to the comic through the agency of the super-ego.*
It is as though (Lipps comments), the Mühl [trouble, to-do] were an instrument like the fork. We have a feeling, however, that these lines, though they are very comic, are far from being a joke, while Heine’s list undoubtedly is one. We may perhaps recall these examples later, when we need no longer evade the problem of the relation between the comic and jokes.

[1905c, 1668]

The second fact which makes an enquiry into the subjective determination of jokes necessary is the generally recognized experience that no one can be content with having made a joke for himself alone. An urge to tell the joke to someone is inextricably bound up with the joke-work; indeed, this urge is so strong that often enough it is carried through in disregard of serious misgivings. In the case of the comic as well, telling it to someone else produces enjoyment; but the demand is not peremptory. If one comes across something comic, one can enjoy it by oneself. A joke, on the contrary, must be told to someone else. The psychical process of constructing a joke seems not to be completed when the joke occurs to one: something remains over which seeks, by communicating the idea, to bring the unknown process of constructing the joke to a conclusion.

[1905c, 1731]

We cannot in the first instance guess what the basis may be of this urge to communicate the joke. But we can see another peculiarity in jokes which distinguishes them from the comic. If I come across something comic, I myself can laugh heartily at it, though it is true that I am also pleased if I can make someone else laugh by telling it to him. But I myself cannot laugh at a joke that has occurred to me, that I have made, in spite of the unmistakable enjoyment that the joke gives me. It is possible that my need to communicate the joke to someone else is in some way connected with the laughter produced by it, which is denied to me but is manifest in the other person.

[1905c, 1731]
We have approached the problems of the comic in an unusual way. It seemed to us that jokes, which are ordinarily regarded as a sub-species of the comic, offer enough peculiarities to be attacked directly; thus we have avoided their relation to the more inclusive category of the comic so long as that was possible, though we have not failed to pick out en passant a few hints that might throw light on the comic. We have had no difficulty in discovering that socially the comic behaves differently from jokes. It can be content with two persons: a first who finds what is comic and a second in whom it is found. The third person, to whom the comic thing is told, intensifies the comic process but adds nothing new to it. In a joke this third person is indispensable for the completion of the pleasure-producing process; but on the other hand the second person may be absent, except where a tendentious, aggressive joke is concerned. A joke is made, the comic is found - and first and foremost in people, only by a subsequent transference in things, situations, and so on, as well. As regards jokes, we know that the sources of the pleasure that is to be fostered lie in the subject himself and not in outside people. We have seen, too, that jokes can sometimes re-open sources of the comic which have become inaccessible, and that the comic often serves as a façade for a joke and replaces the fore-pleasure which has otherwise to be produced by the familiar technique (p. 1739). None of this precisely suggests that the relations between jokes and the comic are very simple. On the other hand, the problems of the comic have proved so complicated and all the efforts of the philosophers at solving them have been so unsuccessful that we cannot hold out any prospect that we shall be able to master them in a sudden onslaught, as it were, by approaching them from the direction of jokes. Moreover, for our investigation of jokes we brought with us an instrument of which no one else had hitherto made use - a knowledge of the dream-work. We have no similar advantage at our command to help us to understand the comic, and we must therefore expect that we shall discover no more about the nature of the comic than what we have already found in jokes, in so far as they form part of the comic and possess in their own nature certain of its features unchanged or merely modified.

[1905c, 1762]

Under the heading of 'unmasking' we may also include a procedure for making things comic with which we are already acquainted - the method of degrading the dignity of individuals by directing attention to the frailties which they share with all humanity, but in particular the dependence of their mental functions on bodily needs. The unmasking is equivalent here to an admonition: such and such a person, who is admired as a demigod, is after all only human like you and me. Here, too, are to be placed the efforts at laying bare the monotonous psychical automatism that lies behind the wealth and apparent freedom of psychical functions. We came across examples of 'unmasking' of this kind in the marriage-broker jokes, and felt a doubt at the time whether these anecdotes have a right to be counted as jokes. We are now able to decide with greater certainty that the anecdote of the echo who reinforced all the assertions of the marriage-broker and finally confirmed his admission that the bride had a hump with the exclamation 'And what a hump!' - that this anecdote is essentially a comic story, an example of the unmasking of a psychical automatism. Here, however, the comic story is only serving as a façade. For anyone who will attend to the hidden meaning of the marriage-broker anecdotes, the whole thing remains an admirably staged joke; anyone who does not penetrate so far is left with a comic story. The same thing applies to the other joke, about the marriage-broker who, in order to answer an objection, ended by confessing the truth with a cry of 'But I ask you, who would lend such people anything?'. Here again we have a comic unmasking as the façade for a joke, though in this instance the characteristic of a joke is much more unmistakable, since the marriage-broker's remark is at the same time a representation by the opposite. In trying to prove that the people are rich he at the same time proves that they are not rich, but very poor. Here a joke and the comic are combined, and teach us that the same remark can be both things at once.

[1905c, 1781]
We are glad to seize the opportunity of returning to jokes from the comic of unmasking, since our true problem is not to determine the nature of the comic but to throw light on the relation between jokes and the comic. We have discussed the uncovering of psychical automatism, in a case in which our feeling as to whether something is comic or a joke left us in the lurch. And we will now add another case in which there is a similar confusion between jokes and the comic - the case of nonsensical jokes. But our investigation will show us in the end that as regards this second case the convergence between jokes and the comic can be theoretically accounted for.

There is a similar comic story of a Hungarian village in which the blacksmith had been guilty of a capital offence. The burgomaster, however, decided that as a penalty a tailor should be hanged and not the blacksmith, because there were two tailors in the village but no second blacksmith, and the crime must be expiated. A displacement of this kind from the figure of the guilty person to another naturally contradicts every law of conscious logic but by no means the mode of thought of the unconscious. I do not hesitate to call this story comic, and yet I have included the one about the kettle among the jokes. I will now admit that this latter story too is far more correctly described as 'comic' rather than as a joke. But I now understand how it is that my feeling, which is as a rule so sure, can leave me in doubt as to whether this story is comic or a joke. This is a case in which I cannot come to a decision on the basis of my feeling - when, that is, the comic arises from the uncovering of a mode of thought that is exclusively proper to the unconscious. A story like this may be comic and a joke at the same time; but it will give me the impression of being a joke, even if it is merely comic, because the use of the faulty reasoning of the unconscious reminds me of jokes, just as did the manoeuvres for uncovering what is not manifestly comic (p. 1781).

I set great store by clarifying this most delicate point in my arguments - the relation of jokes to the comic; and I will therefore supplement what I have said with a few negative statements. I may first draw attention to the fact that the instance of the convergence of jokes and the comic which I am dealing with here is not identical with the former one (p. 1781). It is true that the distinction is a rather narrow one, but it can be made with certainty. In the earlier case the comic arose from the uncovering of psychical automatism. This, however, is by no means peculiar to the unconscious alone, nor does it play any striking part in the technique of jokes. Unmasking only comes into relation with jokes accidentally, when it serves some other joke-technique, such as representation by the opposite. But in the case of giving free play to unconscious modes of thought the convergence of jokes and the comic is a necessary one, since the same method which is used here by the first person of the joke as a technique for releasing pleasure must from its very nature produce comic pleasure in the third person.

One might be tempted to generalize from this last case and look for the relation of jokes to the comic in the notion that the effect of jokes on the third person takes place according to the mechanism of comic pleasure. But there is no question of this being so. Contact with the comic is by no means to be found in all jokes or even in the majority of them; in most cases, on the contrary, a clear distinction is to be made between jokes and the comic. Whenever a joke succeeds in escaping the appearance of nonsense - that is, in most jokes accompanied by double meaning and allusion - there is no trace to be found in the hearer of any effect resembling the comic. This may be tested in the examples I have given earlier, or on a few new ones that I can bring up:
It might further be thought that at any rate all jokes with a façade of nonsense will seem comic and must produce a comic effect. But I must recall that jokes of this kind very often affect the hearer in another way and provoke bewilderment and a tendency to repudiation (see p. 1727 n.). Thus it evidently depends on whether the nonsense of a joke appears as comic or as sheer ordinary nonsense - and we have not yet investigated what determines this. We therefore stick to our conclusion that jokes are from their nature to be distinguished from the comic and only converge with it, on the one hand in certain special cases, and on the other hand in their aim of obtaining pleasure from intellectual sources.
[1905c, 1785]

During these enquiries into the relations between jokes and the comic the distinction has become plain to us which we must emphasize as the most important and which points at the same time to a main psychological characteristic of the comic. We found ourselves obliged to locate the pleasure in jokes in the unconscious; no reason is to be found for making the same localization in the case of the comic. On the contrary, all the analyses we have hitherto made have pointed to the source of comic pleasure being a comparison between two expenditures both of which must be ascribed to the preconscious. Jokes and the comic are distinguished first and foremost in their psychical localization; the joke, it may be said, is the contribution made to the comic from the realm of the unconscious.
[1905c, 1785]
There is no need to apologize for this digression, since the relation of jokes to the comic was the reason for our being forced into an investigation of the comic. But it is certainly time we returned to our previous topic - the discussion of the methods which serve for making things comic. We considered caricature and unmasking first, because we can derive some indications from these two for the analysis of the comic of mimicry. As a rule, no doubt, mimicry is permeated with caricature - the exaggeration of traits that are not otherwise striking -, and it also involves the characteristic of degradation. But this does not seem to exhaust its nature. It cannot be disputed that it is in itself an extraordinarily fertile source of comic pleasure, for we laugh particularly at the faithfulness of a piece of mimicry. It is not easy to give a satisfactory explanation of this unless one is prepared to adopt the view held by Bergson (1900), which approximates the comic of mimicry to the comic due to the discovery of psychical automatism. Bergson's opinion is that everything in a living person that makes one think of an inanimate mechanism has a comic effect. His formula for this runs 'mécanisation de la vie'. He explains the comic of mimicry by starting out from a problem raised by Pascal in his Pensées of why it is that one laughs when one compares two similar faces neither of which has a comic effect by itself. 'What is living should never, according to our expectation, be repeated exactly the same. When we find such a repetition we always suspect some mechanism lying behind the living thing.' When one sees two faces that resemble each other closely, one thinks of two impressions from the same mould or of some similar mechanical procedure. In short, the cause of laughter in such cases would be the divergence of the living from the inanimate, or, as we might say, the degradation of the living to the inanimate (ibid., 35). If, moreover, we were to accept these plausible suggestions of Bergson's, we should not find it difficult to include his view under our own formula. Experience has taught us that every living thing is different from every other and calls for a kind of expenditure by our understanding; and we find ourselves disappointed if, as a result of complete conformity or deceptive mimicry, we need make no fresh expenditure. But we are disappointed in the sense of a relief, and the expenditure on expectation which has become superfluous is discharged by laughter. The same formula would also cover all the cases which Bergson considers of comic rigidity ('raideur'), of professional customs, fixed ideas, and turns of speech repeated on every possible occasion. All these cases would go back to a comparison between the expenditure on expectation and the expenditure actually required for an understanding of something that has remained the same; and the larger amount needed for expectation would be based on observation of the multiplicity and plasticity of living things. In the case of mimicry, accordingly, the source of the comic pleasure would be not the comic of situation but of expectation.

Since we derive comic pleasure in general from a comparison, it is incumbent on us to examine the comic of comparison itself; and this, indeed, serves as a method of making things comic. Our interest in this question will be increased when we recall that in the case of analogies, too, we often found that our 'feeling' left us in the lurch as to whether something was to be called a joke or merely comic (p. 1680 f.).
A comparison can, however, as we have already seen, be in the nature of a joke, without a trace of comic admixture - precisely, that is, when it avoids degradation. Thus the comparison of truth with a torch that cannot be carried through a crowd without singeing someone's beard is purely in the nature of a joke, because it takes a watered-down turn of speech ('the torch of truth') at its full value, and it is not comic, because a torch as an object, though it is a concrete thing, is without a certain distinction. But a comparison can just as easily be a joke and comic as well, and can be each independently of the other, since a comparison can be of help to certain techniques of jokes, such as unification or allusion. In this way Nestroy's comparison of memory to a 'warehouse' (p. 1683) is at once comic and a joke - the former because of the extraordinary degradation which the psychological concept has to put up with in being compared to a 'warehouse', and the latter because the person making use of the comparison is a clerk, who thus establishes in the comparison a quite unexpected unification between psychology and his profession. Heine's phrase 'till at last all the buttons burst on the breeches of my patience' seems at first sight to be no more than a remarkable example of a comically degrading comparison; but on further consideration we must also allow it the characteristics of a joke, since the comparison, as a means of allusion, impinges on the region of the obscene and so succeeds in liberating pleasure in the obscene. The same material, by what is admittedly not an entirely chance coincidence, provides us with a yield of pleasure which is simultaneously comic and of the character of a joke. If the conditions of the one favour the generation of the other, their union has a confusing effect on the 'feeling' which is supposed to tell us whether we are being offered a joke or something comic, and a decision can only be arrived at by an attentive investigation that has been freed from any predisposition to a particular kind of pleasure.

We therefore readily recall that many authorities do not recognize the sharp conceptual and material distinction between jokes and the comic to which we have found ourselves led, and that they regard jokes as simply 'the comic of speech' or 'of words'. In order to test this view we will choose one example each of something intentionally and of something involuntarily comic in words to compare with jokes. We have remarked earlier that we believe ourselves very well able to distinguish a comic remark from a joke:

² We can accept this formula without question, since it leads to nothing that would contradict our earlier discussions. The difference between the two expenditures must in essence come down to the inhibitory expenditure that is saved. The lack of this economy in inhibition in the case of the comic, and the absence of quantitative contrast in the case of jokes, would determine the distinction between the comic feeling and the impression of a joke, in spite of their agreeing in the characteristic of using two kinds of ideational activity for the same view.
It is now time to acquaint ourselves with a few of the characteristics of humour. Like jokes and the comic, humour has something liberating about it; but it also has something of grandeur and elevation, which is lacking in the other two ways of obtaining pleasure from intellectual activity. The grandeur in it clearly lies in the triumph of narcissism, the victorious assertion of the ego’s invulnerability. The ego refuses to be distressed by the provocations of reality, to let itself be compelled to suffer. It insists that it cannot be affected by the traumas of the external world; it shows, in fact, that such traumas are no more than occasions for it to gain pleasure. This last feature is a quite essential element of humour. Let us suppose that the criminal who was being led to execution on Monday had said: 'It doesn't worry me. What does it matter, after all, if a fellow like me is hanged? The world won't come to an end because of it.' We should have to admit that such a speech does in fact display the same magnificent superiority over the real situation. It is wise and true; but it does not betray a trace of humour. Indeed, it is based on an appraisal of reality which runs directly counter to the appraisal made by humour. Humour is not resigned; it is rebellious. It signifies not only the triumph of the ego but also of the pleasure principle, which is able here to assert itself against the unkindness of the real circumstances. [1927d, 4542]

I think, therefore, that the possibility I have suggested here, that in a particular situation the subject suddenly hypercathects his super-ego and then, proceeding from it, alters the reactions of the ego, is one which deserves to be retained. Moreover, what I have suggested about humour finds a remarkable analogy in the kindred field of jokes. As regards the origin of jokes I was led to assume that a preconscious thought is given over for a moment to unconscious revision. A joke is thus the contribution made to the comic by the unconscious. In just the same way, humour would be the contribution made to the comic through the agency of the super-ego. [1927d, 4545]
Here is a joke that is said to have been made during an examination in jurisprudence. The candidate had to translate a passage in the Corpus Juris: "'Labeo ait' . . . I fall, says he.' 'You fail, say I', replied the examiner, and the examination was at an end. Anyone who mistakes the name of the great jurist for a verbal form, and moreover one wrongly recalled, no doubt deserves nothing better. But the technique of the joke lies in the fact that almost the same words which proved the ignorance of the candidate were used to pronounce his punishment by the examiner. The joke is, moreover, an example of 'ready repartee', the technique of which, as we shall see, does not differ greatly from what we are illustrating here. [1905c, 1639]
Or when Simplicissimus describes a collection of incredible pieces of brutality and cynicism as the expressions of 'men of feeling', this too is a representation by the opposite. But we call this 'irony' and no longer a joke. The only technique that characterizes irony is representation by the opposite. Moreover we read and hear of 'ironical jokes'. So it can no longer be doubted that technique alone is insufficient to characterize the nature of jokes. Something further is needed which we have not yet discovered. But on the other hand it remains an uncontradicted fact that if we undo the technique of a joke it disappears. For the time being we may find difficulty in thinking how these two fixed points that we have arrived at in explaining jokes can be reconciled.

[1905c, 1672]

Among the techniques common to jokes and dreams, representation by the opposite and the use of nonsense claim some amount of our interest. The former is one of the more effective methods employed in jokes, as may be seen among others by the examples of 'overstatement jokes' (p. 1670 f.). Incidentally, representation by the opposite is not able, like most other joke-techniques, to escape conscious attention. A person who tries to bring the joke-work into operation in himself as deliberately as possible - a professional wag - soon discovers as a rule that the easiest way of replying to an assertion by a joke is by asserting its contrary and by leaving it to the inspiration of the moment to get rid of the objection which his contradiction is likely to provoke, by giving what he has said a fresh interpretation. It may be that representation by the opposite owes the favour it enjoys to the fact that it forms the core of another pleasurable way of expressing a thought, which can be understood without any need for bringing in the unconscious. I am thinking of irony, which comes very close to joking and is counted among the sub-species of the comic. Its essence lies in saying the opposite of what one intends to convey to the other person, but in sparing him contradiction by making him understand - by one's tone of voice, by some accompanying gesture, or (where writing is concerned) by some small stylistic indications - that one means the opposite of what one says. Irony can only be employed when the other person is prepared to hear the opposite, so that he cannot fail to feel an inclination to contradict. As a result of this condition, irony is exposed particularly easily to the danger of being misunderstood. It brings the person who uses it the advantage of enabling him readily to evade the difficulties of direct expression, for instance in invectives. It produces comic pleasure in the hearer, probably because it stirs him into a contradictory expenditure of energy which is at once recognized as being unnecessary. A comparison like this between jokes and a closely related type of the comic may confirm our assumption that what is peculiar to jokes is their relation to the unconscious and that this may perhaps distinguish them from the comic as well.¹

[1905c, 1757]
¹ The goodness of these jokes depends on the fact that another technical method of a far higher order is simultaneously brought into use (see below). - At this point I may also draw attention to a connection between jokes and riddles. The philosopher Brentano composed a kind of riddle in which a small number of syllables had to be guessed which when they were put together into words gave a different sense according as they were grouped in one way or another. For instance: '. . . liess mich das Platanenblatt ahnen' ['the plane-tree leaf (Platanenblatt) led me to think (ahnen)', where 'Platanen' and 'blatt ahnen' sound almost the same]. Or: 'wie du dem Inder hast verschrieben, in der Hast verschrieben' ['when you wrote a prescription for the Indian, in your haste you made a slip of the pen', where 'Inder hast (have to the Indian)' and 'in der hast (in your haste)' sound the same.]

[1905c, 1637]

¹ In order to give a better description of 'unification' than the examples above allow of, I will make use of something I have already mentioned - namely the peculiar negative relation that holds between jokes and riddles, according to which the one conceals what the other exhibits. Many of the riddles with the production of which G. T. Fechner, the philosopher, passed his time when he was blind, are characterized by a high degree of unification, which lends them a special charm. Take, for instance, as a neat example, Riddle No. 203 (Dr. Mises' Rätselbüchlein, 4th edition, enlarged, N.D.):

[1905c, 1667]

If the person in whom the joke is formed cannot laugh, this, as we have already said, points to a divergence from what happens in the third person that lies either in the lifting of the inhibitory cathexis or in the possibility of its discharge. But the first of these alternatives will not meet the case, as we shall see at once. The inhibitory cathexis must have been lifted in the first person as well, or otherwise no joke would have come about, since its formation was precisely in order to overcome a resistance of that kind; otherwise, too, it would be impossible for the first person to feel the pleasure in the joke which we have been obliged to trace back precisely to the lifting of the inhibition. All that remains, then, is the other alternative, namely that the first person cannot laugh, although he feels pleasure, because there is an interference with the possibility of discharge. An interference of this kind with the possibility of discharge, which is a necessary precondition of laughter, may arise from the liberated cathectic energy being immediately applied to some other endopsychic use. It is a good thing that our attention has been drawn to that possibility; and our interest in it will very soon be further engaged. Another condition, however, leading to the same result, may be realized in the first person of a joke. It is possible that no quota of energy at all that is capable of being manifested may be liberated, in spite of the lifting of the inhibitory cathexis. In the first person of a joke the joke-work is performed, which must correspond to a certain quota of new psychical expenditure. Thus the first person himself produces the force which lifts the inhibition. This no doubt results in a yield of pleasure for him, and even, in the case of tendentious jokes, a very considerable one, since the fore-pleasure obtained by the joke-work itself takes over the lifting of further inhibitions; but the expenditure on the joke-work is in every case deducted from the yield resulting from the lifting of the inhibition - an expenditure which is the same as the one which the hearer of the joke avoids. What I have just said may be confirmed by observing that a joke loses its effect of laughter even in the third person as soon as he is required to make an expenditure on intellectual work in connection with it. The allusions made in a joke must be obvious and the omissions easy to fill; an awakening of conscious intellectual interest usually makes the effect of the joke impossible. There is an important distinction here between jokes and riddles. Perhaps the psychical constellation during the joke-work is in general not favourable to the free discharge of what has been gained. We are not, it seems, in a position to see further on this point; we have been more successful in throwing light on one part of our problem - on why the third person laughs - than on its other part - on why the first person does not laugh.

[1905c, 1737]
It appears to be far from easy to avoid the endopsychic employment of cathexes that have become superfluous, for in our thought-processes we are constantly in the habit of displacing such cathexes from one path to another without losing any of their energy by discharge. Jokes make use of the following methods with that aim in view. Firstly, they try to keep their expression as short as possible, so as to offer fewer points of attack to the attention. Secondly, they observe the condition of being easy to understand (see above); as soon as they call for intellectual work which would demand a choice between different paths of thought, they would endanger their effect not only by the unavoidable expenditure of thought but also by the awakening of attention. But besides this they employ the device of distracting attention by putting forward something in the joke’s form of expression which catches it, so that in the meantime the liberation of the inhibitory cathexis and its discharge may be completed without interruption. This aim is already fulfilled by the omissions in the joke’s wording; they offer an incitement to filling up the gaps and in that way succeed in withdrawing the joking process from attention. Here the technique of riddles, which attract the attention, is, as it were, brought into the service of the joke-work. Far more effective even are the façades which we have found especially in some groups of tendentious jokes (p. 1699 ff.). The syllogistic façades admirably fulfil the aim of holding the attention by setting it a task. While we are beginning to wonder what was wrong with the reply, we are already laughing; our attention has been caught unawares and the discharge of the liberated inhibitory cathexis has been completed. The same is true of jokes with a comic façade, in which the comic comes to the help of the joke-technique. A comic façade encourages the effectiveness of a joke in more than one way; not only does it make the automatism of the joking process possible, by holding the attention, but it also facilitates the discharge by the joke, by sending on ahead a discharge of a comic kind. The comic is here operating exactly like a bribing fore-pleasure, and we can in this way understand how some jokes are able to renounce entirely the fore-pleasure produced by the ordinary methods of joking and make use only of the comic for fore-pleasure. Among the joke-techniques proper, it is in particular displacement and representation by something absurd which, apart from their other qualifications, give rise, too, to a distraction of the attention which is desirable for the automatic course of the joking process.

For there are other easily intelligible cases in which inadequacy of this kind as compared with what ought to be effected makes the nonsense irresistibly comic. The counterpart of jokes - riddles - can perhaps offer us better examples of this than jokes themselves. For instance, here is a ‘facetious question’: ‘What is it that hangs on the wall and that one can dry one's hands on?’ It would be a stupid riddle if the answer were ‘a hand-towel’. But that answer is rejected. - ‘No, a herring.’ - ‘But for heaven's sake’, comes the infuriated protest ‘a herring doesn't hang on the wall.’ - ‘You can hang it up there.’ - ‘But who in the world is going to dry his hands on a herring?’ - ‘Well,’ is the soothing reply, ‘you don't have to.’ This explanation, given by means of two typical displacements, shows how far this question falls short of a genuine riddle; and on account of its absolute inadequacy it strikes us as being - instead of simply nonsensically stupid - irresistibly comic. In this way, by failing to comply with essential conditions, jokes, riddles, and other things, which do not produce comic pleasure in themselves, are made into sources of comic pleasure.

[1905c, 1739]

[1905c, 1792]
Are processes similar to those which we have described here as the technique of jokes known already in any other field of mental events? They are - in a single field, and an apparently very remote one. In 1900 I published a book which, as its title (*The Interpretation of Dreams*) indicates, attempted to throw light on what is puzzling in dreams and to establish them as derivatives of our normal mental functioning. I found occasion there to contrast the manifest, and often strange, content of the dream with the latent, but perfectly logical, dream-thoughts from which the dream is derived; and I entered into an investigation of the processes which make the dream out of the latent dream-thoughts, as well as of the psychical forces which are involved in that transformation. To the totality of these transforming processes I gave the name of the 'dream-work'; and I have described as a part of this dream-work a process of condensation which shows the greatest similarity to the one found in the technique of jokes - which, like it, leads to abbreviation, and creates substitute-formations of the same character. Everyone will be familiar, from a recollection of his own dreams, with the composite structures both of people and of things which emerge in dreams. Indeed, dreams even construct them out of words, and they can then be dissected in analysis. (For instance, 'Autodidasker' = 'Autodidakt' + 'Lasker'.) On other occasions - much more often, in fact - what the work of condensation in dreams produces is not composite structures but pictures which exactly resemble one thing or one person except for an addition or alteration derived from another source - modifications, that is, just like those in Herr N.'s jokes. We cannot doubt that in both cases we are faced by the same psychical process, which we may recognize from its identical results. Such a far-reaching analogy between the technique of jokes and the dream-work will undoubtedly increase our interest in the former and raise an expectation in us that a comparison between jokes and dreams may help to throw light on jokes. But we will refrain from entering upon this task, for we must reflect that so far we have investigated the technique of only a very small number of jokes, so that we cannot tell whether the analogy by which we are proposing to be guided will in fact hold good. We will therefore turn away from the comparison with dreams and go back to the technique of jokes, though at this point we shall, as it were, be leaving a loose end to our enquiry, which at some later stage we may perhaps pick up once more. [1905c, 1634]
Can we feel sure that none of the possible techniques of jokes has escaped our investigation? Of course not. But a continued examination of fresh material can convince us that we have got to know the commonest and most important technical methods of the joke-work - at all events as much as is required for forming a judgement on the nature of that psychical process. So far we have not arrived at any such judgement; but on the other hand we are now in possession of an important indication of the direction from which we may expect to receive further light upon the problem. The interesting processes of condensation accompanied by the formation of a substitute, which we have recognized as the core of the technique of verbal jokes, point towards the formation of dreams, in the mechanism of which the same psychical processes have been discovered. This is equally true, however, of the techniques of conceptual jokes - displacement, faulty reasoning, absurdity, indirect representation, representation by the opposite - which re-appear one and all in the technique of the dream-work. Displacement is responsible for the puzzling appearance of dreams, which prevents our recognizing that they are a continuation of our waking life. The use of absurdity and nonsense in dreams has cost them the dignity of being regarded as psychical products and has led the authorities to suppose that a disintegration of the mental activities and a cessation of criticism, morality and logic are necessary conditions of the formation of dreams. Representation by the opposite is so common in dreams that even the popular books of dream-interpretation, which are on a completely wrong tack, are in the habit of taking it into account. Indirect representation - the replacement of a dream-thought by an allusion, by something small, a symbolism akin to analogy - is precisely what distinguishes the mode of expression of dreams from that of our waking life.¹ So far-reaching an agreement between the methods of the joke-work and those of the dream-work can scarcely be a matter of chance. To demonstrate this agreement in detail and to examine its basis will be one of our later tasks.

The abundant and unrestrained use in the dream-work of indirect representation, of displacements, and especially of allusions, has a result which I mention not for its own importance but because it became my subjective reason for taking up the problem of jokes. If one gives an account to an uninformed or unaccustomed person of a dream-analysis, in which are set out, therefore, the strange processes of allusions and displacements - processes so obnoxious to waking life - of which the dream-work has made use, the reader receives an uncomfortable impression and declares that these interpretations are 'in the nature of a joke'. But he clearly does not regard them as successful jokes, but as forced, and in some way violating the rules of jokes. It is easy to explain this impression. It arises from the fact that the dream-work operates by the same methods as jokes, but in its use of them it transgresses the limits that are respected by jokes. We shall presently learn that, as a result of the part played by the third person, jokes are bound by a certain condition which does not apply to dreams.

[1905c, 1686]

[1905c, 1757]
I should be very glad if it were possible for me on the one hand to give a clearer exposition of this single decisive point in my view of jokes and on the other hand to reinforce it with conclusive arguments. But in fact what I am faced with here is not a two-fold failure but one and the same failure. I cannot give a clearer exposition because I have no further proof of my view. I arrived at it on the basis of a study of the technique and of a comparison with the dream-work, and on no other basis; and I then found that on the whole it fits in excellently with the characteristics of jokes. Thus this view has been arrived at by inference; and if from an inference of this kind one is led, not to a familiar region, but on the contrary, to one that is alien and new to one's thought, one calls the inference a 'hypothesis' and rightly refuses to regard the relation of the hypothesis to the material from which it was inferred as a 'proof' of it. It can only be regarded as 'proved' if it is reached by another path as well and if it can be shown to be the nodal point of still other connections. But proof of this sort is not to be had, in view of the fact that our knowledge of unconscious processes has scarcely begun. In the realization that we are standing upon ground which has never before been trodden, we are thus content, from our point of observation, to take one single, short and uncertain step forward into the unexplored region.

[1905c, 1760]

With this last contribution, however, which explains, even though still only hypothetically, the joke-work in the first person, our interest in jokes is, strictly speaking, at an end. It remains for us to make a further short comparison between jokes and the better-known dream; and we may expect that, apart from the single conformity we have already considered, two such dissimilar mental functions will only reveal differences. The most important difference lies in their social behaviour. A dream is a completely asocial mental product; it has nothing to communicate to anyone else; it arises within the subject as a compromise between the mental forces struggling in him, it remains unintelligible to the subject himself and is for that reason totally uninteresting to other people. Not only does it not need to set any store by intelligibility, it must actually avoid being understood, for otherwise it would be destroyed; it can only exist in masquerade. For that reason it can without hindrance make use of the mechanism that dominates unconscious mental processes, to the point of a distortion which can no longer be set straight. A joke, on the other hand, is the most social of all the mental functions that aim at a yield of pleasure. It often calls for three persons and its completion requires the participation of someone else in the mental process it starts. The condition of intelligibility is, therefore, binding on it; it may only make use of possible distortion in the unconscious through condensation and displacement up to the point at which it can be set straight by the third person's understanding. Moreover, jokes and dreams have grown up in quite different regions of mental life and must be allotted to points in the psychological system far remote from each other. A dream still remains a wish, even though one that has been made unrecognizable; a joke is developed play. Dreams, in spite of all their practical nonentity, retain their connection with the major interests of life; they seek to fulfil needs by the regressive detour of hallucination, and they are permitted to occur for the sake of the one need that is active during the night - the need to sleep. Jokes, on the other hand, seek to gain a small yield of pleasure from the mere activity, untrammelled by needs, of our mental apparatus. Later they try to catch hold of that pleasure as a by-product during the activity of that apparatus and thus arrive secondarily at not unimportant functions directed to the external world. Dreams serve predominantly for the avoidance of unpleasure, jokes for the attainment of pleasure; but all our mental activities converge in these two aims.

[1905c, 1761]
If we recognize that the links between a latent dream-element and its manifest substitute can be of the most out-of-the-way and peculiar nature, sometimes appearing comic and sometimes resembling a joke, we are basing ourselves on copious experience of examples which, as a rule, we have not solved ourselves. It is often impossible to give such interpretations on our own account: no sensible person could guess at the connection. The dreamer gives us the translation either all at once by a direct association - he is able to, since it was he who produced the substitute - or else he brings up so much material that the solution no longer calls for any particular acumen, but presents itself, so to speak, as a matter of course. If the dreamer fails to assist in one or other of these two ways, the manifest element in question will for ever remain unintelligible to us. I will, if I may, give you an example which occurred to me recently. One of my women patients lost her father in the course of the treatment. Since then she has taken every opportunity of bringing him to life in her dreams. In one of these her father appeared (in a particular connection of no further relevance) and said: 'It's a quarter past eleven, it's half-past eleven, it's a quarter to twelve.' By way of interpretation of this oddity all that occurred to her was that her father liked his grown-up children to appear punctually at the family meals. No doubt this was connected with the dream-element, but it threw no light on its origin. There was a suspicion, based on the immediate situation in the treatment, that a carefully suppressed critical revolt against her beloved and honoured father played some part in the dream. In the further course of her associations, apparently remote from the dream, she told how the day before there had been a lot of talk about psychology in her presence, and a relative of hers had remarked: 'The Urmensch [primal man] survives in all of us.' This seemed to provide us with the explanation. It had given her an excellent opportunity of bringing her dead father to life once again. She made him in the dream into an 'Uhrmensch' ['clock-man'] by making him announce the quarter hours at midday.

[1916-1917, 3320]

You will not be able to escape the resemblance of this example to a joke; and it has in fact often happened that a joke of the dreamer's has been regarded as a joke of the interpreter's. There are other instances in which it has been far from easy to decide whether what we are dealing with is a joke or a dream. But you will recall that the same doubt arose in the case of some parapraxes - slips of the tongue. A man reported as a dream of his that his uncle had given him a kiss while they were sitting in his auto (mobile). He himself very quickly added the interpretation: it meant 'auto-erotism' (a term from the theory of the libido, indicating satisfaction obtained without any outside object). Had the man set out, then, to have some fun with us and was he passing off a joke that had occurred to him as a dream? I think not; I believe he really dreamt it. But what is the origin of this puzzling similarity? This question once led me temporarily aside from my path by compelling me to make jokes themselves the subject of a detailed investigation. It was there shown how jokes originate: a preconscious train of thought is abandoned for a moment to be worked over in the unconscious, and from this it emerges as a joke. Under the influence of the unconscious it is subjected to the effects of the mechanisms that hold sway there - condensation and displacement - the same processes that we have found concerned in the dream-work; and it is to this common feature that is to be ascribed the similarity, when it occurs, between jokes and dreams. But the unintended 'dream-joke' brings none of the yield of pleasure of a true joke. You can learn why if you go more deeply into the study of jokes. A 'dream-joke' strikes us as a bad joke; it does not make us laugh, it leaves us cold.

[1916-1917, 3321]
What means have we at our disposal for overcoming this continual resistance? Few, but they include almost all those by which one man can ordinarily exert a psychical influence on another. In the first place, we must reflect that a psychical resistance, especially one that has been in force for a long time, can only be resolved slowly and by degrees, and we must wait patiently. In the next place, we may reckon on the intellectual interest which the patient begins to feel after working for a short time. By explaining things to him, by giving him information about the marvellous world of psychical processes into which we ourselves only gained insight by such analyses, we make him himself into a collaborator, induce him to regard himself with the objective interest of an investigator, and thus push back his resistance, resting as it does on an affective basis. But lastly - and this remains the strongest lever - we must endeavour, after we have discovered the motives for his defence, to deprive them of their value or even to replace them by more powerful ones. This no doubt is where it ceases to be possible to state psychotherapeutic activity in formulas. One works to the best of one's power, as an elucidator (where ignorance has given rise to fear), as a teacher, as the representative of a freer or superior view of the world, as a father confessor who gives absolution, as it were, by a continuance of his sympathy and respect after the confession has been made. One tries to give the patient human assistance, so far as this is allowed by the capacity of one's own personality and by the amount of sympathy that one can feel for the particular case. It is an essential precondition for such psychical activity that we should have more or less divined the nature of the case and the motives of the defence operating in it, and fortunately the technique of insistence and pressure takes us as far as this. The more such riddles we have already solved, the easier we may find it to guess a new one and the sooner we shall be able to start on the truly curative psychical work. For it is well to recognize this clearly: the patient only gets free from the hysterical symptom by reproducing the pathogenic impressions that caused it and by giving utterance to them with an expression of affect, and thus the therapeutic task consists solely in inducing him to do so; when once this task has been accomplished there is nothing left for the physician to correct or to remove. Whatever may be required for this purpose in the way of counter-suggestions has already been expended during the struggle against the resistance. The situation may be compared with the unlocking of a locked door, after which opening it by turning the handle offers no further difficulty.

The action of the play consists in nothing other than the process of revealing, with cunning delays and ever-mounting excitement - a process that can be likened to the work of a psycho-analysis - that Oedipus himself is the murderer of Laius, but further that he is the son of the murdered man and of Jocasta. Appalled at the abomination which he has unwittingly perpetrated, Oedipus blinds himself and forsakes his home. The oracle has been fulfilled.

I cannot say the same of the therapeutic procedure which was introduced to our colleagues at the same time as our theory; it is still struggling for recognition. There may be special reasons for this. At that time the technique of the method was as yet undeveloped; it was impossible for me to give medical readers of the book the directions necessary to enable them to carry through the treatment completely. But causes of a general nature have certainly also played a part. To many physicians, even to-day, psychotherapy seems to be a product of modern mysticism and, compared with our physico-chemical remedies which are applied on the basis of physiological knowledge, appears positively unscientific and unworthy of the attention of a serious investigator. Allow me, therefore, to defend the cause of psychotherapy before you, and to point out to you what may be described as unjust or mistaken in this condemnation of it.
In the first place, let me remind you that psychotherapy is in no way a modern method of treatment. On the contrary, it is the most ancient form of therapy in medicine. In Löwenfeld's instructive *Lehrbuch der gesamten Psychotherapie* many of the methods of primitive and ancient medical science are described. The majority of them must be classed under the head of psychotherapy; in order to effect a cure a condition of 'expectation coloured by faith' was induced in sick persons - a condition which answers a similar purpose for us to-day. Even since physicians have come upon other remedies, psychotherapeutic endeavours of one kind or another have never completely disappeared from medicine.

[1905a, 1564]

Secondly, let me draw your attention to the fact that we physicians cannot discard psychotherapy, if only because another person intimately concerned in the process of recovery - the patient - has no intention of discarding it. You will know of the increase in knowledge on this subject that we owe to the Nancy school, to Liébeault and Bernheim. A factor dependent on the psychical disposition of the patient contributes, without any intention on our part, to the effect of every therapeutic process initiated by a physician; most frequently it is favourable to recovery, but often it acts as an inhibition. We have learned to use the word 'suggestion' for this phenomenon, and Möbius has taught us that the unreliability which we deplore in so many of our therapeutic measures may be traced back to the disturbing influence of this very powerful factor. All physicians, therefore, yourselves included, are continually practising psychotherapy, even when you have no intention of doing so and are not aware of it; it is a disadvantage, however, to leave the mental factor in your treatment so completely in the patient's hands. Thus it is impossible to keep a check on it, to administer it in doses or to intensify it. Is it not then a justifiable endeavour on the part of a physician to seek to obtain command of this factor, to use it with a purpose, and to direct and strengthen it? This and nothing else is what scientific psychotherapy proposes.

[1905a, 1564]

There are many ways and means of practising psychotherapy. All that lead to recovery are good. Our usual word of comfort, which we dispense so liberally to our patients - 'You'll soon be all right again' - , corresponds to one of these psychotherapeutic methods; but now that we have deeper insight into the neuroses, we are no longer obliged to confine ourselves to the word of comfort. We have developed the technique of hypnotic suggestion, and psychotherapy by mental distraction, by exercise, and by eliciting suitable affects. I despise none of these methods and would use them all in appropriate circumstances. If I have actually come to confine myself to one form of treatment, to the method which Breuer called *cathartic*, but which I myself prefer to call 'analytic', it is because I have allowed myself to be influenced by purely subjective motives. Because of the part I have played in founding this therapy, I feel a personal obligation to devote myself to closer investigation of it and to the development of its technique. And I may say that the analytic method of psychotherapy is the one that penetrates most deeply and carries farthest, the one by means of which the most extensive transformations can be effected in patients. Putting aside for a moment the therapeutic point of view, I may also say of it that it is the most interesting method, the only one which informs us at all about the origin and inter-relation of morbid phenomena. Owing to the insight which we gain into mental illness by this method, it alone should be capable of leading us beyond its own limits and of pointing out the way to other forms of therapeutic influence.

[1905a, 1565]
'Psyche' is a Greek word which may be translated 'mind'. Thus 'psychical treatment' means 'mental treatment'. The term might accordingly be supposed to signify 'treatment of the pathological phenomena of mental life'. This, however, is not its meaning. 'Psychical treatment' denotes, rather, treatment taking its start in the mind, treatment (whether of mental or physical disorders) by measures which operate in the first instance and immediately upon the human mind. [1890a, 1586]

It is only comparatively recently, too, that physicians with a scientific training have learnt to appreciate the value of mental treatment. And we can easily see why this was so when we reflect on the evolution of medicine during the last half-century. After a somewhat unfruitful period during which it was dependent on what was known as 'Natural Philosophy', it came under the happy influence of the natural sciences and has achieved the greatest advances alike as a science and as an art: it has shown that the organism is built up from microscopically small elements (the cells), it has learnt to understand the physics and chemistry of the various vital processes (functions), it has distinguished the visible and observable modifications which are brought about in the bodily organs by different morbid processes, and has discovered, on the other hand, the signs that reveal the operation of deep-lying morbid processes in the living body; moreover it has identified a great number of the micro-organisms which cause illness and, with the help of its newly acquired knowledge, it has reduced to a quite extraordinary degree the dangers arising from severe surgical operations. All of these advances and discoveries were related to the physical side of man, and it followed, as a result of an incorrect though easily understandable trend of thought, that physicians came to restrict their interest to the physical side of things and were glad to leave the mental field to be dealt with by the philosophers whom they despised. [1890a, 1586]

Modern medicine, it is true, had reason enough for studying the indisputable connection between the body and the mind; but it never ceased to represent mental events as determined by physical ones and dependent on them. Thus stress was laid on the fact that intellectual functioning was conditional upon the presence of a normally developed and sufficiently nourished brain, that any disease of that organ led to disturbances of intellectual functioning, that the introduction of toxic substances into the circulation could produce certain states of mental illness, or - to descend to more trivial matters - that dreams could be modified by stimuli brought to bear upon a sleeper for experimental purposes. [1890a, 1587]

The relation between body and mind (in animals no less than in human beings) is a reciprocal one; but in earlier times the other side of this relation, the effect of the mind upon the body, found little favour in the eyes of physicians. They seemed to be afraid of granting mental life any independence, for fear of that implying an abandonment of the scientific ground on which they stood. [1890a, 1587]
This one-sided attitude of medicine towards the body has undergone a gradual change in the course of the last decade and a half, a change brought about directly by clinical experience. There are a large number of patients, suffering from affections of greater or less severity, whose disorders and complaints make great demands on the skill of their physicians, but in whom no visible or observable signs of a pathological process can be discovered either during their life or after their death, in spite of all the advances in the methods of investigation made by scientific medicine. One group of these patients are distinguished by the copiousness and variety of their symptoms: they are incapable of intellectual work because of headaches or inability to concentrate their attention, their eyes ache when they read, their legs become fatigued when they walk, develop dull pains or go to sleep, their digestion is disturbed by distressing sensations, by eructations or gastric spasms, they cannot defaecate without aperients, they are subject to sleeplessness, and so on. They may suffer from all these disorders simultaneously or in succession, or from only a selection of them; but in every case the illness is evidently the same. Moreover, its signs are often variable and replace one another. A patient who has hitherto been incapacitated by headaches but has had a fairly good digestion may next day enjoy a clear head but may thenceforward be unable to manage most kinds of food. Again, his sufferings may suddenly cease if there is a marked change in the circumstances of his existence. If he is travelling he may feel perfectly well and be able to enjoy the most varied diet without any ill effects, but when he gets home he may once more have to restrict himself to sour milk. In a few cases the disorder - whether it is a pain or a weakness resembling a paralysis - may suddenly pass from one side of the body to the other: it may jump from his right side to the corresponding part of the body on his left side. But in every instance it is to be observed that the symptoms are very clearly influenced by excitement, emotion, worry, etc., and also that they can disappear and give place to perfect health without leaving any traces, even if they have persisted over a long period.

[1890a, 1587]
The orthopaedic institute referred back to a remark I had made in which I had compared the treatment, alike in its length and in its nature, to an orthopaedic one. When I started her treatment I had been obliged to tell her that for the time being I had not much time for her, though later I should be able to give her a whole hour daily. This had stirred up her old sensitiveness, which is a principal trait in the character of children inclined to hysteria: they are insatiable for love. My patient had been the youngest of a family of six children (hence: at the same time as five others) and had therefore been her father's favourite; but even so she seems to have felt that her adored father devoted too little of his time and attention to her. -Her waiting for me to say it wasn't true had the following origin. A young tailor's apprentice had brought her a dress and she had given him the money for it. Afterwards she had asked her husband whether if the boy lost the money she would have to pay it over again. Her husband, to tease her, had said that was so. (The teasing in the dream.) She kept on asking over and over again and waited for him to say after all it wasn't true. It was then possible to infer that in the latent content of the dream she had had a thought of whether she would have to pay me twice as much if I gave her twice as much time - a thought which she felt was avaricious or filthy. (Uncleanness in childhood is often replaced in dreams by avariciousness for money; the link between the two is the word 'filthy'.) If the whole passage about waiting for me to say, etc., was intended in the dream as a circumlocution for the word 'filthy', then her 'standing in the corner' and 'not lying down in the bed' would fit in with it as constituents of a scene from her childhood: a scene in which she had dirtied her bed and been punished by being made to stand in the corner, with a threat that her father would not love her any more and her brothers and sisters would laugh at her, and so on. -The small squares related to her little niece, who had shown her the arithmetical trick of arranging the digits in nine squares (I believe this is correct) so that they add up in all directions to fifteen. [1900a, 684]
Indeed, when we look into the matter more closely, we must recognize the fact that the
dream-work is doing nothing original in making substitutions of this kind. In order to gain its
ends - in this case the possibility of a representation hampered by censorship - it merely follows
the paths which it finds already laid down in the unconscious; and it gives preference to those
transformations of the repressed material which can also become conscious in the form of jokes
or allusions and of which the phantasies of neurotic patients are so full. At this point we
suddenly reach an understanding of Scherner's dream interpretations, whose essential
correctness I have defended elsewhere. The imagination's pre-occupation with the subject's
own body is by no means peculiar to dreams or characteristic only of them. My analyses have
shown me that it is habitually present in the unconscious thoughts of neurotics, and that it is
derived from sexual curiosity, which, in growing youths or girls, is directed to the genitals of the
other sex, and to those of their own as well. Nor, as Scherner and Volkelt have rightly insisted,
is a house the only circle of ideas employed for symbolizing the body; and this is equally true of
dreams and of the unconscious phantasies of neurosis. It is true that I know patients who have
retained an architectural symbolism for the body and the genitals. (Sexual interest ranges far
beyond the sphere of the external genitalia.) For these patients pillars and columns represent
the legs (as they do in the Song of Solomon), every gateway stands for one of the bodily orifices
(a 'hole'), every water-pipe is a reminder of the urinary apparatus, and so on. But the circle of
ideas centring round plant-life or the kitchen may just as readily be chosen to conceal sexual
images.¹ In the former case the way has been well prepared by linguistic usage, itself the
precipitate of imaginative similes reaching back to remote antiquity: e.g. the Lord's vineyard, the
seed, and the maiden's garden in the Song of Solomon. The ugliest as well as the most intimate
details of sexual life may be thought and dreamt of in seemingly innocent allusions to activities
in the kitchen; and the symptoms of hysteria could never be interpreted if we forgot that sexual
symbolism can find its best hiding-place behind what is commonplace and inconspicuous.
There is a valid sexual meaning behind the neurotic child's intolerance of blood or raw meat, or
his nausea at the sight of eggs or macaroni, and behind the enormous exaggeration in neurotics
of the natural human dread of snakes. Wherever neuroses make use of such disguises they are
following paths along which all humanity passed in the earliest periods of civilization - paths of
whose continued existence today, under the thinnest of veils, evidence is to be found in
linguistic usages, superstitions and customs.
[1900a, 815]

That this state of affairs should exist in regard to the memories relating to the history of the
illness is a necessary correlate of the symptoms and one which is theoretically requisite. In the
further course of the treatment the patient supplies the facts which, though he had known them
all along, had been kept back by him or had not occurred to his mind. The paramnesias prove
untenable, and the gaps in his memory are filled in. It is only towards the end of the treatment
that we have before us all intelligible, consistent, and unbroken case history. Whereas the
practical aim of the treatment is to remove all possible symptoms and to replace them by
conscious thoughts, we may regard it as a second and theoretical aim to repair all the damages
to the patient's memory. These two aims are coincident. When one is reached, so is the other;
and the same path leads to them both.
[1905e, 1359]

It follows from the nature of the facts which form the material of psycho-analysis that we are
obliged to pay as much attention in our case histories to the purely human and social
circumstances of our patients as to the somatic data and the symptoms of the disorder. Above
all, our interest will be directed towards their family circumstances - and not only, as will be seen
later, for the purpose of enquiring into their heredity.
[1905e, 1359]
Our efforts to trace the origins of the sexual instinct have shown us so far that sexual excitation arises (a) as a reproduction of a satisfaction experienced in connection with other organic processes, (b) through appropriate peripheral stimulation of erotogenic zones and (c) as an expression of certain 'instincts' (such as the scopophilic instinct and the instinct of cruelty) of which the origin is not yet completely intelligible. Psycho-analytic investigation, reaching back into childhood from a later time, and contemporary observation of children combine to indicate to us still other regularly active sources of sexual excitation. The direct observation of children has the disadvantage of working upon data which are easily misunderstandable; psycho-analysis is made difficult by the fact that it can only reach its data, as well as its conclusions, after long detours. But by co-operation the two methods can attain a satisfactory degree of certainty in their findings.

The cathartic method had already renounced suggestion; Freud went a step further and gave up hypnosis as well. At the present time he treats his patients as follows. Without exerting my other kind of influence, he invites them to lie down in a comfortable attitude on a sofa, while he himself sits on a chair behind them outside their field of vision. He does not even ask them to close their eyes, and avoids touching them in any way, as well as any other procedure which might be reminiscent of hypnosis. The session thus proceeds like a conversation between two people equally awake, but one of whom is spared every muscular exertion and every distracting sensory impression which might divert his attention from his own mental activity.

In order to secure these ideas and associations he asks the patient to 'let himself go' in what he says, 'as you would do in a conversation in which you were rambling on quite disconnectedly and at random'. Before he asks them for a detailed account of their case history he insists that they must include in it whatever comes into their heads, even if they think it unimportant or irrelevant or nonsensical; he lays special stress on their not omitting any thought or idea from their story because to relate it would be embarrassing or distressing to them. In the course of collecting this material of otherwise neglected ideas Freud made the observations which became the determining factor of his entire theory. Gaps appear in the patient's memory even while he narrates his case: actual occurrences are forgotten, the chronological order is confused, or causal connections are broken, with unintelligible results. No neurotic case history is without amnesia of some kind or other. If the patient is urged to fill these gaps in his memory by an increased application of attention, it is noticed that all the ideas which occur to him are pushed back by every possible critical expedient, until at last he feels positive discomfort when the memory really returns. From this experience Freud concludes that the amnesias are the result of a process which he calls 'repression' and the motive for which he finds in feelings of displeasure. The psychical forces which have brought about this repression can also be detected, according to him, in the 'resistance' which operates against the recovery of the lost memories.

Now, too, we begin to understand the 'magic' of words. Words are the most important media by which one man seeks to bring his influence to bear on another; words are a good method of producing mental changes in the person to whom they are addressed. So that there is no longer anything puzzling in the assertion that the magic of words can remove the symptoms of illness, and especially such as are themselves founded on mental states.
But, you will ask, if people make such a mystery of their phantasying, how is it that we know
such a lot about it? Well, there is a class of human beings upon whom, not a god, indeed, but a
stern goddess - Necessity - has allotted the task of telling what they suffer and what things give
them happiness. These are the victims of nervous illness, who are obliged to tell their
phantasies, among other things, to the doctor by whom they expect to be cured by mental
treatment. This is our best source of knowledge, and we have since found good reason to
suppose that our patients tell us nothing that we might not also hear from healthy people.
[1908e, 1924]

You ask me to name 'ten good books' for you, and refrain from adding to this any word of
explanation. Thus you leave to me not only the choice of the books but also the interpretation of
your request. Accustomed to paying attention to small signs, I must then trust the wording in
which you couch your enigmatical demand. You did not say: 'the ten most magnificent works (of
world literature)', in which case I should have been obliged to reply, with so many others:
Homer, the tragedies of Sophocles, Goethe's *Faust*, Shakespeare's *Hamlet*, *Macbeth*, etc. Nor
did you say the 'ten most significant books', among which scientific achievements like those of
Copernicus, of the old physician Johann Weier on the belief in witches, Darwin's *Descent of
Man*, and others, would then have found a place. You did not even ask for 'favourite books',
among which I should not have forgotten Milton's *Paradise Lost* and Heine's *Lazarus*. I think,
therefore, that a particular stress falls on the 'good' in your phrase, and that with this predicate
you intend to designate books to which one stands in rather the same relationship as to 'good'
friends, to whom one owes a part of one's knowledge of life and view of the world - books which
one has enjoyed oneself and gladly commends to others, but in connection with which the
element of timid reverence, the feeling of one's own smallness in the face of their greatness, is
not particularly prominent.
[1906f, 1991]

But the peculiar value of this observation lies in the considerations which follow. When a
physician treats an adult neurotic by psycho-analysis, the process he goes through of
uncovering the psychical formations, layer by layer, eventually enables him to frame certain
hypotheses as to the patient's infantile sexuality; and it is in the components of the latter that he
believes he has discovered the motive forces of all the neurotic symptoms of later life. I have set
out these hypotheses in my *Three Essays on the Theory of Sexuality* (1905d), and I am aware
that they seem as strange to an outside reader as they seem incontrovertible to a psycho-
analyst. But even a psycho-analyst may confess to the wish for a more direct and less
roundabout proof of these fundamental theorems. Surely there must be a possibility of
observing in children at first hand and in all the freshness of life the sexual impulses and wishes
which we dig out so laboriously in adults from among their own débris - especially as it is also
our belief that they are the common property of all men, a part of the human constitution, and
merely exaggerated or distorted in the case of neurotics.
[1909b, 2002]
It is true that during the analysis Hans had to be told many things that he could not say himself, that he had to be presented with thoughts which he had so far shown no signs of possessing, and that his attention had to be turned in the direction from which his father was expecting something to come. This detracts from the evidential value of the analysis; but the procedure is the same in every case. For a psycho-analysis is not an impartial scientific investigation, but a therapeutic measure. Its essence is not to prove anything, but merely to alter something. In a psycho-analysis the physician always gives his patient (sometimes to a greater and some times to a less extent) the conscious anticipatory ideas by the help of which he is put in a position to recognize and to grasp the unconscious material. For there are some patients who need more of such assistance and some who need less; but there are none who get through without some of it. Slight disorders may perhaps be brought to an end by the subject's unaided efforts, but never a neurosis - a thing which has set itself up against the ego as an element alien to it. To get the better of such an element another person must be brought in, and in so far as that other person can be of assistance the neurosis will be curable. If it is in the very nature of any neurosis to turn away from the 'other person' - and this seems to be one of the characteristics of the states grouped together under the name of dementia praecox - then for that very reason such a state will be incurable by any efforts of ours. It is true that a child, on account of the small development of his intellectual systems, requires especially energetic assistance. But, after all, the information which the physician gives his patient is itself derived in its turn from analytical experience; and indeed it is sufficiently convincing if, at the cost of this intervention by the physician, we are enabled to discover the structure of the pathogenic material and simultaneously to dissipate it.

[1909b, 2089]

To put the matter more directly, The investigation of hysterical patients and of other neurotics leads us to the conclusion that their repression of the idea to which the intolerable wish is attached has been a failure. It is true that they have driven it out of consciousness and out of memory and have apparently saved themselves a large amount of unpleasure. But the repressed wishful impulse continues to exist in the unconscious. It is on the look-out for an opportunity of being activated, and when that happens it succeeds in sending into consciousness a disguised and unrecognizable substitute for what had been repressed, and to this there soon become attached the same feelings of unpleasure which it was hoped had been saved by the repression. This substitute for the repressed idea - the symptom - is proof against further attacks from the defensive ego; and in place of the short conflict an ailment now appears which is not brought to an end by the passage of time. Alongside the indication of distortion in the symptom, we can trace in it the remains of some kind of indirect resemblance to the idea that was originally repressed. The paths along which the substitution was effected can be traced in the course of the patient's psycho-analytic treatment; and in order to bring about recovery, the symptom must be led back along the same paths and once more turned into the repressed idea. If what was repressed is brought back again into conscious mental activity - a process which presupposes the overcoming of considerable resistances - the resulting psychical conflict, which the patient had tried to avoid, can, under the physician's guidance, reach a better outcome than was offered by repression. There are a number of such opportune solutions, which may bring the conflict and the neurosis to a happy end, and which may in certain instances be combined. The patient's personality may be convinced that it has been wrong in rejecting the pathogenic wish and may be led into accepting it wholly or in part; or the wish itself may be directed to a higher and consequently unobjectionable aim (this is what we call its 'sublimation'); or the rejection of the wish may be recognized as a justifiable one, but the automatic and therefore inefficient mechanism of repression may be replaced by a condemning judgement with the help of the highest human mental functions - conscious control of the wish is attained.

[1910a, 2215]
You must forgive me if I have not succeeded in giving you a more clearly intelligible account of these basic positions adopted by the method of treatment that is now described as 'psycho-analysis'. The difficulties have not lain only in the novelty of the subject. The nature of the incompatible wishes which, in spite of repression, succeed in making their existence in the unconscious perceptible, and the subjective and constitutional determinants which must be present in anyone before a failure of repression can occur and a substitute or symptom be formed - on all this I shall have more light to throw in some of my later observations.

[1910a, 2216]

When we come to putting this procedure into effect, we are subject to yet another interference. For the patient will often pause and come to a stop, and assert that he can think of nothing to say, and that nothing whatever occurs to his mind. If this were so and if the patient were right, then our procedure would once again have proved ineffective. But closer observation shows that such a stoppage of the flow of ideas never in fact occurs. It appears to happen only because the patient holds back or gets rid of the idea that he has become aware of, under the influence of the resistances which disguise themselves as various critical judgements about the value of the idea that has occurred to him. We can protect ourselves against this by warning him beforehand of this behaviour and requiring him to take no notice of such criticisms. He must, we tell him, entirely renounce any critical selection of this kind and say whatever comes into his head, even if he considers it incorrect or irrelevant or nonsensical, and above all if he finds it disagreeable to let himself think about what has occurred to him. So long as this ordinance is carried out we are certain of obtaining the material which will put us on the track of the repressed complexes.

[1910a, 2219]

It will now be asked whether we shall not be giving up too much valuable material which might throw light on the unconscious if dream-interpretation is only to be carried out subject to such restrictions of method. The answer to this is that the loss is by no means so great as might appear from a superficial view of the matter. To begin with, it must be recognized that in cases of severe neurosis any elaborate dream-productions must from the nature of things be regarded as incapable of complete solution. A dream of this kind is often based on the entire pathogenic material of the case, as yet unknown to both doctor and patient (so called 'programme-dreams' and biographical dreams), and is sometimes equivalent to a translation into dream-language of the whole content of the neurosis. In the attempt to interpret such a dream all the latent, as yet untouched, resistances will be roused to activity and soon set a limit to its understanding. The full interpretation of such a dream will coincide with the completion of the whole analysis; if a note is made of it at the beginning, it may be possible to understand it at the end, many months later. It is the same as with the elucidation of a single symptom (the main symptom, perhaps). The whole analysis is needed to explain it; in the course of the treatment one must endeavour to lay hold first of this, then of that, fragment of the symptom's meaning, one after another, until they can all be pieced together. Similarly, no more can be expected of a dream occurring in the early stages of the analysis; one must be content if the attempt at interpretation brings a single pathogenic wishful impulse to light.

[1911e, 2451]
To shorten analytic treatment is a justifiable wish, and its fulfilment, as we shall learn, is being attempted along various lines. Unfortunately, it is opposed by a very important factor, namely, the slowness with which deep-going changes in the mind are accomplished - in the last resort, no doubt, the 'timelessness' of our unconscious processes. When patients are faced with the difficulty of the great expenditure of time required for analysis they not infrequently manage to propose a way out of it. They divide up their ailments and describe some as unbearable, and others as secondary, and then say: 'If only you will relieve me from this one (for instance, a headache or a particular fear) I can deal with the other one on my own in my ordinary life.' In doing this, however, they over-estimate the selective power of analysis. The analyst is certainly able to do a great deal, but he cannot determine beforehand exactly what results he will effect. He sets in motion a process, that of the resolving of existing repressions. He can supervise this process, further it, remove obstacles in its way, and he can undoubtedly vitiate much of it. But on the whole, once begun, it goes its own way and does not allow either the direction it takes or the order in which it picks up its points to be prescribed for it. The analyst's power over the symptoms of the disease may thus be compared to male sexual potency. A man can, it is true, beget a whole child, but even the strongest man cannot create in the female organism a head alone or an arm or a leg; he cannot even prescribe the child's sex. He, too, only sets in motion a highly complicated process, determined by events in the remote past, which ends with the severance of the child from its mother. A neurosis as well has the character of an organism. Its component manifestations are not independent of one another; they condition one another and give one another mutual support. A person suffers from one neurosis only, never from several which have accidentally met together in a single individual. The patient freed, according to his wish, from his one unendurable symptom might easily find that a symptom which had previously been negligible had now increased and grown unendurable. The analyst who wishes the treatment to owe its success as little as possible to its elements of suggestion (i.e. to the transference) will do well to refrain from making use of even the trace of selective influence upon the results of the therapy which may perhaps be open to him. The patients who are bound to be most welcome to him are those who ask him to give them complete health, in so far as that is attainable, and who place as much time at his disposal as is necessary for the process of recovery. Such favourable conditions as these are, of course, to be looked for in only a few cases.

[1913c, 2483]
It seems to me not unnecessary to keep on reminding students of the far-reaching changes which psycho-analytic technique has undergone since its first beginnings. In its first phase - that of Breuer's catharsis - it consisted in bringing directly into focus the moment at which the symptom was formed, and in persistently endeavouring to reproduce the mental processes involved in that situation, in order to direct their discharge along the path of conscious activity. Remembering and abreacting, with the help of the hypnotic state, were what was at that time aimed at. Next, where hypnosis had been given up, the task became one of discovering from the patient's free associations what he failed to remember. The resistance was to be circumvented by the work of interpretation and by making its results known to the patient. The situations which had given rise to the formation of the symptom and the other situations which lay behind the moment at which the illness broke out retained their place as the focus of interest; but the element of abreaction receded into the background and seemed to be replaced by the expenditure of work which the patient had to make in being obliged to overcome his criticism of his free associations, in accordance with the fundamental rule of psycho-analysis. Finally, there was evolved the consistent technique used to-day, in which the analyst gives up the attempt to bring a particular moment or problem into focus. He contents himself with studying whatever is present for the time being on the surface of the patient's mind, and he employs the art of interpretation mainly for the purpose of recognizing the resistances which appear there, and making them conscious to the patient. From this there results a new sort of division of labour: the doctor uncovers the resistances which are unknown to the patient; when these have been got the better of, the patient often relates the forgotten situations and connections without any difficulty. The aim of these different techniques has, of course, remained the same. Descriptively speaking, it is to fill in gaps in memory; dynamically speaking, it is to overcome resistances due to repression.

First and foremost, the initiation of the treatment in itself brings about a change in the patient's conscious attitude to his illness. He has usually been content with lamenting it, despising it as nonsensical and under-estimating its importance; for the rest, he has extended to its manifestations the ostrich-like policy of repression which he adopted towards its origins. Thus it can happen that he does not properly know under what conditions his phobia breaks out or does not listen to the precise wording of his obsessional ideas or does not grasp the actual purpose of his obsessional impulse. The treatment, of course, is not helped by this. He must find the courage to direct his attention to the phenomena of his illness. His illness itself must no longer seem to him contemptible, but must become an enemy worthy of his mettle, a piece of his personality, which has solid ground for its existence and out of which things of value for his future life have to be derived. The way is thus paved from the beginning for a reconciliation with the repressed material which is coming to expression in his symptoms, while at the same time place is found for a certain tolerance for the state of being ill. If this new attitude towards the illness intensifies the conflicts and brings to the fore symptoms which till then had been indistinct, one can easily console the patient by pointing out that these are only necessary and temporary aggravations and that one cannot overcome an enemy who is absent or not within range. The resistance, however, may exploit the situation for its own ends and abuse the licence to be ill. It seems to say: 'See what happens if I really give way to such things. Was I not right to consign them to repression?’ Young and childish people in particular are inclined to make the necessity imposed by the treatment for paying attention to their illness a welcome excuse for luxuriating in their symptoms.

[1914g, 2498]

[1914g, 2503]
The tactics to be adopted by the physician in this situation are easily justified. For him, remembering in the old manner - reproduction in the psychical field - is the aim to which he adheres, even though he knows that such an aim cannot be achieved in the new technique. He is prepared for a perpetual struggle with his patient to keep in the psychical sphere all the impulses which the patient would like to direct into the motor sphere; and he celebrates it as a triumph for the treatment if he can bring it about that something that the patient wishes to discharge in action is disposed of through the work of remembering. If the attachment through transference has grown into something at all serviceable, the treatment is able to prevent the patient from executing any of the more important repetitive actions and to utilize his intention to do so in statu nascendi as material for the therapeutic work. One best protects the patient from injuries brought about through carrying out one of his impulses by making him promise not to take any important decisions affecting his life during the time of his treatment - for instance, not to choose any profession or definitive love-object - but to postpone all such plans until after his recovery.

I can, however, assume this much - that you know that psycho-analysis is a procedure for the medical treatment of neurotic patients. And here I can at once give you an instance of how in this field a number of things take place in a different way - often, indeed, in an opposite way - from what they do elsewhere in medical practice. When elsewhere we introduce a patient to a medical technique which is new to him, we usually minimize its inconveniences and give him confident assurances of the success of the treatment. I think we are justified in this, since by doing so we are increasing the probability of success. But when we take a neurotic patient into psycho-analytic treatment, we act differently. We point out the difficulties of the method to him, its long duration, the efforts and sacrifices it calls for; and as regards its success, we tell him we cannot promise it with certainty, that it depends on his own conduct, his understanding, his adaptability and his perseverance. We have good reasons, of course, for such apparently wrong-headed behaviour, as you will perhaps come to appreciate later on.

In psycho-analysis, alas, everything is different. Nothing takes place in a psycho-analytic treatment but an interchange of words between the patient and the analyst. The patient talks, tells of his past experiences and present impressions, complains, confesses to his wishes and his emotional impulses. The doctor listens, tries to direct the patient's processes of thought, exhorts, forces his attention in certain directions, gives him explanations and observes the reactions of understanding or rejection which he in this way provokes in him. The uninstructed relatives of our patients, who are only impressed by visible and tangible things - preferably by actions of the sort that are to be witnessed at the cinema - never fail to express their doubts whether 'anything can be done about the illness by mere talking'. That, of course, is both a short-sighted and an inconsistent line of thought. These are the same people who are so certain that patients are 'simply imagining' their symptoms. Words were originally magic and to this day words have retained much of their ancient magical power. By words one person can make another blissfully happy or drive him to despair, by words the teacher conveys his knowledge to his pupils, by words the orator carries his audience with him and determines their judgements and decisions. Words provoke affects and are in general the means of mutual influence among men. Thus we shall not depreciate the use of words in psychotherapy and we shall be pleased if we can listen to the words that pass between the analyst and his patient.
But we cannot do that either. The talk of which psycho-analytic treatment consists brooks no
listener; it cannot be demonstrated. A neurasthenic or hysterical patient can of course, like any
other, be introduced to students in a psychiatric lecture. He will give an account of his
complaints and symptoms, but of nothing else. The information required by analysis will be
given by him only on condition of his having a special emotional attachment to the doctor; he
would become silent as soon as he observed a single witness to whom he felt indifferent. For
this information concerns what is most intimate in his mental life, everything that, as a socially
independent person, he must conceal from other people, and, beyond that, everything that, as a
homogeneous personality, he will not admit to himself.
[1916-1917, 3131]

Thus you cannot be present as an audience at a psycho-analytic treatment. You can only be
told about it; and, in the strictest sense of the word, it is only by hearsay that you will get to
know psycho-analysis. As a result of receiving your instruction at second hand, as it were, you
find yourselves under quite unusual conditions for forming a judgement. That will obviously
depend for the most part on how much credence you can give to your informant.
[1916-1917, 3132]

Since this is the first time I have spoken of the subject-matter of sexual life in one of these
lectures, I owe you some account of the way in which I propose to treat the topic. Psycho-
analysis finds no occasion for concealments and hints, it does not think it necessary to be
ashamed of dealing with this important material, it believes it is right and proper to call
everything by its correct name, and it hopes that this will be the best way of keeping irrelevant
thoughts of a disturbing kind at a distance. The fact that these lectures are being given before a
mixed audience of both sexes can make no difference to this. Just as there can be no science
in usum Delphini, there can be none for schoolgirls; and the ladies among you have made it
clear by their presence in this lecture-room that they wish to be treated on an equality with men.
[1916-1917, 3248]
I am to put before you, then, the psycho-analytic view of the phenomena of neurosis. In doing so, the best plan would seem to be to make a start in connection with the phenomena we have already dealt with, for the sake both of analogy and contrast; and I will begin with a symptomatic action which I have seen many people perform during my consulting hours. We analysts cannot do much for the people who come to us in our consulting-room to lay before us in a quarter of an hour the miseries of a long lifetime. Our deeper knowledge makes it difficult for us to give the kind of opinion another doctor would - 'There's nothing wrong with you' - with the added advice: 'You should arrange for a mild hydropathic treatment.' One of my colleagues who was asked what he did with his consultation patients shrugged his shoulders and replied: 'I find them so-and-so many Kronen for a frivolous waste of time.' So you will not be surprised to hear that even in the case of busy psycho-analysts their consulting hours are not apt to be very lively. I have had the ordinary door between my waiting-room and my consulting- and treatment-room doubled and given a baize lining. There can be no doubt about the purpose of this arrangement. Now it constantly happens that a person whom I have brought in from the waiting-room omits to shut the door behind him and almost always he leaves both doors open. As soon as I notice this I insist in a rather unfriendly tone on his or her going back and making good the omission even if the person concerned is a well-dressed gentleman or a fashionable lady. This makes an impression of uncalled-for pedantry. Occasionally, too, I have put myself in a foolish position by making this request when it has turned out to be a person who cannot touch a door-handle himself and is glad if someone with him spares him the necessity. But in the majority of cases I have been right; for anyone who behaves like this and leaves the door open between a doctor's waiting-room and consulting-room is ill-mannered and deserves an unfriendly reception. But do not take sides over this till you have heard the sequel. For this carelessness on the part of the patient only occurs when he has been alone in the waiting-room and has therefore left an empty room behind him; it never happens if other people, strangers to him, have been waiting with him. In this latter case he knows quite well that it is in his interest not to be overheard while he is talking to the doctor, and he never fails to shut both the doors carefully.

[1916-1917, 3329]
But can psycho-analysis do more here? Yes, it actually can. I hope to be able to show you that, even in a case so hard of access as this, it can discover something which makes a first understanding possible. And to begin with I would draw your attention to the inconspicuous detail that the patient herself positively provoked the anonymous letter, which now gave support to her delusion, by informing the scheming housemaid on the previous day that it would cause her the greatest unhappiness if her husband had a love affair with a young girl. In this way she first put the notion of sending the anonymous Letter into the housemaid's head. Thus the delusion acquires a certain independence of the letter; it had been present already in the patient as a fear - or was it as a wish? Let us now add to this the small further indications yielded by only two analytic sessions. The patient, indeed, behaved in a very unco-operative way when, after telling me her story, she was asked for her further thoughts, ideas and memories. She said that nothing occurred to her, that she had told me everything already, and after two sessions the experiment with me had in fact to be broken off because she announced that she already felt well and that she was sure the pathological idea would not come back. She only said this, of course, from resistance and from dread of the continuation of the analysis. Nevertheless, during these two sessions she let fall a few remarks which allowed of, and indeed necessitated, a particular interpretation; and this interpretation threw a clear light on the genesis of her delusion of jealousy. She herself was intensely in love with a young man, with the same son-in-law who had persuaded her to come to me as a patient. She herself knew nothing, or perhaps only a very little, of this love; in the family relationship that existed between them it was easy for this passionate liking to disguise itself as innocent affection. After all our experiences elsewhere, it is not hard for us to feel our way into the mental life of this upright wife and worthy mother, of the age of fifty-three. Being in love like this, a monstrous and impossible thing, could not become conscious; but it remained in existence and, even though it was unconscious, it exercised a severe pressure. Something had to become of it, some relief had to be looked for; and the easiest mitigation was offered, no doubt, by the mechanism of displacement which plays a part so regularly in the generating of delusional jealousy. If not only were she, the old woman, in love with a young man, but if also her old husband were having a love affair with a young girl, then her conscience would be relieved of the weight of her unfaithfulness. The phantasy of her husband's unfaithfulness thus acted as a cooling compress on her burning wound. Her own love had not become conscious to her, but its mirror-reflection, which brought her such an advantage, now became conscious as an obsession and delusion. No arguments against it could, of course, have any effect, for they were only directed against the mirror-image and not against the original which gave the other its strength and which lay hidden, inviolable, in the unconscious.
Certainly this is a crazy illness. The most extravagant psychiatric imagination would not, I think, have succeeded in constructing anything like it; and if one did not see it before one every day one would never bring oneself to believe in it. Do not suppose, however, that you will help the patient in the least by calling on him to take a new line, to cease to occupy himself with such foolish thoughts and to do something sensible instead of his childish pranks. He would like to do so himself, for he is completely clear in his head, shares your opinion of his obsessional symptoms and even puts it forward to you spontaneously. Only he cannot help himself. What is carried into action in an obsessional neurosis is sustained by an energy to which we probably know nothing comparable in normal mental life. There is only one thing he can do: he can make displacements, and exchanges, he can replace one foolish idea by another somewhat milder, he can proceed from one precaution or prohibition to another, instead of one ceremonial he can perform another. He can displace the obsession but not remove it. The ability to displace any symptom into something far removed from its original conformation is a main characteristic of his illness. Moreover it is a striking fact that in his condition the contradictions (polarities) with which mental life is interlaced emerge especially sharply differentiated. Alongside of obsessions with a positive and negative content, doubt makes itself felt in the intellectual field and little by little it begins to gnaw even at what is usually most certain. The whole position ends up in an ever-increasing degree of indecision, loss of energy and restriction of freedom. At the same time, the obsessional neurotic starts off with a very energetic disposition, he is often extraordinarily self-willed and as a rule he has intellectual gifts above the average. He has usually reached a satisfactorily high level of ethical development; he exhibits over-conscientiousness, and is more than ordinarily correct in his behaviour. You can imagine that no small amount of work is needed before one can make one's way any distance into this contradictory hotch-potch of character-traits and symptoms. And to begin with we aim at nothing whatever else than understanding a few of the symptoms and being able to interpret them.

[1916-1917, 3340]

The analysis of these torments did not proceed so simply as that of our earlier patient's obsessional action. I was obliged to give the girl hints and propose interpretations, which were always rejected with a decided 'no' or accepted with contemptuous doubt. But after this first reaction of rejection there followed a time during which she occupied herself with the possibilities put before her, collected associations to them, produced recollections and made connections, until by her own work she had accepted all the interpretations. In proportion as this happened, she relaxed the performance of her obsessional measures, and even before the end of the treatment she had given up the whole ceremonial. You must understand, too, that the work of analysis as we carry it out to-day quite excludes the systematic treatment of any individual symptom till it has been entirely cleared up. We are, on the contrary, obliged to keep on leaving any particular topic, in the certain expectation of coming back to it again in other connections. The interpretation of her symptoms which I am about to give you is accordingly a synthesis of findings which were arrived at, interrupted by other work, over a period of weeks and months.

[1916-1917, 3346]
Our patient gradually came to learn that it was as symbols of the female genitals that clocks were banished from her equipment for the night. Clocks and watches - though elsewhere we have found other symbolic interpretations for them - have arrived at a genital role owing to their relation to periodic processes and equal intervals of time. A woman may boast that her menstruation behaves with the regularity of clockwork. Our patient's anxiety, however, was directed in particular against being disturbed in her sleep by the ticking of a clock. The ticking of a clock may be compared with the knocking or throbbing in the clitoris during sexual excitement. She had in fact been repeatedly woken from her sleep by this sensation, which had now become distressing to her; and she gave expression to this fear of an erection in the rule that all clocks and watches that were going should be removed from her neighbourhood at night. Flower-pots and vases, like all vessels, are also female symbols. Taking precautions against their falling and being broken at night was thus not without its good sense. We know the widespread custom of breaking a vessel or plate at betrothal ceremonies. Each man present gets hold of a fragment, and we may regard this as a sign of his resigning the claims he had upon the bride in virtue of a marriage-regulation dating from before the establishment of monogamy. In connection with this part of her ceremonial the girl produced a recollection and several associations. Once when she was a child she had fallen down while she was carrying a glass or china vase and had cut her finger and bled profusely. When she grew up and came to know the facts about sexual intercourse she formed an anxious idea that on her wedding-night she would not bleed and would thus fail to show that she was a virgin. Her precautions against vases being broken thus meant a repudiation of the whole complex concerned with virginity and bleeding at the first intercourse - a repudiation equally of the fear of bleeding and of the contrary fear of not bleeding. These precautions, which she subsumed under her avoidance of noise, had only a remote connection with it.

