I must now mention two attempts that have been made - both of which convey the impression of being desperate efforts - to evade the problem. One, of a violent nature, is ancient; the other is subtle and modern. The first is the 'Credo quia absurdum' of the early Father of the Church. It maintains that religious doctrines are outside the jurisdiction of reason - are above reason. Their truth must be felt inwardly, and they need not be comprehended. But this Credo is only of interest as a self-confession. As an authoritative statement it has no binding force. Am I to be obliged to believe every absurdity? And if not, why this one in particular? There is no appeal to a court above that of reason. If the truth of religious doctrines is dependent on an inner experience which bears witness to that truth, what is one to do about the many people who do not have this rare experience? One may require every man to use the gift of reason which he possesses, but one cannot erect, on the basis of a motive that exists only for a very few, an obligation that shall apply to everyone. If one man has gained an unshakable conviction of the true reality of religious doctrines from a state of ecstasy which has deeply moved him, of what significance is that to others?

But at present they still behave quite differently; and in past times religious ideas, in spite of their incontrovertible lack of authentication, have exercised the strongest possible influence on mankind. This is a fresh psychological problem. We must ask where the inner force of those doctrines lies and to what it is that they owe their efficacy, independent as it is of recognition by reason.

Having thus taken our bearings, let us return once more to the question of religious doctrines. We can now repeat that all of them are illusions and insusceptible of proof. No one can be compelled to think them true, to believe in them. Some of them are so improbable, so incompatible with everything we have laboriously discovered about the reality of the world, that we may compare them - if we pay proper regard to the psychological differences - to delusions. Of the reality value of most of them we cannot judge; just as they cannot be proved, so they cannot be refuted. We still know too little to make a critical approach to them. The riddles of the universe reveal themselves only slowly to our investigation; there are many questions to which science to-day can give no answer. But scientific work is the only road which can lead us to a knowledge of reality outside ourselves. It is once again merely an illusion to expect anything from intuition and introspection; they can give us nothing but particulars about our own mental life, which are hard to interpret, never any information about the questions which religious doctrine finds so easy to answer. It would be insolent to let one's own arbitrary will step into the breach and, according to one's personal estimate, declare this or that part of the religious system to be less or more acceptable. Such questions are too momentous for that; they might be called too sacred.
At this point one must expect to meet with an objection. 'Well then, if even obdurate sceptics admit that the assertions of religion cannot be refuted by reason, why should I not believe in them, since they have so much on their side - tradition, the agreement of mankind, and all the consolations they offer?' Why not, indeed? Just as no one can be forced to believe, so no one can be forced to disbelieve. But do not let us be satisfied with deceiving ourselves that arguments like these take us along the road of correct thinking. If ever there was a case of a lame excuse we have it here. Ignorance is ignorance; no right to believe anything can be derived from it. In other matters no sensible person will behave so irresponsibly or rest content with such feeble grounds for his opinions and for the one he takes. It is only in the highest and most sacred things that he allows himself to do so. In reality these are only attempts at pretending to oneself or to other people that one is still firmly attached to religion, when one has long since cut oneself loose from it. Where questions of religion are concerned, people are guilty of every possible sort of dishonesty and intellectual misdemeanour. Philosophers stretch the meaning of words until they retain scarcely anything of their original sense. They give the name of 'God' to some vague abstraction which they have created for themselves; having done so they can pose before all the world as deists, as believers in God, and they can even boast that they have recognized a higher, purer concept of God, notwithstanding that their God is now nothing more than an insubstantial shadow and no longer the mighty personality of religious doctrines. Critics persist in describing as 'deeply religious' anyone who admits to a sense of man's insignificance or impotence in the face of the universe, although what constitutes the essence of the religious attitude is not this feeling but only the next step after it, the reaction to it which seeks a remedy for it. The man who goes no further, but humbly acquiesces in the small part which human beings play in the great world - such a man is, on the contrary, irreligious in the truest sense of the word.

To assess the truth-value of religious doctrines does not lie within the scope of the present enquiry. It is enough for us that we have recognized them as being, in their psychological nature, illusions. But we do not have to conceal the fact that this discovery also strongly influences our attitude to the question which must appear to many to be the most important of all. We know approximately at what periods and by what kind of men religious doctrines were created. If in addition we discover the motives which led to this, our attitude to the problem of religion will undergo a marked displacement. We shall tell ourselves that it would be very nice if there were a God who created the world and was a benevolent Providence, and if there were a moral order in the universe and an after-life; but it is a very striking fact that all this is exactly as we are bound to wish it to be. And it would be more remarkable still if our wretched, ignorant and downtrodden ancestors had succeeded in solving all these difficult riddles of the universe.
Archaeological interests are no doubt most praiseworthy, but no one undertakes an excavation if by doing so he is going to undermine the habitations of the living so that they collapse and bury people under their ruins. The doctrines of religion are not a subject one can quibble about like any other. Our civilization is built up on them, and the maintenance of human society is based on the majority of men's believing in the truth of those doctrines. If men are taught that there is no almighty and all-just God, no divine world-order and no future life, they will feel exempt from all obligation to obey the precepts of civilization. Everyone will, without inhibition or fear, follow his asocial, egoistic instincts and seek to exercise his power; Chaos, which we have banished through many thousands of years of the work of civilization, will come again. Even if we knew, and could prove, that religion was not in possession of the truth, we ought to conceal the fact and behave in the way prescribed by the philosophy of "As if" - and this in the interest of the preservation of us all. And apart from the danger of the undertaking, it would be a purposeless cruelty. Countless people find their one consolation in religious doctrines, and can only bear life with their help. You would rob them of their support, without having anything better to give them in exchange. It is admitted that so far science has not achieved much, but even if it had advanced much further it would not suffice for man. Man has imperative needs of another sort, which can never be satisfied by cold science; and it is very strange - indeed, it is the height of inconsistency - that a psychologist who has always insisted on what a minor part is played in human affairs by the intelligence as compared with the life of the instincts - that such a psychologist should now try to rob mankind of a precious wish-fulfilment and should propose to compensate them for it with intellectual nourishment.'

What a lot of accusations all at once! Nevertheless I am ready with rebuttals for them all; and, what is more, I shall assert the view that civilization runs a greater risk if we maintain our present attitude to religion than if we give it up.

But I hardly know where to begin my reply. Perhaps with the assurance that I myself regard my undertaking as completely harmless and free of risk. It is not I who am overvaluing the intellect this time. If people are as my opponents describe them - and I should not like to contradict them - then there is no danger of a devout believer's being overcome by my arguments and deprived of his faith. Besides, I have said nothing which other and better men have not said before me in a much more complete, forcible and impressive manner. Their names are well known, and I shall not cite them, for I should not like to give an impression that I am seeking to rank myself as one of them. All I have done - and this is the only thing that is new in my exposition - is to add some psychological foundation to the criticisms of my great predecessors. It is hardly to be expected that precisely this addition will produce the effect which was denied to those earlier efforts. No doubt I might be asked here what is the point of writing these things if I am certain that they will be ineffective. But I shall come back to that later.
An outcry of this kind will really be disagreeable to me on account of my many fellow-workers, some of whom do not by any means share my attitude to the problems of religion. But psycho-analysis has already weathered many storms and now it must brave this fresh one. In point of fact psycho-analysis is a method of research, an impartial instrument, like the infinitesimal calculus, as it were. If a physicist were to discover with the latter's help that after a certain time the earth would be destroyed, we would nevertheless hesitate to attribute destructive tendencies to the calculus itself and therefore to proscribe it. Nothing that I have said here against the truth-value of religions needed the support of psycho-analysis; it had been said by others long before analysis came into existence. If the application of the psycho-analytic method makes it possible to find a new argument against the truths of religion, tant pis for religion; but defenders of religion will by the same right make use of psycho-analysis in order to give full value to the affective significance of religious doctrines.

And now to proceed with our defence. Religion has clearly performed great services for human civilization. It has contributed much towards the taming of the asocial instincts. But not enough. It has ruled human society for many thousands of years and has had time to show what it can achieve. If it had succeeded in making the majority of mankind happy, in comforting them, in reconciling them to life and in making them into vehicles of civilization, no one would dream of attempting to alter the existing conditions. But what do we see instead? We see that an appallingly large number of people are dissatisfied with civilization and unhappy in it, and feel it as a yoke which must be shaken off; and that these people either do everything in their power to change that civilization, or else go so far in their hostility to it that they will have nothing to do with civilization or with a restriction of instinct. At this point it will be objected against us that this state of affairs is due to the very fact that religion has lost a part of its influence over human masses precisely because of the deplorable effect of the advances of science. We will note this admission and the reason given for it, and we shall make use of it later for our own purposes; but the objection itself has no force.

It is doubtful whether men were in general happier at a time when religious doctrines held unrestricted sway; more moral they certainly were not. They have always known how to externalize the precepts of religion and thus to nullify their intentions. The priests, whose duty it was to ensure obedience to religion, met them half-way in this. God's kindness must lay a restraining hand on His justice. One sinned, and then one made a sacrifice or did penance and then one was free to sin once more. Russian introspectiveness has reached the pitch of concluding that sin is indispensable for the enjoyment of all the blessings of divine grace, so that, at bottom, sin is pleasing to God. It is no secret that the priests could only keep the masses submissive to religion by making such large concessions as these to the instinctual nature of man. Thus it was agreed: God alone is strong and good, man is weak and sinful. In every age immorality has found no less support in religion than morality has. If the achievements of religion in respect to man's happiness, susceptibility to culture and moral control are no better than this, the question cannot but arise whether we are not overrating its necessity for mankind, and whether we do wisely in basing our cultural demands upon it.
Let us consider the unmistakable situation as it is to-day. We have heard the admission that religion no longer has the same influence on people that it used to. (We are here concerned with European Christian civilization.) And this is not because its promises have grown less but because people find them less credible. Let us admit that the reason - though perhaps not the only reason - for this change is the increase of the scientific spirit in the higher strata of human society. Criticism has whittled away the evidential value of religious documents, natural science has shown up the errors in them, and comparative research has been struck by the fatal resemblance between the religious ideas which we revere and the mental products of primitive peoples and times. [1927c, 4447]

The scientific spirit brings about a particular attitude towards worldly matters; before religious matters it pauses for a little, hesitates, and finally there too crosses the threshold. In this process there is no stopping; the greater the number of men to whom the treasures of knowledge become accessible, the more widespread is the falling-away from religious belief - at first only from its obsolete and objectionable trappings, but later from its fundamental postulates as well. The Americans who instituted the 'monkey trial' at Dayton have alone shown themselves consistent. Elsewhere the inevitable transition is accomplished by way of half-measures and insincerities. [1927c, 4447]

Civilization has little to fear from educated people and brain-workers. In them the replacement of religious motives for civilized behaviour by other, secular motives would proceed unobtrusively; moreover, such people are to a large extent themselves vehicles of civilization. But it is another matter with the great mass of the uneducated and oppressed, who have every reason for being enemies of civilization. So long as they do not discover that people no longer believe in God, all is well. But they will discover it, infallibly, even if this piece of writing of mine is not published. And they are ready to accept the results of scientific thinking, but without the change having taken place in them which scientific thinking brings about in people. Is there not a danger here that the hostility of these masses to civilization will throw itself against the weak spot that they have found in their task-mistress? If the sole reason why you must not kill your neighbour is because God has forbidden it and will severely punish you for it in this or the next life then, when you learn that there is no God and that you need not fear His punishment, you will certainly kill your neighbour without hesitation, and you can only be prevented from doing so by mundane force. Thus either these dangerous masses must be held down most severely and kept most carefully away from any chance of intellectual awakening, or else the relationship between civilization and religion must undergo a fundamental revision. [1927c, 4448]
When civilization laid down the commandment that a man shall not kill the neighbour whom he hates or who is in his way or whose property he covets, this was clearly done in the interest of man's communal existence, which would not otherwise be practicable. For the murderer would draw down on himself the vengeance of the murdered man's kinsmen and the secret envy of others, who within themselves feel as much inclined as he does for such acts of violence. Thus he would not enjoy his revenge or his robbery for long, but would have every prospect of soon being killed himself. Even if he protected himself against his single foes by extraordinary strength and caution, he would be bound to succumb to a combination of weaker men. If a combination of this sort did not take place, the murdering would continue endlessly and the final outcome would be that men would exterminate one another. We should arrive at the same state of affairs between individuals as still persists in Corsica between families, though elsewhere only between nations. Insecurity of life, which is an equal danger for everyone, now unites men into a society which prohibits the individual from killing and reserves to itself the right to communal killing of anyone who violates the prohibition. Here, then, we have justice and punishment.

But we do not publish this rational explanation of the prohibition against murder. We assert that the prohibition has been issued by God. Thus we take it upon ourselves to guess His intentions, and we find that He, too, is unwilling for men to exterminate one another. In behaving in this way we are investing the cultural prohibition with a quite special solemnity, but at the same time we risk making its observance dependent on belief in God. If we retrace this step - if we no longer attribute to God what is our own will and if we content ourselves with giving the social reason - then, it is true, we have renounced the transfiguration of the cultural prohibition, but we have also avoided the risk to it. But we gain something else as well. Through some kind of diffusion or infection, the character of sanctity and inviolability - of belonging to another world, one might say - has spread from a few major prohibitions on to every other cultural regulation, law and ordinance. But on these the halo often looks far from becoming: not only do they invalidate one another by giving contrary decisions at different times and places, but apart from this they show every sign of human inadequacy. It is easy to recognize in them things that can only be the product of short-sighted apprehensiveness or an expression of selfishly narrow interests or a conclusion based on insufficient premisses. The criticism which we cannot fail to level at them also diminishes to an unwelcome extent our respect for other, more justifiable cultural demands. Since it is an awkward task to separate what God Himself has demanded from what can be traced to the authority of an all-powerful parliament or a high judiciary, it would be an undoubted advantage if we were to leave God out altogether and honestly admit the purely human origin of all the regulations and precepts of civilization. Along with their pretended sanctity, these commandments and laws would lose their rigidity and unchangeableness as well. People could understand that they are made, not so much to rule them as, on the contrary, to serve their interests; and they would adopt a more friendly attitude to them, and instead of aiming at their abolition, would aim only at their improvement. This would be an important advance along the road which leads to becoming reconciled to the burden of civilization.
But here our plea for ascribing purely rational reasons to the precepts of civilization - that is to say, for deriving them from social necessity - is interrupted by a sudden doubt. We have chosen as our example the origin of the prohibition against murder. But does our account of it tally with historical truth? We fear not; it appears to be nothing but a rationalistic construction. With the help of psycho-analysis, we have made a study of precisely this piece of the cultural history of mankind, and, basing ourselves on it, we are bound to say that in reality things happened otherwise. Even in present-day man purely reasonable motives can effect little against passionate impulsions. How much weaker then must they have been in the human animal of primaeval times! Perhaps his descendants would even now kill one another without inhibition, if it were not that among those murderous acts there was one - the killing of the primitive father - which evoked an irresistible emotional reaction with momentous consequences. From it arose the commandment: Thou shalt not kill. Under totemism this commandment was restricted to the father-substitute; but it was later extended to other people, though even to-day it is not universally obeyed.

We now observe that the store of religious ideas includes not only wish-fulfilments but important historical recollections. This concurrent influence of past and present must give religion a truly incomparable wealth of power. But perhaps with the help of an analogy yet another discovery may begin to dawn on us. Though it is not a good plan to transplant ideas far from the soil in which they grew up, yet here is a conformity which we cannot avoid pointing out. We know that a human child cannot successfully complete its development to the civilized stage without passing through a phase of neurosis sometimes of greater and sometimes of less distinctness. This is because so many instinctual demands which will later be unserviceable cannot be suppressed by the rational operation of the child's intellect but have to be tamed by acts of repression, behind which, as a rule, lies the motive of anxiety. Most of these infantile neuroses are overcome spontaneously in the course of growing up, and this is especially true of the obsessive neuroses of childhood. The remainder can be cleared up later still by psycho-analytic treatment. In just the same way, one might assume, humanity as a whole, in its development through the ages, fell into states analogous to the neuroses, and for the same reasons - namely because in the times of its ignorance and intellectual weakness the instinctual renunciations indispensable for man's communal existence had only been achieved by it by means of purely affective forces. The precipitates of these processes resembling repression which took place in prehistoric times still remained attached to civilization for long periods. Religion would thus be the universal obsessional neurosis of humanity; like the obsessional neurosis of children, it arose out of the Oedipus complex, out of the relation to the father. If this view is right, it is to be supposed that a turning-away from religion is bound to occur with the fatal inevitability of a process of growth, and that we find ourselves at this very juncture in the middle of that phase of development. Our behaviour should therefore be modelled on that of a sensible teacher who does not oppose an impending new development but seeks to ease its path and mitigate the violence of its irruption. Our analogy does not, to be sure, exhaust the essential nature of religion. If, on the one hand, religion brings with it obsessional restrictions, exactly as an individual obsessional neurosis does, on the other hand it comprises a system of wishful illusions together with a disavowal of reality, such as we find in an isolated form nowhere else but in amnesia, in a state of blissful hallucinatory confusion. But these are only analogies, by the help of which we endeavour to understand a social phenomenon; the pathology of the individual does not supply us with a fully valid counterpart.
Our knowledge of the historical worth of certain religious doctrines increases our respect for them, but does not invalidate our proposal that they should cease to be put forward as the reasons for the precepts of civilization. On the contrary! Those historical residues have helped us to view religious teachings, as it were, as neurotic relics, and we may now argue that the time has probably come, as it does in an analytic treatment, for replacing the effects of repression by the results of the rational operation of the intellect. We may foresee, but hardly regret, that such a process of remoulding will not stop at renouncing the solemn transfiguration of cultural precepts, but that a general revision of them will result in many of them being done away with. In this way our appointed task of reconciling men to civilization will to a great extent be achieved. We need not deplore the renunciation of historical truth when we put forward rational grounds for the precepts of civilization. The truths contained in religious doctrines are after all so distorted and systematically disguised that the mass of humanity cannot recognize them as truth. The case is similar to what happens when we tell a child that new-born babies are brought by the stork. Here, too, we are telling the truth in symbolic clothing, for we know what the large bird signifies. But the child does not know it. He hears only the distorted part of what we say, and feels that he has been deceived; and we know how often his distrust of the grown-ups and his refractoriness actually take their start from this impression. We have become convinced that it is better to avoid such symbolic disguisings of the truth in what we tell children and not to withhold from them a knowledge of the true state of affairs commensurate with their intellectual level.

[1927c, 4453]

But I think you yourself attach more weight to the other contradiction which you charge me with. Since men are so little accessible to reasonable arguments and are so entirely governed by their instinctual wishes, why should one set out to deprive them of an instinctual satisfaction and replace it by reasonable arguments? It is true that men are like this; but have you asked yourself whether they must be like this, whether their innermost nature necessitates it? Can an anthropologist give the cranial index of a people whose custom it is to deform their children’s heads by bandaging them round from their earliest years? Think of the depressing contrast between the radiant intelligence of a healthy child and the feeble intellectual powers of the average adult. Can we be quite certain that it is not precisely religious education which bears a large share of the blame for this relative atrophy? I think it would be a very long time before a child who was not influenced began to trouble himself about God and things in another world. Perhaps his thoughts on these matters would then take the same paths as they did with his forefathers. But we do not wait for such a development; we introduce him to the doctrines of religion at an age when he is neither interested in them nor capable of grasping their import. Is it not true that the two main points in the programme for the education of children to-day are retardation of sexual development and premature religious influence? Thus by the time the child’s intellect awakens, the doctrines of religion have already become unassailable. But are you of opinion that it is very conducive to the strengthening of the intellectual function that so important a field should be closed against it by the threat of Hell-fire? When a man has once brought himself to accept uncritically all the absurdities that religious doctrines put before him and even to overlook the contradictions between them, we need not be greatly surprised at the weakness of his intellect. But we have no other means of controlling our instinctual nature but our intelligence. How can we expect people who are under the dominance of prohibitions of thought to attain the psychological ideal, the primacy of the intelligence? You know, too, that women in general are said to suffer from ‘physiological feeble-mindedness’ - that is, from a lesser intelligence than men. The fact itself is disputable and its interpretation doubtful, but one argument in favour of this intellectual atrophy being of a secondary nature is that women labour under the harshness of an early prohibition against turning their thoughts to what would most have interested them - namely, the problems of sexual life. So long as a person’s early years are influenced not only by a sexual inhibition of thought but also by a religious inhibition and by a loyal inhibition derived from this, we cannot really tell what in fact he is like.

[1927c, 4455]
On another point I agree with you unreservedly. It is certainly senseless to begin by trying to
do away with religion by force and at a single blow. Above all, because it would be hopeless.
The believer will not let his belief be torn from him, either by arguments or by prohibitions. And
even if this did succeed with some it would be cruelty. A man who has been taking sleeping
draughts for tens of years is naturally unable to sleep if his sleeping draught is taken away from
him. That the effect of religious consolations may be likened to that of a narcotic is well
illustrated by what is happening in America. There they are now trying - obviously under the
influence of petticoat government - to deprive people of all stimulants, intoxicants, and other
pleasure-producing substances, and instead, by way of compensation, are surfeiting them with
piety. This is another experiment as to whose outcome we need not feel curious.
[1927c, 4456]

Thus I must contradict you when you go on to argue that men are completely unable to do
without the consolation of the religious illusion, that without it they could not bear the troubles of
life and the cruelties of reality. That is true, certainly, of the men into whom you have instilled
the sweet - or bitter-sweet - poison from childhood onwards. But what of the other men, who
have been sensibly brought up? Perhaps those who do not suffer from the neurosis will need no
intoxicant to deaden it. They will, it is true, find themselves in a difficult situation. They will have
to admit to themselves the full extent of their helplessness and their insignificance in the
machinery of the universe; they can no longer be the centre of creation, no longer the object of
tender care on the part of a beneficent Providence. They will be in the same position as a child
who has left the parental house where he was so warm and comfortable. But surely infantilism
is destined to be surmounted. Men cannot remain children for ever; they must in the end go out
into 'hostile life'. We may call this 'education to reality'. Need I confess to you that the sole
purpose of my book is to point out the necessity for this forward step?
[1927c, 4456]
That sounds splendid! A race of men who have renounced all illusions and have thus become capable of making their existence on earth tolerable! I, however, cannot share your expectations. And that is not because I am the obstinate reactionary you perhaps take me for. No, it is because I am sensible. We seem now to have exchanged roles: you emerge as an enthusiast who allows himself to be carried away by illusions, and I stand for the claims of reason, the rights of scepticism. What you have been expounding seems to me to be built upon errors which, following your example, I may call illusions, because they betray clearly enough the influence of your wishes. You pin your hope on the possibility that generations which have not experienced the influence of religious doctrines in early childhood will easily attain the desired primacy of the intelligence over the life of the instincts. This is surely an illusion: in this decisive respect human nature is hardly likely to change. If I am not mistaken - one knows so little about other civilizations - there are even to-day peoples which do not grow up under the pressure of a religious system, and yet they approach no nearer to your ideal than the rest. If you want to expel religion from our European civilization, you can only do it by means of another system of doctrines; and such a system would from the outset take over all the psychological characteristics of religion - the same sanctity, rigidity and intolerance, the same prohibition of thought - for its own defence. You have to have something of the kind in order to meet the requirements of education. And you cannot do without education. The path from the infant at the breast to the civilized man is a long one; too many human young would go astray on it and fail to reach their life-tasks at the proper time if they were left without guidance to their own development. The doctrines which had been applied in their upbringing would always set limits to the thinking of their riper years - which is exactly what you reproach religion with doing today. Do you not observe that it is an ineradicable and innate defect of our and every other civilization, that it imposes on children, who are driven by instinct and weak in intellect, the making of decisions which only the mature intelligence of adults can vindicate? But civilization cannot do otherwise, because of the fact that mankind's age-long development is compressed into a few years of childhood; and it is only by emotional forces that the child can be induced to master the task set before it. Such, then, are the prospects for your "primacy of the intellect". [1927c, 4458]
And there are two points that I must dwell on a little longer. Firstly, the weakness of my position does not imply any strengthening of yours. I think you are defending a lost cause. We may insist as often as we like that man's intellect is powerless in comparison with his instinctual life, and we may be right in this. Nevertheless, there is something peculiar about this weakness. The voice of the intellect is a soft one, but it does not rest till it has gained a hearing. Finally, after a countless succession of rebuffs, it succeeds. This is one of the few points on which one may be optimistic about the future of mankind, but it is in itself a point of no small importance. And from it one can derive yet other hopes. The primacy of the intellect lies, it is true, in a distant, distant future, but probably not in an infinitely distant one. It will presumably set itself the same aims as those whose realization you expect from your God (of course within human limits - so far as external reality, Αναγχη, allows it), namely the love of man and the decrease of suffering. This being so, we may tell ourselves that our antagonism is only a temporary one and not irreconcilable. We desire the same things, but you are more impatient, more exacting, and - why should I not say it? - more self-seeking than I and those on my side. You would have the state of bliss begin directly after death; you expect the impossible from it and you will not surrender the claims of the individual. Our God, Λσγοξ,¹ will fulfil whichever of these wishes nature outside us allows, but he will do it very gradually, only in the unforeseeable future, and for a new generation of men. He promises no compensation for us, who suffer grievously from life. On the way to this distant goal your religious doctrines will have to be discarded, no matter whether the first attempts fail, or whether the first substitutes prove to be untenable. You know why: in the long run nothing can withstand reason and experience, and the contradiction which religion offers to both is all too palpable. Even purified religious ideas cannot escape this fate, so long as they try to preserve anything of the consolation of religion. No doubt if they confine themselves to a belief in a higher spiritual being, whose qualities are indefinable and whose purposes cannot be discerned, they will be proof against the challenge of science; but then they will also lose their hold on human interest.

[1927c, 4460]
Education freed from the burden of religious doctrines will not, it may be, effect much change in men's psychological nature. Our god Λογος is perhaps not a very almighty one, and he may only be able to fulfil a small part of what his predecessors have promised. If we have to acknowledge this we shall accept it with resignation. We shall not on that account lose our interest in the world and in life, for we have one sure support which you lack. We believe that it is possible for scientific work to gain some knowledge about the reality of the world, by means of which we can increase our power and in accordance with which we can arrange our life. If this belief is an illusion, then we are in the same position as you. But science has given us evidence by its numerous and important successes that it is no illusion. Science has many open enemies, and many more secret ones, among those who cannot forgive her for having weakened religious faith and for threatening to overthrow it. She is reproached for the smallness of the amount she has taught us and for the incomparably greater field she has left in obscurity. But, in this, people forget how young she is, how difficult her beginnings were and how infinitesimally small is the period of time since the human intellect has been strong enough for the tasks she sets. Are we not all at fault, in basing our judgements on periods of time that are too short? We should make the geologists our pattern. People complain of the unreliability of science - how she announces as a law to-day what the next generation recognizes as an error and replaces by a new law whose accepted validity lasts no longer. But this is unjust and in part untrue. The transformations of scientific opinion are developments, advances, not revolutions. A law which was held at first to be universally valid proves to be a special case of a more comprehensive uniformity, or is limited by another law, not discovered till later; a rough approximation to the truth is replaced by a more carefully adapted one, which in turn awaits further perfectioning. There are various fields where we have not yet surmounted a phase of research in which we make trial with hypotheses that soon have to be rejected as inadequate; but in other fields we already possess an assured and almost unalterable core of knowledge. Finally, an attempt has been made to discredit scientific endeavour in a radical way, on the ground that, being bound to the conditions of our own organization, it can yield nothing else than subjective results, whilst the real nature of things outside ourselves remains inaccessible. But this is to disregard several factors which are of decisive importance for the understanding of scientific work. In the first place, our organization - that is, our mental apparatus - has been developed precisely in the attempt to explore the external world, and it must therefore have realized in its structure some degree of expediency; in the second place, it is itself a constituent part of the world which we set out to investigate, and it readily admits of such an investigation; thirdly, the task of science is fully covered if we limit it to showing how the world must appear to us in consequence of the particular character of our organization; fourthly, the ultimate findings of science, precisely because of the way in which they are acquired, are determined not only by our organization but by the things which have affected that organization; finally, the problem of the nature of the world without regard to our percipient mental apparatus is an empty abstraction, devoid of practical interest.

[1927c, 4461]
In my *Future of an Illusion* I was concerned much less with the deepest sources of the religious feeling than with what the common man understands by his religion - with the system of doctrines and promises which on the one hand explains to him the riddles of this world with enviable completeness, and, on the other, assures him that a careful Providence will watch over his life and will compensate him in a future existence for any frustrations he suffers here. The common man cannot imagine this Providence otherwise than in the figure of an enormously exalted father. Only such a being can understand the needs of the children of men and be softened by their prayers and placated by the signs of their remorse. The whole thing is so patently infantile, so foreign to reality, that to anyone with a friendly attitude to humanity it is painful to think that the great majority of mortals will never be able to rise above this view of life. It is still more humiliating to discover how large a number of people living to-day, who cannot but see that this religion is not tenable, nevertheless try to defend it piece by piece in a series of pitiful rearguard actions. One would like to mix among the ranks of the believers in order to meet these philosophers, who think they can rescue the God of religion by replacing him by an impersonal, shadowy and abstract principle, and to address them with the warning words: 'Thou shalt not take the name of the Lord thy God in Vain!' And if some of the great men of the past acted in the same way, no appeal can be made to their example: we know why they were obliged to.

[1930a, 4473]

Religion restricts this play of choice and adaptation, since it imposes equally on everyone its own path to the acquisition of happiness and protection from suffering. Its technique consists in depressing the value of life and distorting the picture of the real world in a delusional manner - which presupposes an intimidation of the intelligence. At this price, by forcibly fixing them in a state of psychical infantilism and by drawing them into a mass-delusion, religion succeeds in sparing many people an individual neurosis. But hardly anything more. There are, as we have said, many paths which *may* lead to such happiness as is attainable by men, but there is none which does so for certain. Even religion cannot keep its promise. If the believer finally sees himself obliged to speak of God's 'inscrutable decrees', he is admitting that all that is left to him as a last possible consolation and source of pleasure in his suffering is an unconditional submission. And if he is prepared for that, he could probably have spared himself the *détour* he has made.

[1930a, 4483]
The assumption of the existence of an instinct of death or destruction has met with resistance even in analytic circles; I am aware that there is a frequent inclination rather to ascribe whatever is dangerous and hostile in love to an original bipolarity in its own nature. To begin with it was only tentatively that I put forward the views I have developed here, but in the course of time they have gained such a hold upon me that I can no longer think in any other way. To my mind, they are far more serviceable from a theoretical standpoint than any other possible ones; they provide that simplification, without either ignoring or doing violence to the facts, for which we strive in scientific work. I know that in sadism and masochism we have always seen before us manifestations of the destructive instinct (directed outwards and inwards), strongly alloyed with erotism; but I can no longer understand how we can have overlooked the ubiquity of non-erotic aggressivity and destructiveness and can have failed to give it its due place in our interpretation of life. (The desire for destruction when it is directed inwards mostly eludes our perception, of course, unless it is tinged with erotism.) I remember my own defensive attitude when the idea of an instinct of destruction first emerged in psycho-analytic literature, and how long it took before I became receptive to it. That others should have shown, and still show, the same attitude of rejection surprises me less. For 'little children do not like it' when there is talk of the inborn human inclination to 'badness', to aggressiveness and destructiveness, and so to cruelty as well. God has made them in the image of His own perfection; nobody wants to be reminded how hard it is to reconcile the undeniable existence of evil - despite the protestations of Christian Science - with His all-powerfulness or His all-goodness. The Devil would be the best way out as an excuse for God; in that way he would be playing the same part as an agent of economic discharge as the Jew does in the world of the Aryan ideal. But even so, one can hold God responsible for the existence of the Devil just as well as for the existence of the wickedness which the Devil embodies. In view of these difficulties, each of us will be well advised, on some suitable occasion, to make a low bow to the deeply moral nature of mankind; it will help us to be generally popular and much will be forgiven us for it.¹

[1930a, 4510]

As to the origin of the sense of guilt, the analyst has different views from other psychologists; but even he does not find it easy to give an account of it. To begin with, if we ask how a person comes to have a sense of guilt, we arrive at an answer which cannot be disputed: a person feels guilty (devout people would say 'sinful') when he has done something which he knows to be 'bad'. But then we notice how little this answer tells us. Perhaps, after some hesitation, we shall add that even when a person has not actually done the bad thing but has only recognized in himself an intention to do it, he may regard himself as guilty; and the question then arises of why the intention is regarded as equal to the deed. Both cases, however, presuppose that one had already recognized that what is bad is reprehensible, is something that must not be carried out. How is this judgement arrived at? We may reject the existence of an original, as it were natural, capacity to distinguish good from bad. What is bad is often not at all what is injurious or dangerous to the ego; on the contrary, it may be something which is desirable and enjoyable to the ego. Here, therefore, there is an extraneous influence at work, and it is this that decides what is to be called good or bad. Since a person's own feelings would not have led him along this path, he must have had a motive for submitting to this extraneous influence. Such a motive is easily discovered in his helplessness and his dependence on other people, and it can best be designated as fear of loss of love. If he loses the love of another person upon whom he is dependent, he also ceases to be protected from a variety of dangers. Above all, he is exposed to the danger that this stronger person will show his superiority in the form of punishment. At the beginning, therefore, what is bad is whatever causes one to be threatened with loss of love. For fear of that loss, one must avoid it. This, too, is the reason why it makes little difference whether one has already done the bad thing or only intends to do it. In either case the danger only sets in if and when the authority discovers it, and in either case the authority would behave in the same way.

[1930a, 4514]
At this second stage of development, the conscience exhibits a peculiarity which was absent from the first stage and which is no longer easy to account for. For the more virtuous a man is, the more severe and distrustful is its behaviour, so that ultimately it is precisely those people who have carried saintliness furthest who reproach themselves with the worst sinfulness. This means that virtue forfeits some part of its promised reward; the docile and continent ego does not enjoy the trust of its mentor, and strives in vain, it would seem, to acquire it. The objection will at once be made that these difficulties are artificial ones, and it will be said that a stricter and more vigilant conscience is precisely the hallmark of a moral man. Moreover, when saints call themselves sinners, they are not so wrong, considering the temptations to instinctual satisfaction to which they are exposed in a specially high degree - since, as is well known, temptations are merely increased by constant frustration, whereas an occasional satisfaction of them causes them to diminish, at least for the time being. The field of ethics, which is so full of problems, presents us with another fact: namely that ill-luck - that is, external frustration - so greatly enhances the power of the conscience in the super-ego. As long as things to well with a man, his conscience is lenient and lets the ego do all sorts of things; but when misfortune befalls him, he searches his soul, acknowledges his sinfulness, heightens the demands of his conscience, imposes abstinences on himself and punishes himself with penances.¹ Whole peoples have behaved in this way, and still do. This, however, is easily explained by the original infantile stage of conscience, which, as we see, is not given up after the introjection into the super-ego, but persists alongside of it and behind it. Fate is regarded as a substitute for the parental agency. If a man is unfortunate it means that he is no longer loved by this highest power; and, threatened by such a loss of love, he once more bows to the parental representative in his super-ego - a representative whom, in his days of good fortune, he was ready to neglect. This becomes especially clear where Fate is looked upon in the strictly religious sense of being nothing else than an expression of the Divine Will. The people of Israel had believed themselves to be the favourite child of God, and when the great Father caused misfortune after misfortune to rain down upon this people of his, they were never shaken in their belief in his relationship to them or questioned his power or righteousness. Instead, they produced the prophets, who held up their sinfulness before them; and out of their sense of guilt they created the over-strict commandments of their priestly religion. It is remarkable how differently a primitive man behaves. If he has met with a misfortune, he does not throw the blame on himself but on his fetish, which has obviously not done its duty, and he gives it a thrashing instead of punishing himself.

¹I have called the third doubt the historical one; and by it I mean to point out that there is in fact nothing new in the world of occultism. There emerge in it once more all the signs, miracles, prophecies and apparitions which have been reported to us from ancient times and in ancient books and which we thought had long since been disposed of as the offspring of unbridled imagination or of tendentious fraud, as the product of an age in which man's ignorance was very great and the scientific spirit was still in its cradle. If we accept the truth of what, according to the occultists' information, still occurs to-day, we must also believe in the authenticity of the reports which have come down to us from ancient times. And we must then reflect that the tradition and sacred books of all peoples are brimful of similar marvellous tales and that the religions base their claim to credibility on precisely such miraculous events and find proof in them of the operation of superhuman powers. That being so, it will be hard for us to avoid a suspicion that the interest in occultism is in fact a religious one and that one of the secret motives of the occultist movement is to come to the help of religion, threatened as it is by the advance of scientific thought. And with the discovery of this motive our distrust must increase and our disinclination to embark on the examination of these supposedly occult phenomena.

[1930a, 4516]

[1933a, 4646]
You are perhaps aware that I have never been a therapeutic enthusiast; there is no danger of my misusing this lecture by indulging in eulogies. I would rather say too little than too much. During the period at which I was the only analyst, people who were ostensibly friendly to my ideas used to say to me: 'That's all very nice and clever; but show me a case that you have cured by analysis.' This was one of the many formulas which in the course of time have succeeded one another in performing the function of pushing the uncomfortable novelty aside. To-day it is as out of date as many others: the analyst, too, has a heap of letters in his files from grateful patients who have been cured. The analogy does not stop at that. Psycho-analysis is really a method of treatment like others. It has its triumphs and its defeats, its difficulties, its limitations, its indications. At one time a complaint was made against analysis that it was not to be taken seriously as a treatment since it did not dare to issue any statistics of its successes. Since then, the Psycho-Analytic Institute in Berlin, which was founded by Dr. Max Eitingon, has published a statement of its results during its first ten years. Its therapeutic successes give grounds neither for boasting nor for being ashamed. But statistics of that kind are in general uninformative; the material worked upon is so heterogeneous that only very large numbers would show anything. It is wiser to examine one's individual experiences. And here I should like to add that I do not think our cures can compete with those of Lourdes. There are so many more people who believe in the miracles of the Blessed Virgin than in the existence of the unconscious. If we turn to mundane competitors, we must compare psycho-analytic treatment with other kinds of psychotherapy. To-day organic physical methods of treating neurotic states need scarcely be mentioned. Analysis as a psycho-therapeutic procedure does not stand in opposition to other methods used in this specialized branch of medicine; it does not diminish their value nor exclude them. There is no theoretical inconsistency in a doctor who likes to call himself a psychotherapist using analysis on his patients alongside of any other method of treatment according to the peculiarities of the case and the favourable or unfavourable external circumstances. It is in fact technique that necessitates the specialization in medical practice. Thus in the same way surgery and orthopaedics were obliged to separate. Psycho-analytic activity is arduous and exacting; it cannot well be handled like a pair of glasses that one puts on for reading and takes off when one goes for a walk. As a rule psycho-analysis possesses a doctor either entirely or not at all. Those psychotherapists who make use of analysis among other methods, occasionally, do not to my knowledge stand on firm analytic ground; they have not accepted the whole of analysis but have watered it down - have drawn its fangs, perhaps; they cannot be counted as analysts. This is, I think, to be regretted. But co-operation in medical practice between an analyst and a psychotherapist who restricts himself to other techniques would serve quite a useful purpose.

[1933a, 4751]

Of the three powers which may dispute the basic position of science, religion alone is to be taken seriously as an enemy. Art is almost always harmless and beneficent; it does not seek to be anything but an illusion. Except for a few people who are spoken of as being 'possessed' by art, it makes no attempt at invading the realm of reality. Philosophy is not opposed to science, it behaves like a science and works in part by the same methods; it departs from it, however, by clinging to the illusion of being able to present a picture of the universe which is without gaps and is coherent, though one which is bound to collapse with every fresh advance in our knowledge. It goes astray in its method by over-estimating the epistemological value of our logical operations and by accepting other sources of knowledge such as intuition. And it often seems that the poet's derisive comment is not unjustified when he says of the philosopher: [1933a, 4759]
But philosophy has no direct influence on the great mass of mankind; it is of interest to only a small number even of the top layer of intellectuals and is scarcely intelligible to anyone else. On the other hand, religion is an immense power which has the strongest emotions of human beings at its service. It is well known that at an earlier date it comprised everything that played an intellectual part in men's lives, that it took the place of science when there was scarcely yet such a thing as science, and that it constructed a Weltanschauung, consistent and self-contained to an unparalleled degree, which, although it has been profoundly shaken, persists to this day.

[1933a, 4760]

If we are to give an account of the grandiose nature of religion, we must bear in mind what it undertakes to do for human beings. It gives them information about the origin and coming into existence of the universe, it assures them of its protection and of ultimate happiness in the ups and downs of life and it directs their thoughts and actions by precepts which it lays down with its whole authority. Thus it fulfils three functions. With the first of them it satisfies the human thirst for knowledge; it does the same thing that science attempts to do with its means, and at that point enters into rivalry with it. It is to its second function that it no doubt owes the greatest part of its influence. Science can be no match for it when it soothes the fear that men feel of the dangers and vicissitudes of life, when it assures them of a happy ending and offers them comfort in unhappiness. It is true that science can teach us how to avoid certain dangers and that there are some sufferings which it can successfully combat; it would be most unjust to deny that it is a powerful helper to men; but there are many situations in which it must leave a man to his suffering and can only advise him to submit to it. In its third function, in which it issues precepts and lays down prohibitions and restrictions, religion is furthest away from science. For science is content to investigate and to establish facts, though it is true that from its application rules and advice are derived on the conduct of life. In some circumstances these are the same as those offered by religion, but, when this is so, the reasons for them are different.

[1933a, 4760]

The convergence between these three aspects of religion is not entirely clear. What has an explanation of the origin of the universe to do with the inculcation of certain particular ethical precepts? The assurances of protection and happiness are more intimately linked with the ethical requirements. They are the reward for fulfilling these commands; only those who obey them may count upon these benefits, punishment awaits the disobedient. Incidentally, something similar is true of science. Those who disregard its lessons, so it tells us, expose themselves to injury.

[1933a, 4761]
The remarkable combination in religion of instruction, consolation and requirements can only be understood if it is subjected to a genetic analysis. This may be approached from the most striking point of the aggregate, from its instruction on the origin of the universe; for why, we may ask, should a cosmogony be a regular component of religious systems? The doctrine is, then, that the universe was created by a being resembling a man, but magnified in every respect, in power, wisdom, and the strength of his passions - an idealized super-man. Animals as creators of the universe point to the influence of totemism, upon which we shall have a few words at least to say presently. It is an interesting fact that this creator is always only a single being, even when there are believed to be many gods. It is interesting, too, that the creator is usually a man, though there is far from being a lack of indications of female deities; and some mythologies actually make the creation begin with a male god getting rid of a female deity, who is degraded into being a monster. Here the most interesting problems of detail open out; but we must hurry on. Our further path is made easy to recognize, for this god-creator is undisguisedly called ‘father’. Psycho-analysis infers that he really is the father, with all the magnificence in which he once appeared to the small child. A religious man pictures the creation of the universe just as he pictures his own origin.

This being so, it is easy to explain how it is that consoling assurances and strict ethical demands are combined with a cosmogony. For the same person to whom the child owed his existence, the father (or more correctly, no doubt, the parental agency compounded of the father and mother), also protected and watched over him in his feeble and helpless state, exposed as he was to all the dangers lying in wait in the external world; under his father’s protection he felt safe. When a human being has himself grown up, he knows, to be sure, that he is in possession of greater strength, but his insight into the perils of life has also grown greater, and he rightly concludes that fundamentally he still remains just as helpless and unprotected as he was in his childhood, that faced by the world he is still a child. Even now, therefore, he cannot do without the protection which he enjoyed as a child. But he has long since recognized, too, that his father is a being of narrowly restricted power, and not equipped with every excellence. He therefore harks back to the mnemonic image of the father whom in his childhood he so greatly overvalued. He exalts the image into a deity and makes it into something contemporary and real. The effective strength of this mnemonic image and the persistence of his need for protection jointly sustain his belief in God.
The third main item in the religious programme, the ethical demand, also fits into this childhood situation with ease. I may remind you of Kant's famous pronouncement in which he names, in a single breath, the starry heavens and the moral law within us. However strange this juxtaposition may sound - for what have the heavenly bodies to do with the question of whether one human creature loves another or kills him? - it nevertheless touches on a great psychological truth. The same father (or parental agency) which gave the child life and guarded him against its perils, taught him as well what he might do and what he must leave undone, instructed him that he must adapt himself to certain restrictions on his instinctual wishes, and made him understand what regard he was expected to have for his parents and brothers and sisters, if he wanted to become a tolerated and welcome member of the family circle and later on of larger associations. The child is brought up to a knowledge of his social duties by a system of loving rewards and punishments, he is taught that his security in life depends on his parents (and afterwards other people) loving him and on their being able to believe that he loves them. All these relations are afterwards introduced by men unaltered into their religion. Their parents' prohibitions and demands persist within them as a moral conscience. With the help of this same system of rewards and punishments, God rules the world of men. The amount of protection and happy satisfaction assigned to an individual depends on his fulfilment of the ethical demands; his love of God and his consciousness of being loved by God are the foundations of the security with which he is armed against the dangers of the external world and of his human environment. Finally, in prayer he has assured himself a direct influence on the divine will and with it a share in the divine omnipotence.

I feel sure that while you have been listening to me you have been bothered by a number of questions which you would be glad to hear answered. I cannot undertake to do so here and now, but I feel confident that none of these detailed enquiries would upset our thesis that the religious Weltanschauung is determined by the situation of our childhood. That being so, it is all the more remarkable that, in spite of its infantile nature, it nevertheless had a precursor. There is no doubt that there was a time without religion, without gods. This is known as the stage of animism. At that time, too, the world was peopled with spiritual beings resembling men - we call them demons. All the objects in the external world were their habitation, or perhaps were identical with them; but there was no superior power which had created them all and afterwards ruled them and to which one could turn for protection and help. The demons of animism were for the most part hostile in their attitude to human beings, but it appears that human beings had more self-confidence then than later on. They were certainly in a constant state of the most acute fear of these evil spirits; but they defended themselves against them by certain actions to which they ascribed the power to drive them away. Nor apart from this did they regard themselves as defenceless. If they desired something from Nature - if they wished for rain, for instance - they did not direct a prayer to the weather-god, but they performed a magical act which they expected to influence Nature directly: they themselves did something which resembled rain. In their struggle against the powers of the world around them their first weapon was magic, the earliest fore-runner of the technology of to-day. Their reliance on magic was, as we suppose, derived from their overvaluation of their own intellectual operations, from their belief in the 'omnipotence of thoughts', which, incidentally, we come upon again in our obsessional neurotic patients. We may suppose that human beings at that period were particularly proud of their acquisitions in the way of language, which must have been accompanied by a great facilitation of thinking. They attributed magical power to words. This feature was later taken over by religion. 'And God said "Let there be light!" and there was light.' Moreover the fact of their magical actions shows that animistic men did not simply rely on the power of their wishes. They expected results, rather, from the performance of an action which would induce Nature to imitate it. If they wanted rain, they themselves poured out water; if they wanted to encourage the earth to be fruitful, they demonstrated a dramatic performance of sexual intercourse to it in the fields.

[1933a, 4762]

[1933a, 4763]
It would be well worth knowing what brought about the transition from animism to religion, but you may imagine the obscurity which to-day still veils these primaeval ages of the evolution of the human spirit. It appears to be a fact that the first form assumed by religion was the remarkable phenomenon of totemism, the worship of animals, in whose train the first ethical commandments, the taboos, made their appearance. In a volume called *Totem and Taboo*, I once elaborated a notion which traced this transformation back to a revolution in the circumstances of the human family. The main achievement of religion as compared with animism lies in the psychical binding of the fear of demons. Nevertheless a vestige of this primaeval age, the Evil Spirit, has kept a place in the religious system.

[1933a, 4764]

This being the prehistory of the religious *Weltanschauung* let us turn now to what has happened since then and to what is still going on before our eyes. The scientific spirit, strengthened by the observation of natural processes, has begun, in the course of time, to treat religion as a human affair and to submit it to a critical examination. Religion was not able to stand up to this. What first gave rise to suspicion and scepticism were its tales of miracles, for they contradicted everything that had been taught by sober observation and betrayed too clearly the influence of the activity of the human imagination. After this its doctrines explaining the origin of the universe met with rejection, for they gave evidence of an ignorance which bore the stamp of ancient times and to which, thanks to their increased familiarity with the laws of nature, people knew they were superior. The idea that the universe came into existence through acts of copulation or creation analogous to the origin of individual people had ceased to be the most obvious and self-evident hypothesis since the distinction between animate creatures with a mind and an inanimate Nature had impressed itself on human thought - a distinction which made it impossible to retain belief in the original animism. Nor must we overlook the influence of the comparative study of different religious systems and the impression of their mutual exclusiveness and intolerance.

[1933a, 4764]

Strengthened by these preliminary exercises, the scientific spirit gained enough courage at last to venture on an examination of the most important and emotionally valuable elements of the religious *Weltanschauung*. People may always have seen, though it was long before they dared to say so openly, that the pronouncements of religion promising men protection and happiness if they would only fulfil certain ethical requirements had also shown themselves unworthy of belief. It seems not to be the case that there is a Power in the universe which watches over the well-being of individuals with parental care and brings all their affairs to a happy ending. On the contrary, the destinies of mankind can be brought into harmony neither with the hypothesis of a Universal Benevolence nor with the partly contradictory one of a Universal Justice. Earthquakes, tidal waves, conflagrations, make no distinction between the virtuous and pious and the scoundrel or unbeliever. Even where what is in question is not inanimate Nature but where an individual's fate depends on his relations to other people, it is by no means the rule that virtue is rewarded and that evil finds its punishment. Often enough the violent, cunning or ruthless man seizes the envied good things of the world and the pious man goes away empty. Obscure, unfeeling and unloving powers determine men's fate; the system of rewards and punishments which religion ascribes to the government of the universe seems not to exist. Here once again is a reason for dropping a portion of the animistic theory which had been rescued from animism by religion.