The construction of a symptom is a substitute for something else that did not happen. Some particular mental processes should normally have developed to a point at which consciousness received information of them. This, however, did not take place, and instead - out of the interrupted processes, which had been somehow disturbed and were obliged to remain unconscious - the symptom emerged. Thus something in the nature of an exchange has taken place; if this can be reversed the therapy of the neurotic symptoms will have achieved its task.

If only that was how things happened! We came upon discoveries in this connection for which we were at first unprepared. Knowledge is not always the same as knowledge: there are different sorts of knowledge, which are far from equivalent psychologically. 'Il y a fagots et fagots', as Molière has said. The doctor's knowledge is not the same as the patient's and cannot produce the same effects. If the doctor transfers his knowledge to the patient as a piece of information, it has no result. No, it would be wrong to say that. It does not have the result of removing the symptoms, but it has another one - of setting the analysis in motion, of which the first signs are often expressions of denial. The patient knows after this what he did not know before - the sense of his symptom; yet he knows it just as little as he did. Thus we learn that there is more than one kind of ignorance. We shall need to have a somewhat deeper understanding of psychology to show us in what these differences consist. But our thesis that the symptoms vanish when their sense is known remains true in spite of this. All we have to add is that the knowledge must rest on an internal change in the patient such as can only be brought about by a piece of psychical work with a particular aim. We are faced here by problems which will presently be brought together into the dynamics of the construction of symptoms.
A disturbance of memory of this kind is enough for obsessional neurosis; but the case is different with hysteria. As a rule the latter neurosis is marked by amnesias on a really large scale. In analysing each separate hysterical symptom one is usually led to a whole chain of impressions of events, which, when they recur, are expressly described by the patient as having been till then forgotten. On the one hand, this chain reaches back to the earliest years of life, so that the hysterical amnesia can be recognized as an immediate continuation of the infantile amnesia which, for us normal people, conceals the beginnings of our mental life. On the other hand, we learn with astonishment that even the patient's most recent experiences can be subject to forgetting, and that the occasions which precipitated the outbreak of the illness or led to its intensification are in particular encroached upon, if not completely swallowed up, by amnesia. It regularly happens that important details have disappeared from the total picture of a recent recollection of this sort or that they have been replaced by falsifications of memory. Indeed it happens with almost equal regularity that certain memories of recent experiences only emerge shortly before the end of an analysis - memories which had been held back till that late moment and had left perceptible gaps in the continuity of the case.

[1916-1917, 3360]

In the first place, then, when we undertake to restore a patient to health, to relieve him of the symptoms of his illness, he meets us with a violent and tenacious resistance, which persists throughout the whole length of the treatment. This is such a strange fact that we cannot expect it to find much credence. It is best to say nothing about it to the patient's relatives, for they invariably regard it as an excuse on our part for the length or failure of our treatment. The patient, too, produces all the phenomena of this resistance without recognizing it as such, and if we can induce him to take our view of it and to reckon with its existence, that already counts as a great success. Only think of it! The patient, who is suffering so much from his symptoms and is causing those about him to share his sufferings, who is ready to undertake so many sacrifices in time, money, effort and self-discipline in order to be freed from those symptoms we are to believe that this same patient puts up a struggle in the interest of his illness against the person who is helping him. How improbable such an assertion must sound! Yet it is true; and when its improbability is pointed out to us, we need only reply that it is not without analogies. A man who has gone to the dentist because of an unbearable toothache will nevertheless try to hold the dentist back when he approaches the sick tooth with a pair of forceps.

[1916-1917, 3362]

In psycho-analytic therapy we make use of the same technique that is familiar to you from dream-interpretation. We instruct the patient to put himself into a state of quiet, unreflecting self-observation, and to report to us whatever internal perceptions he is able to make - feelings, thoughts, memories in the order in which they occur to him. At the same time we warn him expressly against giving way to any motive which would lead him to make a selection among these associations or to exclude any of them, whether on the ground that it is too disagreeable or too indiscreet to say, or that it is too unimportant or irrelevant, or that it is nonsensical and need not be said. We urge him always to follow only the surface of his consciousness and to leave aside any criticism of what he finds, whatever shape that criticism may take; and we assure him that the success of the treatment, and above all its duration, depends on the conscientiousness with which he obeys this fundamental technical rule of analysis. We already know from the technique of dream-interpretation that the associations giving rise to the doubts and objections I have just enumerated are precisely the ones that invariably contain the material which leads to the uncovering of the unconscious.

[1916-1917, 3362]
The first thing we achieve by setting up this fundamental technical rule is that it becomes the target for the attacks of the resistance. The patient endeavours in every sort of way to extricate himself from its provisions. At one moment he declares that nothing occurs to him, at the next that so many things are crowding in on him that he cannot get hold of anything. Presently we observe with pained astonishment that he has given way first to one and then to another critical objection: he betrays this to us by the long pauses that he introduces into his remarks. He then admits that there is something he really cannot say - he would be ashamed to; and he allows this reason to prevail against his promise. Or he says that something has occurred to him, but it concerns another person and not himself and is therefore exempt from being reported. Or, what has now occurred to him is really too unimportant, too silly and senseless: I cannot possibly have meant him to enter into thoughts like that. So it goes on in innumerable variations, and one can only reply that 'to say everything' really does mean 'to say everything'.

[1916-1917, 3363]

It now appears as an intellectual resistance, it fights by means of arguments and exploits all the difficulties and improbabilities which normal but uninstructed thinking finds in the theories of analysis. It is now our fate to hear from this single voice all the criticisms and objections which assail our ears in a chorus in the scientific literature of the subject. And for this reason none of the shouts that reach us from outside sound unfamiliar. It is a regular storm in a tea-cup. But the patient is willing to be argued with; he is anxious to get us to instruct him, teach him, contradict him, introduce him to the literature, so that he can find further instruction. He is quite ready to become an adherent of psycho-analysis - on condition that analysis spares him personally. But we recognize this curiosity as a resistance, as a diversion from our particular tasks, and we repel it. In the case of an obsessional neurotic we have to expect special tactics of resistance. He will often allow the analysis to proceed on its way uninhibited, so that it is able to shed an ever-increasing light upon the riddle of his illness. We begin to wonder in the end, however, why this enlightenment is accompanied by no practical advance, no diminution of the symptoms. We are then able to realize that resistance has withdrawn on to the doubt belonging to the obsessional neurosis and from that position is successfully defying us. It is as though the patient were saying: 'Yes, that's all very nice and interesting, and I'll be very glad to go on with it further. It would change my illness a lot if it were true. But I don't in the least believe that it is true; and, so long as I don't believe it, it makes no difference to my illness.' Things can proceed like this for a long time, till finally one comes up against this uncommitted attitude itself, and the decisive struggle then breaks out.

[1916-1917, 3364]
If, however, the recognition of resistance has become so important, we should do well to find room for a cautious doubt whether we have not been too light-heartedly assuming resistances. Perhaps there really are cases of neurosis in which associations fail for other reasons, perhaps the arguments against our hypotheses really deserve to have their content examined, and perhaps we are doing patients an injustice in so conveniently setting aside their intellectual criticisms as resistance. But, Gentlemen, we did not arrive at this judgement lightly. We have had occasion to observe all these critical patients at the moment of the emergence of a resistance and after its disappearance. For resistance is constantly altering its intensity during the course of a treatment; it always increases when we are approaching a new topic, it is at its most intense while we are at the climax of dealing with that topic, and it dies away when the topic has been disposed of. Nor do we ever, unless we have been guilty of special clumsiness in our technique, have to meet the full amount of resistance of which a patient is capable. We have therefore been able to convince ourselves that on countless occasions in the course of his analysis the same man will abandon his critical attitude and then take it up again. If we are on the point of bringing a specially distressing piece of unconscious material to his consciousness, he is extremely critical; he may previously have understood and accepted a great deal, but now it is just as though those acquisitions have been swept away; in his efforts for opposition at any price, he may offer a complete picture of someone who is an emotional imbecile. But if we succeed in helping him to overcome this new resistance, he recovers his insight and understanding. Thus his critical faculty is not an independent function, to be respected as such, it is the tool of his emotional attitudes and is directed by his resistance. If there is something he does not like, he can put up a shrewd fight against it and appear highly critical; but if something suits his book, he can, on the contrary, show himself most credulous. Perhaps none of us are very different; a man who is being analysed only reveals this dependence of the intellect upon emotional life so clearly because in analysis we are putting such great pressure on him.

[1916-1917, 3367]

You will recollect that, in the two cases whose symptoms we submitted to a detailed investigation, the analysis initiated us into these patients' most intimate sexual life. In the first case we further recognized with particular clarity the intention or purpose of the symptom we were examining; in the second case this was perhaps somewhat concealed by a factor which will be mentioned later. Well, every other case that we submit to analysis would show us the same thing that we have found in these two examples. In every instance we should be introduced by the analysis into the patient's sexual experiences and wishes; and in every instance we should be bound to see that the symptoms served the same intention. We find that this intention is the satisfaction of sexual wishes; the symptoms serve for the patients' sexual satisfaction; they are a substitute for satisfaction of this kind, which the patients are without in their lives.

[1916-1917, 3371]
But I still owe you further enlightenment, Gentlemen, on my reasons for not starting my account of the theory of the neuroses with the common neurotic state. You may perhaps suppose that it was because in that case I should have had greater difficulty in proving the sexual causation of the neuroses. But you would be wrong there. In the case of the transference neuroses one must work one's way through the interpretation of symptoms before one can arrive at that discovery. In the common forms of what are known as the 'actual neuroses' the aetiological significance of sexual life is a crude fact that springs to the observer's eyes. I came upon it more than twenty years ago when one day I asked myself the question of why in the examination of neurotics their sexual activities were so regularly excluded from consideration. At that time I sacrificed my popularity with my patients for the sake of these enquiries; but after only a brief effort I was able to declare that 'if the vita sexualis is normal, there can be no neurosis' - and by this I meant no 'actual neurosis'. No doubt this statement passes too lightly over people's individual differences; it suffers, too, from the indefiniteness inseparable from the judgement of what is 'normal'. But as a rough guide it retains its value to this day. I had by then reached the point of establishing specific relations between particular forms of neurosis and particular sexual noxae; and I have no doubt that I could repeat the same observations to-day if similar pathological material were still at my disposal. I found often enough that a man who indulged in a certain kind of incomplete sexual satisfaction (for instance, manual masturbation) had fallen ill of a particular form of 'actual neurosis', and that this neurosis promptly gave place to another if he replaced this sexual régime by another equally far from being irreproachable. I was then in a position to infer the change in a patient's sexual mode of life from an alteration in his condition. I also learnt then to stand obstinately by my suspicions till I had overcome the patients' disingenuousness and compelled them to confirm my views. It is true that thereafter they preferred to go to other doctors who did not make such keen enquiries about their sexual life.

[1916-1917, 3438]

(b) A second pointer is to be found in the analysis of the psychoneuroses, and especially of hysteria. We have seen that in this illness anxiety often appears in company with the symptoms, but that unbound anxiety appears, too, manifested as an attack or as a chronic condition. The patients cannot say what it is they are afraid of, and, by the help of an unmistakable secondary revision, link it to the first phobias that come to hand - such as dying, going mad, or having a stroke. If the situation out of which the anxiety (or the symptoms accompanied by anxiety) arose is subjected to analysis, we can as a rule discover what normal course of psychical events has failed to occur and has been replaced by phenomena of anxiety. To express it in another way: we construct the unconscious process as it would have been if it had not experienced any repression and had proceeded unhindered into consciousness. This process would have been accompanied by a particular affect, and we now learn to our surprise that this affect accompanying the normal course of events is invariably replaced by anxiety after repression has occurred, no matter what its own quality may be. Thus, when we have a hysterical anxiety-state before us, its unconscious correlate may be an impulse of a similar character - anxiety, shame, embarrassment - or, just as easily, a positive libidinal excitation or a hostile aggressive one, such as rage or anger. Anxiety is therefore the universally current coinage for which any affective impulse is or can be exchanged if the ideational content attached to it is subjected to repression.

[1916-1917, 3450]
What, then, must we do in order to replace what is unconscious in our patients by what is conscious? There was a time when we thought this was a very simple matter: all that was necessary was for us to discover this unconscious material and communicate it to the patient. But we know already that this was a short-sighted error. Our knowledge about the unconscious material is not equivalent to his knowledge; if we communicate our knowledge to him, he does not receive it instead of his unconscious material but beside it; and that makes very little change in it. We must rather picture this unconscious material topographically, we must look for it in his memory at the place where it became unconscious owing to a repression. The repression must be got rid of - after which the substitution of the conscious material for the unconscious can proceed smoothly. How, then, do we lift a repression of this kind? Here our task enters a second phase. First, the search for the repression and then the removal of the resistance which maintains the repression.

How do we remove the resistance? In the same way: by discovering it and showing it to the patient. Indeed, the resistance too is derived from a repression - from the same one that we are endeavouring to resolve, or from one that took place earlier. It was set up by the anticathexis which arose in order to repress the objectionable impulse. Thus we now do the same thing that we tried to do to begin with: interpret, discover and communicate; but now we are doing it at the right place. The anticathexis or the resistance does not form part of the unconscious but of the ego, which is our collaborator, and is so even if it is not conscious. As we know, the word 'unconscious' is being used here in two senses: on the one hand as a phenomenon and on the other as a system. This sounds very difficult and obscure; but is it not only repeating what we have already said in earlier passages? We have long been prepared for it. We expect that this resistance will be given up and the anticathexis withdrawn when our interpretation has made it possible for the ego to recognize it. What are the motive forces that we work with in such a case? First with the patient's desire for recovery, which has induced him to take part with us in our joint work, and secondly with the help of his intelligence, to which we give support by our interpretation. There is no doubt that it is easier for the patient's intelligence to recognize the resistance and to find the translation corresponding to what is repressed if we have previously given him the appropriate anticipatory ideas. If I say to you: 'Look up at the sky! There's a balloon there!' you will discover it much more easily than if I simply tell you to look up and see if you can see anything. In the same way, a student who is looking through a microscope for the first time is instructed by his teacher as to what he will see; otherwise he does not see it at all, though it is there and visible.

But here I will pause, and let you have a word; for I see an objection boiling up in you so fiercely that it would make you incapable of listening if it were not put into words: 'Ah! so you've admitted it at last! You work with the help of suggestion, just like the hypnotists! That is what we've thought for a long time. But, if so, why the roundabout road by way of memories of the past, discovering the unconscious, interpreting and translating back distortions - this immense expenditure of labour, time and money - when the one effective thing is after all only suggestion? Why do you not make direct suggestion against the symptoms, as the others do - the honest hypnotists? Moreover, if you try to excuse yourself for your long detour on the ground that you have made a number of important psychological discoveries which are hidden by direct suggestion - what about the certainty of these discoveries now? Are not they a result of suggestion too, of unintentional suggestion? Is it not possible that you are forcing on the patient what you want and what seems to you correct, in this field as well?'
Thus our therapeutic work falls into two phases. In the first, all the libido is forced from the symptoms into the transference and concentrated there; in the second, the struggle is waged around this new object and the libido is liberated from it. The change which is decisive for a favourable outcome is the elimination of repression in this renewed conflict so that the libido cannot withdraw once more from the ego by flight into the unconscious. This is made possible by the alteration of the ego which is accomplished under the influence of the doctor's suggestion. By means of the work of interpretation, which transforms what is unconscious into what is conscious, the ego is enlarged at the cost of this unconscious; by means of instruction, it is made conciliatory towards the libido and inclined to grant it some satisfaction, and its repugnance to the claims of the libido is diminished by the possibility of disposing of a portion of it by sublimation. The more closely events in the treatment coincide with this ideal description, the greater will be the success of the psycho-analytic therapy. It finds its limits in the lack of mobility of the libido, which may refuse to leave its objects, and the rigidity of narcissism, which will not allow transference on to objects to increase beyond certain bounds. Further light may perhaps be thrown on the dynamics of the process of cure if I say that we get hold of the whole of the libido which has been withdrawn from the dominance of the ego by attracting a portion of it on to ourselves by means of the transference.

I am anxious not to be misunderstood. Every analyst knows - and he has met with the experience on countless occasions - that in the course of a successful treatment the patient brings up a large number of spontaneous recollections from his childhood, for the appearance of which (a first appearance, perhaps) the physician feels himself entirely blameless, since he has not made any attempt at a construction which could have put any material of the sort into the patient's head. It does not necessarily follow that these previously unconscious recollections are always true. They may be; but they are often distorted from the truth, and interspersed with imaginary elements, just like the so-called screen memories which are preserved spontaneously. All that I mean to say is this: scenes, like this one in my present patient's case, which date from such an early period and exhibit a similar content, and which further lay claim to such an extraordinary significance for the history of the case, are as a rule not reproduced as recollections, but have to be divined - constructed - gradually and laboriously from an aggregate of indications. Moreover, it would be sufficient for the purposes of the argument if my admission that scenes of this kind do not become conscious in the shape of recollections applied only to cases of obsessional neurosis, or even if I were to limit my assertion to the case which we are studying here.

With this as a starting-point we go on to make our first important discovery. We learn that, when we try to understand neurotic disorders, by far the greater significance attaches to the sexual instincts; that in fact neuroses are the specific disorders, so to speak, of the sexual function; that in general whether or not a person develops a neurosis depends on the quantity of his libido, and on the possibility of satisfying it and of discharging it through satisfaction; that the form taken by the disease is determined by the way in which the individual passes through the course of development of his sexual function, or, as we put it, by the fixations his libido has undergone in the course of its development; and, further, that by a special, not very simple technique for influencing the mind we are able to throw light on the nature of some groups of neuroses and at the same time to do away with them. Our therapeutic efforts have their greatest success with a certain class of neuroses which proceed from a conflict between the ego-instincts and the sexual instincts. For in human beings it may happen that the demands of the sexual instincts, whose reach of course extends far beyond the individual, seem to the ego to constitute a danger which threatens its self-preservation or its self-esteem. The ego then assumes the defensive, denies the sexual instincts the satisfaction they desire and forces them into those by-paths of substitutive satisfaction which become manifest as nervous symptoms.
During the work of treatment we have to consider the distribution of the patient's libido; we look for the object presentations to which it is bound and free it from them, so as to place it at the disposal of the ego. In the course of this, we have come to form a very curious picture of the original, primal distribution of libido in human beings. We have been driven to assume that at the beginning of the development of the individual all his libido (all his erotic tendencies, all his capacity for love) is tied to himself - that as we say, it cathects his own ego. It is only later that, being attached to the satisfaction of the major vital needs, the libido flows over from the ego on to external objects. Not till then are we able to recognize the libidinal instincts as such and distinguish them from the ego instincts. It is possible for the libido to become detached from these objects and withdrawn again into the ego.

[1917a, 3609]

The work by which we bring the repressed mental material into the patient's consciousness has been called by us psycho-analysis. Why 'analysis' - which means breaking up or separating out, and suggests an analogy with the work carried out by chemists on substances which they find in nature and bring into their laboratories? Because in an important respect there really is an analogy between the two. The patient's symptoms and pathological manifestations, like all his mental activities, are of a highly composite kind; the elements of this compound are at bottom motives, instinctual impulses. But the patient knows nothing of these elementary motives or not nearly enough. We teach him to understand the way in which these highly complicated mental formations are compounded; we trace the symptoms back to the instinctual impulses which motivate them; we point out to the patient these instinctual motives, which are present in his symptoms and of which he has hitherto been unaware, - just as a chemist isolates the fundamental substance, the chemical 'element', out of the salt in which it had been combined with other elements and in which it was unrecognizable. In the same way, as regards those of the patient's mental manifestations that were not considered pathological, we show him that he was only to a certain extent conscious of their motivation - that other instinctual impulses of which he had remained in ignorance had co-operated in producing them.

[1919a, 3629]
To a physician who was to undertake psycho-analytic treatment of the girl there were many grounds for misgiving. The situation he had to deal with was not the one that analysis demands, in which alone it can demonstrate its effectiveness. As is well known, the ideal situation for analysis is when someone who is otherwise his own master is suffering from an inner conflict which he is unable to resolve alone, so that he brings his trouble to the analyst and begs for his help. The physician then works hand in hand with one portion of the pathologically divided personality, against the other party in the conflict. Any situation which differs from this is to a greater or lesser degree unfavourable for psycho-analysis and adds fresh difficulties to the internal ones already present. Situations like that of a prospective house-owner who orders an architect to build him a villa to his own tastes and requirements, or of a pious donor who commissions an artist to paint a sacred picture in the corner of which is to be a portrait of himself in adoration, are at bottom incompatible with the conditions necessary for psycho-analysis. Thus, it constantly happens that a husband instructs the physician as follows: ‘My wife suffers from nerves, and for that reason gets on badly with me; please cure her, so that we may lead a happy married life again.’ But often enough it turns out that such a request is impossible to fulfil - that is to say, the physician cannot bring about the result for which the husband sought the treatment. As soon as the wife is freed from her neurotic inhibitions she sets about getting a separation, for her neurosis was the sole condition under which the marriage could be maintained. Or else parents expect one to cure their nervous and unruly child. By a healthy child they mean one who never causes his parents trouble, and gives them nothing but pleasure. The physician may succeed in curing the child, but after that it goes its own way all the more decidedly, and the parents are now far more dissatisfied than before. In short, it is not a matter of indifference whether someone comes to analysis of his own accord or because he is brought to it - whether it is he himself who desires to be changed, or only his relatives, who love him (or who might be expected to love him). [1920a, 3840]

For these reasons I refrained altogether from holding out to the parents any prospect of their wish being fulfilled. I merely said I was prepared to study the girl carefully for a few weeks or months, so as then to be able to pronounce how far a continuation of the analysis would be likely to influence her. In quite a number of cases, indeed, an analysis falls into two clearly distinguishable phases. In the first, the physician procures from the patient the necessary information, makes him familiar with the premises and postulates of psycho-analysis, and unfolds to him the reconstruction of the genesis of his disorder as deduced from the material brought up in the analysis. In the second phase the patient himself gets hold of the material put before him; he works on it, recollects what he can of the apparently repressed memories, and tries to repeat the rest as if he were in some way living it over again. In this way he can confirm, supplement, and correct the inferences made by the physician. It is only during this work that he experiences, through overcoming resistances, the inner change aimed at, and acquires for himself the convictions that make him independent of the physician's authority. These two phases in the course of the analytic treatment are not always sharply divided from each other; this can only happen when the resistance obeys certain conditions. But when this is so, one may bring up as an analogy the two stages of a journey. The first comprises all the necessary preparations, to-day so complicated and hard to effect, before, ticket in hand, one can at last go on to the platform and secure a seat in the train. One then has the right, and the possibility, of travelling into a distant country; but after all these preliminary exertions one is not yet there - indeed, one is not a single mile nearer to one's goal. For this to happen one has to make the journey itself from one station to the other, and this part of the performance may well be compared with the second phase of the analysis. [1920a, 3842]
Let us take as an example the so-called dreams of recovery. If a patient has had a dream of this kind, in which he seems to abandon the restrictions of his neurosis - if, for instance, he overcomes some phobia or gives up some emotional attachment - we are inclined to think that he has made a great step forward, that he is ready to take his place in a new state of life, that he has begun to reckon on his recovery, etc. This may often be true, but quite as often such dreams of recovery only have the value of dreams of convenience: they signify a wish to be well at last, in order to avoid another portion of the work of analysis which is felt to lie ahead. In this sense, dreams of recovery very frequently occur, for instance, when the patient is about to enter upon a new and disagreeable phase of the transference. He is behaving in this just like some neurotics who after a few hours of analysis declare they have been cured - because they want to escape all the unpleasantness that is bound to come up for discussion in the analysis. Sufferers from war neuroses, too, who gave up their symptoms because the therapy adopted by the army doctors succeeded in making being ill even more uncomfortable than serving at the front - these sufferers, too, were following the same economic laws and in both cases alike the cures have proved to be only temporary.

If a dream brings up situations that can be interpreted as referring to scenes from the dreamer's past, it seems especially important to ask whether the physician's influence can also play a part in such contents of the dream as these. And this question is most urgent of all in the case of what are called 'corroborative' dreams, dreams which, as it were, 'tag along behind' the analysis. With some patients these are the only dreams that one obtains. Such patients reproduce the forgotten experiences of their childhood only after one has constructed them from their symptoms, associations and other signs and has propounded these constructions to them. Then follow the corroborative dreams, concerning which, however, the doubt arises whether they may not be entirely without evidential value, since they may have been imagined in compliance with the physician's words instead of having been brought to light from the dreamer's unconscious. This ambiguous position cannot be escaped in the analysis, since with these patients unless one interprets, constructs and propounds, one never obtains access to what is repressed in them.

The situation takes a favourable turn if the analysis of a corroborative dream of this sort, which 'tags along behind', is immediately followed by feelings of remembering what has hitherto been forgotten. But even then the sceptic can fall back upon an assertion that the recollections are illusory. Moreover, such feelings are for the most part absent. The repressed material is only allowed through bit by bit; and every lack of completeness inhibits or delays the forming of a sense of conviction. Furthermore, what we are dealing with may not be the reproduction of a real and forgotten event but the bringing forward of an unconscious phantasy, about which no feeling of memory is ever to be expected, though the possibility may sometimes remain of a sense of subjective conviction.
Is it possible, then, that corroborative dreams are really the result of suggestion, that they are 'obliging' dreams? The patients who produce only corroborative dreams are the same patients in whom doubt plays the principal part in resistance. One makes no attempt at shoutting down this doubt by means of one's authority or at reducing it by arguments. It must persist until it is brought to an end in the further course of the analysis. The analyst, too, may himself retain a doubt of the same kind in some particular instances. What makes him certain in the end is precisely the complication of the problem before him, which is like the solution of a jig-saw puzzle. A coloured picture, pasted upon a thin sheet of wood and fitting exactly into a wooden frame, is cut into a large number of pieces of the most irregular and crooked shapes. If one succeeds in arranging the confused heap of fragments, each of which bears upon it an unintelligible piece of drawing, so that the picture acquires a meaning, so that there is no gap anywhere in the design and so that the whole fits into the frame - if all these conditions are fulfilled, then one knows that one has solved the puzzle and that there is no alternative solution. [1923c, 4037]

But hypnotism had been of immense help in the cathartic treatment, by widening the field of the patient's consciousness and putting within his reach knowledge which he did not possess in his waking life. It seemed no easy task to find a substitute for it. While I was in this perplexity there came to my help the recollection of an experiment which I had often witnessed while I was with Bernheim. When the subject awoke from the state of somnambulism, he seemed to have lost all memory of what had happened while he was in that state. But Bernheim maintained that the memory was present all the same; and if he insisted on the subject remembering, if he asseverated that the subject knew it all and had only to say it, and if at the same time he laid his hand on the subject's forehead, then the forgotten memories used in fact to return, hesitatingly at first, but eventually in a flood and with complete clarity. I determined that I would act in the same way. My patients, I reflected, must in fact 'know' all the things which had hitherto only been made accessible to them in hypnosis; and assurances and encouragement on my part, assisted perhaps by the touch of my hand, would, I thought, have the power of forcing the forgotten facts and connections into consciousness. No doubt this seemed a more laborious process than putting the patients into hypnosis, but it might prove highly instructive. So I abandoned hypnotism, only retaining my practice of requiring the patient to lie upon a sofa while I sat behind him, seeing him, but not seen myself. [1925d, 4205]
It may seem surprising that this method of free association, carried out subject to the observation of the fundamental rule of psycho-analysis, should have achieved what was expected of it, namely the bringing into consciousness of the repressed material which was held back by resistances. We must, however, bear in mind that free association is not really free. The patient remains under the influence of the analytic situation even though he is not directing his mental activities on to a particular subject. We shall be justified in assuming that nothing will occur to him that has not some reference to that situation. His resistance against reproducing the repressed material will now be expressed in two ways. Firstly it will be shown by critical objections; and it was to deal with these that the fundamental rule of psycho-analysis was invented. But if the patient observes that rule and so overcomes his reticences, the resistance will find another means of expression. It will so arrange it that the repressed material itself will never occur to the patient but only something which approximates to it in an allusive way; and the greater the resistance, the more remote from the actual idea that the analyst is in search of will be the substitutive association which the patient has to report. The analyst, who listens composedly but without any constrained effort to the stream of associations and who, from his experience, has a general notion of what to expect, can make use of the material brought to light by the patient according to two possibilities. If the resistance is slight he will be able from the patient's allusions to infer the unconscious material itself; or if the resistance is stronger he will be able to recognize its character from the associations, as they seem to become more remote from the topic in hand, and will explain it to the patient. Uncovering the resistance, however, is the first step towards overcoming it. Thus the work of analysis involves an art of interpretation, the successful handling of which may require tact and practice but which is not hard to acquire. But it is not only in the saving of labour that the method of free association has an advantage over the earlier method. It exposes the patient to the least possible amount of compulsion, it never allows of contact being lost with the actual current situation, it guarantees to a great extent that no factor in the structure of the neurosis will be overlooked and that nothing will be introduced into it by the expectations of the analyst. It is left to the patient in all essentials to determine the course of the analysis and the arrangement of the material; any systematic handling of particular symptoms or complexes thus becomes impossible. In complete contrast to what happened with hypnosis and with the urging method, interrelated material makes its appearance at different times and at different points in the treatment. To a spectator, therefore - though in fact there must be none - an analytic treatment would seem completely obscure.

[1925d, 4216]
We showed on an earlier occasion that the resistance that has to be overcome in analysis proceeds from the ego, which clings to its anticathexes. It is hard for the ego to direct its attention to perceptions and ideas which it has up till now made a rule of avoiding, or to acknowledge as belonging to itself impulses that are the complete opposite of those which it knows as its own. Our fight against resistance in analysis is based upon this view of the facts. If the resistance is itself unconscious, as so often happens owing to its connection with the repressed material, we make it conscious. If it is conscious, or when it has become conscious, we bring forward logical arguments against it; we promise the ego rewards and advantages if it will give up its resistance. There can be no doubt or mistake about the existence of this resistance on the part of the ego. But we have to ask ourselves whether it covers the whole state of affairs in analysis. For we find that even after the ego has decided to relinquish its resistances it still has difficulty in undoing the repressions; and we have called the period of strenuous effort which follows after its praiseworthy decision, the phase of 'working-through'. The dynamic factor which makes a working-through of this kind necessary and comprehensible is not far to seek. It must be that after the ego's resistance has been removed the power of the compulsion to repeat - the attraction exerted by the unconscious prototype upon the repressed instinctual process - has still to be overcome. There is nothing to be said against describing this factor as the resistance of the unconscious. There is no need to be discouraged by these emendations. They are to be welcomed if they add something to our knowledge, and they are no disgrace to us so long as they enrich rather than invalidate our earlier views - by limiting some statement, perhaps, that was too general or by enlarging some idea that was too narrowly formulated.

Whether this happens will depend on people who are not obliged to be familiar with the peculiarities of an analytic treatment. It is our task to give information on the subject to these impartial persons, whom we shall assume to be, at the moment, still in ignorance. It is to be regretted that we cannot let them be present as an audience at a treatment of this kind. But the 'analytic situation' allows of the presence of no third person. Moreover the different sessions are of very unequal value. An unauthorized listener who hit upon a chance one of them would as a rule form no useful impression; he would be in danger of not understanding what was passing between the analyst and the patient, or he would be bored. For good or ill, therefore, he must be content with our information, which we shall try to make as trustworthy as possible.

During this disquisition on the symptoms of neurotics, the Impartial Person, whom I imagine as being present, has been showing signs of impatience. At this point, however, he becomes attentive and interested. 'So now', he says, 'we shall learn what the analyst does with the patient whom the doctor has not been able to help.'

Nothing takes place between them except that they talk to each other. The analyst makes use of no instruments not even for examining the patient - nor does he prescribe any medicines. If it is at all possible, he even leaves the patient in his environment and in his usual mode of life during the treatment. This is not a necessary condition, of course, and may not always be practicable. The analyst agrees upon a fixed regular hour with the patient, gets him to talk, listens to him, talks to him in his turn and gets him to listen.
The Impartial Person's features now show signs of unmistakable relief and relaxation, but they also clearly betray some contempt. It is as though he were thinking: 'Nothing more than that? Words, words, words, as Prince Hamlet says.' And no doubt he is thinking too of Mephistopheles' mocking speech on how comfortably one can get along with words - lines that no German will ever forget.

'So it is a kind of magic,' he comments: 'you talk, and blow away his ailments.'

Quite true. It would be magic if it worked rather quicker. An essential attribute of a magician is speed - one might say suddenness - of success. But analytic treatments take months and even years: magic that is so slow loses its miraculous character. And incidentally do not let us despise the word. After all it is a powerful instrument; it is the means by which we convey our feelings to one another, our method of influencing other people. Words can do unspeakable good and cause terrible wounds. No doubt 'in the beginning was the deed' and the word came later; in some circumstances it meant an advance in civilization when deeds were softened into words. But originally the word was magic - a magical act; and it has retained much of its ancient power.

The Impartial Person proceeds: 'Let us suppose that the patient is no better prepared to understand analytic treatment than I am; then how are you going to make him believe in the magic of the word or of the speech that is to free him from his sufferings?'

Some preparation must of course be given to him; and there is a simple way of doing it. We call on him to be completely straightforward with his analyst, to keep nothing back intentionally that comes into his head, and then to put aside every reservation that might prevent his reporting certain thoughts or memories. Everyone is aware that there are some things in himself that he would be very unwilling to tell other people or that he considers it altogether out of the question to tell. These are his 'intimacies'. He has a notion too - and this represents a great advance in psychological self-knowledge - that there are other things that one would not care to admit to oneself: things that one likes to conceal from oneself and which for that reason one breaks off short and drives out of one's thoughts if, in spite of everything, they turn up. Perhaps he may himself notice that a very remarkable psychological problem begins to appear in this situation - of a thought of his own being kept secret from his own self. It looks as though his own self were no longer the unity which he had always considered it to be, as though there were something else as well in him that could confront that self. He may become obscurely aware of a contrast between a self and a mental life in the wider sense. If now he accepts the demand made by analysis that he shall say everything, he will easily become accessible to an expectation that to have relations and exchanges of thought with someone under such unusual conditions might also lead to peculiar results.

'I understand,' says our Impartial Person. 'You assume that every neurotic has something oppressing him, some secret. And by getting him to tell you about it you relieve his oppression and do him good. That, of course, is the principle of Confession, which the Catholic Church has used from time immemorial in order to make secure its dominance over people's minds.'
We must reply: 'Yes and no!' Confession no doubt plays a part in analysis - as an introduction to it, we might say. But it is very far from constituting the essence of analysis or from explaining its effects. In Confession the sinner tells what he knows; in analysis the neurotic has to tell more. Nor have we heard that Confession has ever developed enough power to get rid of actual pathological symptoms.

[1926e, 4332]

'Then, after all, I do not understand,' comes the rejoinder. 'What can you possibly mean by "telling more than he knows"? But I can well believe that as an analyst you gain a stronger influence over your patients than a Father Confessor over his penitents, since your contacts with him are so much longer, more intensive and also more individual, and since you use this increased influence to divert him from his sick thoughts, to talk him out of his fears, and so on. It would certainly be strange if it were possible by such means to control purely physical phenomena as well, such as vomiting, diarrhoea, convulsions; but I know that influence like that is in fact quite possible if a person is put into a state of hypnosis. By the trouble you take with the patient you probably succeed in bringing about a hypnotic relation of that sort with him - a suggestive attachment to yourself - even though you may not intend to; and in that case the miraculous results of your treatment are the effect of hypnotic suggestion. But, so far as I know, hypnotic treatment works much faster than your analysis, which, as you tell me, lasts for months and years.'

[1926e, 4332]

Our Impartial Person cannot be either so ignorant or so perplexed as we thought to begin with. There are unmistakable signs that he is trying to understand psycho-analysis with the help of his previous knowledge, that he is trying to link it up with something he already knows. The difficult task now lies ahead of us of making it clear to him that he will not succeed in this: that analysis is a procedure *sui generis*, something novel and special, which can only be understood with the help of new insights - or hypotheses, if that sounds better. But he is still waiting for our answer to his last remarks.

[1926e, 4332]

'It would surprise me', comments the Impartial Person, 'if you were able to soothe your patients by agreeing with their sense of guilt in that way. But what *are* your analytic intentions? and what *do* you do with your patients?'

[1926e, 4333]

If I am to say anything intelligible to you, I shall no doubt have to tell you something of a psychological theory which is not known or not appreciated outside analytic circles. It will be easy to deduce from this theory what we want from our patients and how we obtain it. I shall expound it to you dogmatically, as though it were a complete theoretical structure. But do not suppose that it came into being as such a structure, like a philosophical system. We have developed it very slowly, we have wrestled over every small detail of it, we have unceasingly modified it, keeping a continuous contact with observation, till it has finally taken a shape in which it seems to suffice for our purposes. Only a few years ago I should have had to clothe this theory in other terms. Nor, of course, can I guarantee to you that the form in which it is expressed to-day will remain the final one. Science, as you know, is not a revelation; long after its beginnings it still lacks the attributes of definiteness, immutability and infallibility for which human thought so deeply longs. But such as it is, it is all that we can have. If you will further bear in mind that our science is very young, scarcely as old as the century, and that it is concerned with what is perhaps the most difficult material that can be the subject of human research, you will easily be able to adopt the correct attitude towards my exposition. But interrupt me whenever you feel inclined, if you cannot follow me or if you want further explanations.

[1926e, 4334]
You will probably protest at our having chosen simple pronouns to describe our two agencies or provinces instead of giving them orotund Greek names. In psycho-analysis, however, we like to keep in contact with the popular mode of thinking and prefer to make its concepts scientifically serviceable rather than to reject them. There is no merit in this; we are obliged to take this line; for our theories must be understood by our patients, who are often very intelligent, but not always learned. The impersonal 'it' is immediately connected with certain forms of expression used by normal people. 'It shot through me,' people say; ‘there was something in me at that moment that was stronger than me.' 'C'était plus fort que moi.'

[1926e, 4338]

'Well, it is generally reported that in analyses the most intimate - and the nastiest - events in sexual life come up for discussion in every detail. If that is so - I have not been able to gather from your psychological discussions that it is necessarily so - it would be a strong argument in favour of restricting these treatments to doctors. How could one dream of allowing such dangerous liberties to people of whose discretion one was not sure and of whose character one had no guarantee?'

[1926e, 4349]

And it must be so, firstly, because analysis is entirely founded on complete candour. Financial circumstances, for instance, are discussed with equal detail and openness: things are said that are kept back from every fellow-citizen, even if he is not a competitor or a tax-collector. I will not dispute - indeed, I will myself insist with energy - that this obligation to candour puts a grave moral responsibility on the analyst as well. And it must be so, secondly, because factors from sexual life play an extremely important, a dominating, perhaps even a specific part among the causes and precipitating factors of neurotic illnesses. What else can analysis do but keep close to its subject-matter, to the material brought up by the patient? The analyst never entices his patient on to the ground of sex. He does not say to him in advance: 'We shall be dealing with the intimacies of your sexual life!' He allows him to begin what he has to say whenever he pleases, and quietly waits until the patient himself touches on sexual things. I used always to warn my pupils: 'Our opponents have told us that we shall come upon cases in which the factor of sex plays no part. Let us be careful not to introduce it into our analyses and so spoil our chance of finding such a case.' But so far none of us has had that good fortune.

[1926e, 4350]

Let me return to your question about certainty. We have become quite generally convinced from the direct analytic examination of children that we were right in our interpretation of what adults told us about their childhood. In a number of cases, however, another sort of confirmation has become possible. The material of the analysis of some patients has enabled us to reconstruct certain external happenings, certain impressive events of their childhood years, of which they have preserved no conscious memory. Lucky accidents, information from parents or nurses, have afterwards provided irrefutable evidence that these occurrences which we had inferred really did take place. This, of course, has not happened often, but when it has it has made an overwhelming impression. The correct reconstruction, you must know, of such forgotten experiences of childhood always has a great therapeutic effect, whether they permit of objective confirmation or not. These events owe their importance, of course, to their having occurred at such an early age, at a time when they could still produce a traumatic effect on the feeble ego.

[1926e, 4358]

Decidedly not. There are still gaps to be filled. May I make a request? Will you describe how you now picture an analytic treatment? - just as though you had to undertake one yourself.

[1926e, 4360]
'A fine idea, to be sure! No, I have not the least intention of settling our controversy by an experiment of that sort. But just to oblige, I will do what you ask - the responsibility will be yours. Very well. I will suppose that the patient comes to me and complains of his troubles. I promise him recovery or improvement if he will follow my directions. I call on him to tell me with perfect candour everything that he knows and that occurs to him, and not to be deterred from that intention even if some things are disagreeable to say. Have I taken in the rule properly?'
[1926e, 4360]

'I will add that. Thereupon he begins to talk and I listen. And what then? I infer from what he tells me the kind of impressions, experiences and wishes which he has repressed because he came across them at a time when his ego was still feeble and was afraid of them instead of dealing with them. When he has learnt this from me, he puts himself back in the old situations and with my help he manages better. The limitations to which his ego was tied then disappear, and he is cured. Is that right?'
[1926e, 4360]

When one really practises analysis one learns all kinds of things besides. For instance: you would not find it at all such a simple matter to deduce from what the patient tells you the experiences he has forgotten and the instinctual impulses he has repressed. He says something to you which at first means as little to you as it does to him. You will have to make up your mind to look at the material which he delivers to you in obedience to the rule in a quite special way: as though it were ore, perhaps, from which its content of precious metal has to be extracted by a particular process. You will be prepared, too, to work over many tons of ore which may contain but little of the valuable material you are in search of. Here we should have a first reason for the prolonged character of the treatment.
[1926e, 4361]

'But how does one work over this raw material - to keep to your simile?'
[1926e, 4361]

By assuming that the patient's remarks and associations are only distortions of what you are looking for - allusions, as it were, from which you have to guess what is hidden behind them. In a word, this material, whether it consists of memories, associations or dreams, has first to be interpreted. You will do this, of course, with an eye to the expectations you have formed as you listened, thanks to your special knowledge.
[1926e, 4361]

It is a good thing you have asked me about that. This personal influence is our most powerful dynamic weapon. It is the new element which we introduce into the situation and by means of which we make it fluid. The intellectual content of our explanations cannot do it, for the patient, who shares all the prejudices of the world around him, need believe us as little as our scientific critics do. The neurotic sets to work because he has faith in the analyst, and he believes him because he acquires a special emotional attitude towards the figure of the analyst. Children, too, only believe people they are attached to. I have already told you what use we make of this particularly large 'suggestive' influence. Not for suppressing the symptoms - this distinguishes the analytic method from other psychotherapeutic procedures - but as a motive force to induce the patient to overcome his resistances.
[1926e, 4366]
Yes, it ought to. But there turns out to be an unexpected complication. It was perhaps the greatest of the analyst's surprises to find that the emotional relation which the patient adopts towards him is of a quite peculiar nature. The very first doctor who attempted an analysis - it was not myself - came up against this phenomenon and did not know what to make of it. For this emotional relation is, to put it plainly, in the nature of falling in love. Strange, is it not? Especially when you take into account that the analyst does nothing to provoke it but on the contrary rather keeps at a distance from the patient, speaking humanly, and surrounds himself with some degree of reserve - when you learn besides that this odd love-relationship disregards anything else that is really propitious and every variation in personal attraction, age, sex or class. This love is of a positively compulsive kind. Not that that characteristic need be absent from spontaneous falling in love. As you know, the contrary is often the case. But in the analytic situation it makes its appearance with complete regularity without there being any rational explanation for it. One would have thought that the patient's relation to the analyst called for no more than a certain amount of respect, trust, gratitude and human sympathy. Instead, there is this falling in love, which itself gives the impression of being a pathological phenomenon.

[1926e, 4367]

There are at the moment two Institutes at which instruction in psycho-analysis is given. The first has been founded in Berlin by Dr. Max Eitingon, who is a member of the Society there. The second is maintained by the Vienna Psycho-Analytical Society at its own expense and at considerable sacrifice. The part played by the authorities is at present limited to the many difficulties which they put in the way of the young undertaking. A third training Institute is at this moment being opened in London by the Society there, under the direction of Dr. Ernest Jones. At these Institutes the candidates themselves are taken into analysis, receive theoretical instruction by lectures on all the subjects that are important for them, and enjoy the supervision of older and more experienced analysts when they are allowed to make their first trials with comparatively slight cases. A period of some two years is calculated for this training. Even after this period, of course, the candidate is only a beginner and not yet a master. What is still needed must be acquired by practice and by an exchange of ideas in the psycho-analytical societies in which young and old members meet together. Preparation for analytic activity is by no means so easy and simple. The work is hard, the responsibility great. But anyone who has passed through such a course of instruction, who has been analysed himself, who has mastered what can be taught to-day of the psychology of the unconscious, who is at home in the science of sexual life, who has learnt the delicate technique of psycho-analysis, the art of interpretation, of fighting resistances and of handling the transference - anyone who has accomplished all this is no longer a layman in the field of psycho-analysis. He is capable of undertaking the treatment of neurotic disorders, and will be able in time to achieve in that field whatever can be required from this form of therapy.

[1926e, 4370]
The evidence of the share taken by the unconscious id in the formation of dreams is abundant and convincing. (a) Memory is far more comprehensive in dreams than in waking life. Dreams bring up recollections which the dreamer has forgotten, which are inaccessible to him when he is awake. (b) Dreams make an unrestricted use of linguistic symbols, the meaning of which is for the most part unknown to the dreamer. Our experience, however, enables us to confirm their sense. They probably originate from earlier phases in the development of speech. (c) Memory very often reproduces in dreams impressions from the dreamer's early childhood of which we can definitely assert not only that they had been forgotten but that they had become unconscious owing to repression. That explains the help - usually indispensable - given us by dreams in the attempts we make during the analytic treatment of neuroses to reconstruct the dreamer's early life. (d) Furthermore, dreams bring to light material which cannot have originated either from the dreamer's adult life or from his forgotten childhood. We are obliged to regard it as part of the archaic heritage which a child brings with him into the world, before any experience of his own, influenced by the experiences of his ancestors. We find the counterpart of this phylogenetic material in the earliest human legends and in surviving customs. Thus dreams constitute a source of human prehistory which is not to be despised.

[1940a [1938], 4976]

At the moment, however, we are not concerned with the pathogenic role of the defensive mechanisms. What we are trying to discover is what influence the alteration of the ego which corresponds to them has upon our therapeutic efforts. The material for an answer to this question is given in the volume by Anna Freud to which I have already referred. The essential point is that the patient repeats these modes of reaction during the work of analysis as well, that he produces them before our eyes, as it were. In fact, it is only in this way that we get to know them. This does not mean that they make analysis impossible. On the contrary, they constitute half of our analytic task. The other half, the one which was first tackled by analysis in its early days, is the uncovering of what is hidden in the id. During the treatment our therapeutic work is constantly swinging backwards and forwards like a pendulum between a piece of id-analysis and a piece of ego-analysis. In the one case we want to make something from the id conscious, in the other we want to correct something in the ego. The crux of the matter is that the defensive mechanisms directed against former danger recur in the treatment as resistances against recovery. It follows from this that the ego treats recovery itself as a new danger.

[1937c, 5034]

Unfortunately something else happens as well. In trying to describe this, one can only rely on impressions. Hostility on the one side and partisanship on the other create an atmosphere which is not favourable to objective investigation. It seems that a number of analysts learn to make use of defensive mechanisms which allow them to divert the implications and demands of analysis from themselves (probably by directing them on to other people), so that they themselves remain as they are and are able to withdraw from the critical and corrective influence of analysis. Such an event may justify the words of the writer who warns us that when a man is endowed with power it is hard for him not to misuse it.¹ Sometimes, when we try to understand this, we are driven into drawing a disagreeable analogy with the effect of X-rays on people who handle them without taking special precautions. It would not be surprising if the effect of a constant preoccupation with all the repressed material which struggles for freedom in the human mind were to stir up in the analyst as well all the instinctual demands which he is otherwise able to keep under suppression. These, too, are 'dangers of analysis', though they threaten, not the passive but the active partner in the analytic situation; and we ought not to neglect to meet them. There can be no doubt how this is to be done. Every analyst should periodically - at intervals of five years or so - submit himself to analysis once more, without feeling ashamed of taking this step. This would mean, then, that not only the therapeutic analysis of patients but his own analysis would change from a terminable into an interminable task.

[1937c, 5043]
Some of my medical colleagues have looked upon my theory of hysteria as a purely psychological one, and have for that reason pronounced it *ipso facto* incapable of solving a pathological problem. They may perhaps discover from this paper that their objection was based upon their having unjustifiably transferred what is a characteristic of the technique on to the theory itself. It is the therapeutic technique alone that is purely psychological; the theory does not by any means fail to point out that neuroses have an organic basis - though it is true that it does not look for that basis in any pathological anatomical changes, and provisionally substitutes the conception of organic functions for the chemical changes which we should expect to find but which we are at present unable to apprehend. No one, probably, will be inclined to deny the sexual function the character of an organic factor, and it is the sexual function that I look upon as the foundation of hysteria and of the psychoneuroses in general. No theory of sexual life will, I suspect, be able to avoid assuming the existence of some definite sexual substances having an excitant action. Indeed, of all the clinical pictures which we meet with in clinical medicine, it is the phenomena of intoxication and abstinence in connection with the use of certain chronic poisons that most closely resemble the genuine psychoneuroses. [1905e, 1447]

The interest felt by the practical psychiatrist in such delusional formations as these is, as a rule, exhausted when once he has ascertained the character of the products of the delusion and has formed an estimate of their influence on the patient's general behaviour: in his case marveling is not the beginning of understanding. The psycho-analyst, in the light of his knowledge of the psychoneuroses, approaches the subject with a suspicion that even thought-structures so extraordinary as these and so remote from our common modes of thinking are nevertheless derived from the most general and comprehensible impulses of the human mind; and he would be glad to discover the motives of such a transformation as well as the manner in which it has been accomplished. With this aim in view, he will wish to go more deeply into the details of the delusion and into the history of its development. [1911c, 2394]

I can, however, assume this much - that you know that psycho-analysis is a procedure for the medical treatment of neurotic patients. And here I can at once give you an instance of how in this field a number of things take place in a different way - often, indeed, in an opposite way - from what they do elsewhere in medical practice. When elsewhere we introduce a patient to a medical technique which is new to him, we usually minimize its inconveniences and give him confident assurances of the success of the treatment. I think we are justified in this, since by doing so we are increasing the probability of success. But when we take a neurotic patient into psycho-analytic treatment, we act differently. We point out the difficulties of the method to him, its long duration, the efforts and sacrifices it calls for; and as regards its success, we tell him we cannot promise it with certainty, that it depends on his own conduct, his understanding, his adaptability and his perseverance. We have good reasons, of course, for such apparently wrong-headed behaviour, as you will perhaps come to appreciate later on. [1916-1917, 3129]
Moreover, I can assure you that you are misinformed if you suppose that advice and guidance in the affairs of life play an integral part in analytic influence. On the contrary, so far as possible we avoid the role of a mentor such as this and there is nothing we would rather bring about than the patient should make his decisions for himself. With this purpose, too, we require him to postpone for the term of his treatment any vital decisions on choice of a profession, business undertakings, marriage or divorce, and only to put them in practice when the treatment is finished. You must admit that all this is different from what you pictured. Only in the case of some very youthful or quite helpless or unstable individuals are we unable to put the desired limitation of our role into effect. With them we have to combine the functions of a doctor and an educator; but when this is so we are quite conscious of our responsibility and behave with the necessary caution.

But you must not conclude from my eagerness in defending myself against the charge that neurotics are encouraged in analytic treatment to live a full life - you must not conclude from this that we influence them in favour of conventional virtue. That is at least as far from being the case. It is true that we are not reformers but merely observers; nevertheless, we cannot help observing with a critical eye and we have found it impossible to side with conventional sexual morality or to form a very high opinion of the manner in which society attempts the practical regulation of the problems of sexual life. We can present society with a blunt calculation that what is described as its morality calls for a bigger sacrifice than it is worth and that its proceedings are not based on honesty and do not display wisdom. We do not keep such criticisms from our patients' ears, we accustom them to giving unprejudiced consideration to sexual matters no less than to any others; and if, having grown independent after the completion of their treatment, they decide on their own judgement in favour of some midway position between living a full life and absolute asceticism, we feel our conscience clear whatever their choice. We tell ourselves that anyone who has succeeded in educating himself to truth about himself is permanently defended against the danger of immorality, even though his standard of morality may differ in some respect from that which is customary in society. Moreover, we must guard against over-estimating the importance of the part played by the question of abstinence in influencing neuroses. Only in a minority of cases can the pathogenic situation of frustration and the subsequent damming-up of libido be brought to an end by the sort of sexual intercourse that can be procured without much trouble.

In the light of the knowledge we have gained from psycho-analysis we can describe the difference between hypnotic and psycho-analytic suggestion as follows. Hypnotic treatment seeks to cover up and gloss over something in mental life; analytic treatment seeks to expose and get rid of something. The former acts like a cosmetic, the latter like surgery. The former makes use of suggestion in order to forbid the symptoms; it strengthens the repressions, but, apart from that, leaves all the processes that have led to the formation of the symptoms unaltered. Analytic treatment makes its impact further back towards the roots, where the conflicts are which gave rise to the symptoms, and uses suggestion in order to alter the outcome of those conflicts. Hypnotic treatment leaves the patient inert and unchanged, and for that reason, too, equally unable to resist any fresh occasion for falling ill. An analytic treatment demands from both doctor and patient the accomplishment of serious work, which is employed in lifting internal resistances. Through the overcoming of these resistances the patient's mental life is permanently changed, is raised to a high level of development and remains protected against fresh possibilities of falling ill. This work of overcoming resistances is the essential function of analytic treatment; the patient has to accomplish it and the doctor makes this possible for him with the help of suggestion operating in an educative sense. For that reason psycho-analytic treatment has justly been described as a kind of after-education.
I hope I have now made it clear to you in what way our method of employing suggestion therapeutically differs from the only method possible in hypnotic treatment. You will understand too, from the fact that suggestion can be traced back to transference, the capriciousness which struck us in hypnotic therapy, while analytic treatment remains calculable within its limits. In using hypnosis we are dependent on the state of the patient's capacity for transference without being able to influence it itself. The transference of a person who is to be hypnotized may be negative or, as most frequently, ambivalent, or he may have protected himself against his transference by adopting special attitudes; of that we learn nothing. In psycho-analysis we act upon the transference itself, resolve what opposes it, adjust the instrument with which we wish to make our impact. Thus it becomes possible for us to derive an entirely fresh advantage from the power of suggestion; we get it into our hands. The patient does not suggest to himself whatever he pleases: we guide his suggestion so far as he is in any way accessible to its influence.

[1916-1917, 3492]

Comparison between Psycho-Analysis and Hypnotic and Suggestive Methods. - Psycho-analytic procedure differs from all methods making use of suggestion, persuasion, etc., in that it does not seek to suppress by means of authority any mental phenomenon that may occur in the patient. It endeavours to trace the causation of the phenomenon and to remove it by bringing about a permanent modification in the conditions that led to it. In psycho-analysis the suggestive influence which is inevitably exercised by the physician is diverted on to the task assigned to the patient of overcoming his resistances, that is, of carrying forward the curative process. Any danger of falsifying the products of a patient's memory by suggestion can be avoided by prudent handling of the technique; but in general the arousing of resistances is a guarantee against the misleading effects of suggestive influence. It may be laid down that the aim of the treatment is to remove the patient's resistances and to pass his repressions in review and thus to bring about the most far-reaching unification and strengthening of his ego, to enable him to save the mental energy which he is expending upon internal conflicts, to make the best of him that his inherited capacities will allow and so to make him as efficient and as capable of enjoyment as is possible. The removal of the symptoms of the illness is not specifically aimed at, but is achieved, as it were, as a by-product if the analysis is properly carried through. The analyst respects the patient's individuality and does not seek to remould him in accordance with his own - that is, according to the physician's - personal ideals; he is glad to avoid giving advice and instead to arouse the patient's power of initiative.

[1923a, 3927]

Nothing takes place between them except that they talk to each other. The analyst makes use of no instruments not even for examining the patient - nor does he prescribe any medicines. If it is at all possible, he even leaves the patient in his environment and in his usual mode of life during the treatment. This is not a necessary condition, of course, and may not always be practicable. The analyst agrees upon a fixed regular hour with the patient, gets him to talk, listens to him, talks to him in his turn and gets him to listen.

[1926e, 4330]
What you say about the special personal influence of the analyst certainly deserves great attention. An influence of the kind exists and plays a large part in analysis - but not the same part as in hypnotism. It ought to be possible to convince you that the situations in the two cases are quite different. It may be enough to point out that we do not use this personal influence, the factor of 'suggestion', to suppress the symptoms of the illness, as happens with hypnotic suggestion. Further, it would be a mistake to believe that this factor is the vehicle and promoter of the treatment throughout its length. At its beginning, no doubt. But later on it opposes our analytic intentions and forces us to adopt the most far-reaching counter-measures. And I should like to show by an example how far diverting a patient's thoughts and talking him out of things are from the technique of analysis. If a patient of ours is suffering from a sense of guilt, as though he had committed a serious crime, we do not recommend him to disregard his qualms of conscience and do not emphasize his undoubted innocence; he himself has often tried to do so without success. What we do is to remind him that such a strong and persistent feeling must after all be based on something real, which it may perhaps be possible to discover.
[1926e, 4333]

It is a good thing you have asked me about that. This personal influence is our most powerful dynamic weapon. It is the new element which we introduce into the situation and by means of which we make it fluid. The intellectual content of our explanations cannot do it, for the patient, who shares all the prejudices of the world around him, need believe us as little as our scientific critics do. The neurotic sets to work because he has faith in the analyst, and he believes him because he acquires a special emotional attitude towards the figure of the analyst. Children, too, only believe people they are attached to. I have already told you what use we make of this particularly large 'suggestive' influence. Not for suppressing the symptoms - this distinguishes the analytic method from other psychotherapeutic procedures - but as a motive force to induce the patient to overcome his resistances.
[1926e, 4366]
I come now to a question the discussion of which seems to me more important. Is the practice of psycho-analysis a matter which should in general be subject to official interference, or would it be more expedient to leave it to follow its natural development? I shall certainly not come to any decision on this point here and now, but I shall take the liberty of putting the problem before you for your consideration. In our country from of old a positive *furor prohibendi* has been the rule, a tendency to keep people under tutelage, to interfere and to forbid, which, as we all know, has not borne particularly good fruit. In our new republican Austria, it seems, things have not yet changed very much. I fancy you will have an important word to say in deciding the case of psycho-analysis which we are now considering; I do not know whether you have the wish or the influence with which to oppose these bureaucratic tendencies. At all events, I shall not spare you my unauthoritative thoughts on the subject. In my opinion a superabundance of regulations and prohibitions injures the authority of the law. It can be observed that where only a few prohibitions exist they are carefully observed, but where one is accompanied by prohibitions at every step, one feels definitely tempted to disregard them. Moreover, it does not mean one is quite an anarchist if one is prepared to realize that laws and regulations cannot from their origin claim to possess the attribute of being sacred and untransgressable, that they are often inadequately framed and offend our sense of justice, or will do so after a time, and that, in view of the sluggishness of the authorities, there is often no other means of correcting such inexpedient laws than by boldly violating them. Furthermore, if one desires to maintain respect for laws and regulations it is advisable not to enact any where a watch cannot easily be kept on whether they are obeyed or transgressed. Much of what I have quoted above on the practice of analysis by doctors could be repeated here in regard to genuine analysis by laymen which the law is seeking to suppress. The course of an analysis is most inconspicuous, it employs neither medicines nor instruments and consists only in talking and an exchange of information; it will not be easy to prove that a layman is practising 'analysis', if he asserts that he is merely giving encouragement and explanations and trying to establish a healthy human influence on people who are in search of mental assistance. It would surely not be possible to forbid that merely because doctors sometimes do the same thing. In English-speaking countries the practices of Christian Science have become very widespread: a kind of dialectical denial of the evils in life, based on an appeal to the doctrines of the Christian religion. I do not hesitate to assert that that procedure represents a regrettable aberration of the human spirit; but who in America or England would dream of forbidding it and making it punishable? Are the authorities so certain of the right path to salvation that they venture to prevent each man from trying 'to be saved after his own fashion'. And granted that many people if they are left to themselves run into danger and come to grief, would not the authorities do better carefully to mark the limits of the regions which are to be regarded as not to be trespassed upon, and for the rest, so far as possible, to allow human beings to be educated by experience and mutual influence? Psycho-analysis is something so new in the world, the mass of mankind is so little informed about it, the attitude of official science to it is still so vacillating, that it seems to me over-hasty to intervene in its development with legislative regulations. Let us allow patients themselves to discover that it is damaging to them to look for mental assistance to people who have not learnt how to give it. If we explain this to them and warn them against it, we shall have spared ourselves the need to forbid it. On the main roads of Italy the pylons that carry high-tension cables bear the brief and impressive inscription: ‘*Chi tocca, muore.*’ This is perfectly calculated to regulate the behaviour of passers-by to any wires that may be hanging down. The corresponding German notices exhibit an unnecessary and offensive verbosity: ‘*Das Berühren der Leitungsdrähte ist, weil lebensgefährlich, strengstens verboten.*’ Why the prohibition? Anyone who holds his life dear will make the prohibition for himself; and anyone who wants to kill himself in that way will not ask for permission.

[1926e, 4377]
Psycho-analysis finds a constantly increasing amount of support as a therapeutic procedure, owing to the fact that it can do more for its patients than any other method of treatment. The principle field of its application is in the milder neuroses - hysteria, phobias and obsessional states; and in malformations of character and sexual inhibitions or abnormalities it can also bring about marked improvements or even recoveries. Its influence upon dementia praecox and paranoia is doubtful; on the other hand, in favourable circumstances it can cope with depressive states, even if they are of a severe type. [1926f, 4402]

In every instance the treatment makes heavy claims upon both the physician and the patient: the former requires a special training and must devote a long period of time to exploring the mind of each patient, while the latter must make considerable sacrifices, both material and mental. Nevertheless, all the trouble involved is as a rule rewarded by the results. Psycho-analysis does not act as a convenient panacea ('cito, tute, jucunde') for psychological disorders. On the contrary, its application has been instrumental in making clear for the first time the difficulties and limitations in the treatment of such affections. For the moment it is only in Berlin and Vienna that there are voluntary institutions which make psycho-analytic treatment accessible to the wage-earning classes. [1926f, 4402]
Finally, Gentlemen, I must confess that it is hardly fair to take up your attention for so long on the subject of psycho-analytic therapy without telling you in what this treatment consists and on what it is based. Still, as I am forced to be brief, I can only hint at this: This therapy, then, is based on the recognition that unconscious ideas - or better, the unconsciousness of certain mental processes - are the direct cause of the morbid symptoms. We share this opinion with the French school (Janet) who, by the way, owing to excessive schematization, refer the cause of hysterical symptoms to an unconscious *idée fixe*. Now please do not be afraid that this is going to land us in the depths of philosophical obscurities. Our unconscious is not quite the same thing as that of philosophers and, moreover, the majority of philosophers will hear nothing of ‘unconscious mental processes’. If, however, you will look at the matter from our point of view, you will understand that the transformation of this unconscious material in the mind of the patient into conscious material must have the result of correcting his deviation from normality and of lifting the compulsion to which his mind has been subjected. For conscious will-power governs only conscious mental processes, and every mental compulsion is rooted in the unconscious. Nor need you ever fear that the patient will be harmed by the shock accompanying the introduction of the unconscious into consciousness, for you can convince yourselves theoretically that the somatic and emotional effect of an impulse that has become conscious can never be so powerful as that of an unconscious one. It is only by the application of our highest mental functions, which are bound up with consciousness, that we can control all our impulses.

[1905a, 1571]

Psycho-analytic research into the neuroses (the various forms of nervous illness with a mental causation) has endeavoured to trace their connection with instinctual life and the restrictions imposed on it by the claims of civilization, with the activities of the normal individual in phantasies and dreams, and with the creations of the popular mind in religion, myths and fairy tales. The psycho-analytic treatment of neurotic patients, based on this method of research, makes far higher demands on doctor and patient than the methods hitherto in common use, which operate through medicaments, diet, hydropathy and suggestion. But it brings the patients so much more relief and permanent strengthening in the face of life’s problems, that there is no cause for surprise at the continual advances made by this therapeutic method in spite of violent opposition.

[1910b, 1995]
At the next session the patient showed great interest in what I had said, but ventured, so he told me, to bring for ward a few doubts. - How, he asked, could the information that the self-reproach, the sense of guilt, was justified have a therapeutic effect? - I explained that it was not the information that had this effect, but the discovery of the unknown content to which the self-reproach was really attached. - Yes, he said, that was the precise point to which his question had been directed. - I then made some short observations upon the psychological differences between the conscious and the unconscious, and upon the fact that everything conscious was subject to a process of wearing-away, while what was unconscious was relatively unchangeable; and I illustrated my remarks by pointing to the antiques standing about in my room. They were, in fact, I said, only objects found in a tomb, and their burial had been their preservation: the destruction of Pompeii was only beginning now that it had been dug up. - Was there any guarantee, he next enquired, of what one’s attitude would be towards what was discovered? One man, he thought, would no doubt behave in such a way as to get the better of his self-reproach, but another would not. - No, I said, it followed from the nature of the circumstances that in every case the affect would be overcome - for the most part during the progress of the work itself. Every effort was made to preserve Pompeii, whereas people were anxious to be rid of tormenting ideas like his. - He had said to himself, he went on, that a self-reproach could only arise from a breach of a person’s own inner moral principles and not from that of any external ones. - I agreed, and said that the man who merely breaks an external law often regards himself as a hero. - Such an occurrence, he continued, was thus only possible where a disintegration of the personality was already present. Was there a possibility of his effecting a reintegration of his personality? If this could be done, he thought he would be able to make a success of his life, perhaps more of one than most people. - I replied that I was in complete agreement with this notion of a splitting of his personality. He had only to assimilate this new contrast, between a moral self and an evil one, with the contrast I had already mentioned, between the conscious and the unconscious. The moral self was the conscious, the evil self was the unconscious.¹ - He then said that, though he considered himself a moral person, he could quite definitely remember having done things in his childhood which came from his other self. - I remarked that here he had incidentally hit upon one of the chief characteristics of the unconscious, namely, its relation to the infantile. The unconscious, I explained, was the infantile; it was that part of the self which had become separated off from it in infancy, which had not shared the later stages of its development, and which had in consequence become repressed. It was the derivatives of this repressed unconscious that were responsible for the involuntary thoughts which constituted his illness. He might now, I added, discover yet another characteristic of the unconscious; it was a discovery which I should be glad to let him make for himself. - He found nothing more to say in this immediate connection, but instead he expressed a doubt whether it was possible to undo modifications of such long standing. What, in particular, could be done against his idea about the next world, for it could not be refuted by logic? - I told him I did not dispute the gravity of his case nor the significance of his pathological constructions; but at the same time his youth was very much in his favour as well as the intactness of his personality. In this connection I said a word or two upon the good opinion I had formed of him, and this gave him visible pleasure.

¹ [1909d, 2143]
The other conflict, that between love and hatred, strikes us more strangely. We know that incipient love is often perceived as hatred, and that love, if it is denied satisfaction, may easily be partly converted into hatred, and poets tell us that in the more tempestuous stages of love the two opposed feelings may subsist side by side for a while as though in rivalry with each other. But the chronic co-existence of love and hatred, both directed towards the same person and both at the highest degree of intensity, cannot fail to astonish us. We should have expected that the passionate love would long ago have conquered the hatred or been devoured by it. And in fact such a protracted survival of two opposites is only possible under quite peculiar psychological conditions and with the co-operation of the state of affairs in the unconscious. The love has not succeeded in extinguishing the hatred but only in driving it down into the unconscious; and in the unconscious the hatred, safe from the danger of being destroyed by the operations of consciousness, is able to persist and even to grow. In such circumstances the conscious love attains as a rule, by way of reaction, an especially high degree of intensity, so as to be strong enough for the perpetual task of keeping its opponent under repression. The necessary condition for the occurrence of such a strange state of affairs in a person's erotic life appears to be that at a very early age, somewhere in the prehistoric period of his infancy, the two opposites should have been split apart and one of them, usually the hatred, have been repressed.¹

It is in obsessional neuroses that the survival of the omnipotence of thoughts is most clearly visible and that the consequences of this primitive mode of thinking come closest to consciousness. But we must not be misled into supposing that it is a distinguishing feature of this particular neurosis, for analytic investigation reveals the same thing in the other neuroses as well. In all of them what determines the formation of symptoms is the reality not of experience but of thought. Neurotics live in a world apart, where, as I have said elsewhere, only ‘neurotic currency’ is legal tender; that is to say, they are only affected by what is thought with intensity and pictured with emotion, whereas agreement with external reality is a matter of no importance. What hysterics repeat in their attacks and fix by means of their symptoms are experiences which have occurred in that form only in their imagination though it is true that in the last resort those imagined experiences go back to actual events or are based upon them. To attribute the neurotic sense of guilt to real misdeeds would show an equal misunderstanding. An obsessional neurotic may be weighed down by a sense of guilt that would be appropriate in a mass-murderer, while in fact, from his childhood onwards, he has behaved to his fellow-men as the most considerate and scrupulous member of society. Nevertheless, his sense of guilt has a justification: it is founded on the intense and frequent death wishes against his fellows which are unconsciously at work in him. It has a justification if what we take into account are unconscious thoughts and not intentional deeds. Thus the omnipotence of thoughts, the overvaluation of mental processes as compared with reality, is seen to have unrestricted play in the emotional life of neurotic patients and in everything that derives from it. If one of them undergoes psychoanalytic treatment, which makes what is unconscious in him conscious, he will be unable to believe that thoughts are free and will constantly be afraid of expressing evil wishes, as though their expression would lead inevitably to their fulfilment. This behaviour, as well as the superstitions which he practises in ordinary life, reveals his resemblance to the savages who believe they can alter the external world by mere thinking.

[1912-1913, 2729]
I have treated this point in such great detail because I must now inform you that this experience of ours with the resistance of neurotics to the removal of their symptoms became the basis of our dynamic view of the neuroses. Originally Breuer and I myself carried out psychotherapy by means of hypnosis; Breuer’s first patient was treated throughout under hypnotic influence, and to begin with I followed him in this. I admit that at that period the work proceeded more easily and pleasantly, and also in a much shorter time. But results were capricious and not lasting; and for that reason I finally dropped hypnosis. And I then understood that an insight into the dynamics of these illnesses had not been possible so long as hypnosis was employed. That state was precisely able to withhold the existence of the resistance from the doctor’s perception. It pushed the resistance back, making a certain area free for analytic work, and dammed it up at the frontiers of that area in such a way as to be impenetrable, just as doubt does in obsessional neurosis. For that reason I have been able to say that psychoanalysis proper began when I dispensed with the help of hypnosis.

[1916-1917, 3367]

I have credited you with a wish that I might have started my description of the neuroses from the behaviour of neurotic people, from an account of the manner in which they suffer under their neurosis, of how they defend themselves against it and how they come to terms with it. No doubt that is an interesting topic, worth investigating; nor would it be very difficult to handle. But it would be of debatable wisdom to start with it. There would be a risk of not discovering the unconscious and at the same time of overlooking the great importance of the libido and of judging everything as it appears to the ego of the neurotic subject. It is obvious that this ego is not a trustworthy or impartial agency. The ego is indeed the power which disavows the unconscious and has degraded it into being repressed; so how can we trust it to be fair to the unconscious? The most prominent elements in what is thus repressed are the repudiated demands of sexuality, and it is quite self-evident that we should never be able to guess their extent and importance from the ego's conceptions. From the moment the notion of repression dawns on us, we are warned against making one of the two contesting parties (and the victorious one, at that) into being judge in the dispute. We are prepared to find that the ego's assertions will lead us astray. If we are to believe the ego, it was active at every point and itself willed and created its symptoms. But we know that it puts up with a good amount of passivity, which it afterwards tries to disguise and gloss over. It is true that it does not always venture on such an attempt; in the symptoms of obsessional neurosis it is obliged to admit that there is something alien which is confronting it and against which it can only defend itself with difficulty.

[1916-1917, 3433]

I will digress for a moment to ask if you know what is meant by a causal therapy. That is how we describe procedure which does not take the symptoms of an illness as its point of attack but sets about removing its causes. Well, then, is our psycho-analytic method a causal therapy or not? The reply is not a simple one, but it may perhaps give us an opportunity of realizing the worthlessness of a question framed in this way. In so far as analytic therapy does not make it its first task to remove the symptoms, it is behaving like a causal therapy. In another respect, you may say, it is not. For we long ago traced the causal chain back through the repressions to the instinctual dispositions, their relative intensities in the constitution and the deviations in the course of their development. Supposing, now, that it was possible, by some chemical means, perhaps, to interfere in this mechanism, to increase or diminish the quantity of libido present at a given time or to strengthen one instinct at the cost of another - this then would be a causal therapy in the true sense of the word, for which our analysis would have carried out the indispensable preliminary work of reconnaissance. At present, as you know, there is no question of any such method of influencing libidinal processes; with our psychical therapy we attack at a different point in the combination - not exactly at what we know are the roots of the phenomena, but nevertheless far enough away from the symptoms, at a point which has been made accessible to us by some very remarkable circumstances.

[1916-1917, 3478]
With this as a starting-point we go on to make our first important discovery. We learn that, when we try to understand neurotic disorders, by far the greater significance attaches to the sexual instincts; that in fact neuroses are the specific disorders, so to speak, of the sexual function; that in general whether not a person develops a neurosis depends on the quantity of his libido, and on the possibility of satisfying it and of discharging it through satisfaction; that the form taken by the disease is determined by the way in which the individual passes through the course of development of his sexual function, or, as we put it, by the fixations his libido has undergone in the course of its development; and, further, that by a special, not very simple technique for influencing the mind we are able to throw light on the nature of some groups of neuroses and at the same time to do away with them. Our therapeutic efforts have their greatest success with a certain class of neuroses which proceed from a conflict between the ego-instincts and the sexual instincts. For in human beings it may happen that the demands of the sexual instincts, whose reach of course extends far beyond the individual, seem to the ego to constitute a danger which threatens its self-preservation or its self-esteem. The ego then assumes the defensive, denies the sexual instincts the satisfaction they desire and forces them into those by-paths of substitutive satisfaction which become manifest as nervous symptoms. [1917a, 3609]

For a time psycho-analysis seemed fated to merge into psychology without being able to show why the psychology of the sick differed from that of the normal. In the course of its advance, however, it came up against the problem of dreams, which are abnormal products of the mind created by normal men under regularly recurrent physiological conditions. When psycho-analysis had solved the problem of dreams, it had discovered in unconscious psychical processes the common ground in which the highest and the lowest of mental impulses have their roots and from which spring the most normal as well as the most morbid and erratic of mental productions. The new picture of the workings of the mind began to grow ever clearer and more complete. It was a picture of obscure instinctual forces organic in origin, striving towards inborn aims, and, above them, of an agency comprising more highly organized mental structures - acquisitions of human evolution made under the impact of human history -, an agency which has taken over portions of the instinctual impulses, has developed them further or has even directed them towards higher aims, but which in any case binds them firmly and manipulates their energy to suit its own purposes. This higher organization, however, which is known to us as the ego, has rejected another portion of these same elementary instinctual impulses as being unserviceable because they cannot be fitted into the organic unity of the individual or because they rebel against the individual's cultural aims. The ego is not in a position to exterminate these unsubdued mental powers, but it turns its back on them, lets them remain at the lowest psychological level, defends itself from their demands by the energetic erection of protective and antithetical barriers or seeks to come to terms with them by means of substitutive satisfactions. These instincts which have fallen victim to repression - untamed and indestructible, yet inhibited from any kind of activity - together with their primitive mental representatives, constitute the mental underworld, the nucleus of the true unconscious, and are at every moment ready to assert their demands and, by hook or by crook, to force their way forward to satisfaction. To this is due the instability of the proud superstructure of the mind, the emergence at night of the proscribed and repressed material in the form of dreams, and the tendency to fall ill with neuroses and psychoses as soon as the balance of power between the ego and the repressed shifts to the disadvantage of the ego. [1919g, 3703]
It can be done very well. It is hardly to be believed what goes on in a child of four or five years old. Children are very active-minded at that age; their early sexual period is also a period of intellectual flowering. I have an impression that with the onset of the latency period they become mentally inhibited as well, stupidier. From that time on, too, many children lose their physical charm. And, as regards the damage done by early analysis, I may inform you that the first child on whom the experiment was ventured, nearly twenty years ago, has since then grown into a healthy and capable young man, who has passed through his puberty irreproachably, in spite of some severe psychical traumas. It may be hoped that things will turn out no worse for the other 'victims' of early analysis. Much that is of interest attaches to these child analyses; it is possible that in the future they will become still more important. From the point of view of theory, their value is beyond question. They give unambiguous information on problems which remain unsolved in the analyses of adults; and they thus protect the analyst from errors that might have momentous consequences for him. One surprises the factors that lead to the formation of a neurosis while they are actually at work and one cannot then mistake them. In the child's interest, it is true, analytic influence must be combined with educational measures. The technique has still to receive its shaping. But practical interest is aroused by the observation that a very large number of our children pass through a plainly neurotic phase in the course of their development. Since we have learnt how to look more sharply, we are tempted to say that neurosis in children is not the exception but the rule, as though it could scarcely be avoided on the path from the innate disposition of infancy to civilized society. In most cases this neurotic phase in childhood is overcome spontaneously. But may it not also regularly leave its traces in the average healthy adult? On the other hand in those who are neurotics in later life we never fail to find links with the illness in childhood, though at the time it need not have been very noticeable. In a precisely analogous way physicians to-day, I believe, hold the view that each one of us has gone through an attack of tuberculosis in his childhood. It is true that in the case of the neuroses the factor of immunization does not operate, but only the factor of predisposition.

The chief interest is naturally focused on the first of these assertions, the most unexpected of all. It has been found that in early childhood there are signs of bodily activity to which only an ancient prejudice could deny the name of sexual and which are linked to psychical phenomena that we come across later in adult erotic life - such as fixation to particular objects, jealousy, and so on. It is further found, however, that these phenomena which emerge in early childhood form part of an ordered course of development, that they pass through a regular process of increase, reaching a climax towards the end of the fifth year, after which there follows a lull. During this lull progress is at a standstill and much is unlearnt and there is much recession. After the end of this period of latency, as it is called, sexual life advances once more with puberty; we might say that it has a second efflorescence. And here we come upon the fact that the onset of sexual life is diphasic, that it occurs in two waves - something that is unknown except in man and evidently has an important bearing on hominization.¹ It is not a matter of indifference that the events of this early period, except for a few residues, fall a victim to infantile amnesia. Our views on the aetiology of the neuroses and our technique of analytic therapy are derived from these conceptions; and our tracing of the developmental processes in this early period has also provided evidence for yet other conclusions.

¹ [1926e, 4357]

[1940a [1938], 4964]
(1) Whether a neurotic illness occurs at all depends upon a quantitative factor - upon the total load on the nervous system as compared with the latter's capacity for resistance. Everything which can keep this quantitative factor below a certain threshold-value, or can bring it back to that level, has a therapeutic effect, since by so doing it keeps the aetiological equation unsatisfied.

[1895f, 365]

I think, Gentlemen, that you will best come to terms with what you have just been told about fixation and regression of the libido if you will regard it as a preparation for research into the aetiology of the neuroses. Hitherto I have only given you one piece of information about this: namely that people fall ill of a neurosis if they are deprived of the possibility of satisfying their libido - that they fall ill owing to 'frustration', as I put it - and that their symptoms are precisely a substitute for their frustrated satisfaction. This is not supposed to mean, of course, that every frustration of a libidinal satisfaction makes the person it affects neurotic, but merely that the factor of frustration could be discerned in every case of neurosis that has been examined. Thus the proposition is not convertible. No doubt, too, you will have understood that this assertion does not claim to reveal the whole secret of the aetiology of neuroses but is only bringing into prominence one important and indispensable determinant.

[1916-1917, 3407]

Think it over! You have learnt all that is essential about the determinants of falling ill as well as all the factors that come into effect after the patient has fallen ill. Where do these leave room for any therapeutic influence? In the first place there is hereditary disposition. We have not talked about it very often because it is emphatically stressed from other directions and we have nothing new to say about it. But do not suppose that we underestimate it; precisely as therapists we come to realize its power clearly enough. In any case we can do nothing to alter it; we too must take it as something given, which sets a limit to our efforts. Next there is the influence of early experiences in childhood, to which we are in the habit of giving prominence in analysis: they belong to the past and we cannot undo them. Then comes everything that we have summarized as 'real frustration' - the misfortunes of life from which arise deprivation of love, poverty, family quarrels, ill-judged choice of a partner in marriage, unfavourable social circumstances, and the strictness of the ethical standards to whose pressure the individual is subject. Here, to be sure, there would be handles enough for a very effective therapy, but it would have to be of the kind which Viennese folklore attributes to the Emperor Joseph - the benevolent interference of a powerful personage before whose will people bow and difficulties vanish. But who are we, that we should be able to adopt benevolence of this kind as an instrument of our therapy? Poor ourselves and socially powerless, and compelled to earn our livelihood from our medical activity, we are not even in a position to extend our efforts to people without means, as other doctors with other methods of treatment are after all able to do. Our therapy is too time-consuming and too laborious for that to be possible. Perhaps, however, you are clutching at one of the factors I have mentioned and believe that there you have found the point at which our influence can make its attack. If the ethical restrictions demanded by society play a part in the deprivation imposed on the patient, treatment can, after all, give him the courage, or perhaps a direct injunction, to disregard those barriers and achieve satisfaction and recovery while forgoing the fulfilment of an ideal that is exalted, but so often not adhered to, by society. The patient will thus become healthy by 'living a full life' sexually. This, it is true, casts a shadow on analytic treatment for not serving general morality. What it has given to the individual it will have taken from the community.

[1916-1917, 3475]
I will digress for a moment to ask if you know what is meant by a causal therapy. That is how we describe procedure which does not take the symptoms of an illness as its point of attack but sets about removing its causes. Well, then, is our psycho-analytic method a causal therapy or not? The reply is not a simple one, but it may perhaps give us an opportunity of realizing the worthlessness of a question framed in this way. In so far as analytic therapy does not make it its first task to remove the symptoms, it is behaving like a causal therapy. In another respect, you may say, it is not. For we long ago traced the causal chain back through the repressions to the instinctual dispositions, their relative intensities in the constitution and the deviations in the course of their development. Supposing, now, that it was possible, by some chemical means, perhaps, to interfere in this mechanism, to increase or diminish the quantity of libido present at a given time or to strengthen one instinct at the cost of another - this then would be a causal therapy in the true sense of the word, for which our analysis would have carried out the indispensable preliminary work of reconnaissance. At present, as you know, there is no question of any such method of influencing libidinal processes; with our psychical therapy we attack at a different point in the combination - not exactly at what we know are the roots of the phenomena, but nevertheless far enough away from the symptoms, at a point which has been made accessible to us by some very remarkable circumstances.

[1916-1917, 3478]

Many attempts at treatment miscarried during the early period of analysis because they were undertaken in cases which were altogether unsuited to the procedure and which we should exclude to-day on the basis of our present view of the indications for treatment. But these indications, too, could only be arrived at by experiment. In those days we did not know a priori that paranoia and dementia praecox in strongly marked forms are inaccessible, and we had a right to make trial of the method on all kinds of disorders. But most of the failures of those early years were due not to the doctor's fault or an unsuitable choice of patients but to unfavourable external conditions. Here we have only dealt with internal resistances, those of the patient, which are inevitable and can be overcome. The external resistances which arise from the patient's circumstances, from his environment, are of small theoretical interest but of the greatest practical importance. Psycho-analytic treatment may be compared with a surgical operation and may similarly claim to be carried out under arrangements that will be the most favourable for its success. You know the precautionary measures adopted by a surgeon: a suitable room, good lighting, assistants, exclusion of the patient's relatives, and so on. Ask yourselves now how many of these operations would turn out successfully if they had to take place in the presence of all the members of the patient's family, who would stick their noses into the field of the operation and exclaim aloud at every incision. In psycho-analytic treatments the intervention of relatives is a positive danger and a danger one does not know how to meet. One is armed against the patient's internal resistances which one knows are inevitable, but how can one ward off these external resistances? No kind of explanations make any impression on the patient's relatives; they cannot be induced to keep at a distance from the whole business, and one cannot make common cause with them because of the risk of losing the confidence of the patient, who - quite rightly moreover - expects the person in whom he has put his trust to take his side. No one who has any experience of the rifts which so often divide a family will, if he is an analyst, be surprised to find that the patient's closest relatives sometimes betray less interest in his recovering than in his remaining as he is. When, as so often, the neurosis is related to conflicts between members of a family, the healthy party will not hesitate long in choosing between his own interest and the sick party's recovery. It is not to be wondered at, indeed, if a husband looks with disfavour on a treatment in which, as he may rightly suspect, the whole catalogue of his sins will be brought to light. Nor do we wonder at it; but we cannot in that case blame ourselves if our efforts remain unsuccessful and the treatment is broken off prematurely because the husband's resistance is added to that of his sick wife. We had in fact undertaken something which in the prevailing circumstances was unrealizable.

[1916-1917, 3498]
With this as a starting-point we go on to make our first important discovery. We learn that, when we try to understand neurotic disorders, by far the greater significance attaches to the sexual instincts; that in fact neuroses are the specific disorders, so to speak, of the sexual function; that in general whether or not a person develops a neurosis depends on the quantity of his libido, and on the possibility of satisfying it and of discharging it through satisfaction; that the form taken by the disease is determined by the way in which the individual passes through the course of development of his sexual function, or, as we put it, by the fixations his libido has undergone in the course of its development; and, further, that by a special, not very simple technique for influencing the mind we are able to throw light on the nature of some groups of neuroses and at the same time to do away with them. Our therapeutic efforts have their greatest success with a certain class of neuroses which proceed from a conflict between the ego-instincts and the sexual instincts. For in human beings it may happen that the demands of the sexual instincts, whose reach of course extends far beyond the individual, seem to the ego to constitute a danger which threatens its self-preservation or its self-esteem. The ego then assumes the defensive, denies the sexual instincts the satisfaction they desire and forces them into those by-paths of substitutive satisfaction which become manifest as nervous symptoms.

But this episode, though it is now closed, was not without an important influence on the spread of psycho-analysis. Medical men who had hitherto held back from any approach to psycho-analytic theories were brought into closer contact with them when, in the course of their duties as army doctors, they were obliged to deal with war neuroses. The reader will be able to gather from Ferenczi's paper with what hesitations and under what disguises these closer contacts were made. Some of the factors which psycho-analysis had recognized and described long before as being at work in peace-time neuroses - the psychogenic origin of the symptoms, the importance of unconscious instinctual impulses, the part played in dealing with mental conflicts by the primary gain from being ill ('the flight into illness') - were observed to be present equally in the war neuroses and were accepted almost universally. Simmel's studies show, too, what successes could be achieved by treating war neurotics by the method of catharsis, which, as we know, was the first step towards the psycho-analytic technique.

In a far greater number of cases the neurosis is more autonomous and more independent of the interests of self-preservation and self-maintenance. In the conflict which creates the neurosis, what are at stake are either solely libidinal interests or libidinal interests in intimate connections with self-preservative ones. In all three instances the dynamics of the neurosis are the same. A dammed-up libido which cannot be satisfied in reality succeeds, with the help of a regression to old fixations, in finding discharge through the repressed unconscious. The sick man's ego, in so far as it can extract a 'gain from illness' out of this process, countenances the neurosis, although there can be no doubt of its injuriousness in its economic aspect.

It is a familiar fact that the aetiological preconditions of neurosis are not yet known with certainty. The precipitating causes of it are frustrations and internal conflicts: conflicts between the three major psychical agencies, conflicts arising within the libidinal economy in consequence of our bisexual disposition and conflicts between the erotic and the aggressive instinctual components. It is the endeavour of the psychology of the neuroses to discover what makes these processes, which belong to the normal course of mental life, become pathogenic.
We have heard how the weak and immature ego of the first period of childhood is permanently damaged by the stresses put upon it in its efforts to fend off the dangers that are peculiar to that period of life. Children are protected against the dangers that threaten them from the external world by the solicitude of their parents; they pay for this security by a fear of loss of love which would deliver them over helpless to the dangers of the external world. This factor exerts a decisive influence on the outcome of the conflict when a boy finds himself in the situation of the Oedipus complex, in which the threat to his narcissism by the danger of castration, reinforced from primaeval sources, takes possession of him. Driven by the combined operation of these two influences, the contemporary real danger and the remembered one with its phylogenetic basis, the child embarks on his attempts at defence - repressions - which are effective for the moment but nevertheless turn out to be psychologically inadequate when the later re-animation of sexual life brings a reinforcement to the instinctual demands which have been repudiated in the past. If this is so, it would have to be said from a biological standpoint that the ego comes to grief over the task of mastering the excitations of the early sexual period, at a time when its immaturity makes it incompetent to do so. It is in this lagging of ego development behind libidinal development that we see the essential precondition of neurosis; and we cannot escape the conclusion that neuroses could be avoided if the childish ego were spared this task - if, that is to say, the child's sexual life were allowed free play, as happens among many primitive peoples. It may be that the aetiology of neurotic illnesses is more complicated than we have here described it; if so, we have at least brought out one essential part of the aetiological complex. Nor should we forget the phylogenetic influences, which are represented in some way in the id in forms that we are not yet able to grasp, and which must certainly act upon the ego more powerfully in that early period than later. On the other hand, the realization dawns on us that such an early attempt at damming up the sexual instinct, so decided a partisanship by the young ego in favour of the external as opposed to the internal world, brought about by the prohibition of infantile sexuality, cannot be without its effect on the individual's later readiness for culture. The instinctual demands forced away from direct satisfaction are compelled to enter on new paths leading to substitutive satisfaction, and in the course of these détours they may become desexualized and their connection with their original instinctual aims may become looser. And at this point we may anticipate the thesis that many of the highly valued assets of our civilization were acquired at the cost of sexuality and by the restriction of sexual motive forces.

[1940a [1938], 5006]
The mechanisms of defence serve the purpose of keeping off dangers. It cannot be disputed that they are successful in this; and it is doubtful whether the ego could do without them altogether during its development. But it is also certain that they may become dangers themselves. It sometimes turns out that the ego has paid too high a price for the services they render it. The dynamic expenditure necessary for maintaining them, and the restrictions of the ego which they almost invariably entail, prove a heavy burden on the psychical economy. Moreover, these mechanisms are not relinquished after they have assisted the ego during the difficult years of its development. No one individual, of course, makes use of all the possible mechanisms of defence. Each person uses no more than a selection of them. But these become fixated in his ego. They become regular modes of reaction of his character, which are repeated throughout his life whenever a situation occurs that is similar to the original one. This turns them into infantilisms, and they share the fate of so many institutions which attempt to keep themselves in existence after the time of their usefulness has passed. "Vernunft wird Unsinn, Wohltat Plage"¹ as the poet complains. The adult's ego, with its increased strength, continues to defend itself against dangers which no longer exist in reality; indeed, it finds itself compelled to seek out those situations in reality which can serve as an approximate substitute for the original danger, so as to be able to justify, in relation to them, its maintaining its habitual modes of reaction. Thus we can easily understand how the defensive mechanisms, by bringing about an ever more extensive alienation from the external world and a permanent weakening of the ego, pave the way for, and encourage, the outbreak of neurosis.

[1937c, 5033]
The value of making a correct diagnostic separation of the psychoneuroses from neurasthenia is also shown by the fact that the psychoneuroses call for a different practical assessment and for special therapeutic measures. They make their appearance as a result of two kinds of determinants, either independently or in the train of the 'actual neuroses' (neurasthenia and anxiety neurosis). In the latter case we are dealing with a new type of neurosis - incidentally, a very frequent one - a mixed neurosis. The aetiology of the 'actual neuroses' has become an auxiliary aetiology of the psychoneuroses. A clinical picture arises in which, let us say, anxiety neurosis predominates but which also contains traits of genuine neurasthenia, hysteria and obsessional neurosis. When confronted with a mixture of this kind, we shall nevertheless not be wise to give up separating out the clinical pictures proper to each neurotic illness; for after all it is not difficult to explain the case to oneself in the following manner. The predominant place taken by the anxiety neurosis shows that the illness has come into being under the aetiological influence of an 'actual' sexual noxa. But the person concerned was, apart from that, disposed to one or more of the psychoneuroses owing to a special aetiology and would at some time or other have fallen ill of a psychoneurosis either spontaneously or with the advent of some other weakening factor. In this way the auxiliary aetiology for the psychoneurosis which is still lacking is supplied by the actual aetiology of the anxiety neurosis.

Nevertheless you will rightly expect that we should devote some interest to the 'actual' neuroses as well. Their intimate clinical connection with the psychoneuroses would alone compel us to do so. I may inform you, then, that we distinguish three pure forms of 'actual' neuroses: neurasthenia, anxiety neurosis and hypochondria. Even this assertion is not uncontradicted. All the names are in use, it is true, but their content is indefinite and fluctuating. There are even doctors who oppose any dividing lines in the chaotic world of neurotic phenomena, any segregation of clinical entities or individual diseases, and who do not even recognize the distinction between the 'actual' neuroses and the psychoneuroses. I think they are going too far and have not chosen the path which leads to progress. The forms of neurosis which I have mentioned occur occasionally in their pure form; more often, however, they are intermixed with each other and with a psychoneurotic disorder. This need not lead us to abandon the distinction between them. Consider the difference between the study of minerals and of rocks in mineralogy. The minerals are described as individuals, no doubt on the basis of the fact that they often occur as crystals, sharply separated from their environment. Rocks consist of aggregations of minerals, which, we may be sure, have not come together by chance but as a result of what determined their origin. In the theory of the neuroses we still know too little of the course of their development to produce anything resembling petrology. But we are certainly doing the right thing if we start by isolating from the mass the individual clinical entities which we recognize and which are comparable to the minerals.

Since that time I have had no opportunity of returning to the investigation of the 'actual neuroses'; nor has this part of my work been continued by anyone else. If I look back to-day at my early findings, they strike me as being the first rough outlines of what is probably a far more complicated subject. But on the whole they seem to me still to hold good. I should have been very glad if I had been able, later on, to make a psycho-analytic examination of some more cases of simple juvenile neurasthenia, but unluckily the occasion did not arise. To avoid misconceptions, I should like to make it clear that I am far from denying the existence of mental conflicts and of neurotic complexes in neurasthenia. All that I am asserting is that the symptoms of these patients are not mentally determined or removable by analysis, but that they must be regarded as direct toxic consequences of disturbed sexual chemical processes.
We see, then, that it is not so much a question of taking back our earlier findings as of bringing them into line with more recent discoveries. It is still an undeniable fact that in sexual abstinence, in improper interference with the course of sexual excitation or if the latter is diverted from being worked over psychically, anxiety arises directly out of libido; in other words, that the ego is reduced to a state of helplessness in the face of an excessive tension due to need, as it was in the situation of birth, and that anxiety is then generated. Here once more, though the matter is of little importance, it is very possible that what finds discharge in the generating of anxiety is precisely the surplus of unutilized libido. As we know, a psychoneurosis is especially liable to develop on the basis of an 'actual' neurosis. This looks as though the ego were attempting to save itself from anxiety, which it has learned to keep in suspension for a while, and to bind it by the formation of symptoms. Analysis of the traumatic war neuroses - a term which, incidentally, covers a great variety of disorders - would probably have shown that a number of them possess some characteristics of the 'actual' neuroses.

[1926d, 4296]
But I should like to say a few words to you to relieve you of your surprise at the emergence of this unexpected phenomenon. We must not forget that the patient's illness, which we have undertaken to analyse, is not something which has been rounded off and become rigid but that it is still growing and developing like a living organism. The beginning of the treatment does not put an end to this development; when, however, the treatment has obtained mastery over the patient, what happens is that the whole of his illness's new production is concentrated upon a single point - his relation to the doctor. Thus the transference may be compared to the cambium layer in a tree between the wood and the bark, from which the new formation of tissue and the increase in the girth of the trunk derive. When the transference has risen to this significance, work upon the patient's memories retreats far into the background. Thereafter it is not incorrect to say that we are no longer concerned with the patient's earlier illness but with a newly created and transformed neurosis which has taken the former's place. We have followed this new edition of the old disorder from its start, we have observed its origin and growth, and we are especially well able to find our way about in it since, as its object, we are situated at its very centre. All the patient's symptoms have abandoned their original meaning and have take on a new sense which lies in a relation to the transference; or only such symptoms have persisted as are capable of undergoing such a transformation. But the mastering of this new, artificial neurosis coincides with getting rid of the illness which was originally brought to the treatment - with the accomplishment of our therapeutic task. A person who has become normal and free from the operation of repressed instinctual impulse in his relation to the doctor will remain so in his own life after the doctor has once more withdrawn from it.

[1916-1917, 3486]

A capacity for directing libidinal object-cathexes on to people must of course be attributed to every normal person. The tendency to transference of the neurotics I have spoken of is only an extraordinary increase of this universal characteristic. It would indeed be very strange if a human trait so widespread and so important had never been noticed or appreciated. And in fact it has been. Bernheim, with an unerring eye based his theory of hypnotic phenomena on the thesis that everyone is in some way 'suggestible'. His suggestibility was nothing other than the tendency to transference, somewhat too narrowly conceived, so that it did not include negative transference. But Bernheim was never able to say what suggestion actually was and how it came about. For him it was a fundamental fact on whose origin he could throw no light. He did not know that his 'suggestibilité' depended on sexuality, on the activity of the libido. And it must dawn on us that in our technique we have abandoned hypnosis only to rediscover suggestion in the shape of transference.

[1916-1917, 3488]

Thus in our view the individual advances from narcissism to object-love. But we do not believe that the whole of the libido ever passes over from the ego to objects. A certain quantity of libido is always retained in the ego; even when object-love is highly developed, a certain amount of narcissism persists. The ego is a great reservoir from which the libido that is destined for objects flows out and into which it flows back from those objects. Object-libido was at first ego-libido and can be transformed back into ego-libido. For complete health it is essential that the libido should not lose this full mobility. As an illustration of this state of things we may think of an amoeba, whose viscous substance puts out pseudopodia, elongations into which the substance of the body extends but which can be retracted at any time so that the form of the protoplasmic mass is restored.

[1917a, 3610]
An investigation of normal, stable states, in which the frontiers of the ego are safeguarded against the id by resistances (anticathexes) and have held firm, and in which the super-ego is not distinguished from the ego, because they work together harmoniously - an investigation of that kind would teach us little. The only thing that can help us are states of conflict and uproar, when the contents of the unconscious id have a prospect of forcing their way into the ego and into consciousness and the ego puts itself once more on the defensive against this invasion. It is only under these conditions that we can make such observations as will confirm or correct our statements about the two partners. Now, our nightly sleep is precisely a state of this sort, and for that reason psychical activity during sleep, which we perceive as dreams, is our most favourable object of study. In that way, too, we avoid the familiar reproach that we base our constructions of normal mental life on pathological findings; for dreams are regular events in the life of a normal person, however much their characteristics may differ from the productions of our waking life. Dreams, as everyone knows, may be confused, unintelligible or positively nonsensical, what they say may contradict all that we know of reality, and we behave in them like insane people, since, so long as we are dreaming, we attribute objective reality to the contents of the dream.
[1940a [1938], 4975]
But I should like to say a few words to you to relieve you of your surprise at the emergence of this unexpected phenomenon. We must not forget that the patient's illness, which we have undertaken to analyse, is not something which has been rounded off and become rigid but that it is still growing and developing like a living organism. The beginning of the treatment does not put an end to this development; when, however, the treatment has obtained mastery over the patient, what happens is that the whole of his illness's new production is concentrated upon a single point - his relation to the doctor. Thus the transference may be compared to the cambium layer in a tree between the wood and the bark, from which the new formation of tissue and the increase in the girth of the trunk derive. When the transference has risen to this significance, work upon the patient's memories retreats far into the background. Thereafter it is not incorrect to say that we are no longer concerned with the patient's earlier illness but with a newly created and transformed neurosis which has taken the former's place. We have followed this new edition of the old disorder from its start, we have observed its origin and growth, and we are especially well able to find our way about in it since, as its object, we are situated at its very centre. All the patient's symptoms have abandoned their original meaning and have take on a new sense which lies in a relation to the transference; or only such symptoms have persisted as are capable of undergoing such a transformation. But the mastering of this new, artificial neurosis coincides with getting rid of the illness which was originally brought to the treatment - with the accomplishment of our therapeutic task. A person who has become normal and free from the operation of repressed instinctual impulse in his relation to the doctor will remain so in his own life after the doctor has once more withdrawn from it.

[1916-1917, 3486]

I will now complete my picture of the mechanism of cure by clothing it in the formulas of the libido theory. A neurotic is incapable of enjoyment and of efficiency - the former because his libido is not directed on to any real object and the latter because he is obliged to employ a great deal of this available energy on keeping his libido under repression and on warding off its assaults. He would become healthy if the conflict between his ego and his libido came to an end and if his ego had his libido again at its disposal. The therapeutic task consists, therefore, in freeing the libido from its present attachments, which are withdrawn from the ego, and in making it once more serviceable to the ego. Where, then, is the neurotic's libido situated? It is easily found: it is attached to the symptoms, which yield it the only substitutive satisfaction possible at the time. We must therefore make ourselves masters of the symptoms and resolve them - which is precisely the same thing that the patient requires of us. In order to resolve the symptoms, we must go back as far as their origin, we must renew the conflict from which they arose, and, with the help of motive forces which were not at the patient's disposal in the past, we must guide it to a different outcome. This revision of the process of repression can be accomplished only in part in connection with the memory traces of the processes which led to repression. The decisive part of the work is achieved by creating in the patient's relation to the doctor - in the 'transference' - new editions of the old conflicts; in these the patient would like to behave in the same way as he did in the past, while we, by summoning up every available mental force, compel him to come to a fresh decision. Thus the transference becomes the battlefield on which all the mutually struggling forces should meet one another.

[1916-1917, 3494]
With this as a starting-point we go on to make our first important discovery. We learn that, when we try to understand neurotic disorders, by far the greater significance attaches to the sexual instincts; that in fact neuroses are the specific disorders, so to speak, of the sexual function; that in general whether or not a person develops a neurosis depends on the quantity of his libido, and on the possibility of satisfying it and of discharging it through satisfaction; that the form taken by the disease is determined by the way in which the individual passes through the course of development of his sexual function, or, as we put it, by the fixations his libido has undergone in the course of its development; and, further, that by a special, not very simple technique for influencing the mind we are able to throw light on the nature of some groups of neuroses and at the same time to do away with them. Our therapeutic efforts have their greatest success with a certain class of neuroses which proceed from a conflict between the ego-instincts and the sexual instincts. For in human beings it may happen that the demands of the sexual instincts, whose reach of course extends far beyond the individual, seem to the ego to constitute a danger which threatens its self-preservation or its self-esteem. The ego then assumes the defensive, denies the sexual instincts the satisfaction they desire and forces them into those by-paths of substitutive satisfaction which become manifest as nervous symptoms. [1917a, 3609]

'Nothing has entered into you from without; a part of the activity of your own mind has been withdrawn from your knowledge and from the command of your will. That, too, is why you are so weak in your defence; you are using one part of your force to fight the other part and you cannot concentrate the whole of your force as you would against an external enemy. And it is not even the worst or least important part of your mental forces that has thus become antagonistic to you and independent of you. The blame, I am bound to say, lies with yourself. You over-estimated your strength when you thought you could treat your sexual instincts as you liked and could utterly ignore their intentions. The result is that they have rebelled and have taken their own obscure paths to escape this suppression; they have established their rights in a manner you cannot approve. How they have achieved this, and the paths which they have taken, have not come to your knowledge. All you have learned is the outcome of their work - the symptom which you experience as suffering. Thus you do not recognize it as a derivative of your own rejected instincts and do not know that it is a substitutive satisfaction of them. [1917a, 3613]

In actual fact, indeed, the neurotic patient presents us with a torn mind, divided by resistances. As we analyse it and remove the resistances, it grows together; the great unity which we call his ego fits into itself all the instinctual impulses which before had been split off and held apart from it. The psycho-synthesis is thus achieved during analytic treatment without our intervention, automatically and inevitably. We have created the conditions for it by breaking up the symptoms into their elements and by removing the resistances. It is not true that something in the patient has been divided into its components and is now quietly waiting for us to put it somehow together again. [1919a, 3630]
You have no notion how close I am to fulfilling my promise. Even in organisms which later
develop an efficient ego-organization, their ego is feeble and little differentiated from their id to
begin with, during their first years of childhood. Imagine now what will happen if this powerless
ego experiences an instinctual demand from the id which it would already like to resist (because
it senses that to satisfy it is dangerous and would conjure up a traumatic situation, a collision
with the external world) but which it cannot control, because it does not yet possess enough
strength to do so. In such a case the ego treats the instinctual danger as if it was an external
one; it makes an attempt at flight, draws back from this portion of the id and leaves it to its fate,
after withholding from it all the contributions which it usually makes to instinctual impulses. The
ego, as we put it, institutes a *repression* of these instinctual impulses. For the moment this has
the effect of fending off the danger; but one cannot confuse the inside and the outside with
impunity. One cannot run away from oneself. In repression the ego is following the pleasure
principle, which it is usually in the habit of correcting; and it is bound to suffer damage in
revenge. This lies in the ego's having permanently narrowed its sphere of influence. The
repressed instinctual impulse is now isolated, left to itself, inaccessible, but also
uninfluenceable. It goes its own way. Even later, as a rule, when the ego has grown stronger, it
still cannot lift the repression; its synthesis is impaired, a part of the id remains forbidden ground
to the ego. Nor does the isolated instinctual impulse remain idle; it understands how to make up
for being denied normal satisfaction; it produces psychical derivatives which take its place; it
links itself to other processes which by its influence it likewise tears away from the ego; and
finally it breaks through into the ego and into consciousness in the form of an unrecognizably
distorted substitute, and creates what we call a symptom. All at once the nature of a neurotic
disorder becomes clear to us: on the one hand an ego which is inhibited in its synthesis, which
has no influence on parts of the id, which must renounce some of its activities in order to avoid
a fresh collision with what has been repressed, and which exhausts itself in what are for the
most part vain acts of defence against the symptoms, the derivatives of the repressed impulses;
and on the other hand an id in which individual instincts have made themselves independent,
pursue their aims regardless of the interests of the person as a whole and henceforth obey the
laws only of the primitive psychology that rules in the depths of the id. If we survey the whole
situation we arrive at a simple formula for the origin of a neurosis: the ego has made an attempt
to suppress certain portions of the id *in an inappropriate manner*, this attempt has failed and the
id has taken its revenge. A neurosis is thus the result of a conflict between the ego and the id,
upon which the ego has embarked because, as careful investigation shows, it wishes at all
costs to retain its adaptability in relation to the real external world. The disagreement is between
the external world and the id; and it is because the ego, loyal to its inmost nature, takes sides
with the external world that it becomes involved in a conflict with its id. But please observe that
what creates the determinant for the illness is not the fact of this conflict - for disagreements of
this kind between reality and the id are unavoidable and it is one of the ego's standing tasks to
mediate in them - but the circumstance that the ego has made use of the inefficient instrument
of repression for dealing with the conflict. But this in turn is due to the fact that the ego, at the
time at which it was set the task, was undeveloped and powerless. The decisive repressions all
take place in early childhood.

[1926e, 4346]
An investigation of normal, stable states, in which the frontiers of the ego are safeguarded against the id by resistances (anticathexes) and have held firm, and in which the super-ego is not distinguished from the ego, because they work together harmoniously - an investigation of that kind would teach us little. The only thing that can help us are states of conflict and uproar, when the contents of the unconscious id have a prospect of forcing their way into the ego and into consciousness and the ego puts itself once more on the defensive against this invasion. It is only under these conditions that we can make such observations as will confirm or correct our statements about the two partners. Now, our nightly sleep is precisely a state of this sort, and for that reason psychical activity during sleep, which we perceive as dreams, is our most favourable object of study. In that way, too, we avoid the familiar reproach that we base our constructions of normal mental life on pathological findings; for dreams are regular events in the life of a normal person, however much their characteristics may differ from the productions of our waking life. Dreams, as everyone knows, may be confused, unintelligible or positively nonsensical, what they say may contradict all that we know of reality, and we behave in them like insane people, since, so long as we are dreaming, we attribute objective reality to the contents of the dream.

[1940a [1938], 4975]

Our plan of cure is based on these discoveries. The ego is weakened by the internal conflict and we must go to its help. The position is like that in a civil war which has to be decided by the assistance of an ally from outside. The analytic physician and the patient's weakened ego, basing themselves on the real external world, have to band themselves together into a party against the enemies, the instinctual demands of the id and the conscientious demands of the super-ego. We form a pact with each other. The sick ego promises us the most complete candour - promises, that is, to put at our disposal all the material which its self-perception yields it; we assure the patient of the strictest discretion and place at his service our experience in interpreting material that has been influenced by the unconscious. Our knowledge is to make up for his ignorance and to give his ego back its mastery over lost provinces of his mental life. This pact constitutes the analytic situation.

[1940a [1938], 4983]
Let us once more glance over the situation which we have reached in our attempt at bringing help to the patient's neurotic ego. That ego is no longer able to fulfil the task set by the external world (including human society). Not all of its experiences are at its disposal, a large proportion of its store of memories have escaped it. Its activity is inhibited by strict prohibitions from the super-ego, its energy is consumed in vain attempts at fending off the demands of the id. Beyond this, as a result of continuous irruptions by the id, its organization is impaired, it is no longer capable of any proper synthesis, it is torn by mutually opposed urges, by unsettled conflicts and by unresolved doubts. To start with, we get the patient's thus weakened ego to take part in the purely intellectual work of interpretation, which aims at provisionally filling the gaps in his mental assets, and to transfer to us the authority of his super-ego; we encourage it to take up the struggle over each individual demand made by the id and to conquer the resistances which arise in connection with it. At the same time we restore order in the ego by detecting the material and urges which have forced their way in from the unconscious, and expose them to criticism by tracing them back to their origin. We serve the patient in various functions, as an authority and a substitute for his parents, as a teacher and educator; and we have done the best for him if, as analysts, we raise the mental processes in his ego to a normal level, transform what has become unconscious and repressed into preconscious material and thus return it once more to the possession of his ego. On the patient's side a few rational factors work in our favour, such as the need for recovery which has its motive in his sufferings, and the intellectual interest that we may awaken in him in the theories and revelations of psycho-analysis; but of far greater force is the positive transference with which he meets us. Fighting against us, on the other hand, are the negative transference, the ego's resistance due to repression (that is, its unpleasure at having to lay itself open to the hard work imposed on it), the sense of guilt arising from its relation to the super-ego and the need to be ill due to deep-going changes in the economics of his instincts. The share taken by the last two factors decides whether the case is to be regarded as slight or severe. Apart from these, a few other factors may be discerned as having a favourable or unfavourable bearing. A certain psychical inertia, a sluggishness of the libido, which is unwilling to abandon its fixations cannot be welcome to us; the patient's capacity for sublimating his instincts plays a large part and so does his capacity for rising above the crude life of the instincts; so, too, does the relative power of his intellectual functions.

[1940a [1938], 4990]
When I consult my experience on this point, I cannot find that there is any antithetic relation as regards anxiety neurosis between hereditary disposition and the specific sexual factor. On the contrary, the two aetiological factors support and supplement each other. The sexual factor is usually only operative in those who have an innate hereditary taint as well; heredity alone is usually not able to produce an anxiety neurosis, but waits for the occurrence of a sufficient amount of the specific sexual noxa. The discovery of the hereditary element does not, therefore, exempt us from searching for a specific factor. On its discovery, incidentally, all our therapeutic interest as well depends. For what can we do therapeutically about heredity as an aetiological element? It has always been there in the patient and will continue to be there until the end of his life. Taken by itself, it cannot help us to understand the episodic onset of a neurosis or the cessation of a neurosis as a result of treatment. It is nothing but a precondition of the neurosis - an inexpressibly important precondition, it is true, but nevertheless one which has been over-estimated, to the detriment of therapy and theoretical comprehension. To be convinced by the contrasting state of affairs, one has only to think of the cases of nervous diseases that run in families (such as chorea chronica, Thomsen's disease, and so on), in which heredity unites in itself all the aetiological preconditions.

There has been too little research into these specific and determining causes of nervous disorders, for the attention of physicians has remained dazzled by the grandiose prospect of the aetiological precondition of heredity. Those causes nevertheless deserve to be made the object of industrious study. Although their pathogenic power is in general only accessory to that of heredity, great practical interest attaches to the knowledge of this specific aetiology; it will allow our therapeutic efforts a path of access, whereas hereditary disposition, which is something fixed in advance for the patient from his birth, brings our efforts to a halt with its unapproachable power.
The sexual causes, too, are the ones which most readily offer the physician a foothold for his therapeutic influence. Heredity is no doubt an important factor, when it is present; it enables a strong pathological effect to come about where otherwise only a very slight one would have resulted. But heredity is inaccessible to the physician's influence; everyone is born with his own hereditary tendencies to illness, and we can do nothing to change them. Nor should we forget that it is precisely in regard to the aetiology of the neurasthenias that we must necessarily deny the first place to heredity. Neurasthenia (in both its forms) is one of those affections which anyone may easily acquire without having any hereditary taint. If it were otherwise, the enormous increase in neurasthenia, of which all the authorities complain, would be unthinkable.

In what concerns civilization, among whose sins people so often include responsibility for neurasthenia, these authorities may indeed be right (although the way in which this comes about is probably quite different from what they imagine). Yet the state of our civilization is, once again, something that is unalterable for the individual. Moreover this factor, being common to all the members of the same society, can never explain the fact of selectivity in the incidence of the illness. The physician who is not neurasthenic is exposed to the same influence of an allegedly detrimental civilization as the neurasthenic patient whom he has to treat. Subject to these limitations, the factors of exhaustion retain their significance. But the element of 'overwork', which physicians are so fond of producing to their patients as the cause of their neurosis, is too often unduly misused. It is quite true that anyone who, owing to sexual noxae, has made himself disposed to neurasthenia, tolerates intellectual work and the psychical exigencies of life badly; but no one ever becomes neurotic through work or excitement alone. Intellectual work is rather a protection against falling ill of neurasthenia; it is precisely the most unremitting intellectual workers who remain exempt from neurasthenia, and what neurasthenics complain of as 'overwork that is making them ill' does not as a rule deserve to be called 'intellectual work' at all, either in its quality or quantity. Physicians will have to become accustomed to explaining to an office-worker who has been 'overworked' at his desk or to a housewife for whom her domestic activities have become too heavy, that they have fallen ill, not because they have tried to carry out duties which are in fact easily performed by a civilized brain, but because all the while they have been grossly neglecting and damaging their sexual life.

[1897b, 463]
As we know, it is in an attempt to bridge this gap that the assumption has been made of a special neuropathic disposition (which, incidentally, if it existed, would not leave much hope of success for the treatment of such pathological conditions). The neuropathic disposition itself is regarded as a sign of a general degeneracy, and thus this convenient technical term has come to be superabundantly used against the wretched patients whom the doctors are quite incapable of helping. Fortunately, the state of affairs is different. The neuropathic disposition does no doubt exist, but I must deny that it suffices for the creation of a psychoneurosis. I must further deny that the conjunction of a neuropathic disposition with precipitating causes occurring in later life constitutes an adequate aetiology of the psychoneuroses. In tracing back the vicissitudes of an individual's illness to the experiences of his ancestors, we have gone too far; we have forgotten that between his conception and his maturity there lies a long and important period of life - his childhood - in which the seeds of later illness may be acquired. And that is what in fact happens with a psychoneurosis. Its true aetiology is to be found in childhood experiences, and, once again - and exclusively - in impressions concerned with sexual life. We do wrong to ignore the sexual life of children entirely; in my experience, children are capable of every psychical sexual activity, and many somatic sexual ones as well. Just as the whole human sexual apparatus is not comprised in the external genitals and the two reproductive glands, so human sexual life does not begin only with puberty, as on a rough inspection it may appear to do. Nevertheless it is true that the organization and evolution of the human species strives to avoid any great degree of sexual activity during childhood. It seems that in man the sexual instinctual forces are meant to be stored up so that, on their release at puberty, they may serve great cultural ends. (W. Fliess.) Consideration of this sort may make it possible to understand why the sexual experiences of childhood are bound to have a pathogenic effect. But they produce their effect only to a very slight degree at the time at which they occur; what is far more important is their deferred effect, which can only take place at later periods of growth. This deferred effect originates - as it can do in no other way - in the psychical traces which have been left behind by infantile sexual experiences. During the interval between the experiences of those impressions and their reproduction (or rather, the reinforcement of the libidinal impulses which proceed from them), not only the somatic sexual apparatus but the psychical apparatus as well has undergone an important development; and thus it is that the influence of these earlier sexual experiences now leads to an abnormal psychical reaction, and psychopathological structures come into existence.

[1897b, 472]
Since the manifestations of the psychoneuroses arise from the deferred action of unconscious psychical traces, they are accessible to psychotherapy. But in this case the therapy must pursue paths other than the only one so far followed of suggestion with or without hypnosis. Basing myself on the 'cathartic' method introduced by Josef Breuer, I have in recent years almost completely worked out a therapeutic procedure which I propose to describe as 'psycho-analytic'. I owe a great number of successes to it, and I hope I may be able further to increase its effectiveness considerably. The first accounts of the technique and scope of this method were given in *Studies on Hysteria*, written jointly with Breuer and published in 1895. Since then a good deal, as I think I may say, has been altered for the better. Whereas at that time we modestly declared that we could undertake only to remove the symptoms of hysteria, not to cure hysteria itself, this distinction has since come to seem to me without substance, so that there is a prospect of a genuine cure of hysteria and obsessions. It is therefore with very lively interest that I have read in the publications of colleagues that 'in this case the ingenious procedure devised by Breuer and Freud has failed', or that 'the method has not performed what it seemed to promise'. This gave me something of the feelings of a man who reads his own obituary in the paper, but who is able to reassure himself by his better knowledge of the facts. For the method is so difficult that it has quite definitely to be learned; and I cannot recall that a single one of my critics has expressed a wish to learn it from me. Nor do I believe that, like me, they have occupied themselves with it intensely enough to have been able to discover it for themselves. The remarks in the *Studies on Hysteria* are totally inadequate to enable a reader to master the technique, nor are they in any way intended to give any such complete instruction. [1897b, 473]
Am I now going on to assert that in every instance in which there are periodical attacks of aphonia we are to diagnose the existence of a loved person who is at times away from the patient? Nothing could be further from my intention. The determination of Dora's symptoms is far too specific for it to be possible to expect a frequent recurrence of the same accidental aetiology. But, if so, what is the value of our elucidation of the aphonia in the present case? Have we not merely allowed ourselves to become the victims of a jeu d'esprit? I think not. In this connection we must recall the question which has so often been raised, whether the symptoms of hysteria are of psychical or of somatic origin, or whether, if the former is granted, they are necessarily all of them psychically determined. Like so many other questions to which we find investigators returning again and again without success, this question is not adequately framed. The alternatives stated in it do not cover the real essence of the matter. As far as I can see, every hysterical symptom involves the participation of both sides. It cannot occur without the presence of a certain degree of somatic compliance offered by some normal or pathological process in or connected with one of the bodily organs. And it cannot occur more than once - and the capacity for repeating itself is one of the characteristics of a hysterical symptom - unless it has a psychical significance, a meaning. The hysterical symptom does not carry this meaning with it, but the meaning is lent to it, soldered to it, as it were; and in every instance the meaning can be a different one, according to the nature of the suppressed thoughts which are struggling for expression. However, there are a number of factors at work which tend to make less arbitrary the relations between the unconscious thoughts and the somatic processes that are at their disposal as a means of expression, and which tend to make those relations approximate to a few typical forms. For therapeutic purposes the most important determinants are those given by the fortuitous psychical material; the clearing-up of the symptoms is achieved by looking for their psychical significance. When everything that can be got rid of by psycho-analysis has been cleared away, we are in a position to form all kinds of conjectures, which probably meet the facts, as regards the somatic basis of the symptoms - a basis which is as a rule constitutional and organic. Thus in Dora's case we shall not content ourselves with a psycho-analytic interpretation of her attacks of coughing and aphonia; but we shall also indicate the organic factor which was the source of the 'somatic compliance' that enabled her to express her love for a man who was periodically absent. And if the connection between the symptomatic expression and the unconscious mental content should strike us as being in this case a clever tour de force, we shall be relieved to hear that it succeeds in creating the same impression in every other case and in every other instance.

[1905e, 1378]
We have already learnt that it quite regularly happens that a single symptom corresponds to several meanings simultaneously. We may now add that it can express several meanings in succession. In the course of years a symptom can change its meaning or its chief meaning, or the leading role can pass from one meaning to another. It is as though there were a conservative trait in the character of neuroses which ensures that a symptom that has once been formed shall if possible be retained, even though the unconscious thought to which it gave expression has lost its meaning. Moreover, there is no difficulty in explaining this tendency towards the retention of a symptom upon a mechanical basis. The production of a symptom of this kind is so difficult, the translation of a purely psychical excitation into physical terms - the process which I have called 'conversion' - depends on the concurrence of so many favourable conditions, the somatic compliance necessary for conversion is so seldom forthcoming, that an impulsion towards the discharge of an unconscious excitation will so far as possible make use of any channel for discharge which may already be in existence. It appears to be far more difficult to create a fresh conversion than to form paths of association between a new thought which is in need of discharge and the old one which is no longer in need of it. The current flows along these paths from the new source of excitation to the old point of discharge - pouring into the symptom, in the words of the Gospel, like new wine into an old bottle. These remarks would make it seem that the somatic side of a hysterical symptom is the more stable of the two and the harder to replace, while the psychical side is a variable element for which a substitute can more easily be found. Yet we should not try to infer anything from this comparison as regards the relative importance of the two elements. From the point of view of mental therapeutics the mental side must always be the more significant.

[1905e, 1390]

I suspect that we are here concerned with unconscious processes of thought which are twined around a pre-existing structure of organic connections, much as festoons of flowers are twined around a wire; so that on another occasion one might find other lines of thought inserted between the same points of departure and termination. Yet a knowledge of the thought connections which have been effective in the individual case is of a value which cannot be exaggerated for clearing up the symptoms. It is only because the analysis was prematurely broken off that we have been obliged in Dora's case to resort to framing conjectures and filling in deficiencies. Whatever I have brought forward for filling up the gaps is based upon other cases which have been more thoroughly analysed.

[1905e, 1420]

The fact that this book is based upon the psycho-analytic observations which led to its composition is shown, however, not only in the choice of the topics dealt with, but also in their arrangement. Throughout the entire work the various factors are placed in a particular order of precedence: preference is given to the accidental factors while disposition is left in the background, and more weight is attached to ontogenesis than to phylogenesis. For it is the accidental factors that play the principal part in analysis: they are almost entirely subject to its influence. The dispositional ones only come to light after them, as something stirred into activity by experience: adequate consideration of them would lead far beyond the sphere of psycho-analysis.

[1905d, 1460]
ACCIDENTAL EXPERIENCES  No other influences on the course of sexual development can compare in importance with releases of sexuality, waves of repression and sublimations - the two latter being processes of which the inner causes are quite unknown to us. It might be possible to include repressions and sublimations as a part of the constitutional disposition, by regarding them as manifestations of it in life; and anyone who does so is justified in asserting that the final shape taken by sexual life is principally the outcome of the innate constitution. No one with perception will, however, dispute that an interplay of factors such as this also leaves room for the modifying effects of accidental events experienced in childhood and later. It is not easy to estimate the relative efficacy of the constitutional and accidental factors. In theory one is always inclined to overestimate the former; therapeutic practice emphasizes the importance of the latter. It should, however, of no account be forgotten that the relation between the two is a co-operative and not a mutually exclusive one. The constitutional factor must await experiences before it can make itself felt; the accidental factor must have a constitutional basis in order to come into operation. To cover the majority of cases we can picture what has been described as a 'complemental series', in which the diminishing intensity of one factor is balanced by the increasing intensity of the other; there is, however, no reason to deny the existence of extreme cases at the two ends of the series.

[1905d, 1550]

There is, however, another angle from which you may seek to understand the psycho-analytic method. The uncovering and translating of the unconscious occurs in the face of a continuous resistance on the part of the patient. The process of bringing this unconscious material to light is associated with unpleasure, and because of this the patient rejects it again and again. It is for you then to interpose in this conflict in the patient's mental life. If you succeed in persuading him to accept, by virtue of a better understanding, something that up to now, in consequence of this automatic regulation by unpleasure, he has rejected (repressed), you will have accomplished something towards his education. For it is education even to induce someone who dislikes getting up early to do so all the same. Psycho-analytic treatment may in general be conceived of as such a re-education in overcoming internal resistances. Re-education of this kind is, however, in no respect more necessary to nervous patients than in regard to the mental element in their sexual life. For nowhere else have civilization and education done so much harm as in this field, and this is the point, as experience will show you, at which to look for those aetiologies of the neuroses that are amenable to influence; for the other aetiological factor, the constitutional component, consists of something fixed and unalterable. And from this it follows that one important qualification is required of the physician in this work: not only must his own character be irreproachable - 'As to morals, that goes without saying', as the hero of Vischer's novel Auch Einer was in the habit of declaring - but he must also have overcome in his own mind that mixture of prurience and prudery with which, unfortunately, so many people habitually consider sexual problems.

[1905a, 1571]
Think it over! You have learnt all that is essential about the determinants of falling ill as well as all the factors that come into effect after the patient has fallen ill. Where do these leave room for any therapeutic influence? In the first place there is hereditary disposition. We have not talked about it very often because it is emphatically stressed from other directions and we have nothing new to say about it. But do not suppose that we underestimate it; precisely as therapists we come to realize its power clearly enough. In any case we can do nothing to alter it; we too must take it as something given, which sets a limit to our efforts. Next there is the influence of early experiences in childhood, to which we are in the habit of giving prominence in analysis: they belong to the past and we cannot undo them. Then comes everything that we have summarized as ‘real frustration’ - the misfortunes of life from which arise deprivation of love, poverty, family quarrels, ill-judged choice of a partner in marriage, unfavourable social circumstances, and the strictness of the ethical standards to whose pressure the individual is subject. Here, to be sure, there would be handles enough for a very effective therapy, but it would have to be of the kind which Viennese folklore attributes to the Emperor Joseph - the benevolent interference of a powerful personage before whose will people bow and difficulties vanish. But who are we, that we should be able to adopt benevolence of this kind as an instrument of our therapy? Poor ourselves and socially powerless, and compelled to earn our livelihood from our medical activity, we are not even in a position to extend our efforts to people without means, as other doctors with other methods of treatment are after all able to do. Our therapy is too time-consuming and too laborious for that to be possible. Perhaps, however, you are clutching at one of the factors I have mentioned and believe that there you have found the point at which our influence can make its attack. If the ethical restrictions demanded by society play a part in the deprivation imposed on the patient, treatment can, after all, give him the courage, or perhaps a direct injunction, to disregard those barriers and achieve satisfaction and recovery while forgoing the fulfilment of an ideal that is exalted, but so often not adhered to, by society. The patient will thus become healthy by ‘living a full life’ sexually. This, it is true, casts a shadow on analytic treatment for not serving general morality. What it has given to the individual it will have taken from the community.

[1916-1917, 3475]
Compared with the other psychotherapeutic procedures psycho-analysis is beyond any doubt the most powerful. It is just and fair, too, that this should be so for it is also the most laborious and time-consuming; it would not be used on slight cases. In suitable cases it is possible by its means to get rid of disturbances and bring about changes for which in pre-analytic times one would not have ventured to hope. But it has its very appreciable limits. The therapeutic ambition of some of my adherents has made the greatest efforts to overcome these obstacles so that every sort of neurotic disorder might be curable by psycho-analysis. They have endeavoured to compress the work of analysis into a shorter duration, to intensify transference so that it may be able to overcome any resistance, to unite other forms of influence with it so as to compel a cure. These efforts are certainly praiseworthy, but, in my opinion, they are vain. They bring with them, too, a danger of being oneself forced away from analysis and drawn into a boundless course of experimentation. The expectation that every neurotic phenomenon can be cured may, I suspect, be derived from the layman’s belief that the neuroses are something quite unnecessary which have no right whatever to exist. Whereas in fact they are severe, constitutionally fixed illnesses, which rarely restrict themselves to only a few attacks but persist as a rule over long periods or throughout life. Our analytic experience that they can be extensively influenced, if the historical precipitating causes and accidental auxiliary factors of the illness can be dealt with, has led us to neglect the constitutional factor in our therapeutic practice, and in any case we can do nothing about it; but in theory we ought always to bear it in mind. The radical inaccessibility of the psychoses to analytic treatment should, in view of their close relationship to the neuroses, restrict our pretensions in regard to these latter. The therapeutic effectiveness of psycho-analysis remains cramped by a number of weighty and scarcely assailable factors. In the case of children, where one might count on the greatest successes, the difficulties are the external ones connected with their relation to their parents, though these difficulties are after all a necessary part of being a child. In the case of adults the difficulties arise in the first instance from two factors: the amount of psychical rigidity present and the form of the illness with all that that covers in the way of deeper determinants.

[1933a, 4752]
I should not like it to be wrongly thought that I do not wish to allow that hysteria is an independent neurotic affection, that I regard it merely as a psychical manifestation of anxiety neurosis and that I attribute to it 'ideogenic' symptoms only and am transferring the somatic symptoms (such as hyterogenic points and anaesthesias) to anxiety neurosis. Nothing of the sort. In my opinion it is possible to deal with hysteria, freed from any admixture, as something independent; and to do so in every respect except in that of therapeutics. For in therapeutics we are concerned with a practical aim, with getting rid of the pathological state as a whole. And if hysteria generally appears as a component of a mixed neurosis, the situation resembles that in which there is a mixed infection, where preserving life sets a problem which does not coincide with that of combating the operation of one particular pathogenic agent.

(4) Where we meet with an acute hysteria, a case which is passing through the period of the most active production of hysterical symptoms and in which the ego is being constantly overwhelmed by the products of the illness (i.e. during a hysterical psychosis), even the cathartic method will make little change in the appearance and course of the disorder. In such circumstances we find ourselves in the same position as regards the neurosis as a physician faced by an acute infectious disease. The aetiological factors have performed their work sufficiently, at a time which has now passed and is beyond the reach of any influence; and now, after the period of incubation has elapsed, they have become manifest. The illness cannot be broken off short. We must wait for it to run its course and in the mean time make the patient's circumstances as favourable as possible. If, during an acute period like this, we get rid of the products of the illness, the freshly generated hysterical symptoms, we must also be prepared to find that those that have been got rid of will promptly be replaced by others. The physician will not be spared the depressing feeling of being faced by a Sisyphean task. The immense expenditure of labour, and the dissatisfaction of the patient's family, to whom the inevitable length of an acute infectious disease is not likely to be as familiar as the analogous case of an acute infectious disease - these and other difficulties will probably make a systematic application of the cathartic method as a rule impossible in any given case. Nevertheless, it remains a matter for serious consideration whether it may not be true that even in an acute hysteria the regular clearing up of the products of the illness exercises a curative influence, by supporting the patient's normal ego which is engaged in the work of defence, and by preserving it from being overwhelmed and falling into a psychosis and even perhaps into a permanent state of confusion.

Psycho-analytic therapy is not at present applicable to all cases. It has, to my knowledge, the following limitations. It demands a certain degree of maturity and understanding in the patient and is therefore not suited for the young or for adults who are feeble-minded or uneducated. It also fails with people who are very advanced in years, because, owing to the accumulation of material in them, it would take up so much time that by the end of the treatment they would have reached a period of life in which value is no longer attached to nervous health. Finally, the treatment is only possible if the patient has a normal psychical state from which the pathological material can be mastered from which to work ie a relatively normal ego. During a condition of hysterical confusion, or an interpolated mania or melancholia, nothing can be effected by psycho-analytic means. Such cases can nevertheless be treated by analysis after the violent manifestations have been quieted by the usual measures. In actual practice, chronic cases of psychoneurosis are altogether more amenable to the method than cases with acute crises, in which the greatest stress is naturally laid on the speed with which the crises can be dealt with. For this reason, the most favourable field of work for this new therapy is offered by hysterical phobias and the various forms of obsessional neurosis.
That the method is confined within these limits is to a large extent explained by the circumstances in which I had to work it out. My material does in fact consist of chronic nervous cases derived from the more educated classes. I think it very probable that supplementary methods may be devised for treating children and the public who go for assistance to hospitals. I ought also to say that up to the present I have tried my treatment exclusively on severe cases of hysteria and obsessional neurosis; I cannot tell how it would turn out with those mild cases which, to all appearance at least, are cured by some unspecific kind of treatment lasting for a few months. It will readily be understood that a new therapy which calls for many sacrifices can only reckon on obtaining patients who have already tried the generally accepted methods without success, or whose condition has justified the inference that they could expect nothing from these supposedly more convenient and shorter therapeutic procedures. Thus it happened that I was obliged to tackle the hardest tasks straightaway with an imperfect instrument. The test has proved all the more convincing.

[1897b, 474]

In the course of my psycho-analytic treatment of cases of hysteria, obsessional neurosis, etc., I have often had to deal with fragmentary recollections which have remained in the patient's memory from the earliest years of his childhood. As I have shown elsewhere, great pathogenic importance must be attributed to the impressions of that time of life. But the subject of childhood memories is in any case bound to be of psychological interest, for they bring into striking relief a fundamental difference between the psychical functioning of children and of adults. No one calls in question the fact that the experiences of the earliest years of our childhood leave ineradicable traces in the depths of our minds. If, however, we seek in our memories to ascertain what were the impressions that were destined to influence us to the end of our lives, the outcome is either nothing at all or a relatively small number of isolated recollections which are often of dubious or enigmatic importance. It is only from the sixth or seventh year onwards - in many cases only after the tenth year - that our lives can be reproduced in memory as a connected chain of events. From that time on, however, there is also a direct relation between the psychical significance of an experience and its retention in the memory. Whatever seems important on account of its immediate or directly subsequent effects is recollected; whatever is judged to be inessential is forgotten. If I can remember an event a long time after its occurrence, I regard the fact of having retained it in my memory as evidence of its having made a deep impression on me at the time. I feel surprised at forgetting; and I feel even more surprised, perhaps, at remembering something apparently indifferent.

[1899a, 487]

ANALYSIS. -This dreamer belonged to a type whose therapeutic prospects are not favourable: up to a certain point they offer no resistance at all to analysis, but from then onwards turn out to be almost inaccessible. He interpreted this dream almost unaided. 'The Rotunda', he said, 'was my genitals and the captive balloon in front of it was my penis, whose limpness I have reason to complain of.' Going into greater detail, then, we may translate the Rotunda as the bottom (habitually regarded by children as part of the genitals) and the small annex in front of it as the scrotum. His father asked him in the dream what all this was, that is, what was the purpose and function of the genitals. It seemed plausible to reverse this situation and turn the dreamer into the questioner. Since he had in fact never questioned his father in this way, we had to look upon the dream-thought as a wish, or take it as a conditional clause, such as: 'If I had asked my father for sexual enlightenment. . .' We shall presently find the continuation of this thought in another part of the dream.

[1900a, 826]
Thus I would look for the theoretical value of the study of dreams in the contributions it makes to psychological knowledge and in the preliminary light it throws on the problems of the psychoneuroses. Who can guess the importance of the results which might be obtained from a thorough understanding of the structure and functions of the mental apparatus, since even the present state of our knowledge allows us to exert a favourable therapeutic influence on the curable forms of psychoneurosis? But what of the practical value of this study - I hear the question raised - as a means towards an understanding of the mind, towards a revelation of the hidden characteristics of individual men? Have not the unconscious impulses brought out by dreams the importance of real forces in mental life? Is the ethical significance of suppressed wishes to be made light of - wishes which, just as they lead to dreams, may some day lead to other things?

¹ A supervalent thought of this kind is often the only symptom, beyond deep depression, of a pathological condition which is usually described as 'melancholia', but which can be cleared up by psycho-analysis like a hysteria.

The therapeutic procedure remains the same, apart from insignificant modifications, for all the various clinical pictures that may be presented in hysteria, and all forms of obsessional neurosis. This does not imply, however, that it can have an unlimited application. The nature of the psycho-analytic method involves indications and contra-indications with respect to the person to be treated as well as with respect to the clinical picture. Chronic cases of psychoneuroses without any very violent or dangerous symptoms are the most favourable ones for psycho-analysis: thus in the first place every species of obsessional neurosis, obsessive thinking and acting, and cases of hysteria in which phobias and aboulias play the most important part; further, all somatic expressions of hysteria whenever they do not, as in anorexia, require the physician to attend promptly to the speedy removal of symptoms. In acute cases of hysteria it will be necessary to wait for a calmer stage; in all cases where nervous exhaustion dominates the clinical picture a treatment which in itself demands effort, brings only slow improvement and for a time cannot take the persistence of the symptoms into account, will have to be avoided.

Various qualifications are required of anyone who is to be beneficially affected by psycho-analysis. To begin with, he must be capable of a psychically normal condition; during periods of confusion or melancholic depression nothing can be accomplished even in cases of hysteria. Furthermore, a certain measure of natural intelligence and ethical development are to be required of him; if the physician has to deal with a worthless character, he soon loses the interest which makes it possible for him to enter profoundly into the patient's mental life. Deep-rooted malformations of character, traits of an actually degenerate constitution, show themselves during treatment as sources of a resistance that can scarcely be overcome. In this respect the constitution of the patient sets a general limit to the curative effect of psychotherapy. If the patient's age is in the neighbourhood of the fifties the conditions for psycho-analysis become unfavourable. The mass of psychical material is then no longer manageable; the time required for recovery is too long; and the ability to undo psychical processes begins to grow weaker.
In spite of all these limitations, the number of persons suitable for psycho-analytic treatment is extraordinarily large and the extension which has come to our therapeutic powers from this method is, according to Freud, very considerable. Freud requires long periods, six months to three years, for an effective treatment; yet he informs us that up to the present, owing to various circumstances which can easily be guessed, he has for the most part been in a position to try his treatment only on very severe cases: patients have come to him after many years of illness, completely incapacitated for life, and, after being disappointed by all kinds of treatments, have had recourse as a last resort to a method which is novel and has been greeted with many doubts. In cases of less severe illness the duration of the treatment might well be much shorter, and very great advantage in the direction of future prevention might be achieved.

From certain of my remarks you will have gathered that there are many characteristics in the analytic method which prevent it from being an ideal form of therapy. *Tuto, cito, jucunde*: investigation and probing do not indicate speedy results, and the resistance I have mentioned would prepare you to expect unpleasantness of various kinds. Psycho-analytic treatment certainly makes great demands upon the patient as well as upon the physician. From the patient it requires perfect sincerity - a sacrifice in itself; it absorbs time and is therefore also costly; for the physician it is no less time-absorbing, and the technique which he must study and practise is fairly laborious. I consider it quite justifiable to resort to more convenient methods of treatment as long as there is any prospect of achieving anything by their means. That, after all, is the only point at issue. If the more difficult and lengthy method accomplishes considerably more than the short and easy one, then, in spite of everything, the use of the former is justified. Only consider, Gentlemen, how much more inconvenient and costly is the Finsen therapy of lupus than the method of cauterizing and scraping previously employed; and yet the use of the former signifies a great advance, for it performs a radical cure. Although I do not wish to carry this comparison to extremes, the psycho-analytic method may claim a similar privilege. Actually, I have been able to elaborate and to test my therapeutic method only on severe, indeed on the severest cases; at first my material consisted entirely of patients who had tried everything else without success, and had spent long years in sanatoria. I have scarcely been able to bring together sufficient material to enable me to say how my method works with those slighter, episodic cases which we see recovering under all kinds of influences and even spontaneously. Psycho-analytic therapy was created through and for the treatment of patients permanently unfit for existence, and its triumph has been that it has made a satisfactorily large number of these permanently fit for existence. In the face of such an achievement all the effort expended seems trivial. We cannot conceal from ourselves what, as physicians, we are in the habit of denying to our patients, namely, that a severe neurosis is no less serious for the sufferer than any cachexia or any of the dreaded major diseases.

The conditions under which this method is indicated, or contra-indicated, can scarcely be definitely laid down as yet, because of the many practical limitations to which my activities have been subjected. Nevertheless, I will attempt to discuss a few of them here:
(1) One should look beyond the patient’s illness and form an estimate of his whole personality; those patients who do not possess a reasonable degree of education and a fairly reliable character should be refused. It must not be forgotten that there are healthy people as well as unhealthy ones who are good for nothing in life, and that there is a temptation to ascribe to their illness everything that incapacitates them, if they show any sign of neurosis. In my opinion a neurosis is by no means a stamp of degeneracy, though it may often enough be found in one person along with the signs of degeneracy. Now analytic psychotherapy is not a process suited to the treatment of neuropathic degeneracy; on the contrary, degeneracy is a barrier to its effectiveness. Nor is the method applicable to people who are not driven to seek treatment by their own sufferings, but who submit to it only because they are forced to by the authority of relatives. The qualification which is the determining factor of fitness for psycho-analytic treatment - that is, whether the patient is educable - must be discussed further from another standpoint.

[1905a, 1569]

(2) To be quite safe, one should limit one’s choice of patients to those who possess a normal mental condition, since in the psycho-analytic method this is used as a foothold from which to obtain control of the morbid manifestations. Psychoses, states of confusion and deeply-rooted (I might say toxic) depression are therefore not suitable for psycho-analysis; at least not for the method as it has been practised up to the present. I do not regard it as by any means impossible that by suitable changes in the method we may succeed in overcoming this contraindication - and so be able to initiate a psychotherapy of the psychoses.

[1905a, 1569]

(3) The age of patients has this much importance in determining their fitness for psycho-analytic treatment, that, on the one hand, near or above the age of fifty the elasticity of the mental processes, on which the treatment depends, is as a rule lacking - old people are no longer educable - and, on the other hand, the mass of material to be dealt with would prolong the duration of the treatment indefinitely. In the other direction the age limit can be determined only individually; youthful persons under the age of adolescence are often exceedingly amenable to influence.

[1905a, 1569]

(4) Psycho-analysis should not be attempted when the speedy removal of dangerous symptoms is required, as, for example, in a case of hysterical anorexia.

[1905a, 1569]

By this time you will have formed an impression that the field of analytic psychotherapy is a very narrow one, since you have in fact heard nothing from me except indications that point against it. There remain, however, cases and types of disease enough on which this therapy may be tested - as, for instance, all chronic forms of hysteria with residual manifestations, the broad field of obsessive conditions, aboulias, and the like.

[1905a, 1570]

It is gratifying that precisely the most valuable and most highly developed persons are best suited for this procedure; and one may also safely claim that in cases where analytic psychotherapy has been able to achieve but little, any other therapy would certainly not have been able to effect anything at all.

[1905a, 1570]

Let me end upon this defensive note. And let us hope that your interest in psychotherapy, when freed from every hostile prejudice, may lend us support in our endeavour to achieve success in treating even severe cases of psychoneurosis.

[1905a, 1572]
Perhaps, too, in most people’s eyes we are doing our author a poor service in declaring his work to be a psychiatric study. An author, we hear them say, should keep out of the way of any contact with psychiatry and should leave the description of pathological mental states to the doctors. The truth is that no truly creative writer has ever obeyed this injunction. The description of the human mind is indeed the domain which is most his own; he has from time immemorial been the precursor of science, and so too of scientific psychology. But the frontier between states of mind described as normal and pathological is in part a conventional one and in part so fluctuating that each of us probably crosses it many times in the course of a day. On the other hand, psychiatry would be doing wrong if it tried to restrict itself permanently to the study of the severe and gloomy illnesses that arise from gross injuries to the delicate apparatus of the mind. Deviations from health which are slighter and capable of correction, and which to-day we can trace back no further than to disturbances in the interplay of mental forces, arouse its interest no less. Indeed, only through the medium of these can it understand either normal states or the phenomena of severe illness. Thus the creative writer cannot evade the psychiatrist nor the psychiatrist the creative writer, and the poetic treatment of a psychiatric theme can turn out to be correct without any sacrifice of its beauty.

[1907a, 1843]

But the similarity between Gradiva’s procedure and the analytic method of psychotherapy is not limited to these two points - the making conscious of what has been repressed and the coinciding of explanation with cure. It also extends to what turns out to be the essence of the whole change - to the awakening of feelings. Every disorder analogous to Hanold’s delusion, what in scientific terms we are in the habit of calling ‘psychoneuroses’, has as its precondition the repression of a portion of instinctual life, or, as we can safely say, of the sexual instinct. At every attempt to introduce the unconscious and repressed causes of the illness into consciousness, the instinctual component concerned is necessarily aroused to a renewed struggle with the repressing powers, only to come to terms with them in the final outcome, often to the accompaniment of violent manifestations of reaction. The process of cure is accomplished in a relapse into love, if we combine all the many components of the sexual instinct under the term ‘love’; and such a relapse is indispensable, for the symptoms on account of which the treatment has been undertaken are nothing other than precipitates of earlier struggles connected with repression or the return of the repressed, and they can only be resolved and washed away by a fresh high tide of the same passions. Every psycho-analytic treatment is an attempt at liberating repressed love which has found a meagre outlet in the compromise of a symptom. Indeed, the agreement between such treatments and the process of cure described by the author of Gradiva reaches its climax in the further fact that in analytic psychotherapy too the re-awakened passion, whether it is love or hate, invariably chooses as its object the figure of the doctor.

[1907a, 1881]
The field I have in mind is indeed very different from yours. I am referring to the therapy employed for certain 'nervous diseases' - what are known as the psychoneuroses - of which hysteria and obsessional ideas may be taken as samples. The method is called 'psycho-analysis'; it was evolved by me from the 'cathartic' method of therapy first practised by Josef Breuer in Vienna.¹ To combat your surprise, I must draw an analogy between the criminal and the hysteric. In both we are concerned with a secret, with something hidden. But in order not to be paradoxical I must at once point out the difference. In the case of the criminal it is a secret which he knows and hides from you, whereas in the case of the hysteric it is a secret which he himself does not know either, which is hidden even from himself. How is this possible? Now we know, through laborious research, that all these illnesses are the result of the patient's having succeeded in repressing certain ideas and memories that are strongly cathected with affect, together with the wishes that arise from them, in such a way that they play no part in his thinking - do not enter into his consciousness - and thus remain unknown to him. But from this repressed psychical material (these 'complexes') are generated the somatic and psychical symptoms which plague the patient in just the same way as a guilty conscience does. In this one respect, therefore, the difference between the criminal and the hysteric is fundamental.

[1906c, 1892]

It is true that during the analysis Hans had to be told many things that he could not say himself, that he had to be presented with thoughts which he had so far shown no signs of possessing, and that his attention had to be turned in the direction from which his father was expecting something to come. This detracts from the evidential value of the analysis; but the procedure is the same in every case. For a psycho-analysis is not an impartial scientific investigation, but a therapeutic measure. Its essence is not to prove anything, but merely to alter something. In a psycho-analysis the physician always gives his patient (sometimes to a greater and some times to a less extent) the conscious anticipatory ideas by the help of which he is put in a position to recognize and to grasp the unconscious material. For there are some patients who need more of such assistance and some who need less; but there are none who get through without some of it. Slight disorders may perhaps be brought to an end by the subject's unaided efforts, but never a neurosis - a thing which has set itself up against the ego as an element alien to it. To get the better of such an element another person must be brought in, and in so far as that other person can be of assistance the neurosis will be curable. If it is in the very nature of any neurosis to turn away from the 'other person' - and this seems to be one of the characteristics of the states grouped together under the name of dementia praecox - then for that very reason such a state will be incurable by any efforts of ours. It is true that a child, on account of the small development of his intellectual systems, requires especially energetic assistance. But, after all, the information which the physician gives his patient is itself derived in its turn from analytical experience; and indeed it is sufficiently convincing if, at the cost of this intervention by the physician, we are enabled to discover the structure of the pathogenic material and simultaneously to dissipate it.

[1909b, 2089]
At the next session the patient showed great interest in what I had said, but ventured, so he told me, to bring forward a few doubts. - How, he asked, could the information that the self-reproach, the sense of guilt, was justified have a therapeutic effect? - I explained that it was not the information that had this effect, but the discovery of the unknown content to which the self-reproach was really attached. - Yes, he said, that was the precise point to which his question had been directed. - I then made some short observations upon the psychological differences between the conscious and the unconscious, and upon the fact that everything conscious was subject to a process of wearing-away, while what was unconscious was relatively unchangeable; and I illustrated my remarks by pointing to the antiques standing about in my room. They were, in fact, I said, only objects found in a tomb, and their burial had been their preservation: the destruction of Pompeii was only beginning now that it had been dug up. - Was there any guarantee, he next enquired, of what one's attitude would be towards what was discovered? One man, he thought, would no doubt behave in such a way as to get the better of his self-reproach, but another would not. - No, I said, it followed from the nature of the circumstances that in every case the effect would be overcome - for the most part during the progress of the work itself. Every effort was made to preserve Pompeii, whereas people were anxious to be rid of tormenting ideas like his. - He had said to himself, he went on, that a self-reproach could only arise from a breach of a person's own inner moral principles and not from that of any external ones. - I agreed, and said that the man who merely breaks an external law often regards himself as a hero. - Such an occurrence, he continued, was thus only possible where a disintegration of the personality was already present. Was there a possibility of his effecting a reintegration of his personality? If this could be done, he thought he would be able to make a success of his life, perhaps more of one than most people. - I replied that I was in complete agreement with this notion of a splitting of his personality. He had only to assimilate this new contrast, between a moral self and an evil one, with the contrast I had already mentioned, between the conscious and the unconscious. The moral self was the conscious, the evil self was the unconscious.¹ - He then said that, though he considered himself a moral person, he could quite definitely remember having done things in his childhood which came from his other self. - I remarked that here he had incidentally hit upon one of the chief characteristics of the unconscious, namely, its relation to the infantile. The unconscious, I explained, was the infantile; it was that part of the self which had become separated off from it in infancy, which had not shared the later stages of its development, and which had in consequence become repressed. It was the derivatives of this repressed unconscious that were responsible for the involuntary thoughts which constituted his illness. He might now, I added, discover yet another characteristic of the unconscious; it was a discovery which I should be glad to let him make for himself. - He found nothing more to say in this immediate connection, but instead he expressed a doubt whether it was possible to undo modifications of such long standing. What, in particular, could be done against his idea about the next world, for it could not be refuted by logic? - I told him I did not dispute the gravity of his case nor the significance of his pathological constructions; but at the same time his youth was very much in his favour as well as the intactness of his personality. In this connection I said a word or two upon the good opinion I had formed of him, and this gave him visible pleasure.

Oddly enough, the three therapeutic alternatives of this so-called psycho-analyst leave no room for - psycho-analysis! This woman could apparently only be cured of her anxiety by returning to her husband, or by satisfying her needs by masturbation or with a lover. And where does analytic treatment come in, the treatment which we regard as the main remedy in anxiety-states?

[1909d, 2143]

[1910k, 2378]
The analytic investigation of paranoia presents difficulties of a peculiar nature to physicians who, like myself, are not attached to public institutions. We cannot accept patients suffering from this complaint, or, at all events, we cannot keep them for long, since we cannot offer treatment unless there is some prospect of therapeutic success. It is only in exceptional circumstances, therefore, that I succeed in getting more than a superficial view of the structure of paranoia - when, for instance, the diagnosis (which is not always an easy matter) is uncertain enough to justify an attempt at influencing the patient, or when, in spite of an assured diagnosis, I yield to the entreaties of the patient's relatives and undertake to treat him for a time. Apart from this, of course, I see plenty of cases of paranoia and of dementia praecox, and I learn as much about them as other psychiatrists do about their cases; but that is not enough, as a rule, to lead to any analytic conclusions.

The negative transference deserves a detailed examination, which it cannot be given within the limits of the present paper. In the curable forms of psychoneurosis it is found side by side with the affectionate transference, often directed simultaneously towards the same person. Bleuler has coined the excellent term 'ambivalence' to describe this phenomenon.¹ Up to a point, ambivalence of feeling of this sort seems to be normal; but a high degree of it is certainly a special peculiarity of neurotic people. In obsessional neurotics an early separation of the 'pairs of opposites' seems to be characteristic of their instinctual life and to be one of their constitutional preconditions. Ambivalence in the emotional trends of neurotics is the best explanation of their ability to enlist their transferences in the service of resistance. Where the capacity for transference has become essentially limited to a negative one, as is the case with paranoids, there ceases to be any possibility of influence or cure.

Some years ago I set out the most important indications for selecting patients¹ and I shall therefore not repeat them here. They have in the meantime been approved by other psychoanalysts. But I may add that since then I have made it my habit, when I know little about a patient, only to take him on at first provisionally, for a period of one to two weeks. If one breaks off within this period one spares the patient the distressing impression of an attempted cure having failed. One has only been undertaking a 'sounding' in order to get to know the case and to decide whether it is a suitable one for psycho-analysis. No other kind of preliminary examination but this procedure is at our disposal; the most lengthy discussions and questionings in ordinary consultations would offer no substitute. This preliminary experiment, however, is itself the beginning of a psycho-analysis and must conform to its rules. There may perhaps be this distinction made, that in it one lets the patient do nearly all the talking and explains nothing more than what is absolutely necessary to get him to go on with what he is saying.