[1933a, 4765]
The last contribution to the criticism of the religious Weltanschauung was effected by psycho-
analysis, by showing how religion originated from the helplessness of children and by tracing its
contents to the survival into maturity of the wishes and needs of childhood. This did not
precisely mean a contradiction of religion, but it was nevertheless a necessary rounding-off of
our knowledge about it, and in one respect at least it was a contradiction, for religion itself lays
claim to a divine origin. And, to be sure, it is not wrong in this, provided that our interpretation of
God is accepted.
[1933a, 4765]

In summary, therefore, the judgement of science on the religious Weltanschauung is this.
While the different religions wrangle with one another as to which of them is in possession of
the truth, our view is that the question of the truth of religious beliefs may be left altogether on
one side. Religion is an attempt to master the sensory world in which we are situated by means
of the wishful world which we have developed within us as a result of biological and
psychological necessities. But religion cannot achieve this. Its doctrines bear the imprint of the
times in which they arose, the ignorant times of the childhood of humanity. Its consolations
deserve no trust. Experience teaches us that the world is no nursery. The ethical demands on
which religion seeks to lay stress need, rather, to be given another basis; for they are
indispensable to human society and it is dangerous to link obedience to them with religious
faith. If we attempt to assign the place of religion in the evolution of mankind, it appears not as a
permanent acquisition but as a counterpart to the neurosis which individual civilized men have
to go through in their passage from childhood to maturity.
[1933a, 4766]

The struggle of the scientific spirit against the religious Weltanschauung is, as you know, not
at an end: it is still going on to-day under our eyes. Though as a rule psycho-analysis makes
little use of the weapon of controversy, I will not hold back from looking into this dispute. In
doing so I may perhaps throw some further light on our attitude to Weltanschauungen. You will
see how easily some of the arguments brought forward by the supporters of religion can be
answered, though it is true that others may evade refutation.
[1933a, 4767]

The first objection we meet with is to the effect that it is an impertinence on the part of science
to make religion a subject for its investigations, for religion is something sublime, superior to any
operation of the human intellect, something which may not be approached with hair-splitting
criticisms. In other words, science is not qualified to judge religion: it is quite serviceable and
 estimable otherwise, so long as it keeps to its own sphere. But religion is not its sphere, and it
has no business there. If we do not let ourselves be put off by this brusque repulse and enquire
further what is the basis of this claim to a position exceptional among all human concerns, the
reply we receive (if we are thought worthy of any reply) is that religion cannot be measured by
human measurements, for it is of divine origin and was given us as a revelation by a Spirit
which the human spirit cannot comprehend. One would have thought that there was nothing
earlier than the refutation of this argument: it is a clear case of petitio principii, of 'begging the
question' - I know of no good German equivalent expression. The actual question raised is
whether there is a divine spirit and a revelation by it; and the matter is certainly not decided by
saying that this question cannot be asked, since the deity may not be put in question. The
position here is what it occasionally is during the work of analysis. If a usually sensible patient
rejects some particular suggestion on specially foolish grounds, this logical weakness is
evidence of the existence of a specially strong motive for the denial - a motive which can only
be of an affective nature, an emotional tie.
[1933a, 4767]
We may also be given another answer, in which a motive of this kind is openly admitted: religion may not be critically examined because it is the highest, most precious, and most sublime thing that the human spirit has produced, because it gives expression to the deepest feelings and alone makes the world tolerable and life worthy of men. We need not reply by disputing this estimate of religion but by drawing attention to another matter. What we do is to emphasize the fact that what is in question is not in the least an invasion of the field of religion by the scientific spirit, but on the contrary an invasion by religion of the sphere of scientific thought. Whatever may be the value and importance of religion, it has no right in any way to restrict thought - no right, therefore, to exclude itself from having thought applied to it.

Scientific thinking does not differ in its nature from the normal activity of thought, which all of us, believers and unbelievers, employ in looking after our affairs in ordinary life. It has only developed certain features: it takes an interest in things even if they have no immediate, tangible use; it is concerned carefully to avoid individual factors and affective influences; it examines more strictly the trustworthiness of the sense-perceptions on which it bases its conclusions; it provides itself with new perceptions which cannot be obtained by everyday means and it isolates the determinants of these new experiences in experiments which are deliberately varied. Its endeavour is to arrive at correspondence with reality - that is to say, with what exists outside us and independently of us and, as experience has taught us, is decisive for the fulfilment or disappointment of our wishes. This correspondence with the real external world we call 'truth'. It remains the aim of scientific work even if we leave the practical value of that work out of account. When, therefore, religion asserts that it can take the place of science, that, because it is beneficent and elevating, it must also be true, that is in fact an invasion which must be repulsed in the most general interest. It is asking a great deal of a person who has learnt to conduct his ordinary affairs in accordance with the rules of experience and with a regard to reality, to suggest that he shall hand over the care of what are precisely his most intimate interests to an agency which claims as its privilege freedom from the precepts of rational thinking. And as regards the protection which religion promises its believers, I think none of us would be so much as prepared to enter a motor-car if its driver announced that he drove, unperturbed by traffic regulations, in accordance with the impulses of his soaring imagination.

The prohibition against thought issued by religion to assist in its self-preservation is also far from being free from danger either for the individual or for human society. Analytic experience has taught us that a prohibition like this, even if it is originally limited to a particular field, tends to widen out and thereafter to become the cause of severe inhibitions in the subject's conduct of life. This result may be observed, too, in the female sex, following from their being forbidden to have anything to do with their sexuality even in thought. Biography is able to point to the damage done by the religious inhibition of thought in the life stories of nearly all eminent individuals in the past. On the other hand intellect - or let us call it by the name that is familiar to us, reason - is among the powers which we may most expect to exercise a unifying influence on men - on men who are held together with such difficulty and whom it is therefore scarcely possible to rule. It may be imagined how impossible human society would be, merely if everyone had his own multiplication table and his own private units of length and weight. Our best hope for the future is that intellect - the scientific spirit, reason - may in process of time establish a dictatorship in the mental life of man. The nature of reason is a guarantee that afterwards it will not fail to give man's emotional impulses and what is determined by them the position they deserve. But the common compulsion exercised by such a dominance of reason will prove to be the strongest uniting bond among men and lead the way to further unions. Whatever, like religion's prohibition against thought, opposes such a development, is a danger for the future of mankind.

[1933a, 4768]
It may then be asked why religion does not put an end to this dispute which is so hopeless for it by frankly declaring: 'It is a fact that I cannot give you what is commonly called "truth"; if you want that, you must keep to science. But what I have to offer you is something incomparably more beautiful, more consoling and more uplifting than anything you could get from science. And because of that, I say to you that it is true in another, higher sense.' It is easy to find the answer to this. Religion cannot make this admission because it would involve its forfeiting all its influence on the mass of mankind. The ordinary man only knows one kind of truth, in the ordinary sense of the word. He cannot imagine what a higher or a highest truth may be. Truth seems to him no more capable of comparative degrees than death; and he cannot join in the leap from the beautiful to the true. Perhaps you will think as I do that he is right in this.

So the struggle is not at an end. The supporters of the religious Weltanschauung act upon the ancient dictum: the best defence is attack. 'What', they ask, 'is this science which presumes to disparage our religion - our religion which has brought salvation and consolation to millions of people over many thousands of years? What has it accomplished so far? What can we expect from it in the future? On its own admission it is incapable of bringing consolation and exaltation. Let us leave them on one side then, though that is no light renunciation. But what about its theories? Can it tell us how the universe came about and what fate lies before it? Can it even draw us a coherent picture of the universe, or show us where we are to look for the unexplained phenomena of life or how the forces of the mind are able to act upon inert matter? If it could do this we should not refuse it our respect. But none of these, no problem of this kind, has been solved by it hitherto. It gives us fragments of alleged discovery, which it cannot bring into harmony with one another; it collects observations of uniformities in the course of events which it dignifies with the name of laws and submits to its risky interpretations. And consider the small degree of certainty which it attaches to its findings! Everything it teaches is only provisionally true: what is praised to-day as the highest wisdom will be rejected to-morrow and replaced by something else, though once more only tentatively. The latest error is then described as the truth. And for this truth we are to sacrifice our highest good!'

We must admit to some extent the correctness of the other criticisms. The path of science is indeed slow, hesitating, laborious. This fact cannot be denied or altered. No wonder the gentlemen in the other camp are dissatisfied. They are spoilt: revelation gave them an easier time. Progress in scientific work is just as it is in an analysis. We bring expectations with us into the work, but they must be forcibly held back. By observation, now at one point and now at another, we come upon something new; but to begin with the pieces do not fit together. We put forward conjectures, we construct hypotheses, which we withdraw if they are not confirmed, we need much patience and readiness for any eventuality, we renounce early convictions so as not to be led by them into overlooking unexpected factors, and in the end our whole expenditure of effort is rewarded, the scattered findings fit themselves together, we get an insight into a whole section of mental events, we have completed our task and now we are free for the next one. In analysis, however, we have to do without the assistance afforded to research by experiment.

And what, finally, is the aim of these passionate disparagements of science? In spite of its present incompleteness and of the difficulties attaching to it, it remains indispensable to us and nothing can take its place. It is capable of undreamt-of improvements, whereas the religious Weltanschauung is not. This is complete in all essential respects; if it was a mistake, it must remain one for ever. No belittlement of science can in any way alter the fact that it is attempting to take account of our dependence on the real external world, while religion is an illusion and it derives its strength from its readiness to fit in with our instinctual wishful impulses.
The newly achieved discovery of the far-reaching importance of economic relations brought with it a temptation not to leave alterations in them to the course of historical development but to put them into effect oneself by revolutionary action. Theoretical Marxism, as realized in Russian Bolshevism, has acquired the energy and the self-contained and exclusive character of a Weltanschauung, but at the same time an uncanny likeness to what it is fighting against. Though originally a portion of science and built up, in its implementation, upon science and technology, it has created a prohibition of thought which is just as ruthless as was that of religion in the past. Any critical examination of Marxist theory is forbidden, doubts of its correctness are punished in the same way as heresy was once punished by the Catholic Church. The writings of Marx have taken the place of the Bible and the Koran as a source of revelation, though they would seem to be no more free from contradictions and obscurities than those older sacred books.

And although practical Marxism has mercilessly cleared away all idealistic systems and illusions, it has itself developed illusions which are no less questionable and unprovable than the earlier ones. It hopes in the course of a few generations so to alter human nature that people will live together almost without friction in the new order of society, and that they will undertake the duties of work without any compulsion. Meanwhile it shifts elsewhere the instinctual restrictions which are essential in society; it diverts the aggressive tendencies which threaten all human communities to the outside and finds support in the hostility of the poor against the rich and of the hitherto powerless against the former rulers. But a transformation of human nature such as this is highly improbable. The enthusiasm with which the mass of the people follow the Bolshevist instigation at present, so long as the new order is incomplete and is threatened from outside, gives no certainty for a future in which it would be fully built up and in no danger. In just the same way as religion, Bolshevism too must compensate its believers for the sufferings and deprivations of their present life by promises of a better future in which there will no longer be any unsatisfied need. This Paradise, however, is to be in this life, instituted on earth and thrown open within a foreseeable time. But we must remember that the Jews as well, whose religion knows nothing of an after-life, expected the arrival of a Messiah on earth, and that the Christian Middle Ages at many times believed that the Kingdom of God was at hand.

A complaint which you make about the abuse of authority brings me to another suggestion for the indirect combating of the propensity to war. One instance of the innate and ineradicable inequality of men is their tendency to fall into the two classes of leaders and followers. The latter constitute the vast majority; they stand in need of an authority which will make decisions for them and to which they for the most part offer an unqualified submission. This suggests that more care should be taken than hitherto to educate an upper stratum of men with independent minds, not open to intimidation and eager in the pursuit of truth, whose business it would be to give direction to the dependent masses. It goes without saying that the encroachments made by the executive power of the State and the prohibition laid by the Church upon freedom of thought are far from propitious for the production of a class of this kind. The ideal condition of things would of course be a community of men who had subordinated their instinctual life to the dictatorship of reason. Nothing else could unite men so completely and so tenaciously, even if there were no emotional ties between them. But in all probability that is a Utopian expectation. No doubt the other indirect methods of preventing war are more practicable, though they promise no rapid success. An unpleasant picture comes to one's mind of mills that grind so slowly that people may starve before they get their flour.
We must not expect the mythical structures of religion to pay too much attention to logical coherence. Otherwise popular feeling might have taken justified offence against a deity who made a covenant with their forefathers with mutual obligations and then, for centuries on end, paid no attention to his human partners, till it suddenly occurred to him to manifest himself anew to their descendants. Even more puzzling is the notion of a god's all at once 'choosing' a people, declaring them to be his people and himself to be their god. I believe this is the only instance of its sort in the history of human religions. Ordinarily god and people are indissolubly linked, they are one from the very beginning of things. No doubt we sometimes hear of a people taking on a different god, but never of a god seeking a different people. We may perhaps understand this unique event better if we recall the relations between Moses and the Jewish people. Moses had stooped to the Jews, had made them his people: they were his 'chosen people'.¹

[1939a, 4874]

And here, it seems, I have reached the conclusion of my study, which was directed to the single aim of introducing the figure of an Egyptian Moses into the nexus of Jewish history. Our findings may be thus expressed in the most concise formula. Jewish history is familiar to us for its dualities: two groups of people who came together to form the nation, two kingdoms into which this nation fell apart, two gods' names in the documentary sources of the Bible. To these we add two fresh ones: the foundation of two religions - the first repressed by the second but nevertheless later emerging victoriously behind it, and two religious founders, who are both called by the same name of Moses and whose personalities we have to distinguish from each other. All of these dualities are the necessary consequences of the first one: the fact that one portion of the people had an experience which must be regarded as traumatic and which the other portion escaped. Beyond this there would be a very great deal to discuss, to explain and to assert. Only thus would an interest in our purely historical study find its true justification. What the real nature of a tradition resides in, and what its special power rests on, how impossible it is to dispute the personal influence upon world-history of individual great men, what sacrilege one commits against the splendid diversity of human life if one recognizes only those motives which arise from material needs, from what sources some ideas (and particularly religious ones) derive their power to subject both men and peoples to their yoke - to study all this in the special case of Jewish history would be an alluring task. To continue my work on such lines as these would be to find a link with the statements I put forward twenty-five years ago in Totem and Taboo. But I no longer feel that I have the strength to do so.

[1939a, 4881]

We are living in a specially remarkable period. We find to our astonishment that progress has allied itself with barbarism. In Soviet Russia they have set about improving the living conditions of some hundred millions of people who were held firmly in subjection. They have been rash enough to withdraw the 'opium' of religion from them and have been wise enough to give them a reasonable amount of sexual liberty; but at the same time they have submitted them to the most cruel coercion and robbed them of any possibility of freedom of thought. With similar violence, the Italian people are being trained up to orderliness and a sense of duty. We feel it as a relief from an oppressive apprehension when we see in the case of the German people that a relapse into almost prehistoric barbarism can occur as well without being attached to any progressive ideas. In any case, things have so turned out that to-day the conservative democracies have become the guardians of cultural advance and that, strange to say, it is precisely the institution of the Catholic Church which puts up a powerful defence against the spread of this danger to civilization - the Church which has hitherto been the relentless foe to freedom of thought and to advances towards the discovery of the truth!

[1939a, 4882]
We are living here in a Catholic country under the protection of that Church, uncertain how long that protection will hold out. But so long as it lasts, we naturally hesitate to do anything that would be bound to arouse the Church's hostility. This is not cowardice, but prudence. The new enemy, to whom we want to avoid being of service, is more dangerous than the old one with whom we have already learnt to come to terms. The psycho-analytic researches which we carry on are in any case viewed with suspicious attention by Catholicism. I will not maintain that this is unjustly so. If our work leads us to a conclusion which reduces religion to a neurosis of humanity and explains its enormous power in the same way as a neurotic compulsion in our individual patients, we may be sure of drawing the resentment of our ruling powers down upon us. Not that I should have anything to say that would be new or that I did not say clearly a quarter of a century ago: but it has been forgotten in the meantime and it could not be without effect if I repeated it to-day and illustrated it from an example which offers a standard for all religious foundations. It would probably lead to our being prohibited from practising psycho-analysis. Such violent methods of suppression are, indeed, by no means alien to the Church; the fact is rather that it feels it as an invasion of its privileges if someone else makes use of those methods. But psycho-analysis, which in the course of my long life has gone everywhere, still possesses no home that could be more valuable for it than the city in which it was born and grew up.

[1939a, 4883]

In Egypt Aten had begun to dominate during a fortunate period of established possession, and even when the empire began to totter, his worshippers had been able to turn away from the disturbance and continued to praise and to enjoy his creations. The Jewish people were fated to experience a series of grave trials and painful events; their god became harsh and severe and, as it were, wrapped in gloom. He retained the characteristic of being a universal god, reigning over all countries and peoples, but the fact that his worship had passed over from the Egyptians to the Jews found expression in the additional belief that the Jews were his chosen people whose special obligations would eventually meet with a special reward as well. It may not have been easy for the people to reconcile a belief in being preferred by their omnipotent god with the sad experiences of their unfortunate destiny. But they did not allow themselves to be shaken in their convictions; they increased their own sense of guilt in order to stifle their doubts of God, and it may be that they pointed at last to the 'inscrutable decrees of Providence', as pious people do to this day. If they felt inclined to wonder at his allowing one violent aggressor after another to arise and overthrow and maltreat them - Assyrians, Babylonians, Persians - they could yet recognize his power in the fact that all these evil foes were themselves conquered in turn and that their empires vanished.

[1939a, 4890]
We have already repeatedly described what happened at Kadesh when the two portions of what was later to be the Jewish people came together to receive a new religion. In those, on the one hand, who had been in Egypt, memories of the Exodus and of the figure of Moses were still so strong and vivid that they demanded their inclusion in an account of early times. They were grandchildren, perhaps, of people who had known Moses himself, and some of them still felt themselves Egyptians and bore Egyptian names. But they had good motives for repressing the memory of the fate with which their leader and lawgiver had met. The determining purpose of the other portion of the people was to glorify the new god and to dispute his being foreign. Both portions had the same interest in disavowing the fact of their having had an earlier religion and the nature of its content. So it was that the first compromise came about, and it was probably soon recorded in writing. The people who had come from Egypt had brought writing and the desire to write history along with them; but it was to be a long time before historical writing realized that it was pledged to unswerving truthfulness. To begin with it had no scruples about shaping its narratives according to the needs and purposes of the moment, as though it had not yet recognized the concept of falsification. As a result of these circumstances a discrepancy was able to grow up between the written record and the oral transmission of the same material - tradition. What had been omitted or changed in the written record might very well have been preserved intact in tradition. Tradition was a supplement but at the same time a contradiction to historical writing. It was less subjected to the influence of distorting purposes and perhaps at some points quite exempt from them, and it might therefore be more truthful than the account that had been recorded in writing. Its trustworthiness, however, suffered from the fact that it was less stable and definite than the written account and exposed to numerous changes and alterations when it was handed on from one generation to another by oral communication. A tradition of such a kind might meet with various sorts of fate. What we should most expect would be that it would be crushed by the written account, would be unable to stand up against it, would become more and more shadowy and would finally pass into oblivion. But it might meet with other fates: one of these would be that the tradition itself would end in a written record, and we shall have to deal with yet others as we proceed.

The phenomenon of latency in the history of the Jewish religion, with which we are dealing, may be explained, then, by the circumstance that the facts and ideas which were intentionally disavowed by what may be called the official historians were in fact never lost. Information about them persisted in traditions which survived among the people. As we are assured by Sellin, indeed, there was actually a tradition about the end of Moses which flatly contradicted the official account and was far nearer the truth. The same, we may assume, also applied to other things which apparently ceased to exist at the same time as Moses - to some of the contents of the Mosaic religion, which had been unacceptable to the majority of his contemporaries.

The remarkable fact with which we are here confronted is, however, that these traditions, instead of becoming weaker with time, became more and more powerful in the course of centuries, forced their way into the later revisions of the official accounts and finally showed themselves strong enough to have a decisive influence on the thoughts and actions of the people. The determinants which made this outcome possible are for the moment, it is true, outside our knowledge.
This fact is so remarkable that we feel justified in looking at it once again. Our problem is comprised in it. The Jewish people had abandoned the Aten religion brought to them by Moses and had turned to the worship of another god who differed little from the Baalim of the neighbouring peoples. All the tendentious efforts of later times failed to disguise this shameful fact. But the Mosaic religion had not vanished without leaving a trace; some sort of memory of it had kept alive - a possibly obscured and distorted tradition. And it was this tradition of a great past which continued to operate (from the background, as it were), which gradually acquired more and more power over people's minds and which in the end succeeded in changing the god Yahweh into the Mosaic god and in re-awakening into life the religion of Moses that had been introduced and then abandoned long centuries before. That a tradition thus sunk in oblivion should exercise such a powerful effect on the mental life of a people is an unfamiliar idea to us. We find ourselves here in the field of group psychology, where we do not feel at home. We shall look about for analogies, for facts that are at least of a similar nature, even though in different fields. And facts of that sort are, I believe, to be found.

[1939a, 4895]

This analogy is met with in psychopathology, in the genesis of human neuroses - in a field, that is to say, belonging to the psychology of individuals, while religious phenomena have of course to be reckoned as part of group psychology. We shall see that this analogy is not so surprising as might at first be thought - indeed that it is more like a postulate.

[1939a, 4898]

It is worth specially stressing the fact that each portion which returns from oblivion asserts itself with peculiar force, exercises an incomparably powerful influence on people in the mass, and raises an irresistible claim to truth against which logical objections remain powerless: a kind of \textit{credo quia absurdum}. This remarkable feature can only be understood on the pattern of the delusions of psychotics. We have long understood that a portion of forgotten truth lies hidden in delusional ideas, that when this returns it has to put up with distortions and misunderstandings, and that the compulsive conviction which attaches to the delusion arises from this core of truth and spreads out on to the errors that wrap it round. We must grant an ingredient such as this of what may be called \textit{historical} truth to the dogmas of religion as well, which, it is true, bear the character of psychotic symptoms but which, as group phenomena, escape the curse of isolation.

[1939a, 4909]

¹ I protest, however, against being misunderstood to say that the world is so complicated that any assertion one may make is bound to hit upon a piece of truth somewhere. No. Our thought has upheld its liberty to discover dependent relations and connections to which there is nothing corresponding in reality; and it clearly sets a very high value on this gift, since it makes such copious use of it both inside and outside of science.

[1939a, 4928]
What help does this explanation of the satisfaction arising from instinctual renunciation give us towards understanding the processes that we want to study - the elevation of self-regard when there are advances in intellectuality? Very little, it seems. The circumstances are quite different. There is no question of any instinctual renunciation and there is no second person or agency for whose sake the sacrifice is made. We shall soon feel doubts about this last assertion. It can be said that the great man is precisely the authority for whose sake the achievement is carried out; and, since the great man himself operates by virtue of his similarity to the father, there is no need to feel surprise if in group psychology the role of the super-ego falls to him. So that this would apply too to the man Moses in relation to the Jewish people. As regards the other point, however, no proper analogy can be established. An advance in intellectuality consists in deciding against direct sense-perception in favour of what are known as the higher intellectual processes - that is, memories, reflections and inferences. It consists, for instance, in deciding that paternity is more important than maternity, although it cannot, like the latter, be established by the evidence of the senses, and that for that reason the child should bear his father's name and be his heir. Or it declares that our God is the greatest and mightiest, although he is invisible like a gale of wind or like the soul. The rejection of a sexual or aggressive instinctual demand seems to be something quite different from this. Moreover, in the case of some advances in intellectuality - for instance, in the case of the victory of patriarchy - we cannot point to the authority which lays down the standard which is to be regarded as higher. It cannot in this case be the father, since he is only elevated into being an authority by the advance itself. Thus we are faced by the phenomenon that in the course of the development of humanity sensuality is gradually overpowered by intellectuality and that men feel proud and exalted by every such advance. But we are unable to say why this should be so. It further happens later on that intellectuality itself is overpowered by the very puzzling emotional phenomenon of faith. Here we have the celebrated 'credo quia absurdum', and, once more, anyone who has succeeded in this regards it as a supreme achievement. Perhaps the common element in all these psychological situations is something else. Perhaps men simply pronounce that what is more difficult is higher, and their pride is merely their narcissism augmented by the consciousness of a difficulty overcome.

[1939a, 4937]

A further depth is added to these discoveries when we examine the remarkable concept of holiness. What is it really that seems to us 'holy' in preference to other things that we value highly and recognize as important? On the one hand, the connection of holiness or sacredness with what is religious is unmistakable. It is insisted upon emphatically: everything religious is sacred, it is the very core of sacredness. On the other hand, our judgement is disturbed by the numerous attempts to apply the characteristic of sacredness to so many other things - people, institutions, functions - which have little to do with religion. These efforts serve obvious tendentious purposes. Let us start from the prohibitive character which is so firmly attached to sacredness. What is sacred is obviously something that may not be touched. A sacred prohibition has a very strong emotional tone but has in fact no rational basis. For why, for instance, should incest with a daughter or sister be such a specially serious crime - so much worse than any other sexual intercourse? If we ask for a rational basis we shall certainly be told that all our feelings rebel against it. But that only means that people regard the prohibition as self-evident and that they know of no basis for it.

[1939a, 4939]
Our construction of prehistory forces us to another explanation. The command in favour of exogamy, of which the horror of incest is the negative expression, was a product of the will of the father and carried this will on after he had been removed. Hence come the strength of its emotional tone and the impossibility of finding a rational basis for it - that is, its sacredness. We confidently expect that an investigation of all the other cases of a sacred prohibition would lead to the same conclusion as in that of the horror of incest: that what is sacred was originally nothing other than the prolongation of the will of the primal father. This would also throw light on the hitherto incomprehensible ambivalence of the words which express the concept of sacredness. It is the ambivalence which in general dominates the relation to the father. [The Latin] 'sacer' means not only 'sacred', 'consecrated', but also something that we can only translate as 'infamous', 'detestable' (e.g. 'auri sacra fames'). But the father's will was not only something which one might not touch, which one had to hold in high respect, but also something one trembled before, because it demanded a painful instinctual renunciation. When we hear that Moses made his people holy by introducing the custom of circumcision we now understand the deep meaning of that assertion. Circumcision is the symbolic substitute for the castration which the primal father once inflicted upon his sons in the plenitude of his absolute power, and whoever accepted that symbol was showing by it that he was prepared to submit to the father's will, even if it imposed the most painful sacrifice on him.

[1939a, 4940]

How enviable, to those of us who are poor in faith, do those enquirers seem who are convinced of the existence of a Supreme Being! To that great Spirit the world offers no problems, for he himself created all its institutions. How comprehensive, how exhaustive and how definitive are the doctrines of believers compared with the laborious, paltry and fragmentary attempts at explanation which are the most we are able to achieve! The divine Spirit, which is itself the ideal of ethical perfection, has planted in men the knowledge of that ideal and, at the same time, the urge to assimilate their own nature to it. They perceive directly what is higher and nobler and what is lower and more base. Their affective life is regulated in accordance with their distance from the ideal at any moment. When they approach to it - at their perihelion, as it were - they are brought high satisfaction; when, at their aphelion, they have become remote from it, the punishment is severe unpleasure. All of this is laid down so simply and so unshakeably. We can only regret that certain experiences in life and observations in the world make it impossible for us to accept the premiss of the existence of such a Supreme Being. As though the world had not riddles enough, we are set the new problem of understanding how these other people have been able to acquire their belief in the Divine Being and whence that belief obtained its immense power, which overwhelms 'reason and science'.

[1939a, 4941]
The direction to be taken by this father-religion was in this way laid down for all time. Yet this
did not bring its development to an end. Ambivalence is a part of the essence of the relation to
the father: in the course of time the hostility too could not fail to stir, which had once driven
the sons into killing their admired and dreaded father. There was no place in the framework of the
religion of Moses for a direct expression of the murderous hatred of the father. All that could
come to light was a mighty reaction against it - a sense of guilt on account of that hostility, a bad
conscience for having sinned against God and for not ceasing to sin. This sense of guilt, which
was uninterruptedly kept awake by the Prophets, and which soon formed an essential part of
the religious system, had yet another superficial motivation, which neatly disguised its true
origin. Things were going badly for the people; the hopes resting on the favour of God failed in
fulfilment; it was not easy to maintain the illusion, loved above all else, of being God's chosen
people. If they wished to avoid renouncing that happiness, a sense of guilt on account of their
own sinfulness offered a welcome means of exculpating God: they deserved no better than to
be punished by him since they had not obeyed his commandments. And, driven by the need to
satisfy this sense of guilt, which was insatiable and came from sources so much deeper, they
must make those commandments grow ever stricter, more meticulous and even more trivial. In
a fresh rapture of moral asceticism they imposed more and more new instinctual renunciations
on themselves and in that way reached - in doctrine and precept, at least - ethical heights which
had remained inaccessible to the other peoples of antiquity. Many Jews regard this attainment
of ethical heights as the second main characteristic and the second great achievement of their
religion. The way in which it was connected with the first one - the idea of a single god - should
be plain from our remarks. These ethical ideas cannot, however, disavow their origin from the
sense of guilt felt on account of a suppressed hostility to God. They possess the characteristic -
uncompleted and incapable of completion - of obsessional neurotic reaction-formations; we can
guess, too, that they serve the secret purposes of punishment.
[1939a, 4951]

If we consider mankind as a whole and substitute it for the single human individual, we
discover that it too has developed delusions which are inaccessible to logical criticism and
which contradict reality. If, in spite of this, they are able to exert an extraordinary power over
men, investigation leads us to the same explanation as in the case of the single individual. They
owe their power to the element of historical truth which they have brought up from the
repression of the forgotten and primaeval past.
[1937d, 5059]
I may recall the two stories - one of the impoverished gourmet who was caught eating ‘salmon mayonnaise’ and the other of the dipsomaniac tutor - which we learnt to know as sophistical displacement jokes. I will now continue their interpretation. We have since heard that if an appearance of logic is tacked on to the façade of a story the thought would like to say seriously ‘the man is right’, but, owing to an opposing contradiction, does not venture to declare the man right except on a single point, on which it can easily be shown that he is wrong. The ‘point’ chosen is the correct compromise between his righteousness and his wrongness; this, indeed, is no decision, but corresponds to the conflict within ourselves. The two anecdotes are simply epicurean. They say: ‘Yes. The man is right. There is nothing higher than enjoyment and it is more or less a matter of indifference how one obtains it.’ This sounds shockingly immoral and is no doubt not much better. But at bottom it is nothing other than the poet's ‘Carpe diem’, which appeals to the uncertainty of life and the unfruitfulness of virtuous renunciation. If the idea that the man in the ‘salmon mayonnaise’ joke was right has such a repellent effect on us, this is only because the truth is illustrated by an enjoyment of the lowest kind, which it seems to us we could easily do without. In reality each of us has had hours and times at which he has admitted the rightness of this philosophy of life and has reproached moral doctrine with only understanding how to demand without offering any compensation. Since we have ceased any longer to believe in the promise of a next world in which every renunciation will be rewarded by a satisfaction - there are, incidentally, very few pious people if we take renunciation as the sign of faith - 'Carpe diem' has become a serious warning. I will gladly put off satisfaction: but do I know whether I shall still be here tomorrow? 'Di doman' non c'è certezza.'¹

[1905c, 1703]

Some features of this state of affairs may be seen in the sphere of religious life as well. The formation of a religion, too, seems to be based on the suppression, the renunciation, of certain instinctual impulses. These impulses, however, are not, as in the neuroses, exclusively components of the sexual instinct; they are self-seeking, socially harmful instincts, though, even so, they are usually not without a sexual component. A sense of guilt following upon continual temptation and an expectant anxiety in the form of fear of divine punishment have, after all, been familiar to us in the field of religion longer than in that of neurosis. Perhaps because of the admixture of sexual components, perhaps because of some general characteristics of the instincts, the suppression of instinct proves to be an inadequate and interminable process in religious life also. Indeed, complete backslidings into sin are more common among pious people than among neurotics and these give rise to a new form of religious activity, namely acts of penance, which have their counterpart in obsessional neurosis.

[1907b, 1908]

We have noted as a curious and derogatory characteristic of obsessional neurosis that its ceremonials are concerned with the small actions of daily life and are expressed in foolish regulations and restrictions in connection with them. We cannot understand this remarkable feature of the clinical picture until we have realized that the mechanism of psychical displacement, which was first discovered by me in the construction of dreams,¹ dominates the mental processes of obsessional neurosis. It is already clear from the few examples of obsessive actions given above that their symbolism and the detail of their execution are brought about by a displacement from the actual, important thing on to a small one which takes its place - for instance, from a husband on to a chair. It is this tendency to displacement which progressively changes the clinical picture and eventually succeeds in turning what is apparently the most trivial matter into something of the utmost importance and urgency. It cannot be denied that in the religious field as well there is a similar tendency to a displacement of psychical values, and in the same direction, so that the petty ceremonials of religious practice gradually become the essential thing and push aside the underlying thoughts. That is why religions are subject to reforms which work retroactively and aim at a re-establishment of the original balance of values.

[1907b, 1908]
The character of compromise which obsessive actions possess in their capacity as neurotic symptoms is the character least easily detected in corresponding religious observances. Yet here, too, one is reminded of this feature of neuroses when one remembers how commonly all the acts which religion forbids - the expressions of the instincts it has suppressed - are committed precisely in the name of, and ostensibly for the sake of, religion.

[1907b, 1909]

A progressive renunciation of constitutional instincts, whose activation might afford the ego primary pleasure, appears to be one of the foundations of the development of human civilization. Some part of this instinctual repression is effected by its religions, in that they require the individual to sacrifice his instinctual pleasure to the Deity: 'Vengeance is mine, saith the Lord.' In the development of the ancient religions one seems to discern that many things which man kind had renounced as 'iniquities' had been surrendered to the Deity and were still permitted in his name, so that the handing over to him of bad and socially harmful instincts was the means by which man freed himself from their domination. For this reason, it is surely no accident that all the attributes of man, along with the misdeeds that follow from them, were to an unlimited amount ascribed to the ancient gods. Nor is it a contradiction of this that nevertheless man was not permitted to justify his own iniquities by appealing to divine example.

[1907b, 1909]

(4) Just as the pleasure-ego can do nothing but wish, work for a yield of pleasure, and avoid unpleasure, so the reality-ego need do nothing but strive for what is useful and guard itself against damage.¹ Actually the substitution of the reality principle for the pleasure principle implies no deposing of the pleasure principle, but only a safeguarding of it. A momentary pleasure, uncertain in its results, is given up, but only in order to gain along the new path an assured pleasure at a later time. But the endopsychic impression made by this substitution has been so powerful that it is reflected in a special religious myth. The doctrine of reward in the after-life for the - voluntary or enforced - renunciation of earthly pleasures is nothing other than a mythical projection of this revolution in the mind. Following consistently along these lines, religions have been able to effect absolute renunciation of pleasure in this life by means of the promise of compensation in a future existence; but they have not by this means achieved a conquest of the pleasure principle. It is science which comes nearest to succeeding in that conquest; science too, however, offers intellectual pleasure during its work and promises practical gain in the end.

[1911b, 2556]

An investigation of primitive peoples shows mankind caught up, to begin with, in a childish belief in its own omnipotence.¹ A whole number of mental structures can thus be understood as attempts to deny whatever might disturb this feeling of omnipotence and so to prevent emotional life from being affected by reality until the latter could be better controlled and used for purposes of satisfaction. The principle of avoiding unpleasure dominates human actions until it is replaced by the better one of adaptation to the external world. Pari passu with men's progressive control over the world goes a development in their Weltanschauung, their view of the universe as a whole. They turn away more and more from their original belief in their own omnipotence, rising from an animistic phase through a religious to a scientific one. Myths, religion and morality find their place in this scheme as attempts to seek a compensation for the lack of satisfaction of human wishes.

[1913], 2822]
Our knowledge of the neurotic illnesses of individuals has been of much assistance to our understanding of the great social institutions. For the neuroses themselves have turned out to be attempts to find individual solutions for the problems of compensating for unsatisfied wishes, while the institutions seek to provide social solutions for these same problems. The recession of the social factor and the predominance of the sexual one turns these neurotic solutions of the psychological problem into caricatures which are of no service except to help us in explaining such important questions.

[1913], 2822

Psycho-analytic work is continually confronted with the task of inducing the patient to renounce an immediate and directly attainable yield of pleasure. He is not asked to renounce all pleasure; that could not, perhaps, be expected of any human being, and even religion is obliged to support its demand that earthly pleasure shall be set aside by promising that it will provide instead an incomparably greater amount of superior pleasure in another world. No, the patient is only asked to renounce such satisfactions as will inevitably have detrimental consequences. His privation is only to be temporary; he has only to learn to exchange an immediate yield of pleasure for a better assured, even though a postponed one. Or, in other words, under the doctor's guidance he is asked to make the advance from the pleasure principle to the reality principle by which the mature human being is distinguished from the child. In this educative process, the doctor's clearer insight can hardly be said to play a decisive part; as a rule, he can only tell his patient what the latter's own reason can tell him. But it is not the same to know a thing in one's own mind and to hear it from someone outside. The doctor plays the part of this effective outsider; he makes use of the influence which one human being exercises over another. Or - recalling that it is the habit of psycho-analysis to replace what is derivative and etiolated by what is original and basic - let us say that the doctor, in his educative work, makes use of one of the components of love. In this work of after-education, he is probably doing no more than repeat the process which made education of any kind possible in the first instance. Side by side with the exigencies of life, love is the great educator; and it is by the love of those nearest him that the incomplete human being is induced to respect the decrees of necessity and to spare himself the punishment that follows any infringement of them.

[1916d, 3100]

Apart from these pathological phenomena, it may be said that in the present case religion achieved all the aims for the sake of which it is included in the education of the individual. It put a restraint on his sexual impulsions by affording them a sublimation and a safe mooring; it lowered the importance of his family relationships, and thus protected him from the threat of isolation by giving him access to the great community of mankind. The untamed and fear-ridden child became social, well-behaved, and amenable to education.

[1918b, 3590]
The phenomenon which accompanies the dissolution that is here supposed to overtake a religious group is not fear, for which the occasion is wanting. Instead of it ruthless and hostile impulses towards other people make their appearance, which, owing to the equal love of Christ, they had previously been unable to do.¹ But even during the kingdom of Christ those people who do not belong to the community of believers, who do not love him, and whom he does not love, stand outside this tie. Therefore a religion, even if it calls itself the religion of love, must be hard and unloving to those who do not belong to it. Fundamentally indeed every religion is in this same way a religion of love for all those whom it embraces; while cruelty and intolerance towards those who do not belong to it are natural to every religion. However difficult we may find it personally, we ought not to reproach believers too severely on this account; people who are unbelieving or indifferent are much better off psychologically in this matter. If to-day that intolerance no longer shows itself so violent and cruel as in former centuries, we can scarcely conclude that there has been a softening in human manners. The cause is rather to be found in the undeniable weakening of religious feelings and the libidinal ties which depend upon them. If another group tie takes the place of the religious one - and the socialistic tie seems to be succeeding in doing so - then there will be the same intolerance towards outsiders as in the age of the Wars of Religion; and if differences between scientific opinions could ever attain a similar significance for groups, the same result would again be repeated with this new motivation.

[1921c, 3792]

In this function the mother is soon replaced by the stronger father, who retains that position for the rest of childhood. But the child's attitude to its father is coloured by a peculiar ambivalence. The father himself constitutes a danger for the child, perhaps because of its earlier relation to its mother. Thus it fears him no less than it longs for him and admires him. The indications of this ambivalence in the attitude to the father are deeply imprinted in every religion, as was shown in Totem and Taboo. When the growing individual finds that he is destined to remain a child for ever, that he can never do without protection against strange superior powers, he lends those powers the features belonging to the figure of his father; he creates for himself the gods whom he dreads, whom he seeks to propitiate, and whom he nevertheless entrusts with his own protection. Thus his longing for a father is a motive identical with his need for protection against the consequences of his human weakness. The defence against childish helplessness is what lends its characteristic features to the adult's reaction to the helplessness which he has to acknowledge - a reaction which is precisely the formation of religion. But it is not my intention to enquire any further into the development of the idea of God; what we are concerned with here is the finished body of religious ideas as it is transmitted by civilization to the individual.

[1927c, 4436]
If we are to give an account of the grandiose nature of religion, we must bear in mind what it undertakes to do for human beings. It gives them information about the origin and coming into existence of the universe, it assures them of its protection and of ultimate happiness in the ups and downs of life and it directs their thoughts and actions by precepts which it lays down with its whole authority. Thus it fulfils three functions. With the first of them it satisfies the human thirst for knowledge; it does the same thing that science attempts to do with its means, and at that point enters into rivalry with it. It is to its second function that it no doubt owes the greatest part of its influence. Science can be no match for it when it soothes the fear that men feel of the dangers and vicissitudes of life, when it assures them of a happy ending and offers them comfort in unhappiness. It is true that science can teach us how to avoid certain dangers and that there are some sufferings which it can successfully combat; it would be most unjust to deny that it is a powerful helper to men; but there are many situations in which it must leave a man to his suffering and can only advise him to submit to it. In its third function, in which it issues precepts and lays down prohibitions and restrictions, religion is furthest away from science. For science is content to investigate and to establish facts, though it is true that from its application rules and advice are derived on the conduct of life. In some circumstances these are the same as those offered by religion, but, when this is so, the reasons for them are different.

The convergence between these three aspects of religion is not entirely clear. What has an explanation of the origin of the universe to do with the inculcation of certain particular ethical precepts? The assurances of protection and happiness are more intimately linked with the ethical requirements. They are the reward for fulfilling these commands; only those who obey them may count upon these benefits, punishment awaits the disobedient. Incidentally, something similar is true of science. Those who disregard its lessons, so it tells us, expose themselves to injury.

The remarkable combination in religion of instruction, consolation and requirements can only be understood if it is subjected to a genetic analysis. This may be approached from the most striking point of the aggregate, from its instruction on the origin of the universe; for why, we may ask, should a cosmogony be a regular component of religious systems? The doctrine is, then, that the universe was created by a being resembling a man, but magnified in every respect, in power, wisdom, and the strength of his passions - an idealized super-man. Animals as creators of the universe point to the influence of totemism, upon which we shall have a few words at least to say presently. It is an interesting fact that this creator is always only a single being, even when there are believed to be many gods. It is interesting, too, that the creator is usually a man, though there is far from being a lack of indications of female deities; and some mythologies actually make the creation begin with a male god getting rid of a female deity, who is degraded into being a monster. Here the most interesting problems of detail open out; but we must hurry on. Our further path is made easy to recognize, for this god-creator is undisguisedly called ‘father’. Psycho-analysis infers that he really is the father, with all the magnificence in which he once appeared to the small child. A religious man pictures the creation of the universe just as he pictures his own origin.
This being so, it is easy to explain how it is that consoling assurances and strict ethical demands are combined with a cosmogony. For the same person to whom the child owed his existence, the father (or more correctly, no doubt, the parental agency compounded of the father and mother), also protected and watched over him in his feeble and helpless state, exposed as he was to all the dangers lying in wait in the external world; under his father's protection he felt safe. When a human being has himself grown up, he knows, to be sure, that he is in possession of greater strength, but his insight into the perils of life has also grown greater, and he rightly concludes that fundamentally he still remains just as helpless and unprotected as he was in his childhood, that faced by the world he is still a child. Even now, therefore, he cannot do without the protection which he enjoyed as a child. But he has long since recognized, too, that his father is a being of narrowly restricted power, and not equipped with every excellence. He therefore harks back to the mnemonic image of the father whom in his childhood he so greatly overvalued. He exalts the image into a deity and makes it into something contemporary and real. The effective strength of this mnemonic image and the persistence of his need for protection jointly sustain his belief in God.

[1933a, 4762]

The third main item in the religious programme, the ethical demand, also fits into this childhood situation with ease. I may remind you of Kant's famous pronouncement in which he names, in a single breath, the starry heavens and the moral law within us. However strange this juxtaposition may sound - for what have the heavenly bodies to do with the question of whether one human creature loves another or kills him? - it nevertheless touches on a great psychological truth. The same father (or parental agency) which gave the child life and guarded him against its perils, taught him as well what he might do and what he must leave undone, instructed him that he must adapt himself to certain restrictions on his instinctual wishes, and made him understand what regard he was expected to have for his parents and brothers and sisters, if he wanted to become a tolerated and welcome member of the family circle and later on of larger associations. The child is brought up to a knowledge of his social duties by a system of loving rewards and punishments, he is taught that his security in life depends on his parents (and afterwards other people) loving him and on their being able to believe that he loves them. All these relations are afterwards introduced by men unaltered into their religion. Their parents' prohibitions and demands persist within them as a moral conscience. With the help of this same system of rewards and punishments, God rules the world of men. The amount of protection and happy satisfaction assigned to an individual depends on his fulfilment of the ethical demands; his love of God and his consciousness of being loved by God are the foundations of the security with which he is armed against the dangers of the external world and of his human environment. Finally, in prayer he has assured himself a direct influence on the divine will and with it a share in the divine omnipotence.

[1933a, 4762]
Strengthened by these preliminary exercises, the scientific spirit gained enough courage at last to venture on an examination of the most important and emotionally valuable elements of the religious Weltanschauung. People may always have seen, though it was long before they dared to say so openly, that the pronouncements of religion promising men protection and happiness if they would only fulfil certain ethical requirements had also shown themselves unworthy of belief. It seems not to be the case that there is a Power in the universe which watches over the well-being of individuals with parental care and brings all their affairs to a happy ending. On the contrary, the destinies of mankind can be brought into harmony neither with the hypothesis of a Universal Benevolence nor with the partly contradictory one of a Universal Justice. Earthquakes, tidal waves, conflagrations, make no distinction between the virtuous and pious and the scoundrel or unbeliever. Even where what is in question is not inanimate Nature but where an individual's fate depends on his relations to other people, it is by no means the rule that virtue is rewarded and that evil finds its punishment. Often enough the violent, cunning or ruthless man seizes the envied good things of the world and the pious man goes away empty. Obscure, unfeeling and unloving powers determine men's fate; the system of rewards and punishments which religion ascribes to the government of the universe seems not to exist. Here once again is a reason for dropping a portion of the animistic theory which had been rescued from animism by religion.

[1933a, 4765]

In summary, therefore, the judgement of science on the religious Weltanschauung is this. While the different religions wrangle with one another as to which of them is in possession of the truth, our view is that the question of the truth of religious beliefs may be left altogether on one side. Religion is an attempt to master the sensory world in which we are situated by means of the wishful world which we have developed within us as a result of biological and psychological necessities. But religion cannot achieve this. Its doctrines bear the imprint of the times in which they arose, the ignorant times of the childhood of humanity. Its consolations deserve no trust. Experience teaches us that the world is no nursery. The ethical demands on which religion seeks to lay stress need, rather, to be given another basis; for they are indispensable to human society and it is dangerous to link obedience to them with religious faith. If we attempt to assign the place of religion in the evolution of mankind, it appears not as a permanent acquisition but as a counterpart to the neurosis which individual civilized men have to go through in their passage from childhood to maturity.

[1933a, 4766]
Scientific thinking does not differ in its nature from the normal activity of thought, which all of us, believers and unbelievers, employ in looking after our affairs in ordinary life. It has only developed certain features: it takes an interest in things even if they have no immediate, tangible use; it is concerned carefully to avoid individual factors and affective influences; it examines more strictly the trustworthiness of the sense-perceptions on which it bases its conclusions; it provides itself with new perceptions which cannot be obtained by everyday means and it isolates the determinants of these new experiences in experiments which are deliberately varied. Its endeavour is to arrive at correspondence with reality - that is to say, with what exists outside us and independently of us and, as experience has taught us, is decisive for the fulfilment or disappointment of our wishes. This correspondence with the real external world we call 'truth'. It remains the aim of scientific work even if we leave the practical value of that work out of account. When, therefore, religion asserts that it can take the place of science, that, because it is beneficent and elevating, it must also be true, that is in fact an invasion which must be repulsed in the most general interest. It is asking a great deal of a person who has learnt to conduct his ordinary affairs in accordance with the rules of experience and with a regard to reality, to suggest that he shall hand over the care of what are precisely his most intimate interests to an agency which claims as its privilege freedom from the precepts of rational thinking. And as regards the protection which religion promises its believers, I think none of us would be so much as prepared to enter a motor-car if its driver announced that he drove, unperturbed by traffic regulations, in accordance with the impulses of his soaring imagination.

[1933a, 4768]

And although practical Marxism has mercilessly cleared away all idealistic systems and illusions, it has itself developed illusions which are no less questionable and unprovable than the earlier ones. It hopes in the course of a few generations so to alter human nature that people will live together almost without friction in the new order of society, and that they will undertake the duties of work without any compulsion. Meanwhile it shifts elsewhere the instinctual restrictions which are essential in society; it diverts the aggressive tendencies which threaten all human communities to the outside and finds support in the hostility of the poor against the rich and of the hitherto powerless against the former rulers. But a transformation of human nature such as this is highly improbable. The enthusiasm with which the mass of the people follow the Bolshevist instigation at present, so long as the new order is incomplete and is threatened from outside, gives no certainty for a future in which it would be fully built up and in no danger. In just the same way as religion, Bolshevism too must compensate its believers for the sufferings and deprivations of their present life by promises of a better future in which there will no longer be any unsatisfied need. This Paradise, however, is to be in this life, instituted on earth and thrown open within a foreseeable time. But we must remember that the Jews as well, whose religion knows nothing of an after-life, expected the arrival of a Messiah on earth, and that the Christian Middle Ages at many times believed that the Kingdom of God was at hand.

[1933a, 4776]
The religious ideas that have been summarized above have of course passed through a long process of development and have been adhered to in various phases by various civilizations. I have singled out one such phase, which roughly corresponds to the final form taken by our present-day white Christian civilization. It is easy to see that not all the parts of this picture tally equally well with one another, that not all the questions that press for an answer receive one, and that it is difficult to dismiss the contradiction of daily experience. Nevertheless, such as they are, those ideas - ideas which are religious in the widest sense - are prized as the most precious possession of civilization, as the most precious thing it has to offer its participants. It is far more highly prized than all the devices for winning treasures from the earth or providing men with sustenance or preventing their illnesses, and so forth. People feel that life would not be tolerable if they did not attach to these ideas the value that is claimed for them. And now the question arises: what are these ideas in the light of psychology? Whence do they derive the esteem in which they are held? And, to take a further timid step, what is their real worth?

Let us now take up the thread of our enquiry. What, then, is the psychological significance of religious ideas and under what heading are we to classify them? The question is not at all easy to answer immediately. After rejecting a number of formulations, we will take our stand on the following one. Religious ideas are teachings and assertions about facts and conditions of external (or internal) reality which tell one something one has not discovered for oneself and which lay claim to one's belief. Since they give us information about what is most important and interesting to us in life, they are particularly highly prized. Anyone who knows nothing of them is very ignorant; and anyone who has added them to his knowledge may consider himself much the richer.

But at present they still behave quite differently; and in past times religious ideas, in spite of their incontrovertible lack of authentication, have exercised the strongest possible influence on mankind. This is a fresh psychological problem. We must ask where the inner force of those doctrines lies and to what it is that they owe their efficacy, independent as it is of recognition by reason.

No feature, however, seems better to characterize civilization than its esteem and encouragement of man's higher mental activities - his intellectual, scientific and artistic achievements and the leading role that it assigns to ideas in human life. Foremost among those ideas are the religious systems, on whose complicated structure I have endeavoured to throw light elsewhere. Next come the speculations of philosophy; and finally what might be called man's 'ideals' - his ideas of a possible perfection of individuals, or of peoples or of the whole of humanity, and the demands he sets up on the basis of such ideas. The fact that these creations of his are not independent of one another, but are on the contrary closely interwoven, increases the difficulty not only of describing them but of tracing their psychological derivation. If we assume quite generally that the motive force of all human activities is a striving towards the two confluent goals of utility and a yield of pleasure, we must suppose that this is also true of the manifestations of civilization which we have been discussing here, although this is easily visible only in scientific and aesthetic activities. But it cannot be doubted that the other activities, too, correspond to strong needs in men - perhaps to needs which are only developed in a minority. Nor must we allow ourselves to be misled by judgements of value concerning any particular religion, or philosophic system, or ideal. Whether we think to find in them the highest achievements of the human spirit, or whether we deplore them as aberrations, we cannot but recognize that where they are present, and, in especial, where they are dominant, a high level of civilization is implied.
How enviable, to those of us who are poor in faith, do those enquirers seem who are convinced of the existence of a Supreme Being! To that great Spirit the world offers no problems, for he himself created all its institutions. How comprehensive, how exhaustive and how definitive are the doctrines of believers compared with the laborious, paltry and fragmentary attempts at explanation which are the most we are able to achieve! The divine Spirit, which is itself the ideal of ethical perfection, has planted in men the knowledge of that ideal and, at the same time, the urge to assimilate their own nature to it. They perceive directly what is higher and nobler and what is lower and more base. Their affective life is regulated in accordance with their distance from the ideal at any moment. When they approach to it - at their perihelion, as it were - they are brought high satisfaction; when, at their aphelion, they have become remote from it, the punishment is severe unpleasure. All of this is laid down so simply and so unshakeably. We can only regret that certain experiences in life and observations in the world make it impossible for us to accept the premiss of the existence of such a Supreme Being. As though the world had not riddles enough, we are set the new problem of understanding how these other people have been able to acquire their belief in the Divine Being and whence that belief obtained its immense power, which overwhelms 'reason and science'.
[1939a, 4941]
What he related to me as his recollection of his reactions to this initiation was met by me at first with complete disbelief. It was impossible, I thought, that these could have been the thoughts of a child of four and a half or five; he had probably referred back to this remote past the thoughts which had arisen from the reflections of a grown man of thirty.¹ But the patient would not hear of this correction; I could not succeed, as in so many other differences of opinion between us, in convincing him; and in the end the correspondence between the thoughts which he had recollected and the symptoms of which he gave particulars, as well as the way in which the thoughts fitted into his sexual development, compelled me on the contrary to come to believe him. And I then reflected that this very criticism of the doctrines of religion, which I was unwilling to ascribe to the child, was only achieved by an infinitesimal minority of adults.