¹ [1911c, 2387]

¹ [1912b, 2463]

¹ [1913c, 2477]
There are also diagnostic reasons for beginning the treatment with a trial period of this sort lasting for one or two weeks. Often enough, when one sees a neurosis with hysterical or obsessional symptoms, which is not excessively marked and has not been in existence for long - just the type of case, that is, that one would regard as suitable for treatment - one has to, reckon with the possibility that it may be a preliminary stage of what is known as dementia praecox ('schizophrenia', in Bleuler's terminology; 'paraphrenia', as I have proposed to call it), and that sooner or later it will show a well-marked picture of that affection. I do not agree that it is always possible to make the distinction so easily. I am aware that there are psychiatrists who hesitate less often in their differential diagnosis, but I have become convinced that just as often they make mistakes. To make a mistake, moreover, is of far greater moment for the psycho-analyst than it is for the clinical psychiatrist, as he is called. For the latter is not attempting to do anything that will be of use, whichever kind of case it may be. He merely runs the risk of making a theoretical mistake, and his diagnosis is of no more than academic interest. Where the psycho-analyst is concerned, however, if the case is unfavourable he has committed a practical error; he has been responsible for wasted expenditure and has discredited his method of treatment. He cannot fulfil his promise of cure if the patient is suffering, not from hysteria or obsessional neurosis, but from paraphrenia, and he therefore has particularly strong motives for avoiding mistakes in diagnosis. In an experimental treatment of a few weeks he will often observe suspicious signs which may determine him not to pursue the attempt any further. Unfortunately I cannot assert that an attempt of this kind always enables us to arrive at a certain decision; it is only one wise precaution the more.¹

¹ There is a great deal to be said about this uncertainty in diagnosis, about the prospects of success in analysing mild forms of paraphrenia and about the reasons for the similarity between the two disorders; but I cannot enlarge on these subjects in the present context. I should be glad to follow Jung in contrasting hysteria and obsessional neurosis as 'transference neuroses' with the paraphrenic affections as 'introversion neuroses', if it were not that such a usage would deprive the concept of 'introversion' (of the libido) of its sole legitimate meaning.

[1913c, 2478]
To shorten analytic treatment is a justifiable wish, and its fulfilment, as we shall learn, is being attempted along various lines. Unfortunately, it is opposed by a very important factor, namely, the slowness with which deep-going changes in the mind are accomplished - in the last resort, no doubt, the 'timelessness' of our unconscious processes. When patients are faced with the difficulty of the great expenditure of time required for analysis they not infrequently manage to propose a way out of it. They divide up their ailments and describe some as unbearable, and others as secondary, and then say: 'If only you will relieve me from this one (for instance, a headache or a particular fear) I can deal with the other one on my own in my ordinary life.' In doing this, however, they over-estimate the selective power of analysis. The analyst is certainly able to do a great deal, but he cannot determine beforehand exactly what results he will effect. He sets in motion a process, that of the resolving of existing repressions. He can supervise this process, further it, remove obstacles in its way, and he can undoubtedly vitiate much of it. But on the whole, once begun, it goes its own way and does not allow either the direction it takes or the order in which it picks up its points to be prescribed for it. The analyst's power over the symptoms of the disease may thus be compared to male sexual potency. A man can, it is true, beget a whole child, but even the strongest man cannot create in the female organism a head alone or an arm or a leg; he cannot even prescribe the child's sex. He, too, only sets in motion a highly complicated process, determined by events in the remote past, which ends with the severance of the child from its mother. A neurosis as well has the character of an organism. Its component manifestations are not independent of one another; they condition one another and give one another mutual support. A person suffers from one neurosis only, never from several which have accidentally met together in a single individual. The patient freed, according to his wish, from his one unendurable symptom might easily find that a symptom which had previously been negligible had now increased and grown unendurable. The analyst who wishes the treatment to owe its success as little as possible to its elements of suggestion (i.e. to the transference) will do well to refrain from making use of even the trace of selective influence upon the results of the therapy which may perhaps be open to him. The patients who are bound to be most welcome to him are those who ask him to give them complete health, in so far as that is attainable, and who place as much time at his disposal as is necessary for the process of recovery. Such favourable conditions as these are, of course, to be looked for in only a few cases.

There is, it is true, one class of women with whom this attempt to preserve the erotic transference for the purposes of analytic work without satisfying it will not succeed. These are women of elemental passionateness who tolerate no surrogates. They are children of nature who refuse to accept the psychical in place of the material, who, in the poet's words, are accessible only to 'the logic of soup, with dumplings for arguments'. With such people one has the choice between returning their love or else bringing down upon oneself the full enmity of a woman scorned. In neither case can one safeguard the interests of the treatment. One has to withdraw, unsuccessful; and all one can do is to turn the problem over in one's mind of how it is that a capacity for neurosis is joined with such an intractable need for love.

We may give as instances of disorders that are accessible to psycho-analytic treatment hysterical convulsions and paralyses as well as the various symptoms of obsessional neurosis (obsessive ideas and actions). All of these are conditions which are occasionally subject to spontaneous recovery and are dependent on the personal influence of the physician in a haphazard fashion which has not yet been explained. Psycho-analysis has no therapeutic effect on the severer forms of mental disorder properly so called. But - for the first time in the history of medicine - psycho-analysis has made it possible to get some insight into the origin and mechanism alike of the neuroses and psychoses.
In another neurotic disorder, dementia praecox (paraphrenia or schizophrenia), a condition which is in fact incurable, the patient is left, in the most severe cases, in a state of apparently complete apathy. Often his sole remaining actions are certain movements and gestures which are repeated monotonously and have been given the name of 'stereotypies'. An analytic investigation of residues of this kind, made by Jung, has shown that they are the remains of perfectly significant mimetic actions, which at one time gave expression to the subject's ruling wishes. The craziest speeches and the queerest poses and attitudes adopted by these patients become intelligible and can be given a place in the chain of their mental processes if they are approached on the basis of psycho-analytic hypotheses.

Another very severe drawback is that I cannot entirely avoid throwing some analytic light on these two opposition movements. Analysis is not suited, however, for polemical use; it presupposes the consent of the person who is being analysed and a situation in which there is a superior and a subordinate. Anyone, therefore, who undertakes an analysis for polemical purposes must expect the person analysed to use analysis against him in turn, so that the discussion will reach a state which entirely excludes the possibility of convincing any impartial third person. I shall therefore restrict to a minimum my use of analytic knowledge, and, with it, of indiscretion and aggressiveness towards my opponents; and I may also point out that I am not basing any scientific criticism on these grounds. I am not concerned with the truth that may be contained in the theories which I am rejecting, nor shall I attempt to refute them. I shall leave that task to other qualified workers in the field of psycho-analysis, and it has, indeed, already been partly accomplished. I wish merely to show that these theories controvert the fundamental principles of analysis (and on what points they controvert them) and that for this reason they should not be known by the name of analysis. So I shall avail myself of analysis only in order to explain how these divergences from it could arise among analysts. When I come to the points at which the divergences occurred, I shall have, it is true, to defend the just rights of psycho-analysis with some remarks of a purely critical nature.

Psycho-analytic observers were subsequently struck by the fact that individual features of the narcissistic attitude are found in many people who suffer from other disorders - for instance, as Sadger has pointed out, in homosexuals - and finally it seemed probable that an allocation of the libido such as deserved to be described as narcissism might be present far more extensively, and that it might claim a place in the regular course of human sexual development.¹ Difficulties in psycho-analytic work upon neurotics led to the same supposition, for it seemed as though this kind of narcissistic attitude in them constituted one of the limits to their susceptibility to influence. Narcissism in this sense would not be a perversion, but the libidinal complement to the egoism of the instinct of self-preservation, a measure of which may justifiably be attributed to every living creature.

¹
Since the publication of a work by Abraham (1908) - which that conscientious author has attributed to my instigation - we have tried to base our characterization of Kraepelin's 'dementia praecox' (Bleuler's 'schizophrenia') on its position with reference to the antithesis between ego and object. In the transference neuroses (anxiety hysteria, conversion hysteria and obsessional neurosis) there was nothing to give special prominence to this antithesis. We knew, indeed, that frustration in regard to the object brings on the outbreak of the neurosis and that the neurosis involves a renunciation of the real object; we knew too that the libido that is withdrawn from the real object reverts first to a phantasied object and then to one that had been repressed (introversion). But in these disorders object-cathexis in general is retained with great energy, and more detailed examination of the process of repression has obliged us to assume that object-cathexis persists in the system Ucs. in spite of - or rather in consequence of - repression. Indeed, the capacity for transference, of which we make use for therapeutic purposes in these affections, presupposes an unimpaired object-cathexis.

[1915e, 3018]

In the case of schizophrenia, on the other hand, we have been driven to the assumption that after the process of repression the libido that has been withdrawn does not seek a new object, but retreats into the ego; that is to say, that here the object-cathexes are given up and a primitive objectless condition of narcissism is re-established. The incapacity of these patients for transference (so far as the pathological process extends), their consequent inaccessibility to therapeutic efforts, their characteristic repudiation of the external world, the appearance of signs of a hypercathexis of their own ego, the final outcome in complete apathy - all these clinical features seem to agree excellently with the assumption that their object-cathexes have been given up. As regards the relation of the two psychical systems to each other, all observers have been struck by the fact that in schizophrenia a great deal is expressed as being conscious which in the transference neuroses can only be shown to be present in the Ucs. by psychoanalysis. But to begin with we were not able to establish any intelligible connection between the ego-object relation and the relationships of consciousness.

[1915e, 3019]

But you must not take this warning of mine to mean that I propose to give you dogmatic lectures and to insist on your unqualified belief. Such a misunderstanding would do me a grave injustice. I do not wish to arouse conviction; I wish to stimulate thought and to upset prejudices. If as a result of lack of knowledge of the material you are not in a position to form a judgement, you should neither believe nor reject. You should listen and allow what I tell you to work on you. It is not so easy to arrive at convictions, or, if they are reached easily, they soon turn out to be worthless and incapable of resistance. The only person who has a right to a conviction is someone who, like me, has worked for many years at the same material and who, in doing so, has himself had the same new and surprising experiences. What is the good, then, in the sphere of the intellect, of these sudden convictions, these lightning-like conversions, these instantaneous rejections? Is it not clear that the 'coup de foudre', love at first sight, is derived from quite another sphere, from that of the emotions? We do not even require of our patients that they should bring a conviction of the truth of psycho-analysis into the treatment or be adherents of it. Such an attitude often raises our suspicions. The attitude that we find the most desirable in them is a benevolent scepticism. So you too should endeavour to allow the psychoanalytic view to grow up quietly in you alongside of the popular or psychiatric one, till opportunities arise for the two to influence each other, to compete with each other and to unite in leading to a conclusion.

[1916-1917, 3326]
Perhaps, however, the much-abused psycho-analysis has friends among you who will be pleased if it can be justified from another direction - from the therapeutic side. As you know, our psychiatric therapy is not hitherto able to influence delusions. Is it possible, perhaps, that psycho-analysis can do so, thanks to its insight into the mechanism of these symptoms? No, Gentlemen, it cannot. It is as powerless (for the time being at least) against these ailments as any other form of therapy. We can understand, indeed, what has happened in the patient, but we have no means of making the patient himself understand it. You have heard how I was unable to pursue the analysis of this delusion beyond a first beginning. Will you be inclined to maintain on that account that an analysis of such cases is to be rejected because it is fruitless? I think not. We have a right, or rather a duty, to carry on our research without consideration of any immediate beneficial effect. In the end - we cannot tell where or when - every little fragment of knowledge will be transformed into power, and into therapeutic power as well. Even if psycho-analysis showed itself as unsuccessful in every other form of nervous and psychical disease as it does in delusions, it would still remain completely justified as an irreplaceable instrument of scientific research. It is true that in that case we should not be in a position to practise it. The human material on which we seek to learn, which lives, has its own will and needs its motives for co-operating in our work, would hold back from us. Let me therefore end my remarks to-day by informing you that there are extensive groups of nervous disorders in which the transformation of our better understanding into therapeutic power has actually taken place, and that in these illnesses, which are difficult of access by other means, we achieve, under favourable conditions, successes which are second to no others in the field of internal medicine.

[1916-1917, 3337]

This neurosis, known as 'obsessional neurosis', is not so popular as the universally familiar hysteria. It is not, if I may express myself thus, so obtrusively noisy, it behaves more like a private affair of the patient's, it dispenses almost entirely with somatic phenomena, and creates all its symptoms in the mental sphere. Obsessional neurosis and hysteria are the forms of neurotic illness upon the study of which psycho-analysis was first built, and in the treatment of which, too, our therapy celebrates its triumphs. But obsessional neurosis, in which the puzzling leap from the mental to the physical plays no part, has actually, through the efforts of psycho-analysis, become more perspicuous and familiar to us than hysteria, and we have learnt that it displays certain extreme characteristics of the nature of neurosis far more glaringly.

[1916-1917, 3339]

This discovery of Breuer's is still the foundation of psycho-analytic therapy. The thesis that symptoms disappear when we have made their unconscious predeterminants conscious has been confirmed by all subsequent research, although we meet with the strangest and most unexpected complications when we attempt to carry it through in practice. Our therapy works by transforming what is unconscious into what is conscious, and it works only in so far as it is in a position to effect that transformation.

[1916-1917, 3357]
I should like to anticipate, Gentlemen, the qualifications which I shall have to make later in the universal validity of these statements. I will therefore point out to you that all I have said here about repression and the formation and meaning of symptoms was derived from three forms of neurosis - anxiety hysteria, conversion hysteria and obsessional neurosis - and that in the first instance it is also valid only for these forms. These three disorders, which we are accustomed to group together as 'transference neuroses', also circumscribe the region in which psychoanalytic therapy can function. The other neuroses have been far less thoroughly studied by psycho-analysis; in one group of them the impossibility of therapeutic influence has been a reason for this neglect. Nor should you forget that psycho-analysis is still a very young science, that preparing for it costs much trouble and time, and that not at all long ago it was being practised single-handed. Nevertheless, we are everywhere on the point of penetrating to an understanding of these other disorders which are not transference neuroses. I hope later to be able to introduce you to the extensions of our hypotheses and findings which result from adaptation to this new material, and to show you that these further studies have not led to contradictions but to the establishment of higher unities. If, then, everything I am saying here applies to the transference neuroses, let me first increase the value of symptoms by a new piece of information. For a comparative study of the determining causes of falling ill leads to a result which can be expressed in a formula: these people fall ill in one way or another of frustration, when reality prevents them from satisfying their sexual wishes. You see how excellently these two findings tally with each other. It is only thus that symptoms can be properly viewed as substitutive satisfactions for what is missed in life.

[1916-1917, 3372]

But, Ladies and Gentlemen, who has so seriously misinformed you? A recommendation to the patient to 'live a full life' sexually could not possibly play a part in analytic therapy - if only because we ourselves have declared that an obstinate conflict is taking place in him between a libidinal impulse and sexual repression, between a sensual and an ascetic trend. This conflict would not be solved by our helping one of these trends to victory over its opponent. We see, indeed, that in neurotics asceticism has the upper hand; and the consequence of this is precisely that the suppressed sexual tendency finds a way out in symptoms. If, on the contrary, we were to secure victory for sensuality, then the sexual repression that had been put on one side would necessarily be replaced by symptom. Neither of these two alternative decisions could end the internal conflict; in either case one party to it would remain unsatisfied. There are only a few cases in which the conflict is so unstable that a factor such as the doctor's taking sides could decide it; and such cases do not in fact stand in need of analytic treatment. Anyone on whom the doctor could have so much influence would have found the same way out without the doctor. You must be aware that if an abstinent young man decides in favour of illicit sexual intercourse or if an unsatisfied wife seeks relief with another man, they have not as a rule waited for permission from a doctor or even from their analyst.

[1916-1917, 3476]
And now for the fact! In a whole number of nervous diseases - in hysteria, anxiety states, obsessional neurosis - our expectation is fulfilled. By searching for the repression in this way, by uncovering the resistances, by pointing out what is repressed, we really succeed in accomplishing our task - that is, in overcoming the resistances, lifting the repression and transforming the unconscious material into conscious. In doing so we gain the clearest impression of the way in which a violent struggle takes place in the patient's mind about the overcoming of each resistance - a normal mental struggle, on the same psychological ground, between the motives which seek to maintain the anticathexis and those which are prepared to give it up. The former are the old motives which in the past put the repression into effect; among the latter are the newly arrived ones which, we may hope, will decide the conflict in our favour. We have succeeded in reviving the old conflict which led to repression and in bringing up for revision the process that was then decided. The new material that we produce includes, first the reminder that the earlier decision led to illness and the promise that a different path will lead to recovery, and, second, the enormous change in all the circumstances that has place since the time of the original rejection. Then the ego was feeble, infantile, and may perhaps have had grounds for banning the demands of the libido as a danger. To-day it has grown strong and experienced, and moreover has a helper at and in the shape of the doctor. Thus we may expect to lead the revived conflict to a better outcome than that which ended in repression, and, as I have said, in hysteria and in the anxiety and obsessional neuroses success proves us in general to be correct.

[1916-1917, 3480]

There are, however, other forms of illness in which, in spite of the conditions being the same, our therapeutic procedure is never successful. In them, too, it had been a question of an original conflict between the ego and the libido which led to repression - though this may call for a different topographical description; in them, too, it is possible to trace the points in the patient's life at which the repressions occurred; we make use of the same procedure, are ready to make the same promises and give the same help by the offer of anticipatory ideas; and once again the lapse of time between the repressions and the present day favours a different outcome to the conflict. And yet we do not succeed in lifting a single resistance or getting rid of a single repression. These patients, paranoics, melancholics, sufferers from dementia praecox, remain on the whole unaffected and proof against psycho-analytic therapy. What can be the reason for this? Not any lack of intelligence. A certain amount of intellectual capacity is naturally required in our patients; but there is certainly no lack of it in, for instance, the extremely shrewd combinatory paranoics. Nor do any of the other motives seem to be absent. Thus the melancholics have a very high degree of consciousness, absent in paranoics, that they are ill and that that is why they suffer so much; but this does not make them more accessible. We are faced here by a fact which we do not understand and which therefore leads us to doubt whether we have really understood all the determinants of our possible success with the other neuroses.

[1916-1917, 3480]
With this as a starting-point we go on to make our first important discovery. We learn that, when we try to understand neurotic disorders, by far the greater significance attaches to the sexual instincts; that in fact neuroses are the specific disorders, so to speak, of the sexual function; that in general whether or not a person develops a neurosis depends on the quantity of his libido, and on the possibility of satisfying it and of discharging it through satisfaction; that the form taken by the disease is determined by the way in which the individual passes through the course of development of his sexual function, or, as we put it, by the fixations his libido has undergone in the course of its development; and, further, that by a special, not very simple technique for influencing the mind we are able to throw light on the nature of some groups of neuroses and at the same time to do away with them. Our therapeutic efforts have their greatest success with a certain class of neuroses which proceed from a conflict between the ego-instincts and the sexual instincts. For in human beings it may happen that the demands of the sexual instincts, whose reach of course extends far beyond the individual, seem to the ego to constitute a danger which threatens its self-preservation or its self-esteem. The ego then assumes the defensive, denies the sexual instincts the satisfaction they desire and forces them into those by-paths of substitutive satisfaction which become manifest as nervous symptoms.

[1917a, 3609]

Thus in our view the individual advances from narcissism to object-love. But we do not believe that the whole of the libido ever passes over from the ego to objects. A certain quantity of libido is always retained in the ego; even when object-love is highly developed, a certain amount of narcissism persists. The ego is a great reservoir from which the libido that is destined for objects flows out and into which it flows back from those objects. Object-libido was at first ego-libido and can be transformed back into ego-libido. For complete health it is essential that the libido should not lose this full mobility. As an illustration of this state of things we may think of an amoeba, whose viscous substance puts out pseudopodia, elongations into which the substance of the body extends but which can be retracted at any time so that the form of the protoplasmic mass is restored.

[1917a, 3610]

My male cases with an infantile beating-phantasy comprised only a few who did not exhibit some other gross injury to their sexual activities; again they included a fairly large number of persons who would have to be described as true masochists in the sense of being sexual perverts. They were either people who obtained their sexual satisfaction exclusively from masturbation accompanied by masochistic phantasies; or they were people who had succeeded in combining masochism with their genital activity in such a way that, along with masochistic performances and under similar conditions, they were able to bring about erection and emission or to carry out normal intercourse. In addition to this there was the rarer case in which a masochist is interfered with in his perverse activities by the appearance of obsessional ideas of unbearable intensity. Now perverts who can obtain satisfaction do not often have occasion to come for analysis. But as regards the three classes of masochists that have been mentioned there may be strong motives to induce them to go to an analyst. The masochist masturbator finds that he is absolutely impotent if after all he does attempt intercourse with a woman; and the man who has hitherto effected intercourse with the help of a masochistic idea or performance may suddenly make the discovery that the alliance which was so convenient for him has broken down, his genital organs no longer reacting to the masochistic stimulus. We are accustomed confidently to promise recovery to psychically impotent patients who come to us for treatment; but we ought to be more guarded in making this prognosis so long as the dynamics of the disturbance are unknown to us. It comes as a disagreeable surprise if the analysis reveals the cause of the 'merely psychical' impotence to be a typically masochistic attitude, perhaps deeply embedded since infancy.

[1919e, 3656]
To a physician who was to undertake psycho-analytic treatment of the girl there were many grounds for misgiving. The situation he had to deal with was not the one that analysis demands, in which alone it can demonstrate its effectiveness. As is well known, the ideal situation for analysis is when someone who is otherwise his own master is suffering from an inner conflict which he is unable to resolve alone, so that he brings his trouble to the analyst and begs for his help. The physician then works hand in hand with one portion of the pathologically divided personality, against the other party in the conflict. Any situation which differs from this is to a greater or lesser degree unfavourable for psycho-analysis and adds fresh difficulties to the internal ones already present. Situations like that of a prospective house-owner who orders an architect to build him a villa to his own tastes and requirements, or of a pious donor who commissions an artist to paint a sacred picture in the corner of which is to be a portrait of himself in adoration, are at bottom incompatible with the conditions necessary for psycho-analysis. Thus, it constantly happens that a husband instructs the physician as follows: 'My wife suffers from nerves, and for that reason gets on badly with me; please cure her, so that we may lead a happy married life again.' But often enough it turns out that such a request is impossible to fulfil - that is to say, the physician cannot bring about the result for which the husband sought the treatment. As soon as the wife is freed from her neurotic inhibitions she sets about getting a separation, for her neurosis was the sole condition under which the marriage could be maintained. Or else parents expect one to cure their nervous and unruly child. By a healthy child they mean one who never causes his parents trouble, and gives them nothing but pleasure. The physician may succeed in curing the child, but after that it goes its own way all the more decidedly, and the parents are now far more dissatisfied than before. In short, it is not a matter of indifference whether someone comes to analysis of his own accord or because he is brought to it - whether it is he himself who desires to be changed, or only his relatives, who love him (or who might be expected to love him).

[1920a, 3840]

The jealousy that arises from such a projection has, it is true, an almost delusional character; it is, however, amenable to the analytic work of exposing the unconscious phantasies of the subject's own infidelity. The position is worse as regards jealousy belonging to the third layer, the true delusional type. It too has its origin in repressed impulses towards unfaithfulness; but the object in these cases is of the same sex as the subject. Delusional jealousy is what is left of a homosexuality that has run its course, and it rightly takes its position among the classical forms of paranoia. As an attempt at defence against an unduly strong homosexual impulse it may, in a man, be described in the formula: 'I do not love him, she loves him!'¹ In a delusional case one will be prepared to find jealousy belonging to all three layers, never to the third alone.

[1922b, 3902]
Psycho-Analysis as a Therapeutic Procedure. - Psycho-analysis has never set itself up as a panacea and has never claimed to perform miracles. In one of the most difficult spheres of medical activity it is the only possible method of treatment for certain illnesses and for others it is the method which yields the best or the most permanent results - though never without a corresponding expenditure of time and trouble. A physician who is not wholly absorbed in the work of giving help will find his labours amply repaid by obtaining an unhoped-for insight into the complications of mental life and the interrelations between the mental and the physical. Where at present it cannot offer help but only theoretical understanding, it may perhaps be preparing the way for some later, more direct means of influencing neurotic disorders. Its province is above all the two transference neuroses, hysteria and obsessional neurosis, in which it has contributed to the discovery of their internal structure and operative mechanisms; and, beyond them, all kinds of phobias, inhibitions, deformities of character, sexual perversions and difficulties in erotic life. Some analysts (Jelliffe, Groddeck, Felix Deutsch) have reported too that the analytic treatment of gross organic diseases is not unpromising, since a mental factor not infrequently contributes to the origin and continuance of such illnesses. Since psycho-analysis demands a certain amount of psychical plasticity from its patients, some kind of age-limit must be laid down in their selection; and since it necessitates the devotion of long and intense attention to the individual patient, it would be uneconomical to squander such expenditure upon completely worthless persons who happen to be neurotic. Experience upon material in clinics can alone show what modifications may be necessary in order to make psycho-analytic treatment accessible to wider strata of the population or to adapt it to weaker intelligences.

[1923a, 3926]

Among the hypothetical concepts which enable the doctor to deal with the analytic material, the first to be mentioned is that of 'libido'. Libido means in psycho-analysis in the first instance the force (thought of as quantitatively variable and measurable) of the sexual instincts directed towards an object - 'sexual' in the extended sense required by analytic theory. Further study showed that it was necessary to set alongside this 'object-libido' a 'narcissistic' or 'ego-libido', directed to the subject's own ego; and the interaction of these two forces has enabled us to account for a great number of normal and abnormal processes in mental life. A rough distinction was soon made between what are known as the 'transference neuroses' and the narcissistic disorders. The former (hysteria and obsessional neurosis) are the objects proper of psycho-analytic treatment, while the others, the narcissistic neuroses, though they can, it is true, be examined by the help of analysis, offer fundamental difficulties to therapeutic influence. It is true that the libido theory of psycho-analysis is by no means complete and that its relation to a general theory of the instincts is not yet clear, for psycho-analysis is a young science, quite unfinished and in a stage of rapid development. Here, however, it should be emphatically pointed out how erroneous the charge of pan-sexualism is which is so often levelled at psycho-analysis. It seeks to show that psycho-analytic theory knows of no mental motive forces other than purely sexual ones and in doing so exploits popular prejudices by using the word 'sexual' not in its analytic but in its vulgar sense.

[1924f, 4113]
A patient, then, may be suffering from fluctuations in his moods which he cannot control, or from a sense of despondency by which his energy feels paralysed because he thinks he is incapable of doing anything properly, or from a nervous embarrassment among strangers. He may perceive, without understanding the reason for it, that he has difficulties in carrying out his professional work, or indeed any comparatively important decision or any undertaking. He may one day have suffered from a distressing attack - unknown in its origin - of feelings of anxiety, and since then have been unable, without a struggle, to walk along the street alone, or to travel by train; he may perhaps have had to give up both entirely. Or, a very remarkable thing, his thoughts may go their own way and refuse to be directed by his will. They pursue problems that are quite indifferent to him, but from which he cannot get free. Quite ludicrous tasks, too, are imposed on him, such as counting up the windows on the fronts of houses. And when he has performed simple actions such as posting a letter or turning off a gas-jet, he finds himself a moment later doubting whether he has really done so. This may be no more than an annoyance and a nuisance. But his state becomes intolerable if he suddenly finds he is unable to fend off the idea that he has pushed a child under the wheels of a car or has thrown a stranger off the bridge into the water, or if he has to ask himself whether he is not the murderer whom the police are looking for in connection with a crime that was discovered that day. It is obvious nonsense, as he himself knows; he has never done any harm to anyone; but if he were really the murderer who is being looked for, his feeling - his sense of guilt - could not be stronger.

It is unjust and inexpedient to try to compel a person who wants to set someone else free from the torment of a phobia or an obsession to take the roundabout road of the medical curriculum. Nor will such an endeavour have any success, unless it results in suppressing analysis entirely. Imagine a landscape in which two paths lead to a hilltop with a view - one short and straight, the other long, winding and circuitous. You try to stop up the short path by a prohibitory notice, perhaps because it passes by some flower-beds that you want to protect. The only chance you have of your prohibition being respected is if the short path is steep and difficult while the longer one leads gently up. If, however, that is not so, and the roundabout path is on the contrary the harder, you may imagine the use of your prohibition and the fate of your flower-beds! I fear you will succeed in compelling the laymen to study medicine just as little as I shall be able to induce doctors to learn analysis. For you know human nature as well as I do.

Psycho-analysis finds a constantly increasing amount of support as a therapeutic procedure, owing to the fact that it can do more for its patients than any other method of treatment. The principle field of its application is in the milder neuroses - hysteria, phobias and obsessional states; and in malformations of character and sexual inhibitions or abnormalities it can also bring about marked improvements or even recoveries. Its influence upon dementia praecox and paranoia is doubtful; on the other hand, in favourable circumstances it can cope with depressive states, even if they are of a severe type.
We now observe that the store of religious ideas includes not only wish-fulfilments but important historical recollections. This concurrent influence of past and present must give religion a truly incomparable wealth of power. But perhaps with the help of an analogy yet another discovery may begin to dawn on us. Though it is not a good plan to transplant ideas far from the soil in which they grew up, yet here is a conformity which we cannot avoid pointing out. We know that a human child cannot successfully complete its development to the civilized stage without passing through a phase of neurosis sometimes of greater and sometimes of less distinctness. This is because so many instinctual demands which will later be unserviceable cannot be suppressed by the rational operation of the child's intellect but have to be tamed by acts of repression, behind which, as a rule, lies the motive of anxiety. Most of these infantile neuroses are overcome spontaneously in the course of growing up, and this is especially true of the obsessional neuroses of childhood. The remainder can be cleared up later still by psychoanalytic treatment. In just the same way, one might assume, humanity as a whole, in its development through the ages, fell into states analogous to the neuroses, and for the same reasons - namely because in the times of its ignorance and intellectual weakness the instinctual renunciations indispensable for man's communal existence had only been achieved by it by means of purely affective forces. The precipitates of these processes resembling repression which took place in prehistoric times still remained attached to civilization for long periods. Religion would thus be the universal obsessional neurosis of humanity; like the obsessional neurosis of children, it arose out of the Oedipus complex, out of the relation to the father. If this view is right, it is to be supposed that a turning-away from religion is bound to occur with the fatal inevitability of a process of growth, and that we find ourselves at this very juncture in the middle of that phase of development. Our behaviour should therefore be modelled on that of a sensible teacher who does not oppose an impending new development but seeks to ease its path and mitigate the violence of its irruption. Our analogy does not, to be sure, exhaust the essential nature of religion. If, on the one hand, religion brings with it obsessional restrictions, exactly as an individual obsessional neurosis does, on the other hand it comprises a system of wishful illusions together with a disavowal of reality, such as we find in an isolated form nowhere else but in amnestic, in a state of blissful hallucinatory confusion. But these are only analogies, by the help of which we endeavour to understand a social phenomenon; the pathology of the individual does not supply us with a fully valid counterpart.

[1927c, 4452]

The fact that women must be regarded as having little sense of justice is no doubt related to the predominance of envy in their mental life; for the demand for justice is a modification of envy and lays down the condition subject to which one can put envy aside. We also regard women as weaker in their social interests and as having less capacity for sublimating their instincts than men. The former is no doubt derived from the dissocial quality which unquestionably characterizes all sexual relations. Lovers find sufficiency in each other, and families too resist inclusion in more comprehensive associations. The aptitude for sublimation is subject to the greatest individual variations. On the other hand I cannot help mentioning an impression that we are constantly receiving during analytic practice. A man of about thirty strikes us as a youthful, somewhat unformed individual, whom we expect to make powerful use of the possibilities for development opened up to him by analysis. A woman of the same age, however, often frightens us by her psychical rigidity and unchangeability. Her libido has taken up final positions and seems incapable of exchanging them for others. There are no paths open to further development; it is as though the whole process had already run its course and remains thenceforward insusceptible to influence - as though, indeed, the difficult development to femininity had exhausted the possibilities of the person concerned. As therapists we lament this state of things, even if we succeed in putting an end to our patient's ailment by doing away with her neurotic conflict.

[1933a, 4736]
Compared with the other psychotherapeutic procedures psycho-analysis is beyond any doubt the most powerful. It is just and fair, too, that this should be so for it is also the most laborious and time-consuming; it would not be used on slight cases. In suitable cases it is possible by its means to get rid of disturbances and bring about changes for which in pre-analytic times one would not have ventured to hope. But it has its very appreciable limits. The therapeutic ambition of some of my adherents has made the greatest efforts to overcome these obstacles so that every sort of neurotic disorder might be curable by psycho-analysis. They have endeavoured to compress the work of analysis into a shorter duration, to intensify transference so that it may be able to overcome any resistance, to unite other forms of influence with it so as to compel a cure. These efforts are certainly praiseworthy, but, in my opinion, they are vain. They bring with them, too, a danger of being oneself forced away from analysis and drawn into a boundless course of experimentation. The expectation that every neurotic phenomenon can be cured may, I suspect, be derived from the layman's belief that the neuroses are something quite unnecessary which have no right whatever to exist. Whereas in fact they are severe, constitutionally fixed illnesses, which rarely restrict themselves to only a few attacks but persist as a rule over long periods or throughout life. Our analytic experience that they can be extensively influenced, if the historical precipitating causes and accidental auxiliary factors of the illness can be dealt with, has led us to neglect the constitutional factor in our therapeutic practice, and in any case we can do nothing about it; but in theory we ought always to bear it in mind. The radical inaccessibility of the psychoses to analytic treatment should, in view of their close relationship to the neuroses, restrict our pretensions in regard to these latter. The therapeutic effectiveness of psycho-analysis remains cramped by a number of weighty and scarcely assailable factors. In the case of children, where one might count on the greatest successes, the difficulties are the external ones connected with their relation to their parents, though these difficulties are after all a necessary part of being a child. In the case of adults the difficulties arise in the first instance from two factors: the amount of psychical rigidity present and the form of the illness with all that covers in the way of deeper determinants.

The second limitation upon analytic successes is given by the form of the illness. You know already that the field of application of analytic therapy lies in the transference neuroses - phobias, hysteria, obsessional neurosis - and further, abnormalities of character which have been developed in place of these illnesses. Everything differing from these, narcissistic and psychotic conditions, is unsuitable to a greater or less extent. It would be entirely legitimate to guard against failures by carefully excluding such cases. This precaution would lead to a great improvement in the statistics of analysis. There is, however, a pitfall here. Our diagnoses are very often made only after the event. They resemble the Scottish King's test for identifying witches that I read about in Victor Hugo. This king declared that he was in possession of an infallible method of recognizing a witch. He had the women stewed in a cauldron of boiling water and then tasted the broth. Afterwards he was able to say: 'That was a witch', or 'No, that was not one.' It is the same with us, except that we are the sufferers. We cannot judge the patient who comes for treatment (or, in the same way, the candidate who comes for training) till we have studied him analytically for a few weeks or months. We are in fact buying a pig in a poke. The patient brings along indefinite general ailments which do not admit of a conclusive diagnosis. After this period of testing it may turn out that the case is an unsuitable one. If so we send him away if he is a candidate, or continue the trial a little longer if he is a patient on the chance that we may yet see things in a more favourable light. The patient has his revenge by adding to our list of failures, and the rejected candidate does so perhaps, if he is paranoid, by writing books on psycho-analysis himself. As you see, our precautions have been of no avail.

[1933a, 4752]
I am afraid these detailed discussions are exhausting your interest. But I should be still more sorry if you were to think it is my intention to lower your opinion of psycho-analysis as a therapy. Perhaps I really made a clumsy start. For I wanted to do the opposite: to excuse the therapeutic limitations of analysis by pointing out their inevitability. With the same aim in view I turn to another point: the reproach against analytic treatment that it takes a disproportionately long time. On this it must be said that psychical changes do in fact only take place slowly; if they occur rapidly, suddenly, that is a bad sign. It is true that the treatment of a fairly severe neurosis may easily extend over several years; but consider, in case of success, how long the illness would have lasted. A decade, probably, for every year of treatment: the illness, that is to say (as we see so often in untreated cases), would not have ended at all. In some cases we have reasons for resuming an analysis many years afterwards. Life had developed fresh pathological reactions to fresh precipitating causes; but in the meantime our patient had been well. The first analysis had not in fact brought to light all his pathological dispositions, and it was natural for the analysis to have been stopped when success was achieved. There are also severely handicapped people who are kept under analytic supervision all through their lives and are taken back into analysis from time to time. But these people would otherwise have been altogether incapable of existence and we must feel glad that they can be kept on their feet by this piecemeal and recurrent treatment. The analysis of character disorders also calls for long periods of treatment; but it is often successful; and do you know of any other therapy with which such a task could even be approached? Therapeutic ambition may feel unsatisfied by such results; but we have learnt from the example of tuberculosis and lupus that success can only be obtained when the treatment has been adapted to the characteristics of the illness.

[1933a, 4755]

No sooner have we taken this step than a first disappointment awaits us, a first warning against over-confidence. If the patient's ego is to be a useful ally in our common work, it must, however hard it may be pressed by the hostile powers, have retained a certain amount of coherence and some fragment of understanding for the demands of reality. But this is not to be expected of the ego of a psychotic; it cannot observe a pact of this kind, indeed it can scarcely enter into one. It will very soon have tossed us away and the help we offer it and sent us to join the portions of the external world which no longer mean anything to it. Thus we discover that we must renounce the idea of trying our plan of cure upon psychotics - renounce it perhaps for ever or perhaps only for the time being, till we have found some other plan better adapted for them.
[1940a [1938], 4983]

There is, however, another class of psychical patients who clearly resemble the psychotics very closely - the vast number of people suffering severely from neuroses. The determinants of their illness as well as its pathogenic mechanisms must be the same or at least very similar. But their ego has proved more resistant and has become less disorganized. Many of them, in spite of their maladies and the inadequacies resulting from them, have been able to maintain themselves in real life. These neurotics may show themselves ready to accept our help. We will confine our interest to them and see how far and by what methods we are able to 'cure' them.
[1940a [1938], 4983]

The overcoming of resistances is the part of our work that requires the most time and the greatest trouble. It is worth while, however, for it brings about an advantageous alteration of the ego which will be maintained independently of the outcome of the transference and will hold good in life. We have also worked simultaneously at getting rid of the alteration of the ego which had been brought about under the influence of the unconscious; for whenever we have been able to detect any of its derivatives in the ego we have pointed out their illegitimate origin and have instigated the ego to reject them. It will be remembered that it was one of the necessary preconditions of our pact of assistance that any such alteration of the ego due to the intrusion of unconscious elements should not have gone beyond a certain amount.
[1940a [1938], 4989]
We have arrived at a general acquaintance with the psychical apparatus, with the parts, organs
and agencies of which it is composed, with the forces which operate in it and with the functions
allotted to its parts. The neuroses and psychoses are the states in which disturbances in the
functioning of the apparatus come to expression. We have chosen the neuroses as the subjects
of our study because they alone seem accessible to the psychological methods of our
intervention. While we are trying to influence them, we collect observations which give us a
picture of their origin and of the manner in which they arise.
[1940a [1938], 4992]

Experience has taught us that psycho-analytic therapy - the freeing of someone from his
neurotic symptoms, inhibitions and abnormalities of character - is a time-consuming business.
Hence, from the very first, attempts have been made to shorten the duration of analyses. Such
endeavours required no justification; they could claim to be based on the strongest
considerations of reason and expediency. But there was probably still at work in them as well
some trace of the impatient contempt with which the medical science of an earlier day regarded
the neuroses as being uncalled-for consequences of invisible injuries. If it had now become
necessary to attend to them, they should at least be disposed of as quickly as possible.
[1937c, 5014]

Every analyst will have treated a few cases which have had this gratifying outcome. He has
succeeded in clearing up the patient's neurotic disturbance, and it has not returned and has not
been replaced by any other such disturbance. Nor are we without some insight into the
determinants of these successes. The patient's ego had not been noticeably altered and the
aetiology of his disturbance had been essentially traumatic. The aetiology of every neurotic
disturbance is, after all, a mixed one. It is a question either of the instincts being excessively
strong - that is to say, recalcitrant to taming by the ego - or of the effects of early (i.e.
premature) traumas which the immature ego was unable to master. As a rule there is a
combination of both factors, the constitutional and the accidental. The stronger the constitutional
factor, the more readily will a trauma lead to a fixation and leave behind a developmental
disturbance; the stronger the trauma, the more certainly will its injurious effects become
manifest even when the instinctual situation is normal. There is no doubt that an aetiology of the
traumatic sort offers by far the more favourable field for analysis. Only when a case is a
predominantly traumatic one will analysis succeed in doing what it is so superlatively able to do;
only then will it, thanks to having strengthened the patient's ego, succeed in replacing by a
correct solution the inadequate decision made in his early life. Only in such cases can one
speak of an analysis having been definitively ended. In them, analysis has done all that it should
and does not need to be continued. It is true that, if the patient who has been restored in this
way never produces another disorder calling for analysis, we do not know how much his
immunity may not be due to a kind fate which has spared him ordeals that are too severe.
[1937c, 5018]
If, however, what we are aiming at is a prophylactic treatment of instinctual conflicts that are not currently active but merely potential, it will not be enough to regulate sufferings which are already present in the patient and which he cannot avoid. We should have to make up our minds to provoke fresh sufferings in him; and this we have hitherto quite rightly left to fate. We should receive admonitions from all sides against the presumption of vying with fate in subjecting poor human creatures to such cruel experiments. And what sort of experiments would they be? Could we, for purposes of prophylaxis, take the responsibility of destroying a satisfactory marriage, or causing a patient to give up a post upon which his livelihood depends? Fortunately, we never find ourselves in the position of having to consider whether such interventions in the patient's real life are justified; we do not possess the plenary powers which they would necessitate, and the subject of our therapeutic experiment would certainly refuse to co-operate in it. In practice, then, such a procedure is virtually excluded; but there are, besides, theoretical objections to it. For the work of analysis proceeds best if the patient's pathogenic experiences belong to the past, so that his ego can stand at a distance from them. In states of acute crisis analysis is to all intents and purposes unusable. The ego's whole interest is taken up by the painful reality and it withholds itself from analysis, which is attempting to go below the surface and uncover the influences of the past. To create a fresh conflict would thus only be to make the work of analysis longer and more difficult.

[1937c, 5028]

We started from the question of how we can shorten the inconveniently long duration of analytic treatment, and, still with this question of time in mind, we went on to consider whether it is possible to achieve a permanent cure or even to prevent future illness by prophylactic treatment. In doing so, we found that the factors which were decisive for the success of our therapeutic efforts were the influence of traumatic aetiology, the relative strength of the instincts which have to be controlled, and something which we have called an alteration of the ego. Only the second of these factors has been discussed by us in any detail, and in connection with it we have had occasion to recognize the paramount importance of the quantitative factor and to stress the claim of the metapsychological line of approach to be taken into account in any attempt at explanation.

[1937c, 5030]

The effect brought about in the ego by the defences can rightly be described as an 'alteration of the ego' if by that we understand a deviation from the fiction of a normal ego which would guarantee unshakable loyalty to the work of analysis. It is easy, then, to accept the fact, shown by daily experience, that the outcome of an analytic treatment depends essentially on the strength and on the depth of root of these resistances that bring about an alteration of the ego. Once again we are confronted with the importance of the quantitative factor, and once again we are reminded that analysis can only draw upon definite and limited amounts of energy which have to be measured against the hostile forces. And it seems as if victory is in fact as a rule on the side of the big battalions.

[1937c, 5034]
The procedure is laborious and time-consuming for the physician. It presupposes great interest in psychological happenings, but personal concern for the patients as well. I cannot imagine bringing myself to delve into the psychical mechanism of a hysteria in anyone who struck me as low-minded and repellent, and who, on closer acquaintance, would not be capable of arousing human sympathy; whereas I can keep the treatment of a tabetic or rheumatic patient apart from personal approval of this kind. The demands made on the patient are not less. The procedure is not applicable at all below a certain level of intelligence, and it is made very much more difficult by any trace of feebleness of mind. The complete consent and complete attention of the patients are needed, but above all their confidence, since the analysis invariably leads to the disclosure of the most intimate and secret psychical events. A good number of the patients who would be suitable for this form of treatment abandon the doctor as soon as the suspicion begins to dawn on them of the direction in which the investigation is leading. For patients such as these the doctor has remained a stranger. With others, who have decided to put themselves in his hands and place their confidence in him - a step which in other such situations is only taken voluntarily and never at the doctor's request - with these other patients, I say, it is almost inevitable that their personal relation to him will force itself, for a time at least, unduly into the foreground. It seems, indeed, as though an influence of this kind on the part of the doctor is a sine qua non to a solution of the problem. I do not think any essential difference is made in this respect whether hypnosis can be used or whether it has to be bypassed and replaced by something else. But reason demands that we should emphasize the fact that these drawbacks, though they are inseparable from our procedure, cannot be laid at its door. On the contrary, it is quite clear that they are based on the predetermining conditions of the neuroses that are to be cured and that they must attach to any medical activity which involves intense preoccupation with the patient and leads to a psychical change in him. I have not been able to attribute any deleterious effects or danger to the employment of hypnosis, though I made copious use of it in some of my cases. Where I caused damage, the reasons lay elsewhere and deeper. If I survey my therapeutic efforts during the last few years since the communications made by my honoured teacher and friend Josef Breuer showed me the use of the cathartic method, I believe that in spite of everything, I have done much more, and more frequent, good than harm and have accomplished some things which no other therapeutic procedure could have achieved. It has on the whole, as the 'Preliminary Communication' put it, brought 'considerable therapeutic advantages'.

[1895d, 235]

We can follow the object-libido through still further vicissitudes. When it is withdrawn from objects, it is held in suspense in peculiar conditions of tension and is finally drawn back into the ego, so that it becomes ego-libido once again. In contrast to object-libido, we also describe ego-libido as 'narcissistic' libido. From the vantage-point of psycho-analysis we can look across a frontier, which we may not pass, at the activities of narcissistic libido, and may form some idea of the relation between it and object-libido. Narcissistic or ego-libido seems to be the great reservoir from which the object-cathexes are sent out and into which they are withdrawn once more; the narcissistic libidinal cathexis of the ego is the original state of things, realized in earliest childhood, and is merely covered by the later extrusions of libido, but in essentials persists behind them.  

[1905d, 1532]
Various qualifications are required of anyone who is to be beneficially affected by psycho-
analysis. To begin with, he must be capable of a psychically normal condition; during periods of
confusion or melancholic depression nothing can be accomplished even in cases of hysteria.
Furthermore, a certain measure of natural intelligence and ethical development are to be
required of him; if the physician has to deal with a worthless character, he soon loses the
interest which makes it possible for him to enter profoundly into the patient's mental life. Deep-
rooted malformations of character, traits of an actually degenerate constitution, show
themselves during treatment as sources of a resistance that can scarcely be overcome. In this
respect the constitution of the patient sets a general limit to the curative effect of psychotherapy.
If the patient's age is in the neighbourhood of the fifties the conditions for psycho-analysis
become unfavourable. The mass of psychical material is then no longer manageable; the time
required for recovery is too long; and the ability to undo psychical processes begins to grow
weaker.
[1904a, 1560]

(1) One should look beyond the patient's illness and form an estimate of his whole personality;
those patients who do not possess a reasonable degree of education and a fairly reliable
character should be refused. It must not be forgotten that there are healthy people as well as
unhealthy ones who are good for nothing in life, and that there is a temptation to ascribe to their
illness everything that incapacitates them, if they show any sign of neurosis. In my opinion a
neurosis is by no means a stamp of degeneracy, though it may often enough be found in one
person along with the signs of degeneracy. Now analytic psychotherapy is not a process suited
to the treatment of neuropathic degeneracy; on the contrary, degeneracy is a barrier to its
effectiveness. Nor is the method applicable to people who are not driven to seek treatment by
their own sufferings, but who submit to it only because they are forced to by the authority of
relatives. The qualification which is the determining factor of fitness for psycho-analytic
treatment - that is, whether the patient is educable - must be discussed further from another
standpoint.
[1905a, 1569]

(2) To be quite safe, one should limit one's choice of patients to those who possess a normal
mental condition, since in the psycho-analytic method this is used as a foothold from which to
obtain control of the morbid manifestations. Psychoses, states of confusion and deeply-rooted (I
might say toxic) depression are therefore not suitable for psycho-analysis; at least not for the
method as it has been practised up to the present. I do not regard it as by any means
impossible that by suitable changes in the method we may succeed in overcoming this
contraindication - and so be able to initiate a psychotherapy of the psychoses.
[1905a, 1569]

(3) The age of patients has this much importance in determining their fitness for psycho-
analytic treatment, that, on the one hand, near or above the age of fifty the elasticity of the
mental processes, on which the treatment depends, is as a rule lacking - old people are no
longer educable - and, on the other hand, the mass of material to be dealt with would prolong
the duration of the treatment indefinitely. In the other direction the age limit can be determined
only individually; youthful persons under the age of adolescence are often exceedingly
amenable to influence.
[1905a, 1569]

(4) Psycho-analysis should not be attempted when the speedy removal of dangerous
symptoms is required, as, for example, in a case of hysterical anorexia.
[1905a, 1569]
It is true that during the analysis Hans had to be told many things that he could not say himself, that he had to be presented with thoughts which he had so far shown no signs of possessing, and that his attention had to be turned in the direction from which his father was expecting something to come. This detracts from the evidential value of the analysis; but the procedure is the same in every case. For a psycho-analysis is not an impartial scientific investigation, but a therapeutic measure. Its essence is not to prove anything, but merely to alter something. In a psycho-analysis the physician always gives his patient (sometimes to a greater and some times to a less extent) the conscious anticipatory ideas by the help of which he is put in a position to recognize and to grasp the unconscious material. For there are some patients who need more of such assistance and some who need less; but there are none who get through without some of it. Slight disorders may perhaps be brought to an end by the subject's unaided efforts, but never a neurosis - a thing which has set itself up against the ego as an element alien to it. To get the better of such an element another person must be brought in, and in so far as that other person can be of assistance the neurosis will be curable. If it is in the very nature of any neurosis to turn away from the 'other person' - and this seems to be one of the characteristics of the states grouped together under the name of dementia praecox - then for that very reason such a state will be incurable by any efforts of ours. It is true that a child, on account of the small development of his intellectual systems, requires especially energetic assistance. But, after all, the information which the physician gives his patient is itself derived in its turn from analytical experience; and indeed it is sufficiently convincing if, at the cost of this intervention by the physician, we are enabled to discover the structure of the pathogenic material and simultaneously to dissipate it.

The analytic investigation of paranoia presents difficulties of a peculiar nature to physicians who, like myself, are not attached to public institutions. We cannot accept patients suffering from this complaint, or, at all events, we cannot keep them for long, since we cannot offer treatment unless there is some prospect of therapeutic success. It is only in exceptional circumstances, therefore, that I succeed in getting more than a superficial view of the structure of paranoia - when, for instance, the diagnosis (which is not always an easy matter) is uncertain enough to justify an attempt at influencing the patient, or when, in spite of an assured diagnosis, I yield to the entreaties of the patient's relatives and undertake to treat him for a time. Apart from this, of course, I see plenty of cases of paranoia and of dementia praecox, and I learn as much about them as other psychiatrists do about their cases; but that is not enough, as a rule, to lead to any analytic conclusions.

The negative transference deserves a detailed examination, which it cannot be given within the limits of the present paper. In the curable forms of psychoneurosis it is found side by side with the affectionate transference, often directed simultaneously towards the same person. Bleuler has coined the excellent term 'ambivalence' to describe this phenomenon.¹ Up to a point, ambivalence of feeling of this sort seems to be normal; but a high degree of it is certainly a special peculiarity of neurotic people. In obsessional neurotics an early separation of the 'pairs of opposites' seems to be characteristic of their instinctual life and to be one of their constitutional preconditions. Ambivalence in the emotional trends of neurotics is the best explanation of their ability to enlist their transferences in the service of resistance. Where the capacity for transference has become essentially limited to a negative one, as is the case with paranoics, there ceases to be any possibility of influence or cure.

There are also diagnostic reasons for beginning the treatment with a trial period of this sort lasting for one or two weeks. Often enough, when one sees a neurosis with hysterical or obsessional symptoms, which is not excessively marked and has not been in existence for long - just the type of case, that is, that one would regard as suitable for treatment - one has to, reckon with the possibility that it may be a preliminary stage of what is known as dementia praecox ('schizophrenia', in Bleuler's terminology; 'paraphrenia', as I have proposed to call it), and that sooner or later it will show a well-marked picture of that affection. I do not agree that it is always possible to make the distinction so easily. I am aware that there are psychiatrists who hesitate less often in their differential diagnosis, but I have become convinced that just as often they make mistakes. To make a mistake, moreover, is of far greater moment for the psycho-analyst than it is for the clinical psychiatrist, as he is called. For the latter is not attempting to do anything that will be of use, whichever kind of case it may be. He merely runs the risk of making a theoretical mistake, and his diagnosis is of no more than academic interest. Where the psycho-analyst is concerned, however, if the case is unfavourable he has committed a practical error; he has been responsible for wasted expenditure and has discredited his method of treatment. He cannot fulfil his promise of cure if the patient is suffering, not from hysteria or obsessional neurosis, but from paraphrenia, and he therefore has particularly strong motives for avoiding mistakes in diagnosis. In an experimental treatment of a few weeks he will often observe suspicious signs which may determine him not to pursue the attempt any further. Unfortunately I cannot assert that an attempt of this kind always enables us to arrive at a certain decision: it is only one wise precaution the more.¹

¹ There is a great deal to be said about this uncertainty in diagnosis, about the prospects of success in analysing mild forms of paraphrenia and about the reasons for the similarity between the two disorders; but I cannot enlarge on these subjects in the present context. I should be glad to follow Jung in contrasting hysteria and obsessional neurosis as 'transference neuroses' with the paraphrenic affections as 'introversion neuroses', if it were not that such a usage would deprive the concept of 'introversion' (of the libido) of its sole legitimate meaning.

In another neurotic disorder, dementia praecox (paraphrenia or schizophrenia), a condition which is in fact incurable, the patient is left, in the most severe cases, in a state of apparently complete apathy. Often his sole remaining actions are certain movements and gestures which are repeated monotonously and have been given the name of 'stereotypies'. An analytic investigation of residues of this kind, made by Jung, has shown that they are the remains of perfectly significant mimetic actions, which at one time gave expression to the subject's ruling wishes. The craziest speeches and the queerest poses and attitudes adopted by these patients become intelligible and can be given a place in the chain of their mental processes if they are approached on the basis of psycho-analytic hypotheses.

Psycho-analytic observers were subsequently struck by the fact that individual features of the narcissistic attitude are found in many people who suffer from other disorders - for instance, as Sadger has pointed out, in homosexuals - and finally it seemed probable that an allocation of the libido such as deserved to be described as narcissism might be present far more extensively, and that it might claim a place in the regular course of human sexual development.¹ Difficulties in psycho-analytic work upon neurotics led to the same supposition, for it seemed as though this kind of narcissistic attitude in them constituted one of the limits to their susceptibility to influence. Narcissism in this sense would not be a perversion, but the libidinal complement to the egoism of the instinct of self-preservation, a measure of which may justifiably be attributed to every living creature.
A pressing motive for occupying ourselves with the conception of a primary and normal narcissism arose when the attempt was made to subsume what we know of dementia praecox (Kraepelin) or schizophrenia (Bleuler) under the hypothesis of the libido theory. Patients of this kind, whom I have proposed to term paraphrenics, display two fundamental characteristics: megalomania and diversion of their interest from the external world - from people and things. In consequence of the latter change, they become inaccessible to the influence of psychoanalysis and cannot be cured by our efforts. But the paraphrenic's turning away from the external world needs to be more precisely characterized. A patient suffering from hysteria or obsessional neurosis has also, as far as his illness extends, given up his relation to reality. But analysis shows that he has by no means broken off his erotic relations to people and things. He still retains them in phantasy; i.e. he has, on the one hand, substituted for real objects imaginary ones from his memory, or has mixed the latter with the former; and on the other hand, he has renounced the initiation of motor activities for the attainment of his aims in connection with those objects. Only to this condition of the libido may we legitimately apply the term 'introversion' of the libido which is used by Jung indiscriminately. It is otherwise with the paraphrenic. He seems really to have withdrawn his libido from people and things in the external world, without replacing them by others in phantasy. When he does so replace them, the process seems to be a secondary one and to be part of an attempt at recovery, designed to lead the libido back to objects.¹

But you must not take this warning of mine to mean that I propose to give you dogmatic lectures and to insist on your unqualified belief. Such a misunderstanding would do me a grave injustice. I do not wish to arouse conviction; I wish to stimulate thought and to upset prejudices. If as a result of lack of knowledge of the material you are not in a position to form a judgement, you should neither believe nor reject. You should listen and allow what I tell you to work on you. It is not so easy to arrive at convictions, or, if they are reached easily, they soon turn out to be worthless and incapable of resistance. The only person who has a right to a conviction is someone who, like me, has worked for many years at the same material and who, in doing so, has himself had the same new and surprising experiences. What is the good, then, in the sphere of the intellect, of these sudden convictions, these lightning-like conversions, these instantaneous rejections? Is it not clear that the 'coup de foudre', love at first sight, is derived from quite another sphere, from that of the emotions? We do not even require of our patients that they should bring a conviction of the truth of psycho-analysis into the treatment or be adherents of it. Such an attitude often raises our suspicions. The attitude that we find the most desirable in them is a benevolent scepticism. So you too should endeavour to allow the psychoanalytic view to grow up quietly in you alongside of the popular or psychiatric one, till opportunities arise for the two to influence each other, to compete with each other and to unite in leading to a conclusion.

[1914c, 2932]

[1916-1917, 3326]
Perhaps, however, the much-abused psycho-analysis has friends among you who will be pleased if it can be justified from another direction - from the therapeutic side. As you know, our psychiatric therapy is not hitherto able to influence delusions. Is it possible, perhaps, that psycho-analysis can do so, thanks to its insight into the mechanism of these symptoms? No, Gentlemen, it cannot. It is as powerless (for the time being at least) against these ailments as any other form of therapy. We can understand, indeed, what has happened in the patient, but we have no means of making the patient himself understand it. You have heard how I was unable to pursue the analysis of this delusion beyond a first beginning. Will you be inclined to maintain on that account that an analysis of such cases is to be rejected because it is fruitless? I think not. We have a right, or rather a duty, to carry on our research without consideration of any immediate beneficial effect. In the end - we cannot tell where or when - every little fragment of knowledge will be transformed into power, and into therapeutic power as well. Even if psycho-analysis showed itself as unsuccessful in every other form of nervous and psychical disease as it does in delusions, it would still remain completely justified as an irreplaceable instrument of scientific research. It is true that in that case we should not be in a position to practise it. The human material on which we seek to learn, which lives, has its own will and needs its motives for co-operating in our work, would hold back from us. Let me therefore end my remarks to-day by informing you that there are extensive groups of nervous disorders in which the transformation of our better understanding into therapeutic power has actually taken place, and that in these illnesses, which are difficult of access by other means, we achieve, under favourable conditions, successes which are second to no others in the field of internal medicine.

This discovery of Breuer's is still the foundation of psycho-analytic therapy. The thesis that symptoms disappear when we have made their unconscious predeterminants conscious has been confirmed by all subsequent research, although we meet with the strangest and most unexpected complications when we attempt to carry it through in practice. Our therapy works by transforming what is unconscious into what is conscious, and it works only in so far as it is in a position to effect that transformation.

I should like to anticipate, Gentlemen, the qualifications which I shall have to make later in the universal validity of these statements. I will therefore point out to you that all I have said here about repression and the formation and meaning of symptoms was derived from three forms of neurosis - anxiety hysteria, conversion hysteria and obsessional neurosis - and that in the first instance it is also valid only for these forms. These three disorders, which we are accustomed to group together as 'transference neuroses', also circumscribe the region in which psycho-analytic therapy can function. The other neuroses have been far less thoroughly studied by psycho-analysis; in one group of them the impossibility of therapeutic influence has been a reason for this neglect. Nor should you forget that psycho-analysis is still a very young science, that preparing for it costs much trouble and time, and that not at all long ago it was being practised single-handed. Nevertheless, we are everywhere on the point of penetrating to an understanding of these other disorders which are not transference neuroses. I hope later to be able to introduce you to the extensions of our hypotheses and findings which result from adaptation to this new material, and to show you that these further studies have not led to contradictions but to the establishment of higher unities. If, then, everything I am saying here applies to the transference neuroses, let me first increase the value of symptoms by a new piece of information. For a comparative study of the determining causes of falling ill leads to a result which can be expressed in a formula: these people fall ill in one way or another of frustration, when reality prevents them from satisfying their sexual wishes. You see how excellently these two findings tally with each other. It is only thus that symptoms can be properly viewed as substitutive satisfactions for what is missed in life.
The ego takes a similar interest, however, in the development and maintenance of the neurosis in every other case. I have already shown that symptoms are supported by the ego, too, because they have a side with which they offer satisfaction to the repressing purpose of the ego. Moreover, settling the conflict by constructing a symptom is the most convenient way out and the one most agreeable to the pleasure principle: it unquestionably spares the ego a large amount of internal work which is felt as distressing. Indeed there are cases in which even the physician must admit that for a conflict to end in neurosis is the most harmless and socially tolerable solution. You must not be surprised to hear that even the physician may occasionally take the side of the illness he is combating. It is not his business to restrict himself in every situation in life to being a fanatic in favour of health. He knows that there is not only neurotic misery in the world but real, irremovable suffering as well, that necessity may even require a person to sacrifice his health; and he learns that a sacrifice of this kind made by a single person can prevent immeasurable unhappiness for many others. If we may say, then, that whenever a neurotic is faced by a conflict he takes flight into illness, yet we must allow that in some cases that flight is fully justified, and a physician who has recognized how the situation lies will silently and solicitously withdraw.

I have now led you into the region in which the next advances in the work of analysis are to be expected. Since we have ventured to operate with the concept of ego-libido the narcissistic neuroses have become accessible to us; the task before us is to arrive at a dynamic elucidation of these disorders and at the same time to complete our knowledge of mental life by coming to understand the ego. The ego-psychology after which we are seeking must not be based on the data of our self-perceptions but (as in the case of the libido) on the analysis of disturbances and disruptions of the ego. It is likely that we shall have a low opinion of our present knowledge of the vicissitudes of the libido, which we have gained from a study of the transference neuroses, when we have achieved this greater task. But hitherto we have not made much progress with it. The narcissistic neuroses can scarcely be attacked with the technique that has served us with the transference neuroses. You will soon learn why. What always happens with them is that, after proceeding for a short distance, we come up against a wall which brings us to a stop. Even with the transference neuroses, as you know, we met with barriers of resistance, but we were able to demolish them bit by bit. In the narcissistic neuroses the resistance is unconquerable; at the most, we are able to cast an inquisitive glance over the top of the wall and spy out what is going on on the other side of it. Our technical methods must accordingly be replaced by others; and we do not know yet whether we shall succeed in finding substitute. Nevertheless, we have no lack of material with these patients either. They make a large number of remarks, even if they do not answer our questions, and for the time being it is our business to interpret these remarks with the help of the understanding we have gained from the symptoms of the transference neuroses. The agreement is great enough to guarantee us some initial advantage. It remains to be seen how far this technique will take us.

Thus you cannot explain the therapeutic effect of psycho-analysis by its permitting a full sexual life. Look around, then, for something else. I fancy that, while I was rejecting this suggestion of yours, one remark of mine put you on the right track. What we make use of must no doubt be the replacing of what is unconscious by what is conscious, the translation of what is unconscious into what is conscious. Yes, that is it. By carrying what is unconscious on into what is conscious, we lift the repressions, we remove the preconditions for the formation of symptoms, we transform the pathogenic conflict to a normal one for which it must be possible somehow to find a solution. All that we bring about in a patient is this single psychical change: the length to which it is carried is the measure of the help we provide. Where no repressions (or analogous psychical processes) can be undone, our therapy has nothing to expect.
There are, however, other forms of illness in which, in spite of the conditions being the same, our therapeutic procedure is never successful. In them, too, it had been a question of an original conflict between the ego and the libido which led to repression - though this may call for a different topographical description; in them, too, it is possible to trace the points in the patient's life at which the repressions occurred; we make use of the same procedure, are ready to make the same promises and give the same help by the offer of anticipatory ideas; and once again the lapse of time between the repressions and the present day favours a different outcome to the conflict. And yet we do not succeed in lifting a single resistance or getting rid of a single repression. These patients, paranoics, melancholics, sufferers from dementia praecox, remain on the whole unaffected and proof against psycho-analytic therapy. What can be the reason for this? Not any lack of intelligence. A certain amount of intellectual capacity is naturally required in our patients; but there is certainly no lack of it in, for instance, the extremely shrewd combinatory paranoics. Nor do any of the other motives seem to be absent. Thus the melancholics have a very high degree of consciousness, absent in paranoics, that they are ill and that that is why they suffer so much; but this does not make them more accessible. We are faced here by a fact which we do not understand and which therefore leads us to doubt whether we have really understood all the determinants of our possible success with the other neuroses.

There is every reason now for us to improve our earlier dynamic account of the therapeutic process and to bring it into harmony with our new realization. If the patient is to fight his way through the normal conflict with the resistances which we have uncovered for him in the analysis, he is in need of a powerful stimulus which will influence the decision in the sense which we desire, leading to recovery. Otherwise it might happen that he would choose in favour of repeating the earlier outcome and would allow what had been brought up into consciousness to slip back again into repression. At this point what turns the scale in his struggle is not his intellectual insight which is neither strong enough nor free enough for such an achievement - but simply and solely his relation to the doctor. In so far as his transference bears a 'plus' sign, it clothes the doctor with authority and is transformed into belief in his communications and explanations. In the absence of such a transference, or if it is a negative one, the patient would never even give a hearing to the doctor and his arguments. In this his belief is repeating the story of its own development; it is a derivative of love and, to start with, needed no arguments. Only later did he allow them enough room to submit them to examination, provided they were brought forward by someone he loved. Without such supports arguments carried no weight, and in most people's lives they never do. Thus in general a man is only accessible from the intellectual side too, in so far as he is capable of a libidinal cathexis of objects; and we have good reason to recognize and to dread in the amount of his narcissism a barrier against the possibility of being influenced by even the best analytic technique.

What you are throwing up at me in this is uncommonly interesting and must be answered. But I cannot do so to-day: we have not the time. Till our next meeting, then. I will answer you, you will see. But to-day I must finish what I have begun. I promised to make you understand by the help of the fact of transference why our therapeutic efforts have no success with the narcissistic neuroses.
I can do so in a few words, and you will see how simply the riddle can be solved and how well everything fits together. Observation shows that sufferers from narcissistic neuroses have no capacity for transference or only insufficient residues of it. They reject the doctor, not with hostility but with indifference. For that reason they cannot be influenced by him either; what he says leaves them cold, makes no impression on them; consequently the mechanism of cure which we carry through with other people - the revival of the pathogenic conflict and the overcoming of the resistance due to repression - cannot be operated with them. They remain as they are. Often they have already undertaken attempts at recovery on their own account which have led to pathological results. We cannot alter this in any way.
[1916-1917, 3489]

On the basis of our clinical impressions we maintained that these patients' object-cathexes must have been given up and that their object-libido must have been transformed into ego-libido. Through this characteristic we distinguished them from the first group of neurotics (sufferers from hysteria, anxiety-hysteria and obsessional neurosis). This suspicion is now confirmed by their behaviour in our attempts at therapy. They manifest no transference and for that reason are inaccessible to our efforts and cannot be cured by us.
[1916-1917, 3489]

Thus our therapeutic work falls into two phases. In the first, all the libido is forced from the symptoms into the transference and concentrated there; in the second, the struggle is waged around this new object and the libido is liberated from it. The change which is decisive for a favourable outcome is the elimination of repression in this renewed conflict so that the libido cannot withdraw once more from the ego by flight into the unconscious. This is made possible by the alteration of the ego which is accomplished under the influence of the doctor's suggestion. By means of the work of interpretation, which transforms what is unconscious into what is conscious, the ego is enlarged at the cost of this unconscious; by means of instruction, it is made conciliatory towards the libido and inclined to grant it some satisfaction, and its repugnance to the claims of the libido is diminished by the possibility of disposing of a portion of it by sublimation. The more closely events in the treatment coincide with this ideal description, the greater will be the success of the psycho-analytic therapy. It finds its limits in the lack of mobility of the libido, which may refuse to leave its objects, and the rigidity of narcissism, which will not allow transference on to objects to increase beyond certain bounds. Further light may perhaps be thrown on the dynamics of the process of cure if I say that we get hold of the whole of the libido which has been withdrawn from the dominance of the ego by attracting a portion of it on to ourselves by means of the transference.
[1916-1917, 3495]
Many attempts at treatment miscarried during the early period of analysis because they were undertaken in cases which were altogether unsuited to the procedure and which we should exclude to-day on the basis of our present view of the indications for treatment. But these indications, too, could only be arrived at by experiment. In those days we did not know a priori that paranoia and dementia praecox in strongly marked forms are inaccessible, and we had a right to make trial of the method on all kinds of disorders. But most of the failures of those early years were due not to the doctor's fault or an unsuitable choice of patients but to unfavourable external conditions. Here we have only dealt with internal resistances, those of the patient, which are inevitable and can be overcome. The external resistances which arise from the patient's circumstances, from his environment, are of small theoretical interest but of the greatest practical importance. Psycho-analytic treatment may be compared with a surgical operation and may similarly claim to be carried out under arrangements that will be the most favourable for its success. You know the precautionary measures adopted by a surgeon: a suitable room, good lighting, assistants, exclusion of the patient's relatives, and so on. Ask yourselves now how many of these operations would turn out successfully if they had to take place in the presence of all the members of the patient's family, who would stick their noses into the field of the operation and exclaim aloud at every incision. In psycho-analytic treatments the intervention of relatives is a positive danger and a danger one does not know how to meet. One is armed against the patient's internal resistances which one knows are inevitable, but how can one ward off these external resistances? No kind of explanations make any impression on the patient's relatives; they cannot be induced to keep at a distance from the whole business, and one cannot make common cause with them because of the risk of losing the confidence of the patient, who - quite rightly moreover - expects the person in whom he has put his trust to take his side. No one who has any experience of the rifts which so often divide a family will, if he is an analyst, be surprised to find that the patient's closest relatives sometimes betray less interest in his recovering than in his remaining as he is. When, as so often, the neurosis is related to conflicts between members of a family, the healthy party will not hesitate long in choosing between his own interest and the sick party's recovery. It is not to be wondered at, indeed, if a husband looks with disfavour on a treatment in which, as he may rightly suspect, the whole catalogue of his sins will be brought to light. Nor do we wonder at it; but we cannot in that case blame ourselves if our efforts remain unsuccessful and the treatment is broken off prematurely because the husband's resistance is added to that of his sick wife. We had in fact undertaken something which in the prevailing circumstances was unrealizable.

[1916-1917, 3498]
The opposition which he at first offered to religion had three different points of origin. To begin with, there was, in general, his characteristic (which we have seen exemplified already) of fending off all novelties. Any position of the libido which he had once taken up was obstinately defended by him from fear of what he would lose by giving it up and from distrust of the probability of a complete substitute being afforded by the new position that was in view. This is an important and fundamental psychological peculiarity, which I described in my *Three Essays on the Theory of Sexuality* (1905d) as a susceptibility to 'fixation'. Under the name of psychical 'inertia' Jung has attempted to erect it into the principal cause of all the failures of neurotics. I think he is wrong in this; for this factor has a far more general application and plays an important part in the lives of the non-neurotic as well. Great mobility or sluggishness of libidinal cathexes (as well as of other kinds of energetic cathexes) are special characteristics which attach to many normal people and by no means to all neurotics, and which have hitherto not been brought into relation with other qualities. They are, as it were, like prime numbers, not further divisible. We only know one thing about them, and that is that mobility of the mental cathexes is a quality which shows striking diminution with the advance of age. This has given us one of the indications of the limits within which psycho-analytic treatment is effective. There are some people, however, who retain this mental plasticity far beyond the usual age-limit, and others who lose it very prematurely. If the latter are neurotics, we make the unwelcome discovery that it is impossible to undo developments in them which, in apparently similar circumstances, have been easily dealt with in other people. So that in considering the conversion of psychical energy no less than of physical, we must make use of the concept of an entropy, which opposes the undoing of what has already occurred.

To a physician who was to undertake psycho-analytic treatment of the girl there were many grounds for misgiving. The situation he had to deal with was not the one that analysis demands, in which alone it can demonstrate its effectiveness. As is well known, the ideal situation for analysis is when someone who is otherwise his own master is suffering from an inner conflict which he is unable to resolve alone, so that he brings his trouble to the analyst and begs for his help. The physician then works hand in hand with one portion of the pathologically divided personality, against the other party in the conflict. Any situation which differs from this is to a greater or lesser degree unfavourable for psycho-analysis and adds fresh difficulties to the internal ones already present. Situations like that of a prospective house-owner who orders an architect to build him a villa to his own tastes and requirements, or of a pious donor who commissions an artist to paint a sacred picture in the corner of which is to be a portrait of himself in adoration, are at bottom incompatible with the conditions necessary for psycho-analysis. Thus, it constantly happens that a husband instructs the physician as follows: 'My wife suffers from nerves, and for that reason gets on badly with me; please cure her, so that we may lead a happy married life again.' But often enough it turns out that such a request is impossible to fulfil - that is to say, the physician cannot bring about the result for which the husband sought the treatment. As soon as the wife is freed from her neurotic inhibitions she sets about getting a separation, for her neurosis was the sole condition under which the marriage could be maintained. Or else parents expect one to cure their nervous and unruly child. By a healthy child they mean one who never causes his parents trouble, and gives them nothing but pleasure. The physician may succeed in curing the child, but after that it goes its own way all the more decidedly, and the parents are now far more dissatisfied than before. In short, it is not a matter of indifference whether someone comes to analysis of his own accord or because he is brought to it - whether it is he himself who desires to be changed, or only his relatives, who love him (or who might be expected to love him).
The jealousy that arises from such a projection has, it is true, an almost delusional character; it is, however, amenable to the analytic work of exposing the unconscious phantasies of the subject's own infidelity. The position is worse as regards jealousy belonging to the third layer, the true delusional type. It too has its origin in repressed impulses towards unfaithfulness; but the object in these cases is of the same sex as the subject. Delusional jealousy is what is left of a homosexuality that has run its course, and it rightly takes its position among the classical forms of paranoia. As an attempt at defence against an unduly strong homosexual impulse it may, in a man, be described in the formula: 'I do not love him, she loves him!'¹ In a delusional case one will be prepared to find jealousy belonging to all three layers, never to the third alone. [1922b, 3902]

Paraonia - Cases of paranoia are for well-known reasons not usually amenable to analytic investigation. I have recently been able, nevertheless, by an intensive study of two paranoics, to discover something new to me. [1922b, 3902]

Narcissism. - The most important theoretical advance has certainly been the application of the libido theory to the repressing ego. The ego itself came to be regarded as a reservoir of what was described as narcissistic libido, from which the libidinal cathexes of objects flowed out and into which they could be once more withdrawn. By the help of this conception it became possible to embark upon the analysis of the ego and to make a clinical distinction of the psychoneuroses into transference neuroses and narcissistic disorders. In the former (hysteria and obsessional neurosis) the subject has at his disposal a quantity of libido striving to be transferred on to extraneous objects, and use is made of this in carrying out analytic treatment; on the other hand, the narcissistic disorders (dementia praecox, paranoia, melancholia) are characterized by a withdrawal of the libido from objects and they are therefore scarcely accessible to analytic therapy. But their therapeutic inaccessibility has not prevented analysis from making the most fruitful beginnings in the deeper study of these illnesses, which are counted among the psychoses. [1923a, 3925]

Psycho-Analysis as a Therapeutic Procedure. - Psycho-analysis has never set itself up as a panacea and has never claimed to perform miracles. In one of the most difficult spheres of medical activity it is the only possible method of treatment for certain illnesses and for others it is the method which yields the best or the most permanent results - though never without a corresponding expenditure of time and trouble. A physician who is not wholly absorbed in the work of giving help will find his labours amply repaid by obtaining an unhoped-for insight into the complications of mental life and the interrelations between the mental and the physical. Where at present it cannot offer help but only theoretical understanding, it may perhaps be preparing the way for some later, more direct means of influencing neurotic disorders. Its province is above all the two transference neuroses, hysteria and obsessional neurosis, in which it has contributed to the discovery of their internal structure and operative mechanisms; and, beyond them, all kinds of phobias, inhibitions, deformities of character, sexual perversions and difficulties in erotic life. Some analysts (Jelliffe, Groddeck, Felix Deutsch) have reported too that the analytic treatment of gross organic diseases is not unpromising, since a mental factor not infrequently contributes to the origin and continuance of such illnesses. Since psycho-analysis demands a certain amount of psychical plasticity from its patients, some kind of age-limit must be laid down in their selection; and since it necessitates the devotion of long and intense attention to the individual patient, it would be uneconomical to squander such expenditure upon completely worthless persons who happen to be neurotic. Experience upon material in clinics can alone show what modifications may be necessary in order to make psycho-analytic treatment accessible to wider strata of the population or to adapt it to weaker intelligences. [1923a, 3926]
There is no doubt that there is something in these people that sets itself against their recovery, and its approach is dreaded as though it were a danger. We are accustomed to say that the need for illness has got the upper hand in them over the desire for recovery. If we analyse this resistance in the usual way then, even after allowance has been made for an attitude of defiance towards the physician and for fixation to the various forms of gain from illness, the greater part of it is still left over; and this reveals itself as the most powerful of all obstacles to recovery, more powerful than the familiar ones of narcissistic inaccessibility, a negative attitude towards the physician and clinging to the gain from illness.

The description we have given applies to the most extreme instances of this state of affairs, but in a lesser measure this factor has to be reckoned with in very many cases, perhaps in all comparatively severe cases of neurosis. In fact it may be precisely this element in the situation, the attitude of the ego ideal, that determines the severity of a neurotic illness. We shall not hesitate, therefore, to discuss rather more fully the way in which the sense of guilt expresses itself under different conditions.

Among the hypothetical concepts which enable the doctor to deal with the analytic material, the first to be mentioned is that of 'libido'. Libido means in psycho-analysis in the first instance the force (thought of as quantitatively variable and measurable) of the sexual instincts directed towards an object - 'sexual' in the extended sense required by analytic theory. Further study showed that it was necessary to set alongside this 'object-libido' a 'narcissistic' or 'ego-libido', directed to the subject's own ego; and the interaction of these two forces has enabled us to account for a great number of normal and abnormal processes in mental life. A rough distinction was soon made between what are known as the 'transference neuroses' and the narcissistic disorders. The former (hysteria and obsessional neurosis) are the objects proper of psycho-analytic treatment, while the others, the narcissistic neuroses, though they can, it is true, be examined by the help of analysis, offer fundamental difficulties to therapeutic influence. It is true that the libido theory of psycho-analysis is by no means complete and that its relation to a general theory of the instincts is not yet clear, for psycho-analysis is a young science, quite unfinished and in a stage of rapid development. Here, however, it should be emphatically pointed out how erroneous the charge of pan-sexualism is which is so often levelled at psycho-analysis. It seeks to show that psycho-analytic theory knows of no mental motive forces other than purely sexual ones and in doing so exploits popular prejudices by using the word 'sexual' not in its analytic but in its vulgar sense.
The second lesson has a somewhat conservative ring. It is to the effect that the work of education is something *sui generis*: it is not to be confused with psycho-analytic influence and cannot be replaced by it. Psycho-analysis can be called in by education as an auxiliary means of dealing with a child; but it is not a suitable substitute for education. Not only is such a substitution impossible on practical grounds but it is also to be disrecommended for theoretical reasons. The relation between education and psycho-analytic treatment will probably before long be the subject of a detailed investigation. Here I will only give a few hints. One should not be misled by the statement - incidentally a perfectly true one - that the psycho-analysis of an adult neurotic is equivalent to an after-education. A child, even a wayward and delinquent child, is still not a neurotic; and after-education is something quite different from the education of the immature. The possibility of analytic influence rests on quite definite preconditions which can be summed up under the term 'analytic situation'; it requires the development of certain psychical structures and a particular attitude to the analyst. Where these are lacking - as in the case of children, of juvenile delinquents, and, as a rule, of impulsive criminals - something other than analysis must be employed, though something which will be at one with analysis in its *purpose*. The theoretical chapters of the present volume will give the reader a preliminary grasp of the multiplicity of the decisions involved.

[1925f, 4168]

Since that time I have had no opportunity of returning to the investigation of the 'actual neuroses'; nor has this part of my work been continued by anyone else. If I look back to-day at my early findings, they strike me as being the first rough outlines of what is probably a far more complicated subject. But on the whole they seem to me still to hold good. I should have been very glad if I had been able, later on, to make a psycho-analytic examination of some more cases of simple juvenile neurasthenia, but unluckily the occasion did not arise. To avoid misconceptions, I should like to make it clear that I am far from denying the existence of mental conflicts and of neurotic complexes in neurasthenia. All that I am asserting is that the symptoms of these patients are not mentally determined or removable by analysis, but that they must be regarded as direct toxic consequences of disturbed sexual chemical processes.

[1925d, 4203]

I now come to the description of a factor which adds an essential feature to my picture of analysis and which can claim, alike technically and theoretically, to be regarded as of the first importance. In every analytic treatment there arises, without the physician's agency, an intense emotional relationship between the patient and the analyst which is not to be accounted for by the actual situation. It can be of a positive or of a negative character and can vary between the extremes of a passionate, completely sensual love and the unbridled expression of an embittered defiance and hatred. This *transference* - to give it its short name - soon replaces in the patient's mind the desire to be cured, and, so long as it is affectionate and moderate, becomes the agent of the physician's influence and neither more nor less than the mainspring of the joint work of analysis. Later on, when it has become passionate or has been converted into hostility, it becomes the principal tool of the resistance. It may then happen that it will paralyse the patient's powers of associating and endanger the success of the treatment. Yet it would be senseless to try to evade it; for an analysis without transference is an impossibility. It must not be supposed, however, that transference is created by analysis and does not occur apart from it. Transference is merely uncovered and isolated by analysis. It is a universal phenomenon of the human mind, it decides the success of all medical influence, and in fact dominates the whole of each person's relations to his human environment. We can easily recognize it as the same dynamic factor which the hypnotists have named 'suggestibility', which is the agent of hypnotic *rapport* and whose incalculable behaviour led to difficulties with the cathartic method as well. When there is no inclination to a transference of emotion such as this, or when it has become entirely negative, as happens in dementia praecox or paranoia, then there is also no possibility of influencing the patient by psychological means.

[1925d, 4217]
The neuroses were the first subject of analysis, and for a long time they were the only one. No analyst could doubt that medical practice was wrong in separating those disorders from the psychoses and in attaching them to the organic nervous diseases. The theory of the neuroses belongs to psychiatry and is indispensable as an introduction to it. It would seem, however, that the analytic study of the psychoses is impracticable owing to its lack of therapeutic results. Mental patients are as a rule without the capacity for forming a positive transference, so that the principal instrument of analytic technique is inapplicable to them. There are nevertheless a number of methods of approach to be found. Transference is often not so completely absent but that it can be used to a certain extent; and analysis has achieved undoubted successes with cyclical depressions, light paranoic modifications, and partial schizophrenias. It has at least been a benefit to science that in many cases the diagnosis can oscillate for quite a long time between assuming the presence of a psychoneurosis or of a dementia praecox; for therapeutic attempts initiated in such cases have resulted in valuable discoveries before they have had to be broken off. But the chief consideration in this connection is that so many things that in the neuroses have to be laboriously fetched up from the depths are found in the psychoses on the surface, visible to every eye. For that reason the best subjects for the demonstration of many of the assertions of analysis are provided by the psychiatric clinic. It was thus bound to happen before long that analysis would find its way to the objects of psychiatric observation. I was able very early (1896) to establish in a case of paranoid dementia the presence of the same aetiological factors and the same emotional complexes as in the neuroses. Jung explained some most puzzling stereotypies in dements by bringing them into relation with the patients' life-histories; Bleuler demonstrated the existence in various psychoses of mechanisms like those which analysis had discovered in neurotics. Since then analysts have never relaxed their efforts to come to an understanding of the psychoses. Especially since it has been possible to work with the concept of narcissism, they have managed, now in this place and now in that, to get a glimpse beyond the wall. Most of all, no doubt, was achieved by Abraham in his elucidation of the melancholias. It is true that in this sphere all our knowledge is not yet converted into therapeutic power; but the mere theoretical gain is not to be despised, and we may be content to wait for its practical application. In the long run even the psychiatrists cannot resist the convincing force of their own clinical material. At the present time German psychiatry is undergoing a kind of 'peaceful penetration' by analytic views. While they continually declare that they will never be psycho-analysts, that they do not belong to the 'orthodox' school or agree with its exaggerations, and in particular that they do not believe in the predominance of the sexual factor, nevertheless the majority of the younger workers take over one piece or another of analytic theory and apply it in their own fashion to the material. All the signs point to the proximity of further developments in the same direction.

Only let us hold fast to this: the nodal point and pivot of the whole situation is the relative strength of the ego organization. We shall then find it easy to complete our aetiological survey. As what may be called the normal causes of neurotic illness we already know the feebleness of the childhood ego, the task of dealing with the early sexual impulses and the effects of the more or less chance experiences of childhood. Is it not possible, however, that yet other factors play a part, derived from the time before the beginning of the child's life? For instance, an innate strength and unruliness of the instinctual life in the id, which from the outset sets the ego tasks too hard for it? Or a special developmental feebleness of the ego due to unknown reasons? Such factors must of course acquire an aetiological importance, in some cases a transcendent one. We have invariably to reckon with the instinctual strength of the id; if it has developed to excess, the prospects of our therapy are poor. We still know too little of the causes of a developmental inhibition of the ego. These then would be the cases of neurosis with an essentially constitutional basis. Without some such constitutional, congenital favouring factors a neurosis can, no doubt, scarcely come about.
Psycho-analysis finds a constantly increasing amount of support as a therapeutic procedure, owing to the fact that it can do more for its patients than any other method of treatment. The principle field of its application is in the milder neuroses - hysteria, phobias and obsessional states; and in malformations of character and sexual inhibitions or abnormalities it can also bring about marked improvements or even recoveries. Its influence upon dementia praecox and paranoia is doubtful; on the other hand, in favourable circumstances it can cope with depressive states, even if they are of a severe type.

In the last few years I have had an opportunity of studying analytically a number of men whose object-choice was dominated by a fetish. There is no need to expect that these people came to analysis on account of their fetish. For though no doubt a fetish is recognized by its adherents as an abnormality, it is seldom felt by them as the symptom of an ailment accompanied by suffering. Usually they are quite satisfied with it, or even praise the way in which it eases their erotic life. As a rule, therefore, the fetish made its appearance in analysis as a subsidiary finding.

Compared with the other psychotherapeutic procedures psycho-analysis is beyond any doubt the most powerful. It is just and fair, too, that this should be so for it is also the most laborious and time-consuming; it would not be used on slight cases. In suitable cases it is possible by its means to get rid of disturbances and bring about changes for which in pre-analytic times one would not have ventured to hope. But it has its very appreciable limits. The therapeutic ambition of some of my adherents has made the greatest efforts to overcome these obstacles so that every sort of neurotic disorder might be curable by psycho-analysis. They have endeavoured to compress the work of analysis into a shorter duration, to intensify transference so that it may be able to overcome any resistance, to unite other forms of influence with it so as to compel a cure. These efforts are certainly praiseworthy, but, in my opinion, they are vain. They bring with them, too, a danger of being oneself forced away from analysis and drawn into a boundless course of experimentation. The expectation that every neurotic phenomenon can be cured may, I suspect, be derived from the layman's belief that the neuroses are something quite unnecessary which have no right whatever to exist. Whereas in fact they are severe, constitutionally fixed illnesses, which rarely restrict themselves to only a few attacks but persist as a rule over long periods or throughout life. Our analytic experience that they can be extensively influenced, if the historical precipitating causes and accidental auxiliary factors of the illness can be dealt with, has led us to neglect the constitutional factor in our therapeutic practice, and in any case we can do nothing about it; but in theory we ought always to bear it in mind. The radical inaccessibility of the psychoses to analytic treatment should, in view of their close relationship to the neuroses, restrict our pretensions in regard to these latter. The therapeutic effectiveness of psycho-analysis remains cramped by a number of weighty and scarcely assailable factors. In the case of children, where one might count on the greatest successes, the difficulties are the external ones connected with their relation to their parents, though these difficulties are after all a necessary part of being a child. In the case of adults the difficulties arise in the first instance from two factors: the amount of psychical rigidity present and the form of the illness with all that that covers in the way of deeper determinants.
The first of these factors is often unjustly overlooked. However great may be the plasticity of mental life and the possibility of reviving old conditions, not everything can be brought to life again. Some changes seem to be definitive and correspond to scars formed when a process has run its course. On other occasions one has an impression of a general stiffening of mental life; the psychical processes, to which one could very well indicate other paths, seem incapable of abandoning the old ones. But perhaps this is the same thing as what I mentioned just now, only looked at differently. All too often one seems to see that it is only the treatment’s lack of the necessary motive force that prevents one from bringing the change about. One particular dependent relation, one special instinctual component, is too powerful in comparison with the opposing forces that we are able to mobilize. This is quite generally true with the psychoses. We understand them well enough to know the point at which the levers should be applied, but they would not be able to move the weight. It is here, indeed, that hope for the future lies: the possibility that our knowledge of the operation of the hormones (you know what they are) may give us the means of successfully combating the quantitative factors of the illnesses: but we are far from that to-day. I realize that the uncertainty in all these matters is a constant instigation towards perfecting analysis and in particular the transference. Beginners in analysis especially are left in doubt in case of a failure whether they should blame the peculiarities of the case or their own clumsy handling of the therapeutic procedure. But, as I have said already, I do not think much can be achieved by efforts in this direction.

The second limitation upon analytic successes is given by the form of the illness. You know already that the field of application of analytic therapy lies in the transference neuroses - phobias, hysteria, obsessional neurosis - and further, abnormalities of character which have been developed in place of these illnesses. Everything differing from these, narcissistic and psychotic conditions, is unsuitable to a greater or less extent. It would be entirely legitimate to guard against failures by carefully excluding such cases. This precaution would lead to a great improvement in the statistics of analysis. There is, however, a pitfall here. Our diagnoses are very often made only after the event. They resemble the Scottish King’s test for identifying witches that I read about in Victor Hugo. This king declared that he was in possession of an infallible method of recognizing a witch. He had the women stewed in a cauldron of boiling water and then tasted the broth. Afterwards he was able to say: ‘That was a witch’, or ‘No, that was not one.’ It is the same with us, except that we are the sufferers. We cannot judge the patient who comes for treatment (or, in the same way, the candidate who comes for training) till we have studied him analytically for a few weeks or months. We are in fact buying a pig in a poke. The patient brings along indefinite general ailments which do not admit of a conclusive diagnosis. After this period of testing it may turn out that the case is an unsuitable one. If so we send him away if he is a candidate, or continue the trial a little longer if he is a patient on the chance that we may yet see things in a more favourable light. The patient has his revenge by adding to our list of failures, and the rejected candidate does so perhaps, if he is paranoid, by writing books on psycho-analysis himself. As you see, our precautions have been of no avail.

No sooner have we taken this step than a first disappointment awaits us, a first warning against over-confidence. If the patient’s ego is to be a useful ally in our common work, it must, however hard it may be pressed by the hostile powers, have retained a certain amount of coherence and some fragment of understanding for the demands of reality. But this is not to be expected of the ego of a psychotic; it cannot observe a pact of this kind, indeed it can scarcely enter into one. It will very soon have tossed us away and the help we offer it and sent us to join the portions of the external world which no longer mean anything to it. Thus we discover that we must renounce the idea of trying our plan of cure upon psychotics - renounce it perhaps for ever or perhaps only for the time being, till we have found some other plan better adapted for them.

[1933a, 4753]

[1933a, 4754]

[1940a [1938], 4983]
The overcoming of resistances is the part of our work that requires the most time and the greatest trouble. It is worth while, however, for it brings about an advantageous alteration of the ego which will be maintained independently of the outcome of the transference and will hold good in life. We have also worked simultaneously at getting rid of the alteration of the ego which had been brought about under the influence of the unconscious; for whenever we have been able to detect any of its derivatives in the ego we have pointed out their illegitimate origin and have instigated the ego to reject them. It will be remembered that it was one of the necessary preconditions of our pact of assistance that any such alteration of the ego due to the intrusion of unconscious elements should not have gone beyond a certain amount.

We have arrived at a general acquaintance with the psychical apparatus, with the parts, organs and agencies of which it is composed, with the forces which operate in it and with the functions allotted to its parts. The neuroses and psychoses are the states in which disturbances in the functioning of the apparatus come to expression. We have chosen the neuroses as the subjects of our study because they alone seem accessible to the psychological methods of our intervention. While we are trying to influence them, we collect observations which give us a picture of their origin and of the manner in which they arise.

A constitutional strength of instinct and an unfavourable alteration of the ego acquired in its defensive struggle in the sense of its being dislocated and restricted - these are the factors which are prejudicial to the effectiveness of analysis and which may make its duration interminable. One is tempted to make the first factor - strength of instinct - responsible as well for the emergence of the second - the alteration of the ego; but it seems that the latter too has an aetiology of its own. And, indeed, it must be admitted that our knowledge of these matters is as yet insufficient. They are only now becoming the subject of analytic study. In this field the interest of analysts seems to me to be quite wrongly directed. Instead of an enquiry into how a cure by analysis comes about (a matter which I think has been sufficiently elucidated) the question should be asked of what are the obstacles that stand in the way of such a cure.

If, however, what we are aiming at is a prophylactic treatment of instinctual conflicts that are not currently active but merely potential, it will not be enough to regulate sufferings which are already present in the patient and which he cannot avoid. We should have to make up our minds to provoke fresh sufferings in him; and this we have hitherto quite rightly left to fate. We should receive admonitions from all sides against the presumption of vying with fate in subjecting poor human creatures to such cruel experiments. And what sort of experiments would they be? Could we, for purposes of prophylaxis, take the responsibility of destroying a satisfactory marriage, or causing a patient to give up a post upon which his livelihood depends? Fortunately, we never find ourselves in the position of having to consider whether such interventions in the patient's real life are justified; we do not possess the plenary powers which they would necessitate, and the subject of our therapeutic experiment would certainly refuse to co-operate in it. In practice, then, such a procedure is virtually excluded; but there are, besides, theoretical objections to it. For the work of analysis proceeds best if the patient's pathogenic experiences belong to the past, so that his ego can stand at a distance from them. In states of acute crisis analysis is to all intents and purposes unusable. The ego's whole interest is taken up by the painful reality and it withholds itself from analysis, which is attempting to go below the surface and uncover the influences of the past. To create a fresh conflict would thus only be to make the work of analysis longer and more difficult.
Concerning the third factor, the alteration of the ego, we have as yet said nothing. When we turn our attention to it, the first impression we receive is that there is much to ask and much to answer here, and that what we have to say about it will prove to be very inadequate. This first impression is confirmed when we go further into the problem. As is well known, the analytic situation consists in our allying ourselves with the ego of the person under treatment, in order to subdue portions of his id which are uncontrolled - that is to say to include them in the synthesis of his ego. The fact that a co-operation of this kind habitually fails in the case of psychotics affords us a first solid footing for our judgement. The ego, if we are to be able to make such a pact with it, must be a normal one. But a normal ego of this sort is, like normality in general, an ideal fiction. The abnormal ego, which is unserviceable for our purposes, is unfortunately no fiction. Every normal person, in fact, is only normal on the average. His ego approximates to that of the psychotic in some part or other and to a greater or lesser extent; and the degree of its remoteness from one end of the series and of its proximity to the other will furnish us with a provisional measure of what we have so indefinitely termed an 'alteration of the ego'.

With the recognition that the properties of the ego which we meet with in the form of resistances can equally well be determined by heredity as acquired in defensive struggles, the topographical distinction between what is ego and what is id loses much of its value for our investigation. If we advance a step further in our analytic experience, we come upon resistances of another kind, which we can no longer localize and which seem to depend on fundamental conditions in the mental apparatus. I can only give a few examples of this type of resistance; the whole field of enquiry is still bewilderingly strange and insufficiently explored. We come across people, for instance, to whom we should be inclined to attribute a special 'adhesiveness of the libido'. The processes which the treatment sets in motion in them are so much slower than in other people because, apparently, they cannot make up their minds to detach libidinal cathexes from one object and displace them on to another, although we can discover no special reason for this cathetic loyalty. One meets with the opposite type of person, too, in whom the libido seems particularly mobile; it enters readily upon the new cathexes suggested by analysis, abandoning its former ones in exchange for them. The difference between the two types is comparable to the one felt by a sculptor, according to whether he works in hard stone or soft clay. Unfortunately, in this second type the results of analysis often turn out to be very impermanent: the new cathexes are soon given up once more, and we have an impression, not of having worked in clay, but of having written on water. In the words of the proverb: 'Soon got, soon gone.'
I should not like it to be wrongly thought that I do not wish to allow that hysteria is an independent neurotic affection, that I regard it merely as a psychical manifestation of anxiety neurosis and that I attribute to it 'ideogenic' symptoms only and am transferring the somatic symptoms (such as heterogenic points and anaesthesias) to anxiety neurosis. Nothing of the sort. In my opinion it is possible to deal with hysteria, freed from any admixture, as something independent; and to do so in every respect except in that of therapeutics. For in therapeutics we are concerned with a practical aim, with getting rid of the pathological state as a whole. And if hysteria generally appears as a component of a mixed neurosis, the situation resembles that in which there is a mixed infection, where preserving life sets a problem which does not coincide with that of combating the operation of one particular pathogenic agent.

Among the tasks presented by analysis is that of getting rid of symptoms which are capable of increasing in intensity or of returning: pains, symptoms (such as vomiting) which are due to stimuli, sensations or contractures. While we are working at one of these symptoms we come across the interesting and not undesired phenomenon of 'joining in the conversation'. The problematical symptom re-appears, or appears with greater intensity, as soon as we reach the region of the pathogenic organization which contains the symptom's aetiology, and thenceforward it accompanies the work with characteristic oscillations which are instructive to the physician. The intensity of the symptom (let us take for instance a desire to vomit) increases the deeper we penetrate into one of the relevant pathogenic memories; it reaches its climax shortly before the patient gives utterance to that memory; and when he has finished doing so it suddenly diminishes or even vanishes completely for a time. If, owing to resistance, the patient delays his telling for a long time, the tension of the sensation - of the desire to vomit - becomes unbearable, and if we cannot force him to speak he actually begins to vomit. In this way we obtain a plastic impression of the fact that 'vomiting' takes the place of a psychical act (in this instance, the act of utterance), exactly as the conversion theory of hysteria maintains.

To begin with, the work becomes more obscure and difficult, as a rule, the deeper we penetrate into the stratified psychical structure which I have described above. But once we have worked our way as far as the nucleus, light dawns and we need not fear that the patient's general condition will be subject to any severe periods of gloom. But the reward of our labours, the cessation of the symptoms, can only be expected when we have accomplished the complete analysis of every individual symptom; and indeed, if the individual symptoms are interconnected at numerous nodal points, we shall not even be encouraged during the work by partial successes. Thanks to the abundant causal connections, every pathogenic idea which has not yet been got rid of operates as a motive for the whole of the products of the neurosis, and it is only with the last word of the analysis that the whole clinical picture vanishes, just as happens with memories that are reproduced individually.
In the psycho-analysis of neuroses the fullest use is made of these two theorems - that, when conscious purposive ideas are abandoned, concealed purposive ideas assume control of the current of ideas, and that superficial associations are only substitutes by displacement for suppressed deeper ones. Indeed, these theorems have become basic pillars of psycho-analytic technique. When I instruct a patient to abandon reflection of any kind and to tell me whatever comes into his head, I am relying firmly on the presumption that he will not be able to abandon the purposive ideas inherent in the treatment and I feel justified in inferring that what seem to be the most innocent and arbitrary things which he tells me are in fact related to his illness. There is another purposive idea of which the patient has no suspicion - one relating to myself. The full estimate of the importance of these two theorems, as well as more detailed information about them, fall within the province of an account of the technique of psycho-analysis. Here, then, we have reached one of the frontier posts at which, in accordance with our programme, we must drop the subject of dream-interpretation.

That this state of affairs should exist in regard to the memories relating to the history of the illness is a necessary correlate of the symptoms and one which is theoretically requisite. In the further course of the treatment the patient supplies the facts which, though he had known them all along, had been kept back by him or had not occurred to his mind. The paramnesias prove untenable, and the gaps in his memory are filled in. It is only towards the end of the treatment that we have before us all intelligible, consistent, and unbroken case history. Whereas the practical aim of the treatment is to remove all possible symptoms and to replace them by conscious thoughts, we may regard it as a second and theoretical aim to repair all the damages to the patient's memory. These two aims are coincident. When one is reached, so is the other; and the same path leads to them both.

The task which the psycho-analytic method seeks to perform may be formulated in different ways, which are, however, in their essence equivalent. It may, for instance, be stated thus: the task of the treatment is to remove the amnesias. When all gaps in memory have been filled in, all the enigmatic products of mental life elucidated, the continuance and even a renewal of the morbid condition are made impossible. Or the formula may be expressed in this fashion: all repressions must be undone. The mental condition is then the same as one in which all amnesias have been removed. Another formulation reaches further: the task consists in making the unconscious accessible to consciousness, which is done by overcoming the resistances. But it must be remembered that an ideal condition such as this is not present even in the normal, and further that it is only rarely possible to carry the treatment to a point approaching it. Just as health and sickness are not different from each other in essence but are only separated by a quantitative line of demarcation which can be determined in practice, so the aim of the treatment will never be anything else but the practical recovery of the patient, the restoration of his ability to lead an active life and of his capacity for enjoyment. In a treatment which is incomplete or in which success is not perfect, one may at any rate achieve a considerable improvement in the general mental condition, while the symptoms (though now of smaller importance to the patient) may continue to exist without stamping him as a sick man.
(a) I have observed that this method is very often confused with hypnotic treatment by suggestion; I have noticed this because it happens comparatively often that colleagues who do not ordinarily confide their cases to me send me patients refractory patients, of course - with a request that I should hypnotize them. Now I have not used hypnosis for therapeutic purposes for some eight years (except for a few special experiments) so that I habitually send back these cases with the recommendation that anyone who relies upon hypnosis may employ it himself. There is, actually, the greatest possible antithesis between suggestive and analytic technique - the same antithesis which, in regard to the fine arts, the great Leonardo da Vinci summed up in the formulas: per via di porre and per via di levare. Painting, says Leonardo, works per via di porre, for it applies a substance - particles of colour - where there was no thing before, on the colourless canvas; sculpture, however, proceeds per via di levare, since it takes away from the block of stone all that hides the surface of the statue contained in it. In a similar way, the technique of suggestion aims at proceeding per via di porre; it is not concerned with the origin, strength and meaning of the morbid symptoms, but instead, it superimposes something - a suggestion - in the expectation that it will be strong enough to restrain the pathogenic idea from coming to expression. Analytic therapy, on the other hand, does not seek to add or to introduce anything new, but to take away something, to bring out something; and to this end concerns itself with the genesis of the morbid symptoms and the psychical context of the pathogenic idea which it seeks to remove. It is by the use of this mode of investigation that analytic therapy has increased our knowledge so notably. I gave up the suggestive technique, and with it hypnosis, so early in my practice because I despaired of making suggestion powerful and enduring enough to effect permanent cures. In every severe case I saw the suggestions which had been applied crumble away again; after which the disease or some substitute for it was back once more. Besides all this I have another reproach to make against this method, namely, that it conceals from us all insight into the play of mental forces; it does not permit us, for example, to recognize the resistance with which the patient clings to his disease and thus even fights against his own recovery; yet it is this phenomenon of resistance which alone makes it possible to understand his behaviour in daily life.

[1905a, 1566]

(f) Finally, Gentlemen, I must confess that it is hardly fair to take up your attention for so long on the subject of psycho-analytic therapy without telling you in what this treatment consists and on what it is based. Still, as I am forced to be brief, I can only hint at this: This therapy, then, is based on the recognition that unconscious ideas - or better, the unconsciousness of certain mental processes - are the direct cause of the morbid symptoms. We share this opinion with the French school (Janet) who, by the way, owing to excessive schematization, refer the cause of hysterical symptoms to an unconscious idée fixe. Now please do not be afraid that this is going to land us in the depths of philosophical obscurities. Our unconscious is not quite the same thing as that of philosophers and, moreover, the majority of philosophers will hear nothing of 'unconscious mental processes'. If, however, you will look at the matter from our point of view, you will understand that the transformation of this unconscious material in the mind of the patient into conscious material must have the result of correcting his deviation from normality and of lifting the compulsion to which his mind has been subjected. For conscious will-power governs only conscious mental processes, and every mental compulsion is rooted in the unconscious. Nor need you ever fear that the patient will be harmed by the shock accompanying the introduction of the unconscious into consciousness, for you can convince yourselves theoretically that the somatic and emotional effect of an impulse that has become conscious can never be so powerful as that of an unconscious one. It is only by the application of our highest mental functions, which are bound up with consciousness, that we can control all our impulses.

[1905a, 1571]
But the similarity between Gradiva’s procedure and the analytic method of psychotherapy is not limited to these two points - the making conscious of what has been repressed and the coinciding of explanation with cure. It also extends to what turns out to be the essence of the whole change - to the awakening of feelings. Every disorder analogous to Hanold’s delusion, what in scientific terms we are in the habit of calling ‘psychoneuroses’, has as its precondition the repression of a portion of instinctual life, or, as we can safely say, of the sexual instinct. At every attempt to introduce the unconscious and repressed causes of the illness into consciousness, the instinctual component concerned is necessarily aroused to a renewed struggle with the repressing powers, only to come to terms with them in the final outcome, often to the accompaniment of violent manifestations of reaction. The process of cure is accomplished in a relapse into love, if we combine all the many components of the sexual instinct under the term ‘love’; and such a relapse is indispensable, for the symptoms on account of which the treatment has been undertaken are nothing other than precipitates of earlier struggles connected with repression or the return of the repressed, and they can only be resolved and washed away by a fresh high tide of the same passions. Every psycho-analytic treatment is an attempt at liberating repressed love which has found a meagre outlet in the compromise of a symptom. Indeed, the agreement between such treatments and the process of cure described by the author of Gradiva reaches its climax in the further fact that in analytic psychotherapy too the re-awakened passion, whether it is love or hate, invariably chooses as its object the figure of the doctor.
[1907a, 1881]

The task of the therapist, however, is the same as that of the examining magistrate. We have to uncover the hidden psychical material; and in order to do this we have invented a number of detective devices, some of which it seems that you gentlemen of the law are now about to copy from us.
[1906c, 1892]

It will interest you, from the point of view of your own profession, to hear how we doctors proceed in psycho-analysis. After the patient has given us a first account of his history, we ask him to give himself up to the thoughts that occur to him spontaneously and to say without any critical reserve whatever comes into his head. We start, as you see, on the assumption, which he does not share in the least, that these spontaneous thoughts will not be arbitrarily chosen but will be determined by their relation to his secret - to his ‘complex’ - and may, as it were, be regarded as derivatives of that complex. You will note that this is the same assumption as the one with the help of which you were able to interpret the association experiments. But although we have instructed the patient to follow the rule of communicating all the thoughts that occur to him, he seems to be unable to do so. He soon begins to hold back first one thought and then another. He gives various reasons to account for this: either the thought was quite unimportant, or it was irrelevant or it was totally meaningless. We thereupon demand that he shall tell us the thought in spite of these objections and shall follow it up; for the very fact of his criticism proves to us that the thought belongs to the ‘complex’ which we are seeking to uncover. We recognize in this behaviour of the patient’s a manifestation of the ‘resistance’ present in him, which we are never free from through the whole duration of the treatment. I will merely indicate briefly that this concept of resistance has acquired the highest importance for us in understanding the origin of an illness as well as the mechanism of its cure.
[1906c, 1893]

We may justly claim that, in principle, techniques of the kind I have described enable us to make the patient conscious of what is repressed in him - of his secret - and thus to remove the psychological causation of the symptoms from which he is suffering. But before you draw any conclusions from these successful results as to the possibilities of your own work, we will examine some points of difference between the psychological situations in the two cases.
[1906c, 1895]
If you look more deeply into the comparison between the two situations it will become clear to you in general that psycho-analysis is concerned with a simpler, special, form of the task of uncovering what is hidden in the mind; whereas in your work the task is a more comprehensive one. That the case of the psychoneurotic is invariably concerned with a repressed sexual complex (in the widest sense) is a difference which you need not take into account. But there is something else that you must. The aim of psycho-analysis is absolutely uniform in every case: complexes have to be uncovered which have been repressed because of feelings of unpleasure and which produce signs of resistance if an attempt is made to bring them into consciousness. This resistance is as it were localized; it arises at the frontier between unconscious and conscious. In your cases what is concerned is a resistance which comes entirely from consciousness. You cannot dismiss this difference out of hand. You will first have to determine experimentally whether conscious resistance is betrayed by exactly the same indications as unconscious resistance. Further, you cannot yet be certain, in my opinion, whether you may interpret your objective indications of a complex as a 'resistance', as we psycho-therapists do. It may happen with your experimental subjects - even though not very frequently with criminals - that the complex you touch on is pleasurably toned; and the question then arises whether such a complex will produce the same reaction as a complex that is unpleasurably toned.

It is true that during the analysis Hans had to be told many things that he could not say himself, that he had to be presented with thoughts which he had so far shown no signs of possessing, and that his attention had to be turned in the direction from which his father was expecting something to come. This detracts from the evidential value of the analysis; but the procedure is the same in every case. For a psycho-analysis is not an impartial scientific investigation, but a therapeutic measure. Its essence is not to prove anything, but merely to alter something. In a psycho-analysis the physician always gives his patient (sometimes to a greater and some times to a less extent) the conscious anticipatory ideas by the help of which he is put in a position to recognize and to grasp the unconscious material. For there are some patients who need more of such assistance and some who need less; but there are none who get through without some of it. Slight disorders may perhaps be brought to an end by the subject's unaided efforts, but never a neurosis - a thing which has set itself up against the ego as an element alien to it. To get the better of such an element another person must be brought in, and in so far as that other person can be of assistance the neurosis will be curable. If it is in the very nature of any neurosis to turn away from the 'other person' - and this seems to be one of the characteristics of the states grouped together under the name of dementia praecox - then for that very reason such a state will be incurable by any efforts of ours. It is true that a child, on account of the small development of his intellectual systems, requires especially energetic assistance. But, after all, the information which the physician gives his patient is itself derived in its turn from analytical experience; and indeed it is sufficiently convincing if, at the cost of this intervention by the physician, we are enabled to discover the structure of the pathogenic material and simultaneously to dissipate it.
Therapeutic success, however, is not our primary aim; we endeavour rather to enable the patient to obtain a conscious grasp of his unconscious wishes. And this we can achieve by working upon the basis of the hints he throws out, and so, with the help of our interpretative technique, presenting the unconscious complex to his consciousness in our own words. There will be a certain degree of similarity between that which he hears from us and that which he is looking for, and which, in spite of all resistances, is trying to force its way through to consciousness; and it is this similarity that will enable him to discover the unconscious material. The physician is a step in front of him in knowledge; and the patient follows along his own road, until the two meet at the appointed goal. Beginners in psycho-analysis are apt to assimilate these two events, and to suppose that the moment at which one of the patient's unconscious complexes has become known to them is also the moment at which the patient himself recognizes it. They are expecting too much when they think that they will cure the patient by informing him of this piece of knowledge; for he can do no more with the information than make use of it to help himself in discovering the unconscious complex where it is anchored in his unconscious. A first success of this sort had now been achieved with Hans. Having partly mastered his castration complex, he was now able to communicate his wishes in regard to his mother. He did so, in what was still a distorted form, by means of the phantasy of the two giraffes, one of which was calling out in vain because Hans had taken possession of the other. He represented the 'taking possession of' pictorially as 'sitting down on'. His father recognized the phantasy as a reproduction of a bedroom scene which used to take place in the morning between the boy and his parents; and he quickly stripped the underlying wish of the disguise which it still wore. The boy's father and mother were the two giraffes. The reason for the choice of a giraffe-phantasy for the purposes of disguise was fully explained by a visit that the boy had paid to those same large beasts at Schönbrunn a few days earlier, by the giraffe-drawing, belonging to an earlier period, which had been preserved by his father, and also, perhaps, by an unconscious comparison based upon the giraffe's long, stiff neck.¹ It may be remarked that the giraffe, as being a large animal and interesting on account of its widdler, was a possible competitor with the horse for the role of bugbear; moreover, the fact that both his father and his mother appeared as giraffes offered a hint which had not yet been followed up, as regards the interpretation of the anxiety-horses.
[1909b, 2103]

It not at all infrequently happens that it is only after doing a certain amount of psycho-analytic work with a patient that an analyst can succeed in learning the actual content of a phobia, the precise form of words of an obsessional impulse, and so on. Repression has not only descended upon the unconscious complexes, but it is continually attacking their derivatives as well, and even prevents the patient from becoming aware of the products of the disease itself. The analyst thus finds himself in the position, curious for a doctor, of coming to the help of a disease, and of procuring it its due of attention. But only those who entirely misunderstand the nature of psycho-analysis will lay stress upon this phase of the work and suppose that on its account harm is likely to be done by analysis. The fact is that you must catch your thief before you can hang him, and that it requires some expenditure of labour to get securely hold of the pathological structures - at the destruction of which the treatment is aimed.
[1909b, 2106]
To put the matter more directly. The investigation of hysterical patients and of other neurotics leads us to the conclusion that their repression of the idea to which the intolerable wish is attached has been a failure. It is true that they have driven it out of consciousness and out of memory and have apparently saved themselves a large amount of unpleasure. But the repressed wishful impulse continues to exist in the unconscious. It is on the look-out for an opportunity of being activated, and when that happens it succeeds in sending into consciousness a disguised and unrecognizable substitute for what had been repressed, and to this there soon become attached the same feelings of unpleasure which it was hoped had been saved by the repression. This substitute for the repressed idea - the symptom - is proof against further attacks from the defensive ego; and in place of the short conflict an ailment now appears which is not brought to an end by the passage of time. Alongside the indication of distortion in the symptom, we can trace in it the remains of some kind of indirect resemblance to the idea that was originally repressed. The paths along which the substitution was effected can be traced in the course of the patient's psycho-analytic treatment; and in order to bring about recovery, the symptom must be led back along the same paths and once more turned into the repressed idea. If what was repressed is brought back again into conscious mental activity - a process which presupposes the overcoming of considerable resistances - the resulting psychical conflict, which the patient had tried to avoid, can, under the physician's guidance, reach a better outcome than was offered by repression. There are a number of such opportune solutions, which may bring the conflict and the neurosis to a happy end, and which may in certain instances be combined. The patient's personality may be convinced that it has been wrong in rejecting the pathogenic wish and may be led into accepting it wholly or in part; or the wish itself may be directed to a higher and consequently unobjectionable aim (this is what we call its 'sublimation'); or the rejection of the wish may be recognized as a justifiable one, but the automatic and therefore inefficient mechanism of repression may be replaced by a condemning judgement with the help of the highest human mental functions - conscious control of the wish is attained.

[1910a, 2215]

It is highly convenient, Ladies and Gentlemen, to follow the Zurich school (Bleuler, Jung, etc.) in describing a group of interdependent ideational elements cathected with affect as a 'complex'. We see, then, that if in our search for a repressed complex in one of our patients we start out from the last thing he remembers, we shall have every prospect of discovering the complex, provided that the patient puts a sufficient number of his free associations at our disposal. Accordingly, we allow the patient to say whatever he likes, and hold fast to the postulate that nothing can occur to him which is not in an indirect fashion dependent on the complex we are in search of. If this method of discovering what is repressed strikes you as unduly circumstantial, I can at least assure you that it is the only practicable one.

[1910a, 2219]

What, then, becomes of the unconscious wishes which have been set free by psycho-analysis? Along what paths do we succeed in making them harmless to the subject's life? There are several such paths. The most frequent outcome is that, while the work is actually going on, these wishes are destroyed by the rational mental activity of the better impulses that are opposed to them. Repression is replaced by a condemning judgement carried out along the best lines. That is possible because what we have to get rid of is to a great extent only the consequences arising from earlier stages of the ego's development. The subject only succeeded in the past in repressing the unserviceable instinct because he himself was at that time still imperfectly organized and feeble. In his present-day maturity and strength, he will perhaps be able to master what is hostile to him with complete success.

[1910a, 2238]
Advances in our knowledge. We are, of course, still a long way from knowing all that is 
required for an understanding of the unconscious in our patients. It is clear that every advance 
in our knowledge means an increase in our therapeutic power. As long as we have understood 
nothing, we have accomplished nothing; the more we understand, the more we shall achieve. At 
its beginning psycho-analytic treatment was inexorable and exhausting. The patient had to say 
everything himself, and the physician's activity consisted of urging him on incessantly. To-day 
things have a more friendly air. The treatment is made up of two parts - what the physician 
infers and tells the patient, and the patient's working-over of what he has heard. The 
mechanism of our assistance is easy to understand: we give the patient the conscious 
anticipatory idea and he then finds the repressed unconscious idea in himself on the basis of its 
similarity to the anticipatory one. This is the intellectual help which makes it easier for him to 
overcome the resistances between conscious and unconscious. Incidentally, I may remark that 
it is not the only mechanism made use of in analytic treatment; you all know the far more 
powerful one which lies in the use of the 'transference'. It is my intention in the near future to 
deal with these various factors, which are so important for an understanding of the treatment, in 
an Allgemeine Methodik der Psychoanalyse. And further, in speaking to you I need not rebut the 
objection that the evidential value in support of the correctness of our hypotheses is obscured in 
our treatment as we practise it to-day; you will not forget that this evidence is to be found 
elsewhere, and that a therapeutic procedure cannot be carried out in the same way as a 
thoretical investigation.
[1910d, 2307]

This brings us to the technical errors which are to be seen in the doctor's procedure in this 
alleged case. It is a long superseded idea, and one derived from superficial appearances, that 
the patient suffers from a sort of ignorance, and that if one removes this ignorance by giving him 
information (about the causal connection of his illness with his life, about his experiences in 
childhood, and so on) he is bound to recover. The pathological factor is not his ignorance in 
itself, but the root of this ignorance in his inner resistances; it was they that first called this 
ignorance into being, and they still maintain it now. The task of the treatment lies in combating 
these resistances. Informing the patient of what he does not know because he has repressed it 
is only one of the necessary preliminaries to the treatment. If knowledge about the unconscious 
were as important for the patient as people inexperienced in psycho-analysis imagine, listening 
to lectures or reading books would be enough to cure him. Such measures, however, have as 
much influence on the symptoms of nervous illness as a distribution of menu-cards in a time of 
famine has upon hunger. The analogy goes even further than its immediate application; for 
informing the patient of his unconscious regularly results in an intensification of the conflict in 
him and an exacerbation of his troubles.
[1910k, 2378]
Our second problem - the problem of why transference appears in psycho-analysis as resistance - has been left for the moment untouched; and we must now approach it more closely. Let us picture the psychological situation during the treatment. An invariable and indispensable precondition of every onset of a psychoneurosis is the process to which Jung has given the appropriate name of 'introversion'.¹ That is to say: the portion of libido which is capable of becoming conscious and is directed towards reality is diminished, and the portion which is directed away from reality and is unconscious, and which, though it may still feed the subject's phantasies, nevertheless belongs to the unconscious, is proportionately increased. The libido (whether wholly or in part) has entered on a regressive course and has revived the subject's infantile imagos.² The analytic treatment now proceeds to follow it; it seeks to track down the libido, to make it accessible to consciousness and, in the end, serviceable for reality. Where the investigations of analysis come upon the libido withdrawn into its hiding-place, a struggle is bound to break out; all the forces which have caused the libido to regress will rise up as 'resistances' against the work of analysis, in order to conserve the new state of things. For if the libido's introversion or regression had not been justified by a particular relation between the subject and the external world - stated in the most general terms, by the frustration of satisfaction - and if it had not for the moment even become expedient, it could never have taken place at all. But the resistances from this source are not the only ones or indeed the most powerful. The libido at the disposal of the subject's personality had always been under the influence of the attraction of his unconscious complexes (or more correctly, of the portions of those complexes belonging to the unconscious), and it entered on a regressive course because the attraction of reality had diminished. In order to liberate it, this attraction of the unconscious has to be overcome; that is, the repression of the unconscious instincts and of their productions, which has meanwhile been set up in the subject, must be removed. This is responsible for by far the largest part of the resistance, which so often causes the illness to persist even after the turning away from reality has lost its temporary justification. The analysis has to struggle against the resistances from both these sources. The resistance accompanies the treatment step by step. Every single association, every act of the person under treatment must reckon with the resistance and represents a compromise between the forces that are striving towards recovery and the opposing ones which I have described.

[1912b, 2459]

If now we follow a pathogenic complex from its representation in the conscious (whether this is an obvious one in the form of a symptom or something quite inconspicuous) to its root in the unconscious, we shall soon enter a region in which the resistance makes itself felt so clearly that the next association must take account of it and appear as a compromise between its demands and those of the work of investigation. It is at this point, on the evidence of our experience, that transference enters on the scene. When anything in the complexive material (in the subject-matter of the complex) is suitable for being transferred on to the figure of the doctor, that transference is carried out; it produces the next association, and announces itself by indications of a resistance - by a stoppage, for instance. We infer from this experience that the transference-idea has penetrated into consciousness in front of any other possible associations because it satisfies the resistance. An event of this sort is repeated on countless occasions in the course of an analysis. Over and over again, when we come near to a pathogenic complex, the portion of that complex which is capable of transference is first pushed forward into consciousness and defended with the greatest obstinacy.¹

[1912b, 2460]
Thus the solution of the puzzle is that transference to the doctor is suitable for resistance to the treatment only in so far as it is a negative transference or a positive transference of repressed erotic impulses. If we 'remove' the transference by making it conscious, we are detaching only these two components of the emotional act from the person of the doctor; the other component, which is admissible to consciousness and unobjectionable, persists and is the vehicle of success in psycho-analysis exactly as it is in other methods of treatment. To this extent we readily admit that the results of psycho-analysis rest upon suggestion; by suggestion, however, we must understand, as Ferenczi (1909) does, the influencing of a person by means of the transference phenomena which are possible in his case. We take care of the patient's final independence by employing suggestion in order to get him to accomplish a piece of psychical work which has as its necessary result a permanent improvement in his psychical situation.

[1912b, 2462]

In the process of seeking out the libido which has escaped from the patient's conscious, we have penetrated into the realm of the unconscious. The reactions which we bring about reveal at the same time some of the characteristics which we have come to know from the study of dreams. The unconscious impulses do not want to be remembered in the way the treatment desires them to be, but endeavour to reproduce themselves in accordance with the timelessness of the unconscious and its capacity for hallucination. Just as happens in dreams, the patient regards the products of the awakening of his unconscious impulses as contemporaneous and real; he seeks to put his passions into action without taking any account of the real situation. The doctor tries to compel him to fit these emotional impulses into the nexus of the treatment and of his life-history, to submit them to intellectual consideration and to understand them in the light of their psychical value. This struggle between the doctor and the patient, between intellect and instinctual life, between understanding and seeking to act, is played out almost exclusively in the phenomena of transference. It is on that field that the victory must be won - the victory whose expression is the permanent cure of the neurosis. It cannot be disputed that controlling the phenomena of transference presents the psycho-analyst with the greatest difficulties. But it should not be forgotten that it is precisely they that do us the inestimable service of making the patient's hidden and forgotten erotic impulses immediate and manifest. For when all is said and done, it is impossible to destroy anyone in absentia or in effigie.

[1912b, 2464]
Another temptation arises out of the educative activity which, in psycho-analytic treatment, devolves on the doctor without any deliberate intention on his part. When the developmental inhibitions are resolved, it happens of itself that the doctor finds himself in a position to indicate new aims for the trends that have been liberated. It is then no more than a natural ambition if he endeavours to make something specially excellent of a person whom he has been at such pains to free from his neurosis and if he prescribes high aims for his wishes. But here again the doctor should hold himself in check, and take the patient's capacities rather than his own desires as guide. Not every neurotic has a high talent for sublimation; one can assume of many of them that they would not have fallen ill at all if they had possessed the art of sublimating their instincts. If we press them unduly towards sublimation and cut them off from the most accessible and convenient instinctual satisfactions, we shall usually make life even harder for them than they feel it in any case. As a doctor, one must above all be tolerant to the weakness of a patient, and must be content if one has won back some degree of capacity for work and enjoyment for a person even of only moderate worth. Educative ambition is of as little use as therapeutic ambition. It must further be borne in mind that many people fall ill precisely from an attempt to sublimate their instincts beyond the degree permitted by their organization and that in those who have a capacity for sublimation the process usually takes place of itself as soon as their inhibitions have been overcome by analysis. In my opinion, therefore, efforts invariably to make use of the analytic treatment to bring about sublimation of instinct are, though no doubt always laudable, far from being in every case advisable.

It seems to me not unnecessary to keep on reminding students of the far-reaching changes which psycho-analytic technique has undergone since its first beginnings. In its first phase - that of Breuer's catharsis - it consisted in bringing directly into focus the moment at which the symptom was formed, and in persistently endeavouring to reproduce the mental processes involved in that situation, in order to direct their discharge along the path of conscious activity. Remembering and abreacting, with the help of the hypnotic state, were what was at that time aimed at. Next, where hypnosis had been given up, the task became one of discovering from the patient's free associations what he failed to remember. The resistance was to be circumvented by the work of interpretation and by making its results known to the patient. The situations which had given rise to the formation of the symptom and the other situations which lay behind the moment at which the illness broke out retained their place as the focus of interest; but the element of abreaction receded into the background and seemed to be replaced by the expenditure of work which the patient had to make in being obliged to overcome his criticism of his free associations, in accordance with the fundamental rule of psycho-analysis. Finally, there was evolved the consistent technique used to-day, in which the analyst gives up the attempt to bring a particular moment or problem into focus. He contents himself with studying whatever is present for the time being on the surface of the patient's mind, and he employs the art of interpretation mainly for the purpose of recognizing the resistances which appear there, and making them conscious to the patient. From this there results a new sort of division of labour: the doctor uncovers the resistances which are unknown to the patient; when these have been got the better of, the patient often relates the forgotten situations and connections without any difficulty. The aim of these different techniques has, of course, remained the same. Descriptively speaking, it is to fill in gaps in memory; dynamically speaking, it is to overcome resistances due to repression.
We have learnt that the patient repeats instead of remembering, and repeats under the conditions of resistance. We may now ask what it is that he in fact repeats or acts out. The answer is that he repeats everything that has already made its way from the sources of the repressed into his manifest personality - his inhibitions and unserviceable attitudes and his pathological character-traits. He also repeats all his symptoms in the course of the treatment. And now we can see that in drawing attention to the compulsion to repeat we have acquired no new fact but only a more comprehensive view. We have only made it clear to ourselves that the patient's state of being ill cannot cease with the beginning of his analysis, and that we must treat his illness, not as an event of the past, but as a present-day force. This state of illness is brought, piece by piece, within the field and range of operation of the treatment, and while the patient experiences it as something real and contemporary, we have to do our therapeutic work on it, which consists in a large measure in tracing it back to the past.

I have already let it be understood that analytic technique requires of the physician that he should deny to the patient who is craving for love the satisfaction she demands. The treatment must be carried out in abstinence. By this I do not mean physical abstinence alone, nor yet the deprivation of everything that the patient desires, for perhaps no sick person could tolerate this. Instead, I shall state it as a fundamental principle that the patient's need and longing should be allowed to persist in her, in order that they may serve as forces impelling her to do work and to make changes, and that we must beware of appeasing those forces by means of surrogates. And what we could offer would never be anything else than a surrogate, for the patient's condition is such that, until her repressions are removed, she is incapable of getting real satisfaction.

If the necessary amount of patience is added to these arguments, it is usually possible to overcome the difficult situation and to continue the work with a love which has been moderated or transformed; the work then aims at uncovering the patient's infantile object-choice and the phantasies woven round it.

For the doctor, ethical motives unite with the technical ones to restrain him from giving the patient his love. The aim he has to keep in view is that this woman, whose capacity for love is impaired by infantile fixations, should gain free command over a function which is of such inestimable importance to her; that she should not, however, dissipate it in the treatment, but keep it ready for the time when, after her treatment, the demands of real life make themselves felt. He must not stage the scene of a dog-race in which the prize was to be a garland of sausages but which some humorist spoilt by throwing a single sausage on to the track. The result was, of course, that the dogs threw themselves upon it and forgot all about the race and about the garland that was luring them to victory in the far distance. I do not mean to say that it is always easy for the doctor to keep within the limits prescribed by ethics and technique. Those who are still youngish and not yet bound by strong ties may in particular find it a hard task. Sexual love is undoubtedly one of the chief things in life, and the union of mental and bodily satisfaction in the enjoyment of love is one of its culminating peaks. Apart from a few queer fanatics, all the world knows this and conducts its life accordingly; science alone is too delicate to admit it. Again, when a woman sues for love, to reject and refuse is a distressing part for a man to play; and, in spite of neurosis and resistance, there is an incomparable fascination in a woman of high principles who confesses her passion. It is not a patient's crudely sensual desires which constitute the temptation. These are more likely to repel, and it will call for all the doctor's tolerance if he is to regard them as natural phenomenon. It is rather, perhaps, a woman's subtler and aim-inhibited wishes which bring with them the danger of making a man forget his technique and his medical task for the sake of a fine experience.
And yet it is quite out of the question for the analyst to give way. However highly he may prize love he must prize even more highly the opportunity for helping his patient over a decisive stage in her life. She has to learn from him to overcome the pleasure principle, to give up a satisfaction which lies to hand but is socially not acceptable, in favour of a more distant one, which is perhaps altogether uncertain, but which is both psychologically and socially unimpeachable. To achieve this overcoming, she has to be led through the primal period of her mental development and on that path she has to acquire the extra piece of mental freedom which distinguishes conscious mental activity - in the systematic sense - from unconscious. [1915a, 2520]

The first psycho-analytic examinations and attempts at treatment were made with the help of hypnotism. Afterwards this was abandoned and the work was carried out by the method of 'free association', with the patient remaining in his normal state. This modification had the advantage of enabling the procedure to be applied to a far larger number of cases of hysteria, as well as to other neuroses and also to healthy people. The development of a special technique of interpretation became necessary, however, in order to draw conclusions from the expressed ideas of the person under investigation. These interpretations established with complete certainty the fact that psychical dissociations are maintained entirely by 'internal resistances'. The conclusion seems justified, therefore, that the dissociations have originated owing to internal conflict, which has led to the 'repression' of the underlying impulse. To overcome this conflict and in that way to cure the neurosis, the guiding hand of a doctor trained in psycho-analysis is required. [1913m, 2546]

Psycho-analysis had its origin on medical soil, as a therapeutic procedure for the treatment of certain nervous illnesses which were termed 'functional' and which were considered with increasing certainty to be consequences of disturbances in emotional life. It attains its end - of removing the manifestations of these disturbances, the symptoms - by assuming that they are not the only possible and final outcome of particular psychical processes. It therefore uncovers the history of the development of these symptoms in the patient's memory, it revivifies the processes underlying them, and then conducts them, under the doctor's guidance, to a more favourable outlet. Psycho-analysis has set itself the same therapeutic aims as treatment by hypnotism, which was introduced by Liébeault and Bernheim and after lengthy and severe struggles achieved a place in the technique of nerve specialists. But it goes far deeper into the structure of the mechanism of the mind, and seeks to bring about permanent results and viable changes in its subjects. [1913b, 2634]
The theory of repression is the corner-stone on which the whole structure of psycho-analysis rests. It is the most essential part of it; and yet it is nothing but a theoretical formulation of a phenomenon which may be observed as often as one pleases if one undertakes an analysis of a neurotic without resorting to hypnosis. In such cases one comes across a resistance which opposes the work of analysis and in order to frustrate it pleads a failure of memory. The use of hypnosis was bound to hide this resistance; the history of psycho-analysis proper, therefore, only begins with the new technique that dispenses with hypnosis. The theoretical consideration of the fact that this resistance coincides with an amnesia leads inevitably to the view of unconscious mental activity which is peculiar to psycho-analysis and which, too, distinguishes it quite clearly from philosophical speculations about the unconscious. It may thus be said that the theory of psycho-analysis is an attempt to account for two striking and unexpected facts of observation which emerge whenever an attempt is made to trace the symptoms of a neurotic back to their sources in his past life: the facts of transference and of resistance. Any line of investigation which recognizes these two facts and takes them as the starting-point of its work has a right to call itself psycho-analysis, even though it arrives at results other than my own. But anyone who takes up other sides of the problem while avoiding these two hypotheses will hardly escape a charge of misappropriation of property by attempted impersonation, if he persists in calling himself a psycho-analyst.

Such a certain conviction of the existence and importance of infantile sexuality can, however, only be obtained by the method of analysis, by pursuing the symptoms and peculiarities of neurotics back to their ultimate sources, the discovery of which then explains whatever is explicable in them and enables whatever is modifiable to be changed. I can understand that one would arrive at different results if, as C. G. Jung has recently done, one first forms a theoretical conception of the nature of the sexual instinct and then seeks to explain the life of children on that basis. A conception of this kind is bound to be selected arbitrarily or in accordance with irrelevant considerations, and runs the risk of proving inadequate for the field to which one is seeking to apply it. It is true that the analytic method, too, leads to certain ultimate difficulties and obscurities in regard to sexuality and its relation to the total life of the individual. But these problems cannot be got rid of by speculation; they must await solution through other observations or through observations in other fields.

The interpretation of dreams became a solace and a support to me in those arduous first years of analysis, when I had to master the technique, clinical phenomena and therapy of the neuroses all at the same time. At that period I was completely isolated and in the network of problems and accumulation of difficulties I often dreaded losing my bearings and also my confidence. There were often patients with whom an unaccountably long time elapsed before my hypothesis, that a neurosis was bound to become intelligible through analysis, proved true; but these patients' dreams, which might be regarded as analogues of their symptoms, almost always confirmed the hypothesis.
The view that the sexual representation of 'higher' thoughts in dreams and neurosis is nothing but an archaic mode of expression is of course irreconcilable with the fact that in neurosis these sexual complexes prove to be the bearers of the quantities of libido which have been withdrawn from utilization in real life. If it was merely a question of a sexual 'jargon', the economy of the libido could not have been altered in any way by it. Jung admits this himself in his *Darstellung der psychoanalytischen Theorie* and formulates the task of therapy as the detaching of libidinal cathexes from these complexes. This can never be achieved, however, by directing the patient away from them and urging him to sublimate, but only by exhaustive examination of them and by making them fully and completely conscious. The first piece of reality which the patient must deal with is his illness. Efforts to spare him that task point to the physician's incapacity to help him to overcome his resistances, or else to the physician's dread of the results of the work.

When a doctor carries out the psycho-analytic treatment of a neurotic, his interest is by no means directed in the first instance to the patient's character. He would much rather know what the symptoms mean, what instinctual impulses are concealed behind them and are satisfied by them, and what course was followed by the mysterious path that has led from the instinctual wishes to the symptoms. But the technique which he is obliged to follow soon compels him to direct his immediate curiosity towards other objectives. He observes that his investigation is threatened by resistances set up against him by the patient, and these resistances he may justly count as part of the latter's character. This now acquires the first claim on his interest.

Psycho-analytic work is continually confronted with the task of inducing the patient to renounce an immediate and directly attainable yield of pleasure. He is not asked to renounce all pleasure; that could not, perhaps, be expected of any human being, and even religion is obliged to support its demand that earthly pleasure shall be set aside by promising that it will provide instead an incomparably greater amount of superior pleasure in another world. No, the patient is only asked to renounce such satisfactions as will inevitably have detrimental consequences. His privation is only to be temporary; he has only to learn to exchange an immediate yield of pleasure for a better assured, even though a postponed one. Or, in other words, under the doctor's guidance he is asked to make the advance from the pleasure principle to the reality principle by which the mature human being is distinguished from the child. In this educative process, the doctor's clearer insight can hardly be said to play a decisive part; as a rule, he can only tell his patient what the latter's own reason can tell him. But it is not the same to know a thing in one's own mind and to hear it from someone outside. The doctor plays the part of this effective outsider; he makes use of the influence which one human being exercises over another. Or - recalling that it is the habit of psycho-analysis to replace what is derivative and etiolated by what is original and basic - let us say that the doctor, in his educative work, makes use of one of the components of love. In this work of after-education, he is probably doing no more than repeat the process which made education of any kind possible in the first instance. Side by side with the exigencies of life, love is the great educator; and it is by the love of those nearest him that the incomplete human being is induced to respect the decrees of necessity and to spare himself the punishment that follows any infringement of them.
In psycho-analytic treatments we are invariably faced by the task of filling up these gaps in the memory of childhood; and in so far as the treatment is to any extent successful - that is to say, extremely frequently - we also succeed in bringing to light the content of these forgotten years of childhood. Those impressions had never been really forgotten, they were only inaccessible, latent, and had formed part of the unconscious. But it can come about that they emerge from the unconscious spontaneously, and this happens in connection with dreams. It appears that dream-life knows how to find access to these latent, infantile experiences. Excellent examples of this have been reported in the literature and I myself have been able to provide a contribution of the kind. I once dreamt in a certain connection of a person who must have done me a service and whom I saw clearly before me. He was a one-eyed man of small stature, stout, and with his head sunk deep in his shoulders. I concluded from the context that he was a doctor. Luckily I was able to enquire from my mother, who was still alive, what the doctor at my birth-place (which I had left when I was three) had looked like; and I learnt from her that he was one-eyed, short, stout and with his head sunk deep in his shoulders; and I also learnt what the accident was for which he had come to my help and which I myself had forgotten. This fact of dreams having at their disposal the forgotten material of the first years of childhood is thus a further archaic feature.

[1916-1917, 3290]

The construction of a symptom is a substitute for something else that did not happen. Some particular mental processes should normally have developed to a point at which consciousness received information of them. This, however, did not take place, and instead - out of the interrupted processes, which had been somehow disturbed and were obliged to remain unconscious - the symptom emerged. Thus something in the nature of an exchange has taken place; if this can be reversed the therapy of the neurotic symptoms will have achieved its task.

[1916-1917, 3357]

In the first place, then, when we undertake to restore a patient to health, to relieve him of the symptoms of his illness, he meets us with a violent and tenacious resistance, which persists throughout the whole length of the treatment. This is such a strange fact that we cannot expect it to find much credence. It is best to say nothing about it to the patient's relatives, for they invariably regard it as an excuse on our part for the length or failure of our treatment. The patient, too, produces all the phenomena of this resistance without recognizing it as such, and if we can induce him to take our view of it and to reckon with its existence, that already counts as a great success. Only think of it! The patient, who is suffering so much from his symptoms and is causing those about him to share his sufferings, who is ready to undertake so many sacrifices in time, money, effort and self-discipline in order to be freed from those symptoms we are to believe that this same patient puts up a struggle in the interest of his illness against the person who is helping him. How improbable such an assertion must sound! Yet it is true; and when its improbability is pointed out to us, we need only reply that it is not without analogies. A man who has gone to the dentist because of an unbearable toothache will nevertheless try to hold the dentist back when he approaches the sick tooth with a pair of forceps.

[1916-1917, 3362]
How, then, do we account for our observation that the patient fights with such energy against the removal of his symptoms and the setting of his mental processes on a normal course? We tell ourselves that we have succeeded in discovering powerful forces here which oppose any alteration of the patient's condition; they must be the same ones which in the past brought this condition about. During the construction of his symptoms something must have taken place which we can now reconstruct from our experiences during the resolution of his symptoms. We already know from Breuer's observation that there is a precondition for the existence of a symptom: some mental process must not have been brought to an end normally - so that it could become conscious. The symptom is a substitute for what did not happen at that point. We now know the point at which we must locate the operation of the force which we have surmised. A violent opposition must have started against the entry into consciousness of the questionable mental process, and for that reason it remained unconscious. As being something unconscious, it had the power to construct a symptom. This same opposition, during psychoanalytic treatment, sets itself up once more against our effort to transform what is unconscious into what is conscious. This is what we perceive as resistance. We have proposed to give the pathogenic process which is demonstrated by the resistance the name of repression.

[1916-1917, 3368]

Think it over! You have learnt all that is essential about the determinants of falling ill as well as all the factors that come into effect after the patient has fallen ill. Where do these leave room for any therapeutic influence? In the first place there is hereditary disposition. We have not talked about it very often because it is emphatically stressed from other directions and we have nothing new to say about it. But do not suppose that we underestimate it; precisely as therapists we come to realize its power clearly enough. In any case we can do nothing to alter it; we too must take it as something given, which sets a limit to our efforts. Next there is the influence of early experiences in childhood, to which we are in the habit of giving prominence in analysis: they belong to the past and we cannot undo them. Then comes everything that we have summarized as 'real frustration' - the misfortunes of life from which arise deprivation of love, poverty, family quarrels, ill-judged choice of a partner in marriage, unfavourable social circumstances, and the strictness of the ethical standards to whose pressure the individual is subject. Here, to be sure, there would be handles enough for a very effective therapy, but it would have to be of the kind which Viennese folklore attributes to the Emperor Joseph - the benevolent interference of a powerful personage before whose will people bow and difficulties vanish. But who are we, that we should be able to adopt benevolence of this kind as an instrument of our therapy? Poor ourselves and socially powerless, and compelled to earn our livelihood from our medical activity, we are not even in a position to extend our efforts to people without means, as other doctors with other methods of treatment are after all able to do. Our therapy is too time-consuming and too laborious for that to be possible. Perhaps, however, you are clucking at one of the factors I have mentioned and believe that there you have found the point at which our influence can make its attack. If the ethical restrictions demanded by society play a part in the deprivation imposed on the patient, treatment can, after all, give him the courage, or perhaps a direct injunction, to disregard those barriers and achieve satisfaction and recovery while forgoing the fulfilment of an ideal that is exalted, but so often not adhered to, by society. The patient will thus become healthy by 'living a full life' sexually. This, it is true, casts a shadow on analytic treatment for not serving general morality. What it has given to the individual it will have taken from the community.

[1916-1917, 3475]
But, Ladies and Gentlemen, who has so seriously misinformed you? A recommendation to the patient to 'live a full life' sexually could not possibly play a part in analytic therapy - if only because we ourselves have declared that an obstinate conflict is taking place in him between a libidinal impulse and sexual repression, between a sensual and an ascetic trend. This conflict would not be solved by our helping one of these trends to victory over its opponent. We see, indeed, that in neurotics asceticism has the upper hand; and the consequence of this is precisely that the suppressed sexual tendency finds a way out in symptoms. If, on the contrary, we were to secure victory for sensuality, then the sexual repression that had been put on one side would necessarily be replaced by symptom. Neither of these two alternative decisions could end the internal conflict; in either case one party to it would remain unsatisfied. There are only a few cases in which the conflict is so unstable that a factor such as the doctor's taking sides could decide it; and such cases do not in fact stand in need of analytic treatment. Anyone on whom the doctor could have so much influence would have found the same way out without the doctor. You must be aware that if an abstinent young man decides in favour of illicit sexual intercourse or if an unsatisfied wife seeks relief with another man, they have not as a rule waited for permission from a doctor or even from their analyst.

In this connection people usually overlook the one essential point - that the pathogenic conflict in neurotics is not to be confused with a normal struggle between mental impulses both of which are on the same psychological footing. In the former case the dissension is between two powers, one of which has made its way to the stage of what is preconscious or conscious while the other has been held back at the stage of the unconscious. For that reason the conflict cannot be brought to an issue; the disputants can no more come to grips than, in the familiar simile, a polar bear and a whale. A true decision can only be reached when they both meet on the same ground. To make this possible is, I think, the sole task of our therapy.

Thus you cannot explain the therapeutic effect of psycho-analysis by its permitting a full sexual life. Look around, then, for something else. I fancy that, while I was rejecting this suggestion of yours, one remark of mine put you on the right track. What we make use of must no doubt be the replacing of what is unconscious by what is conscious, the translation of what is unconscious into what is conscious. Yes, that is it. By carrying what is unconscious on into what is conscious, we lift the repressions, we remove the preconditions for the formation of symptoms, we transform the pathogenic conflict to a normal one for which it must be possible somehow to find a solution. All that we bring about in a patient is this single psychical change: the length to which it is carried is the measure of the help we provide. Where no repressions (or analogous psychical processes) can be undone, our therapy has nothing to expect.

We can express the aim of our efforts in a variety of formulas: making conscious what is unconscious, lifting repressions, filling gaps in the memory - all these amount to the same thing. But perhaps you will be dissatisfied by this admission. You had formed a different picture of the return to health of a neurotic patient - that, after submitting to the tedious hours of a psycho-analysis, he would become another man; but the total result, so it seems, is that he has rather less that is unconscious and rather more that is conscious in him than he had before. The fact is that you are probably under-estimating the importance of an internal change of this kind. The neurotic who is cured has really become another man, though a bottom, of course, he has remained the same; that is to say, he has become what he might have become at best under the most favourable conditions. But that is a very great deal. If you now hear all that has to be done and what efforts it needs to bring about this apparently trivial change in a man's mental life, you will no doubt begin to realize the importance of this difference in psychical levels.
And now for the fact! In a whole number of nervous diseases - in hysteria, anxiety states, obsessional neurosis - our expectation is fulfilled. By searching for the repression in this way, by uncovering the resistances, by pointing out what is repressed, we really succeed in accomplishing our task - that is, in overcoming the resistances, lifting the repression and transforming the unconscious material into conscious. In doing so we gain the clearest impression of the way in which a violent struggle takes place in the patient's mind about the overcoming of each resistance - a normal mental struggle, on the same psychological ground, between the motives which seek to maintain the anticathexis and those which are prepared to give it up. The former are the old motives which in the past put the repression into effect; among the latter are the newly arrived ones which, we may hope, will decide the conflict in our favour. We have succeeded in reviving the old conflict which led to repression and in bringing up for revision the process that was then decided. The new material that we produce includes, first the reminder that the earlier decision led to illness and the promise that a different path will lead to recovery, and, second, the enormous change in all the circumstances that has take place since the time of the original rejection. Then the ego was feeble, infantile, and may perhaps have had grounds for banning the demands of the libido as a danger. To-day it has grown strong and experienced, and moreover has a helper at and in the shape of the doctor. Thus we may expect to lead the revived conflict to a better outcome than that which ended in repression, and, as I have said, in hysteria and in the anxiety and obsessional neuroses success proves us in general to be correct.

But I should like to say a few words to you to relieve you of your surprise at the emergence of this unexpected phenomenon. We must not forget that the patient's illness, which we have undertaken to analyse, is not something which has been rounded off and become rigid but that it is still growing and developing like a living organism. The beginning of the treatment does not put an end to this development; when, however, the treatment has obtained mastery over the patient, what happens is that the whole of his illness's new production is concentrated upon a single point - his relation to the doctor. Thus the transference may be compared to the cambium layer in a tree between the wood and the bark, from which the new formation of tissue and the increase in the girth of the trunk derive. When the transference has risen to this significance, work upon the patient's memories retreats far into the background. Thereafter it is not incorrect to say that we are no longer concerned with the patient's earlier illness but with a newly created and transformed neurosis which has taken the former's place. We have followed this new edition of the old disorder from its start, we have observed its origin and growth, and we are especially well able to find our way about in it since, as its object, we are situated at its very centre. All the patient's symptoms have abandoned their original meaning and have take on a new sense which lies in a relation to the transference; or only such symptoms have persisted as are capable of undergoing such a transformation. But the mastering of this new, artificial neurosis coincides with getting rid of the illness which was originally brought to the treatment - with the accomplishment of our therapeutic task. A person who has become normal and free from the operation of repressed instinctual impulse in his relation to the doctor will remain so in his own life after the doctor has once more withdrawn from it.
I can do so in a few words, and you will see how simply the riddle can be solved and how well everything fits together. Observation shows that sufferers from narcissistic neuroses have no capacity for transference or only insufficient residues of it. They reject the doctor, not with hostility but with indifference. For that reason they cannot be influenced by him either; what he says leaves them cold, makes no impression on them; consequently the mechanism of cure which we carry through with other people - the revival of the pathogenic conflict and the overcoming of the resistance due to repression - cannot be operated with them. They remain as they are. Often they have already undertaken attempts at recovery on their own account which have led to pathological results. We cannot alter this in any way.

I will now complete my picture of the mechanism of cure by clothing it in the formulas of the libido theory. A neurotic is incapable of enjoyment and of efficiency - the former because his libido is not directed on to any real object and the latter because he is obliged to employ a great deal of this available energy on keeping his libido under repression and on warding off its assaults. He would become healthy if the conflict between his ego and his libido came to an end and if his ego had his libido again at its disposal. The therapeutic task consists, therefore, in freeing the libido from its present attachments, which are withdrawn from the ego, and in making it once more serviceable to the ego. Where, then, is the neurotic's libido situated? It is easily found: it is attached to the symptoms, which yield it the only substitutive satisfaction possible at the time. We must therefore make ourselves masters of the symptoms and resolve them - which is precisely the same thing that the patient requires of us. In order to resolve the symptoms, we must go back as far as their origin, we must renew the conflict from which they arose, and, with the help of motive forces which were not at the patient's disposal in the past, we must guide it to a different outcome. This revision of the process of repression can be accomplished only in part in connection with the memory traces of the processes which led to repression. The decisive part of the work is achieved by creating in the patient's relation to the doctor - in the 'transference' - new editions of the old conflicts; in these the patient would like to behave in the same way as he did in the past, while we, by summoning up every available mental force, compel him to come to a fresh decision. Thus the transference becomes the battlefield on which all the mutually struggling forces should meet one another.

The psycho-analytic method of treatment is then able to subject this process of repression to revision and to bring about a better solution of the conflict - one that is compatible with health. Unintelligent opposition accuses us of one-sidedness in our estimate of the sexual instincts. 'Human beings have other interests besides sexual ones,' they say. We have not forgotten or denied this for a moment. Our one-sidedness is like that of the chemist, who traces all compounds back to the force of chemical attraction. He is not on that account denying the force of gravity; he leaves that to the physicist to deal with.

During the work of treatment we have to consider the distribution of the patient's libido; we look for the object presentations to which it is bound and free it from them, so as to place it at the disposal of the ego. In the course of this, we have come to form a very curious picture of the original, primal distribution of libido in human beings. We have been driven to assume that at the beginning of the development of the individual all his libido (all his erotic tendencies, all his capacity for love) is tied to himself - that as we say, it cathects his own ego. It is only later that, being attached to the satisfaction of the major vital needs, the libido flows over from the ego on to external objects. Not till then are we able to recognize the libidinal instincts as such and distinguish them from the ego instincts. It is possible for the libido to become detached from these objects and withdrawn again into the ego.
We have formulated our task as physicians thus: to bring to the patient's knowledge the unconscious, repressed impulses existing in him, and, for that purpose, to uncover the resistances that oppose this extension of his knowledge about himself. Does the uncovering of these resistances guarantee that they will also be overcome? Certainly not always; but our hope is to achieve this by exploiting the patient's transference to the person of the physician, so as to induce him to adopt our conviction of the inexpediency of the repressive process established in childhood and of the impossibility of conducting life on the pleasure principle. I have set out elsewhere the dynamic conditions prevailing in the fresh conflict through which we lead the patient and which we substitute in him for his previous conflict - that of his illness. I have nothing at the moment to alter in that account.

The work by which we bring the repressed mental material into the patient's consciousness has been called by us psycho-analysis. Why 'analysis' - which means breaking up or separating out, and suggests an analogy with the work carried out by chemists on substances which they find in nature and bring into their laboratories? Because in an important respect there really is an analogy between the two. The patient's symptoms and pathological manifestations, like all his mental activities, are of a highly composite kind; the elements of this compound are at bottom motives, instinctual impulses. But the patient knows nothing of these elementary motives or not nearly enough. We teach him to understand the way in which these highly complicated mental formations are compounded; we trace the symptoms back to the instinctual impulses which motivate them; we point out to the patient these instinctual motives, which are present in his symptoms and of which he has hitherto been unaware, - just as a chemist isolates the fundamental substance, the chemical 'element', out of the salt in which it had been combined with other elements and in which it was unrecognizable. In the same way, as regards those of the patient's mental manifestations that were not considered pathological, we show him that he was only to a certain extent conscious of their motivation - that other instinctual impulses of which he had remained in ignorance had co-operated in producing them.

This well-founded comparison of medical psycho-analytic activity with a chemical procedure might suggest a new direction for our therapy. We have analysed the patient - that is, separated his mental processes into their elementary constituents and demonstrated these instinctual elements in him singly and in isolation; what could be more natural than to expect that we should also help him to make a new and a better combination of them? You know that this demand has actually been put forward. We have been told that after an analysis of a sick mind a synthesis of it must follow. And, close upon this, concern has been expressed that the patient might be given too much analysis and too little synthesis; and there has then followed a move to put all the weight on this synthesis as the main factor in the psychotherapeutic effect, to see in it a kind of restoration of something that had been destroyed - destroyed, as it were, by vivisection.

Let us at once agree upon what we mean by this activity. We have defined our therapeutic task as consisting of two things: making conscious the repressed material and uncovering the resistances. In that we are active enough, to be sure. But are we to leave it to the patient to deal alone with the resistances we have pointed out to him? Can we give him no other help in this besides the stimulus he gets from the transference? Does it not seem natural that we should help him in another way as well, by putting him into the mental situation most favourable to the solution of the conflict which is our aim? After all, what he can achieve depends, too, on a combination of external circumstances. Should we hesitate to alter this combination by intervening in a suitable manner? I think activity of such a kind on the part of the analysing physician is unobjectionable and entirely justified.
You will remember that it was a frustration that made the patient ill, and that his symptoms serve him as substitutive satisfactions. It is possible to observe during the treatment that every improvement in his condition reduces the rate at which he recovers and diminishes the instinctual force impelling him towards recovery. But this instinctual force is indispensable; reduction of it endangers our aim - the patient's restoration to health. What, then, is the conclusion that forces itself inevitably upon us? Cruel though it may sound, we must see to it that the patient's suffering, to a degree that is in some way or other effective, does not come to an end prematurely. If, owing to the symptoms having been taken apart and having lost their value, his suffering becomes mitigated, we must reinstate it elsewhere in the form of some appreciable privation; otherwise we run the danger of never achieving any improvements except quite insignificant and transitory ones.

In all such situations activity on the part of the physician must take the form of energetic opposition to premature substitutive satisfactions. It is easier for him, however, to prevent the second danger which jeopardizes the propelling force of the analysis, though it is not one to be under-estimated. The patient looks for his substitutive satisfactions above all in the treatment itself, in his transference-relationship with the physician; and he may even strive to compensate himself by this means for all the other privations laid upon him. Some concessions must of course be made to him, greater or less, according to the nature of the case and the patient's individuality. But it is not good to let them become too great. Any analyst who out of the fullness of his heart, perhaps, and his readiness to help, extends to the patient all that one human being may hope to receive from another, commits the same economic error as that of which our non-analytic institutions for nervous patients are guilty. Their one aim is to make everything as pleasant as possible for the patient, so that he may feel well there and be glad to take refuge there again from the trials of life. In so doing they make no attempt to give him more strength for facing life and more capacity for carrying out his actual tasks in it. In analytic treatment all such spoiling must be avoided. As far as his relations with the physician are concerned, the patient must be left with unfulfilled wishes in abundance. It is expedient to deny him precisely those satisfactions which he desires most intensely and expresses most importunately.