¹[1918b, 3547]

The second attempt is the one made by the philosophy of 'As if'. This asserts that our thought-activity includes a great number of hypotheses whose groundlessness and even absurdity we fully realize. They are called 'fictions', but for a variety of practical reasons we have to behave 'as if' we believed in these fictions. This is the case with religious doctrines because of their incomparable importance for the maintenance of human society.¹ This line of argument is not far removed from the 'Credo quia absurdum'. But I think the demand made by the 'As if' argument is one that only a philosopher could put forward. A man whose thinking is not influenced by the artifices of philosophy will never be able to accept it; in such a man's view, the admission that something is absurd or contrary to reason leaves no more to be said. It cannot be expected of him that precisely in treating his most important interests he shall forgo the guarantees he requires for all his ordinary activities. I am reminded of one of my children who was distinguished at an early age by a peculiarly marked matter-of-factness. When the children were being told a fairy story and were listening to it with rapt attention, he would come up and ask: 'Is that a true story?' When he was told it was not, he would turn away with a look of disdain. We may expect that people will soon behave in the same way towards the fairy tales of religion, in spite of the advocacy of 'As if'.

¹[1927c, 4440]
There is another feature which was already present in totemism and which has been preserved unaltered in religion. The tension of ambivalence was evidently too great for any contrivance to be able to counteract it; or it is possible that psychological conditions in general are unfavourable to getting rid of these antithetical emotions. However that may be, we find that the ambivalence implicit in the father-complex persists in totemism and in religions generally. Totemic religion not only comprised expressions of remorse and attempts at atonement, it also served as a remembrance of the triumph over the father. Satisfaction over that triumph led to the institution of the memorial festival of the totem meal, in which the restrictions of deferred obedience no longer held. Thus it became a duty to repeat the crime of parricide again and again in the sacrifice of the totem animal, whenever, as a result of the changing conditions of life, the cherished fruit of the crime - appropriation of the paternal attributes - threatened to disappear. We shall not be surprised to find that the element of filial rebelliousness also emerges, in the later products of religion, often in the strangest disguises and transformations.

A great number of powerful motives restrain me from any attempt at picturing the further development of religions from their origin in totemism to their condition to-day. I will only follow two threads whose course I can trace with especial clarity as they run through the pattern: the theme of the totemic sacrifice and the relation of son to father.¹

Nevertheless it would be a mistake to suppose that the hostile impulses inherent in the father-complex were completely silenced during this period of revived paternal authority. On the contrary, the first phases of the dominance of the two new father surrogates - gods and kings - show the most energetic signs of the ambivalence that remains a characteristic of religion.

The memory of the first great act of sacrifice thus proved indestructible, in spite of every effort to forget it; and at the very point at which men sought to be at the farthest distance from the motives that led to it, its undistorted reproduction emerged in the form of the sacrifice of the god. I need not enlarge here upon the developments of religious thought which, in the shape of rationalizations, made this recurrence possible. Robertson Smith, who had no thought of our derivation of sacrifice from the great event in human prehistory, states that the ceremonies at the festivals in which the ancient Semites celebrated the death of a deity 'were currently interpreted as the commemoration of a mythical tragedy'. 'The mourning', he declares, 'is not a spontaneous expression of sympathy with the divine tragedy, but obligatory and enforced by fear of supernatural anger. And a chief object of the mourners is to disclaim responsibility for the god's death - a point which has already come before us in connection with theanthropic sacrifices, such as the "ox-murder at Athens".' (Ibid., 412.) It seems most probable that these 'current interpretations' were correct and that the feelings of the celebrants were fully explained by the underlying situation.

² Since I am used to being misunderstood, I think it worth while to insist explicitly that the derivations which I have proposed in these pages do not in the least overlook the complexity of the phenomena under review. All that they claim is to have added a new factor to the sources, known or still unknown, of religion, morality and society - a factor based on a consideration of the implications of psycho-analysis. I must leave to others the task of synthesizing the explanation into a unity. It does, however, follow from the nature of the new contribution that it could not play any other than a central part in such a synthesis, even though powerful emotional resistance might have to be overcome before its great importance was recognized.
Another difficulty might actually be brought forward from psycho-analytic quarters. The earliest moral precepts and restrictions in primitive society have been explained by us as reactions to a deed which gave those who performed it the concept of 'crime'. They felt remorse for the deed and decided that it should never be repeated and that its performance should bring no advantage. This creative sense of guilt still persists among us. We find it operating in an asocial manner in neurotics, and producing new moral precepts and persistent restrictions, as an atonement for crimes that have been committed and as a precaution against the committing of new ones.¹ If, however, we inquire among these neurotics to discover what were the deeds which provoked these reactions, we shall be disappointed. We find no deeds, but only impulses and emotions, set upon evil ends but held back from their achievement. What lie behind the sense of guilt of neurotics are always psychical realities and never factual ones. What characterizes neurotics is that they prefer psychical to factual reality and react just as seriously to thoughts as normal people do to realities.

[1912-1913, 2798]

There can be no doubt that the Oedipus complex may be looked upon as one of the most important sources of the sense of guilt by which neurotics are so often tormented. But more than this: in a study of the beginnings of human religion and morality which I published in 1913 under the title of Totem and Taboo I put forward a suggestion that mankind as a whole may have acquired its sense of guilt, the ultimate source of religion and morality, at the beginning of its history, in connection with the Oedipus complex. I should be very glad to tell you more about this, but I had better leave it on one side. Once one has begun on that topic it is hard to break off; and we must go back to individual psychology.

[1916-1917, 3399]

To find the starting-point for the psycho-analytic view of religious life we must go a step further. What is to-day the heritage of the individual was once a new acquisition and has been handed on from one to another of a long series of generations. Thus the Oedipus complex too may have had stages of development, and the study of prehistory may enable us to trace them out. Investigation suggests that life in the human family took a quite different form in those remote days from that with which we are now familiar. And this idea is supported by findings based on observations of contemporary primitive races. If the prehistoric and ethnological material on this subject is worked over psycho-analytically, we arrive at an unexpectedly precise result: namely that God the Father once walked upon earth in bodily form and exercised his sovereignty as chieftain of the primal human horde until his sons united to slay him. It emerged further that this crime of liberation and the reactions to it had as their result the appearance of the first social ties, the basic moral restrictions and the oldest form of religion, totemism. But the later religions too have the same content, and on the one hand they are concerned with obliterating the traces of that crime or with expiating it by bringing forward other solutions of the struggle between the father and sons, while on the other hand they cannot avoid repeating once more the elimination of the father. Incidentally, an echo of this monstrous event, which overshadowed the whole course of human development, is also to be found in myths.

[1919g, 3705]
For this purpose we must return for a moment to the scientific myth of the father of the primal horde. He was later on exalted into the creator of the world, and with justice, for he had produced all the sons who composed the first group. He was the ideal of each one of them, at once feared and honoured, a fact which led later to the idea of taboo. These many individuals eventually banded themselves together, killed him and cut him in pieces. None of the group of victors could take his place, or, if one of them did, the battles began afresh, until they understood that they must all renounce their father's heritage. They then formed the totemic community of brothers, all with equal rights and united by the totem prohibitions which were to preserve and to expiate the memory of the murder. But the dissatisfaction with what had been achieved still remained, and it became the source of new developments. The persons who were united in this group of brothers gradually came towards a revival of the old state of things at a new level. The male became once more the chief of a family, and broke down the prerogatives of the gynaecocracy which had become established during the fatherless period. As a compensation for this he may at that time have acknowledged the mother deities, whose priests were castrated for the mother's protection, after the example that had been given by the father of the primal horde. And yet the new family was only a shadow of the old one; there were numbers of fathers and each one was limited by the rights of the others.

[1921c, 3826]

The Non-Medical Applications and Correlations of Psycho-analysis. - Any estimate of psycho-analysis would be incomplete if it failed to make clear that, alone among the medical disciplines, it has the most extensive relations with the mental sciences, and that it is in a position to play a part of the same importance in the studies of religious and cultural history and in the sciences of mythology and literature as it is in psychiatry. This may seem strange when we reflect that originally its only object was the understanding and improvement of neurotic symptoms. But it is easy to indicate the starting-point of the bridge that leads over to the mental sciences. The analysis of dreams gave us an insight into the unconscious processes of the mind and showed us that the mechanisms which produce pathological symptoms are also operative in the normal mind. Thus psychoanalysis became a depth-psychology and capable as such of being applied to the mental sciences, and it was able to answer a good number of questions with which the academic psychology of consciousness was helpless to deal. At quite an early stage problems of human phylogenesis arose. It became clear that pathological function was often nothing more than a regression to an earlier stage in the development of normal function. C. G. Jung was the first to draw explicit attention to the striking similarity between the disordered phantasies of sufferers from dementia praecox and the myths of primitive peoples; while the present writer pointed out that the two wishes which combine to form the Oedipus complex coincide precisely with the two principal prohibitions imposed by totemism (not to kill the tribal ancestor and not to marry any woman belonging to one's own clan) and drew far-reaching conclusions from this fact. The significance of the Oedipus complex began to grow to gigantic proportions and it looked as though social order, morals, justice and religion had arisen together in the primaeval ages of mankind as reaction-formations against the Oedipus complex. Otto Rank threw a brilliant light upon mythology and the history of literature by the application of psycho-analytic views, as did Theodor Reik upon the history of morals and religions, while Dr. Pfister, of Zurich, aroused the interest of religious and secular teachers and demonstrated the importance of the psycho-analytic standpoint for education. Further discussion of these applications of psycho-analysis would be out of place here, and it is enough to say that the limits of their influence are not yet in sight.

[1923a, 3929]
Religion, morality, and a social sense - the chief elements in the higher side of man¹ - were originally one and the same thing. According to the hypothesis which I put forward in *Totem and Taboo* they were acquired phylogenetically out of the father-complex: religion and moral restraint through the process of mastering the Oedipus complex itself, and social feeling through the necessity for overcoming the rivalry that then remained between the members of the younger generation. The male sex seems to have taken the lead in all these moral acquisitions; and they seem to have then been transmitted to women by cross-inheritance. Even to-day the social feelings arise in the individual as a superstructure built upon impulses of jealous rivalry against his brothers and sisters. Since the hostility cannot be satisfied, an identification with the former rival develops. The study of mild cases of homosexuality confirms the suspicion that in this instance, too, the identification is a substitute for an affectionate object-choice which has taken the place of the aggressive, hostile attitude.²

With the mention of phylogenesis, however, fresh problems arise, from which one is tempted to draw cautiously back. But there is no help for it, the attempt must be made - in spite of a fear that it will lay bare the inadequacy of our whole effort. The question is: which was it, the ego of primitive man or his id, that acquired religion and morality in those early days out of the father-complex? If it was his ego, why do we not speak simply of these things being inherited by the ego? If it was the id, how does that agree with the character of the id? Or are we wrong in carrying the differentiation between ego, super-ego, and id back into such early times? Or should we not honestly confess that our whole conception of the processes in the ego is of no help in understanding phylogenesis and cannot be applied to it?³

It does indeed sound strange that the Devil should be chosen as a substitute for a loved father. But this is only so at first sight, for we know a good many things which lessen our surprise. To begin with, we know that God is a father-substitute; or, more correctly, that he is an exalted father; or, yet again, that he is a copy of a father as he is seen and experienced in childhood - by individuals in their own childhood and by mankind in its prehistory as the father of the primitive and primal horde. Later on in life the individual sees his father as something different and lesser. But the ideational image belonging to his childhood is preserved and becomes merged with the inherited memory-traces of the primal father to form the individual's idea of God. We also know, from the secret life of the individual which analysis uncovers, that his relation to his father was perhaps ambivalent from the outset, or, at any rate, soon became so. That is to say, it contained two sets of emotional impulses that were opposed to each other: it contained not only impulses of an affectionate and submissive nature, but also hostile and defiant ones. It is our view that the same ambivalence governs the relations of mankind to its Deity. The unresolved conflict between, on the one hand, a longing for the father and, on the other, a fear of him and a son's defiance of him, has furnished us with an explanation of important characteristics of religion and decisive vicissitudes in it.²

[1923b, 3971]

[1923d, 4009]
By its theory of the instincts psycho-analysis offended the feelings of individuals in so far as they regarded themselves as members of the social community; another branch of its theory was calculated to hurt every single person at the tenderest point of his own psychical development. Psycho-analysis disposed once and for all of the fairy tale of an asexual childhood. It demonstrated the fact that sexual interests and activities occur in small children from the beginning of their lives. It showed what transformations those activities pass through, how at about the age of five they succumb to inhibition and how from puberty onwards they enter the service of the reproductive function. It recognized that early infantile sexual life reaches its peak in what is known as the Oedipus complex (an emotional attachment of the child to the parent of the opposite sex accompanied by an attitude of rivalry to the parent of the same sex) and that at that period of life this impulsion extends uninhibited into a straightforward sexual desire. This can be confirmed so easily that only the greatest efforts could make it possible to overlook it. Every individual has in fact gone through this phase but has afterwards energetically repressed its purport and succeeded in forgetting it. A horror of incest and an enormous sense of guilt are left over from this prehistoric epoch of the individual's existence. It may be that something quite similar occurred in the prehistoric epoch of the human species as a whole and that the beginnings of morality, religion and social order were intimately connected with the surmounting of that primaeval era. To adults their prehistory seems so inglorious that they refuse to allow themselves to be reminded of it: they were infuriated when psycho-analysis tried to lift the veil of amnesia from their years of childhood. There was only one way out: what psycho-analysis asserted must be false and what posed as a new science must be a tissue of fancies and distortions.

[1925e, 4128]

The chief literary sources of my studies in this field were the well-known works of J. G. Frazer (Totemism and Exogamy and The Golden Bough), a mine of valuable facts and opinions. But Frazer effected little towards elucidating the problems of totemism; he had several times fundamentally altered his views on the subject, and the other ethnologists and prehistorians seemed in equal uncertainty and disagreement. My starting-point was the striking correspondence between the two taboo-ordinances of totemism (not to kill the totem and not to have sexual relations with any woman of the same totem-clan) and the two elements of the Oedipus complex (getting rid of the father and taking the mother to wife). I was therefore tempted to equate the totem-animal with the father; and in fact primitive peoples themselves do this explicitly, by honouring it as the forefather of the clan. There next came to my help two facts from psycho-analysis, a lucky observation of a child made by Ferenczi, which enabled me to speak of an 'infantile return of totemism', and the analysis of early animal-phobias in children, which so often showed that the animal was a substitute for the father, a substitute on to which the fear of the father derived from the Oedipus complex had been displaced. Not much was lacking to enable me to recognize the killing of the father as the nucleus of totemism and the starting-point in the formation of religion.
[1925d, 4240]
This missing element was supplied when I became acquainted with W. Robertson Smith's work, *The Religion of the Semites*. Its author (a man of genius who was both a physicist and an expert in biblical researches) introduced the so-called 'totem meal' as an essential part of the totemic religion. Once a year the totem animal, which was at other times regarded as sacred, was solemnly killed in the presence of all the members of the clan, was devoured and was then mourned over. The mourning was followed by a great festival. When I further took into account Darwin's conjecture that men originally lived in hordes, each under the domination of a single powerful, violent and jealous male, there rose before me out of all these components the following hypothesis, or, I would rather say, vision. The father of the primal horde, since he was an unlimited despot, had seized all the women for himself; his sons, being dangerous to him as rivals, had been killed or driven away. One day, however, the sons came together and united to overwhelm, kill, and devour their father, who had been their enemy but also their ideal. After the deed they were unable to take over their heritage since they stood in one another's way. Under the influence of failure and remorse they learned to come to an agreement among themselves; they banded themselves into a clan of brothers by the help of the ordinances of totemism, which aimed at preventing a repetition of such a deed, and they jointly undertook to forgo the possession of the women on whose account they had killed their father. They were then driven to finding strange women, and this was the origin of the exogamy which is so closely bound up with totemism. The totem meal was the festival commemorating the fearful deed from which sprang man's sense of guilt (or 'original sin') and which was the beginning at once of social organization, of religion and of ethical restrictions.

[1925d, 4240]

Now whether we suppose that such a possibility was a historical event or not, it brings the formation of religion within the circle of the father-complex and bases it upon the ambivalence which dominates that complex. After the totem animal had ceased to serve as a substitute for him, the primal father, at once feared and hated, revered and envied, became the prototype of God himself. The son's rebelliousness and his affection for his father struggled against each other through a constant succession of compromises, which sought on the one hand to atone for the act of parricide and on the other to consolidate the advantages it had brought. This view of religion throws a particularly clear light upon the psychological basis of Christianity, in which, as we know, the ceremony of the totem meal still survives with but little distortion, in the form of Communion. I should like explicitly to mention that this last observation was not made by me but is to be found in the works of Robertson Smith and Frazer.

[1925d, 4241]
Shortly before I wrote this study it seemed as though my life would soon be brought to an end by the recurrence of a malignant disease; but surgical skill saved me in 1923 and I was able to continue my life and my work, though no longer in freedom from pain. In the period of more than ten years that has passed since then, I have never ceased my analytic work nor my writing - as is proved by the completion of the twelfth volume of the German edition of my collected works. But I myself find that a significant change has come about. Threads which in the course of my development had become intertangled have now begun to separate; interests which I had acquired in the later part of my life have receded, while the older and original ones become prominent once more. It is true that in this last decade I have carried out some important pieces of analytic work, such as the revision of the problem of anxiety in my book *Inhibitions, Symptoms and Anxiety* (1926d) or the simple explanation of sexual 'fetishism' which I was able to make a year later (1927e). Nevertheless it would be true to say that, since I put forward my hypothesis of the existence of two classes of instinct (Eros and the death instinct) and since I proposed a division of the mental personality into an ego, a super-ego, and an id (1923b), I have made no further decisive contributions to psycho-analysis: what I have written on the subject since then has been either unessential or would soon have been supplied by someone else. This circumstance is connected with an alteration in myself, with what might be described as a phase of regressive development. My interest, after making a lifelong détour through the natural sciences, medicine and psychotherapy, returned to the cultural problems which had fascinated me long before, when I was a youth scarcely old enough for thinking. At the very climax of my psycho-analytic work, in 1912, I had already attempted in *Totem and Taboo* to make use of the newly discovered findings of analysis in order to investigate the origins of religion and morality. I now carried this work a stage further in two later essays, *The Future of an Illusion* (1927c) and *Civilization and its Discontents* (1930a). I perceived ever more clearly that the events of human history, the interactions between human nature, cultural development and the precipitates of primitive experiences (the most prominent example of which is religion) are no more than a reflection of the dynamic conflicts between the ego, the id and the super-ego, which psycho-analysis studies in the individual - are the very same processes repeated upon a wider stage. In *The Future of an Illusion* I expressed an essentially negative valuation of religion. Later, I found a formula which did better justice to it: while granting that its power lies in the truth which it contains, I showed that that truth was not a material but a historical truth. [1925d, 4244]

But here our plea for ascribing purely rational reasons to the precepts of civilization - that is to say, for deriving them from social necessity - is interrupted by a sudden doubt. We have chosen as our example the origin of the prohibition against murder. But does our account of it tally with historical truth? We fear not; it appears to be nothing but a rationalistic construction. With the help of psycho-analysis, we have made a study of precisely this piece of the cultural history of mankind, and, basing ourselves on it, we are bound to say that in reality things happened otherwise. Even in present-day man purely reasonable motives can effect little against passionate impulses. How much weaker then must they have been in the human animal of primaeval times! Perhaps his descendants would even now kill one another without inhibition, if it were not that among those murderous acts there was one - the killing of the primitive father - which evoked an irresistible emotional reaction with momentous consequences. From it arose the commandment: Thou shalt not kill. Under totemism this commandment was restricted to the father-substitute; but it was later extended to other people, though even to-day it is not universally obeyed. [1927c, 4451]
But, as was shown by arguments which I need not repeat here, the primal father was the original image of God, the model on which later generations have shaped the figure of God. Hence the religious explanation is right, God actually played a part in the genesis of that prohibition; it was His influence, not any insight into social necessity, which created it. And the displacement of man's will on to God is fully justified. For men knew that they had disposed of their father by violence, and in their reaction to that impious deed, they determined to respect his will thenceforward. Thus religious doctrine tells us the historical truth - though subject, it is true, to some modification and disguise - whereas our rational account disavows it.

[1927c, 4451]

We now observe that the store of religious ideas includes not only wish-fulfilments but important historical recollections. This concurrent influence of past and present must give religion a truly incomparable wealth of power. But perhaps with the help of an analogy yet another discovery may begin to dawn on us. Though it is not a good plan to transplant ideas far from the soil in which they grew up, yet here is a conformity which we cannot avoid pointing out. We know that a human child cannot successfully complete its development to the civilized stage without passing through a phase of neurosis sometimes of greater and sometimes of less distinctness. This is because so many instinctual demands which will later be unserviceable cannot be suppressed by the rational operation of the child's intellect but have to be tamed by acts of repression, behind which, as a rule, lies the motive of anxiety. Most of these infantile neuroses are overcome spontaneously in the course of growing up, and this is especially true of the obsessional neuroses of childhood. The remainder can be cleared up later still by psychoanalytic treatment. In just the same way, one might assume, humanity as a whole, in its development through the ages, fell into states analogous to the neuroses, and for the same reasons - namely because in the times of its ignorance and intellectual weakness the instinctual renunciations indispensable for man's communal existence had only been achieved by it by means of purely affective forces. The precipitates of these processes resembling repression which took place in prehistoric times still remained attached to civilization for long periods. Religion would thus be the universal obsessional neurosis of humanity; like the obsessional neurosis of children, it arose out of the Oedipus complex, out of the relation to the father. If this view is right, it is to be supposed that a turning-away from religion is bound to occur with the fatal inevitability of a process of growth, and that we find ourselves at this very juncture in the middle of that phase of development. Our behaviour should therefore be modelled on that of a sensible teacher who does not oppose an impending new development but seeks to ease its path and mitigate the violence of its irruption. Our analogy does not, to be sure, exhaust the essential nature of religion. If, on the one hand, religion brings with it obsessional restrictions, exactly as an individual obsessional neurosis does, on the other hand it comprises a system of wishful illusions together with a disavowal of reality, such as we find in an isolated form nowhere else but in amentia, in a state of blissful hallucinatory confusion. But these are only analogies, by the help of which we endeavour to understand a social phenomenon; the pathology of the individual does not supply us with a fully valid counterpart.

[1927c, 4452]
Our knowledge of the historical worth of certain religious doctrines increases our respect for them, but does not invalidate our proposal that they should cease to be put forward as the reasons for the precepts of civilization. On the contrary! Those historical residues have helped us to view religious teachings, as it were, as neurotic relics, and we may now argue that the time has probably come, as it does in an analytic treatment, for replacing the effects of repression by the results of the rational operation of the intellect. We may foresee, but hardly regret, that such a process of remoulding will not stop at renouncing the solemn transfiguration of cultural precepts, but that a general revision of them will result in many of them being done away with. In this way our appointed task of reconciling men to civilization will to a great extent be achieved. We need not deplore the renunciation of historical truth when we put forward rational grounds for the precepts of civilization. The truths contained in religious doctrines are after all so distorted and systematically disguised that the mass of humanity cannot recognize them as truth. The case is similar to what happens when we tell a child that new-born babies are brought by the stork. Here, too, we are telling the truth in symbolic clothing, for we know what the large bird signifies. But the child does not know it. He hears only the distorted part of what we say, and feels that he has been deceived; and we know how often his distrust of the grown-ups and his refractoriness actually take their start from this impression. We have become convinced that it is better to avoid such symbolic disguisings of the truth in what we tell children and not to withhold from them a knowledge of the true state of affairs commensurate with their intellectual level.

[1927c, 4453]

As regards internal difficulties, a political revolution and a change of domicile could alter nothing. No less than before, I feel uncertain in the face of my own work; I lack the consciousness of unity and of belonging together which should exist between an author and his work. It is not as though there were an absence of conviction in the correctness of my conclusion. I acquired that a quarter of a century ago when in 1912 I wrote my book about *Totem and Taboo*, and it has only grown firmer since. From that time I have never doubted that religious phenomena are only to be understood on the pattern of the individual neurotic symptoms familiar to us - as the return of long since forgotten, important events in the primaeval history of the human family - and that they have to thank precisely this origin for their compulsive character and that, accordingly, they are effective on human beings by force of the historical truth of their content. My uncertainty sets in only when I ask myself whether I have succeeded in proving these theses in the example which I have chosen here of Jewish monotheism. To my critical sense this book, which takes its start from the man Moses, appears like a dancer balancing on the tip of one toe. If I could not find support in an analytic interpretation of the exposure myth and could not pass from there to Sellin's suspicion about the end of Moses, the whole thing would have had to remain unwritten. In any case, let us now take the plunge.

[1939a, 4885]

We believe that we can guess these events and we propose to show that their symptom-like consequences are the phenomena of religion. Since the emergence of the idea of evolution no longer leaves room for doubt that the human race has a prehistory, and since this is unknown - that is, forgotten - a conclusion of this kind almost carries the weight of a postulate. When we learn that in both cases the operative and forgotten traumas relate to life in the human family, we can greet this as a highly welcome, unforeseen bonus which has not been called for by our discussions up to this point.

[1939a, 4905]
I put forward these assertions as much as a quarter of a century ago in my *Totem and Taboo* (1912-13) and I need only repeat them here. My construction starts out from a statement of Darwin's and takes in a hypothesis of Atkinson's. It asserts that in primaeval times primitive man lived in small hordes, each under the domination of a powerful male. No date can be assigned to this, nor has it been synchronized with the geological epochs known to us: it is probable that these human creatures had not advanced far in the development of speech. An essential part of the construction is the hypothesis that the events I am about to describe occurred to all primitive men - that is, to all our ancestors. The story is told in an enormously condensed form, as though it had happened on a single occasion, while in fact it covered thousands of years and was repeated countless times during that long period. The strong male was lord and father of the entire horde and unrestricted in his power, which he exercised with violence. All the females were his property - wives and daughters of his own horde and some, perhaps, robbed from other hordes. The lot of his sons was a hard one: if they roused their father's jealousy they were killed or castrated or driven out. Their only resource was to collect together in small communities, to get themselves wives by robbery, and, when one or other of them could succeed in it, to raise themselves into a position similar to their father's in the primal horde. For natural reasons, youngest sons occupied an exceptional position. They were protected by their mother's love, and were able to take advantage of their father's increasing age and succeed him on his death. We seem to detect echoes in legends and fairy tales both of the expulsion of elder sons and of the favouring of youngest sons.

It must be supposed that after the parricide a considerable time elapsed during which the brothers disputed with one another for their father's heritage, which each of them wanted for himself alone. A realization of the dangers and uselessness of these struggles, a recollection of the act of liberation which they had accomplished together, and the emotional ties with one another which had arisen during the period of their expulsion, led at last to an agreement among them, a sort of social contract. The first form of a social organization came about with a renunciation of instinct, a recognition of mutual obligations, the introduction of definite institutions, pronounced inviolable (holy) - that is to say, the beginnings of morality and justice. Each individual renounced his ideal of acquiring his father's position for himself and of possessing his mother and sisters. Thus the taboo on incest and the injunction to exogamy came about. A fair amount of the absolute power liberated by the removal of the father passed over to the women; there came a period of matriarchy. Recollection of their father persisted at this period of the 'fraternal alliance'. A powerful animal - at first, perhaps, always one that was feared as well - was chosen as a substitute for the father. A choice of this kind may seem strange, but the gulf which men established later between themselves and animals did not exist for primitive peoples; nor does it exist for our children, whose animal phobias we have been able to understand as fear of their father. In relation to the totem animal the original dichotomy in the emotional relation to the father (ambivalence) was wholly retained. On the one hand the totem was regarded as the clan's blood ancestor and protective spirit, who must be worshipped and protected, and on the other hand a festival was appointed at which the same fate was prepared for him that the primal father had met with. He was killed and devoured by all the tribesmen in common. (The totem meal, according to Robertson Smith.) This great festival was in fact a triumphant celebration of the combined sons' victory over their father.

If our account of primaeval history is accepted as on the whole worthy of belief, two sorts of elements will be recognized in religious doctrines and rituals: on the one hand fixations to the ancient history of the family and survivals of it, and on the other hand revivals of the past and returns, after long intervals, of what has been forgotten. It is this last portion which, hitherto overlooked and therefore not understood, is to be demonstrated here in at least one impressive instance.
It is worth specially stressing the fact that each portion which returns from oblivion asserts itself with peculiar force, exercises an incomparably powerful influence on people in the mass, and raises an irresistible claim to truth against which logical objections remain powerless: a kind of ‘credo quia absurdum’. This remarkable feature can only be understood on the pattern of the delusions of psychotics. We have long understood that a portion of forgotten truth lies hidden in delusional ideas, that when this returns it has to put up with distortions and misunderstandings, and that the compulsive conviction which attaches to the delusion arises from this core of truth and spreads out on to the errors that wrap it round. We must grant an ingredient such as this of what may be called historical truth to the dogmas of religion as well, which, it is true, bear the character of psychotic symptoms but which, as group phenomena, escape the curse of isolation.

[1939a, 4909]

The killing of Moses by his Jewish people, recognized by Sellin from traces of it in tradition (and also, strange to say, accepted by the young Goethe without any evidence¹) thus becomes an indispensable part of our construction, an important link between the forgotten event of primaeval times and its later emergence in the form of the monotheist religions.² It is plausible to conjecture that remorse for the murder of Moses provided the stimulus for the wishful phantasy of the Messiah, who was to return and lead his people to redemption and the promised world-dominion. If Moses was this first Messiah, Christ became his substitute and successor, and Paul could exclaim to the peoples with some historical justification: ‘Look! the Messiah has really come: he has been murdered before your eyes!’ Then, too, there is a piece of historical truth in Christ's resurrection, for he was the resurrected Moses and behind him the returned primal father of the primitive horde, transfigured and, as the son, put in the place of the father.

[1939a, 4913]
The poor Jewish people, who with their habitual stubbornness continued to disavow the father's murder, atoned heavily for it in the course of time. They were constantly met with the reproach 'You killed our God!' And this reproach is true, if it is correctly translated. If it is brought into relation with the history of religions, it runs: 'You will not admit that you murdered God (the primal picture of God, the primal father, and his later reincarnations).' There should be an addition declaring: 'We did the same thing, to be sure, but we have admitted it and since then we have been absolved.' Not all the reproaches with which anti-semitism persecutes the descendants of the Jewish people can appeal to a similar justification. A phenomenon of such intensity and permanence as the people's hatred of the Jews must of course have more than one ground. It is possible to find a whole number of grounds, some of them clearly derived from reality, which call for no interpretation, and others, lying deeper and derived from hidden sources, which might be regarded as the specific reasons. Of the former, the reproach of being aliens is perhaps the weakest, since in many places dominated by anti-semitism to-day the Jews were among the oldest portions of the population or had even been there before the present inhabitants. This applies, for instance, to the city of Cologne, to which the Jews came with the Romans, before it was occupied by the Germans. Other grounds for hating the Jews are stronger - thus, the circumstances that they live for the most part as minorities among other peoples, for the communal feeling of groups requires, in order to complete it, hostility towards some extraneous minority, and the numerical weakness of this excluded minority encourages its suppression. There are, however, two other characteristics of the Jews which are quite unforgivable. First is the fact that in some respects they are different from their 'host' nations. They are not fundamentally different, for they are not Asiatics of a foreign race, as their enemies maintain, but composed for the most part of remnants of the Mediterranean peoples and heirs of the Mediterranean civilization. But they are none the less different, often in an indefinable way different, especially from the Nordic peoples, and the intolerance of groups is often, strangely enough, exhibited more strongly against small differences than against fundamental ones. The other point has a still greater effect: namely, that they defy all oppression, that the most cruel persecutions have not succeeded in exterminating them, and, indeed, that on the contrary they show a capacity for holding their own in commercial life and, where they are admitted, for making valuable contributions to every form of cultural activity.

[1939a, 4913]

And lastly a remark which brings up a psychological argument. A tradition that was based only on communication could not lead to the compulsive character that attaches to religious phenomena. It would be listened to, judged, and perhaps dismissed, like any other piece of information from outside; it would never attain the privilege of being liberated from the constraint of logical thought. It must have undergone the fate of being repressed, the condition of lingering in the unconscious, before it is able to display such powerful effects on its return, to bring the masses under its spell, as we have seen with astonishment and hitherto without comprehension in the case of religious tradition. And this consideration weighs heavily in favour of our believing that things really happened in the way we have tried to picture them or at least in some similar way.

[1939a, 4923]
Our construction of prehistory forces us to another explanation. The command in favour of exogamy, of which the horror of incest is the negative expression, was a product of the will of the father and carried this will on after he had been removed. Hence come the strength of its emotional tone and the impossibility of finding a rational basis for it - that is, its sacredness. We confidently expect that an investigation of all the other cases of a sacred prohibition would lead to the same conclusion as in that of the horror of incest: that what is sacred was originally nothing other than the prolongation of the will of the primal father. This would also throw light on the hitherto incomprehensible ambivalence of the words which express the concept of sacredness. It is the ambivalence which in general dominates the relation to the father. [The Latin] 'sacer' means not only 'sacred', 'consecrated', but also something that we can only translate as 'infamous', 'detestable' (e.g. 'auri sacra fames'). But the father's will was not only something which one might not touch, which one had to hold in high respect, but also something one trembled before, because it demanded a painful instinctual renunciation. When we hear that Moses made his people holy by introducing the custom of circumcision we now understand the deep meaning of that assertion. Circumcision is the symbolic substitute for the castration which the primal father once inflicted upon his sons in the plenitude of his absolute power, and whoever accepted that symbol was showing by it that he was prepared to submit to the father's will, even if it imposed the most painful sacrifice on him.

We too would like to accept this solution. But we are brought up by a doubt. The pious argument rests on an optimistic and idealistic premiss. It has not been possible to demonstrate in other connections that the human intellect has a particularly fine flair for the truth or that the human mind shows any special inclination for recognizing the truth. We have rather found, on the contrary, that our intellect very easily goes astray without any warning, and that nothing is more easily believed by us than what, without reference to the truth, comes to meet our wishful illusions. We must for that reason add a reservation to our agreement. We too believe that the pious solution contains the truth - but the historical truth and not the material truth. And we assume the right to correct a certain distortion to which this truth has been subjected on its return. That is to say, we do not believe that there is a single great god to-day, but that in primaeval times there was a single person who was bound to appear huge at that time and who afterwards returned in men's memory elevated to divinity.

We had assumed that the religion of Moses was to begin with rejected and half-forgotten and afterwards broke through as a tradition. We are now assuming that this process was being repeated then for the second time. When Moses brought the people the idea of a single god, it was not a novelty but signified the revival of an experience in the primaeval ages of the human family which had long vanished from men's conscious memory. But it had been so important and had produced or paved the way for such deeply penetrating changes in men's life that we cannot avoid believing that it had left behind it in the human mind some permanent traces, which can be compared to a tradition.
We have learnt from the psycho-analyses of individuals that their earliest impressions, received at a time when the child was scarcely yet capable of speaking, produce at some time or another effects of a compulsive character without themselves being consciously remembered. We believe we have a right to make the same assumption about the earliest experiences of the whole of humanity. One of these effects would be the emergence of the idea of a single great god - an idea which must be recognized as a completely justified memory, though, it is true, one that has been distorted. An idea such as this has a compulsive character: it must be believed. To the extent to which it is distorted, it may be described as a delusion; in so far as it brings a return of the past, it must be called the truth. Psychiatric delusions, too, contain a small fragment of truth and the patient's conviction extends over from this truth on to its delusional wrappings.

[1939a, 4947]

I cannot here repeat the contents of Totem and Taboo in greater detail. But I must undertake to fill up the long stretch between that hypothetical primaeval period and the victory of monotheism in historical times. After the institution of the combination of brother-clan, matriarchy, exogamy and totemism, a development began which must be described as a slow 'return if the repressed'. Here I am not using the term 'the repressed' in its proper sense. What is in question is something in a people's life which is past, lost to view, superseded and which we venture to compare with what is repressed in the mental life of an individual. We cannot at first sight say in what form this past existed during the time of its eclipse. It is not easy for us to carry over the concepts of individual psychology into group psychology; and I do not think we gain anything by introducing the concept of a 'collective' unconscious. The content of the unconscious, indeed, is in any case a collective, universal property of mankind. For the moment, then, we will make shift with the use of analogies. The processes in the life of peoples which we are studying here are very similar to those familiar to us in psychopathology, but nevertheless not quite the same. We must finally make up our minds to adopt the hypothesis that the psychical precipitates of the primaeval period became inherited property which, in each fresh generation, called not for acquisition but only for awakening. In this we have in mind the example of what is certainly the 'innate' symbolism which derives from the period of the development of speech, which is familiar to all children without their being instructed, and which is the same among all peoples despite their different languages. What we may perhaps still lack in certainty here is made good by other products of psycho-analytic research. We find that in a number of important relations our children react, not in a manner corresponding to their own experience, but instinctively, like the animals, in a manner that is only explicable as phylogenetic acquisition.

[1939a, 4949]
The return of the repressed took place slowly and certainly not spontaneously but under the
influence of all the changes in conditions of life which fill the history of human civilization. I
cannot give a survey here of these determinants nor more than a fragmentary enumeration of
the stages of this return. The father once more became the head of the family, but was not by
any means so absolute as the father of the primal horde had been. The totem animal was
replaced by a god in a series of transitions which are still very plain. To begin with, the god in
human form still bore an animal's head; later he turned himself by preference into that particular
animal, and afterwards it became sacred to him and was his favourite attendant; or he killed the
animal and himself bore its name as an epithet. Between the totem animal and the god, the
hero emerged, often as a preliminary step towards deification. The idea of a supreme deity
seems to have started early, at first only in a shadowy manner without intruding into men's daily
interests. As tribes and peoples came together into larger unities, the gods too organized
themselves into families and into hierarchies. One of them was often elevated into being
supreme lord over gods and men. After this, the further step was hesitatingly taken of paying
respect to only one god, and finally the decision was taken of giving all power to a single god
and of tolerating no other gods beside him. Only thus was it that the supremacy of the father of
the primal horde was re-established and that the emotions relating to him could be repeated.
[1939a, 4950]

The first effect of meeting the being who had so long been missed and longed for was
overwhelming and was like the traditional description of the law-giving from Mount Sinai.
Admiration, awe and thankfulness for having found grace in his eyes - the religion of Moses
knew none but these positive feelings towards the father-god. The conviction of his irresistibility,
the submission to his will, could not have been more unquestioning in the helpless and
intimidated son of the father of the horde - indeed those feelings only become fully intelligible
when they are transposed into the primitive and infantile setting. A child's emotional impulses
are intensely and inexhaustibly deep to a degree quite other than those of an adult; only
religious ecstasy can bring them back. A rapture of devotion to God was thus the first reaction
to the return of the great father.
[1939a, 4950]
The direction to be taken by this father-religion was in this way laid down for all time. Yet this did not bring its development to an end. Ambivalence is a part of the essence of the relation to the father: in the course of time the hostility too could not fail to stir, which had once driven the sons into killing their admired and dreaded father. There was no place in the framework of the religion of Moses for a direct expression of the murderous hatred of the father. All that could come to light was a mighty reaction against it - a sense of guilt on account of that hostility, a bad conscience for having sinned against God and for not ceasing to sin. This sense of guilt, which was uninterruptedly kept awake by the Prophets, and which soon formed an essential part of the religious system, had yet another superficial motivation, which neatly disguised its true origin. Things were going badly for the people; the hopes resting on the favour of God failed in fulfilment; it was not easy to maintain the illusion, loved above all else, of being God's chosen people. If they wished to avoid renouncing that happiness, a sense of guilt on account of their own sinfulness offered a welcome means of exculpating God: they deserved no better than to be punished by him since they had not obeyed his commandments. And, driven by the need to satisfy this sense of guilt, which was insatiable and came from sources so much deeper, they must make those commandments grow ever stricter, more meticulous and even more trivial. In a fresh rapture of moral asceticism they imposed more and more new instinctual renunciations on themselves and in that way reached - in doctrine and precept, at least - ethical heights which had remained inaccessible to the other peoples of antiquity. Many Jews regard this attainment of ethical heights as the second main characteristic and the second great achievement of their religion. The way in which it was connected with the first one - the idea of a single god - should be plain from our remarks. These ethical ideas cannot, however, disavow their origin from the sense of guilt felt on account of a suppressed hostility to God. They possess the characteristic - uncompleted and incapable of completion - of obsessional neurotic reaction-formations; we can guess, too, that they serve the secret purposes of punishment.

The further development takes us beyond Judaism. The remainder of what returned from the tragic drama of the primal father was no longer reconcilable in any way with the religion of Moses. The sense of guilt of those days was very far from being any longer restricted to the Jewish people; it had caught hold of all the Mediterranean peoples as a dull malaise, a premonition of calamity for which no one could suggest a reason. Historians of our day speak of an ageing of ancient civilization, but I suspect that they have only grasped accidental and contributory causes of this depressed mood of the peoples. The elucidation of this situation of depression sprang from Jewry. Irrespectively of all the approximations and preparations in the surrounding world, it was after all a Jewish man, Saul of Tarsus (who, as a Roman citizen, called himself Paul), in whose spirit the realization first emerged: 'the reason we are so unhappy is that we have killed God the father.' And it is entirely understandable that he could only grasp this piece of truth in the delusional disguise of the glad tidings: 'we are freed from all guilt since one of us has sacrificed his life to absolve us.' In this formula the killing of God was of course not mentioned, but a crime that had to be atoned by the sacrifice of a victim could only have been a murder. And the intermediate step between the delusion and the historical truth was provided by the assurance that the victim of the sacrifice had been God's son. With the strength which it derived from the source of historical truth, this new faith overthrew every obstacle. The blissful sense of being chosen was replaced by the liberating sense of redemption. But the fact of the parricide, in returning to the memory of mankind, had to overcome greater resistances than the other fact, which had constituted the subject-matter of monotheism; it was also obliged to submit to a more powerful distortion. The unnameable crime was replaced by the hypothesis of what must be described as a shadowy 'original sin'.

[1939a, 4951]

[1939a, 4952]
Original sin and redemption by the sacrifice of a victim became the foundation stones of the new religion founded by Paul. It must remain uncertain whether there was a ringleader and instigator to the murder among the band of brothers who rebelled against the primal father, or whether such a figure was created later by the imagination of creative artists in order to turn themselves into heroes, and was then introduced into the tradition. After the Christian doctrine had burst the framework of Judaism, it took up components from many other sources, renounced a number of characteristics of pure monotheism and adapted itself in many details to the rituals of the other Mediterranean peoples. It was as though Egypt was taking vengeance once more on the heirs of Akhenaten. It is worth noticing how the new religion dealt with the ancient ambivalence in the relation to the father. Its main content was, it is true, reconciliation with God the Father, atonement for the crime committed against him; but the other side of the emotional relation showed itself in the fact that the son, who had taken the atonement on himself, became a god himself beside the father and, actually, in place of the father. Christianity, having arisen out of a father-religion, became a son-religion. It has not escaped the fate of having to get rid of the father.
[1939a, 4953]

If we consider mankind as a whole and substitute it for the single human individual, we discover that it too has developed delusions which are inaccessible to logical criticism and which contradict reality. If, in spite of this, they are able to exert an extraordinary power over men, investigation leads us to the same explanation as in the case of the single individual. They owe their power to the element of historical truth which they have brought up from the repression of the forgotten and primaeval past.
[1937d, 5059]
We believe that we can guess these events and we propose to show that their symptom-like consequences are the phenomena of religion. Since the emergence of the idea of evolution no longer leaves room for doubt that the human race has a prehistory, and since this is unknown - that is, forgotten - a conclusion of this kind almost carries the weight of a postulate. When we learn that in both cases the operative and forgotten traumas relate to life in the human family, we can greet this as a highly welcome, unforeseen bonus which has not been called for by our discussions up to this point.

[1939a, 4905]

I put forward these assertions as much as a quarter of a century ago in my Totem and Taboo (1912-13) and I need only repeat them here. My construction starts out from a statement of Darwin's and takes in a hypothesis of Atkinson's. It asserts that in primaeval times primitive man lived in small hordes, each under the domination of a powerful male. No date can be assigned to this, nor has it been synchronized with the geological epochs known to us: it is probable that these human creatures had not advanced far in the development of speech. An essential part of the construction is the hypothesis that the events I am about to describe occurred to all primitive men - that is, to all our ancestors. The story is told in an enormously condensed form, as though it had happened on a single occasion, while in fact it covered thousands of years and was repeated countless times during that long period. The strong male was lord and father of the entire horde and unrestricted in his power, which he exercised with violence. All the females were his property - wives and daughters of his own horde and some, perhaps, robbed from other hordes. The lot of his sons was a hard one: if they roused their father's jealousy they were killed or castrated or driven out. Their only resource was to collect together in small communities, to get themselves wives by robbery, and, when one or other of them could succeed in it, to raise themselves into a position similar to their father's in the primal horde. For natural reasons, youngest sons occupied an exceptional position. They were protected by their mother's love, and were able to take advantage of their father's increasing age and succeed him on his death. We seem to detect echoes in legends and fairy tales both of the expulsion of elder sons and of the favouring of youngest sons.

[1939a, 4905]
When anyone has, like Leonardo, escaped being intimidated by his father during his earliest childhood, and has in his researches cast away the fetters of authority, it would be in the sharpest contradiction to our expectation if we found that he had remained a believer and had been unable to escape from dogmatic religion. Psycho-analysis has made us familiar with the intimate connection between the father-complex and belief in God; it has shown us that a personal God is, psychologically, nothing other than an exalted father, and it brings us evidence every day of how young people lose their religious beliefs as soon as their father's authority breaks down. Thus we recognize that the roots of the need for religion are in the parental complex; the almighty and just God, and kindly Nature, appear to us as grand sublimations of father and mother, or rather, as revivals and restorations of the young child's ideas of them. Biologically speaking, religiousness is to be traced to the small human child's long-drawn-out helplessness and need of help; and when at a later date he perceives how truly forlorn and weak he is when confronted with the great forces of life, he feels his condition as he did in childhood, and attempts to deny his own despondency by a regressive revival of the forces which protected his infancy. The protection against neurotic illness, which religion vouchsafes to those who believe in it, is easily explained: it removes their parental complex, on which the sense of guilt in individuals as well as in the whole human race depends, and disposes of it, while the unbeliever has to grapple with the problem on his own.

The customs of primitive peoples seem to take account of this motif of the early sexual wish by handing over the task of defloration to an elder, priest or holy man, that is, to a substitute for the father (see above). There seems to me to be a direct path leading from this custom to the highly vexed question of the jus primae noctis of the mediaeval lord of the manor. A. J. Storfer (1911) has put forward the same view and has in addition, as Jung (1909) had already done before him, interpreted the widespread tradition of the 'Tobias nights' (the custom of continence during the first three nights of marriage) as an acknowledgement of the privilege of the patriarch. It agrees with our expectations, therefore, when we find the images of gods included among the father-surrogates entrusted with defloration. In some districts of India, the newly-married woman was obliged to sacrifice her hymen to the wooden lingam, and, according to St. Augustine's account, the same custom existed in the Roman marriage ceremony (of his time?), but modified so that the young wife only had to seat herself on the gigantic stone phallus of Priapus.¹

The answer might be that in the meantime the concept of God had emerged - from some unknown source - and had taken control of the whole of religious life; and that, like everything else that was to survive, the totem meal had been obliged to find a point of contact with the new system. The psycho-analysis of individual human beings, however, teaches us with quite special insistence that the god of each of them is formed in the likeness of his father, that his personal relation to God depends on his relation to his father in the flesh and oscillates and changes along with that relation, and that at bottom God is nothing other than an exalted father. As in the case of totemism, psycho-analysis recommends us to have faith in the believers who call God their father, just as the totem was called the tribal ancestor. If psycho-analysis deserves any attention, then - without prejudice to any other sources or meanings of the concept of God, upon which psycho-analysis can throw no light - the paternal element in that concept must be a most important one. But in that case the father is represented twice over in the situation of primitive sacrifice: once as God and once as the totemic animal victim. And, even granting the restricted number of explanations open to psycho-analysis, one must ask whether this is possible and what sense it can have.

¹[1912-1913, 2787]
It therefore seems plausible to suppose that the god himself was the totem animal, and that he developed out of it at a later stage of religious feeling. But we are relieved from the necessity for further discussion by the consideration that the totem is nothing other than a surrogate of the father. Thus, while the totem may be the first form of father-surrogate, the god will be a later one, in which the father has regained his human shape. A new creation such as this, derived from what constitutes the root of every form of religion - a longing for the father - might occur if in the process of time some fundamental change had taken place in man's relation to the father, and perhaps, too, in his relation to animals.

[1912-1913, 2788]

Signs of the occurrence of changes of this kind may easily be seen, even if we leave on one side the beginning of a mental estrangement from animals and the disrupting of totemism owing to domestication. (See above, p2777 f.) There was one factor in the state of affairs produced by the elimination of the father which was bound in the course of time to cause an enormous increase in the longing felt for him. Each single one of the brothers who had banded together for the purpose of killing their father was inspired by a wish to become like him and had given expression to it by incorporating parts of their father's surrogate in the totem meal. But, in consequence of the pressure exercised upon each participant by the fraternal clan as a whole, that wish could not be fulfilled. For the future no one could or might ever again attain the father's supreme power, even though that was what all of them had striven for. Thus after a long lapse of time their bitterness against their father, which had driven them to their deed, grew less, and their longing for him increased; and it became possible for an ideal to emerge which embodied the unlimited power of the primal father against whom they had once fought as well as their readiness to submit to him. As a result of decisive cultural changes, the original democratic equality that had prevailed among all the individual clansmen became untenable; and there developed at the same time an inclination, based on veneration felt for particular human individuals, to revive the ancient paternal ideal by creating gods. The notion of a man becoming a god or of a god dying strikes us to-day as shockingly presumptuous; but even in classical antiquity there was nothing revolting in it.¹ The elevation of the father who had once been murdered into a god from whom the clan claimed descent was a far more serious attempt at atonement than had been the ancient covenant with the totem.

[1912-1913, 2788]

I cannot suggest at what point in this process of development a place is to be found for the great mother-goddesses, who may perhaps in general have preceded the father-gods. It seems certain, however, that the change in attitude to the father was not restricted to the sphere of religion but that it extended in a consistent manner to that other side of human life which had been affected by the father's removal - to social organization. With the introduction of father-deities a fatherless society gradually changed into one organized on a patriarchal basis. The family was a restoration of the former primal horde and it gave back to fathers a large portion of their former rights. There were once more fathers, but the social achievements of the fraternal clan had not been abandoned; and the gulf between the new fathers of a family and the unrestricted primal father of the horde was wide enough to guarantee the continuance of the religious craving, the persistence of an unappeased longing for the father.

[1912-1913, 2789]
Of all the imagos of a childhood which, as a rule, is no longer remembered, none is more important for a youth or a man than that of his father. Organic necessity introduces into a man's relation to his father an emotional ambivalence which we have found most strikingly expressed in the Greek myth of King Oedipus. A little boy is bound to love and admire his father, who seems to him the most powerful, the kindest and the wisest creature in the world. God himself is after all only an exaltation of this picture of a father as he is represented in the mind of early childhood. But soon the other side of this emotional relationship emerges. One's father is recognized as the paramount disturber of one's instinctual life; he becomes a model not only to imitate but also to get rid of, in order to take his place. Thenceforward affectionate and hostile impulses towards him persist side by side, often to the end of one's life, without either of them being able to do away with the other. It is in this existence of contrary feelings side by side that lies the essential character of what we call emotional ambivalence.

The boy had some kind of inkling of the ambivalent feelings towards the father which are an underlying factor in all religions, and attacked his religion on account of the slackening which it implied in this relation between son and father. Naturally his opposition soon ceased to take the form of doubting the truth of the doctrine, and turned instead directly against the figure of God. God had treated his son harshly and cruelly, but he was no better towards men; he had sacrificed his own son and had ordered Abraham to do the same. He began to fear God.

It is easy to show that the ego ideal answers to everything that is expected of the higher nature of man. As a substitute for a longing for the father, it contains the germ from which all religions have evolved. The self-judgement which declares that the ego falls short of its ideal produces the religious sense of humility to which the believer appeals in his longing. As a child grows up, the role of father is carried on by teachers and others in authority; their injunctions and prohibitions remain powerful in the ego ideal and continue, in the form of conscience, to exercise the moral censorship. The tension between the demands of conscience and the actual performances of the ego is experienced as a sense of guilt. Social feelings rest on identifications with other people, on the basis of having the same ego ideal.

Religion, morality, and a social sense - the chief elements in the higher side of man¹ - were originally one and the same thing. According to the hypothesis which I put forward in Totem and Taboo they were acquired phylogenetically out of the father-complex: religion and moral restraint through the process of mastering the Oedipus complex itself, and social feeling through the necessity for overcoming the rivalry that then remained between the members of the younger generation. The male sex seems to have taken the lead in all these moral acquisitions; and they seem to have then been transmitted to women by cross-inheritance. Even to-day the social feelings arise in the individual as a superstructure built upon impulses of jealous rivalry against his brothers and sisters. Since the hostility cannot be satisfied, an identification with the former rival develops. The study of mild cases of homosexuality confirms the suspicion that in this instance, too, the identification is a substitute for an affectionate object-choice which has taken the place of the aggressive, hostile attitude.²
It does indeed sound strange that the Devil should be chosen as a substitute for a loved father. But this is only so at first sight, for we know a good many things which lessen our surprise. To begin with, we know that God is a father-substitute; or, more correctly, that he is an exalted father; or, yet again, that he is a copy of a father as he is seen and experienced in childhood - by individuals in their own childhood and by mankind in its prehistory as the father of the primitive and primal horde. Later on in life the individual sees his father as something different and lesser. But the ideational image belonging to his childhood is preserved and becomes merged with the inherited memory-traces of the primal father to form the individual's idea of God. We also know, from the secret life of the individual which analysis uncovers, that his relation to his father was perhaps ambivalent from the outset, or, at any rate, soon became so. That is to say, it contained two sets of emotional impulses that were opposed to each other: it contained not only impulses of an affectionate and submissive nature, but also hostile and defiant ones. It is our view that the same ambivalence governs the relations of mankind to its Deity. The unresolved conflict between, on the one hand, a longing for the father and, on the other, a fear of him and a son's defiance of him, has furnished us with an explanation of important characteristics of religion and decisive vicissitudes in it.²

We have here an example of the process, with which we are familiar, by which an idea that has a contradictory - an ambivalent - content becomes divided into two sharply contrasted opposites. The contradictions in the original nature of God are, however, a reflection of the ambivalence which governs the relation of the individual to his personal father. If the benevolent and righteous God is a substitute for his father, it is not to be wondered at that his hostile attitude to his father, too, which is one of hating and fearing him and of making complaints against him, should have come to expression in the creation of Satan. Thus the father, it seems, is the individual prototype of both God and the Devil. But we should expect religions to bear ineffaceable marks of the fact that the primitive primal father was a being of unlimited evil - a being less like God than the Devil.

It is true that it is by no means easy to demonstrate the traces of this satanic view of the father in the mental life of the individual. When a boy draws grotesque faces and caricatures, we may no doubt be able to show that he is jeering at his father in them; and when a person of either sex is afraid of robbers and burglars at night, it is not hard to recognize these as split off portions of the father.¹ The animals, too, which appear in children's animal phobias are most often father-substitutes, as were the totem animals of primeval times. But that the Devil is a duplicate of the father and can act as a substitute for him has not been shown so clearly elsewhere as in the demonological neurosis of this seventeenth-century painter. That is why, at the beginning of this paper, I foretold that a demonological case history of this kind would yield in the form of pure metal material which, in the neuroses of a later epoch (no longer superstitious but hypochondriacal instead) has to be laboriously extracted by analytic work from the ore of free associations and symptoms.² A deeper penetration into the analysis of our painter's illness will probably bring stronger conviction. It is no unusual thing for a man to acquire a melancholic depression and an inhibition in his work as a result of his father's death. When this happens, we conclude that the man had been attached to his father with an especially strong love, and we remember how often a severe melancholia appears as a neurotic form of mourning.
The fact that in our analyses we so seldom succeed in finding the Devil as a father-substitute may be an indication that for those who come to us for analysis this figure from mediaeval mythology has long since played out its part. For the pious Christian of earlier centuries belief in the Devil was no less a duty than belief in God. In point of fact, he needed the Devil in order to be able to keep hold of God. The later decrease in faith has, for various reasons, first and foremost affected the figure of the Devil.

If we are bold enough to apply this idea of the Devil as a father substitute to cultural history, we may also be able to see the witch-trials of the Middle Ages in a new light.

In this way the Oedipus complex proves to be - as has already been conjectured in a historical sense¹ - the source of our individual ethical sense, our morality. The course of childhood development leads to an ever-increasing detachment from parents, and their personal significance for the super-ego recedes into the background. To the imagos they leave behind there are then linked the influences of teachers and authorities, self-chosen models and publicly recognized heroes, whose figures need no longer be introjected by an ego which has become more resistant. The last figure in the series that began with the parents is the dark power of Destiny which only the fewest of us are able to look upon as impersonal. There is little to be said against the Dutch writer Multatuli² when he replaces the Moíria [Destiny] of the Greeks by the divine pair 'Λόγος χαί Αυγή' [Reason and necessity]; but all who transfer the guidance of the world to Providence, to God, or to God and Nature, arouse a suspicion that they still look upon these ultimate and remotest powers as a parental couple, in a mythological sense, and believe themselves linked to them by libidinal ties. In The Ego and the Id I made an attempt to derive mankind's realistic fear of death, too, from the same parental view of fate. It seems very hard to free oneself from it.

The fact that moral masochism is unconscious leads us to an obvious clue. We were able to translate the expression 'unconscious sense of guilt' as meaning a need for punishment at the hands of a parental power. We now know that the wish, which so frequently appears in phantasies, to be beaten by the father stands very close to the other wish, to have a passive (feminine) sexual relation to him and is only a regressive distortion of it. If we insert this explanation into the content of moral masochism, its hidden meaning becomes clear to us. Conscience and morality have arisen through the overcoming, the desexualization, of the Oedipus complex; but through moral masochism morality becomes sexualized once more, the Oedipus complex is revived and the way is opened for a regression from morality to the Oedipus complex. This is to the advantage neither of morality nor of the person concerned. An individual may, it is true, have preserved the whole or some measure of ethical sense alongside of his masochism; but, alternatively, a large part of his conscience may have vanished into his masochism. Again, masochism creates a temptation to perform 'sinful' actions, which must then be expiated by the reproaches of the sadistic conscience (as is exemplified in so many Russian character-types) or by chastisement from the great parental power of Destiny. In order to provoke punishment from this last representative of the parents, the masochist must do what is inexpedient, must act against his own interests, must ruin the prospects which open out to him in the real world and must, perhaps, destroy his own real existence.
To take an instance from another field. It is impossible to escape the impression of the perfect correspondence which can be discovered between the obsessive actions of certain obsessional patients and the religious observances of believers all over the world. Some cases of obsessional neurosis actually behave like a caricature of a private religion, so that it is tempting to liken the official religions to an obsessional neurosis that has been mitigated by becoming universalized. This comparison, which is no doubt highly objectionable to all believers, has nevertheless proved most fruitful psychologically. For psycho-analysis soon discovered in the case of obsessional neurosis what the forces are that struggle with one another in it till their conflicts find a remarkable expression in the ceremonial of obsessive actions. Nothing similar was suspected in the case of religious ceremonial until, by tracing back religious feeling to the relation with the father as its deepest root, it became possible to point to an analogous dynamic situation in that case too. This instance, moreover, may warn the reader that even in its application to non-medical fields psycho-analysis cannot avoid wounding cherished prejudices, touching upon deeply-rooted sensibilities and thus provoking enmities which have an essentially emotional basis.

The second of these techniques which we are setting out to describe for the first time, that of isolation, is peculiar to obsessional neurosis. It, too, takes place in the motor sphere. When something unpleasant has happened to the subject or when he himself has done something which has a significance for his neurosis, he interpolates an interval during which nothing further must happen - during which he must perceive nothing and do nothing. This behaviour, which seems strange at first sight, is soon seen to have a relation to repression. We know that in hysteria it is possible to cause a traumatic experience to be overtaken by amnesia. In obsessional neurosis this can often not be achieved: the experience is not forgotten, but, instead, it is deprived of its affect, and its associative connections are suppressed or interrupted so that it remains as though isolated and is not reproduced in the ordinary processes of thought. The effect of this isolation is the same as the effect of repression with amnesia. This technique, then, is reproduced in the isolations of obsessional neurosis; and it is at the same time given motor reinforcement for magical purposes. The elements that are held apart in this way are precisely those which belong together associatively. The motor isolation is meant to ensure an interruption of the connection in thought. The normal phenomenon of concentration provides a pretext for this kind of neurotic procedure: what seems to us important in the way of an impression or a piece of work must not be interfered with by the simultaneous claims of any other mental processes or activities. But even a normal person uses concentration to keep away not only what is irrelevant or unimportant, but, above all, what is unsuitable because it is contradictory. He is most disturbed by those elements which once belonged together but which have been torn apart in the course of his development - as, for instance, by manifestations of the ambivalence of his father-complex in his relation to God, or by impulses attached to his excretory organs in his motions of love. Thus, in the normal course of things, the ego has a great deal of isolating work to do in its function of directing the current of thought. And, as we know, we are obliged, in carrying out our analytic technique, to train it to relinquish that function for the time being, eminently justified as it usually is.
For this situation is nothing new. It has an infantile prototype, of which it is in fact only the
continuation. For once before one has found oneself in a similar state of helplessness: as a
small child, in relation to one's parents. One had reason to fear them, and especially one's
father; and yet one was sure of his protection against the dangers one knew. Thus it was
natural to assimilate the two situations. Here, too, wishing played its part, as it does in dream-
life. The sleeper may be seized with a presentiment of death, which threatens to place him in
the grave. But the dream-work knows how to select a condition that will turn even that dreaded
event into a wish-fulfilment: the dreamer sees himself in an ancient Etruscan grave which he
has climbed down into, happy to find his archaeological interests satisfied. In the same way, a
man makes the forces of nature not simply into persons with whom he can associate as he
would with his equals - that would not do justice to the overpowering impression which those
forces make on him - but he gives them the character of a father. He turns them into gods,
following in this, as I have tried to show, not only an infantile prototype but a phylogenetic one.
[1927c, 4429]

In the course of time the first observations were made of regularity and conformity to law in
natural phenomena, and with this the forces of nature lost their human traits. But man's
helplessness remains and along with it his longing for his father, and the gods. The gods retain
their threefold task: they must exorcize the terrors of nature, they must reconcile men to the
cruelty of Fate, particularly as it is shown in death, and they must compensate them for the
sufferings and privations which a civilized life in common has imposed on them.
[1927c, 4429]
And thus a store of ideas is created, born from man's need to make his helplessness tolerable and built up from the material of memories of the helplessness of his own childhood and the childhood of the human race. It can clearly be seen that the possession of these ideas protects him in two directions - against the dangers of nature and Fate, and against the injuries that threaten him from human society itself. Here is the gist of the matter. Life in this world serves a higher purpose; no doubt it is not easy to guess what that purpose is, but it certainly signifies a perfecting of man's nature. It is probably the spiritual part of man, the soul, which in the course of time has so slowly and unwillingly detached itself from the body, that is the object of this elevation and exaltation. Everything that happens in this world is an expression of the intentions of an intelligence superior to us, which in the end, though its ways and byways are difficult to follow, orders everything for the best - that is, to make it enjoyable for us. Over each one of us there watches a benevolent Providence which is only seemingly stern and which will not suffer us to become a plaything of the overmighty and pitiless forces of nature. Death itself is not extinction, is not a return to inorganic lifelessness, but the beginning of a new kind of existence which lies on the path of development to something higher. And, looking in the other direction, this view announces that the same moral laws which our civilizations have set up govern the whole universe as well, except that they are maintained by a supreme court of justice with incomparably more power and consistency. In the end all good is rewarded and all evil punished, if not actually in this form of life then in the later existences that begin after death. In this way all the terrors, the sufferings and the hardships of life are destined to be obliterated. Life after death, which continues life on earth just as the invisible part of the spectrum joins on to the visible part, brings us all the perfection that we may perhaps have missed here. And the superior wisdom which directs this course of things, the infinite goodness that expresses itself in it, the justice that achieves its aim in it - these are the attributes of the divine beings who also created us and the world as a whole, or rather, of the one divine being into which, in our civilization, all the gods of antiquity have been condensed. The people which first succeeded in thus concentrating the divine attributes was not a little proud of the advance. It had laid open to view the father who had all along been hidden behind every divine figure as its nucleus. Fundamentally this was a return to the historical beginnings of the idea of God. Now that God was a single person, man's relations to him could recover the intimacy and intensity of the child's relation to his father. But if one had done so much for one's father, one wanted to have a reward, or at least to be his only beloved child, his Chosen People. Very much later, pious America laid claim to being 'God's own Country'; and, as regards one of the shapes in which men worship the deity, the claim is undoubtedly valid. [1927c, 4431]

I do not find that so striking. Do you suppose that human thought has no practical motives, that it is simply the expression of a disinterested curiosity? That is surely very improbable. I believe rather that when man personifies the forces of nature he is again following an infantile model. He has learnt from the persons in his earliest environment that the way to influence them is to establish a relation with them; and so, later on, with the same end in view, he treats everything else that he comes across in the same way as he treated those persons. Thus I do not contradict your descriptive observation; it is in fact natural to man to personify everything that he wants to understand in order later to control it (psychical mastering as a preparation for physical mastering); but I provide in addition a motive and a genesis for this peculiarity of human thinking. [1927c, 4434]
'And now here is yet a third point. You have dealt with the origin of religion once before, in your book *Totem and Taboo*. But there it appeared in a different light. Everything was the son-father relationship. God was the exalted father, and the longing for the father was the root of the need for religion. Since then, it seems, you have discovered the factor of human weakness and helplessness, to which indeed the chief role in the formation of religion is generally assigned, and now you transpose everything that was once the father complex into terms of helplessness. May I ask you to explain this transformation?'

[1927c, 4434]

The question of why in the long run the animal god did not suffice, and was replaced by a human one, was hardly touched on in *Totem and Taboo*, and other problems concerning the formation of religion were not mentioned in the book at all. Do you regard a limitation of that kind as the same thing as a denial? My work is a good example of the strict isolation of the particular contribution which psycho-analytic discussion can make to the solution of the problem of religion. If I am now trying to add the other, less deeply concealed part, you should not accuse me of contradicting myself, just as before you accused me of being one-sided. It is, of course, my duty to point out the connecting links between what I said earlier and what I put forward now, between the deeper and the manifest motives, between the father-complex and man's helplessness and need for protection.

[1927c, 4435]

These connections are not hard to find. They consist in the relation of the child's helplessness to the helplessness of the adult which continues it. So that, as was to be expected, the motives for the formation of religion which psycho-analysis revealed now turn out to be the same as the infantile contribution to the *manifest* motives. Let us transport ourselves into the mental life of a child. You remember the choice of object according to the anaclitic type, which psycho-analysis talks of? The libido there follows the paths of narcissistic needs and attaches itself to the objects which ensure the satisfaction of those needs. In this way the mother, who satisfies the child's hunger, becomes its first love-object and certainly also its first protection against all the undefined dangers which threaten it in the external world - its first protection against anxiety, we may say.

[1927c, 4435]

In this function the mother is soon replaced by the stronger father, who retains that position for the rest of childhood. But the child's attitude to its father is coloured by a peculiar ambivalence. The father himself constitutes a danger for the child, perhaps because of its earlier relation to its mother. Thus it fears him no less than it longs for him and admires him. The indications of this ambivalence in the attitude to the father are deeply imprinted in every religion, as was shown in *Totem and Taboo*. When the growing individual finds that he is destined to remain a child for ever, that he can never do without protection against strange superior powers, he lends those powers the features belonging to the figure of his father; he creates for himself the gods whom he dreads, whom he seeks to propitiate, and whom he nevertheless entrusts with his own protection. Thus his longing for a father is a motive identical with his need for protection against the consequences of his human weakness. The defence against childish helplessness is what lends its characteristic features to the adult's reaction to the helplessness which he has to acknowledge - a reaction which is precisely the formation of religion. But it is not my intention to enquire any further into the development of the idea of God; what we are concerned with here is the finished body of religious ideas as it is transmitted by civilization to the individual.

[1927c, 4436]
I think we have prepared the way sufficiently for an answer to both these questions. It will be found if we turn our attention to the psychical origin of religious ideas. These, which are given out as teachings, are not precipitates of experience or end-results of thinking: they are illusions, fulfilments of the oldest, strongest and most urgent wishes of mankind. The secret of their strength lies in the strength of those wishes. As we already know, the terrifying impression of helplessness in childhood arouses the need for protection - for protection through love which was provided by the father; and the recognition that this helplessness lasts throughout life made it necessary to cling to the existence of a father, but this time a more powerful one. Thus the benevolent rule of a divine Providence allays our fear of the dangers of life; the establishment of a moral world-order ensures the fulfilment of the demands of justice, which have so often remained unfulfilled in human civilization; and the prolongation of earthly existence in a future life provides the local and temporal framework in which these wish-fulfilments shall take place. Answers to the riddles that tempt the curiosity of man, such as how the universe began or what the relation is between body and mind, are developed in conformity with the underlying assumptions of this system. It is an enormous relief to the individual psyche if the conflicts of its childhood arising from the father-complex - conflicts which it has never wholly overcome - are removed from it and brought to a solution which is universally accepted.

[1927c, 4441]

At this point one must expect to meet with an objection. 'Well then, if even obdurate sceptics admit that the assertions of religion cannot be refuted by reason, why should I not believe in them, since they have so much on their side - tradition, the agreement of mankind, and all the consolations they offer?' Why not, indeed? Just as no one can be forced to believe, so no one can be forced to disbelieve. But do not let us be satisfied with deceiving ourselves that arguments like these take us along the road of correct thinking. If ever there was a case of a lame excuse we have it here. Ignorance is ignorance; no right to believe anything can be derived from it. In other matters no sensible person will behave so irresponsibly or rest content with such feeble grounds for his opinions and for the one he takes. It is only in the highest and most sacred things that he allows himself to do so. In reality these are only attempts at pretending to oneself or to other people that one is still firmly attached to religion, when one has long since cut oneself loose from it. Where questions of religion are concerned, people are guilty of every possible sort of dishonesty and intellectual misdemeanour. Philosophers stretch the meaning of words until they retain scarcely anything of their original sense. They give the name of 'God' to some vague abstraction which they have created for themselves; having done so they can pose before all the world as deists, as believers in God, and they can even boast that they have recognized a higher, purer concept of God, notwithstanding that their God is now nothing more than an insubstantial shadow and no longer the mighty personality of religious doctrines. Critics persist in describing as 'deeply religious' anyone who admits to a sense of man's insignificance or impotence in the face of the universe, although what constitutes the essence of the religious attitude is not this feeling but only the next step after it, the reaction to it which seeks a remedy for it. The man who goes no further, but humbly acquiesces in the small part which human beings play in the great world - such a man is, on the contrary, irreligious in the truest sense of the word.

[1927c, 4442]
Thus I must contradict you when you go on to argue that men are completely unable to do without the consolation of the religious illusion, that without it they could not bear the troubles of life and the cruelties of reality. That is true, certainly, of the men into whom you have instilled the sweet - or bitter-sweet - poison from childhood onwards. But what of the other men, who have been sensibly brought up? Perhaps those who do not suffer from the neurosis will need no intoxicant to deaden it. They will, it is true, find themselves in a difficult situation. They will have to admit to themselves the full extent of their helplessness and their insignificance in the machinery of the universe; they can no longer be the centre of creation, no longer the object of tender care on the part of a beneficent Providence. They will be in the same position as a child who has left the parental house where he was so warm and comfortable. But surely infantilism is destined to be surmounted. Men cannot remain children for ever; they must in the end go out into 'hostile life'. We may call this 'education to reality'. Need I confess to you that the sole purpose of my book is to point out the necessity for this forward step?

[1927c, 4456]

To me the claim does not seem compelling. After all, a feeling can only be a source of energy if it is itself the expression of a strong need. The derivation of religious needs from the infant's helplessness and the longing for the father aroused by it seems to me incontrovertible, especially since the feeling is not simply prolonged from childhood days, but is permanently sustained by fear of the superior power of Fate. I cannot think of any need in childhood as strong as the need for a father's protection. Thus the part played by the oceanic feeling, which might seek something like the restoration of limitless narcissism, is ousted from a place in the foreground. The origin of the religious attitude can be traced back in clear outlines as far as the feeling of infantile helplessness. There may be something further behind that, but for the present it is wrapped in obscurity.

[1930a, 4472]

In my *Future of an Illusion* I was concerned much less with the deepest sources of the religious feeling than with what the common man understands by his religion - with the system of doctrines and promises which on the one hand explains to him the riddles of this world with enviable completeness, and, on the other, assures him that a careful Providence will watch over his life and will compensate him in a future existence for any frustrations he suffers here. The common man cannot imagine this Providence otherwise than in the figure of an enormously exalted father. Only such a being can understand the needs of the children of men and be softened by their prayers and placated by the signs of their remorse. The whole thing is so patently infantile, so foreign to reality, that to anyone with a friendly attitude to humanity it is painful to think that the great majority of mortals will never be able to rise above this view of life. It is still more humiliating to discover how large a number of people living to-day, who cannot but see that this religion is not tenable, nevertheless try to defend it piece by piece in a series of pitiful rearguard actions. One would like to mix among the ranks of the believers in order to meet these philosophers, who think they can rescue the God of religion by replacing him by an impersonal, shadowy and abstract principle, and to address them with the warning words: 'Thou shalt not take the name of the Lord thy God in Vain!' And if some of the great men of the past acted in the same way, no appeal can be made to their example: we know why they were obliged to.

[1930a, 4473]
As to the origin of the sense of guilt, the analyst has different views from other psychologists; but even he does not find it easy to give an account of it. To begin with, if we ask how a person comes to have a sense of guilt, we arrive at an answer which cannot be disputed: a person feels guilty (devout people would say 'sinful') when he has done something which he knows to be 'bad'. But then we notice how little this answer tells us. Perhaps, after some hesitation, we shall add that even when a person has not actually done the bad thing but has only recognized in himself an intention to do it, he may regard himself as guilty; and the question then arises of why the intention is regarded as equal to the deed. Both cases, however, presuppose that one had already recognized that what is bad is reprehensible, is something that must not be carried out. How is this judgement arrived at? We may reject the existence of an original, as it were natural, capacity to distinguish good from bad. What is bad is often not at all what is injurious or dangerous to the ego; on the contrary, it may be something which is desirable and enjoyable to the ego. Here, therefore, there is an extraneous influence at work, and it is this that decides what is to be called good or bad. Since a person's own feelings would not have led him along this path, he must have had a motive for submitting to this extraneous influence. Such a motive is easily discovered in his helplessness and his dependence on other people, and it can best be designated as fear of loss of love. If he loses the love of another person upon whom he is dependent, he also ceases to be protected from a variety of dangers. Above all, he is exposed to the danger that this stronger person will show his superiority in the form of punishment. At the beginning, therefore, what is bad is whatever causes one to be threatened with loss of love. For fear of that loss, one must avoid it. This, too, is the reason why it makes little difference whether one has already done the bad thing or only intends to do it. In either case the danger only sets in if and when the authority discovers it, and in either case the authority would behave in the same way.

[1930a, 4514]

We may suppose, therefore, that this was the way in which things happened. The sight of a woman's dead body, naked or on the point of being stripped, reminds the young man of his mother. It roused in him a longing for his mother which sprang from his Oedipus complex, and this was immediately completed by a feeling of indignation against his father. His ideas of 'father' and 'God' had not yet become widely separated; so that his desire to destroy his father could become conscious as doubt in the existence of God and could seek to justify itself in the eyes of reason as indignation about the ill-treatment of a mother object. It is of course typical for a child to regard what his father does to his mother in sexual intercourse as ill-treatment. The new impulse, which was displaced into the sphere of religion, was only a repetition of the Oedipus situation and consequently soon met with a similar fate. It succumbed to a powerful opposing current. During the actual conflict the level of displacement was not maintained: there is no mention of arguments in justification of God, nor are we told what the infallible signs were by which God proved his existence to the doubter. The conflict seems to have been unfolded in the form of a hallucinatory psychosis: inner voices were heard which uttered warnings against resistance to God. But the outcome of the struggle was displayed once again in the sphere of religion and it was of a kind predetermined by the fate of the Oedipus complex: complete submission to the will of God the Father. The young man became a believer and accepted everything he had been taught since his childhood about God and Jesus Christ. He had had a religious experience and had undergone a conversion.

[1928a, 4550]
All of this is so simple and straightforward that we cannot but ask ourselves whether by understanding this case we have thrown any light at all on the psychology of conversion in general. I may refer the reader to an admirable volume on the subject by Sante de Sanctis (1924), which incidentally takes all the findings of psycho-analysis into account. Study of this work confirms our expectation that by no means every case of conversion can be understood so easily as this one. In no respect, however, does our case contradict the views arrived at on the subject by modern research. The point which our present observation throws into relief is the manner in which the conversion was attached to a particular determining event, which caused the subject's scepticism to flare up for a last time before being finally extinguished. [1928a, 4550]

If we are to give an account of the grandiose nature of religion, we must bear in mind what it undertakes to do for human beings. It gives them information about the origin and coming into existence of the universe, it assures them of its protection and of ultimate happiness in the ups and downs of life and it directs their thoughts and actions by precepts which it lays down with its whole authority. Thus it fulfils three functions. With the first of them it satisfies the human thirst for knowledge; it does the same thing that science attempts to do with its means, and at that point enters into rivalry with it. It is to its second function that it no doubt owes the greatest part of its influence. Science can be no match for it when it soothes the fear that men feel of the dangers and vicissitudes of life, when it assures them of a happy ending and offers them comfort in unhappiness. It is true that science can teach us how to avoid certain dangers and that there are some sufferings which it can successfully combat; it would be most unjust to deny that it is a powerful helper to men; but there are many situations in which it must leave a man to his suffering and can only advise him to submit to it. In its third function, in which it issues precepts and lays down prohibitions and restrictions, religion is furthest away from science. For science is content to investigate and to establish facts, though it is true that from its application rules and advice are derived on the conduct of life. In some circumstances these are the same as those offered by religion, but, when this is so, the reasons for them are different. [1933a, 4760]

The convergence between these three aspects of religion is not entirely clear. What has an explanation of the origin of the universe to do with the inculcation of certain particular ethical precepts? The assurances of protection and happiness are more intimately linked with the ethical requirements. They are the reward for fulfilling these commands; only those who obey them may count upon these benefits, punishment awaits the disobedient. Incidentally, something similar is true of science. Those who disregard its lessons, so it tells us, expose themselves to injury. [1933a, 4761]
The remarkable combination in religion of instruction, consolation and requirements can only be understood if it is subjected to a genetic analysis. This may be approached from the most striking point of the aggregate, from its instruction on the origin of the universe; for why, we may ask, should a cosmogony be a regular component of religious systems? The doctrine is, then, that the universe was created by a being resembling a man, but magnified in every respect, in power, wisdom, and the strength of his passions - an idealized super-man. Animals as creators of the universe point to the influence of totemism, upon which we shall have a few words at least to say presently. It is an interesting fact that this creator is always only a single being, even when there are believed to be many gods. It is interesting, too, that the creator is usually a man, though there is far from being a lack of indications of female deities; and some mythologies actually make the creation begin with a male god getting rid of a female deity, who is degraded into being a monster. Here the most interesting problems of detail open out; but we must hurry on. Our further path is made easy to recognize, for this god-creator is undisguisedly called 'father'. Psycho-analysis infers that he really is the father, with all the magnificence in which he once appeared to the small child. A religious man pictures the creation of the universe just as he pictures his own origin.

This being so, it is easy to explain how it is that consoling assurances and strict ethical demands are combined with a cosmogony. For the same person to whom the child owed his existence, the father (or more correctly, no doubt, the parental agency compounded of the father and mother), also protected and watched over him in his feeble and helpless state, exposed as he was to all the dangers lying in wait in the external world; under his father's protection he felt safe. When a human being has himself grown up, he knows, to be sure, that he is in possession of greater strength, but his insight into the perils of life has also grown greater, and he rightly concludes that fundamentally he still remains just as helpless and unprotected as he was in his childhood, that faced by the world he is still a child. Even now, therefore, he cannot do without the protection which he enjoyed as a child. But he has long since recognized, too, that his father is a being of narrowly restricted power, and not equipped with every excellence. He therefore harks back to the mnemonic image of the father whom in his childhood he so greatly overvalued. He exalts the image into a deity and makes it into something contemporary and real. The effective strength of this mnemonic image and the persistence of his need for protection jointly sustain his belief in God.

[1933a, 4761]

[1933a, 4762]
The third main item in the religious programme, the ethical demand, also fits into this childhood situation with ease. I may remind you of Kant's famous pronouncement in which he names, in a single breath, the starry heavens and the moral law within us. However strange this juxtaposition may sound - for what have the heavenly bodies to do with the question of whether one human creature loves another or kills him? - it nevertheless touches on a great psychological truth. The same father (or parental agency) which gave the child life and guarded him against its perils, taught him as well what he might do and what he must leave undone, instructed him that he must adapt himself to certain restrictions on his instinctual wishes, and made him understand what regard he was expected to have for his parents and brothers and sisters, if he wanted to become a tolerated and welcome member of the family circle and later on of larger associations. The child is brought up to a knowledge of his social duties by a system of loving rewards and punishments, he is taught that his security in life depends on his parents (and afterwards other people) loving him and on their being able to believe that he loves them. All these relations are afterwards introduced by men unaltered into their religion. Their parents' prohibitions and demands persist within them as a moral conscience. With the help of this same system of rewards and punishments, God rules the world of men. The amount of protection and happy satisfaction assigned to an individual depends on his fulfilment of the ethical demands; his love of God and his consciousness of being loved by God are the foundations of the security with which he is armed against the dangers of the external world and of his human environment. Finally, in prayer he has assured himself a direct influence on the divine will and with it a share in the divine omnipotence.

[1933a, 4762]

I feel sure that while you have been listening to me you have been bothered by a number of questions which you would be glad to hear answered. I cannot undertake to do so here and now, but I feel confident that none of these detailed enquiries would upset our thesis that the religious Weltanschauung is determined by the situation of our childhood. That being so, it is all the more remarkable that, in spite of its infantile nature, it nevertheless had a precursor. There is no doubt that there was a time without religion, without gods. This is known as the stage of animism. At that time, too, the world was peopled with spiritual beings resembling men - we call them demons. All the objects in the external world were their habitation, or perhaps were identical with them; but there was no superior power which had created them all and afterwards ruled them and to which one could turn for protection and help. The demons of animism were for the most part hostile in their attitude to human beings, but it appears that human beings had more self-confidence then than later on. They were certainly in a constant state of the most acute fear of these evil spirits; but they defended themselves against them by certain actions to which they ascribed the power to drive them away. Nor apart from this did they regard themselves as defenceless. If they desired something from Nature - if they wished for rain, for instance - they did not direct a prayer to the weather-god, but they performed a magical act which they expected to influence Nature directly: they themselves did something which resembled rain. In their struggle against the powers of the world around them their first weapon was magic, the earliest fore-runner of the technology of to-day. Their reliance on magic was, as we suppose, derived from their overvaluation of their own intellectual operations, from their belief in the omnipotence of thoughts', which, incidentally, we come upon again in our obsessional neurotic patients. We may suppose that human beings at that period were particularly proud of their acquisitions in the way of language, which must have been accompanied by a great facilitation of thinking. They attributed magical power to words. This feature was later taken over by religion. 'And God said "Let there be light!" and there was light.' Moreover the fact of their magical actions shows that animistic men did not simply rely on the power of their wishes. They expected results, rather, from the performance of an action which would induce Nature to imitate it. If they wanted rain, they themselves poured out water; if they wanted to encourage the earth to be fruitful, they demonstrated a dramatic performance of sexual intercourse to it in the fields.

[1933a, 4763]
Strengthened by these preliminary exercises, the scientific spirit gained enough courage at last to venture on an examination of the most important and emotionally valuable elements of the religious Weltanschauung. People may always have seen, though it was long before they dared to say so openly, that the pronouncements of religion promising men protection and happiness if they would only fulfill certain ethical requirements had also shown themselves unworthy of belief. It seems not to be the case that there is a Power in the universe which watches over the well-being of individuals with parental care and brings all their affairs to a happy ending. On the contrary, the destinies of mankind can be brought into harmony neither with the hypothesis of a Universal Benevolence nor with the partly contradictory one of a Universal Justice. Earthquakes, tidal waves, conflagrations, make no distinction between the virtuous and pious and the scoundrel or unbeliever. Even where what is in question is not inanimate Nature but where an individual’s fate depends on his relations to other people, it is by no means the rule that virtue is rewarded and that evil finds its punishment. Often enough the violent, cunning or ruthless man seizes the envied good things of the world and the pious man goes away empty. Obscure, unfeeling and unloving powers determine men’s fate; the system of rewards and punishments which religion ascribes to the government of the universe seems not to exist. Here once again is a reason for dropping a portion of the animistic theory which had been rescued from animism by religion.

In summary, therefore, the judgement of science on the religious Weltanschauung is this. While the different religions wrangle with one another as to which of them is in possession of the truth, our view is that the question of the truth of religious beliefs may be left altogether on one side. Religion is an attempt to master the sensory world in which we are situated by means of the wishful world which we have developed within us as a result of biological and psychological necessities. But religion cannot achieve this. Its doctrines bear the imprint of the times in which they arose, the ignorant times of the childhood of humanity. Its consolations deserve no trust. Experience teaches us that the world is no nursery. The ethical demands on which religion seeks to lay stress need, rather, to be given another basis; for they are indispensable to human society and it is dangerous to link obedience to them with religious faith. If we attempt to assign the place of religion in the evolution of mankind, it appears not as a permanent acquisition but as a counterpart to the neurosis which individual civilized men have to go through in their passage from childhood to maturity.

The last contribution to the criticism of the religious Weltanschauung was effected by psychoanalysis, by showing how religion originated from the helplessness of children and by tracing its contents to the survival into maturity of the wishes and needs of childhood. This did not precisely mean a contradiction of religion, but it was nevertheless a necessary rounding-off of our knowledge about it, and in one respect at least it was a contradiction, for religion itself lays claim to a divine origin. And, to be sure, it is not wrong in this, provided that our interpretation of God is accepted.

In summary, therefore, the judgement of science on the religious Weltanschauung is this.
We have already said that the Christian ceremony of Holy Communion, in which the believer incorporates the Saviour's blood and flesh, repeats the content of the old totem meal - no doubt only in its affectionate meaning, expressive of veneration, and not in its aggressive meaning. The ambivalence that dominates the relation to the father was clearly shown, however, in the final outcome of the religious novelty. Ostensibly aimed at propitiating the father god, it ended in his being dethroned and got rid of. Judaism had been a religion of the father; Christianity became a religion of the son. The old God the Father fell back behind Christ; Christ, the Son, took his place, just as every son had hoped to do in primaeval times. Paul, who carried Judaism on, also destroyed it. No doubt he owed his success in the first instance to the fact that, through the idea of the redeemer, he exorcized humanity's sense of guilt; but he owed it as well to the circumstance that he abandoned the 'chosen' character of his people and its visible mark - circumcision - so that the new religion could be a universal one, embracing all men. Though a part may have been played in Paul's taking this step by his personal desire for revenge for the rejection of his innovation in Jewish circles, yet it also restored a feature of the old Aten religion - it removed a restriction which that religion had acquired when it was handed over to a new vehicle, the Jewish people.

[1939a, 4911]

Let us try to approach the subject from the opposite direction. We understand how a primitive man is in need of a god as creator of the universe, as chief of his clan, as personal protector. This god takes his position behind the dead fathers, about whom tradition still has something to say. A man of later days, of our own day, behaves in the same way. He, too, remains childish and in need of protection, even when he is grown up; he thinks he cannot do without support from his god. That much is undisputed. But it is less easy to understand why there may only be a single god, why precisely the advance from henotheism to monotheism acquires an overwhelming significance. No doubt it is true, as we have explained, that the believer has a share in the greatness of his god; and the greater the god the more reliable is the protection which he can offer. But a god's power does not necessarily presuppose that he is the only one. Many peoples regarded it only as a glorification of their chief god if he ruled over other deities who were inferior to him, and they did not think it diminished his greatness if there were other gods besides him. No doubt, if this god became a universal one and had all countries and peoples as his concern, it meant a sacrifice of intimacy, too. It was as though one were sharing one's god with the foreigners and one had to make up for this by the proviso that one was preferred by him. We can make the further point that the idea of a single god means in itself an advance in intellectuality, but it is impossible to rate this point so highly.

[1939a, 4946]

The first effect of meeting the being who had so long been missed and longed for was overwhelming and was like the traditional description of the law-giving from Mount Sinai. Admiration, awe and thankfulness for having found grace in his eyes - the religion of Moses knew none but these positive feelings towards the father-god. The conviction of his irresistibility, the submission to his will, could not have been more unquestioning in the helpless and intimidated son of the father of the horde - indeed those feelings only become fully intelligible when they are transposed into the primitive and infantile setting. A child's emotional impulses are intensely and inexhaustibly deep to a degree quite other than those of an adult; only religious ecstasy can bring them back. A rapture of devotion to God was thus the first reaction to the return of the great father.

[1939a, 4950]
The direction to be taken by this father-religion was in this way laid down for all time. Yet this
did not bring its development to an end. Ambivalence is a part of the essence of the relation to
the father: in the course of time the hostility too could not fail to stir, which had once driven the
sons into killing their admired and dreaded father. There was no place in the framework of the
religion of Moses for a direct expression of the murderous hatred of the father. All that could
come to light was a mighty reaction against it - a sense of guilt on account of that hostility, a bad
conscience for having sinned against God and for not ceasing to sin. This sense of guilt, which
was uninterruptedly kept awake by the Prophets, and which soon formed an essential part of
the religious system, had yet another superficial motivation, which neatly disguised its true
origin. Things were going badly for the people; the hopes resting on the favour of God failed in
fulfilment; it was not easy to maintain the illusion, loved above all else, of being God's chosen
people. If they wished to avoid renouncing that happiness, a sense of guilt on account of their
own sinfulness offered a welcome means of exculpating God: they deserved no better than to
be punished by him since they had not obeyed his commandments. And, driven by the need to
satisfy this sense of guilt, which was insatiable and came from sources so much deeper, they
must make those commandments grow ever stricter, more meticulous and even more trivial. In
a fresh rapture of moral asceticism they imposed more and more new instinctual renunciations
on themselves and in that way reached - in doctrine and precept, at least - ethical heights which
had remained inaccessible to the other peoples of antiquity. Many Jews regard this attainment
of ethical heights as the second main characteristic and the second great achievement of their
religion. The way in which it was connected with the first one - the idea of a single god - should
be plain from our remarks. These ethical ideas cannot, however, disavow their origin from the
sense of guilt felt on account of a suppressed hostility to God. They possess the characteristic
uncompleted and incapable of completion - of obsessional neurotic reaction-formations; we can
guess, too, that they serve the secret purposes of punishment.
[1939a, 4951]

Original sin and redemption by the sacrifice of a victim became the foundation stones of the
new religion founded by Paul. It must remain uncertain whether there was a ringleader and
instigator to the murder among the band of brothers who rebelled against the primal father, or
whether such a figure was created later by the imagination of creative artists in order to turn
themselves into heroes, and was then introduced into the tradition. After the Christian doctrine
had burst the framework of Judaism, it took up components from many other sources,
renounced a number of characteristics of pure monotheism and adapted itself in many details to
the rituals of the other Mediterranean peoples. It was as though Egypt was taking vengeance
once more on the heirs of Akhenaten. It is worth noticing how the new religion dealt with the
ancient ambivalence in the relation to the father. Its main content was, it is true, reconciliation
with God the Father, atonement for the crime committed against him; but the other side of the
emotional relation showed itself in the fact that the son, who had taken the atonement on
himself, became a god himself beside the father and, actually, in place of the father.
Christianity, having arisen out of a father-religion, became a son-religion. It has not escaped the
fate of having to get rid of the father.
[1939a, 4953]
An investigation of primitive peoples shows mankind caught up, to begin with, in a childish belief in its own omnipotence.¹ A whole number of mental structures can thus be understood as attempts to deny whatever might disturb this feeling of omnipotence and so to prevent emotional life from being affected by reality until the latter could be better controlled and used for purposes of satisfaction. The principle of avoiding unpleasure dominates human actions until it is replaced by the better one of adaptation to the external world. Pari passu with men’s progressive control over the world goes a development in their Weltanschauung, their view of the universe as a whole. They turn away more and more from their original belief in their own omnipotence, rising from an animistic phase through a religious to a scientific one. Myths, religion and morality find their place in this scheme as attempts to seek a compensation for the lack of satisfaction of human wishes.

[1913], 2822]

There is something to be said, however, in criticism of his disappointment. Strictly speaking it is not justified, for it consists in the destruction of an illusion. We welcome illusions because they spare us unpleasurable feelings, and enable us to enjoy satisfactions instead. We must not complain, then, if now and again they come into collision with some portion of reality, and are shattered against it.

[1915b, 3072]

The psycho-analytic investigation of the psychoneuroses has taught us that their symptoms are to be traced back to directly sexual impulsions which are repressed but still remain active. We can complete this formula by adding - ‘or, to aim-inhibited impulsions, whose inhibition has not been entirely successful or has made room for a return to the repressed sexual aim’. It is in accordance with this that a neurosis should make its victim asocial and should remove him from the usual group formations. It may be said that a neurosis has the same disintegrating effect upon a group as being in love. On the other hand it appears that where a powerful impetus has been given to group formation neuroses may diminish and, at all events temporarily, disappear. Justifiable attempts have also been made to turn this antagonism between neuroses and group formation to therapeutic account. Even those who do not regret the disappearance of religious illusions from the civilized world of to-day will admit that so long as they were in force they offered those who were bound by them the most powerful protection against the danger of neurosis. Nor is it hard to discern that all the ties that bind people to mystico-religious or philosophico-religious sects and communities are expressions of crooked cures of all kinds of neuroses. All of this is correlated with the contrast between directly sexual impulsions and those which are inhibited in their aims.

[1921c, 3833]

No mention has yet been made of what is perhaps the most important item in the psychical inventory of a civilization. This consists in its religious ideas in the widest sense - in other words (which will be justified later) in its illusions.

[1927c, 4426]
I think we have prepared the way sufficiently for an answer to both these questions. It will be found if we turn our attention to the psychical origin of religious ideas. These, which are given out as teachings, are not precipitates of experience or end-results of thinking: they are illusions, fulfilsments of the oldest, strongest and most urgent wishes of mankind. The secret of their strength lies in the strength of those wishes. As we already know, the terrifying impression of helplessness in childhood arouses the need for protection - for protection through love which was provided by the father; and the recognition that this helplessness lasts throughout life made it necessary to cling to the existence of a father, but this time a more powerful one. Thus the benevolent rule of a divine Providence allays our fear of the dangers of life; the establishment of a moral world-order ensures the fulfilment of the demands of justice, which have so often remained unfulfilled in human civilization; and the prolongation of earthly existence in a future life provides the local and temporal framework in which these wish-fulfilsments shall take place. Answers to the riddles that tempt the curiosity of man, such as how the universe began or what the relation is between body and mind, are developed in conformity with the underlying assumptions of this system. It is an enormous relief to the individual psyche if the conflicts of its childhood arising from the father-complex - conflicts which it has never wholly overcome - are removed from it and brought to a solution which is universally accepted.

[1927c, 4441]

When I say that these things are all illusions, I must define the meaning of the word. An illusion is not the same thing as an error; nor is it necessarily an error. Aristotle's belief that vermin are developed out of dung (a belief to which ignorant people still cling) was an error; so was the belief of a former generation of doctors that tabes dorsalis is the result of sexual excess. It would be incorrect to call these errors illusions. On the other hand, it was an illusion of Columbus's that he had discovered a new sea-route to the Indies. The part played by his wish in this error is very clear. One may describe as an illusion the assertion made by certain nationalists that the Indo-Germanic race is the only one capable of civilization; or the belief, which was only destroyed by psycho-analysis, that children are creatures without sexuality. What is characteristic of illusions is that they are derived from human wishes. In this respect they come near to psychiatric delusions. But they differ from them, too, apart from the more complicated structure of delusions. In the case of delusions, we emphasize as essential their being in contradiction with reality. Illusions need not necessarily be false - that is to say, unrealizable or in contradiction to reality. For instance, a middle-class girl may have the illusion that a prince will come and marry her. This is possible; and a few such cases have occurred. That the Messiah will come and found a golden age is much less likely. Whether one classifies this belief as an illusion or as something analogous to a delusion will depend on one's personal attitude. Examples of illusions which have proved true are not easy to find, but the illusion of the alchemists that all metals can be turned into gold might be one of them. The wish to have a great deal of gold, as much gold as possible, has, it is true, been a good deal damped by our present-day knowledge of the determinants of wealth, but chemistry no longer regards the transmutation of metals into gold as impossible. Thus we call a belief an illusion when a wish-fulfilment is a prominent factor in its motivation, and in doing so we disregard its relations to reality, just as the illusion itself sets no store by verification.

[1927c, 4441]
Having thus taken our bearings, let us return once more to the question of religious doctrines. We can now repeat that all of them are illusions and insusceptible of proof. No one can be compelled to think them true, to believe in them. Some of them are so improbable, so incompatible with everything we have laboriously discovered about the reality of the world, that we may compare them - if we pay proper regard to the psychological differences - to delusions. Of the reality value of most of them we cannot judge; just as they cannot be proved, so they cannot be refuted. We still know too little to make a critical approach to them. The riddles of the universe reveal themselves only slowly to our investigation; there are many questions to which science to-day can give no answer. But scientific work is the only road which can lead us to a knowledge of reality outside ourselves. It is once again merely an illusion to expect anything from intuition and introspection; they can give us nothing but particulars about our own mental life, which are hard to interpret, never any information about the questions which religious doctrine finds it so easy to answer. It would be insolent to let one's own arbitrary will step into the breach and, according to one's personal estimate, declare this or that part of the religious system to be less or more acceptable. Such questions are too momentous for that; they might be called too sacred.

To assess the truth-value of religious doctrines does not lie within the scope of the present enquiry. It is enough for us that we have recognized them as being, in their psychological nature, illusions. But we do not have to conceal the fact that this discovery also strongly influences our attitude to the question which must appear to many to be the most important of all. We know approximately at what periods and by what kind of men religious doctrines were created. If in addition we discover the motives which led to this, our attitude to the problem of religion will undergo a marked displacement. We shall tell ourselves that it would be very nice if there were a God who created the world and was a benevolent Providence, and if there were a moral order in the universe and an after-life; but it is a very striking fact that all this is exactly as we are bound to wish it to be. And it would be more remarkable still if our wretched, ignorant and downtrodden ancestors had succeeded in solving all these difficult riddles of the universe.

Having recognized religious doctrines as illusions, we are at once faced by a further question: may not other cultural assets of which we hold a high opinion and by which we let our lives be ruled be of a similar nature? Must not the assumptions that determine our political regulations be called illusions as well? and is it not the case that in our civilization the relations between the sexes are disturbed by an erotic illusion or a number of such illusions? And once our suspicion has been aroused, we shall not shrink from asking too whether our conviction that we can learn something about external reality through the use of observation and reasoning in scientific work - whether this conviction has any better foundation. Nothing ought to keep us from directing our observation to our own selves or from applying our thought to criticism of itself. In this field a number of investigations open out before us, whose results could not but be decisive for the construction of a 'Weltanschauung'. We surmise, moreover, that such an effort would not be wasted and that it would at least in part justify our suspicion. But the author does not dispose of the means for undertaking so comprehensive a task; he needs must confine his work to following out one only of these illusions - that, namely, of religion.
We now observe that the store of religious ideas includes not only wish-fulfilments but important historical recollections. This concurrent influence of past and present must give religion a truly incomparable wealth of power. But perhaps with the help of an analogy yet another discovery may begin to dawn on us. Though it is not a good plan to transplant ideas far from the soil in which they grew up, yet here is a conformity which we cannot avoid pointing out. We know that a human child cannot successfully complete its development to the civilized stage without passing through a phase of neurosis sometimes of greater and sometimes of less distinctness. This is because so many instinctual demands which will later be unserviceable cannot be suppressed by the rational operation of the child's intellect but have to be tamed by acts of repression, behind which, as a rule, lies the motive of anxiety. Most of these infantile neuroses are overcome spontaneously in the course of growing up, and this is especially true of the obsessional neuroses of childhood. The remainder can be cleared up later still by psycho-analytic treatment. In just the same way, one might assume, humanity as a whole, in its development through the ages, fell into states analogous to the neuroses, and for the same reasons - namely because in the times of its ignorance and intellectual weakness the instinctual renunciations indispensable for man's communal existence had only been achieved by it by means of purely affective forces. The precipitates of these processes resembling repression which took place in prehistoric times still remained attached to civilization for long periods. Religion would thus be the universal obsessional neurosis of humanity; like the obsessional neurosis of children, it arose out of the Oedipus complex, out of the relation to the father. If this view is right, it is to be supposed that a turning-away from religion is bound to occur with the fatal inevitability of a process of growth, and that we find ourselves at this very juncture in the middle of that phase of development. Our behaviour should therefore be modelled on that of a sensible teacher who does not oppose an impending new development but seeks to ease its path and mitigate the violence of its irruption. Our analogy does not, to be sure, exhaust the essential nature of religion. If, on the one hand, religion brings with it obsessional restrictions, exactly as an individual obsessional neurosis does, on the other hand it comprises a system of wishful illusions together with a disavowal of reality, such as we find in an isolated form nowhere else but in amnesia, in a state of blissful hallucinatory confusion. But these are only analogies, by the help of which we endeavour to understand a social phenomenon; the pathology of the individual does not supply us with a fully valid counterpart.