I do not think I have exhausted the range of desirable activity on the part of the physician in saying that a condition of privation is to be kept up during the treatment. Activity in another direction during analytic treatment has already, as you will remember, been a point at issue between us and the Swiss school. We refused most emphatically to turn a patient who puts himself into our hands in search of help into our private property, to decide his fate for him, to force our own ideals upon him, and with the pride of a Creator to form him in our own image and see that it is good. I still adhere to this refusal, and I think that this is the proper place for the medical discretion which we have had to ignore in other connections. I have learnt by experience, too, that such a far-reaching activity towards patients is not in the least necessary for therapeutic purposes. For I have been able to help people with whom I had nothing in common - neither race, education, social position nor outlook upon life in general - without affecting their individuality. At the time of the controversy I have just spoken of, I had the impression, to be sure, that the objections of our spokesmen - I think it was Ernest Jones who took the chief part - were too harsh and uncompromising. We cannot avoid taking some patients for treatment who are so helpless and incapable of ordinary life that for them one has to combine analytic with educative influence; and even with the majority, occasions now and then arise in which the physician is bound to take up the position of teacher and mentor. But it must always be done with great caution, and the patient should be educated to liberate and fulfil his own nature, not to resemble ourselves.
Strictly considered - and why should this question not be considered with all possible strictness? - analytic work deserves to be recognized as genuine psycho-analysis only when it has succeeded in removing the amnesia which conceals from the adult his knowledge of his childhood from its beginning (that is, from about the second to the fifth year). This cannot be said among analysts too emphatically or repeated too often. The motives for disregarding this reminder are, indeed, intelligible. It would be desirable to obtain practical results in a shorter period and with less trouble. But at the present time theoretical knowledge is still far more important to all of us than therapeutic success, and anyone who neglects childhood analysis is bound to fall into the most disastrous errors. The emphasis which is laid here upon the importance of the earliest experiences does not imply any underestimation of the influence of later ones. But the later impressions of life speak loudly enough through the mouth of the patient, while it is the physician who has to raise his voice on behalf of the claims of childhood.

[1919e, 3646]

*Development of Technique.* - After the analyst's curiosity had, as it were, been gratified by the elaboration of the technique of interpretation, it was inevitable that interest should turn to the problem of discovering the most effective way of influencing the patient. It soon became evident that the physician's immediate task was to assist the patient in getting to know, and afterwards in overcoming, the resistances which emerged in him during treatment and of which, to begin with, he himself was unaware. And it was found at the same time that the essential part of the process of cure lay in the overcoming of these resistances and that unless this was achieved no permanent mental change could be brought about in the patient. Since the analyst's efforts have in this way been directed upon the patient's resistance, analytic technique has attained a certainty and delicacy rivalling that of surgery. Consequently, everyone is strongly advised against undertaking psycho-analytic treatments without a strict training, and a physician who ventures upon them on the strength of his medical qualification is in no respect better than a layman.

[1923a, 3925]

*Comparison between Psycho-Analysis and Hypnotic and Suggestive Methods.* - Psycho-analytic procedure differs from all methods making use of suggestion, persuasion, etc., in that it does not seek to suppress by means of authority any mental phenomenon that may occur in the patient. It endeavours to trace the causation of the phenomenon and to remove it by bringing about a permanent modification in the conditions that led to it. In psycho-analysis the suggestive influence which is inevitably exercised by the physician is diverted on to the task assigned to the patient of overcoming his resistances, that is, of carrying forward the curative process. Any danger of falsifying the products of a patient's memory by suggestion can be avoided by prudent handling of the technique; but in general the arousing of resistances is a guarantee against the misleading effects of suggestive influence. It may be laid down that the aim of the treatment is to remove the patient's resistances and to pass his repressions in review and thus to bring about the most far-reaching unification and strengthening of his ego, to enable him to save the mental energy which he is expending upon internal conflicts, to make the best of him that his inherited capacities will allow and so to make him as efficient and as capable of enjoyment as is possible. The removal of the symptoms of the illness is not specifically aimed at, but is achieved, as it were, as a by-product if the analysis is properly carried through. The analyst respects the patient's individuality and does not seek to remould him in accordance with his own - that is, according to the physician's - personal ideals; he is glad to avoid giving advice and instead to arouse the patient's power of initiative.

[1923a, 3927]
Criticisms and Misunderstandings of Psycho-Analysis. - Most of what is brought up against psycho-analysis, even in scientific works, is based upon insufficient information which in its turn seems to be determined by emotional resistances. Thus it is a mistake to accuse psycho-analysis of 'pan-sexualism' and to allege that it derives all mental occurrences from sexuality and traces them all back to it. On the contrary, psycho-analysis has from the very first distinguished the sexual instincts from others which it has provisionally termed 'ego instincts'. It has never dreamt of trying to explain 'everything', and even the neuroses it has traced back not to sexuality alone but to the conflict between the sexual impulses and the ego. In psycho-analysis (unlike the works of C. G. Jung) the term 'libido' does not mean psychical energy in general but the motive force of the sexual instincts. Some assertions, such as that every dream is the fulfilment of a sexual wish, have never been maintained by it at all. The charge of one-sidedness made against psycho-analysis, which, as the science of the unconscious mind, has its own definite and restricted field of work, is as inapplicable as it would be if it were made against chemistry. To believe that psycho-analysis seeks a cure for neurotic disorders by giving a free rein to sexuality is a serious misunderstanding which can only be excused by ignorance. The making conscious of repressed sexual desires in analysis makes it possible, on the contrary, to obtain a mastery over them which the previous repression had been unable to achieve. It can more truly be said that analysis sets the neurotic free from the chains of his sexuality. Moreover, it is quite unscientific to judge analysis by whether it is calculated to undermine religion, authority and morals; for, like all sciences, it is entirely non-tendentious and has only a single aim - namely to arrive at a consistent view of one portion of reality. Finally, one can only characterize as simple-minded the fear which is sometimes expressed that all the highest goods of humanity, as they are called - research, art, love, ethical and social sense - will lose their value or their dignity because psycho-analysis is in a position to demonstrate their origin in elementary and animal instinctual impulses.

[1923a, 3928]

But we have arrived at the term or concept of the unconscious along another path, by considering certain experiences in which mental dynamics play a part. We have found - that is, we have been obliged to assume - that very powerful mental processes or ideas exist (and here a quantitative or economic factor comes into question for the first time) which can produce all the effects in mental life that ordinary ideas do (including effects that can in their turn become conscious as ideas), though they themselves do not become conscious. It is unnecessary to repeat in detail here what has been explained so often before. It is enough to say that at this point psycho-analytic theory steps in and asserts that the reason why such ideas cannot become conscious is that a certain force opposes them, that otherwise they could become conscious, and that it would then be apparent how little they differ from other elements which are admittedly psychical. The fact that in the technique of psycho-analysis a means has been found by which the opposing force can be removed and the ideas in question made conscious renders this theory irrefutable. The state in which the ideas existed before being made conscious is called by us repression, and we assert that the force which instituted the repression and maintains it is perceived as resistance during the work of analysis

[1923b, 3948]
In the further course of psycho-analytic work, however, even these distinctions have proved to be inadequate and, for practical purposes, insufficient. This has become clear in more ways than one; but the decisive instance is as follows. We have formed the idea that in each individual there is a coherent organization of mental processes; and we call this his ego. It is to this ego that consciousness is attached; the ego controls the approaches to motility - that is, to the discharge of excitations into the external world; it is the mental agency which supervises all its own constituent processes, and which goes to sleep at night, though even then it exercises the censorship on dreams. From this ego proceed the repressions, too, by means of which it is sought to exclude certain trends in the mind not merely from consciousness but also from other forms of effectiveness and activity. In analysis these trends which have been shut out stand in opposition to the ego, and the analysis is faced with the task of removing the resistances which the ego displays against concerning itself with the repressed. Now we find during analysis that, when we put certain tasks before the patient, he gets into difficulties; his associations fail when they should be coming near the repressed. We then tell him that he is dominated by a resistance; but he is quite unaware of the fact, and, even if he guesses from his unpleasurable feelings that a resistance is now at work in him, he does not know what it is or how to describe it. Since, however, there can be no question but that this resistance emanates from his ego and belongs to it, we find ourselves in an unforeseen situation. We have come upon something in the ego itself which is also unconscious, which behaves exactly like the repressed - that is, which produces powerful effects without itself being conscious and which requires special work before it can be made conscious. From the point of view of analytic practice, the consequence of this discovery is that we land in endless obscurities and difficulties if we keep to our habitual forms of expression and try, for instance, to derive neuroses from a conflict between the conscious and the unconscious. We shall have to substitute for this antithesis another, taken from our insight into the structural conditions of the mind - the antithesis between the coherent ego and the repressed which is split off from it.¹

The description we have given applies to the most extreme instances of this state of affairs, but in a lesser measure this factor has to be reckoned with in very many cases, perhaps in all comparatively severe cases of neurosis. In fact it may be precisely this element in the situation, the attitude of the ego ideal, that determines the severity of a neurotic illness. We shall not hesitate, therefore, to discuss rather more fully the way in which the sense of guilt expresses itself under different conditions.

In Beyond the Pleasure Principle (1920g) I have dealt with the economic problem of how what are in every respect distressing experiences of the early infantile sexual period can succeed in forcing their way through to some kind of reproduction. I was obliged to ascribe to them an extraordinarily strong upward drive in the shape of the 'compulsion to repeat' - a force able to overcome the repression which, in obedience to the pleasure principle, weighs down upon them - though not until 'the work of treatment has gone half-way to meet it and has loosened the repression'. Here we may add that it is the positive transference that gives this assistance to the compulsion to repeat. Thus an alliance has been made between the treatment and the compulsion to repeat, an alliance which is directed in the first instance against the pleasure principle but of which the ultimate purpose is the establishment of the dominion of the reality principle. As I have shown in the passage to which I am referring, it happens only too often that the compulsion to repeat throws over its obligations under this alliance and is not content with the return of the repressed merely in the form of dream-pictures.

[1923b, 3951]

[1923b, 3984]

[1923c, 4038]
The theory of repression became the corner-stone of our understanding of the neuroses. A different view had now to be taken of the task of therapy. Its aim was no longer to 'abreact' an affect which had got on to the wrong lines but to uncover repressions and replace them by acts of judgement which might result either in the accepting or in the condemning of what had formerly been repudiated. I showed my recognition of the new situation by no longer calling my method of investigation and treatment catharsis but psycho-analysis.

[1925d, 4207]

To begin with the last problem. The advance we have made is that we have gone behind reactions of anxiety to situations of danger. If we do the same thing with realistic anxiety we shall have no difficulty in solving the question. Real danger is a danger that is known, and realistic anxiety is anxiety about a known danger of this sort. Neurotic anxiety is anxiety about an unknown danger. Neurotic danger is thus a danger that has still to be discovered. Analysis has shown that it is an instinctual danger. By bringing this danger which is not known to the ego into consciousness, the analyst makes neurotic anxiety no different from realistic anxiety, so that it can be dealt with in the same way.

[1926d, 4317]

What you say about the special personal influence of the analyst certainly deserves great attention. An influence of the kind exists and plays a large part in analysis - but not the same part as in hypnotism. It ought to be possible to convince you that the situations in the two cases are quite different. It may be enough to point out that we do not use this personal influence, the factor of 'suggestion', to suppress the symptoms of the illness, as happens with hypnotic suggestion. Further, it would be a mistake to believe that this factor is the vehicle and promoter of the treatment throughout its length. At its beginning, no doubt. But later on it opposes our analytic intentions and forces us to adopt the most far-reaching counter-measures. And I should like to show by an example how far diverting a patient's thoughts and talking him out of things are from the technique of analysis. If a patient of ours is suffering from a sense of guilt, as though he had committed a serious crime, we do not recommend him to disregard his qualms of conscience and do not emphasize his undoubted innocence; he himself has often tried to do so without success. What we do is to remind him that such a strong and persistent feeling must after all be based on something real, which it may perhaps be possible to discover.

[1926e, 4333]

It is easy now to describe our therapeutic aim. We try to restore the ego, to free it from its restrictions, and to give it back the command over the id which it has lost owing to its early repressions. It is for this one purpose that we carry out analysis, our whole technique is directed to this aim. We have to seek out the repressions which have been set up and to urge the ego to correct them with our help and to deal with conflicts better than by an attempt at flight. Since these repressions belong to the very early years of childhood, the work of analysis leads us, too, back to that period. Our path to these situations of conflict, which have for the most part been forgotten and which we try to revive in the patient's memory, is pointed out to us by his symptoms, dreams and free associations. These must, however, first be interpreted - translated - for, under the influence of the psychology of the id, they have assumed forms of expression that are strange to our comprehension. We may assume that whatever associations, thoughts and memories the patient is unable to communicate to us without internal struggles are in some way connected with the repressed material or are its derivatives. By encouraging the patient to disregard his resistances to telling us these things, we are educating his ego to overcome its inclination towards attempts at flight and to tolerate an approach to what is repressed. In the end, if the situation of the repression can be successfully reproduced in his memory, his compliance will be brilliantly rewarded. The whole difference between his age then and now works in his favour; and the thing from which his childish ego fled in terror will often seem to his adult and strengthened ego no more than child's play.

[1926e, 4348]
Again, I attach no great importance to the argument that a lay analyst, because he must be prepared to consult a doctor, will have no authority in the eyes of his patients and will be treated with no more respect than such people as bone-setters or masseurs. Once again, the analogy is an imperfect one - quite apart from the fact that what governs patients in their recognition of authority is usually their emotional transference and that the possession of a medical diploma does not impress them nearly so much as doctors believe. A professional lay analyst will have no difficulty in winning as much respect as is due to a secular pastoral worker. Indeed, the words, 'secular pastoral worker', might well serve as a general formula for describing the function which the analyst, whether he is a doctor or a layman, has to perform in his relation to the public. Our friends among the protestant clergy, and more recently among the catholic clergy as well, are often able to relieve their parishioners of the inhibitions of their daily life by confirming their faith - after having first offered them a little analytic information about the nature of their conflicts. Our opponents, the Adlerian 'individual psychologists', endeavour to produce a similar result in people who have become unstable and inefficient by arousing their interest in the social community after having first thrown some light upon a single corner of their mental life and shown them the part played in their illness by their egoistic and distrustful impulses. Both of these procedures, which derive their power from being based on analysis, have their place in psychotherapy. We who are analysts set before us as our aim the most complete and profoundest possible analysis of whoever may be our patient. We do not seek to bring him relief by receiving him into the catholic, protestant or socialist community. We seek rather to enrich him from his own internal sources, by putting at the disposal of his ego those energies which, owing to repression, are inaccessibly confined in his unconscious, as well as those which his ego is obliged to squander in the fruitless task of maintaining these repressions. Such activity as this is pastoral work in the best sense of the words. Have we set ourselves too high an aim? Are the majority of our patients worth the pains that this work requires of us? Would it not be more economical to prop up their weaknesses from without rather than to rebuild them from within? I cannot say; but there is something else that I do know. In psycho-analysis there has existed from the very first an inseparable bond between cure and research. Knowledge brought therapeutic success. It was impossible to treat a patient without learning something new; it was impossible to gain fresh insight without perceiving its beneficent results. Our analytic procedure is the only one in which this precious conjunction is assured. It is only by carrying on our analytic pastoral work that we can deepen our dawning comprehension of the human mind. This prospect of scientific gain has been the proudest and happiest feature of analytic work. Are we to sacrifice it for the sake of any considerations of a practical sort?
Our knowledge of the historical worth of certain religious doctrines increases our respect for them, but does not invalidate our proposal that they should cease to be put forward as the reasons for the precepts of civilization. On the contrary! Those historical residues have helped us to view religious teachings, as it were, as neurotic relics, and we may now argue that the time has probably come, as it does in an analytic treatment, for replacing the effects of repression by the results of the rational operation of the intellect. We may foresee, but hardly regret, that such a process of remoulding will not stop at renouncing the solemn transfiguration of cultural precepts, but that a general revision of them will result in many of them being done away with. In this way our appointed task of reconciling men to civilization will to a great extent be achieved. We need not deplore the renunciation of historical truth when we put forward rational grounds for the precepts of civilization. The truths contained in religious doctrines are after all so distorted and systematically disguised that the mass of humanity cannot recognize them as truth. The case is similar to what happens when we tell a child that new-born babies are brought by the stork. Here, too, we are telling the truth in symbolic clothing, for we know what the large bird signifies. But the child does not know it. He hears only the distorted part of what we say, and feels that he has been deceived; and we know how often his distrust of the grown-ups and his refractoriness actually take their start from this impression. We have become convinced that it is better to avoid such symbolic disguisings of the truth in what we tell children and not to withhold from them a knowledge of the true state of affairs commensurate with their intellectual level.
[1927c, 4453]
The cultural super-ego has developed its ideals and set up its demands. Among the latter, those which deal with the relations of human beings to one another are comprised under the heading of ethics. People have at all times set the greatest value on ethics, as though they expected that it in particular would produce especially important results. And it does in fact deal with a subject which can easily be recognized as the sorest spot in every civilization. Ethics is thus to be regarded as a therapeutic attempt - as an endeavour to achieve, by means of a command of the super-ego, something which has so far not been achieved by means of any other cultural activities. As we already know, the problem before us is how to get rid of the greatest hindrance to civilization - namely, the constitutional inclination of human beings to be aggressive towards one another; and for that very reason we are especially interested in what is probably the most recent of the cultural commands of the super-ego, the commandment to love one's neighbour as oneself. In our research into, and therapy of, a neurosis, we are led to make two reproaches against the super-ego of the individual. In the severity of its commands and prohibitions it troubles itself too little about the happiness of the ego, in that it takes insufficient account of the resistances against obeying them - of the instinctual strength of the id, and of the difficulties presented by the real external environment. Consequently we are very often obliged, for therapeutic purposes, to oppose the super-ego, and we endeavour to lower its demands. Exactly the same objections can be made against the ethical demands of the cultural super-ego. It, too, does not trouble itself enough about the facts of the mental constitution of human beings. It issues a command and does not ask whether it is possible for people to obey it. On the contrary, it assumes that a man's ego is psychologically capable of anything that is required of it, that his ego has unlimited mastery over his id. This is a mistake; and even in what are known as normal people the id cannot be controlled beyond certain limits. If more is demanded of a man, a revolt will be produced in him or a neurosis, or he will be made unhappy. The commandment, 'Love thy neighbour as thyself', is the strongest defence against human aggressiveness and an excellent example of the unpsychological proceedings of the cultural super-ego. The commandment is impossible to fulfil; such an enormous inflation of love can only lower its value, not get rid of the difficulty. Civilization pays no attention to all this; it merely admonishes us that the harder it is to obey the precept the more meritorious it is to do so. But anyone who follows such a precept in present-day civilization only puts himself at a disadvantage vis-à-vis the person who disregards it. What a potent obstacle to civilization aggressiveness must be, if the defence against it can cause as much unhappiness as aggressiveness itself! 'Natural' ethics, as it is called, has nothing to offer here except the narcissistic satisfaction of being able to think oneself better than others. At this point the ethics based on religion introduces its promises of a better after-life. But so long as virtue is not rewarded here on earth, ethics will, I fancy, preach in vain. I too think it quite certain that a real change in the relations of human beings to possessions would be of more help in this direction than any ethical commands; but the recognition of this fact among socialists has been obscured and made useless for practical purposes by a fresh idealistic misconception of human nature. [1930a, 4530]
We meet with the second of these facts almost every day in the course of our analytic work; and it does not imply such an important objection as the other does. One of the tasks of psycho-analysis, as you know, is to lift the veil of amnesia which hides the earliest years of childhood and to bring to conscious memory the manifestations of early infantile sexual life which are contained in them. Now these first sexual experiences of a child are linked to painful impressions of anxiety, prohibition, disappointment and punishment. We can understand their having been repressed; but, that being so, we cannot understand how it is that they have such free access to dream-life, that they provide the pattern for so many dream-phantasies and that dreams are filled with reproductions of these scenes from childhood and with allusions to them. It must be admitted that their unpleasurable character and the dream-work's wish-fulfilling purpose seem far from mutually compatible. But it may be that in this case we are magnifying the difficulty. After all, these same infantile experiences have attached to them all the imperishable, unfulfilled instinctual wishes which throughout life provide the energy for the construction of dreams, and to which we may no doubt credit the possibility, in their mighty uprush, of forcing to the surface, along with the rest, the material of distressing events. And on the other hand the manner and form in which this material is reproduced shows unmistakably the efforts of the dream-work directed to denying the unpleasure by means of distortion and to transforming disappointment into attainment.

[1933a, 4641]

Now, however, another problem awaits us - at the opposite end of the ego, as we might put it. It is presented to us by an observation during the work of analysis, an observation which is actually a very old one. As not infrequently happens, it has taken a long time to come to the point of appreciating its importance. The whole theory of psycho-analysis is, as you know, in fact built up on the perception of the resistance offered to us by the patient when we attempt to make his unconscious conscious to him. The objective sign of this resistance is that his associations fail or depart widely from the topic that is being dealt with. He may also recognize the resistance subjectively by the fact that he has distressing feelings when he approaches the topic. But this last sign may also be absent. We then say to the patient that we infer from his behaviour that he is now in a state of resistance; and he replies that he knows nothing of that, and is only aware that his associations have become more difficult. It turns out that we were right; but in that case his resistance was unconscious too, just as unconscious as the repressed, at the lifting of which we were working. We should long ago have asked the question: from what part of his mind does an unconscious resistance like this arise? The beginner in psycho-analysis will be ready at once with the answer: it is, of course, the resistance of the unconscious. An ambiguous and unserviceable answer! If it means that the resistance arises from the repressed, we must rejoin: certainly not! We must rather attribute to the repressed a strong upward drive, an impulsion to break through into consciousness. The resistance can only be a manifestation of the ego, which originally put the repression into force and now wishes to maintain it. That, moreover, is the view we always took. Since we have come to assume a special agency in the ego, the super-ego, which represents demands of a restrictive and rejecting character, we may say that repression is the work of this super-ego and that it is carried out either by itself or by the ego in obedience to its orders. If then we are met by the case of the resistance in analysis not being conscious to the patient, this means either that in quite important situations the super-ego and the ego can operate unconsciously, or - and this would be still more important - that portions of both of them, the ego and the super-ego themselves, are unconscious. In both cases we have to reckon with the disagreeable discovery that on the one hand (super-) ego and conscious and on the other hand repressed and unconscious are far from coinciding.

[1933a, 4677]
And here is another warning, to conclude these remarks, which have certainly been exacting and not, perhaps, very illuminating. In thinking of this division of the personality into an ego, a super-ego and an id, you will not, of course, have pictured sharp frontiers like the artificial ones drawn in political geography. We cannot do justice to the characteristics of the mind by linear outlines like those in a drawing or in primitive painting, but rather by areas of colour melting into one another as they are presented by modern artists. After making the separation we must allow what we have separated to merge together once more. You must not judge too harshly a first attempt at giving a pictorial representations of something so intangible as psychical processes. It is highly probable that the development of these divisions is subject to great variations in different individuals; it is possible that in the course of actual functioning they may change and go through a temporary phase of involution. Particularly in the case of what is phylogenetically the last and most delicate of these divisions - the differentiation between the ego and the super-ego - something of the sort seems to be true. There is no question but that the same thing results from psychical illness. It is easy to imagine, too, that certain mystical practices may succeed in upsetting the normal relations between the different regions of the mind, so that, for instance, perception may be able to grasp happenings in the depths of the ego and in the id which were otherwise inaccessible to it. It may safely be doubted, however, whether this road will lead us to the ultimate truths from which salvation is to be expected. Nevertheless it may be admitted that the therapeutic efforts of psycho-analysis have chosen a similar line of approach. Its intention is, indeed, to strengthen the ego, to make it more independent of the super-ego, to widen its field of perception and enlarge its organization, so that it can appropriate fresh portions of the id. Where id was, there ego shall be. It is a work of culture - not unlike the draining of the Zuider Zee. [1933a, 4687]

The first of these factors is often unjustly overlooked. However great may be the plasticity of mental life and the possibility of reviving old conditions, not everything can be brought to life again. Some changes seem to be definitive and correspond to scars formed when a process has run its course. On other occasions one has an impression of a general stiffening of mental life; the psychical processes, to which one could very well indicate other paths, seem incapable of abandoning the old ones. But perhaps this is the same thing as what I mentioned just now, only looked at differently. All too often one seems to see that it is only the treatment's lack of the necessary motive force that prevents one from bringing the change about. One particular dependent relation, one special instinctual component, is too powerful in comparison with the opposing forces that we are able to mobilize. This is quite generally true with the psychoses. We understand them well enough to know the point at which the levers should be applied, but they would not be able to move the weight. It is here, indeed, that hope for the future lies: the possibility that our knowledge of the operation of the hormones (you know what they are) may give us the means of successfully combating the quantitative factors of the illnesses: but we are far from that to-day. I realize that the uncertainty in all these matters is a constant instigation towards perfecting analysis and in particular the transference. Beginners in analysis especially are left in doubt in case of a failure whether they should blame the peculiarities of the case or their own clumsy handling of the therapeutic procedure. But, as I have said already, I do not think much can be achieved by efforts in this direction. [1933a, 4753]
With the mention of resistance we have reached the second and more important part of our task. We have already learnt that the ego protects itself against the invasion of undesired elements from the unconscious and repressed id by means of anticathexes, which must remain intact if it is to function normally. The more hard-pressed the ego feels, the more convulsively it clings (as though in a fright) to these anticathexes, in order to protect what remains of itself from further irruptions. But this defensive purpose does not by any means accord with the aims of our treatment. What we desire, on the contrary, is that the ego, emboldened by the certainty of our help, shall dare to take the offensive in order to reconquer what has been lost. And it is here that we become aware of the strength of these anticathexes in the form of resistances to our work. The ego draws back in alarm from such undertakings, which seem dangerous and threaten unpleasure; it must be constantly encouraged and soothed if it is not to fail us. This resistance, which persists throughout the whole treatment and is renewed at every fresh piece of work, is known, not quite correctly, as the resistance due to repression. We shall find that it is not the only one that faces us. It is interesting to notice that in this situation the party-divisions are to some extent reversed: for the ego struggles against our instigation, while the unconscious, which is ordinarily our opponent, comes to our help, since it has a natural 'upward drive' and desires nothing better than to press forward across its settled frontiers into the ego and so to consciousness. The struggle which develops, if we gain our end and can induce the ego to overcome its resistances, is carried through under our direction and with our assistance. Its outcome is a matter of indifference: whether it results in the ego accepting, after a fresh examination, an instinctual demand which it has hitherto rejected, or whether it dismisses it once more, this time for good and all. In either case a permanent danger has been disposed of, the compass of the ego has been extended and a wasteful expenditure of energy has been made unnecessary.

Experience has taught us that psycho-analytic therapy - the freeing of someone from his neurotic symptoms, inhibitions and abnormalities of character - is a time-consuming business. Hence, from the very first, attempts have been made to shorten the duration of analyses. Such endeavours required no justification; they could claim to be based on the strongest considerations of reason and expediency. But there was probably still at work in them as well some trace of the impatient contempt with which the medical science of an earlier day regarded the neuroses as being uncalled-for consequences of invisible injuries. If it had now become necessary to attend to them, they should at least be disposed of as quickly as possible.

An analytic experience which now extends over several decades, and a change which has taken place in the nature and mode of my activity, encourage me to attempt to answer the questions before us. In earlier days I treated quite a large number of patients, who, as was natural, wanted to be dealt with as quickly as possible. Of late years I have been mainly engaged in training analyses; a relatively small number of severe cases of illness remained with me for continuous treatment, interrupted, however, by longer or shorter intervals. With them, the therapeutic aim was no longer the same. There was no question of shortening the treatment; the purpose was radically to exhaust the possibilities of illness in them and to bring about a deep-going alteration of their personality.
Applying these remarks to our present problem, I think that the answer to the question of how to explain the variable results of our analytic therapy might well be that we, too, in endeavouring to replace repressions that are insecure by reliable ego-syntonic controls, do not always achieve our aim to its full extent - that is, do not achieve it thoroughly enough. The transformation is achieved, but often only partially; portions of the old mechanisms remain untouched by the work of analysis. It is difficult to prove that this is really so; for we have no other way of judging what happens but by the outcome which we are trying to explain. Nevertheless, the impressions one receives during the work of analysis do not contradict this assumption; indeed, they seem rather to confirm it. But we must not take the clarity of our own insight as a measure of the conviction which we produce in the patient. His conviction may lack 'depth', as one might say; it is always a question of the quantitative factor, which is so easily overlooked. If this is the correct answer to our question, we may say that analysis, in claiming to cure neuroses by ensuring control over instinct, is always right in theory but not always right in practice. And this is because it does not always succeed in ensuring to a sufficient degree the foundations on which a control of instinct is based. The cause of such a partial failure is easily discovered. In the past, the quantitative factor of instinctual strength opposed the ego's defensive efforts; for that reason we called in the work of analysis to help; and now that same factor sets a limit to the efficacy of this new effort. If the strength of the instinct is excessive, the mature ego, supported by analysis, fails in its task, just as the helpless ego failed formerly. Its control over instinct is improved, but it remains imperfect because the transformation in the defensive mechanism is only incomplete. There is nothing surprising in this, since the power of the instruments with which analysis operates is not unlimited but restricted, and the final upshot always depends on the relative strength of the psychical agencies which are struggling with one another.

[1937c, 5026]

No doubt it is desirable to shorten the duration of analytic treatment, but we can only achieve our therapeutic purpose by increasing the power of analysis to come to the assistance of the ego. Hypnotic influence seemed to be an excellent instrument for our purposes; but the reasons for our having to abandon it are well known. No substitute for hypnosis has yet been found. From this point of view we can understand how such a master of analysis as Ferenczi came to devote the last years of his life to therapeutic experiments, which, unhappily, proved to be vain.

[1937c, 5026]

If, however, what we are aiming at is a prophylactic treatment of instinctual conflicts that are not currently active but merely potential, it will not be enough to regulate sufferings which are already present in the patient and which he cannot avoid. We should have to make up our minds to provoke fresh sufferings in him; and this we have hitherto quite rightly left to fate. We should receive admonitions from all sides against the presumption of vying with fate in subjecting poor human creatures to such cruel experiments. And what sort of experiments would they be? Could we, for purposes of prophylaxis, take the responsibility of destroying a satisfactory marriage, or causing a patient to give up a post upon which his livelihood depends? Fortunately, we never find ourselves in the position of having to consider whether such interventions in the patient's real life are justified; we do not possess the plenary powers which they would necessitate, and the subject of our therapeutic experiment would certainly refuse to co-operate in it. In practice, then, such a procedure is virtually excluded; but there are, besides, theoretical objections to it. For the work of analysis proceeds best if the patient's pathogenic experiences belong to the past, so that his ego can stand at a distance from them. In states of acute crisis analysis is to all intents and purposes unusable. The ego's whole interest is taken up by the painful reality and it withholds itself from analysis, which is attempting to go below the surface and uncover the influences of the past. To create a fresh conflict would thus only be to make the work of analysis longer and more difficult.

[1937c, 5028]
Concerning the third factor, the alteration of the ego, we have as yet said nothing. When we turn our attention to it, the first impression we receive is that there is much to ask and much to answer here, and that what we have to say about it will prove to be very inadequate. This first impression is confirmed when we go further into the problem. As is well known, the analytic situation consists in our allying ourselves with the ego of the person under treatment, in order to subdue portions of his id which are uncontrolled - that is to say to include them in the synthesis of his ego. The fact that a co-operation of this kind habitually fails in the case of psychotics affords us a first solid footing for our judgement. The ego, if we are to be able to make such a pact with it, must be a normal one. But a normal ego of this sort is, like normality in general, an ideal fiction. The abnormal ego, which is unserviceable for our purposes, is unfortunately no fiction. Every normal person, in fact, is only normal on the average. His ego approximates to that of the psychotic in some part or other and to a greater or lesser extent; and the degree of its remoteness from one end of the series and of its proximity to the other will furnish us with a provisional measure of what we have so indefinitely termed an 'alteration of the ego'.

At the moment, however, we are not concerned with the pathogenic role of the defensive mechanisms. What we are trying to discover is what influence the alteration of the ego which corresponds to them has upon our therapeutic efforts. The material for an answer to this question is given in the volume by Anna Freud to which I have already referred. The essential point is that the patient repeats these modes of reaction during the work of analysis as well, that he produces them before our eyes, as it were. In fact, it is only in this way that we get to know them. This does not mean that they make analysis impossible. On the contrary, they constitute half of our analytic task. The other half, the one which was first tackled by analysis in its early days, is the uncovering of what is hidden in the id. During the treatment our therapeutic work is constantly swinging backwards and forwards like a pendulum between a piece of id-analysis and a piece of ego-analysis. In the one case we want to make something from the id conscious, in the other we want to correct something in the ego. The crux of the matter is that the defensive mechanisms directed against former danger recur in the treatment as resistances against recovery. It follows from this that the ego treats recovery itself as a new danger.
The therapeutic effect depends on making conscious what is repressed, in the widest sense of the word, in the id. We prepare the way for this making conscious by interpretations and constructions, but we have interpreted only for ourselves not for the patient so long as the ego holds on to its earlier defences and does not give up its resistances. Now these resistances, although they belong to the ego, are nevertheless unconscious and in some sense separated off within the ego. The analyst recognizes them more easily than he does the hidden material in the id. One might suppose that it would be sufficient to treat them like portions of the id and, by making them conscious, bring them into connection with the rest of the ego. In this way, we should suppose, one half of the task of analysis would be accomplished; we should not reckon on meeting with a resistance against the uncovering of resistances. But what happens is this. During the work on the resistances the ego withdraws - with a greater or less degree of seriousness - from the agreement on which the analytic situation is founded. The ego ceases to support our efforts at uncovering the id; it opposes them, disobeys the fundamental rule of analysis, and allows no further derivatives of the repressed to emerge. We cannot expect the patient to have a strong conviction of the curative power of analysis. He may have brought along with him a certain amount of confidence in his analyst, which will be strengthened to an effective point by the factors of the positive transference which will be aroused in him. Under the influence of the unpleasurable impulses which he feels as a result of the fresh activation of his defensive conflicts, negative transferences may now gain the upper hand and completely annul the analytic situation. The patient now regards the analyst as no more than a stranger who is making disagreeable demands on him, and he behaves towards him exactly like a child who does not like the stranger and does not believe anything he says. If the analyst tries to explain to the patient one of the distortions made by him for the purposes of defence, and to correct it, he finds him uncomprehending and inaccessible to sound arguments. Thus we see that there is a resistance against the uncovering of resistances, and the defensive mechanisms really do deserve the name which we gave them originally, before they had been more closely examined. They are resistances not only to the making conscious of contents of the id, but also to the analysis as a whole, and thus to recovery.

Unfortunately something else happens as well. In trying to describe this, one can only rely on impressions. Hostility on the one side and partisanship on the other create an atmosphere which is not favourable to objective investigation. It seems that a number of analysts learn to make use of defensive mechanisms which allow them to divert the implications and demands of analysis from themselves (probably by directing them on to other people), so that they themselves remain as they are and are able to withdraw from the critical and corrective influence of analysis. Such an event may justify the words of the writer who warns us that when a man is endowed with power it is hard for him not to misuse it.¹ Sometimes, when we try to understand this, we are driven into drawing a disagreeable analogy with the effect of X-rays on people who handle them without taking special precautions. It would not be surprising if the effect of a constant preoccupation with all the repressed material which struggles for freedom in the human mind were to stir up in the analyst as well all the instinctual demands which he is otherwise able to keep under suppression. These, too, are 'dangers of analysis', though they threaten, not the passive but the active partner in the analytic situation; and we ought not to neglect to meet them. There can be no doubt how this is to be done. Every analyst should periodically - at intervals of five years or so - submit himself to analysis once more, without feeling ashamed of taking this step. This would mean, then, that not only the therapeutic analysis of patients but his own analysis would change from a terminable into an interminable task.

[1937c, 5034]

[1937c, 5043]
At this point, however, we must guard against a misconception. I am not intending to assert that analysis is altogether an endless business. Whatever one's theoretical attitude to the question may be, the termination of an analysis is, I think, a practical matter. Every experienced analyst will be able to recall a number of cases in which he has bid his patient a permanent farewell *rebus bene gestis*. In cases of what is known as character-analysis there is a far smaller discrepancy between theory and practice. Here it is not easy to foresee a natural end, even if one avoids any exaggerated expectations and sets the analysis no excessive tasks. Our aim will not be to rub off every peculiarity of human character for the sake of a schematic 'normality', nor yet to demand that the person who has been 'thoroughly analysed' shall feel no passions and develop no internal conflicts. The business of the analysis is to secure the best possible psychological conditions for the functions of the ego; with that it has discharged its task.

But we also learn from this that it is not important in what form the resistance appears, whether as a transference or not. The decisive thing remains that the resistance prevents any change from taking place - that everything stays as it was. We often have the impression that with the wish for a penis and the masculine protest we have penetrated through all the psychological strata and have reached bedrock, and that thus our activities are at an end. This is probably true, since, for the psychical field, the biological field does in fact play the part of the underlying bedrock. The repudiation of femininity can be nothing else than a biological fact, a part of the great riddle of sex.¹ It would be hard to say whether and when we have succeeded in mastering this factor in an analytic treatment. We can only console ourselves with the certainty that we have given the person analysed every possible encouragement to re-examine and alter his attitude to it.

It is familiar ground that the work of analysis aims at inducing the patient to give up the repressions (using the word in the widest sense) belonging to his early development and to replace them by reactions of a sort that would correspond to a psychically mature condition. With this purpose in view he must be brought to recollect certain experiences and the affective impulses called up by them which he has for the time being forgotten. We know that his present symptoms and inhibitions are the consequences of repressions of this kind: thus that they are a substitute for these things that he has forgotten. What sort of material does he put at our disposal which we can make use of to put him on the way to recovering the lost memories? All kinds of things. He gives us fragments of these memories in his dreams, invaluable in themselves but seriously distorted as a rule by all the factors concerned in the formation of dreams. Again, he produces ideas, if he gives himself up to 'free association', in which we can discover allusions to the repressed experiences and derivatives of the suppressed affective impulses as well as of the reactions against them. And, finally, there are hints of repetitions of the affects belonging to the repressed material to be found in actions performed by the patient, some fairly important, some trivial, both inside and outside the analytic situation. Our experience has shown that the relation of transference, which becomes established towards the analyst, is particularly calculated to favour the return of these emotional connections. It is out of such raw material - if we may so describe it - that we have to put together what we are in search of.
What we are in search of is a picture of the patient's forgotten years that shall be alike trustworthy and in all essential respects complete. But at this point we are reminded that the work of analysis consists of two quite different portions, that it is carried on in two separate localities, that it involves two people, to each of whom a distinct task is assigned. It may for a moment seem strange that such a fundamental fact should not have been pointed out long ago; but it will immediately be perceived that there was nothing being kept back in this, that it is a fact which is universally known and, as it were, self-evident and is merely being brought into relief here and separately examined for a particular purpose. We all know that the person who is being analysed has to be induced to remember something that has been experienced by him and repressed; and the dynamic determinants of this process are so interesting that the other portion of the work, the task performed by the analyst, has been pushed into the background. The analyst has neither experienced nor repressed any of the material under consideration; his task cannot be to remember anything. What then is his task? His task is to make out what has been forgotten from the traces which it has left behind or, more correctly, to construct it. The time and manner in which he conveys his constructions to the person who is being analysed, as well as the explanations with which he accompanies them, constitute the link between the two portions of the work of analysis, between his own part and that of the patient.

[1937d, 5050]

The analyst, as we have said, works under more favourable conditions than the archaeologist since he has at his disposal material which can have no counterpart in excavations, such as the repetitions of reactions dating from infancy and all that is indicated by the transference in connection with these repetitions. But in addition to this it must be borne in mind that the excavator is dealing with destroyed objects of which large and important portions have quite certainly been lost, by mechanical violence, by fire and by plundering. No amount of effort can result in their discovery and lead to their being united with the surviving remains. The one and only course open is that of reconstruction, which for this reason can often reach only a certain degree of probability. But it is different with the psychical object whose early history the analyst is seeking to recover. Here we are regularly met by a situation which with the archaeological object occurs only in such rare circumstances as those of Pompeii or of the tomb of Tut'ankhamun. All of the essentials are preserved; even things that seem completely forgotten are present somehow and somewhere, and have merely been buried and made inaccessible to the subject. Indeed, it may, as we know, be doubted whether any psychical structure can really be the victim of total destruction. It depends only upon analytic technique whether we shall succeed in bringing what is concealed completely to light. There are only two other facts that weigh against the extraordinary advantage which is thus enjoyed by the work of analysis: namely, that psychical objects are incomparably more complicated than the excavator's material ones and that we have insufficient knowledge of what we may expect to find, since their finer structure contains so much that is still mysterious. But our comparison between the two forms of work can go no further than this; for the main difference between them lies in the fact that for the archaeologist the reconstruction is the aim and end of his endeavours while for analysis the construction is only a preliminary labour.

[1937d, 5051]
Thus our therapeutic work falls into two phases. In the first, all the libido is forced from the symptoms into the transference and concentrated there; in the second, the struggle is waged around this new object and the libido is liberated from it. The change which is decisive for a favourable outcome is the elimination of repression in this renewed conflict so that the libido cannot withdraw once more from the ego by flight into the unconscious. This is made possible by the alteration of the ego which is accomplished under the influence of the doctor's suggestion. By means of the work of interpretation, which transforms what is unconscious into what is conscious, the ego is enlarged at the cost of this unconscious; by means of instruction, it is made conciliatory towards the libido and inclined to grant it some satisfaction, and its repugnance to the claims of the libido is diminished by the possibility of disposing of a portion of it by sublimation. The more closely events in the treatment coincide with this ideal description, the greater will be the success of the psycho-analytic therapy. It finds its limits in the lack of mobility of the libido, which may refuse to leave its objects, and the rigidity of narcissism, which will not allow transference on to objects to increase beyond certain bounds. Further light may perhaps be thrown on the dynamics of the process of cure if I say that we get hold of the whole of the libido which has been withdrawn from the dominance of the ego by attracting a portion of it on to ourselves by means of the transference.

During the work of treatment we have to consider the distribution of the patient's libido; we look for the object presentations to which it is bound and free it from them, so as to place it at the disposal of the ego. In the course of this, we have come to form a very curious picture of the original, primal distribution of libido in human beings. We have been driven to assume that at the beginning of the development of the individual all his libido (all his erotic tendencies, all his capacity for love) is tied to himself - that as we say, it cathects his own ego. It is only later that, being attached to the satisfaction of the major vital needs, the libido flows over from the ego on to external objects. Not till then are we able to recognize the libidinal instincts as such and distinguish them from the ego instincts. It is possible for the libido to become detached from these objects and withdrawn again into the ego.

Comparison between Psycho-Analysis and Hypnotic and Suggestive Methods. - Psychoanalytic procedure differs from all methods making use of suggestion, persuasion, etc., in that it does not seek to suppress by means of authority any mental phenomenon that may occur in the patient. It endeavours to trace the causation of the phenomenon and to remove it by bringing about a permanent modification in the conditions that led to it. In psycho-analysis the suggestive influence which is inevitably exercised by the physician is diverted on to the task assigned to the patient of overcoming his resistances, that is, of carrying forward the curative process. Any danger of falsifying the products of a patient's memory by suggestion can be avoided by prudent handling of the technique; but in general the arousing of resistances is a guarantee against the misleading effects of suggestive influence. It may be laid down that the aim of the treatment is to remove the patient's resistances and to pass his repressions in review and thus to bring about the most far-reaching unification and strengthening of his ego, to enable him to save the mental energy which he is expending upon internal conflicts, to make the best of him that his inherited capacities will allow and so to make him as efficient and as capable of enjoyment as is possible. The removal of the symptoms of the illness is not specifically aimed at, but is achieved, as it were, as a by-product if the analysis is properly carried through. The analyst respects the patient's individuality and does not seek to remould him in accordance with his own - that is, according to the physician's - personal ideals; he is glad to avoid giving advice and instead to arouse the patient's power of initiative.
There are two paths by which the contents of the id can penetrate into the ego. The one is direct, the other leads by way of the ego ideal; which of these two paths they take may, for some mental activities, be of decisive importance. The ego develops from perceiving instincts to controlling them, from obeying instincts to inhibiting them. In this achievement a large share is taken by the ego ideal, which indeed is partly a reaction-formation against the instinctual processes of the id. Psycho-analysis is an instrument to enable the ego to achieve a progressive conquest of the id.

[1923b, 3989]

That this is a correct account of fixation upon repression and of the retention of danger-situations that are no longer present-day ones is confirmed by the fact of analytic therapy - a fact which is modest enough in itself but which can hardly be overrated from a theoretical point of view. When, in analysis, we have given the ego assistance which is able to put it in a position to lift its repressions, it recovers its power over the repressed id and can allow the instinctual impulses to run their course as though the old situations of danger no longer existed. What we can do in this way tallies with what can be achieved in other fields of medicine; for as a rule our therapy must be content with bringing about more quickly, more reliably and with less expenditure of energy than would otherwise be the case the good result which in favourable circumstances would have occurred of itself.

[1926d, 4308]

It is easy now to describe our therapeutic aim. We try to restore the ego, to free it from its restrictions, and to give it back the command over the id which it has lost owing to its early repressions. It is for this one purpose that we carry out analysis, our whole technique is directed to this aim. We have to seek out the repressions which have been set up and to urge the ego to correct them with our help and to deal with conflicts better than by an attempt at flight. Since these repressions belong to the very early years of childhood, the work of analysis leads us, too, back to that period. Our path to these situations of conflict, which have for the most part been forgotten and which we try to revive in the patient's memory, is pointed out to us by his symptoms, dreams and free associations. These must, however, first be interpreted - translated - for, under the influence of the psychology of the id, they have assumed forms of expression that are strange to our comprehension. We may assume that whatever associations, thoughts and memories the patient is unable to communicate to us without internal struggles are in some way connected with the repressed material or are its derivatives. By encouraging the patient to disregard his resistances to telling us these things, we are educating his ego to overcome its inclination towards attempts at flight and to tolerate an approach to what is repressed. In the end, if the situation of the repression can be successfully reproduced in his memory, his compliance will be brilliantly rewarded. The whole difference between his age then and now works in his favour; and the thing from which his childish ego fled in terror will often seem to his adult and strengthened ego no more than child's play.

[1926e, 4348]

'I will add that. Thereupon he begins to talk and I listen. And what then? I infer from what he tells me the kind of impressions, experiences and wishes which he has repressed because he came across them at a time when his ego was still feeble and was afraid of them instead of dealing with them. When he has learnt this from me, he puts himself back in the old situations and with my help he manages better. The limitations to which his ego was tied then disappear, and he is cured. Is that right?'

[1926e, 4360]
That is a question of tact, which can become more refined with experience. You will be making a bad mistake if, in an effort, perhaps, at shortening the analysis, you throw your interpretations at the patient's head as soon as you have found them. In that way you will draw expressions of resistance, rejection and indignation from him; but you will not enable his ego to master his repressed material. The formula is: to wait till he has come so near to the repressed material that he has only a few more steps to take under the lead of the interpretation you propose.

[1926e, 4362]

Yes, we are only beginning to appreciate the significance of all these important circumstances. That is why my description was bound to turn out so obscure. But now I can proceed. We describe all the forces that oppose the work of recovery as the patient's 'resistances'. The gain from illness is one such resistance. The 'unconscious sense of guilt' represents the super-ego's resistance; it is the most powerful factor, and the one most dreaded by us. We meet with still other resistances during the treatment. If the ego during the early period has set up a repression out of fear, then the fear still persists and manifests itself as a resistance if the ego approaches the repressed material. And finally, as you can imagine, there are likely to be difficulties if an instinctual process which has been going along a particular path for whole decades is suddenly expected to take a new path that has just been made open for it. That might be called the id's resistance. The struggle against all these resistances is our main work during an analytic treatment; the task of making interpretations is nothing compared to it. But as a result of this struggle and of the overcoming of the resistances, the patient's ego is so much altered and strengthened that we can look forward calmly to his future behaviour when the treatment is over. On the other hand, you can understand now why we need such long treatments. The length of the path of development and the wealth of the material are not the decisive factors. It is more a question of whether the path is clear. An army can be held up for weeks on a stretch of country which in peace time an express train crosses in a couple of hours - if the army has to overcome the enemy's resistance there. Such battles call for time in mental life too. I am unfortunately obliged to tell you that every effort to hasten analytic treatment appreciably has hitherto failed. The best way of shortening it seems to be to carry it out according to the rules.

[1926e, 4366]
Again, I attach no great importance to the argument that a lay analyst, because he must be prepared to consult a doctor, will have no authority in the eyes of his patients and will be treated with no more respect than such people as bone-setters or masseurs. Once again, the analogy is an imperfect one - quite apart from the fact that what governs patients in their recognition of authority is usually their emotional transference and that the possession of a medical diploma does not impress them nearly so much as doctors believe. A professional lay analyst will have no difficulty in winning as much respect as is due to a secular pastoral worker. Indeed, the words, 'secular pastoral worker', might well serve as a general formula for describing the function which the analyst, whether he is a doctor or a layman, has to perform in his relation to the public. Our friends among the protestant clergy, and more recently among the catholic clergy as well, are often able to relieve their parishioners of the inhibitions of their daily life by confirming their faith - after having first offered them a little analytic information about the nature of their conflicts. Our opponents, the Adlerian 'individual psychologists', endeavour to produce a similar result in people who have become unstable and inefficient by arousing their interest in the social community after having first thrown some light upon a single corner of their mental life and shown them the part played in their illness by their egoistic and distrustful impulses. Both of these procedures, which derive their power from being based on analysis, have their place in psychotherapy. We who are analysts set before us as our aim the most complete and profoundest possible analysis of whoever may be our patient. We do not seek to bring him relief by receiving him into the catholic, protestant or socialist community. We seek rather to enrich him from his own internal sources, by putting at the disposal of his ego those energies which, owing to repression, are inaccessibly confined in his unconscious, as well as those which his ego is obliged to squander in the fruitless task of maintaining these repressions. Such activity as this is pastoral work in the best sense of the words. Have we set ourselves too high an aim? Are the majority of our patients worth the pains that this work requires of us? Would it not be more economical to prop up their weaknesses from without rather than to rebuild them from within? I cannot say; but there is something else that I do know. In psycho-analysis there has existed from the very first an inseparable bond between cure and research. Knowledge brought therapeutic success. It was impossible to treat a patient without learning something new; it was impossible to gain fresh insight without perceiving its beneficent results. Our analytic procedure is the only one in which this precious conjunction is assured. It is only by carrying on our analytic pastoral work that we can deepen our dawning comprehension of the human mind. This prospect of scientific gain has been the proudest and happiest feature of analytic work. Are we to sacrifice it for the sake of any considerations of a practical sort?
And here is another warning, to conclude these remarks, which have certainly been exacting and not, perhaps, very illuminating. In thinking of this division of the personality into an ego, a super-ego and an id, you will not, of course, have pictured sharp frontiers like the artificial ones drawn in political geography. We cannot do justice to the characteristics of the mind by linear outlines like those in a drawing or in primitive painting, but rather by areas of colour melting into one another as they are presented by modern artists. After making the separation we must allow what we have separated to merge together once more. You must not judge too harshly a first attempt at giving a pictorial representations of something so intangible as psychical processes. It is highly probable that the development of these divisions is subject to great variations in different individuals; it is possible that in the course of actual functioning they may change and go through a temporary phase of involution. Particularly in the case of what is phylogenetically the last and most delicate of these divisions - the differentiation between the ego and the super-ego - something of the sort seems to be true. There is no question but that the same thing results from psychical illness. It is easy to imagine, too, that certain mystical practices may succeed in upsetting the normal relations between the different regions of the mind, so that, for instance, perception may be able to grasp happenings in the depths of the ego and in the id which were otherwise inaccessible to it. It may safely be doubted, however, whether this road will lead us to the ultimate truths from which salvation is to be expected. Nevertheless it may be admitted that the therapeutic efforts of psycho-analysis have chosen a similar line of approach. Its intention is, indeed, to strengthen the ego, to make it more independent of the super-ego, to widen its field of perception and enlarge its organization, so that it can appropriate fresh portions of the id. Where id was, there ego shall be. It is a work of culture - not unlike the draining of the Zuider Zee.

[1933a, 4687]

Our plan of cure is based on these discoveries. The ego is weakened by the internal conflict and we must go to its help. The position is like that in a civil war which has to be decided by the assistance of an ally from outside. The analytic physician and the patient's weakened ego, basing themselves on the real external world, have to band themselves together into a party against the enemies, the instinctual demands of the id and the conscientious demands of the super-ego. We form a pact with each other. The sick ego promises us the most complete candour - promises, that is, to put at our disposal all the material which its self-perception yields it; we assure the patient of the strictest discretion and place at his service our experience in interpreting material that has been influenced by the unconscious. Our knowledge is to make up for his ignorance and to give his ego back its mastery over lost provinces of his mental life. This pact constitutes the analytic situation.

[1940a [1938], 4983]
The method by which we strengthen the weakened ego has as a starting-point an extending of its self-knowledge. That is not, of course, the whole story but it is a first step. The loss of such knowledge signifies for the ego a surrender of power and influence; it is the first tangible sign that it is being hemmed in and hampered by the demands of the id and the super-ego. Accordingly, the first part of the help we have to offer is intellectual work on our side and encouragement to the patient to collaborate in it. This first kind of activity, as we know, is intended to pave the way to another, more difficult, task. We shall not lose sight of the dynamic element in this task, even during its preliminary stage. We gather the material for our work from a variety of sources - from what is conveyed to us by the information given us by the patient and by his free associations, from what he shows us in his transferences, from what we arrive at by interpreting his dreams and from what he betrays by his slips or parapraxes. All this material helps us to make constructions about what happened to him and has been forgotten as well as about what is happening in him now without his understanding it. But in all this we never fail to make a strict distinction between our knowledge and his knowledge. We avoid telling him at once things that we have often discovered at an early stage, and we avoid telling him the whole of what we think we have discovered. We reflect carefully over when we shall impart the knowledge of one of our constructions to him and we wait for what seems to us the suitable moment - which it is not always easy to decide. As a rule we put off telling him of a construction or explanation till he himself has so nearly arrived at it that only a single step remains to be taken, though that step is in fact the decisive synthesis. If we proceeded in another way and overwhelmed him with our interpretations before he was prepared for them, our information would either produce no effect or it would provoke a violent outbreak of resistance which would make the progress of our work more difficult or might even threaten to stop it altogether. But if we have prepared everything properly, it often happens that the patient will at once confirm our construction and himself recollect the internal or external event which he had forgotten. The more exactly the construction coincides with the details of what has been forgotten the easier will it be for him to assent. On that particular matter our knowledge will then have become his knowledge as well.

[1940a [1938], 4987]
With the mention of resistance we have reached the second and more important part of our task. We have already learnt that the ego protects itself against the invasion of undesired elements from the unconscious and repressed id by means of anticathexes, which must remain intact if it is to function normally. The more hard-pressed the ego feels, the more convulsively it clings (as though in a fright) to these anticathexes, in order to protect what remains of itself from further irruptions. But this defensive purpose does not by any means accord with the aims of our treatment. What we desire, on the contrary, is that the ego, emboldened by the certainty of our help, shall dare to take the offensive in order to reconquer what has been lost. And it is here that we become aware of the strength of these anticathexes in the form of resistances to our work. The ego draws back in alarm from such undertakings, which seem dangerous and threaten unpleasure; it must be constantly encouraged and soothed if it is not to fail us. This resistance, which persists throughout the whole treatment and is renewed at every fresh piece of work, is known, not quite correctly, as the resistance due to repression. We shall find that it is not the only one that faces us. It is interesting to notice that in this situation the party-divisions are to some extent reversed: for the ego struggles against our instigation, while the unconscious, which is ordinarily our opponent, comes to our help, since it has a natural 'upward drive' and desires nothing better than to press forward across its settled frontiers into the ego and so to consciousness. The struggle which develops, if we gain our end and can induce the ego to overcome its resistances, is carried through under our direction and with our assistance. Its outcome is a matter of indifference: whether it results in the ego accepting, after a fresh examination, an instinctual demand which it has hitherto rejected, or whether it dismisses it once more, this time for good and all. In either case a permanent danger has been disposed of, the compass of the ego has been extended and a wasteful expenditure of energy has been made unnecessary.

[1940a [1938], 4988]

The overcoming of resistances is the part of our work that requires the most time and the greatest trouble. It is worth while, however, for it brings about an advantageous alteration of the ego which will be maintained independently of the outcome of the transference and will hold good in life. We have also worked simultaneously at getting rid of the alteration of the ego which had been brought about under the influence of the unconscious; for whenever we have been able to detect any of its derivatives in the ego we have pointed out their illegitimate origin and have instigated the ego to reject them. It will be remembered that it was one of the necessary preconditions of our pact of assistance that any such alteration of the ego due to the intrusion of unconscious elements should not have gone beyond a certain amount.

[1940a [1938], 4989]
Let us once more glance over the situation which we have reached in our attempt at bringing help to the patient's neurotic ego. That ego is no longer able to fulfil the task set it by the external world (including human society). Not all of its experiences are at its disposal, a large proportion of its store of memories have escaped it. Its activity is inhibited by strict prohibitions from the super-ego, its energy is consumed in vain attempts at fending off the demands of the id. Beyond this, as a result of continuous irruptions by the id, its organization is impaired, it is no longer capable of any proper synthesis, it is torn by mutually opposed urges, by unsettled conflicts and by unsolved doubts. To start with, we get the patient's thus weakened ego to take part in the purely intellectual work of interpretation, which aims at provisionally filling the gaps in his mental assets, and to transfer to us the authority of his super-ego; we encourage it to take up the struggle over each individual demand made by the id and to conquer the resistances which arise in connection with it. At the same time we restore order in the ego by detecting the material and urges which have forced their way in from the unconscious, and expose them to criticism by tracing them back to their origin. We serve the patient in various functions, as an authority and a substitute for his parents, as a teacher and educator; and we have done the best for him if, as analysts, we raise the mental processes in his ego to a normal level, transform what has become unconscious and repressed into preconscious material and thus return it once more to the possession of his ego. On the patient's side a few rational factors work in our favour, such as the need for recovery which has its motive in his sufferings, and the intellectual interest that we may awaken in him in the theories and revelations of psycho-analysis; but of far greater force is the positive transference with which he meets us. Fighting against us, on the other hand, are the negative transference, the ego's resistance due to repression (that is, its unpleasure at having to lay itself open to the hard work imposed on it), the sense of guilt arising from its relation to the super-ego and the need to be ill due to deep-going changes in the economics of his instincts. The share taken by the last two factors decides whether the case is to be regarded as slight or severe. Apart from these, a few other factors may be discerned as having a favourable or unfavourable bearing. A certain psychical inertia, a sluggishness of the libido, which is unwilling to abandon its fixations cannot be welcome to us; the patient's capacity for sublimating his instincts plays a large part and so does his capacity for rising above the crude life of the instincts; so, too, does the relative power of his intellectual functions.

[1940a [1938], 4990]

Every analyst will have treated a few cases which have had this gratifying outcome. He has succeeded in clearing up the patient's neurotic disturbance, and it has not returned and has not been replaced by any other such disturbance. Nor are we without some insight into the determinants of these successes. The patient's ego had not been noticeably altered and the aetiology of his disturbance had been essentially traumatic. The aetiology of every neurotic disturbance is, after all, a mixed one. It is a question either of the instincts being excessively strong - that is to say, recalcitrant to taming by the ego - or of the effects of early (i.e. premature) traumas which the immature ego was unable to master. As a rule there is a combination of both factors, the constitutional and the accidental. The stronger the constitutional factor, the more readily will a trauma lead to a fixation and leave behind a developmental disturbance; the stronger the trauma, the more certainly will its injurious effects become manifest even when the instinctual situation is normal. There is no doubt that an aetiology of the traumatic sort offers by far the more favourable field for analysis. Only when a case is a predominantly traumatic one will analysis succeed in doing what it is so superlatively able to do; only then will it, thanks to having strengthened the patient's ego, succeed in replacing by a correct solution the inadequate decision made in his early life. Only in such cases can one speak of an analysis having been definitively ended. In them, analysis has done all that it should and does not need to be continued. It is true that, if the patient who has been restored in this way never produces another disorder calling for analysis, we do not know how much his immunity may not be due to a kind fate which has spared him ordeals that are too severe.

[1937c, 5018]
Concerning the third factor, the alteration of the ego, we have as yet said nothing. When we turn our attention to it, the first impression we receive is that there is much to ask and much to answer here, and that what we have to say about it will prove to be very inadequate. This first impression is confirmed when we go further into the problem. As is well known, the analytic situation consists in our allying ourselves with the ego of the person under treatment, in order to subdue portions of his id which are uncontrolled - that is to say to include them in the synthesis of his ego. The fact that a co-operation of this kind habitually fails in the case of psychotics affords us a first solid footing for our judgement. The ego, if we are to be able to make such a pact with it, must be a normal one. But a normal ego of this sort is, like normality in general, an ideal fiction. The abnormal ego, which is unserviceable for our purposes, is unfortunately no fiction. Every normal person, in fact, is only normal on the average. His ego approximates to that of the psychotic in some part or other and to a greater or lesser extent; and the degree of its remoteness from one end of the series and of its proximity to the other will furnish us with a provisional measure of what we have so indefinitely termed an 'alteration of the ego'.

[1937c, 5030]
In the psychotherapeutic procedure which I employ for resolving and removing neurotic symptoms I am very often faced with the task of discovering, from the patient's apparently casual utterances and associations, a thought-content which is at pains to remain concealed but which cannot nevertheless avoid unintentionally betraying its existence in a whole variety of ways. Slips of the tongue often perform a most valuable service here, as I could show by some highly convincing and at the same time very singular examples. Thus, for instance, a patient will be speaking of his aunt and, without noticing the slip, will consistently call her 'my mother'; or another will refer to her husband as her 'brother'. In this way they draw my attention to the fact that they have 'identified' these persons with one another - that they have put them into a series which implies a recurrence of the same type in their emotional life. To give another example: a young man of twenty introduced himself to me during my consulting hours in these words: 'I am the father of So-and-so who came to you for treatment. I beg your pardon, I meant to say I am his brother: he is four years older than I am.' I inferred that he intended this slip to express the view that, like his brother, he had fallen ill through the fault of his father; that, like his brother, he wished to be cured; but that his father was the one who most needed to be cured. - At other times an arrangement of words that sounds unusual, or an expression that seems forced, is enough to reveal that a repressed thought is participating in the patient's remarks, which had a different end in view.

[1901b, 1171]

If, then, Leonardo's story about the vulture that visited him in his cradle is only a phantasy from a later period, one might suppose it could hardly be worth while spending much time on it. One might be satisfied with explaining it on the basis of his inclination, of which he makes no secret, to regard his preoccupation with the flight of birds as pre-ordained by destiny. Yet in underrating this story one would be committing just as great an injustice as if one were carelessly to reject the body of legends, traditions and interpretations found in a nation's early history. In spite of all the distortions and misunderstandings, they still represent the reality of the past: they are what a people forms out of the experience of its early days and under the dominance of motives that were once powerful and still operate to-day; and if it were only possible, by a knowledge of all the forces at work, to undo these distortions, there would be no difficulty in disclosing the historical truth lying behind the legendary material. The same holds good for the childhood memories or phantasies of an individual. What someone thinks he remembers from his childhood is not a matter of indifference; as a rule the residual memories - which he himself does not understand - cloak priceless pieces of evidence about the most important features in his mental development.¹ As we now possess in the techniques of psycho-analysis excellent methods for helping us to bring this concealed material to light, we may venture to fill in the gap in Leonardo's life story by analysing his childhood phantasy. And if in doing so we remain dissatisfied with the degree of certainty which we achieve, we shall have to console ourselves with the reflection that so many other studies of this great and enigmatic man have met with no better fate.

[1910c, 2261]
This answer of course involves a condemnation of any line of behaviour which would lead us to give the patient a translation of his symptoms as soon as we have guessed it ourselves, or would even lead us to regard it as a special triumph to fling these ‘solutions’ in his face at the first interview. It is not difficult for a skilled analyst to read the patient’s secret wishes plainly between the lines of his complaints and the story of his illness; but what a measure of self-complacency and thoughtlessness must be possessed by anyone who can, on the shortest acquaintance, inform a stranger who is entirely ignorant of all the tenets of analysis that he is attached to his mother by incestuous ties, that he harbours wishes for the death of his wife whom he appears to love, that he conceals an intention of betraying his superior, and so on! I have heard that there are analysts who plume themselves upon these kinds of lightning diagnoses and ‘express’ treatments, but I must warn everyone against following such examples. Behaviour of this sort will completely discredit oneself and the treatment in the patient’s eyes and will arouse the most violent opposition in him, whether one’s guess has been true or not; indeed, the truer the guess the more violent will be the resistance. As a rule the therapeutic effect will be nil; but the deterring of the patient from analysis will be final. Even in the later stages of analysis one must be careful not to give a patient the solution of a symptom or the translation of a wish until he is already so close to it that he has only one short step more to make in order to get hold of the explanation for himself. In former years I often had occasion to find that the premature communication of a solution brought the treatment to an untimely end, on account not only of the resistances which it thus suddenly awakened but also of the relief which the solution brought with it.

[1913c, 2492]

The construction of a symptom is a substitute for something else that did not happen. Some particular mental processes should normally have developed to a point at which consciousness received information of them. This, however, did not take place, and instead - out of the interrupted processes, which had been somehow disturbed and were obliged to remain unconscious - the symptom emerged. Thus something in the nature of an exchange has taken place; if this can be reversed the therapy of the neurotic symptoms will have achieved its task.

[1916-1917, 3357]

Our plan of cure is based on these discoveries. The ego is weakened by the internal conflict and we must go to its help. The position is like that in a civil war which has to be decided by the assistance of an ally from outside. The analytic physician and the patient’s weakened ego, basing themselves on the real external world, have to band themselves together into a party against the enemies, the instinctual demands of the id and the conscientious demands of the super-ego. We form a pact with each other. The sick ego promises us the most complete candour - promises, that is, to put at our disposal all the material which its self-perception yields it; we assure the patient of the strictest discretion and place at his service our experience in interpreting material that has been influenced by the unconscious. Our knowledge is to make up for his ignorance and to give his ego back its mastery over lost provinces of his mental life. This pact constitutes the analytic situation.

[1940a [1938], 4983]
With the neurotics, then, we make our pact: complete candour on one side and strict discretion on the other. This looks as though we were only aiming at the post of a secular father confessor. But there is a great difference, for what we want to hear from our patient is not only what he knows and conceals from other people; he is to tell us too what he does not know. With this end in view we give him a more detailed definition of what we mean by candour. We pledge him to obey the fundamental rule of analysis, which is henceforward to govern his behaviour towards us. He is to tell us not only what he can say intentionally and willingly, what will give him relief like a confession, but everything else as well that his self-observation yields him, everything that comes into his head, even if it is disagreeable for him to say it, even if it seems to him unimportant or actually nonsensical. If he can succeed after this injunction in putting his self-criticism out of action, he will present us with a mass of material - thoughts, ideas, recollections - which are already subject to the influence of the unconscious, which are often its direct derivatives, and which thus put us in a position to conjecture his repressed unconscious material and to extend, by the information we give him, his ego's knowledge of his unconscious. [1940a [1938], 4984]

The method by which we strengthen the weakened ego has as a starting-point an extending of its self-knowledge. That is not, of course, the whole story but it is a first step. The loss of such knowledge signifies for the ego a surrender of power and influence; it is the first tangible sign that it is being hemmed in and hampered by the demands of the id and the super-ego. Accordingly, the first part of the help we have to offer is intellectual work on our side and encouragement to the patient to collaborate in it. This first kind of activity, as we know, is intended to pave the way to another, more difficult, task. We shall not lose sight of the dynamic element in this task, even during its preliminary stage. We gather the material for our work from a variety of sources - from what is conveyed to us by the information given us by the patient and by his free associations, from what he shows us in his transferences, from what we arrive at by interpreting his dreams and from what he betrays by his slips or parapraxes. All this material helps us to make constructions about what happened to him and has been forgotten as well as about what is happening in him now without his understanding it. But in all this we never fail to make a strict distinction between our knowledge and his knowledge. We avoid telling him at once things that we have often discovered at an early stage, and we avoid telling him the whole of what we think we have discovered. We reflect carefully over when we shall impart the knowledge of one of our constructions to him and we wait for what seems to us the suitable moment - which it is not always easy to decide. As a rule we put off telling him of a construction or explanation till he himself has so nearly arrived at it that only a single step remains to be taken, though that step is in fact the decisive synthesis. If we proceeded in another way and overwhelmed him with our interpretations before he was prepared for them, our information would either produce no effect or it would provoke a violent outbreak of resistance which would make the progress of our work more difficult or might even threaten to stop it altogether. But if we have prepared everything properly, it often happens that the patient will at once confirm our construction and himself recollect the internal or external event which he had forgotten. The more exactly the construction coincides with the details of what has been forgotten the easier will it be for him to assent. On that particular matter our knowledge will then have become his knowledge as well. [1940a [1938], 4987]
How is it possible to remain convinced of the reality of these analytic confessions which claim to be memories preserved from the earliest childhood? and how is one to arm oneself against the tendency to lies and the facility of invention which are attributed to hysterical subjects? I should accuse myself of blame-worthy credulity if I did not possess more conclusive evidence. But the fact is that these patients never repeat these stories spontaneously, nor do they ever in the course of a treatment suddenly present the physician with the complete recollection of a scene of this kind. One only succeeds in awakening the psychical trace of a precocious sexual event under the most energetic pressure of the analytic procedure, and against an enormous resistance. Moreover, the memory must be extracted from them piece by piece, and while it is being awakened in their consciousness they become the prey to an emotion which it would be hard to counterfeit.

[1896a, 377]

GENTLEMEN, - When we set out to form an opinion about the causation of a pathological state such as hysteria, we begin by adopting the method of anamnestic investigation: we question the patient or those about him in order to find out to what harmful influences they themselves attribute his having fallen ill and developed these neurotic symptoms. What we discover in this way is, of course, falsified by all the factors which commonly hide the knowledge of his own state from a patient - by his lack of scientific understanding of aetiological influences, by the fallacy of post hoc, propter hoc, by his reluctance to think about or mention certain noxae and traumas. Thus in making an anamnestic investigation of this sort, we keep to the principle of not adopting the patients' belief without a thorough critical examination, of not allowing them to lay down our scientific opinion for us on the aetiology of the neurosis. Although we do, on the one hand, acknowledge the truth of certain constantly repeated assertions, such as that the hysterical state is a long-persisting after-effect of an emotion experienced in the past, we have, on the other hand, introduced into the aetiology of hysteria a factor which the patient himself never brings forward and whose validity he only reluctantly admits - namely, the hereditary disposition derived from his progenitors. As you know, in the view of the influential school of Charcot heredity alone deserves to be recognized as the true cause of hysteria, while all other noxae of the most various nature and intensity only play the part of incidental causes, of 'agents provocateurs'.

[1896c, 407]
Finding fault with one's wife, a friendship which has turned into its opposite, a doctor's error in diagnosis, a rebuff by some one with similar interests, borrowing someone else's ideas - it can hardly be accidental that a collection of instances of forgetting, gathered at random, should require me to enter into such distressing subjects in explaining them. On the contrary, I suspect that everyone who is willing to enquire into the motives behind his lapses of memory will be able to record a similar sample list of objectionable subjects. The tendency to forget what is disagreeable seems to me to be a quite universal one; the capacity to do so is doubtless developed with different degrees of strength in different people. It is probable that many instances of disowning which we encounter in our medical work are to be traced to forgetting.¹ It is true that our view of such forgetting limits the distinction between the two forms of behaviour to purely psychological factors and allows us to see in both modes of reaction the expression of the same motive. Of all the numerous examples of the disavowal of unpleasant memories which I have observed on the part of relatives of patients, one remains in my recollection as especially singular. A mother was giving me information about the childhood of her neurotic son, now in his puberty, in the course of which she said that, like his brothers and sisters, he had been a bed-wetter till late on - a fact which is certainly of some significance in the case history of a neurotic patient. A few weeks later, when she was wanting to find out about the progress of the treatment, I had occasion to draw her attention to the signs of a constitutional disposition to illness on the young man's part, and in doing so I referred to the bed-wetting which she had brought out in the anamnesis. To my astonishment she contested this fact in regard both to him and to the other children, and asked me how I could know it. Finally I told her that she herself had informed me a short time before. She must therefore have forgotten it.²

¹ [Footnote added 1907:] If we ask someone whether he suffered from a luetic infection ten or fifteen years ago, we are too apt to overlook the fact that, from a psychical point of view, he will have regarded this illness quite differently from, let us say, an acute attack of rheumatism. - In the anamneses which parents give about their daughters' neurotic illnesses, it is hardly possible to distinguish with certainty between what has been forgotten and what is being concealed, since everything standing in the way of a girl's future marriage is systematically set aside, i.e. repressed, by the parents. - [Added 1910:] A man who had recently lost his dearly-loved wife from an affection of the lungs reported the following instance to me in which misleading answers given to the doctor's enquiries could only be ascribed to forgetting of this kind. 'As my poor wife's pleuritis had still not improved after many weeks, Dr. P. was called into consultation. In taking the anamnesis he asked the usual questions, including whether there were any cases of lung illness in my wife's family. My wife said there were none and I could not recall any either. As Dr. P. was leaving, the conversation turned, as though accidentally, to the subject of excursions and my wife said: "Yes, it's a long journey, too, to Langersdorf, where my poor brother's buried." This brother died about fifteen years ago after suffering for years from tuberculosis. My wife was very fond of him and often spoken to me about him. In fact it now occurred to me that at the time that her pleuritis was diagnosed she was very worried and remarked gloomily: "My brother died of a lung complaint too." But now, the memory was so strongly repressed that even after her remark about the excursion to Langersdorf she was not led to correct the information she had given about illnesses in her family. I myself became aware of the lapse of memory at the very moment she spoke of Langersdorf.' - [Added 1912:] A completely analogous experience is related by Jones in the work to which I have referred several times already. A physician, whose wife suffered from an abdominal complaint the diagnosis of which was uncertain, remarked by way of comforting her: 'It is fortunate at any rate that there has been no tuberculosis in your family.' "Have you forgotten", answered his wife in the greatest astonishment, "that my mother died of tuberculosis and that my sister recovered from it only after having been given up by the doctors?"

² [1901b, 1228]
If I were to begin by giving a full and consistent case history, it would place the reader in a very different situation from that of the medical observer. The reports of the patient's relatives - in the present case I was given one by the eighteen-year-old girl's father - usually afford a very indistinct picture of the course of the illness. I begin the treatment, indeed, by asking the patient to give me the whole story of his life and illness, but even so the information I receive is never enough to let me see my way about the case. This first account may be compared to an unnavigable river whose stream is at one moment choked by masses of rock and at another divided and lost among shallows and sandbanks. I cannot help wondering how it is that the authorities can produce such smooth and precise histories in cases of hysteria. As a matter of fact the patients are incapable of giving such reports about themselves. They can, indeed, give the physician plenty of coherent information about this or that period of their lives; but it is sure to be followed by another period as to which their communications run dry, leaving gaps unfilled, and riddles unanswered; and then again will come yet another period which will remain totally obscure and unilluminated by even a single piece of serviceable information. The connections - even the ostensible ones - are for the most part incoherent, and the sequence of different events is uncertain. Even during the course of their story patients will repeatedly correct a particular or a date, and then perhaps, after wavering for some time, return to their first version. The patients' inability to give an ordered history of their life in so far as it coincides with the history of their illness is not merely characteristic of the neurosis.¹ It also possesses great theoretical significance. For this inability has the following grounds. In the first place, patients consciously and intentionally keep back part of what they ought to tell - things that are perfectly known to them - because they have not got over their feelings of timidity and shame (or discretion, where what they say concerns other people); this is the share taken by conscious disingenuousness. In the second place, part of the anamnestic knowledge, which the patients have at their disposal at other times, disappears while they are actually telling their story, but without their making any deliberate reservations: the share taken by unconscious disingenuousness. In the third place, there are invariably true amnesias - gaps in the memory into which not only old recollections but even quite recent ones have fallen - and paramnesias, formed secondarily so as to fill in those gaps.² When the events themselves have been kept in mind, the purpose underlying the amnesias can be fulfilled just as surely by destroying a connection, and a connection is most surely broken by altering the chronological order of events. The latter always proves to be the most vulnerable element in the store of memory and the one which is most easily subject to repression. Again we meet with many recollections that are in what might be described as the first stage of repression, and these we find surrounded with doubts. At a later period the doubts would be replaced by a loss or a falsification of memory.³

[1905e, 1358]
It is familiar ground that the work of analysis aims at inducing the patient to give up the repressions (using the word in the widest sense) belonging to his early development and to replace them by reactions of a sort that would correspond to a psychically mature condition. With this purpose in view he must be brought to recollect certain experiences and the affective impulses called up by them which he has for the time being forgotten. We know that his present symptoms and inhibitions are the consequences of repressions of this kind: thus that they are a substitute for these things that he has forgotten. What sort of material does he put at our disposal which we can make use of to put him on the way to recovering the lost memories? All kinds of things. He gives us fragments of these memories in his dreams, invaluable in themselves but seriously distorted as a rule by all the factors concerned in the formation of dreams. Again, he produces ideas, if he gives himself up to 'free association', in which we can discover allusions to the repressed experiences and derivatives of the suppressed affective impulses as well as of the reactions against them. And, finally, there are hints of repetitions of the affects belonging to the repressed material to be found in actions performed by the patient, some fairly important, some trivial, both inside and outside the analytic situation. Our experience has shown that the relation of transference, which becomes established towards the analyst, is particularly calculated to favour the return of these emotional connections. It is out of such raw material - if we may so describe it - that we have to put together what we are in search of.