Thus I must contradict you when you go on to argue that men are completely unable to do without the consolation of the religious illusion, that without it they could not bear the troubles of life and the cruelties of reality. That is true, certainly, of the men into whom you have instilled the sweet - or bitter-sweet - poison from childhood onwards. But what of the other men, who have been sensibly brought up? Perhaps those who do not suffer from the neurosis will need no intoxicant to deaden it. They will, it is true, find themselves in a difficult situation. They will have to admit to themselves the full extent of their helplessness and their insignificance in the machinery of the universe; they can no longer be the centre of creation, no longer the object of tender care on the part of a beneficent Providence. They will be in the same position as a child who has left the parental house where he was so warm and comfortable. But surely infantilism is destined to be surmounted. Men cannot remain children for ever; they must in the end go out into 'hostile life'. We may call this 'education to reality'. Need I confess to you that the sole purpose of my book is to point out the necessity for this forward step?
That sounds splendid! A race of men who have renounced all illusions and have thus become capable of making their existence on earth tolerable! I, however, cannot share your expectations. And that is not because I am the obstinate reactionary you perhaps take me for. No, it is because I am sensible. We seem now to have exchanged roles: you emerge as an enthusiast who allows himself to be carried away by illusions, and I stand for the claims of reason, the rights of scepticism. What you have been expounding seems to me to be built upon errors which, following your example, I may call illusions, because they betray clearly enough the influence of your wishes. You pin your hope on the possibility that generations which have not experienced the influence of religious doctrines in early childhood will easily attain the desired primacy of the intelligence over the life of the instincts. This is surely an illusion: in this decisive respect human nature is hardly likely to change. If I am not mistaken - one knows so little about other civilizations - there are even to-day peoples which do not grow up under the pressure of a religious system, and yet they approach no nearer to your ideal than the rest. If you want to expel religion from our European civilization, you can only do it by means of another system of doctrines; and such a system would from the outset take over all the psychological characteristics of religion - the same sanctity, rigidity and intolerance, the same prohibition of thought - for its own defence. You have to have something of the kind in order to meet the requirements of education. And you cannot do without education. The path from the infant at the breast to the civilized man is a long one; too many human young would go astray on it and fail to reach their life-tasks at the proper time if they were left without guidance to their own development. The doctrines which had been applied in their upbringing would always set limits to the thinking of their riper years - which is exactly what you reproach religion with doing to-day. Do you not observe that it is an ineradicable and innate defect of our and every other civilization, that it imposes on children, who are driven by instinct and weak in intellect, the making of decisions which only the mature intelligence of adults can vindicate? But civilization cannot do otherwise, because of the fact that mankind's age-long development is compressed into a few years of childhood; and it is only by emotional forces that the child can be induced to master the task set before it. Such, then, are the prospects for your "primacy of the intellect".

[1927c, 4458]

'And now you must not be surprised if I plead on behalf of retaining the religious doctrinal system as the basis of education and of man's communal life. This is a practical problem, not a question of reality-value. Since, for the sake of preserving our civilization, we cannot postpone influencing the individual until he has become ripe for civilization (and many would never become so in any case), since we are obliged to impose on the growing child some doctrinal system which shall operate in him as an axiom that admits of no criticism, it seems to me that the religious system is by far the most suitable for the purpose. And it is so, of course, precisely on account of its wish-fulfilling and consolatory power, by which you claim to recognize it as an "illusion". In view of the difficulty of discovering anything about reality - indeed, of the doubt whether it is possible for us to do so at all - we must not overlook the fact that human needs, too, are a piece of reality, and, in fact, an important piece and one that concerns us especially closely.

[1927c, 4459]
'Another advantage of religious doctrine resides, to my mind, in one of its characteristics to which you seem to take particular exception. For it allows of a refinement and sublimation of ideas, which make it possible for it to be divested of most of the traces which it bears of primitive and infantile thinking. What then remains is a body of ideas which science no longer contradicts and is unable to disprove. These modifications of religious doctrine, which you have condemned as half-measures and compromises, make it possible to avoid the cleft between the uneducated masses and the philosophic thinker, and to preserve the common bond between them which is so important for the safeguarding of civilization. With this, there would be no need to fear that the men of the people would discover that the upper strata of society "no longer believe in God". I think I have now shown that your endeavours come down to an attempt to replace a proved and emotionally valuable illusion by another one, which is unproved and without emotional value.'

[1927c, 4459]

You will not find me inaccessible to your criticism. I know how difficult it is to avoid illusions; perhaps the hopes I have confessed to are of an illusory nature, too. But I hold fast to one distinction. Apart from the fact that no penalty is imposed for not sharing them, my illusions are not, like religious ones, incapable of correction. They have not the character of a delusion. If experience should show - not to me, but to others after me, who think as I do - that we have been mistaken, we will give up our expectations. Take my attempt for what it is. A psychologist who does not deceive himself about the difficulty of finding one's bearings in this world, makes an endeavour to assess the development of man, in the light of the small portion of knowledge he has gained through a study of the mental processes of individuals during their development from child to adult. In so doing, the idea forces itself upon him that religion is comparable to a childhood neurosis, and he is optimistic enough to suppose that mankind will surmount this neurotic phase, just as so many children grow out of their similar neurosis. These discoveries derived from individual psychology may be insufficient, their application to the human race unjustified, and his optimism unfounded. I grant you all these uncertainties. But often one cannot refrain from saying what one thinks, and one excuses oneself on the ground that one is not giving it out for more than it is worth.

[1927c, 4459]

And secondly: observe the difference between your attitude to illusions and mine. You have to defend the religious illusion with all your might. If it becomes discredited - and indeed the threat to it is great enough - then your world collapses. There is nothing left for you but to despair of everything, of civilization and the future of mankind. From that bondage I am, we are, free. Since we are prepared to renounce a good part of our infantile wishes, we can bear it if a few of our expectations turn out to be illusions.

[1927c, 4460]
Education freed from the burden of religious doctrines will not, it may be, effect much change in men's psychological nature. Our god is perhaps not a very almighty one, and he may only be able to fulfil a small part of what his predecessors have promised. If we have to acknowledge this we shall accept it with resignation. We shall not on that account lose our interest in the world and in life, for we have one sure support which you lack. We believe that it is possible for scientific work to gain some knowledge about the reality of the world, by means of which we can increase our power and in accordance with which we can arrange our life. If this belief is an illusion, then we are in the same position as you. But science has given us evidence by its numerous and important successes that it is no illusion. Science has many open enemies, and many more secret ones, among those who cannot forgive her for having weakened religious faith and for threatening to overthrow it. She is reproached for the smallness of the amount she has taught us and for the incomparably greater field she has left in obscurity. But, in this, people forget how young she is, how difficult her beginnings were and how infinitesimally small is the period of time since the human intellect has been strong enough for the tasks she sets. Are we not all at fault, in basing our judgements on periods of time that are too short? We should make the geologists our pattern. People complain of the unreliability of science - how she announces as a law to-day what the next generation recognizes as an error and replaces by a new law whose accepted validity lasts no longer. But this is unjust and in part untrue. The transformations of scientific opinion are developments, advances, not revolutions. A law which was held at first to be universally valid proves to be a special case of a more comprehensive uniformity, or is limited by another law, not discovered till later; a rough approximation to the truth is replaced by a more carefully adapted one, which in turn awaits further perfectioning. There are various fields where we have not yet surmounted a phase of research in which we make trial with hypotheses that soon have to be rejected as inadequate; but in other fields we already possess an assured and almost unalterable core of knowledge. Finally, an attempt has been made to discredit scientific endeavour in a radical way, on the ground that, being bound to the conditions of our own organization, it can yield nothing else than subjective results, whilst the real nature of things outside ourselves remains inaccessible. But this is to disregard several factors which are of decisive importance for the understanding of scientific work. In the first place, our organization - that is, our mental apparatus - has been developed precisely in the attempt to explore the external world, and it must therefore have realized in its structure some degree of expediency; in the second place, it is itself a constituent part of the world which we set out to investigate, and it readily admits of such an investigation; thirdly, the task of science is fully covered if we limit it to showing how the world must appear to us in consequence of the particular character of our organization; fourthly, the ultimate findings of science, precisely because of the way in which they are acquired, are determined not only by our organization but by the things which have affected that organization; finally, the problem of the nature of the world without regard to our percipient mental apparatus is an empty abstraction, devoid of practical interest.

No, our science is no illusion. But an illusion it would be to suppose that what science cannot give us we can get elsewhere.
One of these exceptional few calls himself my friend in his letters to me. I had sent him my small book that treats religion as an illusion, and he answered that he entirely agreed with my judgement upon religion, but that he was sorry I had not properly appreciated the true source of religious sentiments. This, he says, consists in a peculiar feeling, which he himself is never without, which he finds confirmed by many others, and which he may suppose is present in millions of people. It is a feeling which he would like to call a sensation of 'eternity', a feeling as of something limitless, unbounded - as it were, 'oceanic'. This feeling, he adds, is a purely subjective fact, not an article of faith; it brings with it no assurance of personal immortality, but it is the source of the religious energy which is seized upon by the various Churches and religious systems, directed by them into particular channels, and doubtless also exhausted by them. One may, he thinks, rightly call oneself religious on the ground of this oceanic feeling alone, even if one rejects every belief and every illusion.

[1930a, 4464]

And what, finally, is the aim of these passionate disparagements of science? In spite of its present incompleteness and of the difficulties attaching to it, it remains indispensable to us and nothing can take its place. It is capable of undreamt-of improvements, whereas the religious Weltanschauung is not. This is complete in all essential respects; if it was a mistake, it must remain one for ever. No belittlement of science can in any way alter the fact that it is attempting to take account of our dependence on the real external world, while religion is an illusion and it derives its strength from its readiness to fit in with our instinctual wishful impulses.

[1933a, 4772]
Psycho-analytic research into the neuroses (the various forms of nervous illness with a mental causation) has endeavoured to trace their connection with instinctual life and the restrictions imposed on it by the claims of civilization, with the activities of the normal individual in phantasies and dreams, and with the creations of the popular mind in religion, myths and fairy tales. The psycho-analytic treatment of neurotic patients, based on this method of research, makes far higher demands on doctor and patient than the methods hitherto in common use, which operate through medicaments, diet, hydropathy and suggestion. But it brings the patients so much more relief and permanent strengthening in the face of life's problems, that there is no cause for surprise at the continual advances made by this therapeutic method in spite of violent opposition. [1910b, 1995]

The deeper you penetrate into the pathogenesis of nervous illness, the more you will find revealed the connection between the neuroses and other productions of the human mind, including the most valuable. You will be taught that we humans, with the high standards of our civilization and under the pressure of our internal repressions, find reality unsatisfying quite generally, and for that reason entertain a life of phantasy in which we like to make up for the insufficiencies of reality by the production of wish-fulfilments. These phantasies include a great deal of the true constitutional essence of the subject's personality as well as of those of his impulses which are repressed where reality is concerned. The energetic and successful man is one who succeeds by his efforts in turning his wishful phantasies into reality. Where this fails, as a result of the resistances of the external world and of the subject's own weakness, he begins to turn away from reality and withdraws into his more satisfying world of phantasy, the content of which is transformed into symptoms should he fall ill. In certain favourable circumstances, it still remains possible for him to find another path leading from these phantasies to reality, instead of becoming permanently estranged from it by regressing to infancy. If a person who is at loggerheads with reality possesses an *artistic gift* (a thing that is still a psychological mystery to us), he can transform his phantasies into artistic creations instead of into symptoms. In this manner he can escape the doom of neurosis and by this roundabout path regain his contact with reality. (Cf. Rank, 1907.) If there is persistent rebellion against the real world and if this precious gift is absent or insufficient, it is almost inevitable that the libido, keeping to the sources of the phantasies, will follow the path of regression, and will revive infantile wishes and end in neurosis. To-day neurosis takes the place of the monasteries which used to be the refuge of all whom life had disappointed or who felt too weak to face it. [1910a, 2235]

The neuroses exhibit on the one hand striking and far-reaching points of agreement with those great social institutions, art, religion and philosophy. But on the other hand they seem like distortions of them. It might be maintained that a case of hysteria is a caricature of a work of art, that an obsessional neurosis is a caricature of a religion and that a paranoic delusion is a caricature of a philosophical system. The divergence resolves itself ultimately into the fact that the neuroses are asocial structures; they endeavour to achieve by private means what is effected in society by collective effort. If we analyse the instincts at work in the neuroses, we find that the determining influence in them is exercised by instinctual forces of sexual origin; the corresponding cultural formations, on the other hand, are based upon social instincts, originating from the combination of egoistic and erotic elements. Sexual needs are not capable of uniting men in the same way as are the demands of self-preservation. Sexual satisfaction is essentially the private affair of each individual. [1912-1913, 2717]
Another path led from the investigation of dreams to the analysis of works of imagination and ultimately to the analysis of their creators - writers and artists themselves. At an early stage it was discovered that dreams invented by writers will often yield to analysis in the same way as genuine ones. (Cf. 'Gradiva'.) The conception of unconscious mental activity made it possible to form a preliminary idea of the nature of imaginative creative writing; and the realization, gained in the study of neurotics, of the part played by the instinctual impulses enabled us to perceive the sources of artistic production and confronted us with two problems: how the artist reacts to this instigation and what means he employs to disguise his reactions.¹ Most analysts with general interests have contributed something to the solution of these problems, which are the most fascinating among the applications of psycho-analysis. Naturally, opposition was not lacking in this direction either on the part of people who knew nothing of analysis; it took the same form as it did in the original field of psycho-analytic research - the same misconceptions and vehement rejections. It was only to be expected from the beginning that, whatever the regions into which psycho-analysis might penetrate, it would inevitably experience the same struggles with those already in possession of the field. These attempted invasions, however, have not yet stirred up the attention in some quarters which awaits them in the future. Among the strictly scientific applications of analysis to literature, Rank's exhaustive work on the theme of incest easily takes the first place. Its subject is bound to arouse the greatest unpopularity. Up to the present, little work based on psycho-analysis has been done in the sciences of language and history. I myself ventured the first approach to the problems of the psychology of religion by drawing a parallel between religious ritual and the ceremonials of neurotics (1907b). Dr. Pfister, a pastor in Zurich, has traced back the origin of religious fanaticism to perverse eroticism in his book on the piety of Count von Zinzendorf, as well as in other contributions. In the latest works of the Zurich school, however, we find analysis permeated with religious ideas rather than the opposite outcome that had been in view.

¹ [1914d, 2902]

A little reflection was bound to show that it would be impossible to restrict to the provinces of dreams and nervous disorders a view such as this of the life of the human mind. If that view has hit upon a truth, it must apply equally to normal mental events, and even the highest achievements of the human spirit must bear a demonstrable relation to the factors found in pathology - to repression, to the efforts at mastering the unconscious and to the possibilities of satisfying the primitive instincts. There was thus an irresistible temptation and, indeed, a scientific duty, to apply the research methods of psycho-analysis, in regions far remote from its native soil, to the various mental sciences. And indeed psycho-analytic work upon patients itself pointed persistently in the direction of this new task, for it was obvious that the forms assumed by the different neuroses echoed the most highly admired productions of our culture. Thus hysterics are undoubtedly imaginative artists, even if they express their phantasies mimaetically in the main and without considering their intelligibility to other people; the ceremonials and prohibitions of obsessional neurotics drive us to suppose that they have created a private religion of their own; and the delusions of paranoics have an unpalatable external similarity and internal kinship to the systems of our philosophers. It is impossible to escape the conclusion that these patients are, in an asocial fashion, making the very attempts at solving their conflicts and appeasing their pressing needs which, when those attempts are carried out in a fashion that is acceptable to the majority, are known as poetry, religion and philosophy.

[1919g, 3704]
This hypothesis, which is founded on the observations of Robertson Smith and was developed by me in *Totem and Taboo*, has been taken by Theodor Reik as the basis of his studies on the problems of the psychology of religion, of which this is the first volume. In accordance with psycho-analytic technique these studies start out from hitherto unexplained details of religious life, and by means of their elucidation gain access to the fundamental postulates and ultimate aims of religions; moreover they keep steadily in view the relation between prehistoric man and contemporary primitive societies as well as the connection between the products of civilization and the substitutive structures of neurotics. In conclusion, I would draw attention to the author's own introduction and express my belief that his work will recommend itself to the notice of specialists in the branch of knowledge with which it deals.

[1919g, 3705]

Our knowledge of the historical worth of certain religious doctrines increases our respect for them, but does not invalidate our proposal that they should cease to be put forward as the reasons for the precepts of civilization. On the contrary! Those historical residues have helped us to view religious teachings, as it were, as neurotic relics, and we may now argue that the time has probably come, as it does in an analytic treatment, for replacing the effects of repression by the results of the rational operation of the intellect. We may foresee, but hardly regret, that such a process of remoulding will not stop at renouncing the solemn transfiguration of cultural precepts, but that a general revision of them will result in many of them being done away with. In this way our appointed task of reconciling men to civilization will to a great extent be achieved. We need not deplore the renunciation of historical truth when we put forward rational grounds for the precepts of civilization. The truths contained in religious doctrines are after all so distorted and systematically disguised that the mass of humanity cannot recognize them as truth. The case is similar to what happens when we tell a child that new-born babies are brought by the stork. Here, too, we are telling the truth in symbolic clothing, for we know what the large bird signifies. But the child does not know it. He hears only the distorted part of what we say, and feels that he has been deceived; and we know how often his distrust of the grown-ups and his refractoriness actually take their start from this impression. We have become convinced that it is better to avoid such symbolic disguisings of the truth in what we tell children and not to withhold from them a knowledge of the true state of affairs commensurate with their intellectual level.

[1927c, 4453]

Thus I must contradict you when you go on to argue that men are completely unable to do without the consolation of the religious illusion, that without it they could not bear the troubles of life and the cruelties of reality. That is true, certainly, of the men into whom you have instilled the sweet - or bitter-sweet - poison from childhood onwards. But what of the other men, who have been sensibly brought up? Perhaps those who do not suffer from the neurosis will need no intoxicant to deaden it. They will, it is true, find themselves in a difficult situation. They will have to admit to themselves the full extent of their helplessness and their insignificance in the machinery of the universe; they can no longer be the centre of creation, no longer the object of tender care on the part of a beneficent Providence. They will be in the same position as a child who has left the parental house where he was so warm and comfortable. But surely infantilism is destined to be surmounted. Men cannot remain children for ever; they must in the end go out into 'hostile life'. We may call this 'education to reality'. Need I confess to you that the sole purpose of my book is to point out the necessity for this forward step?

[1927c, 4456]
You will not find me inaccessible to your criticism. I know how difficult it is to avoid illusions; perhaps the hopes I have confessed to are of an illusory nature, too. But I hold fast to one distinction. Apart from the fact that no penalty is imposed for not sharing them, my illusions are not, like religious ones, incapable of correction. They have not the character of a delusion. If experience should show - not to me, but to others after me, who think as I do - that we have been mistaken, we will give up our expectations. Take my attempt for what it is. A psychologist who does not deceive himself about the difficulty of finding one's bearings in this world, makes an endeavour to assess the development of man, in the light of the small portion of knowledge he has gained through a study of the mental processes of individuals during their development from child to adult. In so doing, the idea forces itself upon him that religion is comparable to a childhood neurosis, and he is optimistic enough to suppose that mankind will surmount this neurotic phase, just as so many children grow out of their similar neurosis. These discoveries derived from individual psychology may be insufficient, their application to the human race unjustified, and his optimism unfounded. I grant you all these uncertainties. But often one cannot refrain from saying what one thinks, and one excuses oneself on the ground that one is not giving it out for more than it is worth.

In summary, therefore, the judgement of science on the religious Weltanschauung is this. While the different religions wrangle with one another as to which of them is in possession of the truth, our view is that the question of the truth of religious beliefs may be left altogether on one side. Religion is an attempt to master the sensory world in which we are situated by means of the wishful world which we have developed within us as a result of biological and psychological necessities. But religion cannot achieve this. Its doctrines bear the imprint of the times in which they arose, the ignorant times of the childhood of humanity. Its consolations deserve no trust. Experience teaches us that the world is no nursery. The ethical demands on which religion seeks to lay stress need, rather, to be given another basis; for they are indispensable to human society and it is dangerous to link obedience to them with religious faith. If we attempt to assign the place of religion in the evolution of mankind, it appears not as a permanent acquisition but as a counterpart to the neurosis which individual civilized men have to go through in their passage from childhood to maturity.

As regards internal difficulties, a political revolution and a change of domicile could alter nothing. No less than before, I feel uncertain in the face of my own work; I lack the consciousness of unity and of belonging together which should exist between an author and his work. It is not as though there were an absence of conviction in the correctness of my conclusion. I acquired that a quarter of a century ago when in 1912 I wrote my book about Totem and Taboo, and it has only grown firmer since. From that time I have never doubted that religious phenomena are only to be understood on the pattern of the individual neurotic symptoms familiar to us - as the return of long since forgotten, important events in the primaeval history of the human family - and that they have to thank precisely this origin for their compulsive character and that, accordingly, they are effective on human beings by force of the historical truth of their content. My uncertainty sets in only when I ask myself whether I have succeeded in proving these theses in the example which I have chosen here of Jewish monotheism. To my critical sense this book, which takes its start from the man Moses, appears like a dancer balancing on the tip of one toe. If I could not find support in an analytic interpretation of the exposure myth and could not pass from there to Sellin's suspicion about the end of Moses, the whole thing would have had to remain unwritten. In any case, let us now take the plunge.
Perhaps by what I have said I have succeeded in establishing the analogy between neurotic processes and religious events and in thus indicating the unsuspected origin of the latter. In this transference from individual to group psychology two difficulties arise, differing in their nature and importance, to which we must now turn.

[1939a, 4915]
Some features of this state of affairs may be seen in the sphere of religious life as well. The formation of a religion, too, seems to be based on the suppression, the renunciation, of certain instinctual impulses. These impulses, however, are not, as in the neuroses, exclusively components of the sexual instinct; they are self-seeking, socially harmful instincts, though, even so, they are usually not without a sexual component. A sense of guilt following upon continual temptation and an expectant anxiety in the form of fear of divine punishment have, after all, been familiar to us in the field of religion longer than in that of neurosis. Perhaps because of the admixture of sexual components, perhaps because of some general characteristics of the instincts, the suppression of instinct proves to be an inadequate and interminable process in religious life also. Indeed, complete backslidings into sin are more common among pious people than among neurotics and these give rise to a new form of religious activity, namely acts of penance, which have their counterpart in obsessional neurosis.

In view of these similarities and analogies one might venture to regard obsessional neurosis as a pathological counterpart of the formation of a religion, and to describe that neurosis as an individual religiosity and religion as a universal obsessional neurosis. The most essential similarity would reside in the underlying renunciation of the activation of instincts that are constitutionally present; and the chief difference would lie in the nature of those instincts, which in the neurosis are exclusively sexual in their origin, while in religion they spring from egoistic sources.

A progressive renunciation of constitutional instincts, whose activation might afford the ego primary pleasure, appears to be one of the foundations of the development of human civilization. Some part of this instinctual repression is effected by its religions, in that they require the individual to sacrifice his instinctual pleasure to the Deity: 'Vengeance is mine, saith the Lord.' In the development of the ancient religions one seems to discern that many things which man kind had renounced as 'iniquities' had been surrendered to the Deity and were still permitted in his name, so that the handing over to him of bad and socially harmful instincts was the means by which man freed himself from their domination. For this reason, it is surely no accident that all the attributes of man, along with the misdeeds that follow from them, were to an unlimited amount ascribed to the ancient gods. Nor is it a contradiction of this that nevertheless man was not permitted to justify his own iniquities by appealing to divine example.
These are certainly not very fruitful considerations, and it might be thought that they have nothing at all to do with our enquiry as to what has determined the character of the Jewish people. That would only be to our advantage; but a certain connection with our problem is betrayed nevertheless by a fact which will concern us still more later on. The religion which began with the prohibition against making an image of God develops more and more in the course of centuries into a religion of instinctual renunciations. It is not that it would demand sexual abstinence: it is content with a marked restriction of sexual freedom. God, however, becomes entirely removed from sexuality and elevated into the ideal of ethical perfection. But ethics is a limitation of instinct. The Prophets are never tired of asseverating that God requires nothing other from his people than a just and virtuous conduct of life - that is, abstention from every instinctual satisfaction which is still condemned as vicious by our morality to-day as well. And even the demand for belief in him seems to take a second place in comparison with the seriousness of these ethical requirements. In this way instinctual renunciation seems to play a prominent part in the religion, even if it did not stand out in it from the first.

This is the place, however, for an interpolation, in order to avoid a misunderstanding. Even though it may seem that instinctual renunciation and the ethics founded on it do not form part of the essential content of religion, yet genetically they are most intimately connected with it. Totemism, which is the earliest form of a religion which we recognize, carries with it, as indispensable constituents of its system, a number of commands and prohibitions which have no other significance, of course, than as instinctual renunciations: the worship of the totem, which includes a prohibition against injuring or killing it, exogamy - that is, renunciation of the passionately desired mothers and sisters in the horde - the granting of equal rights to all the members of the fraternal alliance - that is, restricting the inclination to violent rivalry among them. In these regulations are to be seen the first beginnings of a moral and social order. It does not escape us that two different motives are at work here. The first two prohibitions operate on the side of the father who has been got rid of: they carry on his will, as it were. The third command - the granting of equal rights to the allied brothers - disregards the father's will; it is justified by an appeal to the necessity for permanently maintaining the new order which succeeded the father's removal. Otherwise a relapse into the earlier state would have become inevitable. It is here that social commands diverge from the others which, as we might say, are derived directly from religious connections.
The direction to be taken by this father-religion was in this way laid down for all time. Yet this did not bring its development to an end. Ambivalence is a part of the essence of the relation to the father: in the course of time the hostility too could not fail to stir, which had once driven the sons into killing their admired and dreaded father. There was no place in the framework of the religion of Moses for a direct expression of the murderous hatred of the father. All that could come to light was a mighty reaction against it - a sense of guilt on account of that hostility, a bad conscience for having sinned against God and for not ceasing to sin. This sense of guilt, which was uninterruptedly kept awake by the Prophets, and which soon formed an essential part of the religious system, had yet another superficial motivation, which neatly disguised its true origin. Things were going badly for the people; the hopes resting on the favour of God failed in fulfilment; it was not easy to maintain the illusion, loved above all else, of being God's chosen people. If they wished to avoid renouncing that happiness, a sense of guilt on account of their own sinfulness offered a welcome means of exculpating God: they deserved no better than to be punished by him since they had not obeyed his commandments. And, driven by the need to satisfy this sense of guilt, which was insatiable and came from sources so much deeper, they must make those commandments grow ever stricter, more meticulous and even more trivial. In a fresh rapture of moral asceticism they imposed more and more new instinctual renunciations on themselves and in that way reached - in doctrine and precept, at least - ethical heights which had remained inaccessible to the other peoples of antiquity. Many Jews regard this attainment of ethical heights as the second main characteristic and the second great achievement of their religion. The way in which it was connected with the first one - the idea of a single god - should be plain from our remarks. These ethical ideas cannot, however, disavow their origin from the sense of guilt felt on account of a suppressed hostility to God. They possess the characteristic - uncompleted and incapable of completion - of obsessional neurotic reaction-formations; we can guess, too, that they serve the secret purposes of punishment.

[1939a, 4951]
And lastly a remark which brings up a psychological argument. A tradition that was based only on communication could not lead to the compulsive character that attaches to religious phenomena. It would be listened to, judged, and perhaps dismissed, like any other piece of information from outside; it would never attain the privilege of being liberated from the constraint of logical thought. It must have undergone the fate of being repressed, the condition of lingering in the unconscious, before it is able to display such powerful effects on its return, to bring the masses under its spell, as we have seen with astonishment and hitherto without comprehension in the case of religious tradition. And this consideration weighs heavily in favour of our believing that things really happened in the way we have tried to picture them or at least in some similar way.

[1939a, 4923]
The son's efforts to put himself in the place of the father-god became ever more obvious. The introduction of agriculture increased the son's importance in the patriarchal family. He ventured upon new demonstrations of his incestuous libido, which found symbolic satisfaction in his cultivation of Mother Earth. Divine figures such as Attis, Adonis and Tammuz emerged, spirits of vegetation and at the same time youthful divinities enjoying the favours of mother goddesses and committing incest with their mother in defiance of their father. But the sense of guilt, which was not allayed by these creations, found expression in myths which granted only short lives to these youthful favourites of the mother-goddesses and decreed their punishment byemasculating or by the wrath of the father in the form of an animal. Adonis was killed by a wild boar, the sacred animal of Aphrodite; Attis, beloved of Cybele, perished by castration.¹ The mourning for these gods and the rejoicings over their resurrection passed over into the ritual of another son-deity who was destined to lasting success.

The remarkable thing, however, is that that was not the case - that the most powerful effects of the people's experience were to come to light only later and to force their way into reality in the course of many centuries. It is unlikely that Yahweh differed much in character from the gods of the surrounding peoples and tribes. It is true that he struggled with them, just as the peoples themselves fought with one another, but we cannot suppose that it came into the head of a Yahweh-worshipper of those days to deny the existence of the gods of Canaan or Moab or Amalek, and so on, any more than to deny the existence of the peoples who believed in them.

We confess the belief, therefore, that the idea of a single god, as well as the rejection of magically effective ceremonial and the stress upon ethical demands made in his name, were in fact Mosaic doctrines, to which no attention was paid to begin with, but which, after a long interval had elapsed, came into operation and eventually became permanently established. How are we to explain a delayed effect of this kind and where do we meet with a similar phenomenon? It occurs to us at once that such things are not infrequently to be found in the most various spheres and that they probably come about in a number of ways which are understandable with greater or less ease. Let us take, for instance, the history of a new scientific theory, such as Darwin's theory of evolution. At first it met with embittered rejection and was violently disputed for decades; but it took no longer than a generation for it to be recognized as a great step forward towards truth. Darwin himself achieved the honour of a grave or cenotaph in Westminster Abbey. A case such as that leaves us little to unravel. The new truth awoke emotional resistances; these found expression in arguments by which the evidence in favour of the unpopular theory could be disputed; the struggle of opinions took up a certain length of time; from the first there were adherents and opponents; the number as well as the weight of the former kept on increasing till at last they gained the upper hand; during the whole time of the struggle the subject with which it was concerned was never forgotten. We are scarcely surprised that the whole course of events took a considerable length of time; and we probably do not sufficiently appreciate that what we are concerned with is a process in group psychology.

If our account of primateval history is accepted as on the whole worthy of belief, two sorts of elements will be recognized in religious doctrines and rituals: on the one hand fixations to the ancient history of the family and survivals of it, and on the other hand revivals of the past and returns, after long intervals, of what has been forgotten. It is this last portion which, hitherto overlooked and therefore not understood, is to be demonstrated here in at least one impressive instance.
It is worth specially stressing the fact that each portion which returns from oblivion asserts itself with peculiar force, exercises an incomparably powerful influence on people in the mass, and raises an irresistible claim to truth against which logical objections remain powerless: a kind of 'credo quia absurdum'. This remarkable feature can only be understood on the pattern of the delusions of psychotics. We have long understood that a portion of forgotten truth lies hidden in delusional ideas, that when this returns it has to put up with distortions and misunderstandings, and that the compulsive conviction which attaches to the delusion arises from this core of truth and spreads out on to the errors that wrap it round. We must grant an ingredient such as this of what may be called historical truth to the dogmas of religion as well, which, it is true, bear the character of psychotic symptoms but which, as group phenomena, escape the curse of isolation.

[1939a, 4909]

The re-establishment of the primal father in his historic rights was a great step forward but it could not be the end. The other portions of the prehistoric tragedy insisted on being recognized. It is not easy to discern what set this process in motion. It appears as though a growing sense of guilt had taken hold of the Jewish people, or perhaps of the whole civilized world of the time, as a precursor to the return of the repressed material. Till at last one of these Jewish people found, in justifying a politico-religious agitator, the occasion for detaching a new - the Christian - religion from Judaism. Paul, a Roman Jew from Tarsus, seized upon this sense of guilt and traced it back correctly to its original source. He called this the 'original sin'; it was a crime against God and could only be atoned for by death. With the original sin death came into the world. In fact this crime deserving death had been the murder of the primal father who was later deified. But the murder was not remembered: instead of it there was a phantasy of its atonement, and for that reason this phantasy could be hailed as a message of redemption (evangelium). A son of God had allowed himself to be killed without guilt and had thus taken on himself the guilt of all men. It had to be a son, since it had been the murder of a father. It is probable that traditions from oriental and Greek mysteries had had an influence on the phantasy of redemption. What was essential in it seems to have been Paul's own contribution. In the most proper sense he was a man of an innately religious disposition: the dark traces of the past lurked in his mind, ready to break through into its more conscious regions.

[1939a, 4910]

That the redeemer had sacrificed himself without guilt was evidently a tendentious distortion, which offered difficulties to logical understanding. For how could someone guiltless of the act of murder take on himself the guilt of the murderers by allowing himself to be killed? In the historical reality there was no such contradiction. The 'redeemer' could be none other than the most guilty person, the ringleader of the company of brothers who had overpowered their father. We must in my judgement leave it undecided whether there was such a chief rebel and ringleader. That is possible; but we must also bear in mind that each one of the company of brothers certainly had a wish to commit the deed by himself alone and so to create an exceptional position for himself and to find a substitute for his identification with the father which was having to be given up and which was becoming merged in the community. If there was no such ringleader, then Christ was the heir to a wishful phantasy which remained unfulfilled; if there was one, then he was his successor and his reincarnation. But no matter whether what we have here is a phantasy or the return of a forgotten reality, in any case the origin of the concept of a hero is to be found at this point - the hero who always rebels against his father and kills him in some shape or other.¹ Here too is the true basis for the 'tragic guilt' of the hero of drama, which is otherwise hard to explain. It can scarcely be doubted that the hero and chorus in Greek drama represent the same rebellious hero and company of brothers; and it is not without significance that in the Middle Ages what the theatre started with afresh was the representation of the story of the Passion.

[1939a, 4911]
The triumph of Christianity was a fresh victory for the priests of Amun over Akhenaten's god after an interval of fifteen hundred years and on a wider stage. And yet in the history of religion - that is, as regards the return of the repressed - Christianity was an advance and from that time on the Jewish religion was to some extent a fossil.

[1939a, 4912]

And lastly a remark which brings up a psychological argument. A tradition that was based only on communication could not lead to the compulsive character that attaches to religious phenomena. It would be listened to, judged, and perhaps dismissed, like any other piece of information from outside; it would never attain the privilege of being liberated from the constraint of logical thought. It must have undergone the fate of being repressed, the condition of lingering in the unconscious, before it is able to display such powerful effects on its return, to bring the masses under its spell, as we have seen with astonishment and hitherto without comprehension in the case of religious tradition. And this consideration weighs heavily in favour of our believing that things really happened in the way we have tried to picture them or at least in some similar way.

[1939a, 4923]

I cannot here repeat the contents of *Totem and Taboo* in greater detail. But I must undertake to fill up the long stretch between that hypothetical primaeval period and the victory of monotheism in historical times. After the institution of the combination of brother-clan, matriarchy, exogamy and totemism, a development began which must be described as a slow 'return if the repressed'. Here I am not using the term 'the repressed' in its proper sense. What is in question is something in a people's life which is past, lost to view, superseded and which we venture to compare with what is repressed in the mental life of an individual. We cannot at first sight say in what form this past existed during the time of its eclipse. It is not easy for us to carry over the concepts of individual psychology into group psychology; and I do not think we gain anything by introducing the concept of a 'collective' unconscious. The content of the unconscious, indeed, is in any case a collective, universal property of mankind. For the moment, then, we will make shift with the use of analogies. The processes in the life of peoples which we are studying here are very similar to those familiar to us in psychopathology, but nevertheless not quite the same. We must finally make up our minds to adopt the hypothesis that the psychical precipitates of the primaeval period became inherited property which, in each fresh generation, called not for acquisition but only for awakening. In this we have in mind the example of what is certainly the 'innate' symbolism which derives from the period of the development of speech, which is familiar to all children without their being instructed, and which is the same among all peoples despite their different languages. What we may perhaps still lack in certainty here is made good by other products of psycho-analytic research. We find that in a number of important relations our children react, not in a manner corresponding to their own experience, but instinctively, like the animals, in a manner that is only explicable as phylogenetic acquisition.

[1939a, 4949]
The return of the repressed took place slowly and certainly not spontaneously but under the influence of all the changes in conditions of life which fill the history of human civilization. I cannot give a survey here of these determinants nor more than a fragmentary enumeration of the stages of this return. The father once more became the head of the family, but was not by any means so absolute as the father of the primal horde had been. The totem animal was replaced by a god in a series of transitions which are still very plain. To begin with, the god in human form still bore an animal's head; later he turned himself by preference into that particular animal, and afterwards it became sacred to him and was his favourite attendant; or he killed the animal and himself bore its name as an epithet. Between the totem animal and the god, the hero emerged, often as a preliminary step towards deification. The idea of a supreme deity seems to have started early, at first only in a shadowy manner without intruding into men's daily interests. As tribes and peoples came together into larger unities, the gods too organized themselves into families and into hierarchies. One of them was often elevated into being supreme lord over gods and men. After this, the further step was hesitatingly taken of paying respect to only one god, and finally the decision was taken of giving all power to a single god and of tolerating no other gods beside him. Only thus was it that the supremacy of the father of the primal horde was re-established and that the emotions relating to him could be repeated.

[1939a, 4950]

The first effect of meeting the being who had so long been missed and longed for was overwhelming and was like the traditional description of the law-giving from Mount Sinai. Admiration, awe and thankfulness for having found grace in his eyes - the religion of Moses knew none but these positive feelings towards the father-god. The conviction of his irresistibility, the submission to his will, could not have been more unquestioning in the helpless and intimidated son of the father of the horde - indeed those feelings only become fully intelligible when they are transposed into the primitive and infantile setting. A child's emotional impulses are intensely and inexhaustibly deep to a degree quite other than those of an adult; only religious ecstasy can bring them back. A rapture of devotion to God was thus the first reaction to the return of the great father.

[1939a, 4950]

The further development takes us beyond Judaism. The remainder of what returned from the tragic drama of the primal father was no longer reconcilable in any way with the religion of Moses. The sense of guilt of those days was very far from being any longer restricted to the Jewish people; it had caught hold of all the Mediterranean peoples as a dull malaise, a premonition of calamity for which no one could suggest a reason. Historians of our day speak of an ageing of ancient civilization, but I suspect that they have only grasped accidental and contributory causes of this depressed mood of the peoples. The elucidation of this situation of depression sprang from Jewry. Irrespectively of all the approximations and preparations in the surrounding world, it was after all a Jewish man, Saul of Tarsus (who, as a Roman citizen, called himself Paul), in whose spirit the realization first emerged: 'the reason we are so unhappy is that we have killed God the father.' And it is entirely understandable that he could only grasp this piece of truth in the delusional disguise of the glad tidings: 'we are freed from all guilt since one of us has sacrificed his life to absolve us.' In this formula the killing of God was of course not mentioned, but a crime that had to be atoned by the sacrifice of a victim could only have been a murder. And the intermediate step between the delusion and the historical truth was provided by the assurance that the victim of the sacrifice had been God's son. With the strength which it derived from the source of historical truth, this new faith overthrew every obstacle. The blissful sense of being chosen was replaced by the liberating sense of redemption. But the fact of the parricide, in returning to the memory of mankind, had to overcome greater resistances than the other fact, which had constituted the subject-matter of monotheism; it was also obliged to submit to a more powerful distortion. The unnameable crime was replaced by the hypothesis of what must be described as a shadowy 'original sin'.

[1939a, 4952]
The theory based by Frazer on the intichiuma ceremony stands or falls with the assertion of the primitive character of the Arunta institutions. But in face of the objections raised by Durkheim¹ and Lang (1903 and 1905), that assertion appears untenable. On the contrary, the Arunta seem to be the most highly developed of the Australian tribes and to represent a stage of totemism in dissolution rather than its beginnings. The myths which impressed Frazer so deeply because, in contrast to the conditions that rule to-day, they lay stress upon liberty to eat the totem and to marry within the totem - these myths are easily explicable as wishful phantasies which, like the myth of a Golden Age, have been projected back into the past.

[1912-1913, 2757]

An investigation of primitive peoples shows mankind caught up, to begin with, in a childish belief in its own omnipotence.¹ A whole number of mental structures can thus be understood as attempts to deny whatever might disturb this feeling of omnipotence and so to prevent emotional life from being affected by reality until the latter could be better controlled and used for purposes of satisfaction. The principle of avoiding unpleasure dominates human actions until it is replaced by the better one of adaptation to the external world. Pari passu with men’s progressive control over the world goes a development in their Weltanschauung, their view of the universe as a whole. They turn away more and more from their original belief in their own omnipotence, rising from an animistic phase through a religious to a scientific one. Myths, religion and morality find their place in this scheme as attempts to seek a compensation for the lack of satisfaction of human wishes.

[1913], 2822

Our knowledge of the neurotic illnesses of individuals has been of much assistance to our understanding of the great social institutions. For the neuroses themselves have turned out to be attempts to find individual solutions for the problems of compensating for unsatisfied wishes, while the institutions seek to provide social solutions for these same problems. The recession of the social factor and the predominance of the sexual one turns these neurotic solutions of the psychological problem into caricatures which are of no service except to help us in explaining such important questions.

[1913], 2822

It was only later that religions succeeded in representing this after-life as the more desirable, the truly valid one, and in reducing the life which is ended by death to a mere preparation. After this, it was no more than consistent to extend life backwards into the past, to form the notion of earlier existences, of the transmigration of souls and of reincarnation, all with the purpose of depriving death of its meaning as the termination of life. So early did the denial of death, which we have described as a ‘conventional and cultural attitude’, have its origin.

[1915b, 3087]

For this situation is nothing new. It has an infantile prototype, of which it is in fact only the continuation. For once before one has found oneself in a similar state of helplessness: as a small child, in relation to one’s parents. One had reason to fear them, and especially one’s father; and yet one was sure of his protection against the dangers one knew. Thus it was natural to assimilate the two situations. Here, too, wishing played its part, as it does in dream-life. The sleeper may be seized with a presentiment of death, which threatens to place him in the grave. But the dream-work knows how to select a condition that will turn even that dreaded event into a wish-fulfilment: the dreamer sees himself in an ancient Etruscan grave which he has climbed down into, happy to find his archaeological interests satisfied. In the same way, a man makes the forces of nature not simply into persons with whom he can associate as he would with his equals - that would not do justice to the overpowering impression which those forces make on him - but he gives them the character of a father. He turns them into gods, following in this, as I have tried to show, not only an infantile prototype but a phylogenetic one.

[1927c, 4429]
I think we have prepared the way sufficiently for an answer to both these questions. It will be
found if we turn our attention to the psychical origin of religious ideas. These, which are given
out as teachings, are not precipitates of experience or end-results of thinking: they are illusions,
fulfilments of the oldest, strongest and most urgent wishes of mankind. The secret of their
strength lies in the strength of those wishes. As we already know, the terrifying impression of
helplessness in childhood arouses the need for protection - for protection through love which
was provided by the father; and the recognition that this helplessness lasts throughout life made
it necessary to cling to the existence of a father, but this time a more powerful one. Thus the
benevolent rule of a divine Providence allays our fear of the dangers of life; the establishment of
a moral world-order ensures the fulfilment of the demands of justice, which have so often
remained unfulfilled in human civilization; and the prolongation of earthly existence in a future
life provides the local and temporal framework in which these wish-fulfilments shall take place.
Answers to the riddles that tempt the curiosity of man, such as how the universe began or what
the relation is between body and mind, are developed in conformity with the underlying
assumptions of this system. It is an enormous relief to the individual psyche if the conflicts of its
childhood arising from the father-complex - conflicts which it has never wholly overcome - are
removed from it and brought to a solution which is universally accepted.
[1927c, 4441]

To assess the truth-value of religious doctrines does not lie within the scope of the present
enquiry. It is enough for us that we have recognized them as being, in their psychological
nature, illusions. But we do not have to conceal the fact that this discovery also strongly
influences our attitude to the question which must appear to many to be the most important of
all. We know approximately at what periods and by what kind of men religious doctrines were
created. If in addition we discover the motives which led to this, our attitude to the problem of
religion will undergo a marked displacement. We shall tell ourselves that it would be very nice if
there were a God who created the world and was a benevolent Providence, and if there were a
moral order in the universe and an after-life; but it is a very striking fact that all this is exactly as
we are bound to wish it to be. And it would be more remarkable still if our wretched, ignorant
and downtrodden ancestors had succeeded in solving all these difficult riddles of the universe.
[1927c, 4442]

'Archaeological interests are no doubt most praiseworthy, but no one undertakes an
excavation if by doing so he is going to undermine the habitations of the living so that they
collapse and bury people under their ruins. The doctrines of religion are not a subject one can
quibble about like any other. Our civilization is built up on them, and the maintenance of human
society is based on the majority of men's believing in the truth of those doctrines. If men are
taught that there is no almighty and all-just God, no divine world-order and no future life, they
will feel exempt from all obligation to obey the precepts of civilization. Everyone will, without
inhibition or fear, follow his asocial, egoistic instincts and seek to exercise his power; Chaos,
which we have banished through many thousands of years of the work of civilization, will come
again. Even if we knew, and could prove, that religion was not in possession of the truth, we
ought to conceal the fact and behave in the way prescribed by the philosophy of "As if" - and
this in the interest of the preservation of us all. And apart from the danger of the undertaking, it
would be a purposeless cruelty. Countless people find their one consolation in religious
doctrines, and can only bear life with their help. You would rob them of their support, without
having anything better to give them in exchange. It is admitted that so far science has not
achieved much, but even if it had advanced much further it would not suffice for man. Man has
imperative needs of another sort, which can never be satisfied by cold science; and it is very
strange - indeed, it is the height of inconsistency - that a psychologist who has always insisted
on what a minor part is played in human affairs by the intelligence as compared with the life of
the instincts - that such a psychologist should now try to rob mankind of a precious wish-
fulfilment and should propose to compensate them for it with intellectual nourishment.'
[1927c, 4443]
The one person this publication may injure is myself. I shall have to listen to the most disagreeable reproaches for my shallowness, narrow-mindedness and lack of idealism or of understanding for the highest interests of mankind. But on the one hand, such remonstrances are not new to me; and on the other, if a man has already learnt in his youth to rise superior to the disapproval of his contemporaries, what can it matter to him in his old age when he is certain soon to be beyond the reach of all favour or disfavour? In former times it was different. Then utterances such as mine brought with them a sure curtailment of one's earthly existence and an effective speeding-up of the opportunity for gaining a personal experience of the after-life. But, I repeat, those times are past and to-day writings such as this bring no more danger to their author than to their readers. The most that can happen is that the translation and distribution of his book will be forbidden in one country or another - and precisely, of course, in a country that is convinced of the high standard of its culture. But if one puts in any plea at all for the renunciation of wishes and for acquiescence in Fate, one must be able to tolerate this kind of injury too.

We now observe that the store of religious ideas includes not only wish-fulfillments but important historical recollections. This concurrent influence of past and present must give religion a truly incomparable wealth of power. But perhaps with the help of an analogy yet another discovery may begin to dawn on us. Though it is not a good plan to transplant ideas far from the soil in which they grew up, yet here is a conformity which we cannot avoid pointing out. We know that a human child cannot successfully complete its development to the civilized stage without passing through a phase of neurosis sometimes of greater and sometimes of less distinctness. This is because so many instinctual demands which will later be unserviceable cannot be suppressed by the rational operation of the child's intellect but have to be tamed by acts of repression, behind which, as a rule, lies the motive of anxiety. Most of these infantile neuroses are overcome spontaneously in the course of growing up, and this is especially true of the obsessional neuroses of childhood. The remainder can be cleared up later still by psychoanalytic treatment. In just the same way, one might assume, humanity as a whole, in its development through the ages, fell into states analogous to the neuroses, and for the same reasons - namely because in the times of its ignorance and intellectual weakness the instinctual renunciations indispensable for man's communal existence had only been achieved by it by means of purely affective forces. The precipitates of these processes resembling repression which took place in prehistoric times still remained attached to civilization for long periods. Religion would thus be the universal obsessional neurosis of humanity; like the obsessional neurosis of children, it arose out of the Oedipus complex, out of the relation to the father. If this view is right, it is to be supposed that a turning-away from religion is bound to occur with the fatal inevitability of a process of growth, and that we find ourselves at this very juncture in the middle of that phase of development. Our behaviour should therefore be modelled on that of a sensible teacher who does not oppose an impending new development but seeks to ease its path and mitigate the violence of its irruption. Our analogy does not, to be sure, exhaust the essential nature of religion. If, on the one hand, religion brings with it obsessional restrictions, exactly as an individual obsessional neurosis does, on the other hand it comprises a system of wishful illusions together with a disavowal of reality, such as we find in an isolated form nowhere else but in amnesia, in a state of blissful hallucinatory confusion. But these are only analogies, by the help of which we endeavour to understand a social phenomenon; the pathology of the individual does not supply us with a fully valid counterpart.
And now you must not be surprised if I plead on behalf of retaining the religious doctrinal system as the basis of education and of man's communal life. This is a practical problem, not a question of reality-value. Since, for the sake of preserving our civilization, we cannot postpone influencing the individual until he has become ripe for civilization (and many would never become so in any case), since we are obliged to impose on the growing child some doctrinal system which shall operate in him as an axiom that admits of no criticism, it seems to me that the religious system is by far the most suitable for the purpose. And it is so, of course, precisely on account of its wish-fulfilling and consolatory power, by which you claim to recognize it as an "illusion". In view of the difficulty of discovering anything about reality - indeed, of the doubt whether it is possible for us to do so at all - we must not overlook the fact that human needs, too, are a piece of reality, and, in fact, an important piece and one that concerns us especially closely.

[1927c, 4459]

And secondly: observe the difference between your attitude to illusions and mine. You have to defend the religious illusion with all your might. If it becomes discredited - and indeed the threat to it is great enough - then your world collapses. There is nothing left for you but to despair of everything, of civilization and the future of mankind. From that bondage I am, we are, free. Since we are prepared to renounce a good part of our infantile wishes, we can bear it if a few of our expectations turn out to be illusions.

[1927c, 4460]

This does not in the least mean that these wishes are to be pushed contemptuously on one side or their value for human life under-estimated. We are ready to trace out the fulfilments of them which they have created for themselves in the products of art and in the systems of religion and philosophy; but we cannot nevertheless overlook the fact that it would be illegitimate and highly inexpedient to allow these demands to be transferred to the sphere of knowledge. For this would be to lay open the paths which lead to psychosis, whether to individual or group psychosis, and would withdraw valuable amounts of energy from endeavours which are directed towards reality in order, so far as possible, to find satisfaction in it for wishes and needs.

[1933a, 4758]

And what, finally, is the aim of these passionate disparagements of science? In spite of its present incompleteness and of the difficulties attaching to it, it remains indispensable to us and nothing can take its place. It is capable of undreamt-of improvements, whereas the religious Weltanschauung is not. This is complete in all essential respects; if it was a mistake, it must remain one for ever. No belittlement of science can in any way alter the fact that it is attempting to take account of our dependence on the real external world, while religion is an illusion and it derives its strength from its readiness to fit in with our instinctual wishful impulses.

[1933a, 4772]
We have noted as a curious and derogatory characteristic of obsessional neurosis that its ceremonials are concerned with the small actions of daily life and are expressed in foolish regulations and restrictions in connection with them. We cannot understand this remarkable feature of the clinical picture until we have realized that the mechanism of psychical displacement, which was first discovered by me in the construction of dreams,¹ dominates the mental processes of obsessional neurosis. It is already clear from the few examples of obsessive actions given above that their symbolism and the detail of their execution are brought about by a displacement from the actual, important thing on to a small one which takes its place - for instance, from a husband on to a chair. It is this tendency to displacement which progressively changes the clinical picture and eventually succeeds in turning what is apparently the most trivial matter into something of the utmost importance and urgency. It cannot be denied that in the religious field as well there is a similar tendency to a displacement of psychical values, and in the same direction, so that the petty ceremonials of religious practice gradually become the essential thing and push aside the underlying thoughts. That is why religions are subject to reforms which work retroactively and aim at a re-establishment of the original balance of values.

[1907b, 1908]
Some features of this state of affairs may be seen in the sphere of religious life as well. The formation of a religion, too, seems to be based on the suppression, the renunciation, of certain instinctual impulses. These impulses, however, are not, as in the neuroses, exclusively components of the sexual instinct; they are self-seeking, socially harmful instincts, though, even so, they are usually not without a sexual component. A sense of guilt following upon continual temptation and an expectant anxiety in the form of fear of divine punishment have, after all, been familiar to us in the field of religion longer than in that of neurosis. Perhaps because of the admixture of sexual components, perhaps because of some general characteristics of the instincts, the suppression of instinct proves to be an inadequate and interminable process in religious life also. Indeed, complete backslidings into sin are more common among pious people than among neurotics and these give rise to a new form of religious activity, namely acts of penance, which have their counterpart in obsessional neurosis.

[1907b, 1908]

When anyone has, like Leonardo, escaped being intimidated by his father during his earliest childhood, and has in his researches cast away the fetters of authority, it would be in the sharpest contradiction to our expectation if we found that he had remained a believer and had been unable to escape from dogmatic religion. Psycho-analysis has made us familiar with the intimate connection between the father-complex and belief in God; it has shown us that a personal God is, psychologically, nothing other than an exalted father, and it brings us evidence every day of how young people lose their religious beliefs as soon as their father's authority breaks down. Thus we recognize that the roots of the need for religion are in the parental complex; the almighty and just God, and kindly Nature, appear to us as grand sublimations of father and mother, or rather, as revivals and restorations of the young child's ideas of them. Biologically speaking, religiousness is to be traced to the small human child's long-drawn-out helplessness and need of help; and when at a later date he perceives how truly forlorn and weak he is when confronted with the great forces of life, he feels his condition as he did in childhood, and attempts to deny his own despondency by a regressive revival of the forces which protected his infancy. The protection against neurotic illness, which religion vouchsafes to those who believe in it, is easily explained: it removes their parental complex, on which the sense of guilt in individuals as well as in the whole human race depends, and disposes of it, while the unbeliever has to grapple with the problem on his own.

[1910c, 2294]

Features were thus brought into existence which continued thenceforward to have a determining influence on the nature of religion. Totemic religion arose from the filial sense of guilt, in an attempt to allay that feeling and to appease the father by deferred obedience to him. All later religions are seen to be attempts at solving the same problem. They vary according to the stage of civilization at which they arise and according to the methods which they adopt; but all have the same end in view and are reactions to the same great event with which civilization began and which, since it occurred, has not allowed mankind a moment's rest.

[1912-1913, 2785]

No one can have failed to observe, in the first place, that I have taken as the basis of my whole position the existence of a collective mind, in which mental processes occur just as they do in the mind of an individual. In particular, I have supposed that the sense of guilt for an action has persisted for many thousands of years and has remained operative in generations which can have had no knowledge of that action. I have supposed that an emotional process, such as might have developed in generations of sons who were ill-treated by their father, has extended to new generations which were exempt from such treatment for the very reason that their father had been eliminated. It must be admitted that these are grave difficulties; and any explanation that could avoid presumptions of such a kind would seem to be preferable.

[1912-1913, 2796]
Another difficulty might actually be brought forward from psycho-analytic quarters. The earliest
moral precepts and restrictions in primitive society have been explained by us as reactions to a
deed which gave those who performed it the concept of 'crime'. They felt remorse for the deed
and decided that it should never be repeated and that its performance should bring no
advantage. This creative sense of guilt still persists among us. We find it operating in an asocial
manner in neurotics, and producing new moral precepts and persistent restrictions, as an
atonement for crimes that have been committed and as a precaution against the committing of
new ones.¹ If, however, we inquire among these neurotics to discover what were the deeds
which provoked these reactions, we shall be disappointed. We find no deeds, but only impulses
and emotions, set upon evil ends but held back from their achievement. What lie behind the
sense of guilt of neurotics are always psychical realities and never factual ones. What
characterizes neurotics is that they prefer psychical to factual reality and react just as seriously
to thoughts as normal people do to realities.
[1912-1913, 2798]

Hence the primaeval history of mankind is filled with murder. Even to-day, the history of the
world which our children learn at school is essentially a series of murders of peoples. The
obscure sense of guilt to which mankind has been subject since prehistoric times, and which in
some religions has been condensed into the doctrine of primal guilt, of original sin, is probably
the outcome of a blood-guilt incurred by prehistoric man. In my book Totem and Taboo (1912-
13) I have, following clues given by Robertson Smith, Atkinson and Charles Darwin, tried to
guess the nature of this primal guilt, and I believe, too, that the Christian doctrine of to-day
enables us to deduce it. If the Son of God was obliged to sacrifice his life to redeem mankind
from original sin, then by the law of talion, the requital of like by like, that sin must have been a
killing, a murder. Nothing else could call for the sacrifice of a life for its expiation. And the
original sin was an offence against God the Father, the primal crime of mankind must have
been a parricide, the killing of the primal father of the primitive human horde, whose mnemic
image was later transfigured into a deity.¹
[1915b, 3084]

What came into existence beside the dead body of the loved one was not only the doctrine of
the soul, the belief in immortality and a powerful source of man's sense of guilt, but also the
earliest ethical commandments. The first and most important prohibition made by the
awakening conscience was: 'Thou shalt not kill.' It was acquired in relation to dead people who
were loved, as a reaction against the satisfaction of the hatred hidden behind the grief for them;
and it was gradually extended to strangers who were not loved, and finally even to enemies.
[1915b, 3087]

There can be no doubt that the Oedipus complex may be looked upon as one of the most
important sources of the sense of guilt by which neurotics are so often tormented. But more
than this: in a study of the beginnings of human religion and morality which I published in 1913
under the title of Totem and Taboo I put forward a suggestion that mankind as a whole may
have acquired its sense of guilt, the ultimate source of religion and morality, at the beginning of
its history, in connection with the Oedipus complex. I should be very glad to tell you more about
this, but I had better leave it on one side. Once one has begun on that topic it is hard to break
off; and we must go back to individual psychology.
[1916-1917, 3399]
By its theory of the instincts psycho-analysis offended the feelings of individuals in so far as they regarded themselves as members of the social community; another branch of its theory was calculated to hurt every single person at the tenderest point of his own psychical development. Psycho-analysis disposed once and for all of the fairy tale of an asexual childhood. It demonstrated the fact that sexual interests and activities occur in small children from the beginning of their lives. It showed what transformations those activities pass through, how at about the age of five they succumb to inhibition and how from puberty onwards they enter the service of the reproductive function. It recognized that early infantile sexual life reaches its peak in what is known as the Oedipus complex (an emotional attachment of the child to the parent of the opposite sex accompanied by an attitude of rivalry to the parent of the same sex) and that at that period of life this impulsion extends uninhibited into a straightforward sexual desire. This can be confirmed so easily that only the greatest efforts could make it possible to overlook it. Every individual has in fact gone through this phase but has afterwards energetically repressed its purport and succeeded in forgetting it. A horror of incest and an enormous sense of guilt are left over from this prehistoric epoch of the individual's existence. It may be that something quite similar occurred in the prehistoric epoch of the human species as a whole and that the beginnings of morality, religion and social order were intimately connected with the surmounting of that primeval era. To adults their prehistory seems so inglorious that they refuse to allow themselves to be reminded of it: they were infuriated when psycho-analysis tried to lift the veil of amnesia from their years of childhood. There was only one way out: what psycho-analysis asserted must be false and what posed as a new science must be a tissue of fancies and distortions.

This missing element was supplied when I became acquainted with W. Robertson Smith's work, The Religion of the Semites. Its author (a man of genius who was both a physicist and an expert in biblical researches) introduced the so-called 'totem meal' as an essential part of the totemic religion. Once a year the totem animal, which was at other times regarded as sacred, was solemnly killed in the presence of all the members of the clan, was devoured and was then mourned over. The mourning was followed by a great festival. When I further took into account Darwin's conjecture that men originally lived in hordes, each under the domination of a single powerful, violent and jealous male, there rose before me out of all these components the following hypothesis, or, I would rather say, vision. The father of the primal horde, since he was an unlimited despot, had seized all the women for himself; his sons, being dangerous to him as rivals, had been killed or driven away. One day, however, the sons came together and united to overwhelm, kill, and devour their father, who had been their enemy but also their ideal. After the deed they were unable to take over their heritage since they stood in one another's way. Under the influence of failure and remorse they learned to come to an agreement among themselves; they banded themselves into a clan of brothers by the help of the ordinances of totemism, which aimed at preventing a repetition of such a deed, and they jointly undertook to forgo the possession of the women on whose account they had killed their father. They were then driven to finding strange women, and this was the origin of the exogamy which is so closely bound up with totemism. The totem meal was the festival commemorating the fearful deed from which sprang man's sense of guilt (or 'original sin') and which was the beginning at once of social organization, of religion and of ethical restrictions.
Now whether we suppose that such a possibility was a historical event or not, it brings the formation of religion within the circle of the father-complex and bases it upon the ambivalence which dominates that complex. After the totem animal had ceased to serve as a substitute for him, the primal father, at once feared and hated, revered and envied, became the prototype of God himself. The son's rebelliousness and his affection for his father struggled against each other through a constant succession of compromises, which sought on the one hand to atone for the act of parricide and on the other to consolidate the advantages it had brought. This view of religion throws a particularly clear light upon the psychological basis of Christianity, in which, as we know, the ceremony of the totem meal still survives with but little distortion, in the form of Communion. I should like explicitly to mention that this last observation was not made by me but is to be found in the works of Robertson Smith and Frazer.

[1925d, 4241]

As to the origin of the sense of guilt, the analyst has different views from other psychologists; but even he does not find it easy to give an account of it. To begin with, if we ask how a person comes to have a sense of guilt, we arrive at an answer which cannot be disputed: a person feels guilty (devout people would say 'sinful') when he has done something which he knows to be 'bad'. But then we notice how little this answer tells us. Perhaps, after some hesitation, we shall add that even when a person has not actually done the bad thing but has only recognized in himself an intention to do it, he may regard himself as guilty; and the question then arises of why the intention is regarded as equal to the deed. Both cases, however, presuppose that one had already recognized that what is bad is reprehensible, is something that must not be carried out. How is this judgement arrived at? We may reject the existence of an original, as it were natural, capacity to distinguish good from bad. What is bad is often not at all what is injurious or dangerous to the ego; on the contrary, it may be something which is desirable and enjoyable to the ego. Here, therefore, there is an extraneous influence at work, and it is this that decides what is to be called good or bad. Since a person's own feelings would not have led him along this path, he must have had a motive for submitting to this extraneous influence. Such a motive is easily discovered in his helplessness and his dependence on other people, and it can best be designated as fear of loss of love. If he loses the love of another person upon whom he is dependent, he also ceases to be protected from a variety of dangers. Above all, he is exposed to the danger that this stronger person will show his superiority in the form of punishment. At the beginning, therefore, what is bad is whatever causes one to be threatened with loss of love. For fear of that loss, one must avoid it. This, too, is the reason why it makes little difference whether one has already done the bad thing or only intends to do it. In either case the danger only sets in if and when the authority discovers it, and in either case the authority would behave in the same way.

[1930a, 4514]
At this second stage of development, the conscience exhibits a peculiarity which was absent from the first stage and which is no longer easy to account for. For the more virtuous a man is, the more severe and distrustful is its behaviour, so that ultimately it is precisely those people who have carried saintliness furthest who reproach themselves with the worst sinfulness. This means that virtue forfeits some part of its promised reward; the docile and continent ego does not enjoy the trust of its mentor, and strives in vain, it would seem, to acquire it. The objection will at once be made that these difficulties are artificial ones, and it will be said that a stricter and more vigilant conscience is precisely the hallmark of a moral man. Moreover, when saints call themselves sinners, they are not so wrong, considering the temptations to instinctual satisfaction to which they are exposed in a specially high degree - since, as is well known, temptations are merely increased by constant frustration, whereas an occasional satisfaction of them causes them to diminish, at least for the time being. The field of ethics, which is so full of problems, presents us with another fact: namely that ill-luck - that is, external frustration - so greatly enhances the power of the conscience in the super-ego. As long as things to well with a man, his conscience is lenient and lets the ego do all sorts of things; but when misfortune befalls him, he searches his soul, acknowledges his sinfulness, heightens the demands of his conscience, imposes abstinences on himself and punishes himself with penances.¹ Whole peoples have behaved in this way, and still do. This, however, is easily explained by the original infantile stage of conscience, which, as we see, is not given up after the introjection into the super-ego, but persists alongside of it and behind it. Fate is regarded as a substitute for the parental agency. If a man is unfortunate it means that he is no longer loved by this highest power; and, threatened by such a loss of love, he once more bows to the parental representative in his super-ego - a representative whom, in his days of good fortune, he was ready to neglect. This becomes especially clear where Fate is looked upon in the strictly religious sense of being nothing else than an expression of the Divine Will. The people of Israel had believed themselves to be the favourite child of God, and when the great Father caused misfortune after misfortune to rain down upon this people of his, they were never shaken in their belief in his relationship to them or questioned his power or righteousness. Instead, they produced the prophets, who held up their sinfulness before them; and out of their sense of guilt they created the over-strict commandments of their priestly religion. It is remarkable how differently a primitive man behaves. If he has met with a misfortune, he does not throw the blame on himself but on his fetish, which has obviously not done its duty, and he gives it a thrashing instead of punishing himself.

[1930a, 4516]
In the first place, I suspect that the reader has the impression that our discussions on the sense of guilt disrupt the framework of this essay: that they take up too much space, so that the rest of its subject-matter, with which they are not always closely connected, is pushed to one side. This may have spoilt the structure of my paper; but it corresponds faithfully to my intention to represent the sense of guilt as the most important problem in the development of civilization and to show that the price we pay for our advance in civilization is a loss of happiness through the heightening of the sense of guilt.¹ Anything that still sounds strange about this statement, which is the final conclusion of our investigation, can probably be traced to the quite peculiar relationship - as yet completely unexplained - which the sense of guilt has to our consciousness. In the common case of remorse, which we regard as normal, this feeling makes itself clearly enough perceptible to consciousness. Indeed, we are accustomed to speak of a 'consciousness of guilt' instead of a 'sense of guilt'. Our study of the neuroses, to which, after all we owe the most valuable pointers to an understanding of normal conditions, brings us up against some contradictions. In one of those affections, obsessional neurosis, the sense of guilt makes itself noisily heard in consciousness; it dominates the clinical picture and the patient's life as well, and it hardly allows anything else to appear alongside of it. But in most other cases and forms of neurosis it remains completely unconscious, without on that account producing any less important effects. Our patients do not believe us when we attribute an 'unconscious sense of guilt' to them. In order to make ourselves at all intelligible to them, we tell them of an unconscious need for punishment, in which the sense of guilt finds expression. But its connection with a particular form of neurosis must not be over-estimated. Even in obsessional neurosis there are types of patients who are not aware of their sense of guilt, or who only feel it as a tormenting uneasiness, a kind of anxiety, if they are prevented from carrying out certain actions. It ought to be possible eventually to understand these things; but as yet we cannot. Here perhaps we may be glad to have it pointed out that the sense of guilt is at bottom nothing else but a topographical variety of anxiety; in its later phases it coincides completely with fear of the super-ego. And the relations of anxiety to consciousness exhibit the same extraordinary variations. Anxiety is always present somewhere or other behind every symptom; but at one time it takes noisy possession of the whole of consciousness, while at another it conceals itself so completely that we are obliged to speak of unconscious anxiety or, if we want to have a clearer psychological conscience, since anxiety is in the first instance simply a feeling, of possibilities of anxiety. Consequently it is very conceivable that the sense of guilt produced by civilization is not perceived as such either, and remains to a large extent unconscious, or appears as a sort of malaise, a dissatisfaction, for which people seek other motivations. Religions, at any rate, have never overlooked the part played in civilization by a sense of guilt. Furthermore - a point which I failed to appreciate elsewhere² - they claim to redeem mankind from this sense of guilt, which they call sin. From the manner in which, in Christianity, this redemption is achieved - by the sacrificial death of a single person, who in this manner takes upon himself a guilt that is common to everyone - we have been able to infer what the first occasion may have been on which this primal guilt, which was also the beginning of civilization, was acquired.³

¹ [1930a, 4523]
Everyone who is familiar with the complicated transformation of meaning undergone by hysterical symptoms will understand that no attempt can be made here to follow out the meaning of Dostoevsky's attacks beyond this beginning.¹ It is enough that we may assume that their original meaning remained unchanged behind all later accretions. We can safely say that Dostoevsky never got free from the feelings of guilt arising from his intention of murdering his father. They also determined his attitude in the two other spheres in which the father-relation is the decisive factor, his attitude towards the authority of the State and towards belief in God. In the first of these he ended up with complete submission to his Little Father, the Tsar, who had once performed with him in reality the comedy of killing which his attacks had so often represented in play. Here penitence gained the upper hand. In the religious sphere he retained more freedom: according to apparently trustworthy reports he wavered, up to the last moment of his life, between faith and atheism. His great intellect made it impossible for him to overlook any of the intellectual difficulties to which faith leads. By an individual recapitulation of a development in world-history he hoped to find a way out and a liberation from guilt in the Christ ideal, and even to make use of his sufferings as a claim to be playing a Christ-like role. If on the whole he did not achieve freedom and became a reactionary, that was because the filial guilt, which is present in human beings generally and on which religious feeling is built, had in him attained a super-individual intensity and remained insurmountable even to his great intelligence. In writing this we are laying ourselves open to the charge of having abandoned the impartiality of analysis and of subjecting Dostoevsky to judgements that can only be justified from the partisan standpoint of a particular Weltanschauung. A conservative would take the side of the Grand Inquisitor and would judge Dostoevsky differently. The objection is just; and one can only say in extenuation that Dostoevsky's decision has every appearance of having been determined by an intellectual inhibition due to his neurosis.

[1928b, 4563]

The re-establishment of the primal father in his historic rights was a great step forward but it could not be the end. The other portions of the prehistoric tragedy insisted on being recognized. It is not easy to discern what set this process in motion. It appears as though a growing sense of guilt had taken hold of the Jewish people, or perhaps of the whole civilized world of the time, as a precursor to the return of the repressed material. Till at last one of these Jewish people found, in justifying a politico-religious agitator, the occasion for detaching a new - the Christian - religion from Judaism. Paul, a Roman Jew from Tarsus, seized upon this sense of guilt and traced it back correctly to its original source. He called this the 'original sin'; it was a crime against God and could only be atoned for by death. With the original sin death came into the world. In fact this crime deserving death had been the murder of the primal father who was later deified. But the murder was not remembered: instead of it there was a phantasy of its atonement, and for that reason this phantasy could be hailed as a message of redemption (evangelium). A son of God had allowed himself to be killed without guilt and had thus taken on himself the guilt of all men. It had to be a son, since it had been the murder of a father. It is probable that traditions from oriental and Greek mysteries had had an influence on the phantasy of redemption. What was essential in it seems to have been Paul's own contribution. In the most proper sense he was a man of an innately religious disposition: the dark traces of the past lurked in his mind, ready to break through into its more conscious regions.

[1939a, 4910]
We have already said that the Christian ceremony of Holy Communion, in which the believer incorporates the Saviour's blood and flesh, repeats the content of the old totem meal - no doubt only in its affectionate meaning, expressive of veneration, and not in its aggressive meaning. The ambivalence that dominates the relation to the father was clearly shown, however, in the final outcome of the religious novelty. Ostensibly aimed at propitiating the father god, it ended in his being dethroned and got rid of. Judaism had been a religion of the father; Christianity became a religion of the son. The old God the Father fell back behind Christ; Christ, the Son, took his place, just as every son had hoped to do in primaeval times. Paul, who carried Judaism on, also destroyed it. No doubt he owed his success in the first instance to the fact that, through the idea of the redeemer, he exorcized humanity's sense of guilt; but he owed it as well to the circumstance that he abandoned the 'chosen' character of his people and its visible mark - circumcision - so that the new religion could be a universal one, embracing all men. Though a part may have been played in Paul's taking this step by his personal desire for revenge for the rejection of his innovation in Jewish circles, yet it also restored a feature of the old Aten religion - it removed a restriction which that religion had acquired when it was handed over to a new vehicle, the Jewish people.

The killing of Moses by his Jewish people, recognized by Sellin from traces of it in tradition (and also, strange to say, accepted by the young Goethe without any evidence¹) thus becomes an indispensable part of our construction, an important link between the forgotten event of primaeval times and its later emergence in the form of the monotheist religions.² It is plausible to conjecture that remorse for the murder of Moses provided the stimulus for the wishful phantasy of the Messiah, who was to return and lead his people to redemption and the promised world-dominion. If Moses was this first Messiah, Christ became his substitute and successor, and Paul could exclaim to the peoples with some historical justification: 'Look! the Messiah has really come: he has been murdered before your eyes!' Then, too, there is a piece of historical truth in Christ's resurrection, for he was the resurrected Moses and behind him the returned primal father of the primitive horde, transfigured and, as the son, put in the place of the father.

[1939a, 4911]

[1939a, 4913]
The direction to be taken by this father-religion was in this way laid down for all time. Yet this did not bring its development to an end. Ambivalence is a part of the essence of the relation to the father: in the course of time the hostility too could not fail to stir, which had once driven the sons into killing their admired and dreaded father. There was no place in the framework of the religion of Moses for a direct expression of the murderous hatred of the father. All that could come to light was a mighty reaction against it - a sense of guilt on account of that hostility, a bad conscience for having sinned against God and for not ceasing to sin. This sense of guilt, which was uninterruptedly kept awake by the Prophets, and which soon formed an essential part of the religious system, had yet another superficial motivation, which neatly disguised its true origin. Things were going badly for the people; the hopes resting on the favour of God failed in fulfilment; it was not easy to maintain the illusion, loved above all else, of being God's chosen people. If they wished to avoid renouncing that happiness, a sense of guilt on account of their own sinfulness offered a welcome means of exculpating God: they deserved no better than to be punished by him since they had not obeyed his commandments. And, driven by the need to satisfy this sense of guilt, which was insatiable and came from sources so much deeper, they must make those commandments grow ever stricter, more meticulous and even more trivial. In a fresh rapture of moral asceticism they imposed more and more new instinctual renunciations on themselves and in that way reached - in doctrine and precept, at least - ethical heights which had remained inaccessible to the other peoples of antiquity. Many Jews regard this attainment of ethical heights as the second main characteristic and the second great achievement of their religion. The way in which it was connected with the first one - the idea of a single god - should be plain from our remarks. These ethical ideas cannot, however, disavow their origin from the sense of guilt felt on account of a suppressed hostility to God. They possess the characteristic - uncompleted and incapable of completion - of obsessional neurotic reaction-formations; we can guess, too, that they serve the secret purposes of punishment.

The further development takes us beyond Judaism. The remainder of what returned from the tragic drama of the primal father was no longer reconcilable in any way with the religion of Moses. The sense of guilt of those days was very far from being any longer restricted to the Jewish people; it had caught hold of all the Mediterranean peoples as a dull malaise, a premonition of calamity for which no one could suggest a reason. Historians of our day speak of an ageing of ancient civilization, but I suspect that they have only grasped accidental and contributory causes of this depressed mood of the peoples. The elucidation of this situation of depression sprang from Jewry. Irrespectively of all the approximations and preparations in the surrounding world, it was after all a Jewish man, Saul of Tarsus (who, as a Roman citizen, called himself Paul), in whose spirit the realization first emerged: 'the reason we are so unhappy is that we have killed God the father.' And it is entirely understandable that he could only grasp this piece of truth in the delusional disguise of the glad tidings: 'we are freed from all guilt since one of us has sacrificed his life to absolve us.' In this formula the killing of God was of course not mentioned, but a crime that had to be atoned by the sacrifice of a victim could only have been a murder. And the intermediate step between the delusion and the historical truth was provided by the assurance that the victim of the sacrifice had been God's son. With the strength which it derived from the source of historical truth, this new faith overthrew every obstacle. The blissful sense of being chosen was replaced by the liberating sense of redemption. But the fact of the parricide, in returning to the memory of mankind, had to overcome greater resistances than the other fact, which had constituted the subject-matter of monotheism; it was also obliged to submit to a more powerful distortion. The unnameable crime was replaced by the hypothesis of what must be described as a shadowy 'original sin'.

[1939a, 4951]

[1939a, 4952]
It is easy to show that the ego ideal answers to everything that is expected of the higher nature of man. As a substitute for a longing for the father, it contains the germ from which all religions have evolved. The self-judgement which declares that the ego falls short of its ideal produces the religious sense of humility to which the believer appeals in his longing. As a child grows up, the role of father is carried on by teachers and others in authority; their injunctions and prohibitions remain powerful in the ego ideal and continue, in the form of conscience, to exercise the moral censorship. The tension between the demands of conscience and the actual performances of the ego is experienced as a sense of guilt. Social feelings rest on identifications with other people, on the basis of having the same ego ideal. [1923b, 3971]

From the point of view of instinctual control, of morality, it may be said of the id that it is totally non-moral, of the ego that it strives to be moral, and of the super-ego that it can be super-moral and then become as cruel as only the id can be. It is remarkable that the more a man checks his aggressiveness towards the exterior the more severe - that is aggressive - he becomes in his ego ideal. The ordinary view sees the situation the other way round: the standard set up by the ego ideal seems to be the motive for the suppression of aggressiveness. The fact remains, however, as we have stated it: the more a man controls his aggressiveness, the more intense becomes his ideal's inclination to aggressiveness against his ego. It is like a displacement, a turning round upon his own ego. But even ordinary normal morality has a harshly restraining, cruelly prohibiting quality. It is from this, indeed, that the conception arises of a higher being who deals out punishment inexorably. [1923b, 3988]

In this way the Oedipus complex proves to be - as has already been conjectured in a historical sense¹ - the source of our individual ethical sense, our morality. The course of childhood development leads to an ever-increasing detachment from parents, and their personal significance for the super-ego recedes into the background. To the imagos they leave behind there are then linked the influences of teachers and authorities, self-chosen models and publicly recognized heroes, whose figures need no longer be introjected by an ego which has become more resistant. The last figure in the series that began with the parents is the dark power of Destiny which only the fewest of us are able to look upon as impersonal. There is little to be said against the Dutch writer Multatuli² when he replaces the Μοία [Destiny] of the Greeks by the divine pair 'Λόγος χαι' Αυάγχη [Reason and necessity]; but all who transfer the guidance of the world to Providence, to God, or to God and Nature, arouse a suspicion that they still look upon these ultimate and remotest powers as a parental couple, in a mythological sense, and believe themselves linked to them by libidinal ties. In *The Ego and the Id* I made an attempt to derive mankind's realistic fear of death, too, from the same parental view of fate. It seems very hard to free oneself from it. [1924c, 4080]
At this second stage of development, the conscience exhibits a peculiarity which was absent from the first stage and which is no longer easy to account for. For the more virtuous a man is, the more severe and distrustful is its behaviour, so that ultimately it is precisely those people who have carried saintliness furthest who reproach themselves with the worst sinfulness. This means that virtue forfeits some part of its promised reward; the docile and continent ego does not enjoy the trust of its mentor, and strives in vain, it would seem, to acquire it. The objection will at once be made that these difficulties are artificial ones, and it will be said that a stricter and more vigilant conscience is precisely the hallmark of a moral man. Moreover, when saints call themselves sinners, they are not so wrong, considering the temptations to instinctual satisfaction to which they are exposed in a specially high degree - since, as is well known, temptations are merely increased by constant frustration, whereas an occasional satisfaction of them causes them to diminish, at least for the time being. The field of ethics, which is so full of problems, presents us with another fact: namely that ill-luck - that is, external frustration - so greatly enhances the power of the conscience in the super-ego. As long as things to well with a man, his conscience is lenient and lets the ego do all sorts of things; but when misfortune befalls him, he searches his soul, acknowledges his sinfulness, heightens the demands of his conscience, imposes abstinences on himself and punishes himself with penances.¹ Whole peoples have behaved in this way, and still do. This, however, is easily explained by the original infantile stage of conscience, which, as we see, is not given up after the introjection into the super-ego, but persists alongside of it and behind it. Fate is regarded as a substitute for the parental agency. If a man is unfortunate it means that he is no longer loved by this highest power; and, threatened by such a loss of love, he once more bows to the parental representative in his super-ego - a representative whom, in his days of good fortune, he was ready to neglect. This becomes especially clear where Fate is looked upon in the strictly religious sense of being nothing else than an expression of the Divine Will. The people of Israel had believed themselves to be the favourite child of God, and when the great Father caused misfortune after misfortune to rain down upon this people of his, they were never shaken in their belief in his relationship to them or questioned his power or righteousness. Instead, they produced the prophets, who held up their sinfulness before them; and out of their sense of guilt they created the over-strict commandments of their priestly religion. It is remarkable how differently a primitive man behaves. If he has met with a misfortune, he does not throw the blame on himself but on his fetish, which has obviously not done its duty, and he gives it a thrashing instead of punishing himself.

[1930a, 4516]
Some features of this state of affairs may be seen in the sphere of religious life as well. The formation of a religion, too, seems to be based on the suppression, the renunciation, of certain instinctual impulses. These impulses, however, are not, as in the neuroses, exclusively components of the sexual instinct; they are self-seeking, socially harmful instincts, though, even so, they are usually not without a sexual component. A sense of guilt following upon continual temptation and an expectant anxiety in the form of fear of divine punishment have, after all, been familiar to us in the field of religion longer than in that of neurosis. Perhaps because of the admixture of sexual components, perhaps because of some general characteristics of the instincts, the suppression of instinct proves to be an inadequate and interminable process in religious life also. Indeed, complete backslidings into sin are more common among pious people than among neurotics and these give rise to a new form of religious activity, namely acts of penance, which have their counterpart in obsessional neurosis. [1907b, 1908]
The pre-scientific view of dreams adopted by the peoples of antiquity was certainly in complete harmony with their view of the universe in general, which led them to project into the external world as realities things which in fact enjoyed reality only within their own minds. Moreover, their view of dreams took into account the principal impression produced upon the waking mind in the morning by what is left of a dream in the memory: an impression of something alien, arising from another world and contrasting with the remaining contents of the mind. Incidentally, it would be a mistake to suppose that the theory of the supernatural origin of dreams is without its supporters in our own days. We may leave on one side pietistic and mystical writers, who, indeed, are perfectly justified in remaining in occupation of what is left of the once wide domain of the supernatural so long as that field is not conquered by scientific explanation. But apart from them, one comes across clear-headed men, without any extravagant ideas, who seek to support their religious faith in the existence and activity of superhuman spiritual forces precisely by the inexplicable nature of the phenomena of dreaming. (Cf. Haffner, 1887.) The high esteem in which dream-life is held by some schools of philosophy (by the followers of Schelling, for instance) is clearly an echo of the divine nature of dreams which was undisputed in antiquity. Nor are discussions of the premonitory character of dreams and their power to foretell the future at an end. For attempts at giving a psychological explanation have been inadequate to cover the material collected, however decidedly the sympathies of those of a scientific cast of mind may incline against accepting any such beliefs. [1900a, 519]

Thus the first picture which man formed of the world - animism - was a psychological one. It needed no scientific basis as yet, since science only begins after it has been realized that the world is unknown and that means must therefore be sought for getting to know it. Animism came to primitive man naturally and as a matter of course. He knew what things were like in the world, namely just as he felt himself to be. We are thus prepared to find that primitive man transposed the structural conditions of his own mind¹ into the external world; and we may attempt to reverse the process and put back into the human mind what animism teaches as to the nature of things. [1912-1913, 2734]

The technique of animism, magic, reveals in the clearest and most unmistakable way an intention to impose the laws governing mental life upon real things; in this, spirits need not as yet play any part, though spirits may be taken as objects of magical treatment. Thus the assumptions of magic are more fundamental and older than the doctrine of spirits, which forms the kernel of animism. Our psycho-analytic point of view coincides here with a theory put forward by R. R. Marett (1900), who postulates a pre-animistic stage before animism, the character of which is best indicated by the term 'animatism', the doctrine of the universality of life. Experience has little light to throw on pre-animism, since no race has yet been discovered which is without the concept of spirits. (Cf. Wundt, 1906, 171 ff.) [1912-1913, 2734]

¹ Which he was aware of by what is known as endopsychic perception. [1912-1913, 2734]

Spirits and demons, as I have shown in the last essay, are only projections of man's own emotional impulses.¹ He turns his emotional cathexes into persons, he peoples the world with them and meets his internal mental processes again outside himself - in just the same way as that intelligent paranoic, Schreber, found a reflection of the attachments and detachments of his libido in the vicissitudes of his confabulated 'rays of God'.² [1912-1913, 2735]
If we may venture to exploit our hypothesis still further, we may inquire which essential part of our psychological structure is reflected and reproduced in the projective creation of souls and spirits. It could scarcely be disputed that the primitive conception of a soul, however much it may differ from the later, purely immaterial soul, is nevertheless intrinsically the same; that is to say, it assumes that both persons and things are of a double nature and that their known attributes and modifications are distributed between their two component portions. This original 'duality', to borrow an expression from Herbert Spencer (1893), is identical with the dualism proclaimed by our current distinction between soul and body and by such ineradicable linguistic expressions of it as the use of phrases like 'beside himself' or 'coming to himself' in relation to fits of rage or fainting (ibid., 144).
[1912-1913, 2736]
I assume that this conscious ignorance and unconscious knowledge of the motivation of accidental psychical events is one of the psychical roots of superstition. Because the superstitious person knows nothing of the motivation of his own chance actions, and because the fact of this motivation presses for a place in his field of recognition, he is forced to allocate it, by displacement, to the external world. If such a connection exists, it can hardly be limited to this single application. In point of fact I believe that a large part of the mythological view of the world, which extends a long way into the most modern religions, is nothing but psychology projected into the external world. The obscure recognition¹ (the endopsychic perception, as it were) of psychical factors and relations in the unconscious is mirrored - it is difficult to express it in other terms, and here the analogy with paranoia must come to our aid - in the construction of a supernatural reality, which is destined to be changed back once more by science into the psychology of the unconscious. One could venture to explain in this way the myths of paradise and the fall of man, of God, of good and evil, of immortality, and so on, and to transform metaphysics into metapsychology. The gap between the paranoid's displacement and that of the superstitious person is less wide than it appears at first sight. When human beings began to think, they were, as is well known, forced to explain the external world anthropomorphically by means of a multitude of personalities in their own image; chance events, which they interpreted superstitiously, were thus actions and manifestations of persons. They behaved, therefore, just like paranoics, who draw conclusions from insignificant signs given them by other people, and just like all normal people, who quite rightly base their estimate of their neighbours' characters on their chance and unintentional actions. It is only in our modern, scientific but as yet by no means perfected Weltanschauung that superstition seems so very much out of place; in the Weltanschauung of pre-scientific times and peoples it was justified and consistent.

The connections between the complexes of interest in money and of defaecation, which seem so dissimilar, appear to be the most extensive of all. Every doctor who has practised psychoanalysis knows that the most refractory and long-standing cases of what is described as habitual constipation in neurotics can be cured by that form of treatment. This is less surprising if we remember that that function has shown itself similarly amenable to hypnotic suggestion. But in psycho-analysis one only achieves this result if one deals with the patients' money complex and induces them to bring it into consciousness with all its connections. It might be supposed that the neurosis is here only following as indication of common usage in speech, which calls a person who keeps too careful a hold on his money 'dirty' or 'filthy'.² But this explanation would be far too superficial. In reality, wherever archaic modes of thought have predominated or persist - in the ancient civilizations, in myths, fairy tales and superstitions, in unconscious thinking, in dreams and in neuroses - money is brought into the most intimate relationship with dirt. We know that the gold which the devil gives his paramours turns into excrement after his departure, and the devil is certainly nothing else than the personification of the repressed unconscious instinctual life.³ We also know about the superstition which connects the finding of treasure with defaecation, and everyone is familiar with the figure of the 'shitter of ducats [Dukatenscheisser]'.⁴ Indeed, even according to ancient Babylonian doctrine gold is 'the faeces of Hell' (Mammon = ilu manmans). Thus in following the usage of language, neurosis, here as elsewhere, is taking words in their original, significant sense, and where it appears to be using a word figuratively it is usually simply restoring its old meaning. [1901b, 1328]

[1908b, 1944]
There can be no doubt that the patient felt a need for finding experiences of this kind to act as props for his superstition, and that it was for that reason that he occupied himself so much with the inexplicable coincidences of everyday life with which we are all familiar, and helped out their shortcomings with unconscious activity of his own. I have come across a similar need in many other obsessional patients and have suspected its presence in many more besides. It seems to me easily explicable in view of the psychological characteristics of the obsessional neurosis. In this disorder, as I have already explained (p. 2155), repression is effected not by means of amnesia but by a severance of causal connections brought about by a withdrawal of affect. These repressed connections appear to persist in some kind of shadowy form (which I have elsewhere compared to an endopsychic perception),¹ and they are thus transferred, by a process of projection, into the external world, where they bear witness to what has been effaced from consciousness.

[1909d, 2181]
There is another feature which was already present in totemism and which has been preserved unaltered in religion. The tension of ambivalence was evidently too great for any contrivance to be able to counteract it; or it is possible that psychological conditions in general are unfavourable to getting rid of these antithetical emotions. However that may be, we find that the ambivalence implicit in the father-complex persists in totemism and in religions generally. Totemic religion not only comprised expressions of remorse and attempts at atonement, it also served as a remembrance of the triumph over the father. Satisfaction over that triumph led to the institution of the memorial festival of the totem meal, in which the restrictions of deferred obedience no longer held. Thus it became a duty to repeat the crime of parricide again and again in the sacrifice of the totem animal, whenever, as a result of the changing conditions of life, the cherished fruit of the crime - appropriation of the paternal attributes - threatened to disappear. We shall not be surprised to find that the element of filial rebelliousness also emerges, in the later products of religion, often in the strangest disguises and transformations. [1912-1913, 2785]
I am certainly not the first person to have been struck by the resemblance between what are called obsessive actions in sufferers from nervous affections and the observances by means of which believers give expression to their piety. The term 'ceremonial', which has been applied to some of these obsessive actions, is evidence of this. The resemblance, however, seems to me to be more than a superficial one, so that an insight into the origin of neurotic ceremonials may embolden us to draw inferences by analogy about the psychological processes of religious life.

It is easy to see where the resemblances lie between neurotic ceremonials and the sacred acts of religious ritual: in the qualms of conscience brought on by their neglect, in their complete isolation from all other actions (shown in the prohibition against interruption) and in the conscientiousness with which they are carried out in every detail. But the differences are equally obvious, and a few of them are so glaring that they make the comparison a sacrilege: the greater individual variability of ceremonial actions in contrast to the stereotyped character of rituals (prayer, turning to the East, etc.), their private nature as opposed to the public and communal character of religious observances, above all, however, the fact that, while the minutiae of religious ceremonial are full of significance and have a symbolic meaning, those of neurotics seem foolish and senseless. In this respect an obsessional neurosis presents a travesty, half comic and half tragic, of a private religion. But it is precisely this sharpest difference between neurotic and religious ceremonial which disappears when, with the help of the psycho-analytic technique of investigation, one penetrates to the true meaning of obsessive actions.¹ In the course of such an investigation the appearance which obsessive actions afford of being foolish and senseless is completely effaced, and the reason for their having that appearance is explained. It is found that the obsessive actions are perfectly significant in every detail, that they serve important interests of the personality and that they give expression to experiences that are still operative and to thoughts that are cathected with affect. They do this in two ways, either by direct or by symbolic representation; and they are consequently to be interpreted either historically or symbolically.

It is one of the conditions of the illness that the person who is obeying a compulsion carries it out without understanding its meaning - or at any rate its chief meaning. It is only thanks to the efforts of psycho-analytic treatment that he becomes conscious of the meaning of his obsessive action and, with it, of the motives that are impelling him to it. We express this important fact by saying that the obsessive action serves to express unconscious motives and ideas. In this, we seem to find a further departure from religious practices; but we must remember that as a rule the ordinary pious individual, too, performs a ceremonial without concerning himself with its significance, although priests and scientific investigators may be familiar with the - mostly symbolic - meaning of the ritual. In all believers, however, the motives which impel them to religious practices are unknown to them or are represented in consciousness by others which are advanced in their place.

The sense of guilt of obsessional neurotics finds its counterpart in the protestations of pious people that they know that at heart they are miserable sinners; and the pious observances (such as prayers, invocations, etc.) with which such people preface every daily act, and in especial every unusual undertaking, seem to have the value of defensive or protective measures.
A deeper insight into the mechanism of obsessional neurosis is gained if we take into account the primary fact which lies at the bottom of it. This is always the repression of an instinctual impulse (a component of the sexual instinct) which was present in the subject's constitution and which was allowed to find expression for a while during his childhood but later succumbed to suppression. In the course of the repression of this instinct a special conscientiousness is created which is directed against the instinct's aims; but this psychical reaction-formation feels insecure and constantly threatened by the instinct which is lurking in the unconscious. The influence of the repressed instinct is felt as a temptation, and during the process of repression itself anxiety is generated, which gains control over the future in the form of expectant anxiety. The process of repression which leads to obsessional neurosis must be considered as one which is only partly successful and which increasingly threatens to fail. It may thus be compared to an unending conflict; fresh psychical efforts are continually required to counterbalance the forward pressure of the instinct. Thus the ceremonial and obsessive actions arise partly as a defence against the temptation and partly as a protection against the ill which is expected. Against the temptation the protective measures seem soon to become inadequate; then the prohibitions come into play, with the purpose of keeping at a distance situations that give rise to temptation. Prohibitions take the place of obsessive actions, it will be seen, just as a phobia is designed to avert a hysterical attack. Again, a ceremonial represents the sum of the conditions subject to which something that is not yet absolutely forbidden is permitted, just as the Church's marriage ceremony signifies for the believer a sanctioning of sexual enjoyment which would otherwise be sinful. A further characteristic of obsessional neurosis, as of all similar affections, is that its manifestations (its symptoms, including the obsessive actions) fulfil the condition of being a compromise between the warring forces of the mind. They thus always reproduce something of the pleasure which they are designed to prevent; they serve the repressed instinct no less than the agencies which are repressing it. As the illness progresses, indeed, actions which were originally mostly concerned with maintaining the defence come to approximate more and more to the proscribed actions through which the instinct was able to find expression in childhood.

[1907b, 1907]

Some features of this state of affairs may be seen in the sphere of religious life as well. The formation of a religion, too, seems to be based on the suppression, the renunciation, of certain instinctual impulses. These impulses, however, are not, as in the neuroses, exclusively components of the sexual instinct; they are self-seeking, socially harmful instincts, though, even so, they are usually not without a sexual component. A sense of guilt following upon continual temptation and an expectant anxiety in the form of fear of divine punishment have, after all, been familiar to us in the field of religion longer than in that of neurosis. Perhaps because of the admixture of sexual components, perhaps because of some general characteristics of the instincts, the suppression of instinct proves to be an inadequate and interminable process in religious life also. Indeed, complete backslidings into sin are more common among pious people than among neurotics and these give rise to a new form of religious activity, namely acts of penance, which have their counterpart in obsessional neurosis.

[1907b, 1908]

The character of compromise which obsessive actions possess in their capacity as neurotic symptoms is the character least easily detected in corresponding religious observances. Yet here, too, one is reminded of this feature of neuroses when one remembers how commonly all the acts which religion forbids - the expressions of the instincts it has suppressed - are committed precisely in the name of, and ostensibly for the sake of, religion.

[1907b, 1909]
In view of these similarities and analogies one might venture to regard obsessional neurosis as a pathological counterpart of the formation of a religion, and to describe that neurosis as an individual religiosity and religion as a universal obsessional neurosis. The most essential similarity would reside in the underlying renunciation of the activation of instincts that are constitutionally present; and the chief difference would lie in the nature of those instincts, which in the neurosis are exclusively sexual in their origin, while in religion they spring from egoistic sources. [1907b, 1909]

The predilection felt by obsessional neurotics for uncertainty and doubt leads them to turn their thoughts by preference to those subjects upon which all mankind are uncertain and upon which our knowledge and judgements must necessarily remain open to doubt. The chief subjects of this kind are paternity, length of life, life after death, and memory - in the last of which we are all in the habit of believing, without having the slightest guarantee of its trustworthiness.¹ [1909d, 2182]

There is a second explanation, also unconcerned with sexuality, which has, however, a much more general scope than the first. It suggests that primitive man is prey to a perpetual lurking apprehensiveness, just as in the psycho-analytic theory of the neuroses we claim to be the case with people suffering from anxiety neurosis. This apprehensiveness will appear most strongly on all occasions which differ in any way from the usual, which involve something new or unexpected, something not understood or uncanny. This is also the origin of the ceremonial practices, widely adopted in later religions, which are connected with the beginning of every new undertaking, the start of every new period of time, the first-fruits of human, animal and plant life. The dangers which the anxious man believes to be threatening him never appear more vivid in his expectation than on the threshold of a dangerous situation, and then, too, is the only time when protecting himself against them is of any use. The first act of intercourse in marriage can certainly claim, on grounds of importance, to be preceded by such precautionary measures. These two attempts at explanation, based on horror of blood and on fear of first occurrences, do not contradict but rather reinforce each other. The first occasion of sexual intercourse is certainly a critical action, all the more so if it is to involve a flow of blood. [1918a, 2353]

The neuroses exhibit on the one hand striking and far-reaching points of agreement with those great social institutions, art, religion and philosophy. But on the other hand they seem like distortions of them. It might be maintained that a case of hysteria is a caricature of a work of art, that an obsessional neurosis is a caricature of a religion and that a paranoic delusion is a caricature of a philosophical system. The divergence resolves itself ultimately into the fact that the neuroses are asocial structures; they endeavour to achieve by private means what is effected in society by collective effort. If we analyse the instincts at work in the neuroses, we find that the determining influence in them is exercised by instinctual forces of sexual origin; the corresponding cultural formations, on the other hand, are based upon social instincts, originating from the combination of egoistic and erotic elements. Sexual needs are not capable of uniting men in the same way as are the demands of self-preservation. Sexual satisfaction is essentially the private affair of each individual. [1912-1913, 2717]
Robertson Smith explains that sacrifice at the altar was the essential feature in the ritual of ancient religions. It plays the same part in all religions, so that its origin must be traced back to very general causes, operating everywhere in the same manner. Sacrifice - the sacred act *par excellence* (*sacrificium*, ἱερουργία) - originally had a somewhat different meaning, however, from its later one of making an offering to the deity in order to propitiate him or gain his favour. (The non-religious usage of the word followed from this subsidiary sense of 'renunciation'.) It can be shown that, to begin with, sacrifice was nothing other than 'an act of fellowship between the deity and his worshippers'.

[1912-1913, 2773]

The sacrificial meal, then, was originally a feast of kinsmen, in accordance with the law that only kinsmen eat together. In our own society the members of a family have their meals in common; but the sacrificial meal bears no relation to the family. Kinship is an older thing than family life, and in the most primitive societies known to us the family contained members of more than one kindred. The man married a woman of another clan and the children inherited their mother's clan; so that there was no communion of kin between the man and the other members of the family. In a family of such a kind there was no common meal. To this day, savages eat apart and alone and the religious food prohibitions of totemism often make it impossible for them to eat in common with their wives and children.

[1912-1913, 2775]

To take an instance from another field. It is impossible to escape the impression of the perfect correspondence which can be discovered between the obsessive actions of certain obsessional patients and the religious observances of believers all over the world. Some cases of obsessional neurosis actually behave like a caricature of a private religion, so that it is tempting to liken the official religions to an obsessional neurosis that has been mitigated by becoming universalized. This comparison, which is no doubt highly objectionable to all believers, has nevertheless proved most fruitful psychologically. For psycho-analysis soon discovered in the case of obsessional neurosis what the forces are that struggle with one another in it till their conflicts find a remarkable expression in the ceremonial of obsessive actions. Nothing similar was suspected in the case of religious ceremonial until, by tracing back religious feeling to the relation with the father as its deepest root, it became possible to point to an analogous dynamic situation in that case too. This instance, moreover, may warn the reader that even in its application to non-medical fields psycho-analysis cannot avoid wounding cherished prejudices, touching upon deeply-rooted sensibilities and thus provoking enmities which have an essentially emotional basis.

[1924f, 4116]
I myself set a higher value on my contributions to the psychology of religion, which began with the establishment of a remarkable similarity between obsessive actions and religious practices or ritual (1907b). Without as yet understanding the deeper connections, I described the obsessional neurosis as a distorted private religion and religion as a kind of universal obsessional neurosis. Later on, in 1912, Jung's forcible indication of the far-reaching analogies between the mental products of neurotics and of primitive peoples led me to turn my attention to that subject. In four essays, which were collected into a book with the title of Totem and Taboo, I showed that the horror of incest was even more marked among primitive than among civilized races and had given rise to very special measures of defence against it. I examined the relations between taboo-prohibitions (the earliest form in which moral restrictions make their appearance) and emotional ambivalence; and I discovered under the primitive scheme of the universe known as 'animism' the principle of the over-estimation of the importance of psychical reality - the belief in 'the omnipotence of thoughts' - which lies at the root of magic as well. I developed the comparison with the obsessional neurosis at every point, and showed how many of the postulates of primitive mental life are still in force in that remarkable illness. Above all, however, I was attracted by totemism, the first system of organization in primitive tribes, a system in which the beginnings of social order are united with a rudimentary religion and the implacable domination of a small number of taboo-prohibitions. The being that is revered is ultimately always an animal, from which the clan also claims to be descended. Many indications pointed to the conclusion that every race, even the most highly developed, had once passed through the stage of totemism.