What we are in search of is a picture of the patient's forgotten years that shall be alike trustworthy and in all essential respects complete. But at this point we are reminded that the work of analysis consists of two quite different portions, that it is carried on in two separate localities, that it involves two people, to each of whom a distinct task is assigned. It may for a moment seem strange that such a fundamental fact should not have been pointed out long ago; but it will immediately be perceived that there was nothing being kept back in this, that it is a fact which is universally known and, as it were, self-evident and is merely being brought into relief here and separately examined for a particular purpose. We all know that the person who is being analysed has to be induced to remember something that has been experienced by him and repressed; and the dynamic determinants of this process are so interesting that the other portion of the work, the task performed by the analyst, has been pushed into the background. The analyst has neither experienced nor repressed any of the material under consideration; his task cannot be to remember anything. What then is his task? His task is to make out what has been forgotten from the traces which it has left behind or, more correctly, to construct it. The time and manner in which he conveys his constructions to the person who is being analysed, as well as the explanations with which he accompanies them, constitute the link between the two portions of the work of analysis, between his own part and that of the patient.
And now for the fact! In a whole number of nervous diseases - in hysteria, anxiety states, obsessional neurosis - our expectation is fulfilled. By searching for the repression in this way, by uncovering the resistances, by pointing out what is repressed, we really succeed in accomplishing our task - that is, in overcoming the resistances, lifting the repression and transforming the unconscious material into conscious. In doing so we gain the clearest impression of the way in which a violent struggle takes place in the patient's mind about the overcoming of each resistance - a normal mental struggle, on the same psychological ground, between the motives which seek to maintain the anticarethesis and those which are prepared to give it up. The former are the old motives which in the past put the repression into effect; among the latter are the newly arrived ones which, we may hope, will decide the conflict in our favour. We have succeeded in reviving the old conflict which led to repression and in bringing up for revision the process that was then decided. The new material that we produce includes, first the reminder that the earlier decision led to illness and the promise that a different path will lead to recovery, and, second, the enormous change in all the circumstances that has take place since the time of the original rejection. Then the ego was feeble, infantile, and may perhaps have had grounds for banning the demands of the libido as a danger. To-day it has grown strong and experienced, and moreover has a helper at and in the shape of the doctor. Thus we may expect to lead the revived conflict to a better outcome than that which ended in repression, and, as I have said, in hysteria and in the anxiety and obsessional neuroses success proves us in general to be correct.

[1916-1917, 3480]

In the further course of psycho-analytic work, however, even these distinctions have proved to be inadequate and, for practical purposes, insufficient. This has become clear in more ways than one; but the decisive instance is as follows. We have formed the idea that in each individual there is a coherent organization of mental processes; and we call this his ego. It is to this ego that consciousness is attached; the ego controls the approaches to motility - that is, to the discharge of excitations into the external world; it is the mental agency which supervises all its own constituent processes, and which goes to sleep at night, though even then it exercises the censorship on dreams. From this ego proceed the repressions, too, by means of which it is sought to exclude certain trends in the mind not merely from consciousness but also from other forms of effectiveness and activity. In analysis these trends which have been shut out stand in opposition to the ego, and the analysis is faced with the task of removing the resistances which the ego displays against concerning itself with the repressed. Now we find during analysis that, when we put certain tasks before the patient, he gets into difficulties; his associations fail when they should be coming near the repressed. We then tell him that he is dominated by a resistance; but he is quite unaware of the fact, and, even if he guesses from his unpleasurable feelings that a resistance is now at work in him, he does not know what it is or how to describe it. Since, however, there can be no question but that this resistance emanates from his ego and belongs to it, we find ourselves in an unforeseen situation. We have come upon something in the ego itself which is also unconscious, which behaves exactly like the repressed - that is, which produces powerful effects without itself being conscious and which requires special work before it can be made conscious. From the point of view of analytic practice, the consequence of this discovery is that we land in endless obscurities and difficulties if we keep to our habitual forms of expression and try, for instance, to derive neuroses from a conflict between the conscious and the unconscious. We shall have to substitute for this antithesis another, taken from our insight into the structural conditions of the mind - the antithesis between the coherent ego and the repressed which is split off from it.¹

[1923b, 3951]
What we are in search of is a picture of the patient's forgotten years that shall be alike trustworthy and in all essential respects complete. But at this point we are reminded that the work of analysis consists of two quite different portions, that it is carried on in two separate localities, that it involves two people, to each of whom a distinct task is assigned. It may for a moment seem strange that such a fundamental fact should not have been pointed out long ago; but it will immediately be perceived that there was nothing being kept back in this, that it is a fact which is universally known and, as it were, self-evident and is merely being brought into relief here and separately examined for a particular purpose. We all know that the person who is being analysed has to be induced to remember something that has been experienced by him and repressed; and the dynamic determinants of this process are so interesting that the other portion of the work, the task performed by the analyst, has been pushed into the background. The analyst has neither experienced nor repressed any of the material under consideration; his task cannot be to remember anything. What then is his task? His task is to make out what has been forgotten from the traces which it has left behind or, more correctly, to construct it. The time and manner in which he conveys his constructions to the person who is being analysed, as well as the explanations with which he accompanies them, constitute the link between the two portions of the work of analysis, between his own part and that of the patient.
[1937d, 5050]
To shorten analytic treatment is a justifiable wish, and its fulfilment, as we shall learn, is being attempted along various lines. Unfortunately, it is opposed by a very important factor, namely, the slowness with which deep-going changes in the mind are accomplished - in the last resort, no doubt, the 'timelessness' of our unconscious processes. When patients are faced with the difficulty of the great expenditure of time required for analysis they not infrequently manage to propose a way out of it. They divide up their ailments and describe some as unbearable, and others as secondary, and then say: 'If only you will relieve me from this one (for instance, a headache or a particular fear) I can deal with the other one on my own in my ordinary life.' In doing this, however, they over-estimate the selective power of analysis. The analyst is certainly able to do a great deal, but he cannot determine beforehand exactly what results he will effect. He sets in motion a process, that of the resolving of existing repressions. He can supervise this process, further it, remove obstacles in its way, and he can undoubtedly vitiate much of it. But on the whole, once begun, it goes its own way and does not allow either the direction it takes or the order in which it picks up its points to be prescribed for it. The analyst's power over the symptoms of the disease may thus be compared to male sexual potency. A man can, it is true, beget a whole child, but even the strongest man cannot create in the female organism a head alone or an arm or a leg; he cannot even prescribe the child's sex. He, too, only sets in motion a highly complicated process, determined by events in the remote past, which ends with the severance of the child from its mother. A neurosis as well has the character of an organism. Its component manifestations are not independent of one another; they condition one another and give one another mutual support. A person suffers from one neurosis only, never from several which have accidentally met together in a single individual. The patient freed, according to his wish, from his one unendurable symptom might easily find that a symptom which had previously been negligible had now increased and grown unendurable. The analyst who wishes the treatment to owe its success as little as possible to its elements of suggestion (i.e. to the transference) will do well to refrain from making use of even the trace of selective influence upon the results of the therapy which may perhaps be open to him. The patients who are bound to be most welcome to him are those who ask him to give them complete health, in so far as that is attainable, and who place as much time at his disposal as is necessary for the process of recovery. Such favourable conditions as these are, of course, to be looked for in only a few cases.

[1913c, 2483]
This answer of course involves a condemnation of any line of behaviour which would lead us to give the patient a translation of his symptoms as soon as we have guessed it ourselves, or would even lead us to regard it as a special triumph to fling these 'solutions' in his face at the first interview. It is not difficult for a skilled analyst to read the patient's secret wishes plainly between the lines of his complaints and the story of his illness; but what a measure of self-complacency and thoughtlessness must be possessed by anyone who can, on the shortest acquaintance, inform a stranger who is entirely ignorant of all the tenets of analysis that he is attached to his mother by incestuous ties, that he harbours wishes for the death of his wife whom he appears to love, that he conceals an intention of betraying his superior, and so on! I have heard that there are analysts who plume themselves upon these kinds of lightning diagnoses and 'express' treatments, but I must warn everyone against following such examples. Behaviour of this sort will completely discredit oneself and the treatment in the patient's eyes and will arouse the most violent opposition in him, whether one's guess has been true or not; indeed, the truer the guess the more violent will be the resistance. As a rule the therapeutic effect will be nil; but the deterring of the patient from analysis will be final. Even in the later stages of analysis one must be careful not to give a patient the solution of a symptom or the translation of a wish until he is already so close to it that he has only one short step more to make in order to get hold of the explanation for himself. In former years I often had occasion to find that the premature communication of a solution brought the treatment to an untimely end, on account not only of the resistances which it thus suddenly awakened but also of the relief which the solution brought with it.

[1913c, 2492]

I have already let it be understood that analytic technique requires of the physician that he should deny to the patient who is craving for love the satisfaction she demands. The treatment must be carried out in abstinence. By this I do not mean physical abstinence alone, nor yet the deprivation of everything that the patient desires, for perhaps no sick person could tolerate this. Instead, I shall state it as a fundamental principle that the patient's need and longing should be allowed to persist in her, in order that they may serve as forces impelling her to do work and to make changes, and that we must beware of appeasing those forces by means of surrogates. And what we could offer would never be anything else than a surrogate, for the patient's condition is such that, until her repressions are removed, she is incapable of getting real satisfaction.

[1915a, 2515]

The construction of a symptom is a substitute for something else that did not happen. Some particular mental processes should normally have developed to a point at which consciousness received information of them. This, however, did not take place, and instead - out of the interrupted processes, which had been somehow disturbed and were obliged to remain unconscious - the symptom emerged. Thus something in the nature of an exchange has taken place; if this can be reversed the therapy of the neurotic symptoms will have achieved its task.

[1916-1917, 3357]
The crudest idea of these systems is the most convenient for us - a spatial one. Let us therefore compare the system of the unconscious to a large entrance hall, in which the mental impulses jostle one another like separate individuals. Adjoining this entrance hall there is a second, narrower, room - a kind of drawing-room - in which consciousness, too, resides. But on the threshold between these two rooms a watchman performs his function: he examines the different mental impulses, acts as a censor, and will not admit them into the drawing-room if they displease him. You will see at once that it does not make much difference if the watchman turns away a particular impulse at the threshold itself or if he pushes it back across the threshold after it has entered the drawing-room. This is merely a question of the degree of his watchfulness and of how early he carries out his act of recognition. If we keep to this picture, we shall be able to extend our nomenclature further. The impulses in the entrance hall of the unconscious are out of sight of the conscious, which is in the other room; to begin with they must remain unconscious. If they have already pushed their way forward to the threshold and have been turned back by the watchman, then they are inadmissible to consciousness; we speak of them as repressed. But even the impulses which the watchman has allowed to cross the threshold are not on that account necessarily conscious as well; they can only become so if they succeed in catching the eye of consciousness. We are therefore justified in calling this second room the system of the preconscious. In that case becoming conscious retains its purely descriptive sense. For any particular impulse, however, the vicissitude of repression consists in its not being allowed by the watchman to pass from the system of the unconscious into that of the preconscious. It is the same watchman whom we get to know as resistance when we try to lift the repression by means of the analytic treatment.

Thus you cannot explain the therapeutic effect of psycho-analysis by its permitting a full sexual life. Look around, then, for something else. I fancy that, while I was rejecting this suggestion of yours, one remark of mine put you on the right track. What we make use of must no doubt be the replacing of what is unconscious by what is conscious, the translation of what is unconscious into what is conscious. Yes, that is it. By carrying what is unconscious on into what is conscious, we lift the repressions, we remove the preconditions for the formation of symptoms, we transform the pathogenic conflict to a normal one for which it must be possible somehow to find a solution. All that we bring about in a patient is this single psychical change: the length to which it is carried is the measure of the help we provide. Where no repressions (or analogous psychical processes) can be undone, our therapy has nothing to expect.

We can express the aim of our efforts in a variety of formulas: making conscious what is unconscious, lifting repressions, filling gaps in the memory - all these amount to the same thing. But perhaps you will be dissatisfied by this admission. You had formed a different picture of the return to health of a neurotic patient - that, after submitting to the tedious hours of a psycho-analysis, he would become another man; but the total result, so it seems, is that he has rather less that is unconscious and rather more that is conscious in him than he had before. The fact is that you are probably under-estimating the importance of an internal change of this kind. The neurotic who is cured has really become another man, though a bottom, of course, he has remained the same; that is to say, he has become what he might have become at best under the most favourable conditions. But that is a very great deal. If you now hear all that has to be done and what efforts it needs to bring about this apparently trivial change in a man's mental life, you will no doubt begin to realize the importance of this difference in psychical levels.
What, then, must we do in order to replace what is unconscious in our patients by what is conscious? There was a time when we thought this was a very simple matter: all that was necessary was for us to discover this unconscious material and communicate it to the patient. But we know already that this was a short-sighted error. Our knowledge about the unconscious material is not equivalent to his knowledge; if we communicate our knowledge to him, he does not receive it instead of his unconscious material but beside it; and that makes very little change in it. We must rather picture this unconscious material topographically, we must look for it in his memory at the place where it became unconscious owing to a repression. The repression must be got rid of - after which the substitution of the conscious material for the unconscious can proceed smoothly. How, then, do we lift a repression of this kind? Here our task enters a second phase. First, the search for the repression and then the removal of the resistance which maintains the repression.

[1916-1917, 3478]

And now for the fact! In a whole number of nervous diseases - in hysteria, anxiety states, obsessional neurosis - our expectation is fulfilled. By searching for the repression in this way, by uncovering the resistances, by pointing out what is repressed, we really succeed in accomplishing our task - that is, in overcoming the resistances, lifting the repression and transforming the unconscious material into conscious. In doing so we gain the clearest impression of the way in which a violent struggle takes place in the patient's mind about the overcoming of each resistance - a normal mental struggle, on the same psychological ground, between the motives which seek to maintain the anticathexis and those which are prepared to give it up. The former are the old motives which in the past put the repression into effect; among the latter are the newly arrived ones which, we may hope, will decide the conflict in our favour. We have succeeded in reviving the old conflict which led to repression and in bringing up for revision the process that was then decided. The new material that we produce includes, first the reminder that the earlier decision led to illness and the promise that a different path will lead to recovery, and, second, the enormous change in all the circumstances that has take place since the time of the original rejection. Then the ego was feeble, infantile, and may perhaps have had grounds for banning the demands of the libido as a danger. To-day it has grown strong and experienced, and moreover has a helper at and in the shape of the doctor. Thus we may expect to lead the revived conflict to a better outcome than that which ended in repression, and, as I have said, in hysteria and in the anxiety and obsessional neuroses success proves us in general to be correct.

[1916-1917, 3480]
But you will now tell me that, no matter whether we call the motive force of our analysis transference or suggestion, there is a risk that the influencing of our patient may make the objective certainty of our findings doubtful. What is advantageous to our therapy is damaging to our researches. This is the objection that is most often raised against psycho-analysis, and it must be admitted that, though it is groundless, it cannot be rejected as unreasonable. If it were justified, psycho-analysis would be nothing more than a particularly well-disguised and particularly effective form of suggestive treatment and we should have to attach little weight to all that it tells us about what influences our lives, the dynamics of the mind or the unconscious. That is what our opponents believe; and in especial they think that we have "talked" the patients into everything relating to the importance of sexual experiences - or even into those experiences themselves - after such notions have grown up in our own depraved imagination. These accusations are contradicted more easily by an appeal to experience than by the help of theory. Anyone who has himself carried out psycho-analyses will have been able to convince himself on countless occasions that it is impossible to make suggestions to a patient in that way. The doctor has no difficulty, of course, in making him a supporter of some particular theory and in thus making him share some possible error of his own. In this respect the patient is behaving like anyone else - like a pupil - but this only affects his intelligence, not his illness. After all, his conflicts will only be successfully solved and his resistances overcome if the anticipatory ideas he is given tally with what is real in him. Whatever in the doctor's conjectures is inaccurate drops out in the course of the analysis; it has to be withdrawn and replaced by something more correct. We endeavour by a careful technique to avoid the occurrence of premature successes due to suggestion; but no harm is done even if they do occur, for we are not satisfied by a first success. We do not regard an analysis as at an end until all the obscurities of the case are cleared up, the gaps in the patient's memory filled in, the precipitating causes of the repressions discovered. We look upon successes that set in too soon as obstacles rather than as a help to the work of analysis; and we put an end to such successes by constantly resolving the transference on which they are based. It is this last characteristic which is the fundamental distinction between analytic and purely suggestive therapy, and which frees the results of analysis from the suspicion of being successes due to suggestion. In every other kind of suggestive treatment the transference is carefully preserved and left untouched; in analysis it is itself subjected to treatment and is dissected in all the shapes in which it appears. At the end of an analytic treatment the transference must itself be cleared away; and if success is then obtained or continues, it rests, not on suggestion, but on the achievement by its means of an overcoming of internal resistances, on the internal change that has been brought about in the patient.

[1916-1917, 3493]
Thus our therapeutic work falls into two phases. In the first, all the libido is forced from the symptoms into the transference and concentrated there; in the second, the struggle is waged around this new object and the libido is liberated from it. The change which is decisive for a favourable outcome is the elimination of repression in this renewed conflict so that the libido cannot withdraw once more from the ego by flight into the unconscious. This is made possible by the alteration of the ego which is accomplished under the influence of the doctor's suggestion. By means of the work of interpretation, which transforms what is unconscious into what is conscious, the ego is enlarged at the cost of this unconscious; by means of instruction, it is made conciliatory towards the libido and inclined to grant it some satisfaction, and its repugnance to the claims of the libido is diminished by the possibility of disposing of a portion of it by sublimation. The more closely events in the treatment coincide with this ideal description, the greater will be the success of the psycho-analytic therapy. It finds its limits in the lack of mobility of the libido, which may refuse to leave its objects, and the rigidity of narcissism, which will not allow transference on to objects to increase beyond certain bounds. Further light may perhaps be thrown on the dynamics of the process of cure if I say that we get hold of the whole of the libido which has been withdrawn from the dominance of the ego by attracting a portion of it on to ourselves by means of the transference.

[1916-1917, 3495]

The psycho-analytic method of treatment is then able to subject this process of repression to revision and to bring about a better solution of the conflict - one that is compatible with health. Unintelligent opposition accuses us of one-sidedness in our estimate of the sexual instincts. 'Human beings have other interests besides sexual ones,' they say. We have not forgotten or denied this for a moment. Our one-sidedness is like that of the chemist, who traces all compounds back to the force of chemical attraction. He is not on that account denying the force of gravity; he leaves that to the physicist to deal with.

[1917a, 3609]

We have formulated our task as physicians thus: to bring to the patient's knowledge the unconscious, repressed impulses existing in him, and, for that purpose, to uncover the resistances that oppose this extension of his knowledge about himself. Does the uncovering of these resistances guarantee that they will also be overcome? Certainly not always; but our hope is to achieve this by exploiting the patient's transference to the person of the physician, so as to induce him to adopt our conviction of the inexpediency of the repressive process established in childhood and of the impossibility of conducting life on the pleasure principle. I have set out elsewhere the dynamic conditions prevailing in the fresh conflict through which we lead the patient and which we substitute in him for his previous conflict - that of his illness. I have nothing at the moment to alter in that account.

[1919a, 3628]
The work by which we bring the repressed mental material into the patient's consciousness has been called by us psycho-analysis. Why 'analysis' - which means breaking up or separating out, and suggests an analogy with the work carried out by chemists on substances which they find in nature and bring into their laboratories? Because in an important respect there really is an analogy between the two. The patient's symptoms and pathological manifestations, like all his mental activities, are of a highly composite kind; the elements of this compound are at bottom motives, instinctual impulses. But the patient knows nothing of these elementary motives or not nearly enough. We teach him to understand the way in which these highly complicated mental formations are compounded; we trace the symptoms back to the instinctual impulses which motivate them; we point out to the patient these instinctual motives, which are present in his symptoms and of which he has hitherto been unaware, - just as a chemist isolates the fundamental substance, the chemical 'element', out of the salt in which it had been combined with other elements and in which it was unrecognizable. In the same way, as regards those of the patient's mental manifestations that were not considered pathological, we show him that he was only to a certain extent conscious of their motivation - that other instinctual impulses of which he had remained in ignorance had co-operated in producing them.

[1919a, 3629]

Let us at once agree upon what we mean by this activity. We have defined our therapeutic task as consisting of two things: making conscious the repressed material and uncovering the resistances. In that we are active enough, to be sure. But are we to leave it to the patient to deal alone with the resistances we have pointed out to him? Can we give him no other help in this besides the stimulus he gets from the transference? Does it not seem natural that we should help him in another way as well, by putting him into the mental situation most favourable to the solution of the conflict which is our aim? After all, what he can achieve depends, too, on a combination of external circumstances. Should we hesitate to alter this combination by intervening in a suitable manner? I think activity of such a kind on the part of the analysing physician is unobjectionable and entirely justified.

[1919a, 3631]

Twenty five years of intense work have had as their result that the immediate aims of psycho-analytic technique are quite other to-day than they were at the outset. At first the analysing physician could do no more than discover the unconscious material that was concealed from the patient, put it together, and, at the right moment, communicate it to him. Psychoanalysis was then first and foremost an art of interpreting. Since this did not solve the therapeutic problem, a further aim quickly came in view: to oblige the patient to confirm the analyst's construction from his own memory. In that endeavour the chief emphasis lay upon the patient's resistances: the art consisted now in uncovering these as quickly as possible, in pointing them out to the patient and in inducing him by human influence - this was where suggestion operating as 'transference' played its part - to abandon his resistances.

[1920g, 3723]
But it became ever clearer that the aim which had been set up - the aim that what was unconscious should become conscious - is not completely attainable by that method. The patient cannot remember the whole of what is repressed in him, and what he cannot remember may be precisely the essential part of it. Thus he acquires no sense of conviction of the correctness of the construction that has been communicated to him. He is obliged to repeat the repressed material as a contemporary experience instead of, as the physician would prefer to see, remembering it as something belonging to the past.¹ These reproductions, which emerge with such unwished-for exactitude, always have as their subject some portion of infantile sexual life - of the Oedipus complex, that is, and its derivatives; and they are invariably acted out in the sphere of the transference, of the patient's relation to the physician. When things have reached this stage, it may be said that the earlier neurosis has now been replaced by a fresh, 'transference neurosis'. It has been the physician's endeavour to keep this transference neurosis within the narrowest limits: to force as much as possible into the channel of memory and to allow as little as possible to emerge as repetition. The ratio between what is remembered and what is reproduced varies from case to case. The physician cannot as a rule spare his patient this phase of the treatment. He must get him to re-experience some portion of his forgotten life, but must see to it, on the other hand, that the patient retains some degree of aloofness, which will enable him, in spite of everything, to recognize that what appears to be reality is in fact only a reflection of a forgotten past. If this can be successfully achieved, the patient's sense of conviction is won, together with the therapeutic success that is dependent on it.

[Criticisms and Misunderstandings of Psycho-Analysis. - Most of what is brought up against psycho-analysis, even in scientific works, is based upon insufficient information which in its turn seems to be determined by emotional resistances. Thus it is a mistake to accuse psycho-analysis of 'pan-sexualism' and to allege that it derives all mental occurrences from sexuality and traces them all back to it. On the contrary, psycho-analysis has from the very first distinguished the sexual instincts from others which it has provisionally termed 'ego instincts'. It has never dreamt of trying to explain 'everything', and even the neuroses it has traced back not to sexuality alone but to the conflict between the sexual impulses and the ego. In psycho-analysis (unlike the works of C. G. Jung) the term 'libido' does not mean psychical energy in general but the motive force of the sexual instincts. Some assertions, such as that every dream is the fulfilment of a sexual wish, have never been maintained by it at all. The charge of one-sidedness made against psycho-analysis, which, as the science of the unconscious mind, has its own definite and restricted field of work, is as inapplicable as it would be if it were made against chemistry. To believe that psycho-analysis seeks a cure for neurotic disorders by giving a free rein to sexuality is a serious misunderstanding which can only be excused by ignorance. The making conscious of repressed sexual desires in analysis makes it possible, on the contrary, to obtain a mastery over them which the previous repression had been unable to achieve. It can more truly be said that analysis sets the neurotic free from the chains of his sexuality. Moreover, it is quite unscientific to judge analysis by whether it is calculated to undermine religion, authority and morals; for, like all sciences, it is entirely non-tendentious and has only a single aim - namely to arrive at a consistent view of one portion of reality. Finally, one can only characterize as simple-minded the fear which is sometimes expressed that all the highest goods of humanity, as they are called - research, art, love, ethical and social sense - will lose their value or their dignity because psycho-analysis is in a position to demonstrate their origin in elementary and animal instinctual impulses.

[1920g, 3723]

[1923a, 3928]
But we have arrived at the term or concept of the unconscious along another path, by considering certain experiences in which mental *dynamics* play a part. We have found - that is, we have been obliged to assume - that very powerful mental processes or ideas exist (and here a quantitative or *economic* factor comes into question for the first time) which can produce all the effects in mental life that ordinary ideas do (including effects that can in their turn become conscious as ideas), though they themselves do not become conscious. It is unnecessary to repeat in detail here what has been explained so often before. It is enough to say that at this point psycho-analytic theory steps in and asserts that the reason why such ideas cannot become conscious is that a certain force opposes them, that otherwise they could become conscious, and that it would then be apparent how little they differ from other elements which are admittedly psychical. The fact that in the technique of psycho-analysis a means has been found by which the opposing force can be removed and the ideas in question made conscious renders this theory irrefutable. The state in which the ideas existed before being made conscious is called by us *repression*, and we assert that the force which instituted the repression and maintains it is perceived as *resistance* during the work of analysis.

In the further course of psycho-analytic work, however, even these distinctions have proved to be inadequate and, for practical purposes, insufficient. This has become clear in more ways than one; but the decisive instance is as follows. We have formed the idea that in each individual there is a coherent organization of mental processes; and we call this his ego. It is to this ego that consciousness is attached; the ego controls the approaches to motility - that is, to the discharge of excitations into the external world; it is the mental agency which supervises all its own constituent processes, and which goes to sleep at night, though even then it exercises the censorship on dreams. From this ego proceed the repressions, too, by means of which it is sought to exclude certain trends in the mind not merely from consciousness but also from other forms of effectiveness and activity. In analysis these trends which have been shut out stand in opposition to the ego, and the analysis is faced with the task of removing the resistances which the ego displays against concerning itself with the repressed. Now we find during analysis that, when we put certain tasks before the patient, he gets into difficulties; his associations fail when they should be coming near the repressed. We then tell him that he is dominated by a resistance; but he is quite unaware of the fact, and, even if he guesses from his unpleasurable feelings that a resistance is now at work in him, he does not know what it is or how to describe it. Since, however, there can be no question but that this resistance emanates from his ego and belongs to it, we find ourselves in an unforeseen situation. We have come upon something in the ego itself which is also unconscious, which behaves exactly like the repressed - that is, which produces powerful effects without itself being conscious and which requires special work before it can be made conscious. From the point of view of analytic practice, the consequence of this discovery is that we land in endless obscurities and difficulties if we keep to our habitual forms of expression and try, for instance, to derive neuroses from a conflict between the conscious and the unconscious. We shall have to substitute for this antithesis another, taken from our insight into the structural conditions of the mind - the antithesis between the coherent ego and the repressed which is split off from it.¹

The theory of repression became the corner-stone of our understanding of the neuroses. A different view had now to be taken of the task of therapy. Its aim was no longer to 'abreact' an affect which had got on to the wrong lines but to uncover repressions and replace them by acts of judgement which might result either in the accepting or in the condemning of what had formerly been repudiated. I showed my recognition of the new situation by no longer calling my method of investigation and treatment *catharsis* but *psycho-analysis*.

¹ [1923b, 3948]
It may seem surprising that this method of free association, carried out subject to the observation of the fundamental rule of psycho-analysis, should have achieved what was expected of it, namely the bringing into consciousness of the repressed material which was held back by resistances. We must, however, bear in mind that free association is not really free. The patient remains under the influence of the analytic situation even though he is not directing his mental activities on to a particular subject. We shall be justified in assuming that nothing will occur to him that has not some reference to that situation. His resistance against reproducing the repressed material will now be expressed in two ways. Firstly it will be shown by critical objections; and it was to deal with these that the fundamental rule of psycho-analysis was invented. But if the patient observes that rule and so overcomes his reticences, the resistance will find another means of expression. It will so arrange it that the repressed material itself will never occur to the patient but only something which approximates to it in an allusive way; and the greater the resistance, the more remote from the actual idea that the analyst is in search of will be the substitutive association which the patient has to report. The analyst, who listens composedly but without any constrained effort to the stream of associations and who, from his experience, has a general notion of what to expect, can make use of the material brought to light by the patient according to two possibilities. If the resistance is slight he will be able from the patient's allusions to infer the unconscious material itself; or if the resistance is stronger he will be able to recognize its character from the associations, as they seem to become more remote from the topic in hand, and will explain it to the patient. Uncovering the resistance, however, is the first step towards overcoming it. Thus the work of analysis involves an art of interpretation, the successful handling of which may require tact and practice but which is not hard to acquire. But it is not only in the saving of labour that the method of free association has an advantage over the earlier method. It exposes the patient to the least possible amount of compulsion, it never allows of contact being lost with the actual current situation, it guarantees to a great extent that no factor in the structure of the neurosis will be overlooked and that nothing will be introduced into it by the expectations of the analyst. It is left to the patient in all essentials to determine the course of the analysis and the arrangement of the material; any systematic handling of particular symptoms or complexes thus becomes impossible. In complete contrast to what happened with hypnosis and with the urging method, interrelated material makes its appearance at different times and at different points in the treatment. To a spectator, therefore - though in fact there must be none - an analytic treatment would seem completely obscure.

That this is a correct account of fixation upon repression and of the retention of dangersituations that are no longer present-day ones is confirmed by the fact of analytic therapy - a fact which is modest enough in itself but which can hardly be overrated from a theoretical point of view. When, in analysis, we have given the ego assistance which is able to put it in a position to lift its repressions, it recovers its power over the repressed id and can allow the instinctual impulses to run their course as though the old situations of danger no longer existed. What we can do in this way tallies with what can be achieved in other fields of medicine; for as a rule our therapy must be content with bringing about more quickly, more reliably and with less expenditure of energy than would otherwise be the case the good result which in favourable circumstances would have occurred of itself.
It is easy now to describe our therapeutic aim. We try to restore the ego, to free it from its restrictions, and to give it back the command over the id which it has lost owing to its early repressions. It is for this one purpose that we carry out analysis, our whole technique is directed to this aim. We have to seek out the repressions which have been set up and to urge the ego to correct them with our help and to deal with conflicts better than by an attempt at flight. Since these repressions belong to the very early years of childhood, the work of analysis leads us, too, back to that period. Our path to these situations of conflict, which have for the most part been forgotten and which we try to revive in the patient's memory, is pointed out to us by his symptoms, dreams and free associations. These must, however, first be interpreted - translated - for, under the influence of the psychology of the id, they have assumed forms of expression that are strange to our comprehension. We may assume that whatever associations, thoughts and memories the patient is unable to communicate to us without internal struggles are in some way connected with the repressed material or are its derivatives. By encouraging the patient to disregard his resistances to telling us these things, we are educating his ego to overcome its inclination towards attempts at flight and to tolerate an approach to what is repressed. In the end, if the situation of the repression can be successfully reproduced in his memory, his compliance will be brilliantly rewarded. The whole difference between his age then and now works in his favour; and the thing from which his childish ego fled in terror will often seem to his adult and strengthened ego no more than child's play.

'I will add that. Thereupon he begins to talk and I listen. And what then? I infer from what he tells me the kind of impressions, experiences and wishes which he has repressed because he came across them at a time when his ego was still feeble and was afraid of them instead of dealing with them. When he has learnt this from me, he puts himself back in the old situations and with my help he manages better. The limitations to which his ego was tied then disappear, and he is cured. Is that right?'

When one really practises analysis one learns all kinds of things besides. For instance: you would not find it at all such a simple matter to deduce from what the patient tells you the experiences he has forgotten and the instinctual impulses he has repressed. He says something to you which at first means as little to you as it does to him. You will have to make up your mind to look at the material which he delivers to you in obedience to the rule in a quite special way: as though it were ore, perhaps, from which its content of precious metal has to be extracted by a particular process. You will be prepared, too, to work over many tons of ore which may contain but little of the valuable material you are in search of. Here we should have a first reason for the prolonged character of the treatment.

That is a question of tact, which can become more refined with experience. You will be making a bad mistake if, in an effort, perhaps, at shortening the analysis, you throw your interpretations at the patient's head as soon as you have found them. In that way you will draw expressions of resistance, rejection and indignation from him; but you will not enable his ego to master his repressed material. The formula is: to wait till he has come so near to the repressed material that he has only a few more steps to take under the lead of the interpretation you propose.
(3) By 'transference' is meant a striking peculiarity of neurotics. They develop towards their physician emotional relations, both of an affectionate and hostile character, which are not based upon the actual situation but are derived from their relations to their parents (the Oedipus complex). Transference is a proof of the fact that adults have not overcome their former childish dependence; it coincides with the force which has been named 'suggestion'; and it is only by learning to make use of it that the physician is enabled to induce the patient to overcome his internal resistances and do away with his repressions. Thus psycho-analytic treatment acts as a second education of the adult, as a corrective to his education as a child.

[1926f, 4406]

Now, however, another problem awaits us - at the opposite end of the ego, as we might put it. It is presented to us by an observation during the work of analysis, an observation which is actually a very old one. As not infrequently happens, it has taken a long time to come to the point of appreciating its importance. The whole theory of psycho-analysis is, as you know, in fact built up on the perception of the resistance offered to us by the patient when we attempt to make his unconscious conscious to him. The objective sign of this resistance is that his associations fail or depart widely from the topic that is being dealt with. He may also recognize the resistance subjectively by the fact that he has distressing feelings when he approaches the topic. But this last sign may also be absent. We then say to the patient that we infer from his behaviour that he is now in a state of resistance; and he replies that he knows nothing of that, and is only aware that his associations have become more difficult. It turns out that we were right; but in that case his resistance was unconscious too, just as unconscious as the repressed, at the lifting of which we were working. We should long ago have asked the question: from what part of his mind does an unconscious resistance like this arise? The beginner in psycho-analysis will be ready at once with the answer: it is, of course, the resistance of the unconscious. An ambiguous and unserviceable answer! If it means that the resistance arises from the repressed, we must rejoin: certainly not! We must rather attribute to the repressed a strong upward drive, an impulsion to break through into consciousness. The resistance can only be a manifestation of the ego, which originally put the repression into force and now wishes to maintain it. That, moreover, is the view we always took. Since we have come to assume a special agency in the ego, the super-ego, which represents demands of a restrictive and rejecting character, we may say that repression is the work of this super-ego and that it is carried out either by itself or by the ego in obedience to its orders. If then we are met by the case of the resistance in analysis not being conscious to the patient, this means either that in quite important situations the super-ego and the ego can operate unconsciously, or - and this would be still more important - that portions of both of them, the ego and the super-ego themselves, are unconscious. In both cases we have to reckon with the disagreeable discovery that on the one hand (super-) ego and conscious and on the other hand repressed and unconscious are far from coinciding.

[1933a, 4677]
You will not expect me to have much to tell you that is new about the id apart from its new name. It is the dark, inaccessible part of our personality; what little we know of it we have learnt from our study of the dream-work and of the construction of neurotic symptoms, and most of that is of a negative character and can be described only as a contrast to the ego. We approach the id with analogies: we call it a chaos, a cauldron full of seething excitations. We picture it as being open at its end to somatic influences, and as there taking up into itself instinctual needs which find their psychical expression in it, but we cannot say in what substratum. It is filled with energy reaching it from the instincts, but it has no organization, produces no collective will, but only a striving to bring about the satisfaction of the instinctual needs subject to the observance of the pleasure principle. The logical laws of thought do not apply in the id, and this is true above all of the law of contradiction. Contrary impulses exist side by side, without cancelling each other out or diminishing each other: at the most they may converge to form compromises under the dominating economic pressure towards the discharge of energy. There is nothing in the id that could be compared with negation; and we perceive with surprise an exception to the philosophical theorem that space and time are necessary forms of our mental acts. There is nothing in the id that corresponds to the idea of time; there is no recognition of the passage of time, and - a thing that is most remarkable and awaits consideration in philosophical thought - no alteration in its mental processes is produced by the passage of time. Wishful impulses which have never passed beyond the id, but impressions, too, which have been sunk into the id by repression, are virtually immortal; after the passage of decades they behave as though they had just occurred. They can only be recognized as belonging to the past, can only lose their importance and be deprived of their cathexis of energy, when they have been made conscious by the work of analysis, and it is on this that the therapeutic effect of analytic treatment rests to no small extent.

With the mention of resistance we have reached the second and more important part of our task. We have already learnt that the ego protects itself against the invasion of undesired elements from the unconscious and repressed id by means of anticathexes, which must remain intact if it is to function normally. The more hard-pressed the ego feels, the more convulsively it clings (as though in a fright) to these anticathexes, in order to protect what remains of itself from further irruptions. But this defensive purpose does not by any means accord with the aims of our treatment. What we desire, on the contrary, is that the ego, emboldened by the certainty of our help, shall dare to take the offensive in order to reconquer what has been lost. And it is here that we become aware of the strength of these anticathexes in the form of resistances to our work. The ego draws back in alarm from such undertakings, which seem dangerous and threaten unpleasure; it must be constantly encouraged and soothed if it is not to fail us. This resistance, which persists throughout the whole treatment and is renewed at every fresh piece of work, is known, not quite correctly, as the resistance due to repression. We shall find that it is not the only one that faces us. It is interesting to notice that in this situation the party-divisions are to some extent reversed: for the ego struggles against our instigation, while the unconscious, which is ordinarily our opponent, comes to our help, since it has a natural 'upward drive' and desires nothing better than to press forward across its settled frontiers into the ego and so to consciousness. The struggle which develops, if we gain our end and can induce the ego to overcome its resistances, is carried through under our direction and with our assistance. Its outcome is a matter of indifference: whether it results in the ego accepting, after a fresh examination, an instinctual demand which it has hitherto rejected, or whether it dismisses it once more, this time for good and all. In either case a permanent danger has been disposed of, the compass of the ego has been extended and a wasteful expenditure of energy has been made unnecessary.

[1933a, 4682]

[1940a [1938], 4988]
Let us once more glance over the situation which we have reached in our attempt at bringing help to the patient's neurotic ego. That ego is no longer able to fulfill the task set it by the external world (including human society). Not all of its experiences are at its disposal; a large proportion of its store of memories have escaped it. Its activity is inhibited by strict prohibitions from the super-ego, its energy is consumed in vain attempts at fending off the demands of the id. Beyond this, as a result of continuous irruptions by the id, its organization is impaired, it is no longer capable of any proper synthesis, it is torn by mutually opposed urges, by unsettled conflicts and by unsolved doubts. To start with, we get the patient's thus weakened ego to take part in the purely intellectual work of interpretation, which aims at provisionally filling the gaps in his mental assets, and to transfer to us the authority of his super-ego; we encourage it to take up the struggle over each individual demand made by the id and to conquer the resistances which arise in connection with it. At the same time we restore order in the ego by detecting the material and urges which have forced their way in from the unconscious, and expose them to criticism by tracing them back to their origin. We serve the patient in various functions, as an authority and a substitute for his parents, as a teacher and educator; and we have done the best for him if, as analysts, we raise the mental processes in his ego to a normal level, transform what has become unconscious and repressed into preconscious material and thus return it once more to the possession of his ego. On the patient's side a few rational factors work in our favour, such as the need for recovery which has its motive in his sufferings, and the intellectual interest that we may awaken in him in the theories and revelations of psycho-analysis; but of far greater force is the positive transference with which he meets us. Fighting against us, on the other hand, are the negative transference, the ego's resistance due to repression (that is, its unpleasure at having to lay itself open to the hard work imposed on it), the sense of guilt arising from its relation to the super-ego and the need to be ill due to deep-going changes in the economics of his instincts. The share taken by the last two factors decides whether the case is to be regarded as slight or severe. Apart from these, a few other factors may be discerned as having a favourable or unfavourable bearing. A certain psychical inertia, a sluggishness of the libido, which is unwilling to abandon its fixations cannot be welcome to us; the patient's capacity for sublimating his instincts plays a large part and so does his capacity for rising above the crude life of the instincts; so, too, does the relative power of his intellectual functions.

We must first of all decide what is meant by the ambiguous phrase 'the end of an analysis'. From a practical standpoint it is easy to answer. An analysis is ended when the analyst and the patient cease to meet each other for the analytic session. This happens when two conditions have been approximately fulfilled: first, that the patient shall no longer be suffering from his symptoms and shall have overcome his anxieties and his inhibitions; and secondly, that the analyst shall judge that so much repressed material has been made conscious, so much that was unintelligible has been explained, and so much internal resistance conquered, that there is no need to fear a repetition of the pathological processes concerned. If one is prevented by external difficulties from reaching this goal, it is better to speak of an incomplete analysis rather than of an unfinished one.
The other meaning of the 'end' of an analysis is much more ambitious. In this sense of it, what we are asking is whether the analyst has had such a far-reaching influence on the patient that no further change could be expected to take place in him if his analysis were continued. It is as though it were possible by means of analysis to attain to a level of absolute psychical normality - a level, moreover, which we could feel confident would be able to remain stable, as though, perhaps, we had succeeded in resolving every one of the patient's repressions and in filling in all the gaps in his memory. We may first consult our experience to enquire whether such things do in fact happen, and then turn to our theory to discover whether there is any possibility of their happening.

[1937c, 5017]

At the moment, however, we are not concerned with the pathogenic role of the defensive mechanisms. What we are trying to discover is what influence the alteration of the ego which corresponds to them has upon our therapeutic efforts. The material for an answer to this question is given in the volume by Anna Freud to which I have already referred. The essential point is that the patient repeats these modes of reaction during the work of analysis as well, that he produces them before our eyes, as it were. In fact, it is only in this way that we get to know them. This does not mean that they make analysis impossible. On the contrary, they constitute half of our analytic task. The other half, the one which was first tackled by analysis in its early days, is the uncovering of what is hidden in the id. During the treatment our therapeutic work is constantly swinging backwards and forwards like a pendulum between a piece of id-analysis and a piece of ego-analysis. In the one case we want to make something from the id conscious, in the other we want to correct something in the ego. The crux of the matter is that the defensive mechanisms directed against former danger recur in the treatment as resistances against recovery. It follows from this that the ego treats recovery itself as a new danger.

[1937c, 5034]
The therapeutic effect depends on making conscious what is repressed, in the widest sense of the word, in the id. We prepare the way for this making conscious by interpretations and constructions, but we have interpreted only for ourselves not for the patient so long as the ego holds on to its earlier defences and does not give up its resistances. Now these resistances, although they belong to the ego, are nevertheless unconscious and in some sense separated off within the ego. The analyst recognizes them more easily than he does the hidden material in the id. One might suppose that it would be sufficient to treat them like portions of the id and, by making them conscious, bring them into connection with the rest of the ego. In this way, we should suppose, one half of the task of analysis would be accomplished; we should not reckon on meeting with a resistance against the uncovering of resistances. But what happens is this. During the work on the resistances the ego withdraws - with a greater or less degree of seriousness - from the agreement on which the analytic situation is founded. The ego ceases to support our efforts at uncovering the id; it opposes them, disobeys the fundamental rule of analysis, and allows no further derivatives of the repressed to emerge. We cannot expect the patient to have a strong conviction of the curative power of analysis. He may have brought along with him a certain amount of confidence in his analyst, which will be strengthened to an effective point by the factors of the positive transference which will be aroused in him. Under the influence of the unpleasurable impulses which he feels as a result of the fresh activation of his defensive conflicts, negative transferences may now gain the upper hand and completely annul the analytic situation. The patient now regards the analyst as no more than a stranger who is making disagreeable demands on him, and he behaves towards him exactly like a child who does not like the stranger and does not believe anything he says. If the analyst tries to explain to the patient one of the distortions made by him for the purposes of defence, and to correct it, he finds him uncomprehending and inaccessible to sound arguments. Thus we see that there is a resistance against the uncovering of resistances, and the defensive mechanisms really do deserve the name which we gave them originally, before they had been more closely examined. They are resistances not only to the making conscious of contents of the id, but also to the analysis as a whole, and thus to recovery.

[1937c, 5034]

It is familiar ground that the work of analysis aims at inducing the patient to give up the repressions (using the word in the widest sense) belonging to his early development and to replace them by reactions of a sort that would correspond to a psychically mature condition. With this purpose in view he must be brought to recollect certain experiences and the affective impulses called up by them which he has for the time being forgotten. We know that his present symptoms and inhibitions are the consequences of repressions of this kind: thus that they are a substitute for these things that he has forgotten. What sort of material does he put at our disposal which we can make use of to put him on the way to recovering the lost memories? All kinds of things. He gives us fragments of these memories in his dreams, invaluable in themselves but seriously distorted as a rule by all the factors concerned in the formation of dreams. Again, he produces ideas, if he gives himself up to 'free association', in which we can discover allusions to the repressed experiences and derivatives of the suppressed affective impulses as well as of the reactions against them. And, finally, there are hints of repetitions of the affects belonging to the repressed material to be found in actions performed by the patient, some fairly important, some trivial, both inside and outside the analytic situation. Our experience has shown that the relation of transference, which becomes established towards the analyst, is particularly calculated to favour the return of these emotional connections. It is out of such raw material - if we may so describe it - that we have to put together what we are in search of.

[1937d, 5050]
What we are in search of is a picture of the patient's forgotten years that shall be alike trustworthy and in all essential respects complete. But at this point we are reminded that the work of analysis consists of two quite different portions, that it is carried on in two separate localities, that it involves two people, to each of whom a distinct task is assigned. It may for a moment seem strange that such a fundamental fact should not have been pointed out long ago; but it will immediately be perceived that there was nothing being kept back in this, that it is a fact which is universally known and, as it were, self-evident and is merely being brought into relief here and separately examined for a particular purpose. We all know that the person who is being analysed has to be induced to remember something that has been experienced by him and repressed; and the dynamic determinants of this process are so interesting that the other portion of the work, the task performed by the analyst, has been pushed into the background. The analyst has neither experienced nor repressed any of the material under consideration; his task cannot be to remember anything. What then is his task? His task is to make out what has been forgotten from the traces which it has left behind or, more correctly, to construct it. The time and manner in which he conveys his constructions to the person who is being analysed, as well as the explanations with which he accompanies them, constitute the link between the two portions of the work of analysis, between his own part and that of the patient.

[1937d, 5050]
This brings us to the technical errors which are to be seen in the doctor’s procedure in this alleged case. It is a long superseded idea, and one derived from superficial appearances, that the patient suffers from a sort of ignorance, and that if one removes this ignorance by giving him information (about the causal connection of his illness with his life, about his experiences in childhood, and so on) he is bound to recover. The pathological factor is not his ignorance in itself, but the root of this ignorance in his inner resistances; it was they that first called this ignorance into being, and they still maintain it now. The task of the treatment lies in combating these resistances. Informing the patient of what he does not know because he has repressed it is only one of the necessary preliminaries to the treatment. If knowledge about the unconscious were as important for the patient as people inexperienced in psycho-analysis imagine, listening to lectures or reading books would be enough to cure him. Such measures, however, have as much influence on the symptoms of nervous illness as a distribution of menu-cards in a time of famine has upon hunger. The analogy goes even further than its immediate application; for informing the patient of his unconscious regularly results in an intensification of the conflict in him and an exacerbation of his troubles.

[1910k, 2378]

Resistances of this kind should not be one-sidedly condemned. They include so much of the most important material from the patient's past and bring it back in so convincing a fashion that they become some of the best supports of the analysis if a skilful technique knows how to give them the right turn. Nevertheless, it remains a remarkable fact that this material is always in the service of the resistance to begin with and brings to the fore a façade that is hostile to the treatment. It may also be said that what is being mobilized for fighting against the alterations we are striving for are character-traits, attitudes of the ego. In this connection we discover that these character-traits were formed in relation to the determinants of the neurosis and in reaction against its demands, and we come upon traits which cannot normally emerge, or not to the same extent, and which may be described as latent. Nor must you get an impression that we regard the appearance of these resistances as an unforeseen risk to analytic influence. No, we are aware that these resistances are bound to come to light; in fact we are dissatisfied if we cannot provoke them clearly enough and are unable to demonstrate them to the patient. Indeed we come finally to understand that the overcoming of these resistances is the essential function of analysis and is the only part of our work which gives us an assurance that we have achieved something with the patient.

[1916-1917, 3366]
In your contact as doctors with neurotics, Gentlemen, you will soon give up expecting that the ones who raise the most lamentations and complaints about their illness will be the most eager to co-operate and will offer you the least resistance. It is rather the opposite. But of course you will easily realize that everything that contributes to the gain from illness will intensify the resistance due to repression and will increase the therapeutic difficulties. But to the portion of gain from illness which is, so to say, born with the illness we have to add another portion which arises later. When a psychical organization like an illness has lasted for some time, it behaves eventually like an independent organism; it manifests something like a self-preservative instinct; it establishes a kind of *modus vivendi* between itself and other parts of the mind, even with those which are at bottom hostile to it; and there can scarcely fail to be occasions when it proves once again useful and expedient and acquires, as it were, a *secondary function* which strengthens its stability afresh. Instead of an example from pathology, let us take a glaring instance from daily life. A capable working-man, who earns his living, is crippled by an accident in the course of his occupation. The injured man can no longer work, but eventually he obtains a small disablement pension, and he learns how to exploit his mutilation by begging. His new, though worsened, means of livelihood is based precisely on the very thing that deprived him of his former means of livelihood. If you could put an end to his injury you would make him, to begin with, without means of subsistence; the question would arise of whether he was still capable of taking up his earlier work again. What corresponds in the case of neuroses to a secondary exploitation like this of an illness may be described as the *secondary* gain from illness in contrast to the primary one.

I have now led you into the region in which the next advances in the work of analysis are to be expected. Since we have ventured to operate with the concept of ego-libido the narcissistic neuroses have become accessible to us; the task before us is to arrive at a dynamic elucidation of these disorders and at the same time to complete our knowledge of mental life by coming to understand the ego. The ego-psychology after which we are seeking must not be based on the data of our self-perceptions but (as in the case of the libido) on the analysis of disturbances and disruptions of the ego. It is likely that we shall have a low opinion of our present knowledge of the vicissitudes of the libido, which we have gained from a study of the transference neuroses, when we have achieved this greater task. But hitherto we have not made much progress with it. The narcissistic neuroses can scarcely be attacked with the technique that has served us with the transference neuroses. You will soon learn why. What always happens with them is that, after proceeding for a short distance, we come up against a wall which brings us to a stop. Even with the transference neuroses, as you know, we met with barriers of resistance, but we were able to demolish them bit by bit. In the narcissistic neuroses the resistance is unconquerable; at the most, we are able to cast an inquisitive glance over the top of the wall and spy out what is going on on the other side of it. Our technical methods must accordingly be replaced by others; and we do not know yet whether we shall succeed in finding substitute. Nevertheless, we have no lack of material with these patients either. They make a large number of remarks, even if they do not answer our questions, and for the time being it is our business to interpret these remarks with the help of the understanding we have gained from the symptoms of the transference neuroses. The agreement is great enough to guarantee us some initial advantage. It remains to be seen how far this technique will take us.
What, then, must we do in order to replace what is unconscious in our patients by what is conscious? There was a time when we thought this was a very simple matter: all that was necessary was for us to discover this unconscious material and communicate it to the patient. But we know already that this was a short-sighted error. Our knowledge about the unconscious material is not equivalent to his knowledge; if we communicate our knowledge to him, he does not receive it instead of his unconscious material but beside it; and that makes very little change in it. We must rather picture this unconscious material topographically, we must look for it in his memory at the place where it became unconscious owing to a repression. The repression must be got rid of - after which the substitution of the conscious material for the unconscious can proceed smoothly. How, then, do we lift a repression of this kind? Here our task enters a second phase. First, the search for the repression and then the removal of the resistance which maintains the repression.

How do we remove the resistance? In the same way: by discovering it and showing it to the patient. Indeed, the resistance too is derived from a repression - from the same one that we are endeavouring to resolve, or from one that took place earlier. It was set up by the anticathexis which arose in order to repress the objectionable impulse. Thus we now do the same thing that we tried to do to begin with: interpret, discover and communicate; but now we are doing it at the right place. The anticathexis or the resistance does not form part of the unconscious but of the ego, which is our collaborator, and is so even if it is not conscious. As we know, the word 'unconscious' is being used here in two senses: on the one hand as a phenomenon and on the other as a system. This sounds very difficult and obscure; but is it not only repeating what we have already said in earlier passages? We have long been prepared for it. We expect that this resistance will be given up and the anticathexis withdrawn when our interpretation has made it possible for the ego to recognize it. What are the motive forces that we work with in such a case? First with the patient's desire for recovery, which has induced him to take part with us in our joint work, and secondly with the help of his intelligence, to which we give support by our interpretation. There is no doubt that it is easier for the patient's intelligence to recognize the resistance and to find the translation corresponding to what is repressed if we have previously given him the appropriate anticipatory ideas. If I say to you: 'Look up at the sky! There's a balloon there!' you will discover it much more easily than if I simply tell you to look up and see if you can see anything. In the same way, a student who is looking through a microscope for the first time is instructed by his teacher as to what he will see; otherwise he does not see it at all, though it is there and visible.

[1916-1917, 3478, 3479]
And now for the fact! In a whole number of nervous diseases - in hysteria, anxiety states, obsessional neurosis - our expectation is fulfilled. By searching for the repression in this way, by uncovering the resistances, by pointing out what is repressed, we really succeed in accomplishing our task - that is, in overcoming the resistances, lifting the repression and transforming the unconscious material into conscious. In doing so we gain the clearest impression of the way in which a violent struggle takes place in the patient's mind about the overcoming of each resistance - a normal mental struggle, on the same psychological ground, between the motives which seek to maintain the anticathexis and those which are prepared to give it up. The former are the old motives which in the past put the repression into effect; among the latter are the newly arrived ones which, we may hope, will decide the conflict in our favour. We have succeeded in reviving the old conflict which led to repression and in bringing up for revision the process that was then decided. The new material that we produce includes, first the reminder that the earlier decision led to illness and the promise that a different path will lead to recovery, and, second, the enormous change in all the circumstances that has taken place since the time of the original rejection. Then the ego was feeble, infantile, and may perhaps have had grounds for banning the demands of the libido as a danger. To-day it has grown strong and experienced, and moreover has a helper at and in the shape of the doctor. Thus we may expect to lead the revived conflict to a better outcome than that which ended in repression, and, as I have said, in hysteria and in the anxiety and obsessional neuroses success proves us in general to be correct.

[1916-1917, 3480]

I can do so in a few words, and you will see how simply the riddle can be solved and how well everything fits together. Observation shows that sufferers from narcissistic neuroses have no capacity for transference or only insufficient residues of it. They reject the doctor, not with hostility but with indifference. For that reason they cannot be influenced by him either; what he says leaves them cold, makes no impression on them; consequently the mechanism of cure which we carry through with other people - the revival of the pathogenic conflict and the overcoming of the resistance due to repression - cannot be operated with them. They remain as they are. Often they have already undertaken attempts at recovery on their own account which have led to pathological results. We cannot alter this in any way.

[1916-1917, 3489]

In the light of the knowledge we have gained from psycho-analysis we can describe the difference between hypnotic and psycho-analytic suggestion as follows. Hypnotic treatment seeks to cover up and gloss over something in mental life; analytic treatment seeks to expose and get rid of something. The former acts like a cosmetic, the latter like surgery. The former makes use of suggestion in order to forbid the symptoms; it strengthens the repressions, but, apart from that, leaves all the processes that have led to the formation of the symptoms unaltered. Analytic treatment makes its impact further back towards the roots, where the conflicts are which gave rise to the symptoms, and uses suggestion in order to alter the outcome of those conflicts. Hypnotic treatment leaves the patient inert and unchanged, and for that reason, too, equally unable to resist any fresh occasion for falling ill. An analytic treatment demands from both doctor and patient the accomplishment of serious work, which is employed in lifting internal resistances. Through the overcoming of these resistances the patient's mental life is permanently changed, is raised to a high level of development and remains protected against fresh possibilities of falling ill. This work of overcoming resistances is the essential function of analytic treatment; the patient has to accomplish it and the doctor makes this possible for him with the help of suggestion operating in an educative sense. For that reason psycho-analytic treatment has justly been described as a kind of after-education.

[1916-1917, 3492]
But you will now tell me that, no matter whether we call the motive force of our analysis transference or suggestion, there is a risk that the influencing of our patient may make the objective certainty of our findings doubtful. What is advantageous to our therapy is damaging to our researches. This is the objection that is most often raised against psycho-analysis, and it must be admitted that, though it is groundless, it cannot be rejected as unreasonable. If it were justified, psycho-analysis would be nothing more than a particularly well-disguised and particularly effective form of suggestive treatment and we should have to attach little weight to all that it tells us about what influences our lives, the dynamics of the mind or the unconscious. That is what our opponents believe; and in especial they think that we have "talked" the patients into everything relating to the importance of sexual experiences - or even into those experiences themselves - after such notions have grown up in our own depraved imagination. These accusations are contradicted more easily by an appeal to experience than by the help of theory. Anyone who has himself carried out psycho-analyses will have been able to convince himself on countless occasions that it is impossible to make suggestions to a patient in that way. The doctor has no difficulty, of course, in making him a supporter of some particular theory and in thus making him share some possible error of his own. In this respect the patient is behaving like anyone else - like a pupil - but this only affects his intelligence, not his illness. After all, his conflicts will only be successfully solved and his resistances overcome if the anticipatory ideas he is given tally with what is real in him. Whatever in the doctor's conjectures is inaccurate drops out in the course of the analysis; it has to be withdrawn and replaced by something more correct. We endeavour by a careful technique to avoid the occurrence of premature successes due to suggestion; but no harm is done even if they do occur, for we are not satisfied by a first success. We do not regard an analysis as at an end until all the obscurities of the case are cleared up, the gaps in the patient's memory filled in, the precipitating causes of the repressions discovered. We look upon successes that set in too soon as obstacles rather than as a help to the work of analysis; and we put an end to such successes by constantly resolving the transference on which they are based. It is this last characteristic which is the fundamental distinction between analytic and purely suggestive therapy, and which frees the results of analysis from the suspicion of being successes due to suggestion. In every other kind of suggestive treatment the transference is carefully preserved and left untouched; in analysis it is itself subjected to treatment and is dissected in all the shapes in which it appears. At the end of an analytic treatment the transference must itself be cleared away; and if success is then obtained or continues, it rests, not on suggestion, but on the achievement by its means of an overcoming of internal resistances, on the internal change that has been brought about in the patient.

We have formulated our task as physicians thus: to bring to the patient's knowledge the unconscious, repressed impulses existing in him, and, for that purpose, to uncover the resistances that oppose this extension of his knowledge about himself. Does the uncovering of these resistances guarantee that they will also be overcome? Certainly not always; but our hope is to achieve this by exploiting the patient's transference to the person of the physician, so as to induce him to adopt our conviction of the inexpediency of the repressive process established in childhood and of the impossibility of conducting life on the pleasure principle. I have set out elsewhere the dynamic conditions prevailing in the fresh conflict through which we lead the patient and which we substitute in him for his previous conflict - that of his illness. I have nothing at the moment to alter in that account.
In actual fact, indeed, the neurotic patient presents us with a torn mind, divided by resistances. As we analyse it and remove the resistances, it grows together; the great unity which we call his ego fits into itself all the instinctual impulses which before had been split off and held apart from it. The psycho-synthesis is thus achieved during analytic treatment without our intervention, automatically and inevitably. We have created the conditions for it by breaking up the symptoms into their elements and by removing the resistances. It is not true that something in the patient has been divided into its components and is now quietly waiting for us to put it somehow together again.

Let us at once agree upon what we mean by this activity. We have defined our therapeutic task as consisting of two things: making conscious the repressed material and uncovering the resistances. In that we are active enough, to be sure. But are we to leave it to the patient to deal alone with the resistances we have pointed out to him? Can we give him no other help in this besides the stimulus he gets from the transference? Does it not seem natural that we should help him in another way as well, by putting him into the mental situation most favourable to the solution of the conflict which is our aim? After all, what he can achieve depends, too, on a combination of external circumstances. Should we hesitate to alter this combination by intervening in a suitable manner? I think activity of such a kind on the part of the analysing physician is unobjectionable and entirely justified.

Twenty five years of intense work have had as their result that the immediate aims of psycho-analytic technique are quite other to-day than they were at the outset. At first the analysing physician could do no more than discover the unconscious material that was concealed from the patient, put it together, and, at the right moment, communicate it to him. Psychoanalysis was then first and foremost an art of interpreting. Since this did not solve the therapeutic problem, a further aim quickly came in view: to oblige the patient to confirm the analyst's construction from his own memory. In that endeavouir the chief emphasis lay upon the patient's resistances: the art consisted now in uncovering these as quickly as possible, in pointing them out to the patient and in inducing him by human influence - this was where suggestion operating as 'transference' played its part - to abandon his resistances.
For these reasons I refrained altogether from holding out to the parents any prospect of their wish being fulfilled. I merely said I was prepared to study the girl carefully for a few weeks or months, so as then to be able to pronounce how far a continuation of the analysis would be likely to influence her. In quite a number of cases, indeed, an analysis falls into two clearly distinguishable phases. In the first, the physician procures from the patient the necessary information, makes him familiar with the premises and postulates of psycho-analysis, and unfolds to him the reconstruction of the genesis of his disorder as deduced from the material brought up in the analysis. In the second phase the patient himself gets hold of the material put before him; he works on it, recollects what he can of the apparently repressed memories, and tries to repeat the rest as if he were in some way living it over again. In this way he can confirm, supplement, and correct the inferences made by the physician. It is only during this work that he experiences, through overcoming resistances, the inner change aimed at, and acquires for himself the convictions that make him independent of the physician's authority. These two phases in the course of the analytic treatment are not always sharply divided from each other; this can only happen when the resistance obeys certain conditions. But when this is so, one may bring up as an analogy the two stages of a journey. The first comprises all the necessary preparations, to-day so complicated and hard to effect, before, ticket in hand, one can at last go on to the platform and secure a seat in the train. One then has the right, and the possibility, of travelling into a distant country; but after all these preliminary exertions one is not yet there - indeed, one is not a single mile nearer to one's goal. For this to happen one has to make the journey itself from one station to the other, and this part of the performance may well be compared with the second phase of the analysis.

[1920a, 3842]

**Development of Technique.** - After the analyst's curiosity had, as it were, been gratified by the elaboration of the technique of interpretation, it was inevitable that interest should turn to the problem of discovering the most effective way of influencing the patient. It soon became evident that the physician's immediate task was to assist the patient in getting to know, and afterwards in overcoming, the resistances which emerged in him during treatment and of which, to begin with, he himself was unaware. And it was found at the same time that the essential part of the process of cure lay in the overcoming of these resistances and that unless this was achieved no permanent mental change could be brought about in the patient. Since the analyst's efforts have in this way been directed upon the patient's resistance, analytic technique has attained a certainty and delicacy rivalling that of surgery. Consequently, everyone is strongly advised against undertaking psycho-analytic treatments without a strict training, and a physician who ventures upon them on the strength of his medical qualification is in no respect better than a layman.

[1923a, 3925]
Comparison between Psycho-Analysis and Hypnotic and Suggestive Methods. - Psycho-analytic procedure differs from all methods making use of suggestion, persuasion, etc., in that it does not seek to suppress by means of authority any mental phenomenon that may occur in the patient. It endeavours to trace the causation of the phenomenon and to remove it by bringing about a permanent modification in the conditions that led to it. In psycho-analysis the suggestive influence which is inevitably exercised by the physician is diverted on to the task assigned to the patient of overcoming his resistances, that is, of carrying forward the curative process. Any danger of falsifying the products of a patient's memory by suggestion can be avoided by prudent handling of the technique; but in general the arousing of resistances is a guarantee against the misleading effects of suggestive influence. It may be laid down that the aim of the treatment is to remove the patient's resistances and to pass his repressions in review and thus to bring about the most far-reaching unification and strengthening of his ego, to enable him to save the mental energy which he is expending upon internal conflicts, to make the best of him that his inherited capacities will allow and so to make him as efficient and as capable of enjoyment as is possible. The removal of the symptoms of the illness is not specifically aimed at, but is achieved, as it were, as a by-product if the analysis is properly carried through. The analyst respects the patient's individuality and does not seek to remould him in accordance with his own - that is, according to the physician's - personal ideals; he is glad to avoid giving advice and instead to arouse the patient's power of initiative.

But we have arrived at the term or concept of the unconscious along another path, by considering certain experiences in which mental dynamics play a part. We have found - that is, we have been obliged to assume - that very powerful mental processes or ideas exist (and here a quantitative or economic factor comes into question for the first time) which can produce all the effects in mental life that ordinary ideas do (including effects that can in their turn become conscious as ideas), though they themselves do not become conscious. It is unnecessary to repeat in detail here what has been explained so often before. It is enough to say that at this point psycho-analytic theory steps in and asserts that the reason why such ideas cannot become conscious is that a certain force opposes them, that otherwise they could become conscious, and that it would then be apparent how little they differ from other elements which are admittedly psychical. The fact that in the technique of psycho-analysis a means has been found by which the opposing force can be removed and the ideas in question made conscious renders this theory irrefutable. The state in which the ideas existed before being made conscious is called by us repression, and we assert that the force which instituted the repression and maintains it is perceived as resistance during the work of analysis.
In the further course of psycho-analytic work, however, even these distinctions have proved to
be inadequate and, for practical purposes, insufficient. This has become clear in more ways
than one; but the decisive instance is as follows. We have formed the idea that in each
individual there is a coherent organization of mental processes; and we call this his ego. It is to
this ego that consciousness is attached; the ego controls the approaches to motility - that is, to
the discharge of excitations into the external world; it is the mental agency which supervises all
its own constituent processes, and which goes to sleep at night, though even then it exercises
the censorship on dreams. From this ego proceed the repressions, too, by means of which it is
sought to exclude certain trends in the mind not merely from consciousness but also from other
forms of effectiveness and activity. In analysis these trends which have been shut out stand in
opposition to the ego, and the analysis is faced with the task of removing the resistances which
the ego displays against concerning itself with the repressed. Now we find during analysis that,
when we put certain tasks before the patient, he gets into difficulties; his associations fail when
they should be coming near the repressed. We then tell him that he is dominated by a
resistance; but he is quite unaware of the fact, and, even if he guesses from his unpleasurable
feelings that a resistance is now at work in him, he does not know what it is or how to describe
it. Since, however, there can be no question but that this resistance emanates from his ego and
belongs to it, we find ourselves in an unforeseen situation. We have come upon something in
the ego itself which is also unconscious, which behaves exactly like the repressed - that is,
which produces powerful effects without itself being conscious and which requires special work
before it can be made conscious. From the point of view of analytic practice, the consequence
of this discovery is that we land in endless obscurities and difficulties if we keep to our habitual
forms of expression and try, for instance, to derive neuroses from a conflict between the
conscious and the unconscious. We shall have to substitute for this antithesis another, taken
from our insight into the structural conditions of the mind - the antithesis between the coherent
ego and the repressed which is split off from it.¹

It is perfectly true that psycho-analysis, like other psychotherapeutic methods, employs the
instrument of suggestion (or transference). But the difference is this: that in analysis it is not
allowed to play the decisive part in determining the therapeutic results. It is used instead to
induce the patient to perform a piece of psychical work - the overcoming of his transference
resistances - which involves a permanent alteration in his mental economy. The transference is
made conscious to the patient by the analyst, and it is resolved by convincing him that in his
transference-attitude he is re-experiencing emotional relations which had their origin in his
earliest object-attachments during the repressed period of his childhood. In this way the
transference is changed from the strongest weapon of the resistance into the best instrument of
the analytic treatment. Nevertheless its handling remains the most difficult as well as the most
important part of the technique of analysis.

[1923b, 3951] [1925d, 4218]
We showed on an earlier occasion that the resistance that has to be overcome in analysis proceeds from the ego, which clings to its anticathexes. It is hard for the ego to direct its attention to perceptions and ideas which it has up till now made a rule of avoiding, or to acknowledge as belonging to itself impulses that are the complete opposite of those which it knows as its own. Our fight against resistance in analysis is based upon this view of the facts. If the resistance is itself unconscious, as so often happens owing to its connection with the repressed material, we make it conscious. If it is conscious, or when it has become conscious, we bring forward logical arguments against it; we promise the ego rewards and advantages if it will give up its resistance. There can be no doubt or mistake about the existence of this resistance on the part of the ego. But we have to ask ourselves whether it covers the whole state of affairs in analysis. For we find that even after the ego has decided to relinquish its resistances it still has difficulty in undoing the repressions; and we have called the period of strenuous effort which follows after its praiseworthy decision, the phase of 'working-through'. The dynamic factor which makes a working-through of this kind necessary and comprehensible is not far to seek. It must be that after the ego's resistance has been removed the power of the compulsion to repeat - the attraction exerted by the unconscious prototype upon the repressed instinctual process - has still to be overcome. There is nothing to be said against describing this factor as the resistance of the unconscious. There is no need to be discouraged by these emendations. They are to be welcomed if they add something to our knowledge, and they are no disgrace to us so long as they enrich rather than invalidate our earlier views - by limiting some statement, perhaps, that was too general or by enlarging some idea that was too narrowly formulated.

It is a good thing you have asked me about that. This personal influence is our most powerful dynamic weapon. It is the new element which we introduce into the situation and by means of which we make it fluid. The intellectual content of our explanations cannot do it, for the patient, who shares all the prejudices of the world around him, needs believe us as little as our scientific critics do. The neurotic sets to work because he has faith in the analyst, and he believes him because he acquires a special emotional attitude towards the figure of the analyst. Children, too, only believe people they are attached to. I have already told you what use we make of this particularly large 'suggestive' influence. Not for suppressing the symptoms - this distinguishes the analytic method from other psychotherapeutic procedures - but as a motive force to induce the patient to overcome his resistances.
There are at the moment two Institutes at which instruction in psycho-analysis is given. The first has been founded in Berlin by Dr. Max Eitingon, who is a member of the Society there. The second is maintained by the Vienna Psycho-Analytical Society at its own expense and at considerable sacrifice. The part played by the authorities is at present limited to the many difficulties which they put in the way of the young undertaking. A third training Institute is at this moment being opened in London by the Society there, under the direction of Dr. Ernest Jones. At these Institutes the candidates themselves are taken into analysis, receive theoretical instruction by lectures on all the subjects that are important for them, and enjoy the supervision of older and more experienced analysts when they are allowed to make their first trials with comparatively slight cases. A period of some two years is calculated for this training. Even after this period, of course, the candidate is only a beginner and not yet a master. What is still needed must be acquired by practice and by an exchange of ideas in the psycho-analytical societies in which young and old members meet together. Preparation for analytic activity is by no means so easy and simple. The work is hard, the responsibility great. But anyone who has passed through such a course of instruction, who has been analysed himself, who has mastered what can be taught to-day of the psychology of the unconscious, who is at home in the science of sexual life, who has learnt the delicate technique of psycho-analysis, the art of interpretation, of fighting resistances and of handling the transference - anyone who has accomplished all this is no longer a layman in the field of psycho-analysis. He is capable of undertaking the treatment of neurotic disorders, and will be able in time to achieve in that field whatever can be required from this form of therapy.

(3) By 'transference' is meant a striking peculiarity of neurotics. They develop towards their physician emotional relations, both of an affectionate and hostile character, which are not based upon the actual situation but are derived from their relations to their parents (the Oedipus complex). Transference is a proof of the fact that adults have not overcome their former childish dependence; it coincides with the force which has been named 'suggestion'; and it is only by learning to make use of it that the physician is enabled to induce the patient to overcome his internal resistances and do away with his repressions. Thus psycho-analytic treatment acts as a second education of the adult, as a corrective to his education as a child.
With the mention of resistance we have reached the second and more important part of our task. We have already learnt that the ego protects itself against the invasion of undesired elements from the unconscious and repressed by means of anticathexes, which must remain intact if it is to function normally. The more hard-pressed the ego feels, the more convulsively it clings (as though in a fright) to these anticathexes, in order to protect what remains of itself from further irruptions. But this defensive purpose does not by any means accord with the aims of our treatment. What we desire, on the contrary, is that the ego, emboldened by the certainty of our help, shall dare to take the offensive in order to reconquer what has been lost. And it is here that we become aware of the strength of these anticathexes in the form of resistances to our work. The ego draws back in alarm from such undertakings, which seem dangerous and threaten unpleasure; it must be constantly encouraged and soothed if it is not to fail us. This resistance, which persists throughout the whole treatment and is renewed at every fresh piece of work, is known, not quite correctly, as the resistance due to repression. We shall find that it is not the only one that faces us. It is interesting to notice that in this situation the party-divisions are to some extent reversed: for the ego struggles against our instigation, while the unconscious, which is ordinarily our opponent, comes to our help, since it has a natural 'upward drive' and desires nothing better than to press forward across its settled frontiers into the ego and so to consciousness. The struggle which develops, if we gain our end and can induce the ego to overcome its resistances, is carried through under our direction and with our assistance. Its outcome is a matter of indifference: whether it results in the ego accepting, after a fresh examination, an instinctual demand which it has hitherto rejected, or whether it dismisses it once more, this time for good and all. In either case a permanent danger has been disposed of, the compass of the ego has been extended and a wasteful expenditure of energy has been made unnecessary.

[1940a [1938], 4988]

The overcoming of resistances is the part of our work that requires the most time and the greatest trouble. It is worth while, however, for it brings about an advantageous alteration of the ego which will be maintained independently of the outcome of the transference and will hold good in life. We have also worked simultaneously at getting rid of the alteration of the ego which had been brought about under the influence of the unconscious; for whenever we have been able to detect any of its derivatives in the ego we have pointed out their illegitimate origin and have instigated the ego to reject them. It will be remembered that it was one of the necessary preconditions of our pact of assistance that any such alteration of the ego due to the intrusion of unconscious elements should not have gone beyond a certain amount.

[1940a [1938], 4989]
Let us once more glance over the situation which we have reached in our attempt at bringing help to the patient's neurotic ego. That ego is no longer able to fulfil the task set it by the external world (including human society). Not all of its experiences are at its disposal, a large proportion of its store of memories have escaped it. Its activity is inhibited by strict prohibitions from the super-ego, its energy is consumed in vain attempts at fending off the demands of the id. Beyond this, as a result of continuous irruptions by the id, its organization is impaired, it is no longer capable of any proper synthesis, it is torn by mutually opposed urges, by unsettled conflicts and by unsolved doubts. To start with, we get the patient's thus weakened ego to take part in the purely intellectual work of interpretation, which aims at provisionally filling the gaps in his mental assets, and to transfer to us the authority of his super-ego; we encourage it to take up the struggle over each individual demand made by the id and to conquer the resistances which arise in connection with it. At the same time we restore order in the ego by detecting the material and urges which have forced their way in from the unconscious, and expose them to criticism by tracing them back to their origin. We serve the patient in various functions, as an authority and a substitute for his parents, as a teacher and educator; and we have done the best for him if, as analysts, we raise the mental processes in his ego to a normal level, transform what has become unconscious and repressed into preconscious material and thus return it once more to the possession of his ego. On the patient's side a few rational factors work in our favour, such as the need for recovery which has its motive in his sufferings, and the intellectual interest that we may awaken in him in the theories and revelations of psycho-analysis; but of far greater force is the positive transference with which he meets us. Fighting against us, on the other hand, are the negative transference, the ego's resistance due to repression (that is, its displeasure at having to lay itself open to the hard work imposed on it), the sense of guilt arising from its relation to the super-ego and the need to be ill due to deep-going changes in the economics of his instincts. The share taken by the last two factors decides whether the case is to be regarded as slight or severe. Apart from these, a few other factors may be discerned as having a favourable or unfavourable bearing. A certain psychical inertia, a sluggishness of the libido, which is unwilling to abandon its fixations cannot be welcome to us; the patient's capacity for sublimating his instincts plays a large part and so does his capacity for rising above the crude life of the instincts; so, too, does the relative power of his intellectual functions.

[1940a [1938], 4990]

We must first of all decide what is meant by the ambiguous phrase 'the end of an analysis'. From a practical standpoint it is easy to answer. An analysis is ended when the analyst and the patient cease to meet each other for the analytic session. This happens when two conditions have been approximately fulfilled: first, that the patient shall no longer be suffering from his symptoms and shall have overcome his anxieties and his inhibitions; and secondly, that the analyst shall judge that so much repressed material has been made conscious, so much that was unintelligible has been explained, and so much internal resistance conquered, that there is no need to fear a repetition of the pathological processes concerned. If one is prevented by external difficulties from reaching this goal, it is better to speak of an incomplete analysis rather than of an unfinished one.