[1925d, 4239]

The two techniques I refer to are undoing what has been done and isolating. The first of these has a wide range of application and goes back very far. It is, as it were, negative magic, and endeavours, by means of motor symbolism, to 'blow away' not merely the consequences of some event (or experience or impression) but the event itself. I choose the term 'blow away' advisedly, so as to remind the reader of the part played by this technique not only in neuroses but in magical acts, popular customs and religious ceremonies as well. In obsessional neurosis the technique of undoing what has been done is first met with in the 'diphasic' symptoms, in which one action is cancelled out by a second, so that it is as though neither action had taken place, whereas, in reality, both have. This aim of undoing is the second underlying motive of obsessional ceremonials, the first being to take precautions in order to prevent the occurrence or recurrence of some particular event. The difference between the two is easily seen: the precautionary measures are rational, while trying to get rid of something by 'making it not to have happened' is irrational and in the nature of magic. It is of course to be suspected that the latter is the earlier motive of the two and proceeds from the animistic attitude towards the environment. This endeavour to undo shades off into normal behaviour in the case in which a person decides to regard an event as not having happened. But whereas he will take no direct steps against the event, and will simply pay no further attention to it or its consequences, the neurotic person will try to make the past itself non-existent. He will try to repress it by motor means. The same purpose may perhaps account for the obsession for repeating which is so frequently met with in this neurosis and the carrying out of which serves a number of contradictory intentions at once. When anything has not happened in the desired way it is undone by being repeated in a different way; and thereupon all the motives that exist for lingering over such repetitions come into play as well. As the neurosis proceeds, we often find that the endeavour to undo a traumatic experience is a motive of first-rate importance in the formation of symptoms. We thus unexpectedly discover a new, motor technique of defence, or (as we may say in this case with less inaccuracy) of repression.

[1926d, 4278]
We now observe that the store of religious ideas includes not only wish-fulfilments but important historical recollections. This concurrent influence of past and present must give religion a truly incomparable wealth of power. But perhaps with the help of an analogy yet another discovery may begin to dawn on us. Though it is not a good plan to transplant ideas far from the soil in which they grew up, yet here is a conformity which we cannot avoid pointing out. We know that a human child cannot successfully complete its development to the civilized stage without passing through a phase of neurosis sometimes of greater and sometimes of less distinctness. This is because so many instinctual demands which will later be unserviceable cannot be suppressed by the rational operation of the child's intellect but have to be tamed by acts of repression, behind which, as a rule, lies the motive of anxiety. Most of these infantile neuroses are overcome spontaneously in the course of growing up, and this is especially true of the obsessional neuroses of childhood. The remainder can be cleared up later still by psycho-analytic treatment. In just the same way, one might assume, humanity as a whole, in its development through the ages, fell into states analogous to the neuroses, and for the same reasons - namely because in the times of its ignorance and intellectual weakness the instinctual renunciations indispensable for man's communal existence had only been achieved by it by means of purely affective forces. The precipitates of these processes resembling repression which took place in prehistoric times still remained attached to civilization for long periods. Religion would thus be the universal obsessional neurosis of humanity; like the obsessional neurosis of children, it arose out of the Oedipus complex, out of the relation to the father. If this view is right, it is to be supposed that a turning-away from religion is bound to occur with the fatal inevitability of a process of growth, and that we find ourselves at this very juncture in the middle of that phase of development. Our behaviour should therefore be modelled on that of a sensible teacher who does not oppose an impending new development but seeks to ease its path and mitigate the violence of its irruption. Our analogy does not, to be sure, exhaust the essential nature of religion. If, on the one hand, religion brings with it obsessional restrictions, exactly as an individual obsessional neurosis does, on the other hand it comprises a system of wishful illusions together with a disavowal of reality, such as we find in an isolated form nowhere else but in amentia, in a state of blissful hallucinatory confusion. But these are only analogies, by the help of which we endeavour to understand a social phenomenon; the pathology of the individual does not supply us with a fully valid counterpart.

[1927c, 4452]

It has been repeatedly pointed out (by myself and in particular by Theodor Reik) in how great detail the analogy between religion and obsessional neurosis can be followed out, and how many of the peculiarities and vicissitudes in the formation of religion can be understood in that light. And it tallies well with this that devout believers are safeguarded in a high degree against the risk of certain neurotic illnesses; their acceptance of the universal neurosis spares them the task of constructing a personal one.

[1927c, 4453]

‘You have said yourself that religion is more than an obsessional neurosis. But you have not dealt with this other side of it. You are content to work out the analogy with a neurosis. Men, you say, must be freed from a neurosis. What else may be lost in the process is of no concern to you.’

[1927c, 4454]
The direction to be taken by this father-religion was in this way laid down for all time. Yet this did not bring its development to an end. Ambivalence is a part of the essence of the relation to the father: in the course of time the hostility too could not fail to stir, which had once driven the sons into killing their admired and dreaded father. There was no place in the framework of the religion of Moses for a direct expression of the murderous hatred of the father. All that could come to light was a mighty reaction against it - a sense of guilt on account of that hostility, a bad conscience for having sinned against God and for not ceasing to sin. This sense of guilt, which was uninterruptedly kept awake by the Prophets, and which soon formed an essential part of the religious system, had yet another superficial motivation, which neatly disguised its true origin. Things were going badly for the people; the hopes resting on the favour of God failed in fulfilment; it was not easy to maintain the illusion, loved above all else, of being God's chosen people. If they wished to avoid renouncing that happiness, a sense of guilt on account of their own sinfulness offered a welcome means of exculpating God: they deserved no better than to be punished by him since they had not obeyed his commandments. And, driven by the need to satisfy this sense of guilt, which was insatiable and came from sources so much deeper, they must make those commandments grow ever stricter, more meticulous and even more trivial. In a fresh rapture of moral asceticism they imposed more and more new instinctual renunciations on themselves and in that way reached - in doctrine and precept, at least - ethical heights which had remained inaccessible to the other peoples of antiquity. Many Jews regard this attainment of ethical heights as the second main characteristic and the second great achievement of their religion. The way in which it was connected with the first one - the idea of a single god - should be plain from our remarks. These ethical ideas cannot, however, disavow their origin from the sense of guilt felt on account of a suppressed hostility to God. They possess the characteristic - uncompleted and incapable of completion - of obsessional neurotic reaction-formations; we can guess, too, that they serve the secret purposes of punishment.
[1939a, 4951]
It is easy to see where the resemblances lie between neurotic ceremonials and the sacred acts of religious ritual: in the qualms of conscience brought on by their neglect, in their complete isolation from all other actions (shown in the prohibition against interruption) and in the conscientiousness with which they are carried out in every detail. But the differences are equally obvious, and a few of them are so glaring that they make the comparison a sacrilege: the greater individual variability of ceremonial actions in contrast to the stereotyped character of rituals (prayer, turning to the East, etc.), their private nature as opposed to the public and communal character of religious observances, above all, however, the fact that, while the minutiae of religious ceremonial are full of significance and have a symbolic meaning, those of neurotics seem foolish and senseless. In this respect an obsessional neurosis presents a travesty, half comic and half tragic, of a private religion. But it is precisely this sharpest difference between neurotic and religious ceremonial which disappears when, with the help of the psycho-analytic technique of investigation, one penetrates to the true meaning of obsessive actions.¹ In the course of such an investigation the appearance which obsessive actions afford of being foolish and senseless is completely effaced, and the reason for their having that appearance is explained. It is found that the obsessive actions are perfectly significant in every detail, that they serve important interests of the personality and that they give expression to experiences that are still operative and to thoughts that are cathected with affect. They do this in two ways, either by direct or by symbolic representation; and they are consequently to be interpreted either historically or symbolically.

The character of compromise which obsessive actions possess in their capacity as neurotic symptoms is the character least easily detected in corresponding religious observances. Yet here, too, one is reminded of this feature of neuroses when one remembers how commonly all the acts which religion forbids - the expressions of the instincts it has suppressed - are committed precisely in the name of, and ostensibly for the sake of, religion.

In view of these similarities and analogies one might venture to regard obsessional neurosis as a pathological counterpart of the formation of a religion, and to describe that neurosis as an individual religiosity and religion as a universal obsessional neurosis. The most essential similarity would reside in the underlying renunciation of the activation of instincts that are constitutionally present; and the chief difference would lie in the nature of those instincts, which in the neurosis are exclusively sexual in their origin, while in religion they spring from egoistic sources.

"You have said yourself that religion is more than an obsessional neurosis. But you have not dealt with this other side of it. You are content to work out the analogy with a neurosis. Men, you say, must be freed from a neurosis. What else may be lost in the process is of no concern to you.'
When anyone has, like Leonardo, escaped being intimidated by his father during his earliest childhood, and has in his researches cast away the fetters of authority, it would be in the sharpest contradiction to our expectation if we found that he had remained a believer and had been unable to escape from dogmatic religion. Psycho-analysis has made us familiar with the intimate connection between the father-complex and belief in God; it has shown us that a personal God is, psychologically, nothing other than an exalted father, and it brings us evidence every day of how young people lose their religious beliefs as soon as their father's authority breaks down. Thus we recognize that the roots of the need for religion are in the parental complex; the almighty and just God, and kindly Nature, appear to us as grand sublimations of father and mother, or rather, as revivals and restorations of the young child's ideas of them. Biologically speaking, religiousness is to be traced to the small human child's long-drawn-out helplessness and need of help; and when at a later date he perceives how truly forlorn and weak he is when confronted with the great forces of life, he feels his condition as he did in childhood, and attempts to deny his own despondency by a regressive revival of the forces which protected his infancy. The protection against neurotic illness, which religion vouchsafes to those who believe in it, is easily explained: it removes their parental complex, on which the sense of guilt in individuals as well as in the whole human race depends, and disposes of it, while the unbeliever has to grapple with the problem on his own.

An investigation of primitive peoples shows mankind caught up, to begin with, in a childish belief in its own omnipotence.¹ A whole number of mental structures can thus be understood as attempts to deny whatever might disturb this feeling of omnipotence and so to prevent emotional life from being affected by reality until the latter could be better controlled and used for purposes of satisfaction. The principle of avoiding unpleasure dominates human actions until it is replaced by the better one of adaptation to the external world. Pari passu with men's progressive control over the world goes a development in their Weltanschauung, their view of the universe as a whole. They turn away more and more from their original belief in their own omnipotence, rising from an animistic phase through a religious to a scientific one. Myths, religion and morality find their place in this scheme as attempts to seek a compensation for the lack of satisfaction of human wishes.

Apart from these pathological phenomena, it may be said that in the present case religion achieved all the aims for the sake of which it is included in the education of the individual. It put a restraint on his sexual impulsions by affording them a sublimation and a safe mooring; it lowered the importance of his family relationships, and thus protected him from the threat of isolation by giving him access to the great community of mankind. The untamed and fear-ridden child became social, well-behaved, and amenable to education.

---

¹ [1910c, 2294]

[1910d, 2311]

[1913j, 2822]

[1918b, 3590]
The psycho-analytic investigation of the psychoneuroses has taught us that their symptoms are to be traced back to directly sexual impulsions which are repressed but still remain active. We can complete this formula by adding - 'or, to aim-inhibited impulsions, whose inhibition has not been entirely successful or has made room for a return to the repressed sexual aim'. It is in accordance with this that a neurosis should make its victim asocial and should remove him from the usual group formations. It may be said that a neurosis has the same disintegrating effect upon a group as being in love. On the other hand it appears that where a powerful impetus has been given to group formation neuroses may diminish and, at all events temporarily, disappear. Justifiable attempts have also been made to turn this antagonism between neuroses and group formation to therapeutic account. Even those who do not regret the disappearance of religious illusions from the civilized world of to-day will admit that so long as they were in force they offered those who were bound by them the most powerful protection against the danger of neurosis. Nor is it hard to discern that all the ties that bind people to mystico-religious or philosophico-religious sects and communities are expressions of crooked cures of all kinds of neuroses. All of this is correlated with the contrast between directly sexual impulsions and those which are inhibited in their aims.

[1921c, 3833]

It has been repeatedly pointed out (by myself and in particular by Theodor Reik) in how great detail the analogy between religion and obsessional neurosis can be followed out, and how many of the peculiarities and vicissitudes in the formation of religion can be understood in that light. And it tallies well with this that devout believers are safeguarded in a high degree against the risk of certain neurotic illnesses; their acceptance of the universal neurosis spares them the task of constructing a personal one.

[1927c, 4453]

Religion restricts this play of choice and adaptation, since it imposes equally on everyone its own path to the acquisition of happiness and protection from suffering. Its technique consists in depressing the value of life and distorting the picture of the real world in a delusional manner - which presupposes an intimidation of the intelligence. At this price, by forcibly fixing them in a state of psychical infantilism and by drawing them into a mass-delusion, religion succeeds in sparing many people an individual neurosis. But hardly anything more. There are, as we have said, many paths which may lead to such happiness as is attainable by men, but there is none which does so for certain. Even religion cannot keep its promise. If the believer finally sees himself obliged to speak of God's 'inscrutable decrees', he is admitting that all that is left to him as a last possible consolation and source of pleasure in his suffering is an unconditional submission. And if he is prepared for that, he could probably have spared himself the détourn he has made.

[1930a, 4483]
I think, all the same, that I am justified in expressing myself in this way. I have tried to show that religious ideas have arisen from the same need as have all the other achievements of civilization: from the necessity of defending oneself against the crushingly superior force of nature. To this a second motive was added - the urge to rectify the shortcomings of civilization which made themselves painfully felt. Moreover, it is especially apposite to say that civilization gives the individual these ideas, for he finds them there already; they are presented to him ready-made, and he would not be able to discover them for himself. What he is entering into is the heritage of many generations, and he takes it over as he does the multiplication table, geometry, and similar things. There is indeed a difference in this, but that difference lies elsewhere and I cannot examine it yet. The feeling of strangeness that you mention may be partly due to the fact that this body of religious ideas is usually put forward as a divine revelation. But this presentation of it is itself a part of the religious system, and it entirely ignores the known historical development of these ideas and their differences in different epochs and civilizations.

In this function the mother is soon replaced by the stronger father, who retains that position for the rest of childhood. But the child’s attitude to its father is coloured by a peculiar ambivalence. The father himself constitutes a danger for the child, perhaps because of its earlier relation to its mother. Thus it fears him no less than it longs for him and admires him. The indications of this ambivalence in the attitude to the father are deeply imprinted in every religion, as was shown in *Totem and Taboo*. When the growing individual finds that he is destined to remain a child for ever, that he can never do without protection against strange superior powers, he lends those powers the features belonging to the figure of his father; he creates for himself the gods whom he dreads, whom he seeks to propitiate, and whom he nevertheless entrusts with his own protection. Thus his longing for a father is a motive identical with his need for protection against the consequences of his human weakness. The defence against childish helplessness is what lends its characteristic features to the adult’s reaction to the helplessness which he has to acknowledge - a reaction which is precisely the formation of religion. But it is not my intention to enquire any further into the development of the idea of God; what we are concerned with here is the finished body of religious ideas as it is transmitted by civilization to the individual.
In view of these similarities and analogies one might venture to regard obsessional neurosis as a pathological counterpart of the formation of a religion, and to describe that neurosis as an individual religiosity and religion as a universal obsessional neurosis. The most essential similarity would reside in the underlying renunciation of the activation of instincts that are constitutionally present; and the chief difference would lie in the nature of those instincts, which in the neurosis are exclusively sexual in their origin, while in religion they spring from egoistic sources.

[1907b, 1909]

An investigation of primitive peoples shows mankind caught up, to begin with, in a childish belief in its own omnipotence.¹ A whole number of mental structures can thus be understood as attempts to deny whatever might disturb this feeling of omnipotence and so to prevent emotional life from being affected by reality until the latter could be better controlled and used for purposes of satisfaction. The principle of avoiding unpleasure dominates human actions until it is replaced by the better one of adaptation to the external world. *Pari passu* with men's progressive control over the world goes a development in their *Weltanschauung*, their view of the universe as a whole. They turn away more and more from their original belief in their own omnipotence, rising from an animistic phase through a religious to a scientific one. Myths, religion and morality find their place in this scheme as attempts to seek a compensation for the lack of satisfaction of human wishes.

[1913j, 2822]

I myself set a higher value on my contributions to the psychology of religion, which began with the establishment of a remarkable similarity between obsessive actions and religious practices or ritual (1907b). Without as yet understanding the deeper connections, I described the obsessional neurosis as a distorted private religion and religion as a kind of universal obsessional neurosis. Later on, in 1912, Jung's forcible indication of the far-reaching analogies between the mental products of neurotics and of primitive peoples led me to turn my attention to that subject. In four essays, which were collected into a book with the title of *Totem and Taboo*, I showed that the horror of incest was even more marked among primitive than among civilized races and had given rise to very special measures of defence against it. I examined the relations between taboo-prohibitions (the earliest form in which moral restrictions make their appearance) and emotional ambivalence; and I discovered under the primitive scheme of the universe known as 'animism' the principle of the over-estimation of the importance of psychical reality - the belief in 'the omnipotence of thoughts' - which lies at the root of magic as well. I developed the comparison with the obsessional neurosis at every point, and showed how many of the postulates of primitive mental life are still in force in that remarkable illness. Above all, however, I was attracted by totemism, the first system of organization in primitive tribes, a system in which the beginnings of social order are united with a rudimentary religion and the implacable domination of a small number of taboo-prohibitions. The being that is revered is ultimately always an animal, from which the clan also claims to be descended. Many indications pointed to the conclusion that every race, even the most highly developed, had once passed through the stage of totemism.

[1925d, 4239]
We now observe that the store of religious ideas includes not only wish-fulfilments but important historical recollections. This concurrent influence of past and present must give religion a truly incomparable wealth of power. But perhaps with the help of an analogy yet another discovery may begin to dawn on us. Though it is not a good plan to transplant ideas far from the soil in which they grew up, yet here is a conformity which we cannot avoid pointing out. We know that a human child cannot successfully complete its development to the civilized stage without passing through a phase of neurosis sometimes of greater and sometimes of less distinctness. This is because so many instinctual demands which will later be unserviceable cannot be suppressed by the rational operation of the child's intellect but have to be tamed by acts of repression, behind which, as a rule, lies the motive of anxiety. Most of these infantile neuroses are overcome spontaneously in the course of growing up, and this is especially true of the obsessional neuroses of childhood. The remainder can be cleared up later still by psychoanalytic treatment. In just the same way, one might assume, humanity as a whole, in its development through the ages, fell into states analogous to the neuroses, and for the same reasons - namely because in the times of its ignorance and intellectual weakness the instinctual renunciations indispensable for man's communal existence had only been achieved by it by means of purely affective forces. The precipitates of these processes resembling repression which took place in prehistoric times still remained attached to civilization for long periods. Religion would thus be the universal obsessional neurosis of humanity; like the obsessional neurosis of children, it arose out of the Oedipus complex, out of the relation to the father. If this view is right, it is to be supposed that a turning-away from religion is bound to occur with the fatal inevitability of a process of growth, and that we find ourselves at this very juncture in the middle of that phase of development. Our behaviour should therefore be modelled on that of a sensible teacher who does not oppose an impending new development but seeks to ease its path and mitigate the violence of its irruption. Our analogy does not, to be sure, exhaust the essential nature of religion. If, on the one hand, religion brings with it obsessional restrictions, exactly as an individual obsessional neurosis does, on the other hand it comprises a system of wishful illusions together with a disavowal of reality, such as we find in an isolated form nowhere else but in amnesia, in a state of blissful hallucinatory confusion. But these are only analogies, by the help of which we endeavour to understand a social phenomenon; the pathology of the individual does not supply us with a fully valid counterpart.

[1927c, 4452]

It has been repeatedly pointed out (by myself and in particular by Theodor Reik) in how great detail the analogy between religion and obsessional neurosis can be followed out, and how many of the peculiarities and vicissitudes in the formation of religion can be understood in that light. And it tallies well with this that devout believers are safeguarded in a high degree against the risk of certain neurotic illnesses; their acceptance of the universal neurosis spares them the task of constructing a personal one.

[1927c, 4453]
You will not find me inaccessible to your criticism. I know how difficult it is to avoid illusions; perhaps the hopes I have confessed to are of an illusory nature, too. But I hold fast to one distinction. Apart from the fact that no penalty is imposed for not sharing them, my illusions are not, like religious ones, incapable of correction. They have not the character of a delusion. If experience should show - not to me, but to others after me, who think as I do - that we have been mistaken, we will give up our expectations. Take my attempt for what it is. A psychologist who does not deceive himself about the difficulty of finding one's bearings in this world, makes an endeavour to assess the development of man, in the light of the small portion of knowledge he has gained through a study of the mental processes of individuals during their development from child to adult. In so doing, the idea forces itself upon him that religion is comparable to a childhood neurosis, and he is optimistic enough to suppose that mankind will surmount this neurotic phase, just as so many children grow out of their similar neurosis. These discoveries derived from individual psychology may be insufficient, their application to the human race unjustified, and his optimism unfounded. I grant you all these uncertainties. But often one cannot refrain from saying what one thinks, and one excuses oneself on the ground that one is not giving it out for more than it is worth.

[1927c, 4459]

In summary, therefore, the judgement of science on the religious Weltanschauung is this. While the different religions wrangle with one another as to which of them is in possession of the truth, our view is that the question of the truth of religious beliefs may be left altogether on one side. Religion is an attempt to master the sensory world in which we are situated by means of the wishful world which we have developed within us as a result of biological and psychological necessities. But religion cannot achieve this. Its doctrines bear the imprint of the times in which they arose, the ignorant times of the childhood of humanity. Its consolations deserve no trust. Experience teaches us that the world is no nursery. The ethical demands on which religion seeks to lay stress need, rather, to be given another basis; for they are indispensable to human society and it is dangerous to link obedience to them with religious faith. If we attempt to assign the place of religion in the evolution of mankind, it appears not as a permanent acquisition but as a counterpart to the neurosis which individual civilized men have to go through in their passage from childhood to maturity.

[1933a, 4766]

We are living here in a Catholic country under the protection of that Church, uncertain how long that protection will hold out. But so long as it lasts, we naturally hesitate to do anything that would be bound to arouse the Church's hostility. This is not cowardice, but prudence. The new enemy, to whom we want to avoid being of service, is more dangerous than the old one with whom we have already learnt to come to terms. The psycho-analytic researches which we carry on are in any case viewed with suspicious attention by Catholicism. I will not maintain that this is unjustly so. If our work leads us to a conclusion which reduces religion to a neurosis of humanity and explains its enormous power in the same way as a neurotic compulsion in our individual patients, we may be sure of drawing the resentment of our ruling powers down upon us. Not that I should have anything to say that would be new or that I did not say clearly a quarter of a century ago: but it has been forgotten in the meantime and it could not be without effect if I repeated it to-day and illustrated it from an example which offers a standard for all religious foundations. It would probably lead to our being prohibited from practising psycho-analysis. Such violent methods of suppression are, indeed, by no means alien to the Church; the fact is rather that it feels it as an invasion of its privileges if someone else makes use of those methods. But psycho-analysis, which in the course of my long life has gone everywhere, still possesses no home that could be more valuable for it than the city in which it was born and grew up.

[1939a, 4883]
As regards internal difficulties, a political revolution and a change of domicile could alter nothing. No less than before, I feel uncertain in the face of my own work; I lack the consciousness of unity and of belonging together which should exist between an author and his work. It is not as though there were an absence of conviction in the correctness of my conclusion. I acquired that a quarter of a century ago when in 1912 I wrote my book about Totem and Taboo, and it has only grown firmer since. From that time I have never doubted that religious phenomena are only to be understood on the pattern of the individual neurotic symptoms familiar to us - as the return of long since forgotten, important events in the primaeval history of the human family - and that they have to thank precisely this origin for their compulsive character and that, accordingly, they are effective on human beings by force of the historical truth of their content. My uncertainty sets in only when I ask myself whether I have succeeded in proving these theses in the example which I have chosen here of Jewish monotheism. To my critical sense this book, which takes its start from the man Moses, appears like a dancer balancing on the tip of one toe. If I could not find support in an analytic interpretation of the exposure myth and could not pass from there to Sellin's suspicion about the end of Moses, the whole thing would have had to remain unwritten. In any case, let us now take the plunge.

[1939a, 4885]
Concealed behind this somewhat unpromising title is the book of a brave man who succeeds in telling the reader much that is worthy of consideration. The sub-title of the work reveals more of its content: 'A Philosophy of Small Words'. The author is in fact fighting against those 'little words and arrangements of words which exclude or include too much' and which reveal, in people who have the habit of using them for preference, a tendency towards 'exclusive or superlative judgements'. It is self-evident - our author would contest even this phrase - that the fight is not concerned with these harmless words but with the tendency to become intoxicated by them and to forget, on account of the exaggerated representation thus achieved, the necessary limitations on our pronouncements and the inevitable relativity of our judgements. It really serves as a useful warning if one is shown how much that was described by people of an earlier generation as 'self-evident' or as 'nonsensical' ranks with us to-day conversely as nonsensical or self-evident; or if we observe, in a series of well-chosen examples, to what a narrowing of their mental horizon even important writers must plead guilty, as a result of their misuse of superlatives. The exhortation to moderation in judgement and expression actually serves our author only as a point of departure for further discussions on other 'errors of thought' of human beings - on the central delusion, faith, on atheistic morality, and the like. In all these observations is manifest the author's honest endeavour to take seriously the implications of the particular view of the world necessitated by the discoveries of modern science, in particular of the theory of evolution. A lot that is psychologically accurate is included, and many truths of the kind that have often been said before but cannot be often enough repeated. The author has set himself the thankless task 'of improving and converting people' by means of exerting a sober influence, without seeking to move them to laughter by humour or sweep them along with him by passion. Let us wish him all success.

[1903-1904, 1996]

Having thus taken our bearings, let us return once more to the question of religious doctrines. We can now repeat that all of them are illusions and insusceptible of proof. No one can be compelled to think them true, to believe in them. Some of them are so improbable, so incompatible with everything we have laboriously discovered about the reality of the world, that we may compare them - if we pay proper regard to the psychological differences - to delusions. Of the reality value of most of them we cannot judge; just as they cannot be proved, so they cannot be refuted. We still know too little to make a critical approach to them. The riddles of the universe reveal themselves only slowly to our investigation; there are many questions to which science to-day can give no answer. But scientific work is the only road which can lead us to a knowledge of reality outside ourselves. It is once again merely an illusion to expect anything from intuition and introspection; they can give us nothing but particulars about our own mental life, which are hard to interpret, never any information about the questions which religious doctrine finds it so easy to answer. It would be insolent to let one's own arbitrary will step into the breach and, according to one's personal estimate, declare this or that part of the religious system to be less or more acceptable. Such questions are too momentous for that; they might be called too sacred.

[1927c, 4442]
You will not find me inaccessible to your criticism. I know how difficult it is to avoid illusions; perhaps the hopes I have confessed to are of an illusory nature, too. But I hold fast to one distinction. Apart from the fact that no penalty is imposed for not sharing them, my illusions are not, like religious ones, incapable of correction. They have not the character of a delusion. If experience should show - not to me, but to others after me, who think as I do - that we have been mistaken, we will give up our expectations. Take my attempt for what it is. A psychologist who does not deceive himself about the difficulty of finding one's bearings in this world, makes an endeavour to assess the development of man, in the light of the small portion of knowledge he has gained through a study of the mental processes of individuals during their development from child to adult. In so doing, the idea forces itself upon him that religion is comparable to a childhood neurosis, and he is optimistic enough to suppose that mankind will surmount this neurotic phase, just as so many children grow out of their similar neurosis. These discoveries derived from individual psychology may be insufficient, their application to the human race unjustified, and his optimism unfounded. I grant you all these uncertainties. But often one cannot refrain from saying what one thinks, and one excuses oneself on the ground that one is not giving it out for more than it is worth.

[1927c, 4459]

Another procedure operates more energetically and more thoroughly. It regards reality as the sole enemy and as the source of all suffering, with which it is impossible to live, so that one must break off all relations with it if one is to be in any way happy. The hermit turns his back on the world and will have no truck with it. But one can do more than that; one can try to re-create the world, to build up in its stead another world in which its most unbearable features are eliminated and replaced by others that are in conformity with one's own wishes. But whoever, in desperate defiance, sets out upon this path to happiness will as a rule attain nothing. Reality is too strong for him. He becomes a madman, who for the most part finds no one to help him in carrying through his delusion. It is asserted, however, that each one of us behaves in some one respect like a paranoic, corrects some aspect of the world which is unbearable to him by the construction of a wish and introduces this delusion into reality. A special importance attaches to the case in which this attempt to procure a certainty of happiness and a protection against suffering through a delusional remoulding of reality is made by a considerable number of people in common. The religions of mankind must be classed among the mass delusions of this kind. No one, needless to say, who shares a delusion ever recognizes it as such.

[1930a, 4480]

Religion restricts this play of choice and adaptation, since it imposes equally on everyone its own path to the acquisition of happiness and protection from suffering. Its technique consists in depressing the value of life and distorting the picture of the real world in a delusional manner - which presupposes an intimidation of the intelligence. At this price, by forcibly fixing them in a state of psychical infantilism and by drawing them into a mass-delusion, religion succeeds in sparing many people an individual neurosis. But hardly anything more. There are, as we have said, many paths which may lead to such happiness as is attainable by men, but there is none which does so for certain. Even religion cannot keep its promise. If the believer finally sees himself obliged to speak of God's 'inscrutable decrees', he is admitting that all that is left to him as a last possible consolation and source of pleasure in his suffering is an unconditional submission. And if he is prepared for that, he could probably have spared himself the détour he has made.

[1930a, 4483]
It is worth specially stressing the fact that each portion which returns from oblivion asserts itself with peculiar force, exercises an incomparably powerful influence on people in the mass, and raises an irresistible claim to truth against which logical objections remain powerless: a kind of 'credo quia absurdum'. This remarkable feature can only be understood on the pattern of the delusions of psychotics. We have long understood that a portion of forgotten truth lies hidden in delusional ideas, that when this returns it has to put up with distortions and misunderstandings, and that the compulsive conviction which attaches to the delusion arises from this core of truth and spreads out on to the errors that wrap it round. We must grant an ingredient such as this of what may be called historical truth to the dogmas of religion as well, which, it is true, bear the character of psychotic symptoms but which, as group phenomena, escape the curse of isolation. [1939a, 4909]

We have learnt from the psycho-analyses of individuals that their earliest impressions, received at a time when the child was scarcely yet capable of speaking, produce at some time or another effects of a compulsive character without themselves being consciously remembered. We believe we have a right to make the same assumption about the earliest experiences of the whole of humanity. One of these effects would be the emergence of the idea of a single great god - an idea which must be recognized as a completely justified memory, though, it is true, one that has been distorted. An idea such as this has a compulsive character: it must be believed. To the extent to which it is distorted, it may be described as a delusion; in so far as it brings a return of the past, it must be called the truth. Psychiatric delusions, too, contain a small fragment of truth and the patient's conviction extends over from this truth on to its delusional wrappings. [1939a, 4947]

The further development takes us beyond Judaism. The remainder of what returned from the tragic drama of the primal father was no longer reconcilable in any way with the religion of Moses. The sense of guilt of those days was very far from being any longer restricted to the Jewish people; it had caught hold of all the Mediterranean peoples as a dull malaise, a premonition of calamity for which no one could suggest a reason. Historians of our day speak of an ageing of ancient civilization, but I suspect that they have only grasped accidental and contributory causes of this depressed mood of the peoples. The elucidation of this situation of depression sprang from Jewry. Irrespectively of all the approximations and preparations in the surrounding world, it was after all a Jewish man, Saul of Tarsus (who, as a Roman citizen, called himself Paul), in whose spirit the realization first emerged: 'the reason we are so unhappy is that we have killed God the father.' And it is entirely understandable that he could only grasp this piece of truth in the delusional disguise of the glad tidings: 'we are freed from all guilt since one of us has sacrificed his life to absolve us.' In this formula the killing of God was of course not mentioned, but a crime that had to be atoned by the sacrifice of a victim could only have been a murder. And the intermediate step between the delusion and the historical truth was provided by the assurance that the victim of the sacrifice had been God's son. With the strength which it derived from the source of historical truth, this new faith overthrew every obstacle. The blissful sense of being chosen was replaced by the liberating sense of redemption. But the fact of the parricide, in returning to the memory of mankind, had to overcome greater resistances than the other fact, which had constituted the subject-matter of monotheism; it was also obliged to submit to a more powerful distortion. The unnameable crime was replaced by the hypothesis of what must be described as a shadowy 'original sin'. [1939a, 4952]
If we consider mankind as a whole and substitute it for the single human individual, we discover that it too has developed delusions which are inaccessible to logical criticism and which contradict reality. If, in spite of this, they are able to exert an extraordinary power over men, investigation leads us to the same explanation as in the case of the single individual. They owe their power to the element of *historical truth* which they have brought up from the repression of the forgotten and primaeval past.

[1937d, 5059]
There can be no doubt about the meaning of this animal myth. It is certain that this is merely ascribing to animals something that is a hallowed custom among men. The procedure gone through by the eagle with his young is an ordeal, a test of lineage, such as is reported of the most various races of antiquity. Thus the Celts living on the banks of the Rhine used to entrust their new-born babies to the waters of the river, in order to ascertain whether they were truly of their own blood. The clan of Psylli, who inhabited what is now Tripoli, boasted that they were descended from snakes, and used to expose their infants to contact with them; those who were true-born children of the clan were either not bitten or recovered rapidly from the effects of the bite.¹ The assumption underlying these trials leads us deep into the totemic habits of thought of primitive peoples. The totem - an animal, or a natural force animistically conceived, to which the tribe traces back its origin - spares the members of the tribe as being its own children, just as it itself is honoured by them as being their ancestor and is spared by them. We have here arrived at the consideration of matters which, as it seems to me, may make it possible to arrive at a psycho-analytic explanation of the origins of religion.

¹ [1911c, 2446]

This short postscript to my analysis of a paranoid patient may serve to show that Jung had excellent grounds for his assertion that the mythopoeic forces of mankind are not extinct, but that to this very day they give rise in the neuroses to the same psychical products as in the remotest past ages. I should like to take up a suggestion that I myself made some time ago,¹ and add that the same holds good of the forces that construct religions. And I am of opinion that the time will soon be ripe for us to make an extension of a thesis which has long been asserted by psycho-analysts, and to complete what has hitherto had only an individual and ontogenetic application by the addition of its anthropological counterpart, which is to be conceived phylogenetically. 'In dreams and in neuroses', so our thesis has run, 'we come once more upon the child and the peculiarities which characterize his modes of thought and his emotional life.' 'And we come upon the savage too,' we may now add, 'upon the primitive man, as he stands revealed to us in the light of the researches of archaeology and of ethnology.'

¹ [1911c, 2447]

With the mention of phylogenesis, however, fresh problems arise, from which one is tempted to draw cautiously back. But there is no help for it, the attempt must be made - in spite of a fear that it will lay bare the inadequacy of our whole effort. The question is: which was it, the ego of primitive man or his id, that acquired religion and morality in those early days out of the father-complex? If it was his ego, why do we not speak simply of these things being inherited by the ego? If it was the id, how does that agree with the character of the id? Or are we wrong in carrying the differentiation between ego, super-ego, and id back into such early times? Or should we not honestly confess that our whole conception of the processes in the ego is of no help in understanding phylogenesis and cannot be applied to it?

¹ [1923b, 3972]
Shortly before I wrote this study it seemed as though my life would soon be brought to an end by the recurrence of a malignant disease; but surgical skill saved me in 1923 and I was able to continue my life and my work, though no longer in freedom from pain. In the period of more than ten years that has passed since then, I have never ceased my analytic work nor my writing - as is proved by the completion of the twelfth volume of the German edition of my collected works. But I myself find that a significant change has come about. Threads which in the course of my development had become intertangled have now begun to separate; interests which I had acquired in the later part of my life have receded, while the older and original ones become prominent once more. It is true that in this last decade I have carried out some important pieces of analytic work, such as the revision of the problem of anxiety in my book *Inhibitions, Symptoms and Anxiety* (1926d) or the simple explanation of sexual 'fetishism' which I was able to make a year later (1927e). Nevertheless it would be true to say that, since I put forward my hypothesis of the existence of two classes of instinct (Eros and the death instinct) and since I proposed a division of the mental personality into an ego, a super-ego, and an id (1923b), I have made no further decisive contributions to psycho-analysis: what I have written on the subject since then has been either unessential or would soon have been supplied by someone else. This circumstance is connected with an alteration in myself, with what might be described as a phase of regressive development. My interest, after making a lifelong détour through the natural sciences, medicine and psychotherapy, returned to the cultural problems which had fascinated me long before, when I was a youth scarcely old enough for thinking. At the very climax of my psycho-analytic work, in 1912, I had already attempted in *Totem and Taboo* to make use of the newly discovered findings of analysis in order to investigate the origins of religion and morality. I now carried this work a stage further in two later essays, *The Future of an Illusion* (1927c) and *Civilization and its Discontents* (1930a). I perceived ever more clearly that the events of human history, the interactions between human nature, cultural development and the precipitates of primaeval experiences (the most prominent example of which is religion) are no more than a reflection of the dynamic conflicts between the ego, the id and the super-ego, which psycho-analysis studies in the individual - are the very same processes repeated upon a wider stage. In *The Future of an Illusion* I expressed an essentially negative valuation of religion. Later, I found a formula which did better justice to it: while granting that its power lies in the truth which it contains, I showed that that truth was not a material but a historical truth.

[1925d, 4244]

But here our plea for ascribing purely rational reasons to the precepts of civilization - that is to say, for deriving them from social necessity - is interrupted by a sudden doubt. We have chosen as our example the origin of the prohibition against murder. But does our account of it tally with historical truth? We fear not; it appears to be nothing but a rationalistic construction. With the help of psycho-analysis, we have made a study of precisely this piece of the cultural history of mankind, and, basing ourselves on it, we are bound to say that in reality things happened otherwise. Even in present-day man purely reasonable motives can effect little against passionate impulsions. How much weaker then must they have been in the human animal of primaeval times! Perhaps his descendants would even now kill one another without inhibition, if it were not that among those murderous acts there was one - the killing of the primitive father - which evoked an irresistible emotional reaction with momentous consequences. From it arose the commandment: Thou shalt not kill. Under totemism this commandment was restricted to the father-substitute; but it was later extended to other people, though even to-day it is not universally obeyed.

[1927c, 4451]
But, as was shown by arguments which I need not repeat here, the primal father was the original image of God, the model on which later generations have shaped the figure of God. Hence the religious explanation is right, God actually played a part in the genesis of that prohibition; it was His influence, not any insight into social necessity, which created it. And the displacement of man's will on to God is fully justified. For men knew that they had disposed of their father by violence, and in their reaction to that impious deed, they determined to respect his will thenceforward. Thus religious doctrine tells us the historical truth - though subject, it is true, to some modification and disguise - whereas our rational account disavows it.

[1927c, 4451]

I feel sure that while you have been listening to me you have been bothered by a number of questions which you would be glad to hear answered. I cannot undertake to do so here and now, but I feel confident that none of these detailed enquiries would upset our thesis that the religious Weltanschauung is determined by the situation of our childhood. That being so, it is all the more remarkable that, in spite of its infantile nature, it nevertheless had a precursor. There is no doubt that there was a time without religion, without gods. This is known as the stage of animism. At that time, too, the world was peopled with spiritual beings resembling men - we call them demons. All the objects in the external world were their habitation, or perhaps were identical with them; but there was no superior power which had created them all and afterwards ruled them and to which one could turn for protection and help. The demons of animism were for the most part hostile in their attitude to human beings, but it appears that human beings had more self-confidence then than later on. They were certainly in a constant state of the most acute fear of these evil spirits; but they defended themselves against them by certain actions to which they ascribed the power to drive them away. Nor apart from this did they regard themselves as defenceless. If they desired something from Nature - if they wished for rain, for instance - they did not direct a prayer to the weather-god, but they performed a magical act which they expected to influence Nature directly: they themselves did something which resembled rain. In their struggle against the powers of the world around them their first weapon was magic, the earliest fore-runner of the technology of to-day. Their reliance on magic was, as we suppose, derived from their overvaluation of their own intellectual operations, from their belief in the 'omnipotence of thoughts', which, incidentally, we come upon again in our obsessional neurotic patients. We may suppose that human beings at that period were particularly proud of their acquisitions in the way of language, which must have been accompanied by a great facilitation of thinking. They attributed magical power to words. This feature was later taken over by religion. 'And God said "Let there be light!" and there was light.' Moreover the fact of their magical actions shows that animistic men did not simply rely on the power of their wishes. They expected results, rather, from the performance of an action which would induce Nature to imitate it. If they wanted rain, they themselves poured out water; if they wanted to encourage the earth to be fruitful, they demonstrated a dramatic performance of sexual intercourse to it in the fields.

[1933a, 4763]

If our account of primaeval history is accepted as on the whole worthy of belief, two sorts of elements will be recognized in religious doctrines and rituals: on the one hand fixations to the ancient history of the family and survivals of it, and on the other hand revivals of the past and returns, after long intervals, of what has been forgotten. It is this last portion which, hitherto overlooked and therefore not understood, is to be demonstrated here in at least one impressive instance.

[1939a, 4908]
Footnote added 1923:] The omnipotence of thoughts, or, more accurately speaking, of wishes, has since been recognized as an essential element in the mental life of primitive people. See Totem and Taboo (1912-13).

To-day we find taboos among primitive peoples already elaborated into an intricate system of just the sort that neurotics among ourselves develop in their phobias, and we find old motifs replaced by new ones that fit together harmoniously. Leaving aside these genetic problems, then, we will go back to the idea that primitive man institutes a taboo where he fears some danger. Taking it generally this danger is a psychical one, for primitive man is not impelled at this point to make two distinctions, which to us it seems cannot be disregarded. He does not separate material from psychical danger, nor real from imaginary. In his consistently applied animistic view of the universe, every danger springs from the hostile intention of some being with a soul like himself, and this is as much the case with dangers which threaten him from some natural force as it is with those from other human beings or animals. But on the other hand he is accustomed to project his own internal impulses of hostility on to the external world, to ascribe them, that is, to the objects which he feels to be disagreeable or even merely strange. In this way women also are regarded as being a source of such dangers, and the first act of sexual intercourse with a woman stands out as a danger of particular intensity.

This short postscript to my analysis of a paranoid patient may serve to show that Jung had excellent grounds for his assertion that the mythopoeic forces of mankind are not extinct, but that to this very day they give rise in the neuroses to the same psychical products as in the remotest past ages. I should like to take up a suggestion that I myself made some time ago,¹ and add that the same holds good of the forces that construct religions. And I am of opinion that the time will soon be ripe for us to make an extension of a thesis which has long been asserted by psycho-analysts, and to complete what has hitherto had only an individual and ontogenetic application by the addition of its anthropological counterpart, which is to be conceived phylogenetically. 'In dreams and in neuroses', so our thesis has run, 'we come once more upon the child and the peculiarities which characterize his modes of thought and his emotional life.' 'And we come upon the savage too,' we may now add, 'upon the primitive man, as he stands revealed to us in the light of the researches of archaeology and of ethnology.'

If that supposition is correct, a comparison between the psychology of primitive peoples, as it is taught by social anthropology, and the psychology of neurotics, as it has been revealed by psycho-analysis, will be bound to show numerous points of agreement and will throw new light upon familiar facts in both sciences.

We see, then, that these savages have an unusually great horror of incest, or are sensitive on the subject to an unusual degree, and that they combine this with a peculiarity which remains obscure to us - of replacing real blood-relationship by totem kinship. This latter contrast must not, however, be too much exaggerated, and we must remember that the totem prohibitions include that against real incest as a special case.
But the horror of incest shown by these peoples is not satisfied by the erection of the institutions which I have described and which seem to be directed principally against group incest. We must add to them a number of 'customs' which regulate the dealings of individuals with their near relatives in our sense of the term, customs which are enforced literally with religious strictness and the purpose of which can scarcely be doubted. These customs or customary prohibitions have been termed 'avoidances'. They extend far beyond the totemic races of Australia; but once again I must ask my readers to be content with a fragmentary extract from the copious material.

[1912-1913, 2658]

Anyone approaching the problem of taboo from the angle of psycho-analysis, that is to say, of the investigation of the unconscious portion of the individual mind, will recognize, after a moment's reflection, that these phenomena are far from unfamiliar to him. He has come across people who have created for themselves individual taboo prohibitions of this very kind and who obey them just as strictly as savages obey the communal taboos of their tribe or society. If he were not already accustomed to describing such people as 'obsessional' patients, he would find 'taboo sickness' a most appropriate name for their condition. Having learnt so much, however, about this obsessional sickness from psycho-analytic examination - its clinical aetiology and the essence of its psychical mechanism - he can scarcely refrain from applying the knowledge he has thus acquired to the parallel sociological phenomenon.

[1912-1913, 2674]

We have now discovered a motive which can explain the idea that the souls of those who have just died are transformed into demons and the necessity felt by survivors to protect themselves by taboos against their hostility. Let us suppose that the emotional life of primitive peoples is characterized by an amount of ambivalence as great as that which we are led by the findings of psycho-analysis to attribute to obsessional patients. It then becomes easy to understand how after a painful bereavement savages should be obliged to produce a reaction against the hostility latent in their unconscious similar to that expressed as obsessive self-reproach in the case of neurotics. But this hostility, distressingly felt in the unconscious as satisfaction over the death, is differently dealt with among primitive peoples. The defence against it takes the form of displacing it on to the object of the hostility, on to the dead themselves. This defensive procedure, which is a common one both in normal and in pathological mental life, is known as a 'projection'. The survivor thus denies that he has ever harboured any hostile feelings against the dead loved one; the soul of the dead harbours them instead and seeks to put them into action during the whole period of mourning. In spite of the successful defence which the survivor achieves by means of projection, his emotional reaction shows the characteristics of punishment and remorse, for he is the subject of fears and submits to renunciations and restrictions, though these are in part disguised as measures of protection against the hostile demon. Once again, therefore, we find that the taboo has grown up on the basis of an ambivalent emotional attitude. The taboo upon the dead arises, like the others, from the contrast between conscious pain and unconscious satisfaction over the death that has occurred. Since such is the origin of the ghost's resentment, it follows naturally that the survivors who have the most to fear will be those who were formerly its nearest and dearest.

[1912-1913, 2705]
The projection of unconscious hostility on to demons in the case of the taboo upon the dead is only a single instance of a number of processes to which the greatest influence must be attributed in the shaping of the primitive mind. In the case we have been dealing with, projection served the purpose of dealing with an emotional conflict; and it is employed in the same way in a large number of psychical situations that lead to neuroses. But projection was not created for the purpose of defence; it also occurs where there is no conflict. The projection outwards of internal perceptions is a primitive mechanism, to which, for instance, our sense perceptions are subject, and which therefore normally plays a very large part in determining the form taken by our external world. Under conditions whose nature has not yet been sufficiently established, internal perceptions of emotional and thought processes can be projected outwards in the same way as sense perceptions; they are thus employed for building up the external world, though they should by rights remain part of the internal world. This may have some genetic connection with the fact that the function of attention was originally directed not towards the internal world but towards the stimuli that stream in from the external world, and that that function's only information upon endopsychic processes was received from feelings of pleasure and unpleasure. It was not until a language of abstract thought had been developed, that is to say, not until the sensory residues of verbal presentations had been linked to the internal processes, that the latter themselves gradually became capable of being perceived. Before that, owing to the projection outwards of internal perceptions, primitive men arrived at a picture of the external world which we, with our intensified conscious perception, have now to translate back into psychology. [1912-1913, 2708]

Let us now return to the animistic system with which we are dealing. The insight we have gained into other psychological systems enables us to conclude that with primitive man, too, 'superstition' need not be the only or the real reason for some particular custom or observance and does not excuse us from the duty of searching for its hidden motives. Under the domination of an animistic system it is inevitable that every observance and every activity shall have a systematic basis, which nowadays we describe as 'superstitious'. 'Superstition' - like 'anxiety', 'dreams' and 'demons' - is one of those provisional psychological concepts which have crumbled under the impact of psycho-analytic research. Once we have penetrated behind these constructions, which are like screens erected as defences against correct understanding, we begin to realize that the mental life and cultural level of savages have not hitherto had all the recognition they deserve. [1912-1913, 2739]

I am under no illusion that in putting forward these attempted explanations I am laying myself open to the charge of endowing modern savages with a subtlety in their mental activities which exceeds all probability. It seems to me quite possible, however, that the same may be true of our attitude towards the psychology of those races that have remained at the animistic level as is true of our attitude towards the mental life of children, which we adults no longer understand and whose fullness and delicacy of feeling we have in consequence so greatly underestimated. [1912-1913, 2740]
In the first place, those who collect the observations are not the same as those who examine and discuss them. The former are travellers and missionaries while the latter are students who may never have set eyes on the objects of their researches. Again, communication with savages is not an easy matter. The observers are not always acquainted with the native language but may be obliged to rely on the help of interpreters or to conduct their inquiries through the medium of pidgin-English. Savages are not communicative on the subject of the most intimate details of their cultural life and they talk openly only to those foreigners who have lived among them for many years. They often give false or misleading information for a great variety of motives. (Cf. Frazer, 1910, 1, 150 f.) It should not be forgotten that primitive races are not young races but are in fact as old as civilized races. There is no reason to suppose that, for the benefit of our information, they have retained their original ideas and institutions undeveloped and undistorted. On the contrary, it is certain that there have been profound changes in every direction among primitive races, so that it is never possible to decide without hesitation how far their present-day conditions and opinions preserve the primaeval past in a petrified form and how far they are distortions and modifications of it. Hence arise the all-too-frequent disputes among the authorities as to which characteristics of a primitive civilization are to be regarded as primary and as to which are later and secondary developments. The determination of the original state of things thus invariably remains a matter of construction. Finally, it is not easy to feel one’s way into primitive modes of thinking. We misunderstand primitive men just as easily as we do children, and we are always apt to interpret their actions and feelings according to our own mental constellations.

Andrew Lang regards it as initially a matter of indifference how clans obtained their animal names. It is only necessary to assume that they awoke one day to the consciousness that they bore such names and could give no account of how this had come about. The origin of the names had been forgotten. They would then attempt to arrive at an explanation by speculating on the subject; and, in view of their belief in the importance of names, they were bound to reach all the ideas contained in the totemic system. Primitive races (as well as modern savages and even our own children²) do not, like us, regard names as something indifferent and conventional, but as significant and essential. A man's name is a principal component of his personality, perhaps even a portion of his soul. The fact of a primitive man bearing the same name as an animal must lead him to assume the existence of a mysterious and significant bond between himself and that particular species of animal. What other bond could it be than one of blood relationship? Once the similarity of names had led to this conclusion, the blood taboo would immediately involve all the totemic ordinances, including exogamy. 'No more than these three things - a group animal name of unknown origin; belief in a transcendent connection between all bearers, human and bestial, of the same name; and belief in the blood superstitions - was needed to give rise to all the totemic creeds and practices, including exogamy.' (Lang, 1905, 125 f.)