[1937c, 5017]
As regards the second class of major neuroses, hysteria and obsessional neurosis, the solution of the aetiological problem is of surprising simplicity and uniformity. I owe my results to a new method of psycho-analysis, Josef Breuer’s exploratory procedure; it is a little intricate, but it is irreplaceable, so fertile has it shown itself to be in throwing light upon the obscure paths of unconscious ideation. By means of that procedure - this is not the place in which to describe it¹ - hysterical symptoms are traced back to their origin, which is always found in some event of the subject's sexual life appropriate for the production of a distressing emotion. Travelling backwards into the patient's past, step by step, and always guided by the organic train of symptoms and of memories and thoughts aroused, I finally reached the starting-point of the pathological process; and I was obliged to see that at bottom the same thing was present in all the cases submitted to analysis - the action of an agent which must be accepted as the specific cause of hysteria.

[1896a, 375]

I cannot say for certain what the upper age-limit is below which sexual injury plays a part in the aetiology of hysteria; but I doubt whether sexual passivity can bring on repression later than between the eighth and tenth years, unless it is enabled to do so by previous experiences. The lower limit extends as far back as memory itself - that is, therefore, to the tender age of one and a half or two years! (I have had two cases of this.) In a number of my cases the sexual trauma (or series of traumas) occurred in the third and fourth years of life. I should not lend credence to these extraordinary findings myself if their complete reliability were not proved by the development of the subsequent neurosis. In every case a number of pathological symptoms, habits and phobias are only to be accounted for by going back to these experiences in childhood, and the logical structure of the neurotic manifestations makes it impossible to reject these faithfully preserved memories which emerge from childhood life. True, it would be useless to try to elicit these childhood traumas from a hysteric by questioning him outside psycho-analysis; their traces are never present in conscious memory, only in the symptoms of the illness.

[1896b, 386]

Concerning the origin of the visual hallucinations, or at least of the vivid images, I learned the following. The image of the lower part of a woman's abdomen almost always coincided with the physical sensation in her own abdomen; but the latter was much more constant and often occurred without the image. The first images of a woman's abdomen had appeared in the hydropathic establishment a few hours after she had in fact seen a number of naked women at the baths; so they turned out to be simple reproductions of a real impression. It was therefore to be presumed that these impressions had been repeated only because great interest was attached to them. She told me that she had felt ashamed for these women; she herself had been ashamed to be seen naked for as long as she could remember. Since I was obliged to regard the shame as something obsessional, I concluded, in accordance with the mechanism of defence, that an experience must have been repressed here about which she had not felt ashamed. So I requested her to let the memories emerge which belonged to the theme of feeling ashamed. She promptly reproduced a series of scenes going back from her seventeenth to her eighth year, in which she had felt ashamed of being naked in her bath in front of her mother, her sister and the doctor; but the series ended in a scene at the age of six, in which she was undressing in the nursery before going to bed, without feeling any shame in front of her brother who was there. On my questioning her, it transpired that scenes like this had occurred often and that the brother and sister had for years been in the habit of showing themselves to one another naked before going to bed. I now understood the meaning of her sudden idea that she was being watched as she was going to bed. It was an unaltered piece of the old memory which involved self-reproach, and she was now making up for the shame which she had omitted to feel as a child.

[1896b, 398]
It seems to me really astonishing that hysterical symptoms can only arise with the co-operation of memories, especially when we reflect that, according to the unanimous accounts of the patients themselves, these memories did not come into their consciousness at the moment when the symptom first made its appearance. Here is much food for thought; but these problems must not distract us at this point from our discussion of the aetiology of hysteria. We must rather ask ourselves: where shall we get to if we follow the chains of associated memories which the analysis has uncovered? How far do they extend? Do they come anywhere to a natural end? Do they perhaps lead to experiences which are in some way alike, either in their content or the time of life at which they occur, so that we may discern in these universally similar factors the aetiology of hysteria of which we are in search?

Luckily for our explanation, some of these sexual experiences at puberty exhibit a further inadequacy, which is calculated to stimulate us into continuing our analytic work. For it sometimes happens that they, too, lack suitability as determinants although this is much more rarely so than with the traumatic scenes belonging to later life. Thus, for instance, let us take the two women patients whom I have just spoken of as cases in which the experiences at puberty were actually innocent ones. As a result of those experiences the patients had become subject to peculiar painful sensations in the genitals which had established themselves as the main symptoms of the neurosis. I was unable to find indications that they had been determined either by the scenes at puberty or by later scenes; but they were certainly not normal organic sensations nor signs of sexual excitement. It seemed an obvious thing, then, to say to ourselves that we must look for the determinants of these symptoms in yet other experiences, in experiences which went still further back - and that we must, for the second time, follow the saving notion which had earlier led us from the first traumatic scenes to the chains of memories behind them. In doing so, to be sure, we arrive at the period of earliest childhood, a period before the development of sexual life; and this would seem to involve the abandonment of a sexual aetiology. But have we not a right to assume that even the age of childhood is not wanting in slight sexual excitations, that later sexual development may perhaps be decisively influenced by childhood experiences? Injuries sustained by an organ which is as yet immature, or by a function which is in process of developing, often cause more severe and lasting effects than they could do in maturer years. Perhaps the abnormal reaction to sexual impressions which surprises us in hysterical subjects at the age of puberty is quite generally based on sexual experiences of this sort in childhood, in which case those experiences must be of a similar nature to one another, and must be of an important kind. If this is so, the prospect is opened up that what has hitherto had to be laid at the door of a still unexplained hereditary predisposition may be accounted for as having been acquired at an early age. And since infantile experiences with a sexual content could after all only exert a psychical effect through their memory-traces, would not this view be a welcome amplification of the finding of psycho-analysis which tells us that hysterical symptoms can only arise with the co-operation of memories?

[1896c, 416]
You will no doubt have guessed, Gentlemen, that I should not have carried this last line of thought so far if I had not wanted to prepare you for the idea that it is this line alone which, after so many delays, will lead us to our goal. For now we are really at the end of our wearisome and laborious analytic work, and here we find the fulfilment of all the claims and expectations upon which we have so far insisted. If we have the perseverance to press on with the analysis into early childhood, as far back as a human memory is capable of reaching, we invariably bring the patient to reproduce experiences which, on account both of their peculiar features and of their relations to the symptoms of his later illness, must be regarded as the aetiology of his neurosis for which we have been looking. These infantile experiences are once more sexual in content, but they are of a far more uniform kind than the scenes at puberty that had been discovered earlier. It is now no longer a question of sexual topics having been aroused by some sense impression or other, but of sexual experiences affecting the subject’s own body - of sexual intercourse (in the wider sense). You will admit that the importance of such scenes needs no further proof; to this may now be added that, in every instance, you will be able to discover in the details of the scenes the determining factors which you may have found lacking in the other scenes - the scenes which occurred later and were reproduced earlier.

Events of this sort strengthen our impression that the patients must really have experienced what they reproduce under the compulsion of analysis as scenes from their childhood. But another and stronger proof of this is furnished by the relationship of the infantile scenes to the content of the whole of the rest of the case history. It is exactly like putting together a child’s picture-puzzle: after many attempts, we become absolutely certain in the end which piece belongs in the empty gap; for only that one piece fills out the picture and at the same time allows its irregular edges to be fitted into the edges of the other pieces in such a manner as to leave no free space and to entail no overlapping. In the same way, the contents of the infantile scenes turn out to be indispensable supplements to the associative and logical framework of the neurosis, whose insertion makes its course of development for the first time evident, or even, as we might often say, self-evident.

Without wishing to lay special stress on the point, I will add that in a number of cases therapeutic evidence of the genuineness of the infantile scenes can also be brought forward. There are cases in which a complete or partial cure can be obtained without our having to go as deep as the infantile experiences. And there are others in which no success at all is obtained until the analysis has come to its natural end with the uncovering of the earliest traumas. In the former cases we are not, I believe, secure against relapses; and my expectation is that a complete psycho-analysis implies a radical cure of the hysteria. We must not, however, be led into forestalling the lessons of observation.
The experience with Herr K. - his making love to her and the insult to her honour which was involved - seems to provide in Dora's case the psychical trauma which Breuer and I declared long ago to be the indispensable prerequisite for the production of a hysterical disorder. But this new case also presents all the difficulties which have since led me to go beyond that theory, besides an additional difficulty of a special kind. For, as so often happens in histories of cases of hysteria, the trauma that we know of as having occurred in the patient's past life is insufficient to explain or to determine the particular character of the symptoms; we should understand just as much or just as little of the whole business if the result of the trauma had been symptoms quite other than tussis nervosa, aphonia, depression, and taedium vitae. But there is the further consideration that some of these symptoms (the cough and the loss of voice) had been produced by the patient years before the time of the trauma, and that their earliest appearances belong to her childhood, since they occurred in her eighth year. If, therefore, the trauma theory is not to be abandoned, we must go back to her childhood and look about there for any influences or impressions which might have had an effect analogous to that of a trauma. Moreover, it deserves to be remarked that in the investigation even of cases in which the first symptoms had not already set in childhood I have been driven to trace back the patients' life history to their earliest years.²

Just at a moment when there was a prospect that the material that was coming up for analysis would throw light upon an obscure point in Dora's childhood, she reported that a few nights earlier she had once again had a dream which she had already dreamt in exactly the same way on many previous occasions. A periodically recurrent dream was by its very nature particularly well calculated to arouse my curiosity; and in any case it was justifiable in the interests of the treatment to consider the way in which the dream worked into the analysis as a whole. I therefore determined to make an especially careful investigation of it.

Nevertheless I cannot bring myself to accept the idea that this part of psycho-analytic theory can be very much more distant than the rest from the reality which it is its business to discover. My recollections, as well as a constant re-examination of the material, assure me that this part of the theory is based upon equally careful and impartial observation. There is, moreover, no difficulty in finding an explanation of this discrepancy in the general acceptance of my views. In the first place, the beginnings of human sexual life which are here described can only be confirmed by investigators who have enough patience and technical skill to trace back an analysis to the first years of a patient's childhood. And there is often no possibility of doing this, since medical treatment demands that an illness should, at least in appearance, be dealt with more rapidly. None, however, but physicians who practise psycho-analysis can have any access whatever to this sphere of knowledge or any possibility of forming a judgement that is uninfluenced by their own dislikes and prejudices. If mankind had been able to learn from a direct observation of children, these three essays could have remained unwritten.
The procedure which the author makes his Zoe adopt for curing her childhood friend's delusion shows a far-reaching similarity - no, a complete agreement in its essence - with a therapeutic method which was introduced into medical practice in 1895 by Dr. Josef Breuer and myself, and to the perfecting of which I have since then devoted myself. This method of treatment, to which Breuer first gave the name of 'cathartic' but which I prefer to describe as 'analytic', consists, as applied to patients suffering from disorders analogous to Hanold's delusion, in bringing to their consciousness, to some extent forcibly, the unconscious whose repression led to their falling ill - exactly as Gradiva did with the repressed memories of their childhood relations. Gradiva, it is true, could carry out this task more easily than a doctor: in several respects she was in what may be described as an ideal position for it. The doctor, who has no pre-existing knowledge of his patient and possesses no conscious memory of what is unconsciously at work in him, must call a complicated technique to his help in order to make up for this disadvantage. He must learn how to infer with great certainty from the conscious associations and communications of the patient what is repressed in him, how to discover his unconscious as it betrays itself behind his conscious words and acts. He then brings about something like what Norbert Hanold grasped at the end of the story when he translated back the name 'Gradiva' into 'Bertgang'. The disorder vanishes while being traced back to its origin; analysis, too, brings simultaneous cure.

[1907a, 1881]

The material on which the following synthesis is based is derived from several sources. Firstly, from the direct observation of what children say and do; secondly, from what adult neurotics consciously remember from their childhood and relate during psycho-analytic treatment; and thirdly, from the inferences and constructions, and from the unconscious memories translated into conscious material, which result from the psycho-analysis of neurotics.

[1908c, 1966]

I do not think much of the objection that neurotics are a special class of people, marked by an innate disposition that is 'degenerate', from whose childhood life we must not be allowed to infer anything about the childhood of other people. Neurotics are people much like others. They cannot be sharply differentiated from normal people, and in their childhood they are not always easily distinguishable from those who remain healthy in later life. It is one of the most valuable results of our psycho-analytic investigations to have discovered that the neuroses of such people have no special mental content that is peculiar to them, but that, as Jung has expressed it, they fall ill of the same complexes against which we healthy people struggle as well. The only difference is that healthy people know how to overcome those complexes without any gross damage demonstrable in practical life, whereas in nervous cases the suppression of the complexes succeeds only at the price of costly substitutive formations - that is to say, from a practical point of view it is a failure. In childhood neurotic and normal people naturally approximate to each other much more closely than they do in later life, so that I cannot regard it as a methodological error to make use of the communications of neurotics about their childhood for drawing conclusions by analogy about normal childhood life. But since those who later become neurotics very often have in their inborn constitution an especially strong sexual instinct and a tendency to precocity and to a premature expression of that instinct, they make it possible for us to recognize a great deal of infantile activity more sharply and clearly than our capacity for observation (which is in any case a blunted one) would enable us to do in other children. But we shall of course only be able to assess the true value of these communications made by neurotic adults when, following Havelock Ellis's example, we shall have thought it worth while to collect the childhood memories of healthy adults as well.

[1908c, 1967]
Investigation of the childhood history of hysterical patients shows that the hysterical attack is designed to take the place of an auto-erotic satisfaction previously practised and since given up. In a great number of cases this satisfaction (masturbation by contact or by pressure of the thighs, or, again, by movements of the tongue, and so on) recurs during the attack itself, while the subject's consciousness is deflected. Moreover, the onset of an attack that is due to an increase of libido and is in the service of the primary purpose - as a consolation - exactly repeats the conditions under which, at the earlier time, the patient had intentionally sought this auto-erotic satisfaction. The anamnesis of the patient shows the following stages: (a) auto-erotic satisfaction, without ideational content; (b) the same satisfaction, connected with a phantasy which leads to the act of satisfaction; (c) renunciation of the act, with retention of the phantasy; (d) repression of the phantasy, which then comes into effect as a hysterical attack, either in an unchanged form, or in a modified one and adapted to new environmental impressions. Furthermore, (e) the phantasy may even reinstate the act of satisfaction belonging to it which had ostensibly been given up. This is a typical cycle of infantile sexual activity: repression, failure of repression, and return of the repressed. [1909a, 1983]

Here, then, we have the beginning of Hans's anxiety as well as of his phobia. As we see, there is good reason for keeping the two separate. Moreover, the material seems to be amply sufficient for giving us our bearings; and no moment of time is so favourable for the understanding of a case as its initial stage, such as we have here, though unluckily that stage is as a rule neglected or passed over in silence. The disorder set in with thoughts that were at the same time fearful and tender, and then followed an anxiety dream on the subject of losing his mother and so not being able to coax with her any more. His affection for his mother must therefore have become enormously intensified. This was the fundamental phenomenon in his condition. In support of this, we may, recall his two attempts at seducing his mother, the first of which dated back to the summer, while the second (a simple commendation of his penis) occurred immediately before the outbreak of his street-anxiety. It was this increased affection for his mother which turned suddenly into anxiety - which, as we should say, succumbed to repression. We do not yet know from what quarter the impetus towards repression may have come. Perhaps it was merely the result of the intensity of the child's emotions, which had become greater than he could control; or perhaps other forces which we have not yet recognized were also at work. This we shall learn as we go on. Hans's anxiety, which thus corresponded to a repressed erotic longing, was, like every infantile anxiety, without an object to begin with: it was still anxiety and not yet fear. The child cannot tell what he is afraid of; and when Hans, on the first walk with the nursemaid, would not say what he was afraid of, it was simply that he himself did not yet know. He said all that he knew, which was that in the street he missed his mother, whom he could coax with, and that he did not want to be away from her. In saying this he quite straightforwardly confessed the primary meaning of his dislike of streets. [1909b, 2017]
The events in his sixth or seventh year which the patient described in the first hour of his treatment were not merely, as he supposed, the beginning of his illness, but were already the illness itself. It was a complete obsessional neurosis, wanting in no essential element, at once the nucleus and the prototype of the later disorder, - an elementary organism, as it were, the study of which could alone enable us to obtain a grasp of the complicated organization of his subsequent illness. The child, as we have seen, was under the domination of a component of the sexual instinct, the desire to look, as a result of which there was a constant recurrence in him of a very intense wish connected with persons of the female sex who pleased him - the wish, that is, to see them naked. This wish corresponds to the later obsessional or compulsive idea; and if the quality of compulsion was not yet present in the wish, this was because the ego had not yet placed itself in complete opposition to it and did not yet regard it as something foreign to itself. Nevertheless, opposition to this wish from some source or other was already in activity, for its occurrence was regularly accompanied by a distressing affect. A conflict was evidently in progress in the mind of this young libertine. Side by side with the obsessive wish, and intimately associated with it, was an obsessive fear: every time he had a wish of this kind he could not help fearing that something dreadful would happen. This something dreadful was already clothed in a characteristic indeterminateness which was thenceforward to be an invariable feature of every manifestation of the neurosis. But in a child it is not hard to discover what it is that is veiled behind an indeterminateness of this kind. If the patient can once be induced to give a particular instance in place of the vague generalities which characterize an obsessional neurosis, it may be confidently assumed that the instance is the original and actual thing which has tried to hide itself behind the generalization. Our present patient's obsessive fear, therefore, when restored to its original meaning, would run as follows: 'If I have this wish to see a woman naked, my father will be bound to die.' The distressing affect was distinctly coloured with a tinge of uncanniness and superstition, and was already beginning to give rise to impulses to do something to ward off the impending evil. These impulses were subsequently to develop into the protective measures which the patient adopted.

I shall not in the present paper attempt any discussion of the psychological significance of obsessional thinking. Such a discussion would be of extraordinary value in its results, and would do more to clarify our ideas upon the nature of the conscious and the unconscious than any study of hysteria or the phenomena of hypnosis. It would be a most desirable thing if the philosophers and psychologists who develop brilliant theoretical views on the unconscious upon a basis of hearsay knowledge or from their own conventional definitions would first submit to the convincing impressions which may be gained from a first-hand study of the phenomena of obsessional thinking. We might almost go to the length of requiring it of them, if the task were not so far more laborious than the methods of work to which they are accustomed. I will only add here that in obsessional neuroses the unconscious mental processes occasionally break through into consciousness in their pure and undistorted form, that such incursions may take place at every possible stage of the unconscious process of thought, and that at the moment of the incursion the obsessional ideas can, for the most part, be recognized as formations of very long standing. This accounts for the striking circumstance that, when the analyst tries, with the patient's help, to discover the date of the first occurrence of an obsessional idea, the patient is obliged to place it further and further back as the analysis proceeds, and is constantly finding fresh 'first' occasions for the appearance of the obsession.
Let me now proceed with my account of our findings. In another set of cases psycho-analytic investigation traces the symptoms back, it is true, not to sexual experiences but to commonplace traumatic ones. But this distinction loses its significance owing to another circumstance. For the work of analysis required for the thorough explanation and complete recovery of a case never comes to a stop at events that occurred at the time of the onset of the illness, but invariably goes back to the patient's puberty and early childhood; and it is only there that it comes upon the impressions and events which determined the later onset of the illness. It is only experiences in childhood that explain susceptibility to later traumas and it is only by uncovering these almost invariably forgotten memory-traces and by making them conscious that we acquire the power to get rid of the symptoms. And here we reach the same conclusion as in our investigation of dreams: the imperishable, repressed wishful impulses of childhood have alone provided the power for the construction of symptoms, and without them the reaction to later traumas would have taken a normal course. But these powerful wishful impulses of childhood may without exception be described as sexual.

[1910a, 2228]

If we reflect on the concurrence in Leonardo of his over-powerful instinct for research and the atrophy of his sexual life (which was restricted to what is called ideal homosexuality) we shall be disposed to claim him as a model instance of our third type. The core of his nature, and the secret of it, would appear to be that after his curiosity had been activated in infancy in the service of sexual interests he succeeded in sublimating the greater part of his libido into an urge for research. But it is not easy, to be sure, to prove that this view is right. To do so we should need some picture of his mental development in the first years of his childhood, and it seems foolish to hope for material of that sort when the accounts of his life are so meagre and so unreliable, and when moreover it is a question of information about circumstances that escape the attention of observers even in relation to people of our own generation.

[1910c, 2257]

At this point I will interpolate a few remarks which every analyst has found confirmed in his observations. Forgetting impressions, scenes or experiences nearly always reduces itself to shutting them off. When the patient talks about these 'forgotten' things he seldom fails to add: 'As a matter of fact I've always known it; only I've never thought of it.' He often expresses disappointment at the fact that not enough things come into his head that he can call 'forgotten' - that he has never thought of since they happened. Nevertheless, even this desire is fulfilled, especially in the case of conversion hysterias. 'Forgetting' becomes still further restricted when we assess at their true value the screen memories which are so generally present. In some cases I have had an impression that the familiar childhood amnesia, which is theoretically so important to us, is completely counterbalanced by screen memories. Not only some but all of what is essential from childhood has been retained in these memories. It is simply a question of knowing how to extract it out of them by analysis. They represent the forgotten years of childhood as adequately as the manifest content of a dream represents the dream-thoughts.

[1914g, 2499]
We have recently received a piece of advice, purporting to represent one of the latest developments of psycho-analysis, to the effect that the current conflict and the exciting cause of illness are to be brought into the foreground in analysis. Now this is exactly what Breuer and I used to do at the beginning of our work with the cathartic method. We led the patient's attention directly to the traumatic scene in which the symptom had arisen, and we endeavoured to discover the mental conflict in that scene and to release the suppressed affect in it. In the course of this we discovered the mental process, characteristic of the neuroses, which I later named 'regression’. The patient's associations moved back from the scene which we were trying to elucidate to earlier experiences, and compelled the analysis, which was supposed to correct the present, to occupy itself with the past. This regression led constantly further backwards; at first it seemed regularly to bring us to puberty; later on, failures and points which still eluded explanation drew the analytic work still further back into years of childhood which had hitherto been inaccessible to any kind of exploration. This regressive direction became an important characteristic of analysis. It appeared that psycho-analysis could explain nothing belonging to the present without referring back to something past; indeed, that every pathogenic experience implied a previous experience which, though not in itself pathogenic, had yet endowed the later one with its pathogenic quality. The temptation to confine one's attention to the known present exciting cause was so strong, however, that even in later analyses I gave way to it. In the analysis of the patient I named 'Dora', carried out in 1899, I had knowledge of the scene which occasioned the outbreak of the current illness. I tried innumerable times to submit this experience to analysis, but even direct demands always failed to produce from her anything more than the same meagre and incomplete description of it. Not until a long détour, leading back over her earliest childhood, had been made, did a dream present itself which on analysis brought to her mind the hitherto forgotten details of this scene, so that a comprehension and a solution of the current conflict became possible.

Another product of this sort was the hypothesis of infantile sexuality. This, however, was made at a much later date. In the early days of tentative investigation by analysis no such thing was thought of. At first it was merely observed that the effects of present-day experiences had to be traced back to something in the past. But enquirers often find more than they bargain for. One was drawn further and further back into the past; one hoped at last to be able to stop at puberty, the period in which the sexual impulses are traditionally supposed to awake. But in vain; the tracks led still further back into childhood and into its earlier years. On the way, a mistaken idea had to be overcome which might have been almost fatal to the young science. Influenced by Charcot's view of the traumatic origin of hysteria, one was readily inclined to accept as true and aetiological significant the statements made by patients in which they ascribed their symptoms to passive sexual experiences in the first years of childhood - to put it bluntly, to seduction. When this aetiology broke down under the weight of its own improbability and contradiction in definitely ascertainable circumstances, the result at first was helpless bewilderment. Analysis had led back to these infantile sexual traumas by the right path, and yet they were not true. The firm ground of reality was gone. At that time I would gladly have given up the whole work, just as my esteemed predecessor, Breuer, had done when he made his unwelcome discovery. Perhaps I persevered only because I no longer had any choice and could not then begin again at anything else. At last came the reflection that, after all, one had no right to despair because one has been deceived in one's expectations; one must revise those expectations. If hysterical subjects trace back their symptoms to traumas that are fictitious, then the new fact which emerges is precisely that they create such scenes in phantasy, and this psychical reality requires to be taken into account alongside practical reality. This reflection was soon followed by the discovery that these phantasies were intended to cover up the auto-erotic activity of the first years of childhood, to embellish it and raise it to a higher plane. And now, from behind the phantasies, the whole range of a child's sexual life came to light.

[1914d, 2880]

[1914d, 2886]
In order to preserve this system intact it was necessary to turn entirely away from observation and from the technique of psycho-analysis. Occasionally enthusiasm for the cause even permitted a disregard of scientific logic - as when Jung finds that the Oedipus complex is not 'specific' enough for the aetiology of the neuroses, and proceeds to attribute this specific quality to inertia, the most universal characteristic of all matter, animate and inanimate! It is to be noted, by the way, that the 'Oedipus complex' represents only a topic with which the individual's mental forces have to deal, and is not itself a force, like 'psychical inertia'. The study of individual people had shown (and always will show) that the sexual complexes in their original sense are alive in them. On that account the investigation of individuals was pushed into the background and replaced by conclusions based on evidence derived from anthropological research. The greatest risk of coming up against the original, undisguised meaning of these re-interpreted complexes was to be met with in the early childhood of every individual; consequently in therapy the injunction was laid down that this past history should be dwelt on as little as possible and the main emphasis put on reverting to the current conflict, in which, moreover, the essential thing was on no account to be what was accidental and personal, but what was general - in fact, the non-fulfilment of the life-task. As we know, however, a neurotic's current conflict becomes comprehensible and admits of solution only when it is traced back to his prehistory, when one goes back along the path that his libido took when he fell ill.

[1914d, 2925]

The form taken by the Neo-Zurich therapy under these influences can be conveyed in the words of a patient who experienced it himself: 'This time not a trace of attention was given to the past or to the transference. Wherever I thought I recognized the latter it was pronounced to be a pure libidinal symbol. The moral instruction was very fine and I followed it faithfully, but I did not advance a step. It was even more annoying for me than for him, but how could I help it? . . . Instead of freeing me by analysis, every day brought fresh tremendous demands on me, which had to be fulfilled if the neurosis was to be conquered - for instance, inward concentration by means of introversion, religious meditation, resuming life with my wife in loving devotion, etc. It was almost beyond one's strength; it was aiming at a radical transformation of one's whole inner nature. I left the analysis as a poor sinner with intense feelings of contrition and the best resolutions, but at the same time in utter discouragement. Any clergyman would have advised what he recommended, but where was I to find the strength?' The patient, it is true, reported that he had heard that analysis of the past and of the transference must be gone through first; but he had been told that he had already had enough of it. Since this first kind of analysis had not helped him more, the conclusion seems to me justified that the patient had not had enough of it. Certainly the subsequent treatment, which no longer had any claim to be called psycho-analysis, did not improve matters. It is remarkable that the members of the Zurich school should have made the long journey round by way of Vienna in order to wind up at the nearby city of Berne, where Dubois cures neuroses by ethical encouragement in a more considerate manner.¹

[1914d, 2926]

More could be made, too, of the analysis of this ceremonial if it could be properly linked up with the patient's other symptoms. But our path does not lead in that direction. You must be content with a hint that the girl was in the grip of an erotic attachment to her father whose beginnings went back to her childhood. Perhaps that was why she behaved in such an unfriendly way to her mother. Nor can we overlook the fact that the analysis of this symptom has once again taken us back to a patient's sexual life. We shall perhaps be less surprised at this the more often we gain an insight into the sense and intention of neurotic symptoms.

[1916-1917, 3348]
And this brings us to the second novelty that I announced to you. For psycho-analytic research has had to concern itself, too, with the sexual life of children, and this is because the memories and associations arising during the analysis of symptoms regularly led back to the early years of childhood. What we inferred from these analyses was later confirmed point by point by direct observations of children. And it then turned out that all these inclinations to perversion had their roots in childhood, that children have a predisposition to all of them and carry them out to an extent corresponding to their immaturity - in short, that perverse sexuality is nothing else than a magnified infantile sexuality split up into its separate impulses. [1916-1917, 3381]

In the first place observation shows, in a manner that excludes all doubt, that the infantile experiences have an importance of their own and give evidence of it already in childhood. Children too have their neuroses, in which the factor of displacement backwards in time is necessarily very much reduced or is even completely absent, since the onset of the illness follows the traumatic experiences immediately. The study of these infantile neuroses protects us from more than one dangerous misunderstanding of the neuroses of adults, just as the dreams of children gave the key to an understanding of adult dreams. Children's neuroses are very common, much commoner than is supposed. They are often overlooked, regarded as signs of a bad or naughty child, often, too, kept under by the nursery authorities; but they can always be easily recognized in retrospect. They usually appear in the form of anxiety hysteria. We shall learn on a later occasion what that means. If a neurosis breaks out in later life, analysis regularly reveals it as a direct continuation of the infantile illness which may have emerged as no more than a veiled hint. As I have said, however, there are cases in which these signs of neurosis in childhood proceed uninterruptedly into a lifelong illness. We have been able to analyse a few examples of these children's neuroses in childhood itself - when they were actually present; but far more often we have had to be content with someone who has fallen ill in adult life enabling us to obtain a deferred insight into his childhood neurosis. In such cases we must not fail to make certain corrections and take certain precautions. [1916-1917, 3421]
I have warned you that we still have something new to learn; it is indeed something surprising and perplexing. By means of analysis, as you know, starting from the symptoms, we arrive at a knowledge of the infantile experiences to which the libido is fixated and out of which the symptoms are made. Well, the surprise lies in the fact that these scenes from infancy are not always true. Indeed, they are not true in the majority of cases, and in a few of them they are the direct opposite of the historical truth. As you will see, this discovery is calculated more than any other to discredit either analysis, which has led to this result, or the patients, on whose statements the analysis and our whole understanding of the neuroses are founded. But there is something else remarkably perplexing about it. If the infantile experiences brought to light by analysis were invariably real, we should feel that we were standing on firm ground; if they were regularly falsified and revealed as inventions, as phantasies of the patient, we should be obliged to abandon this shaky ground and look for salvation elsewhere. But neither of these things is the case: the position can be shown to be that the childhood experiences constructed or remembered in analysis are sometimes indisputably false and sometimes equally certainly correct, and in most cases compounded of truth and falsehood. Sometimes, then, symptoms represent events which really took place and to which we may attribute an influence on the fixation of the libido, and sometimes they represent phantasies of the patient's which are not, of course, suited to playing an aetiological role. It is difficult to find one's way about in this. We can make a first start, perhaps, with a similar discovery - namely, that the isolated childhood memories that people have possessed consciously from time immemorial and before there was any such thing as analysis may equally be falsified or at least may combine truth and falsehood in plenty. In their case there is seldom any difficulty in showing their incorrectness; so we at least have the reassurance of knowing that the responsibility for this unexpected disappointment lies, not with analysis, but in some way with the patients.

The only impression we gain is that these events of childhood are somehow demanded as a necessity, that they are among the essential elements of a neurosis. If they have occurred in reality, so much to the good; but if they have been withheld by reality, they are put together from hints and supplemented by phantasy. The outcome is the same, and up to the present we have not succeeded in pointing to any difference in the consequences, whether phantasy or reality has had the greater share in these events of childhood. Here we simply have once again one of the complemental relations that I have so often mentioned; moreover it is the strangest of all we have met with. Whence comes the need for these phantasies and the material for them? There can be no doubt that their sources lie in the instincts; but it has still to be explained why the same phantasies with the same content are created on every occasion. I am prepared with an answer which I know will seem daring to you. I believe these primal phantasies, as I should like to call them, and no doubt a few others as well, are a phylogenetic endowment. In them the individual reaches beyond his own experience into primaeval experience at points where his own experience as been too rudimentary. It seems to me quite possible that all the things that are told to us to-day in analysis as phantasy - the seduction of children, the inflaming of sexual excitement by observing parental intercourse, the threat of castration (or rather castration itself) - were once real occurrences in the primaeval times of the human family, and that children in their phantasies are simply filling in the gaps in individual truth with prehistoric truth. I have repeatedly been led to suspect that the psychology of the neuroses has stored up in it more of the antiquities of human development than any other source.
Think it over! You have learnt all that is essential about the determinants of falling ill as well as all the factors that come into effect after the patient has fallen ill. Where do these leave room for any therapeutic influence? In the first place there is hereditary disposition. We have not talked about it very often because it is emphatically stressed from other directions and we have nothing new to say about it. But do not suppose that we underestimate it; precisely as therapists we come to realize its power clearly enough. In any case we can do nothing to alter it; we too must take it as something given, which sets a limit to our efforts. Next there is the influence of early experiences in childhood, to which we are in the habit of giving prominence in analysis: they belong to the past and we cannot undo them. Then comes everything that we have summarized as ‘real frustration’ - the misfortunes of life from which arise deprivation of love, poverty, family quarrels, ill-judged choice of a partner in marriage, unfavourable social circumstances, and the strictness of the ethical standards to whose pressure the individual is subject. Here, to be sure, there would be handles enough for a very effective therapy, but it would have to be of the kind which Viennese folklore attributes to the Emperor Joseph - the benevolent interference of a powerful personage before whose will people bow and difficulties vanish. But who are we, that we should be able to adopt benevolence of this kind as an instrument of our therapy? Poor ourselves and socially powerless, and compelled to earn our livelihood from our medical activity, we are not even in a position to extend our efforts to people without means, as other doctors with other methods of treatment are after all able to do. Our therapy is too time-consuming and too laborious for that to be possible. Perhaps, however, you are clutching at one of the factors I have mentioned and believe that there you have found the point at which our influence can make its attack. If the ethical restrictions demanded by society play a part in the deprivation imposed on the patient, treatment can, after all, give him the courage, or perhaps a direct injunction, to disregard those barriers and achieve satisfaction and recovery while forgoing the fulfilment of an ideal that is exalted, but so often not adhered to, by society. The patient will thus become healthy by ‘living a full life’ sexually. This, it is true, casts a shadow on analytic treatment for not serving general morality. What it has given to the individual it will have taken from the community.

[1916-1917, 3475]

I will now complete my picture of the mechanism of cure by clothing it in the formulas of the libido theory. A neurotic is incapable of enjoyment and of efficiency - the former because his libido is not directed on to any real object and the latter because he is obliged to employ a great deal of this available energy on keeping his libido under repression and on warding off its assaults. He would become healthy if the conflict between his ego and his libido came to an end and if his ego had his libido again at its disposal. The therapeutic task consists, therefore, in freeing the libido from its present attachments, which are withdrawn from the ego, and in making it once more serviceable to the ego. Where, then, is the neurotic's libido situated? It is easily found: it is attached to the symptoms, which yield it the only substitutive satisfaction possible at the time. We must therefore make ourselves masters of the symptoms and resolve them - which is precisely the same thing that the patient requires of us. In order to resolve the symptoms, we must go back as far as their origin, we must renew the conflict from which they arose, and, with the help of motive forces which were not at the patient's disposal in the past, we must guide it to a different outcome. This revision of the process of repression can be accomplished only in part in connection with the memory traces of the processes which led to repression. The decisive part of the work is achieved by creating in the patient's relation to the doctor - in the 'transference' - new editions of the old conflicts; in these the patient would like to behave in the same way as he did in the past, while we, by summoning up every available mental force, compel him to come to a fresh decision. Thus the transference becomes the battlefield on which all the mutually struggling forces should meet one another.

[1916-1917, 3494]
All of the phenomena which the patient associated with the phase of his life that began with his naughtiness disappeared in about his eighth year. They did not disappear at a single blow, and made occasional reappearances, but finally gave way, in the patient's opinion, before the influence of the masters and tutors, who then took the place of the women who had hitherto looked after him. Here, then, in the briefest outline, are the riddles for which the analysis had to find a solution. What was the origin of the sudden change in the boy's character? What was the significance of his phobia and of his perversities? How did he arrive at his obsessive piety? And how are all these phenomena interrelated? I will once more recall the fact that our therapeutic work was concerned with a subsequent and recent neurotic illness, and that light could only be thrown upon these earlier problems when the course of the analysis led away for a time from the present, and forced us to make a détour through the prehistoric period of childhood.

The two other doubts are based on a low estimate of the importance of early infantile impressions and an unwillingness to ascribe such enduring effects to them. The supporters of this view look for the causes of neuroses almost exclusively in the grave conflicts of later life; they assume that the importance of childhood is only held up before our eyes in analysis on account of the inclination of neurotics for expressing their present interests in reminiscences and symbols from the remote past. Such an estimate of the importance of the infantile factor would involve the disappearance of much that has formed part of the most intimate characteristics of analysis, though also, no doubt, of much that raises resistance to it and alienates the confidence of the outsider.

The view, then, that we are putting up for discussion is as follows. It maintains that scenes from early infancy, such as are brought up by an exhaustive analysis of neuroses (as, for instance, in the present case), are not reproductions of real occurrences, to which it is possible to ascribe an influence over the course of the patient's later life and over the formation of his symptoms. It considers them rather as products of the imagination, which find their instigation in mature life, which are intended to serve as some kind of symbolic representation of real wishes and interests, and which owe their origin to a regressive tendency, to a turning-away from the tasks of the present. If that is so, we can of course spare ourselves the necessity of attributing such a surprising amount to the mental life and intellectual capacity of children of the tenderest age.

As was to be expected, the enormous shortening of the interval between the outbreak of the neurosis and the date of the childhood experiences which are under discussion reduces to the narrowest limits the regressive part of the causation, while it brings into full view the portion of it which operates in a forward direction, the influence of earlier impressions. The present case history will, I hope, give a clear picture of this position of things. But there are other reasons why neuroses of childhood give a decisive answer to the question of the nature of primal scenes - the earliest experiences of childhood that are brought to light in analysis.
Let us assume as an uncontradicted premise that a primal scene of this kind has been correctly educed technically, that it is indispensable to a comprehensive solution of all the conundrums that are set us by the symptoms of the infantile disorder, that all the consequences radiate out from it, just as all the threads of the analysis have led up to it. Then, in view of its content, it is impossible that it can be anything else than the reproduction of a reality experienced by the child. For a child, like an adult, can produce phantasies only from material which has been acquired from some source or other; and with children, some of the means of acquiring it (by reading, for instance) are cut off, while the space of time at their disposal for acquiring it is short and can easily be searched with a view to the discovery of any such sources.

[1918b, 3542]

In the present case the content of the primal scene is a picture of sexual intercourse between the boy's parents in a posture especially favourable for certain observations. Now it would be no evidence whatever of the reality of such a scene if we were to find it in a patient whose symptoms (the effects of the scene, that is) had appeared at some time or other in the later part of his life. A person such as this might have acquired the impressions, the ideas, and the knowledge on a great number of different occasions in the course of the long interval; he might then have transformed them into an imaginary picture, have projected them back into his childhood, and have attached them to his parents. If, however, the effects of a scene of this sort appear in the child's fourth or fifth year, then he must have witnessed the scene at an age even earlier than that. But in that case we are still faced with all the disconcerting consequences which have arisen from the analysis of this infantile neurosis. The only way out would be to assume that the patient not only unconsciously imagined the primal scene, but also concocted the alteration in his character, his fear of the wolf, and his religious obsession; but such an expedient would be contradicted by his otherwise sober nature and by the direct tradition in his family. It must therefore be left at this (I can see no other possibility): either the analysis based on the neurosis in his childhood is all a piece of nonsense from start to finish, or everything took place just as I have described it above.

[1918b, 3542]

Strictly considered - and why should this question not be considered with all possible strictness? - analytic work deserves to be recognized as genuine psycho-analysis only when it has succeeded in removing the amnesia which conceals from the adult his knowledge of his childhood from its beginning (that is, from about the second to the fifth year). This cannot be said among analysts too emphatically or repeated too often. The motives for disregarding this reminder are, indeed, intelligible. It would be desirable to obtain practical results in a shorter period and with less trouble. But at the present time theoretical knowledge is still far more important to all of us than therapeutic success, and anyone who neglects childhood analysis is bound to fall into the most disastrous errors. The emphasis which is laid here upon the importance of the earliest experiences does not imply any underestimation of the influence of later ones. But the later impressions of life speak loudly enough through the mouth of the patient, while it is the physician who has to raise his voice on behalf of the claims of childhood.

[1919e, 3646]
It would naturally be important to know whether the origin of infantile perversions from the Oedipus complex can be asserted as a general principle. While this cannot be decided without further investigation, it does not seem impossible. When we recall the anamneses which have been obtained in adult cases of perversion we cannot fail to notice that the decisive impression, the 'first experience', of all these perverts, fetishists, etc., is scarcely ever referred back to a time earlier than the sixth year. At this time, however, the dominance of the Oedipus complex is already over; the experience which is recalled, and which has been effective in such a puzzling way, may very well have represented the legacy of that complex. The connections between the experience and the complex which is by this time repressed are bound to remain obscure so long as analysis has not thrown any light on the time before the first 'pathogenic' impression. So it may be imagined how little value is to be attached, for instance, to an assertion that a case of homosexuality is congenital, when the ground given for this belief is that ever since his eighth or sixth year the person in question has felt inclinations only towards his own sex.

[1919e, 3653]

If, however, the derivation of perversions from the Oedipus complex can be generally established, our estimate of its importance will have gained added strength. For in our opinion the Oedipus complex is the actual nucleus of neuroses, and the infantile sexuality which culminates in this complex is the true determinant of neuroses. What remains of the complex in the unconscious represents the disposition to the later development of neuroses in the adult. In this way the beating-phantasy and other analogous perverse fixations would also only be precipitates of the Oedipus complex, scars, so to say, left behind after the process has ended, just as the notorious 'sense of inferiority' corresponds to a narcissistic scar of the same sort. In taking this view of the matter I must express my unreserved agreement with Marcinowski (1918), who has recently put it forward most happily. As is well known, this neurotic delusion of inferiority is only a partial one, and is completely compatible with the existence of a self-overvaluation derived from other sources. The origin of the Oedipus complex itself, and the destiny which compels man, probably alone among all animals, to begin his sexual life twice over, first like all other creatures in his early childhood, and then after a long interruption once more at the age of puberty - all the problems that are connected with man's 'archaic heritage' - have been discussed by me elsewhere, and I have no intention of going into them in this place.

[1919e, 3654]
But it became ever clearer that the aim which had been set up - the aim that what was unconscious should become conscious - is not completely attainable by that method. The patient cannot remember the whole of what is repressed in him, and what he cannot remember may be precisely the essential part of it. Thus he acquires no sense of conviction of the correctness of the construction that has been communicated to him. He is obliged to repeat the repressed material as a contemporary experience instead of, as the physician would prefer to see, remembering it as something belonging to the past.¹ These reproductions, which emerge with such unwished-for exactitude, always have as their subject some portion of infantile sexual life - of the Oedipus complex, that is, and its derivatives; and they are invariably acted out in the sphere of the transference, of the patient's relation to the physician. When things have reached this stage, it may be said that the earlier neurosis has now been replaced by a fresh, 'transference neurosis'. It has been the physician's endeavour to keep this transference neurosis within the narrowest limits: to force as much as possible into the channel of memory and to allow as little as possible to emerge as repetition. The ratio between what is remembered and what is reproduced varies from case to case. The physician cannot as a rule spare his patient this phase of the treatment. He must get him to re-experience some portion of his forgotten life, but must see to it, on the other hand, that the patient retains some degree of aloofness, which will enable him, in spite of everything, to recognize that what appears to be reality is in fact only a reflection of a forgotten past. If this can be successfully achieved, the patient's sense of conviction is won, together with the therapeutic success that is dependent on it.

¹ 1920g, 3723

If a dream brings up situations that can be interpreted as referring to scenes from the dreamer's past, it seems especially important to ask whether the physician's influence can also play a part in such contents of the dream as these. And this question is most urgent of all in the case of what are called 'corroborative' dreams, dreams which, as it were, 'tag along behind' the analysis. With some patients these are the only dreams that one obtains. Such patients reproduce the forgotten experiences of their childhood only after one has constructed them from their symptoms, associations and other signs and has propounded these constructions to them. Then follow the corroborative dreams, concerning which, however, the doubt arises whether they may not be entirely without evidential value, since they may have been imagined in compliance with the physician's words instead of having been brought to light from the dreamer's unconscious. This ambiguous position cannot be escaped in the analysis, since with these patients unless one interprets, constructs and propounds, one never obtains access to what is repressed in them.

² 1923c, 4036

In my own writings and in those of my followers more and more stress is laid on the necessity that the analyses of neurotics shall deal thoroughly with the remotest period of their childhood, the time of the early efflorescence of sexual life. It is only by examining the first manifestations of the patient's innate instinctual constitution and the effects of his earliest experiences that we can accurately gauge the motive forces that have led to his neurosis and can be secure against the errors into which we might be tempted by the degree to which things have become remodelled and overlaid in adult life. This requirement is not only of theoretical but also of practical importance, for it distinguishes our efforts from the work of those physicians whose interests are focused exclusively on therapeutic results and who employ analytic methods, but only up to a certain point. An analysis of early childhood such as we are considering is tedious and laborious and makes demands both upon the physician and upon the patient which cannot always be met. Moreover, it leads us into dark regions where there are as yet no sign posts. Indeed, analysts may feel reassured, I think, that there is no risk of their work becoming mechanical, and so of losing its interest, during the next few decades.

³ 1925j, 4146
In Europe during the years 1911-13 two secessionist movements from psycho-analysis took place, led by men who had previously played a considerable part in the young science, Alfred Adler and C. G. Jung. Both movements seemed most threatening and quickly obtained a large following. But their strength lay, not in their own content, but in the temptation which they offered of being freed from what were felt as the repellent findings of psycho-analysis even though its actual material was no longer rejected. Jung attempted to give to the facts of analysis a fresh interpretation of an abstract, impersonal and non-historical character, and thus hoped to escape the need for recognizing the importance of infantile sexuality and of the Oedipus complex as well as the necessity for any analysis of childhood. Adler seemed to depart still further from psycho-analysis; he entirely repudiated the importance of sexuality, traced back the formation both of character and of the neuroses solely to men’s desire for power and to their need to compensate for their constitutional inferiorities, and threw all the psychological discoveries of psycho-analysis to the winds. But what he had rejected forced its way back into his closed system under other names; his ‘masculine protest’ is nothing else than repression unjustifiably sexualized. The criticism with which the two heretics were met was a mild one; I only insisted that both Adler and Jung should cease to describe their theories as ‘psycho-analysis’. After a lapse of ten years it can be asserted that both of these attempts against psycho-analysis have blown over without doing any harm.

It is easy now to describe our therapeutic aim. We try to restore the ego, to free it from its restrictions, and to give it back the command over the id which it has lost owing to its early repressions. It is for this one purpose that we carry out analysis, our whole technique is directed to this aim. We have to seek out the repressions which have been set up and to urge the ego to correct them with our help and to deal with conflicts better than by an attempt at flight. Since these repressions belong to the very early years of childhood, the work of analysis leads us, too, back to that period. Our path to these situations of conflict, which have for the most part been forgotten and which we try to revive in the patient's memory, is pointed out to us by his symptoms, dreams and free associations. These must, however, first be interpreted - translated - for, under the influence of the psychology of the id, they have assumed forms of expression that are strange to our comprehension. We may assume that whatever associations, thoughts and memories the patient is unable to communicate to us without internal struggles are in some way connected with the repressed material or are its derivatives. By encouraging the patient to disregard his resistances to telling us these things, we are educating his ego to overcome its inclination towards attempts at flight and to tolerate an approach to what is repressed. In the end, if the situation of the repression can be successfully reproduced in his memory, his compliance will be brilliantly rewarded. The whole difference between his age then and now works in his favour; and the thing from which his childish ego fled in terror will often seem to his adult and strengthened ego no more than child's play.

Very well. I can now proceed with my exposition. Sexual life is not simply something spicy; it is also a serious scientific problem. There was much that was novel to be learnt about it, many strange things to be explained. I told you just now that analysis has to go back into the early years of the patient's childhood, because the decisive repressions have taken place then, while his ego was feeble. But surely in childhood there is no sexual life? surely it only starts at puberty? On the contrary. We have to learn that sexual instinctual impulses accompany life from birth onwards, and that it is precisely in order to fend off those instincts that the infantile ego institutes repressions. A remarkable coincidence, is it not? that small children should already be struggling against the power of sexuality, just as the speaker in the learned society was to do later, and later still my followers who have set up their own theories. How does that come about? The most general explanation would be that our civilization is built up entirely at the expense of sexuality; but there is much more to be said on the subject.
It can be done very well. It is hardly to be believed what goes on in a child of four or five years old. Children are very active-minded at that age; their early sexual period is also a period of intellectual flowering. I have an impression that with the onset of the latency period they become mentally inhibited as well, stupider. From that time on, too, many children lose their physical charm. And, as regards the damage done by early analysis, I may inform you that the first child on whom the experiment was ventured, nearly twenty years ago, has since then grown into a healthy and capable young man, who has passed through his puberty irreproachably, in spite of some severe psychical traumas. It may be hoped that things will turn out no worse for the other 'victims' of early analysis. Much that is of interest attaches to these child analyses; it is possible that in the future they will become still more important. From the point of view of theory, their value is beyond question. They give unambiguous information on problems which remain unsolved in the analyses of adults; and they thus protect the analyst from errors that might have momentous consequences for him. One surprises the factors that lead to the formation of a neurosis while they are actually at work and one cannot then mistake them. In the child's interest, it is true, analytic influence must be combined with educational measures. The technique has still to receive its shaping. But practical interest is aroused by the observation that a very large number of our children pass through a plainly neurotic phase in the course of their development. Since we have learnt how to look more sharply, we are tempted to say that neurosis in children is not the exception but the rule, as though it could scarcely be avoided on the path from the innate disposition of infancy to civilized society. In most cases this neurotic phase in childhood is overcome spontaneously. But may it not also regularly leave its traces in the average healthy adult? On the other hand in those who are neurotics in later life we never fail to find links with the illness in childhood, though at the time it need not have been very noticeable. In a precisely analogous way physicians to-day, I believe, hold the view that each one of us has gone through an attack of tuberculosis in his childhood. It is true that in the case of the neuroses the factor of immunization does not operate, but only the factor of predisposition.

Let me return to your question about certainty. We have become quite generally convinced from the direct analytic examination of children that we were right in our interpretation of what adults told us about their childhood. In a number of cases, however, another sort of confirmation has become possible. The material of the analysis of some patients has enabled us to reconstruct certain external happenings, certain impressive events of their childhood years, of which they have preserved no conscious memory. Lucky accidents, information from parents or nurses, have afterwards provided irrefutable evidence that these occurrences which we had inferred really did take place. This, of course, has not happened often, but when it has it has made an overwhelming impression. The correct reconstruction, you must know, of such forgotten experiences of childhood always has a great therapeutic effect, whether they permit of objective confirmation or not. These events owe their importance, of course, to their having occurred at such an early age, at a time when they could still produce a traumatic effect on the feeble ego.

Various sorts. In the first place, impressions capable of permanently influencing the child's budding sexual life - such as observations of sexual activities between adults, or sexual experiences of his own with an adult or another child (no rare events); or, again, overhearing conversations, understood either at the time or retrospectively, from which the child thought it could draw conclusions about mysterious or uncanny matters; or again, remarks or actions by the child himself which give evidence of significant attitudes of affection or enmity towards other people. It is of special importance in an analysis to induce a memory of the patient's own forgotten sexual activity as a child and also of the intervention by the adults which brought it to an end.

We meet with the second of these facts almost every day in the course of our analytic work; and it does not imply such an important objection as the other does. One of the tasks of psycho-analysis, as you know, is to lift the veil of amnesia which hides the earliest years of childhood and to bring to conscious memory the manifestations of early infantile sexual life which are contained in them. Now these first sexual experiences of a child are linked to painful impressions of anxiety, prohibition, disappointment and punishment. We can understand their having been represssed; but, that being so, we cannot understand how it is that they have such free access to dream-life, that they provide the pattern for so many dream-phantasies and that dreams are filled with reproductions of these scenes from childhood and with allusions to them. It must be admitted that their unpleasurable character and the dream-work's wish-fulfilling purpose seem far from mutually compatible. But it may be that in this case we are magnifying the difficulty. After all, these same infantile experiences have attached to them all the imperishable, unfulfilled instinctual wishes which throughout life provide the energy for the construction of dreams, and to which we may no doubt credit the possibility, in their mighty uprush, of forcing to the surface, along with the rest, the material of distressing events. And on the other hand the manner and form in which this material is reproduced shows unmistakably the efforts of the dream-work directed to denying the unpleasure by means of distortion and to transforming disappointment into attainment.

[1933a, 4641]

But the moralist will console himself for a long time to come with the improbability of our speculations. A queer instinct indeed, directed to the destruction of its own organic home! Poets, it is true, talk of such things; but poets are irresponsible people and enjoy the privilege of poetic licence. Incidentally, such ideas are not foreign even to physiology: consider the notion, for instance, of the mucous membrane of the stomach digesting itself. It must be admitted, however, that our self-destructive instinct calls for support on a wider basis. One cannot, after all, venture on a hypothesis of such a wide range merely because a few poor fools have linked their sexual satisfaction to a peculiar condition. A more profound study of the instincts will, I believe, give us what we need. The instincts rule not only mental but also vegetative life, and these organic instincts exhibit a characteristic which deserves our deepest interest. (We shall not be able to judge until later whether it is a general characteristic of instincts.) For they reveal an effort to restore an earlier state of things. We may suppose that from the moment at which a state of things that has once been attained is upset, an instinct arises to create it afresh and brings about phenomena which we can describe as a ‘compulsion to repeat’. Thus the whole of embryology is an example of the compulsion to repeat. A power of regenerating lost organs extends far up into the animal kingdom, and the instinct for recovery to which, alongside of therapeutic assistance, our cures are due must be the residue of this capacity which is so enormously developed in the lower animals. The spawning migrations of fishes, the migratory flights of birds, and possibly all that we describe as manifestations of instinct in animals, take place under the orders of the compulsion to repeat, which expresses the conservative nature of the instincts. Nor have we far to look in the mental field for its manifestations. We have been struck by the fact that the forgotten and repressed experiences of childhood are reproduced during the work of analysis in dreams and reactions, particularly in those occurring in the transference, although their revival runs counter to the interest of the pleasure principle; and we have explained this by supposing that in these cases a compulsion to repeat is overcoming even the pleasure principle. Outside analysis, too, something similar can be observed. There are people in whose lives the same reactions are perpetually being repeated uncorrected, to their own detriment, or others who seem to be pursued by a relentless fate, though closer investigation teaches us that they are unwittingly bringing this fate on themselves. In such cases we attribute a ‘daemonic’ character to the compulsion to repeat.

[1933a, 4710]
I need not say much about other schools which have branched off from our psycho-analysis. The fact that they have done so cannot be used either for or against the validity of psycho-analytic theories. You have only to think of the strong emotional factors that make it hard for many people to fit themselves in with others or to subordinate themselves, and of the still greater difficulty justly insisted on by the dictum 'Quot capita tot sensus'. When the differences of opinion had gone beyond a certain point, the most sensible thing was to part and thereafter to proceed along our different ways - especially when the theoretical divergence involved a change in practical procedure. Suppose, for instance, that an analyst attaches little value to the influence of the patient's personal past and looks for the causation of neuroses exclusively in present-day motives and in expectations of the future. In that case he will also neglect the analysis of childhood; he will have to adopt an entirely different technique and will have to make up for the omission of the events from the analysis of childhood by increasing his didactic influence and by directly indicating certain particular aims in life. We for our part will then say: 'This may be a school of wisdom; but it is no longer analysis.' Or someone else may arrive at the view that the experience of anxiety at birth sows the seed of all later neurotic disturbances. It may thereupon seem to him legitimate to restrict analysis to the consequences of this single impression and to promise therapeutic success from a treatment lasting from three to four months. As you will observe, I have chosen two examples which start from diametrically opposite premisses. It is an almost universal characteristic of these 'secessionist movements' that each of them takes hold of one fragment out of the wealth of themes in psycho-analysis and makes itself independent on the basis of this seizure - selecting the instinct for mastery, for instance, or ethical conflict, or the mother, or genitality, and so on. If it appears to you that secessions of this sort are already more numerous to-day in the history of psycho-analysis than in other intellectual movements, I am not sure that I should agree with you. If it is the case, the responsibility must be laid on the intimate relations which exist in psycho-analysis between theoretical views and therapeutic treatment. Mere differences of opinion would be tolerable for far longer. People like accusing us psycho-analysts of intolerance. The only manifestation of this ugly characteristic has been precisely our parting from those who think differently from us. No other harm has been done to them. On the contrary, they have fallen on their feet, and are better off than they were before. For by their separation they have usually freed themselves of one of the burdens which weigh us down - the odium of infantile sexuality, perhaps, or the absurdity of symbolism - and are regarded by their environment as passably respectable, which is still not true of those of us who are left behind. Moreover, apart from one notable exception, it was they who excluded themselves.

[1933a, 4744]
The road that led to this application is easily traced. When in the treatment of an adult neurotic we followed up the determinants of his symptoms, we were regularly led back to his early childhood. A knowledge of the later aetiological factors was not sufficient either for understanding the case or for producing a therapeutic effect. We were therefore compelled to make ourselves acquainted with the psychical peculiarities of childhood; we learnt a quantity of things which could not have been learnt except through analysis, and we were able to put right many opinions that were generally held about childhood. We recognized that particular importance attached to the first years of childhood - up to the age of five, perhaps - for several reasons. Firstly, because those years include the early efflorescence of sexuality which leaves behind it decisive instigating factors for the sexual life of maturity. Secondly, because the impressions of this period impinge upon an immature and feeble ego, and act upon it like traumas. The ego cannot fend off the emotional storms which they provoke in any way except by repression and in this manner acquires in childhood all its dispositions to later illnesses and functional disturbances. We realized that the difficulty of childhood lies in the fact that in a short span of time a child has to appropriate the results of a cultural evolution which stretches over thousands of years, including the acquisition of control over his instincts and adaptation to society - or at least the first beginnings of these two. He can only achieve a part of this modification through his own development; much must be imposed on him by education. We are not surprised that children often carry out this task very imperfectly. During these early times many of them pass through states that may be put on a par with neuroses - and this is certainly so in the case of all those who produce manifest illnesses later on. In some children the neurotic illness does not wait till maturity but breaks out already in childhood and gives parents and doctors plenty of trouble.

[1933a, 4747]

For I think my hypothesis - that, in order to gain control over fire, men had to renounce the homosexually-tinged desire to put it out with a stream of urine - can be confirmed by an interpretation of the Greek myth of Prometheus, provided that we bear in mind the distortions which must be expected to occur in the transition from facts to the contents of a myth. These distortions are of the same sort as, and no worse than, those which we acknowledge every day, when we reconstruct from patients' dreams the repressed but extremely important experiences of their childhood. The mechanisms employed in the distortions I have in mind are symbolic representation and turning into the opposite. I should not venture to explain all the features of our myth in this fashion; apart from the original set of facts, other and later occurrences may have contributed to its content. But the elements which admit of analytic interpretation are, after all, the most striking and important - viz. the manner in which Prometheus transported the fire, the character of his act (an outrage, a theft, a defrauding of the gods) and the meaning of his punishment.

[1932a, 4781]

¹ This therefore makes it nonsensical to say that one is practising psycho-analysis if one excludes from examination and consideration precisely these earliest periods - as happens in some quarters.

[1939a, 4899]
The chief interest is naturally focused on the first of these assertions, the most unexpected of all. It has been found that in early childhood there are signs of bodily activity to which only an ancient prejudice could deny the name of sexual and which are linked to psychical phenomena that we come across later in adult erotic life - such as fixation to particular objects, jealousy, and so on. It is further found, however, that these phenomena which emerge in early childhood form part of an ordered course of development, that they pass through a regular process of increase, reaching a climax towards the end of the fifth year, after which there follows a lull. During this lull progress is at a standstill and much is unlearnt and there is much recession. After the end of this period of latency, as it is called, sexual life advances once more with puberty; we might say that it has a second efflorescence. And here we come upon the fact that the onset of sexual life is diphasic, that it occurs in two waves - something that is unknown except in man and evidently has an important bearing on hominization.¹ It is not a matter of indifference that the events of this early period, except for a few residues, fall a victim to infantile amnesia. Our views on the aetiology of the neuroses and our technique of analytic therapy are derived from these conceptions; and our tracing of the developmental processes in this early period has also provided evidence for yet other conclusions.

[1940a [1938], 4964]

The evidence of the share taken by the unconscious id in the formation of dreams is abundant and convincing. (a) Memory is far more comprehensive in dreams than in waking life. Dreams bring up recollections which the dreamer has forgotten, which are inaccessible to him when he is awake. (b) Dreams make an unrestricted use of linguistic symbols, the meaning of which is for the most part unknown to the dreamer. Our experience, however, enables us to confirm their sense. They probably originate from earlier phases in the development of speech. (c) Memory very often reproduces in dreams impressions from the dreamer's early childhood of which we can definitely assert not only that they had been forgotten but that they had become unconscious owing to repression. That explains the help - usually indispensable - given us by dreams in the attempts we make during the analytic treatment of neuroses to reconstruct the dreamer's early life. (d) Furthermore, dreams bring to light material which cannot have originated either from the dreamer's adult life or from his forgotten childhood. We are obliged to regard it as part of the archaic heritage which a child brings with him into the world, before any experience of his own, influenced by the experiences of his ancestors. We find the counterpart of this phylogenetic material in the earliest human legends and in surviving customs. Thus dreams constitute a source of human prehistory which is not to be despised.

[1940a [1938], 4976]
I myself had adopted another way of speeding up an analytic treatment even before the war. At that time I had taken on the case of a young Russian, a man spoilt by wealth, who had come to Vienna in a state of complete helplessness, accompanied by a private doctor and an attendant.¹ In the course of a few years it was possible to give him back a large amount of his independence, to awaken his interest in life and to adjust his relations to the people most important to him. But there progress came to a stop. We advanced no further in clearing up the neurosis of his childhood, on which his later illness was based, and it was obvious that the patient found his present position highly comfortable and had no wish to take any step forward which would bring him nearer to the end of his treatment. It was a case of the treatment inhibiting itself: it was in danger of failing as a result of its - partial - success. In this predicament I resorted to the heroic measure of fixing a time limit for the analysis. At the beginning of a year's work I informed the patient that the coming year was to be the last one of his treatment, no matter what he achieved in the time still left to him. At first he did not believe me, but once he was convinced that I was in deadly earnest, the desired change set in. His resistances shrank up, and in these last months of his treatment he was able to reproduce all the memories and to discover all the connections which seemed necessary for understanding his early neurosis and mastering his present one. When he left me in the midsummer of 1914, with as little suspicion as the rest of us of what lay so shortly ahead, I believed that his cure was radical and permanent.

[1937c, 5015]

In a footnote added to this patient's case history in 1923, I have already reported that I was mistaken. When, towards the end of the war, he returned to Vienna, a refugee and destitute, I had to help him to master a part of the transference which had not been resolved. This was accomplished in a few months, and I was able to end my footnote with the statement that 'since then the patient has felt normal and has behaved unexceptionably, in spite of the war having robbed him of his home, his possessions, and all his family relationships'. Fifteen years have passed since then without disproving the truth of this verdict; but certain reservations have become necessary. The patient has stayed on in Vienna and has kept a place in society, if a humble one. But several times during this period his good state of health has been interrupted by attacks of illness which could only be construed as offshoots of his perennial neurosis. Thanks to the skill of one of my pupils, Dr. Ruth Mack Brunswick, a short course of treatment has on each occasion brought these conditions to an end. I hope that Dr. Mack Brunswick herself will shortly report on the circumstances. Some of these attacks were still concerned with residual portions of the transference; and, where this was so, short-lived though they were, they showed a distinctly paranoid character. In other attacks, however, the pathogenic material consisted of pieces of the patient's childhood history, which had not come to light while I was analysing him and which now came away - the comparison is unavoidable - like sutures after an operation, or small fragments of necrotic bone. I have found the history of this patient's recovery scarcely less interesting than that of his illness.

[1937c, 5016]
What we are in search of is a picture of the patient's forgotten years that shall be alike trustworthy and in all essential respects complete. But at this point we are reminded that the work of analysis consists of two quite different portions, that it is carried on in two separate localities, that it involves two people, to each of whom a distinct task is assigned. It may for a moment seem strange that such a fundamental fact should not have been pointed out long ago; but it will immediately be perceived that there was nothing being kept back in this, that it is a fact which is universally known and, as it were, self-evident and is merely being brought into relief here and separately examined for a particular purpose. We all know that the person who is being analysed has to be induced to remember something that has been experienced by him and repressed; and the dynamic determinants of this process are so interesting that the other portion of the work, the task performed by the analyst, has been pushed into the background. The analyst has neither experienced nor repressed any of the material under consideration; his task cannot be to remember anything. What then is his task? His task is to make out what has been forgotten from the traces which it has left behind or, more correctly, to construct it. The time and manner in which he conveys his constructions to the person who is being analysed, as well as the explanations with which he accompanies them, constitute the link between the two portions of the work of analysis, between his own part and that of the patient.

[1937d, 5050]

The analyst, as we have said, works under more favourable conditions than the archaeologist since he has at his disposal material which can have no counterpart in excavations, such as the repetitions of reactions dating from infancy and all that is indicated by the transference in connection with these repetitions. But in addition to this it must be borne in mind that the excavator is dealing with destroyed objects of which large and important portions have quite certainly been lost, by mechanical violence, by fire and by plundering. No amount of effort can result in their discovery and lead to their being united with the surviving remains. The one and only course open is that of reconstruction, which for this reason can often reach only a certain degree of probability. But it is different with the psychical object whose early history the analyst is seeking to recover. Here we are regularly met by a situation which with the archaeological object occurs only in such rare circumstances as those of Pompeii or of the tomb of Tut'ankhamun. All of the essentials are preserved; even things that seem completely forgotten are present somehow and somewhere, and have merely been buried and made inaccessible to the subject. Indeed, it may, as we know, be doubted whether any psychical structure can really be the victim of total destruction. It depends only upon analytic technique whether we shall succeed in bringing what is concealed completely to light. There are only two other facts that weigh against the extraordinary advantage which is thus enjoyed by the work of analysis: namely, that psychical objects are incomparably more complicated than the excavator's material ones and that we have insufficient knowledge of what we may expect to find, since their finer structure contains so much that is still mysterious. But our comparison between the two forms of work can go no further than this; for the main difference between them lies in the fact that for the archaeologist the reconstruction is the aim and end of his endeavours while for analysis the construction is only a preliminary labour.

[1937d, 5051]
It is not, however, a preliminary labour in the sense that the whole of it must be completed before the next piece of work can be begun, as, for instance, is the case with house-building, where all the walls must be erected and all the windows inserted before the internal decoration of the rooms can be taken in hand. Every analyst knows that things happen differently in an analytic treatment and that there both kinds of work are carried on side by side, the one kind being always a little ahead and the other following upon it. The analyst finishes a piece of construction and communicates it to the subject of the analysis so that it may work upon him; he then constructs a further piece out of the fresh material pouring in upon him, deals with it in the same way and proceeds in this alternating fashion until the end. If, in accounts of analytic technique, so little is said about 'constructions', that is because 'interpretations' and their effects are spoken of instead. But I think that 'construction' is by far the more appropriate description. 'Interpretation' applies to something that one does to some single element of the material, such as an association or a parapraxis. But it is a 'construction' when one lays before the subject of the analysis a piece of his early history that he has forgotten, in some such way as this: 'Up to your *n*th year you regarded yourself as the sole and unlimited possessor of your mother; then came another baby and brought you grave disillusionment. Your mother left you for some time, and even after her reappearance she was never again devoted to you exclusively. Your feelings towards your mother became ambivalent, your father gained a new importance for you,' . . . and so on.

[1937d, 5052]
We have appended to it a series of case histories, the selection of which could not unfortunately be determined on purely scientific grounds. Our experience is derived from private practice in an educated and literate social class, and the subject matter with which we deal often touches upon our patients' most intimate lives and histories. It would be a grave breach of confidence to publish material of this kind, with the risk of the patients being recognized and their acquaintances becoming informed of facts which were confided only to the physician. It has therefore been impossible for us to make use of some of the most instructive and convincing of our observations. This of course applies especially to all those cases in which sexual and marital relations play an important aetiological part. Thus it comes about that we are only able to produce very incomplete evidence in favour of our view that sexuality seems to play a principal part in the pathogenesis of hysteria as a source of psychical traumas and as a motive for 'defence' - that is, for repressing ideas from consciousness. It is precisely observations of a markedly sexual nature that we have been obliged to leave unpublished.

[1895d, 3]

¹ I have been deeply impressed in another of my patients by this interesting contrast during somnambulism between a most far-reaching obedience in everything unconnected with the symptoms and the obstinacy with which those symptoms persist because they are deeply rooted and inaccessible to analysis. A lively and gifted girl, who had suffered for eighteen months from severe disturbances of her power of walking, was under my treatment for more than five months without my being able to help her. She was analgesic and had painful areas in both legs and a rapid tremor in her hands. She walked bent forward, dragging her legs and with short steps; she staggered as though she was a cerebellar case and, indeed, often fell down. Her temperament was strikingly cheerful. One of the leading authorities in Vienna at the time was misled by this syndrome into diagnosing her case as one of multiple sclerosis. Another specialist recognized her as a hysteric - a diagnosis which was supported by the complicated picture presented by the disease in its beginnings (pains, fainting-fits, amaurosis) - and handed her on to me for treatment. I tried to improve her gait by suggestion, manipulation of her legs under hypnosis, etc., but I had no success in spite of her being an excellent subject for somnambulism. One day, after she once more came tottering into the room, one arm supported on her father's, the other on an umbrella whose tip was already much worn down, I lost patience and shouted at her in her hypnosis: 'This has gone on too long. To-morrow morning that umbrella of yours will break in your hands and you'll have to walk without it, and from that time on you will never need an umbrella again.' I cannot imagine how I came to be so foolish as to give a suggestion to an umbrella. Afterwards I felt ashamed of myself, and did not suspect that my clever patient would save my reputation in the eyes of her father, who was a physician and was present during her hypnoses. Next day her father said to me: 'What do you think she did yesterday? We were walking along the Ringstrasse when she suddenly got into the highest spirits. She began singing - in the very middle of the street - "Ein freies Leben führen wir" ["We live a free life"] and beat time on the pavement with her umbrella and broke it.' Of course she herself had no notion that she had wittily transformed a nonsensical suggestion into a brilliantly successful one. Since her condition was not improved by assurances, commands and treatment under hypnosis, I turned to psychological analysis and requested her to tell me what emotion had preceded the onset of her illness. She answered (under hypnosis but without any signs of feeling) that a short time previously a young relative of hers had died to whom she had for many years considered herself engaged. This piece of information, however, produced no alteration whatever in her condition. Accordingly, during her next hypnosis, I told her I was quite convinced that her cousin's death had had nothing at all to do with her state, but that something else had happened which she had not mentioned. At this she gave way to the extent of letting fall a single significant phrase; but she had hardly said a word before she stopped, and her old father, who was sitting behind her, began to sob bitterly. Naturally I pressed my investigation no further; but I never saw the patient again.

[1895d, 90]
The procedure is laborious and time-consuming for the physician. It presupposes great interest in psychological happenings, but personal concern for the patients as well. I cannot imagine bringing myself to delve into the psychical mechanism of a hysteria in anyone who struck me as low-minded and repellent, and who, on closer acquaintance, would not be capable of arousing human sympathy; whereas I can keep the treatment of a tabetic or rheumatic patient apart from personal approval of this kind. The demands made on the patient are not less. The procedure is not applicable at all below a certain level of intelligence, and it is made very much more difficult by any trace of feebleness of mind. The complete consent and complete attention of the patients are needed, but above all their confidence, since the analysis invariably leads to the disclosure of the most intimate and secret psychical events. A good number of the patients who would be suitable for this form of treatment abandon the doctor as soon as the suspicion begins to dawn on them of the direction in which the investigation is leading. For patients such as these the doctor has remained a stranger. With others, who have decided to put themselves in his hands and place their confidence in him - a step which in other such situations is only taken voluntarily and never at the doctor's request - with these other patients, I say, it is almost inevitable that their personal relation to him will force itself, for a time at least, unduly into the foreground. It seems, indeed, as though an influence of this kind on the part of the doctor is a *sine qua non* to a solution of the problem. I do not think any essential difference is made in this respect whether hypnosis can be used or whether it has to be bypassed and replaced by something else. But reason demands that we should emphasize the fact that these drawbacks, though they are inseparable from our procedure, cannot be laid at its door. On the contrary, it is quite clear that they are based on the predetermining conditions of the neuroses that are to be cured and that they must attach to any medical activity which involves intense preoccupation with the patient and leads to a psychical change in him. I have not been able to attribute any deleterious effects or danger to the employment of hypnosis, though I made copious use of it in some of my cases. Where I caused damage, the reasons lay elsewhere and deeper. If I survey my therapeutic efforts during the last few years since the communications made by my honoured teacher and friend Josef Breuer showed me the use of the cathartic method, I believe that in spite of everything, I have done much more, and more frequent, good than harm and have accomplished some things which no other therapeutic procedure could have achieved. It has on the whole, as the 'Preliminary Communication' put it, brought 'considerable therapeutic advantages'.
[1895d, 235]
If anyone wants to prove to me that in these remarks I have unduly neglected the significance of the stock aetiological factors, he must confront me with observations in which my specific factor is missing - that is, with cases in which anxiety neurosis has arisen after a psychical shock although the subject has (on the whole) led a normal vita sexualis. Let us see now whether Löwenfeld's case fulfils this condition. My respected opponent has evidently not been clear about this necessity in his own mind, otherwise he would not have left us so completely in the dark about his patient's vita sexualis. I will leave on one side the fact that this case of a lady of thirty is obviously complicated by a hysteria as to the psychical origin of which I have not the least doubt; and I naturally admit without raising any objection the presence of an anxiety neurosis alongside of this hysteria. But before I turn a case to account for or against the theory of the sexual aetiology of the neuroses, I must first have studied the patient's sexual behaviour more closely than Löwenfeld has done here. I should not be content to conclude that, because the time at which the lady received her psychical shock was shortly after a confinement, coitus interruptus could not have played a part during the previous year, and that therefore sexual noxae are ruled out. I know cases of women who were made pregnant every year, and who yet had anxiety neurosis, because - incredible as it may seem - all sexual relations were stopped after the first fertilizing coition, so that in spite of having many children they suffered from sexual privation through all these years. No doctor is ignorant of the fact that women conceive from men whose potency is very slight and who are not able to give them satisfaction. Finally (and this is a consideration which should be taken into account precisely by the upholders of a hereditary aetiology), there are plenty of women who are afflicted with congenital anxiety neurosis - that is to say, who inherit, or who develop without any demonstrable disturbance from outside, a vita sexualis which is the same as the one usually acquired through coitus interruptus and similar noxae. In a number of these women we are able to discover a hysterical illness in their youth, since which their vita sexualis has been disturbed and a deflection of sexual tension from the psychical sphere has been established. Women with this kind of sexuality are incapable of obtaining real satisfaction even from normal coitus, and they develop anxiety neurosis either spontaneously or after further operative factors have supervened. Which of all these elements were present in Löwenfeld's case? I do not know. But I repeat: this case is evidence against me only if the lady who responded to a single fright with an anxiety neurosis had before then enjoyed a normal vita sexualis.

I am aware that efforts will be made, by the use of arguments with an ethical colouring, to prevent the physician from pursuing the matter further. Anyone who wants to make certain whether or not his patients' neuroses are really connected with their sexual life cannot avoid asking them about their sexual life and insisting upon receiving a true account of it. But in this, it is asserted, lies the danger both for the individual and society. A doctor, I hear it being said, has no right to intrude upon his patients' sexual secrets and grossly injure their modesty (especially with women patients) by an interrogation of this sort. His clumsy hand can only ruin family happiness, offend the innocence of young people and encroach upon the authority of parents; and where adults are concerned he will come to share uncomfortable knowledge and destroy his own relations to his patients. It is therefore his ethical duty, the conclusion is, to keep away from the whole business of sex.
To this one may well reply that it is the expression of a prudery which is unworthy of a physician and which inadequately conceals its weakness behind bad arguments. If factors arising out of sexual life must really be acknowledged to be causes of illness, then, for that very reason, investigation and discussion of them automatically falls within the sphere of a physician's duty. The injury to modesty of which he is guilty in this is no different and no worse, one would imagine, than when he insists on examining a woman's genital organs in order to cure a local affection - a demand on which he is pledged to insist by his medical training itself. Even now one often hears elderly women who have spent their youth in the provinces tell of how at one time they were reduced to a state of exhaustion by excessive genital haemorrhages, because they could not make up their minds to allow a doctor to see their nakedness. The educative influence which has been exercised on the public by the medical world has, in the course of one generation, so altered things that an objection of this sort is an extremely rare occurrence among the young women of to-day. If it were to occur, it would be condemned as unreasonable prudery, as modesty in the wrong place. Are we living in Turkey, a husband would ask, where all that a sick woman may show to the physician is her arm through a hole in the wall?

[1897b, 456]

It is not true that interrogation of his patients and knowledge about their sexual concerns give the physician a dangerous degree of power over them. It was possible in earlier times for the same objection to be made against the uses of anaesthetics, which deprive the patient of his consciousness and of the exercise of his will and leave it to the doctor to decide whether and when he shall regain them. And yet to-day anaesthetics have become indispensable to us because they are able, better than anything else, to assist the doctor in his medical work; and among his many other serious obligations, he has taken over the responsibility for their use.