[1912-1913, 2752]
May not the same have been true of primitive men? We are justified in believing that, as one of the phenomena of their narcissistic organization, they overvalued their psychical acts to an extraordinary degree.² Accordingly the mere hostile impulse against the father, the mere existence of a wishful phantasy of killing and devouring him, would have been enough to produce the moral reaction that created totemism and taboo. In this way we should avoid the necessity for deriving the origin of our cultural legacy, of which we justly feel so proud, from a hideous crime, revolting to all our feelings. No damage would thus be done to the causal chain stretching from the beginning to the present day, for psychical reality would be strong enough to bear the weight of these consequences. To this it may be objected that an alteration in the form of society from a patriarchal horde to a fraternal clan did actually take place. This is a powerful argument, but not a conclusive one. The alteration might have been effected in a less violent fashion and none the less have been capable of determining the appearance of the moral reaction. So long as the pressure exercised by the primal father could be felt, the hostile feelings towards him were justified, and remorse on their account would have to await a later day. And if it is further argued that everything derived from the ambivalent relation to the father - taboo and the sacrificial ordinance - is characterized by the deepest seriousness and the most complete reality, this further objection carries just as little weight. For the ceremonials and inhibitions of obsessional neurotics show these same characteristics and are nevertheless derived only from psychical reality - from intentions and not from their execution. We must avoid transplanting a contempt for what is merely thought or wished from our commonplace world, with its wealth of material values, into the world of primitive men and neurotics, of which the wealth lies only within themselves.

Here we are faced by a decision which is indeed no easy one. First, however, it must be confessed that the distinction, which may seem fundamental to other people, does not in our judgement affect the heart of the matter. If wishes and impulses have the full value of facts for primitive men, it is our business to give their attitude our understanding attention instead of correcting it in accordance with our own standards. Let us, then, examine more closely the case of neurosis - comparison with which led us into our present uncertainty. It is not accurate to say that obsessional neurotics, weighed down under the burden of an excessive morality, are defending themselves only against psychical reality and are punishing themselves for impulses which were merely felt. Historical reality has a share in the matter as well. In their childhood they had these evil impulses pure and simple, and turned them into acts so far as the impotence of childhood allowed. Each of these excessively virtuous individuals passed though an evil period in his infancy - a phase of perversion which was the forerunner and precondition of the later period of excessive morality. The analogy between primitive men and neurotics will therefore be far more fully established if we suppose that in the former instance, too, psychical reality - as to the form taken by which we are in no doubt - coincided at the beginning with factual reality: that primitive men actually did what all the evidence shows that they intended to do.

Nor must we let ourselves be influenced too far in our judgement of primitive men by the analogy of neurotics. There are distinctions, too, which must be borne in mind. It is no doubt true that the sharp contrast that we make between thinking and doing is absent in both of them. But neurotics are above all inhibited in their actions: with them the thought is a complete substitute for the deed. Primitive men, on the other hand, are uninhibited: thought passes directly into action. With them it is rather the deed that is a substitute for the thought. And that is why, without laying claim to any finality of judgement, I think that in the case before us it may safely be assumed that 'in the beginning was the Deed'.

[1912-1913, 2798]

[1912-1913, 2799]
This extension of the libido theory - in my opinion, a legitimate one - receives reinforcement from a third quarter, namely, from our observations and views on the mental life of children and primitive peoples. In the latter we find characteristics which, if they occurred singly, might be put down to megalomania: an over-estimation of the power of their wishes and mental acts, the 'omnipotence of thoughts', a belief in the thaumaturgic force of words, and a technique for dealing with the external world - 'magic' - which appears to be a logical application of these grandiose premisses.¹ In the children of to-day, whose development is much more obscure to us, we expect to find an exactly analogous attitude towards the external world.² Thus we form the idea of there being an original libidinal cathexis of the ego, from which some is later given off to objects, but which fundamentally persists and is related to the object-cathexes much as the body of an amoeba is related to the pseudopodia which it puts out. In our researches, taking, as they did, neurotic symptoms for their starting-point, this part of the allocation of libido necessarily remained hidden from us at the outset. All that we noticed were the emanations of this libido - the object-cathexes, which can be sent out and drawn back again. We see also, broadly speaking, an antithesis between ego-libido and object-libido. The more of the one is employed, the more the other becomes depleted. The highest phase of development of which object-libido is capable is seen in the state of being in love, when the subject seems to give up his own personality in favour of an object-cathexis; while we have the opposite condition in the paranoid’s phantasy (or self-perception) of the 'end of the world'.³ Finally, as regards the differentiation of psychical energies, we are led to the conclusion that to begin with, during the state of narcissism, they exist together and that our analysis is too coarse to distinguish between them; not until there is object-cathexis is it possible to discriminate a sexual energy - the libido - from an energy of the ego-instincts.

[1914c, 2933]

Primaeval man took up a very remarkable attitude towards death. It was far from consistent; it was indeed most contradictory. On the one hand, he took death seriously, recognized it as the termination of life and made use of it in that sense; on the other hand, he also denied death and reduced it to nothing. This contradiction arose from the fact that he took up radically different attitudes towards the death of other people, of strangers, of enemies, and towards his own. He had no objection to someone else's death; it meant the annihilation of someone he hated, and primitive man had no scruples against bringing it about. He was no doubt a very passionate creature and more cruel and more malignant than other animals. He liked to kill, and killed as a matter of course. The instinct which is said to restrain other animals from killing and devouring their own species need not be attributed to him.

[1915b, 3084]

What I have been trying to describe in this outline is the libido theory of the neuroses, upon which are founded all our conceptions of the nature of these morbid states, together with our therapeutic measures for relieving them. We naturally regard the premises of the libido theory as valid for normal behaviour as well. We speak of the narcissism of small children, and it is to the excessive narcissism of primitive man that we ascribe his belief in the omnipotence of his thoughts and his consequent attempts to influence the course of events in the external world by the technique of magic.

[1917a, 3610]
(b) In the course of the development of civilization man acquired a dominating position over his fellow-creatures in the animal kingdom. Not content with this supremacy, however, he began to place a gulf between his nature and theirs. He denied the possession of reason to them, and to himself he attributed an immortal soul, and made claims to a divine descent which permitted him to break the bond of community between him and the animal kingdom. Curiously enough, this piece of arrogance is still foreign to children, just as it is to primitive and primaeval man. It is the result of a later, more pretentious stage of development. At the level of totemism primitive man had no repugnance to tracing his descent from an animal ancestor. In myths, which contain the precipitate of this ancient attitude of mind, the gods take animal shapes, and in the art of earliest times they are portrayed with animals' heads. A child can see no difference between his own nature and that of animals. He is not astonished at animals thinking and talking in fairy-tales; he will transfer an emotion of fear which he feels for his human father onto a dog or a horse, without intending any derogation of his father by it. Not until he is grown up does he become so far estranged from animals as to use their names in vilification of human beings.

[1917a, 3611]

The theme of the 'double' has been very thoroughly treated by Otto Rank (1914). He has gone into the connections which the 'double' has with reflections in mirrors, with shadows, with guardian spirits, with the belief in the soul and with the fear of death; but he also lets in a flood of light on the surprising evolution of the idea. For the 'double' was originally an insurance against the destruction of the ego, an 'energetic denial of the power of death', as Rank says; and probably the 'immortal' soul was the first 'double' of the body. This invention of doubling as a preservation against extinction has its counterpart in the language of dreams, which is fond of representing castration by a doubling or multiplication of a genital symbol. The same desire led the Ancient Egyptians to develop the art of making images of the dead in lasting materials. Such ideas, however, have sprung from the soil of unbounded self-love, from the primary narcissism which dominates the mind of the child and of primitive man. But when this stage has been surmounted, the 'double' reverses its aspect. From having been an assurance of immortality, it becomes the uncanny harbinger of death.

[1919h, 3687]

These last examples of the uncanny are to be referred to the principle which I have called 'omnipotence of thoughts', taking the name from an expression used by one of my patients. And now we find ourselves on familiar ground. Our analysis of instances of the uncanny has led us back to the old, animistic conception of the universe. This was characterized by the idea that the world was peopled with the spirits of human beings; by the subject's narcissistic overvaluation of his own mental processes; by the belief in the omnipotence of thoughts and the technique of magic based on that belief; by the attribution to various outside persons and things of carefully graded magical powers, or 'mana'; as well as by all the other creations with the help of which man, in the unrestricted narcissism of that stage of development, strove to fend off the manifest prohibitions of reality. It seems as if each one of us has been through a phase of individual development corresponding to this animistic stage in primitive men, that none of us has passed through it without preserving certain residues and traces of it which are still capable of manifesting themselves, and that everything which now strikes us as 'uncanny' fulfils the condition of touching those residues of animistic mental activity within us and bringing them to expression.¹

[1919h, 3691]
Many people experience the feeling in the highest degree in relation to death and dead bodies, to the return of the dead, and to spirits and ghosts. As we have seen some languages in use to-day can only render the German expression ‘an unheimlich house’ by ‘a haunted house’. We might indeed have begun our investigation with this example, perhaps the most striking of all, of something uncanny, but we refrained from doing so because the uncanny in it is too much intermixed with what is purely gruesome and is in part overlaid by it. There is scarcely any other matter, however, upon which our thoughts and feelings have changed so little since the very earliest times, and in which discarded forms have been so completely preserved under a thin disguise, as our relation to death. Two things account for our conservatism: the strength of our original emotional reaction to death and the insufficiency of our scientific knowledge about it. Biology has not yet been able to decide whether death is the inevitable fate of every living being or whether it is only a regular but yet perhaps avoidable event in life. It is true that the statement ‘All men are mortal’ is paraded in text-books of logic as an example of a general proposition; but no human being really grasps it, and our unconscious has as little use now as it ever had for the idea of its own mortality. Religions continue to dispute the importance of the undeniable fact of individual death and to postulate a life after death; civil governments still believe that they cannot maintain moral order among the living if they do not uphold the prospect of a better life hereafter as a recompense for mundane existence. In our great cities, placards announce lectures that undertake to tell us how to get into touch with the souls of the departed; and it cannot be denied that not a few of the most able and penetrating minds among our men of science have come to the conclusion, especially towards the close of their own lives, that a contact of this kind is not impossible. Since almost all of us still think as savages do on this topic, it is no matter for surprise that the primitive fear of the dead is still so strong within us and always ready to come to the surface on any provocation. Most likely our fear still implies the old belief that the dead man becomes the enemy of his survivor and seeks to carry him off to share his new life with him. Considering our unchanged attitude towards death, we might rather enquire what has become of the repression, which is the necessary condition of a primitive feeling recurring in the shape of something uncanny. But repression is there, too. All supposedly educated people have ceased to believe officially that the dead can become visible as spirits, and have made any such appearances dependent on improbable and remote conditions; their emotional attitude towards their dead, moreover, once a highly ambiguous and ambivalent one, has been toned down in the higher strata of the mind into an unambiguous feeling of piety.¹

Let us turn back, then, to one of the assumptions that we have already made, with the expectation that we shall be able to give it a categorical denial. We have drawn far-reaching conclusions from the hypothesis that all living substance is bound to die from internal causes. We made this assumption thus carelessly because it does not seem to us to be an assumption. We are accustomed to think that such is the fact, and we are strengthened in our thought by the writings of our poets. Perhaps we have adopted the belief because there is some comfort in it. If we are to die ourselves, and first to lose in death those who are dearest to us, it is easier to submit to a remorseless law of nature, to the sublime ‘Ανάγχη, than to a chance which might perhaps have been escaped. It may be, however, that this belief in the internal necessity of dying is only another of those illusions which we have created ‘um die Schwere des Daseins zu ertragen’. It is certainly not a primaeval belief. The notion of ‘natural death’ is quite foreign to primitive races; they attribute every death that occurs among them to the influence of an enemy or of an evil spirit. We must therefore turn to biology in order to test the validity of the belief.  

¹ [1919h, 3692]

[1920g, 3745]
At the same time as this identification with his father, or a little later, the boy has begun to develop a true object-cathexis towards his mother according to the attachment type. He then exhibits, therefore, two psychologically distinct ties: a straightforward sexual object-cathexis towards his mother and an identification with his father which takes him as his model. The two subsist side by side for a time without any mutual influence or interference. In consequence of the irresistible advance towards a unification of mental life, they come together at last; and the normal Oedipus complex originates from their confluence. The little boy notices that his father stands in his way with his mother. His identification with his father then takes on a hostile colouring and becomes identical with the wish to replace his father in regard to his mother as well. Identification, in fact, is ambivalent from the very first; it can turn into an expression of tenderness as easily as into a wish for someone’s removal. It behaves like a derivative of the first, oral phase of the organization of the libido, in which the object that we long for and prize is assimilated by eating and is in that way annihilated as such. The cannibal, as we know, has remained at this standpoint; he has a devouring affection for his enemies and only devours people of whom he is fond.

The Non-Medical Applications and Correlations of Psycho-analysis. - Any estimate of psycho-analysis would be incomplete if it failed to make clear that, alone among the medical disciplines, it has the most extensive relations with the mental sciences, and that it is in a position to play a part of the same importance in the studies of religious and cultural history and in the sciences of mythology and literature as it is in psychiatry. This may seem strange when we reflect that originally its only object was the understanding and improvement of neurotic symptoms. But it is easy to indicate the starting-point of the bridge that leads over to the mental sciences. The analysis of dreams gave us an insight into the unconscious processes of the mind and showed us that the mechanisms which produce pathological symptoms are also operative in the normal mind. Thus psychoanalysis became a depth-psychology and capable as such of being applied to the mental sciences, and it was able to answer a good number of questions with which the academic psychology of consciousness was helpless to deal. At quite an early stage problems of human phyllogenesis arose. It became clear that pathological function was often nothing more than a regression to an earlier stage in the development of normal function. C. G. Jung was the first to draw explicit attention to the striking similarity between the disordered phantasies of sufferers from dementia praecox and the myths of primitive peoples; while the present writer pointed out that the two wishes which combine to form the Oedipus complex coincide precisely with the two principal prohibitions imposed by totemism (not to kill the tribal ancestor and not to marry any woman belonging to one’s own clan) and drew far-reaching conclusions from this fact. The significance of the Oedipus complex began to grow to gigantic proportions and it looked as though social order, morals, justice and religion had arisen together in the primaeval ages of mankind as reaction-formation against the Oedipus complex. Otto Rank threw a brilliant light upon mythology and the history of literature by the application of psycho-analytic views, as did Theodor Reik upon the history of morals and religions, while Dr. Pfister, of Zurich, aroused the interest of religious and secular teachers and demonstrated the importance of the psycho-analytic standpoint for education. Further discussion of these applications of psycho-analysis would be out of place here, and it is enough to say that the limits of their influence are not yet in sight.

An interesting parallel to the replacement of object-choice by identification is to be found in the belief of primitive peoples, and in the prohibitions based upon it, that the attributes of animals which are incorporated as nourishment persist as part of the character of those who eat them. As is well known, this belief is one of the roots of cannibalism and its effects have continued through the series of usages of the totem meal down to Holy Communion. The consequences ascribed by this belief to oral mastery of the object do in fact follow in the case of the later sexual object-choice.
I myself set a higher value on my contributions to the psychology of religion, which began with the establishment of a remarkable similarity between obsessive actions and religious practices or ritual (1907b). Without as yet understanding the deeper connections, I described the obsessional neurosis as a distorted private religion and religion as a kind of universal obsessional neurosis. Later on, in 1912, Jung's forcible indication of the far-reaching analogies between the mental products of neurotics and of primitive peoples led me to turn my attention to that subject. In four essays, which were collected into a book with the title of *Totem and Taboo*, I showed that the horror of incest was even more marked among primitive than among civilized races and had given rise to very special measures of defence against it. I examined the relations between taboo-prohibitions (the earliest form in which moral restrictions make their appearance) and emotional ambivalence; and I discovered under the primitive scheme of the universe known as 'animism' the principle of the over-estimation of the importance of psychical reality - the belief in 'the omnipotence of thoughts' - which lies at the root of magic as well. I developed the comparison with the obsessional neurosis at every point, and showed how many of the postulates of primitive mental life are still in force in that remarkable illness. Above all, however, I was attracted by totemism, the first system of organization in primitive tribes, a system in which the beginnings of social order are united with a rudimentary religion and the implacable domination of a small number of taboo-prohibitions. The being that is revered is ultimately always an animal, from which the clan also claims to be descended. Many indications pointed to the conclusion that every race, even the most highly developed, had once passed through the stage of totemism. [1925d, 4239]
At this second stage of development, the conscience exhibits a peculiarity which was absent from the first stage and which is no longer easy to account for. For the more virtuous a man is, the more severe and distrustful is its behaviour, so that ultimately it is precisely those people who have carried saintliness furthest who reproach themselves with the worst sinfulness. This means that virtue forfeits some part of its promised reward; the docile and continent ego does not enjoy the trust of its mentor, and strives in vain, it would seem, to acquire it. The objection will at once be made that these difficulties are artificial ones, and it will be said that a stricter and more vigilant conscience is precisely the hallmark of a moral man. Moreover, when saints call themselves sinners, they are not so wrong, considering the temptations to instinctual satisfaction to which they are exposed in a specially high degree - since, as is well known, temptations are merely increased by constant frustration, whereas an occasional satisfaction of them causes them to diminish, at least for the time being. The field of ethics, which is so full of problems, presents us with another fact: namely that ill-luck - that is, external frustration - so greatly enhances the power of the conscience in the super-ego. As long as things to well with a man, his conscience is lenient and lets the ego do all sorts of things; but when misfortune befalls him, he searches his soul, acknowledges his sinfulness, heightens the demands of his conscience, imposes abstinences on himself and punishes himself with penances.¹ Whole peoples have behaved in this way, and still do. This, however, is easily explained by the original infantile stage of conscience, which, as we see, is not given up after the introjection into the super-ego, but persists alongside of it and behind it. Fate is regarded as a substitute for the parental agency. If a man is unfortunate it means that he is no longer loved by this highest power; and, threatened by such a loss of love, he once more bows to the parental representative in his super-ego - a representative whom, in his days of good fortune, he was ready to neglect. This becomes especially clear where Fate is looked upon in the strictly religious sense of being nothing else than an expression of the Divine Will. The people of Israel had believed themselves to be the favourite child of God, and when the great Father caused misfortune after misfortune to rain down upon this people of his, they were never shaken in their belief in his relationship to them or questioned his power or righteousness. Instead, they produced the prophets, who held up their sinfulness before them; and out of their sense of guilt they created the over-strict commandments of their priestly religion. It is remarkable how differently a primitive man behaves. If he has met with a misfortune, he does not throw the blame on himself but on his fetish, which has obviously not done its duty, and he gives it a thrashing instead of punishing himself.

We cannot go so far as to assert that the ambivalence of emotional cathexes is a universally valid law, and that it is absolutely impossible to feel great love for a person without its being accompanied by a hatred that is perhaps equally great, or vice versa. Normal adults do undoubtedly succeed in separating those two attitudes from each other, and do not find themselves obliged to hate their love-objects and to love their enemy as well as hate him. But this seems to be the result of later developments. In the first phases of erotic life, ambivalence is evidently the rule. Many people retain this archaic trait all through their lives. It is characteristic of obsessional neurotics that in their object-relationships love and hate counterbalance each other. In primitive races, too, we may say that ambivalence predominates. We shall conclude, then, that the little girl’s intense attachment to her mother is strongly ambivalent, and that it is in consequence precisely of this ambivalence that (with the assistance of the other factors we have adduced) her attachment is forced away from her mother - once again, that is to say, in consequence of a general characteristic of infantile sexuality.
The obscurity of the Prometheus legend, as of other fire myths, is increased by the fact that primitive man was bound to regard fire as something analogous to the passion of love - or, as we should say, as a symbol of the libido. The warmth that is radiated by fire calls up the same sensation that accompanies a state of sexual excitation, and the shape and movements of a flame suggest a phallus in activity. There can be no doubt about the mythological significance of flame as a phallus; we have further evidence of it in the legend of the parentage of Servius Tullius, the Roman king. When we ourselves speak of the 'devouring fire' of love and of 'licking' flames - thus comparing the flame to a tongue - we have not moved so very far away from the mode of thinking of our primitive ancestors. One of the presuppositions on which we based our account of the myth of the acquisition of fire was, indeed, that to primal man the attempt to quench fire with his own water had the meaning of a pleasurable struggle with another phallus. [1932a, 4784]

This may not seem obvious at first sight, and before it can carry conviction we must recall other processes of the same character in the development of human civilization. The earliest of these and perhaps the most important is merged in the obscurity of praeval ages. Its astonishing effects compel us to assert its occurrence. In our children, in adults who are neurotic, as well as in primitive peoples, we meet with the mental phenomenon which we describe as a belief in the 'omnipotence of thoughts'. In our judgement this lies in an over-estimation of the influence which our mental (in this case, intellectual) acts can exercise in altering the external world. At bottom, all magic, the precursor of our technology, rests on this premiss. All the magic of words, too, has its place here, and the conviction of the power which is bound up with the knowledge and pronouncing of a name. The 'omnipotence of thoughts' was, we suppose, an expression of the pride of mankind in the development of speech, which resulted in such an extraordinary advancement of intellectual activities. The new realm of intellectuality was opened up, in which ideas, memories and inferences became decisive in contrast to the lower psychical activity which had direct perceptions by the sense-organs as its content. This was unquestionably one of the most important stages on the path to hominization. [1939a, 4934]
To-day we find taboos among primitive peoples already elaborated into an intricate system of just the sort that neurotics among ourselves develop in their phobias, and we find old motifs replaced by new ones that fit together harmoniously. Leaving aside these genetic problems, then, we will go back to the idea that primitive man institutes a taboo where he fears some danger. Taking it generally this danger is a psychical one, for primitive man is not impelled at this point to make two distinctions, which to us it seems cannot be disregarded. He does not separate material from psychical danger, nor real from imaginary. In his consistently applied animistic view of the universe, every danger springs from the hostile intention of some being with a soul like himself, and this is as much the case with dangers which threaten him from some natural force as it is with those from other human beings or animals. But on the other hand he is accustomed to project his own internal impulses of hostility on to the external world, to ascribe them, that is, to the objects which he feels to be disagreeable or even merely strange. In this way women also are regarded as being a source of such dangers, and the first act of sexual intercourse with a woman stands out as a danger of particular intensity.

[1918a, 2356]

The projection of their own evil impulses into demons is only one portion of a system which constituted the \textit{Weltanschauung} of primitive peoples, and which we shall come to know as 'animism' in the following essay. There we shall have to investigate that system's psychological characteristics, and we shall do so once again by reference to the similar systems which we find constructed by neurotics. For the moment I will only say that the prototype of all such systems is what we have termed the 'secondary revision' of the content of dreams. And we must not forget that, at and after the stage at which systems are constructed, two sets of reasons can be assigned for every psychical event that is consciously judged - one set belonging to the system and the other set real but unconscious.¹

[1912-1913, 2709]

Animism is, in its narrower sense, the doctrine of souls, and, in its wider sense, the doctrine of spiritual beings in general. The term 'animatism' has also been used to denote the theory of the living character of what appear to us to be inanimate objects, and the terms 'animalism' and 'manism' occur as well in this connection. The word 'animism', originally used to describe a particular philosophical system, seems to have been given its present meaning by Tylor.²

[1912-1913, 2718]

What led to the introduction of these terms was a realization of the highly remarkable view of nature and the universe adopted by the primitive races of whom we have knowledge, whether in past history or at the present time. They people the world with innumerable spiritual beings both benevolent and malignant; and these spirits and demons they regard as the causes of natural phenomena and they believe that not only animals and plants but all the inanimate objects in the world are animated by them. A third, and perhaps the most important, article of this primitive 'philosophy of nature' strikes us as less strange, since, while we have retained only a very limited belief in the existence of spirits and explain natural phenomena by the agency of impersonal physical forces, we ourselves are not very far removed from this third belief. For primitive peoples believe that human individuals are inhabited by similar spirits. These souls which live in human beings can leave their habitations and migrate into other human beings; they are the vehicle of mental activities and are to a certain extent independent of their bodies. Originally souls were pictured as very similar to persons and only in the course of a long development have they lost their material characteristics and become to a high degree 'spiritualized'.¹

[1912-1913, 2719]
With these three stages in mind, it may be said that animism itself is not yet a religion but contains the foundations on which religions are later built. It is obvious, too, that myths are based on animistic premises, though the details of the relation between myths and animism seem to be unexplained in some essential respects.

Our psycho-analytic approach to the subject, however, is from another side. It is not to be supposed that men were inspired to create their first system of the universe by pure speculative curiosity. The practical need for controlling the world around them must have played its part. So we are not surprised to learn that, hand in hand with the animistic system, there went a body of instructions upon how to obtain mastery over men, beasts and things - or rather, over their spirits. These instructions go by the names of 'sorcery [Zauberei]' and 'magic [Magie]'. Reinach (1905-12, 2, xv) describes them as the 'strategy of animism'; I should prefer, following Hubert and Mauss (1904), to regard them as its technique.

The fact that it has been possible to construct a system of contagious magic on associations of contiguity shows that the importance attached to wishes and to the will has been extended from them on to all those psychical acts which are subject to the will. A general overvaluation has thus come about of all mental processes - an attitude towards the world, that is, which, in view of our knowledge of the relation between reality and thought, cannot fail to strike us as an overvaluation of the latter. Things become less important than ideas of things: whatever is done to the latter will inevitably also occur to the former. Relations which hold between the ideas of things are assumed to hold equally between the things themselves. Since distance is of no importance in thinking - since what lies furthest apart both in time and space can without difficulty be comprehended in a single act of consciousness - so, too, the world of magic has a telepathic disregard for spatial distance and treats past situations as though they were present. In the animistic epoch the reflection of the internal world is bound to blot out the other picture of the world - the one which we seem to perceive.

By way of summary, then, it may be said that the principle governing magic, the technique of the animistic mode of thinking, is the principle of the 'omnipotence of thoughts'.

¹ We appear to attribute an 'uncanny' quality to impressions that seek to confirm the omnipotence of thoughts and the animistic mode of thinking in general, after we have reached a stage at which, in our judgement, we have abandoned such beliefs.
The primary obsessive acts of these neurotics are of an entirely magical character. If they are not charms, they are at all events counter-charms, designed to ward off the expectations of disaster with which the neurosis usually starts. Whenever I have succeeded in penetrating the mystery, I have found that the expected disaster was death. Schopenhauer has said that the problem of death stands at the outset of every philosophy; and we have already seen that the origin of the belief in souls and in demons, which is the essence of animism, goes back to the impression which is made upon men by death. It is difficult to judge whether the obsessive or protective acts performed by obsessional neurotics follow the law of similarity (or, as the case may be, of contrast); for as a rule, owing to the prevailing conditions of the neurosis, they have been distorted by being displaced on to something very small, some action in itself of the greatest triviality.¹ The protective formulas of obsessional neuroses, too, have their counterpart in the formulas of magic. It is possible, however, to describe the course of development of obsessive acts: we can show how they begin by being remote as possible from anything sexual - magical defences against evil wishes - and how they end by being substitutes for the forbidden sexual act and the closest possible imitations of it.
[1912-1913, 2730]

If we are prepared to accept the account given above of the evolution of human views of the universe - an animistic phase followed by a religious phase and this in turn by a scientific one - it will not be difficult to follow the vicissitudes of the 'omnipotence of thoughts' through these different phases. At the animistic stage men ascribe omnipotence to themselves. At the religious stage they transfer it to the gods but do not seriously abandon it themselves, for they reserve the power of influencing the gods in a variety of ways according to their wishes. The scientific view of the universe no longer affords any room for human omnipotence; men have acknowledged their smallness and submitted resignedly to death and to the other necessities of nature. None the less some of the primitive belief in omnipotence still survives in men's faith in the power of the human mind, which grapples with the laws of reality.
[1912-1913, 2731]

If we may regard the existence among primitive races of the omnipotence of thoughts as evidence in favour of narcissism, we are encouraged to attempt a comparison between the phases in the development of men's view of the universe and the stages of an individual's libidinal development. The animistic phase would correspond to narcissism both chronologically and in its content; the religious phase would correspond to the stage of object-choice of which the characteristic is a child's attachment to his parents; while the scientific phase would have an exact counterpart in the stage at which an individual has reached maturity, has renounced the pleasure principle, adjusted himself to reality and turned to the external world for the object of his desires.¹
[1912-1913, 2733]

Thus the first picture which man formed of the world - animism - was a psychological one. It needed no scientific basis as yet, since science only begins after it has been realized that the world is unknown and that means must therefore be sought for getting to know it. Animism came to primitive man naturally and as a matter of course. He knew what things were like in the world, namely just as he felt himself to be. We are thus prepared to find that primitive man transposed the structural conditions of his own mind¹ into the external world; and we may attempt to reverse the process and put back into the human mind what animism teaches as to the nature of things.
[1912-1913, 2734]
The technique of animism, magic, reveals in the clearest and most unmistakable way an intention to impose the laws governing mental life upon real things; in this, spirits need not as yet play any part, though spirits may be taken as objects of magical treatment. Thus the assumptions of magic are more fundamental and older than the doctrine of spirits, which forms the kernel of animism. Our psycho-analytic point of view coincides here with a theory put forward by R. R. Marett (1900), who postulates a pre-animistic stage before animism, the character of which is best indicated by the term 'animatism', the doctrine of the universality of life. Experience has little light to throw on pre-animism, since no race has yet been discovered which is without the concept of spirits. (Cf. Wundt, 1906, 171 ff.)

I have said that animism is a system of thought, the first complete theory of the universe, and I shall now go on to draw certain conclusions from the psycho-analytic view of such systems. Every day of our lives our experience is in a position to show us the principal characteristics of a 'system'. We have dreams during the night and we have learnt how to interpret them during the day. Dreams may, without contradicting their nature, appear confused and disconnected. But they may, on the contrary, simulate the orderly impressions of a real experience, they may make one event follow from another and make one portion of their content refer to another. Such a result can be more or less successfully achieved; but it scarcely ever succeeds so completely as to leave no absurdity, no rift in its texture, visible. When we come to submit a dream to interpretation, we find that the erratic and irregular arrangement of its constituent parts is quite unimportant from the point of view of our understanding it. The essential elements in a dream are the dream-thoughts, and these have meaning, connection and order. But their order is quite other than that remembered by us as present in the manifest dream. In the latter the connection between the dream-thoughts has been abandoned and may either remain completely lost or be replaced by the new connection exhibited in the manifest content. The elements of the dream, apart from their being condensed, are almost invariably arranged in a new order more or less independent of their earlier arrangement. Finally, it must be added that whatever the original material of the dream-thoughts has been turned into by the dream-work is then subjected to a further influence. This is what is known as 'secondary revision', and its purpose is evidently to get rid of the disconnectedness and unintelligibility produced by the dream-work and replace it by a new 'meaning'. But this new meaning, arrived at by secondary revision, is no longer the meaning of the dream-thoughts.

Let us now return to the animistic system with which we are dealing. The insight we have gained into other psychological systems enables us to conclude that with primitive man, too, 'superstition' need not be the only or the real reason for some particular custom or observance and does not excuse us from the duty of searching for its hidden motives. Under the domination of an animistic system it is inevitable that every observance and every activity shall have a systematic basis, which nowadays we describe as 'superstitious'. 'Superstition' - like 'anxiety', 'dreams' and 'demons' - is one of those provisional psychological concepts which have crumbled under the impact of psycho-analytic research. Once we have penetrated behind these constructions, which are like screens erected as defences against correct understanding, we begin to realize that the mental life and cultural level of savages have not hitherto had all the recognition they deserve.

[1912-1913, 2734]
If we take instinctual repression as a measure of the level of civilization that has been reached, we shall have to admit that even under the animistic system advances and developments took place which are unjustly despised on account of their superstitious basis. When we are told that the warriors in a savage tribe practise the greatest continence and cleanliness when they go on the war-path, the explanation is put forward that their motive is ‘a fear lest the enemy should obtain the refuse of their persons, and thus be enabled to work their destruction by magic’ (Frazer, 1911b, 157); and an analogous superstitious reason could be suggested for their continence. None the less the fact remains that they have made an instinctual renunciation; and we can understand the position better if we suppose that the savage warrior submits to these restrictions as a counter-measure because he is on the point of yielding completely to the satisfaction of cruel and hostile impulses which are as a rule prohibited to him. The same is true of the numerous cases of sexual restrictions being imposed on anyone who is engaged on difficult or responsible work (ibid., 200 f.). Though the grounds alleged for these prohibitions may belong to a magical context, yet the fundamental idea of gaining greater strength by renouncing some instinctual satisfaction remains unmistakable; and the hygienic root of the prohibition which lies alongside its magical rationalization must not be overlooked. When the men of a savage tribe go out on an expedition to hunt, to fish, to fight or to gather precious plants, their wives left at home are subjected to many oppressive restrictions, to which the savages themselves ascribe a favourable influence, operating at a distance upon the success of the expedition. But it requires very little penetration to see that this factor which operates at a distance is nothing other than the absent men's longing thoughts of home, and that behind these disguises lies a sound piece of psychological insight that the men will only do their best if they feel completely secure about the women whom they have left behind them unguarded. Sometimes they will even themselves declare, without alleging any magical reasons, that a wife's infidelity in marriage will bring to nothing the efforts of an absent husband engaged on some responsible work.

[1912-1913, 2739]

An investigation of primitive peoples shows mankind caught up, to begin with, in a childish belief in its own omnipotence.¹ A whole number of mental structures can thus be understood as attempts to deny whatever might disturb this feeling of omnipotence and so to prevent emotional life from being affected by reality until the latter could be better controlled and used for purposes of satisfaction. The principle of avoiding unpleasure dominates human actions until it is replaced by the better one of adaptation to the external world. Pari passu with men's progressive control over the world goes a development in their Weltanschauung, their view of the universe as a whole. They turn away more and more from their original belief in their own omnipotence, rising from an animistic phase through a religious to a scientific one. Myths, religion and morality find their place in this scheme as attempts to seek a compensation for the lack of satisfaction of human wishes.

[1913], 2822]
These last examples of the uncanny are to be referred to the principle which I have called 'omnipotence of thoughts', taking the name from an expression used by one of my patients. And now we find ourselves on familiar ground. Our analysis of instances of the uncanny has led us back to the old, animistic conception of the universe. This was characterized by the idea that the world was peopled with the spirits of human beings; by the subject's narcissistic overvaluation of his own mental processes; by the belief in the omnipotence of thoughts and the technique of magic based on that belief; by the attribution to various outside persons and things of carefully graded magical powers, or 'mana'; as well as by all the other creations with the help of which man, in the unrestricted narcissism of that stage of development, strove to fend off the manifest prohibitions of reality. It seems as if each one of us has been through a phase of individual development corresponding to this animistic stage in primitive men, that none of us has passed through it without preserving certain residues and traces of it which are still capable of manifesting themselves, and that everything which now strikes us as 'uncanny' fulfils the condition of touching those residues of animistic mental activity within us and bringing them to expression.¹
[1919h, 3691]

I myself set a higher value on my contributions to the psychology of religion, which began with the establishment of a remarkable similarity between obsessive actions and religious practices or ritual (1907b). Without as yet understanding the deeper connections, I described the obsessional neurosis as a distorted private religion and religion as a kind of universal obsessional neurosis. Later on, in 1912, Jung's forcible indication of the far-reaching analogies between the mental products of neurotics and of primitive peoples led me to turn my attention to that subject. In four essays, which were collected into a book with the title of Totem and Taboo, I showed that the horror of incest was even more marked among primitive than among civilized races and had given rise to very special measures of defence against it. I examined the relations between taboo-prohibitions (the earliest form in which moral restrictions make their appearance) and emotional ambivalence; and I discovered under the primitive scheme of the universe known as 'animism' the principle of the over-estimation of the importance of psychical reality - the belief in 'the omnipotence of thoughts' - which lies at the root of magic as well. I developed the comparison with the obsessional neurosis at every point, and showed how many of the postulates of primitive mental life are still in force in that remarkable illness. Above all, however, I was attracted by totemism, the first system of organization in primitive tribes, a system in which the beginnings of social order are united with a rudimentary religion and the implacable domination of a small number of taboo-prohibitions. The being that is revered is ultimately always an animal, from which the clan also claims to be descended. Many indications pointed to the conclusion that every race, even the most highly developed, had once passed through the stage of totemism.
[1925d, 4239]
The two techniques I refer to are *undoing what has been done* and *isolating*. The first of these has a wide range of application and goes back very far. It is, as it were, negative magic, and endeavours, by means of motor symbolism, to 'blow away' not merely the consequences of some event (or experience or impression) but the event itself. I choose the term 'blow away' advisedly, so as to remind the reader of the part played by this technique not only in neuroses but in magical acts, popular customs and religious ceremonies as well. In obsessional neurosis the technique of undoing what has been done is first met with in the 'diphasic' symptoms, in which one action is cancelled out by a second, so that it is as though neither action had taken place, whereas, in reality, both have. This aim of undoing is the second underlying motive of obsessional ceremonials, the first being to take precautions in order to prevent the occurrence or recurrence of some particular event. The difference between the two is easily seen: the precautionary measures are rational, while trying to get rid of something by 'making it not to have happened' is irrational and in the nature of magic. It is of course to be suspected that the latter is the earlier motive of the two and proceeds from the animistic attitude towards the environment. This endeavour to undo shades off into normal behaviour in the case in which a person decides to regard an event as not having happened. But whereas he will take no direct steps against the event, and will simply pay no further attention to it or its consequences, the neurotic person will try to make the past itself non-existent. He will try to repress it by motor means. The same purpose may perhaps account for the obsession for repeating which is so frequently met with in this neurosis and the carrying out of which serves a number of contradictory intentions at once. When anything has not happened in the desired way it is undone by being repeated in a different way; and thereupon all the motives that exist for lingering over such repetitions come into play as well. As the neurosis proceeds, we often find that the endeavour to undo a traumatic experience is a motive of first-rate importance in the formation of symptoms. We thus unexpectedly discover a new, motor technique of defence, or (as we may say in this case with less inaccuracy) of repression.

A great deal is already gained with the first step: the humanization of nature. Impersonal forces and destinies cannot be approached; they remain eternally remote. But if the elements have passions that rage as they do in our own souls, if death itself is not something spontaneous but the violent act of an evil Will, if everywhere in nature there are Beings around us of a kind that we know in our own society, then we can breathe freely, can feel at home in the uncanny and can deal by psychical means with our senseless anxiety. We are still defenceless, perhaps, but we are no longer helplessly paralysed; we can at least react. Perhaps, indeed, we are not even defenceless. We can apply the same methods against these violent supermen outside that we employ in our own society; we can try to adjure them, to appease them, to bribe them, and, by so influencing them, we may rob them of a part of their power. A replacement like this of natural science by psychology not only provides immediate relief, but also points the way to a further mastering of the situation.
For this situation is nothing new. It has an infantile prototype, of which it is in fact only the continuation. For once before one has found oneself in a similar state of helplessness: as a small child, in relation to one's parents. One had reason to fear them, and especially one's father; and yet one was sure of his protection against the dangers one knew. Thus it was natural to assimilate the two situations. Here, too, wishing played its part, as it does in dream-life. The sleeper may be seized with a presentiment of death, which threatens to place him in the grave. But the dream-work knows how to select a condition that will turn even that dreaded event into a wish-fulfilment: the dreamer sees himself in an ancient Etruscan grave which he has climbed down into, happy to find his archaeological interests satisfied. In the same way, a man makes the forces of nature not simply into persons with whom he can associate as he would with his equals - that would not do justice to the overpowering impression which those forces make on him - but he gives them the character of a father. He turns them into gods, following in this, as I have tried to show, not only an infantile prototype but a phylogenetic one. [1927c, 4429]

In the course of time the first observations were made of regularity and conformity to law in natural phenomena, and with this the forces of nature lost their human traits. But man's helplessness remains and along with it his longing for his father, and the gods. The gods retain their threefold task: they must exorcize the terrors of nature, they must reconcile men to the cruelty of Fate, particularly as it is shown in death, and they must compensate them for the sufferings and privations which a civilized life in common has imposed on them. [1927c, 4429]

I feel sure that while you have been listening to me you have been bothered by a number of questions which you would be glad to hear answered. I cannot undertake to do so here and now, but I feel confident that none of these detailed enquiries would upset our thesis that the religious Weltanschauung is determined by the situation of our childhood. That being so, it is all the more remarkable that, in spite of its infantile nature, it nevertheless had a precursor. There is no doubt that there was a time without religion, without gods. This is known as the stage of animism. At that time, too, the world was peopled with spiritual beings resembling men - we call them demons. All the objects in the external world were their habitation, or perhaps were identical with them; but there was no superior power which had created them all and afterwards ruled them and to which one could turn for protection and help. The demons of animism were for the most part hostile in their attitude to human beings, but it appears that human beings had more self-confidence then than later on. They were certainly in a constant state of the most acute fear of these evil spirits; but they defended themselves against them by certain actions to which they ascribed the power to drive them away. Nor apart from this did they regard themselves as defenceless. If they desired something from Nature - if they wished for rain, for instance - they did not direct a prayer to the weather-god, but they performed a magical act which they expected to influence Nature directly: they themselves did something which resembled rain. In their struggle against the powers of the world around them their first weapon was magic, the earliest fore-runner of the technology of to-day. Their reliance on magic was, as we suppose, derived from their overvaluation of their own intellectual operations, from their belief in the 'omnipotence of thoughts', which, incidentally, we come upon again in our obsessional neurotic patients. We may suppose that human beings at that period were particularly proud of their acquisitions in the way of language, which must have been accompanied by a great facilitation of thinking. They attributed magical power to words. This feature was later taken over by religion. 'And God said "Let there be light!" and there was light.' Moreover the fact of their magical actions shows that animistic men did not simply rely on the power of their wishes. They expected results, rather, from the performance of an action which would induce Nature to imitate it. If they wanted rain, they themselves poured out water; if they wanted to encourage the earth to be fruitful, they demonstrated a dramatic performance of sexual intercourse to it in the fields. [1933a, 4763]
You know how hard it is for anything to die away when once it has achieved psychical expression. So you will not be surprised to hear that many of the utterances of animism have persisted to this day, for the most part as what we call superstition, alongside of and behind religion. But more than this, you will scarcely be able to reject a judgement that the philosophy of today has retained some essential features of the animistic mode of thought - the overvaluation of the magic of words and the belief that the real events in the world take the course which our thinking seeks to impose on them. It would seem, it is true, to be an animism without magical actions. On the other hand, we may suppose that even in those days there were ethics of some sort, precepts upon the mutual relations of men; but nothing suggests that they had any intimate connection with animistic beliefs. They were probably the direct expression of men's relative powers and of their practical needs.

[1933a, 4764]

It would be well worth knowing what brought about the transition from animism to religion, but you may imagine the obscurity which to-day still veils these primaeval ages of the evolution of the human spirit. It appears to be a fact that the first form assumed by religion was the remarkable phenomenon of totemism, the worship of animals, in whose train the first ethical commandments, the taboos, made their appearance. In a volume called *Totem and Taboo*, I once elaborated a notion which traced this transformation back to a revolution in the circumstances of the human family. The main achievement of religion as compared with animism lies in the psychical binding of the fear of demons. Nevertheless a vestige of this primaeval age, the Evil Spirit, has kept a place in the religious system.

[1933a, 4764]

This being the prehistory of the religious Weltanschauung let us turn now to what has happened since then and to what is still going on before our eyes. The scientific spirit, strengthened by the observation of natural processes, has begun, in the course of time, to treat religion as a human affair and to submit it to a critical examination. Religion was not able to stand up to this. What first gave rise to suspicion and scepticism were its tales of miracles, for they contradicted everything that had been taught by sober observation and betrayed too clearly the influence of the activity of the human imagination. After this its doctrines explaining the origin of the universe met with rejection, for they gave evidence of an ignorance which bore the stamp of ancient times and to which, thanks to their increased familiarity with the laws of nature, people knew they were superior. The idea that the universe came into existence through acts of copulation or creation analogous to the origin of individual people had ceased to be the most obvious and self-evident hypothesis since the distinction between animate creatures with a mind and an inanimate Nature had impressed itself on human thought - a distinction which made it impossible to retain belief in the original animism. Nor must we overlook the influence of the comparative study of different religious systems and the impression of their mutual exclusiveness and intolerance.

[1933a, 4764]
Strengthened by these preliminary exercises, the scientific spirit gained enough courage at last to venture on an examination of the most important and emotionally valuable elements of the religious Weltanschauung. People may always have seen, though it was long before they dared to say so openly, that the pronouncements of religion promising men protection and happiness if they would only fulfil certain ethical requirements had also shown themselves unworthy of belief. It seems not to be the case that there is a Power in the universe which watches over the well-being of individuals with parental care and brings all their affairs to a happy ending. On the contrary, the destinies of mankind can be brought into harmony neither with the hypothesis of a Universal Benevolence nor with the partly contradictory one of a Universal Justice. Earthquakes, tidal waves, conflagrations, make no distinction between the virtuous and pious and the scoundrel or unbeliever. Even where what is in question is not inanimate Nature but where an individual's fate depends on his relations to other people, it is by no means the rule that virtue is rewarded and that evil finds its punishment. Often enough the violent, cunning or ruthless man seizes the envied good things of the world and the pious man goes away empty. Obscure, unfeeling and unloving powers determine men's fate; the system of rewards and punishments which religion ascribes to the government of the universe seems not to exist. Here once again is a reason for dropping a portion of the animistic theory which had been rescued from animism by religion.

[1933a, 4765]
(10) It is not surprising that a person undergoing psycho-analytic treatment should often dream of it and be led to give expression in his dreams to the many thoughts and expectations to which the treatment gives rise. The imagery most frequently chosen to represent it is that of a journey, usually by motor-car, as being a modern and complicated vehicle. The speed of the car will then be used by the patient as an opportunity for giving vent to ironical comments. -If the unconscious, as an element in the subject's waking thoughts, has to be represented in a dream, it may be replaced very appropriately by subterranean regions. -These, where they occur without any reference to analytic treatment, stand for the female body or the womb. - 'Down below' in dreams often relates to the genitals, 'up above', on the contrary, to the face, mouth or breast. -Wild beasts are as a rule employed by the dream-work to represent passionate impulses of which the dreamer is afraid, whether they are his own or those of other people. (It then needs only a slight displacement for the wild beasts to come to represent the people who are possessed by these passions. We have not far to go from here to cases in which a dreaded father is represented by a beast of prey or a dog or wild horse - a form of representation recalling totemism.) It might be said that the wild beasts are used to represent the libido, a force dreaded by the ego and combated by means of repression. It often happens, too, that the dreamer separates off his neurosis, his 'sick personality', from himself and depicts it as an independent person.

[1900a, 865]

I assume that this conscious ignorance and unconscious knowledge of the motivation of accidental psychical events is one of the psychical roots of superstition. Because the superstitious person knows nothing of the motivation of his own chance actions, and because the fact of this motivation presses for a place in his field of recognition, he is forced to allocate it, by displacement, to the external world. If such a connection exists, it can hardly be limited to this single application. In point of fact I believe that a large part of the mythological view of the world, which extends a long way into the most modern religions, is nothing but psychology projected into the external world. The obscure recognition¹ (the endopsychic perception, as it were) of psychical factors and relations in the unconscious is mirrored - it is difficult to express it in other terms, and here the analogy with paranoia must come to our aid - in the construction of a supernatural reality, which is destined to be changed back once more by science into the psychology of the unconscious. One could venture to explain in this way the myths of paradise and the fall of man, of God, of good and evil, of immortality, and so on, and to transform metaphysics into metapsychology. The gap between the paranoic's displacement and that of the superstitious person is less wide than it appears at first sight. When human beings began to think, they were, as is well known, forced to explain the external world anthropomorphically by means of a multitude of personalities in their own image; chance events, which they interpreted superstitiously, were thus actions and manifestations of persons. They behaved, therefore, just like paranoids, who draw conclusions from insignificant signs given them by other people, and just like all normal people, who quite rightly base their estimate of their neighbours' characters on their chance and unintentional actions. It is only in our modern, scientific but as yet by no means perfected Weltanschauung that superstition seems so very much out of place; in the Weltanschauung of pre-scientific times and peoples it was justified and consistent.

[1901b, 1328]

What I have been trying to describe in this outline is the libido theory of the neuroses, upon which are founded all our conceptions of the nature of these morbid states, together with our therapeutic measures for relieving them. We naturally regard the premises of the libido theory as valid for normal behaviour as well. We speak of the narcissism of small children, and it is to the excessive narcissism of primitive man that we ascribe his belief in the omnipotence of his thoughts and his consequent attempts to influence the course of events in the external world by the technique of magic.

[1917a, 3610]
These things that, by his science and technology, man has brought about on this earth, on which he first appeared as a feeble animal organism and on which each individual of his species must once more make its entry ('oh inch of nature!') as a helpless suckling - these things do not only sound like a fairy tale, they are an actual fulfilment of every - or of almost every - fairy-tale wish. All these assets he may lay claim to as his cultural acquisition. Long ago he formed an ideal conception of omnipotence and omniscience which he embodied in his gods. To these gods he attributed everything that seemed unattainable to his wishes, or that was forbidden to him. One may say, therefore, that these gods were cultural ideals. To-day he has come very close to the attainment of this ideal, he has almost become a god himself. Only, it is true, in the fashion in which ideals are usually attained according to the general judgement of humanity. Not completely; in some respects not at all, in others only half way. Man has, as it were, become a kind of prosthetic God. When he puts on all his auxiliary organs he is truly magnificent; but those organs have not grown on to him and they still give him much trouble at times. Nevertheless, he is entitled to console himself with the thought that this development will not come to an end precisely with the year 1930 A.D. Future ages will bring with them new and probably unimaginably great advances in this field of civilization and will increase man's likeness to God still more. But in the interests of our investigations, we will not forget that present-day man does not feel happy in his Godlike character.
[1930a, 4489]
There can be no doubt about the meaning of this animal myth. It is certain that this is merely ascribing to animals something that is a hallowed custom among men. The procedure gone through by the eagle with his young is an ordeal, a test of lineage, such as is reported of the most various races of antiquity. Thus the Celts living on the banks of the Rhine used to entrust their new-born babies to the waters of the river, in order to ascertain whether they were truly of their own blood. The clan of Psylli, who inhabited what is now Tripoli, boasted that they were descended from snakes, and used to expose their infants to contact with them; those who were true-born children of the clan were either not bitten or recovered rapidly from the effects of the bite.¹ The assumption underlying these trials leads us deep into the totemic habits of thought of primitive peoples. The totem - an animal, or a natural force animistically conceived, to which the tribe traces back its origin - spares the members of the tribe as being its own children, just as it itself is honoured by them as being their ancestor and is spared by them. We have here arrived at the consideration of matters which, as it seems to me, may make it possible to arrive at a psycho-analytic explanation of the origins of religion.

It will be found that the two principal themes from which the title of this little book is derived - totems and taboos - have not received the same treatment. The analysis of taboos is put forward as an assured and exhaustive attempt at the solution of the problem. The investigation of totemism does no more than declare that 'here is what psycho-analysis can at the moment contribute towards elucidating the problem of the totem'. The difference is related to the fact that taboos still exist among us. Though expressed in a negative form and directed towards another subject-matter, they do not differ in their psychological nature from Kant's 'categorical imperative', which operates in a compulsive fashion and rejects any conscious motives. Totemism, on the contrary, is something alien to our contemporary feelings - a religio-social institution which has been long abandoned as an actuality and replaced by newer forms. It has left only the slightest traces behind it in the religions, manners and customs of the civilized peoples of to-day and has been subject to far-reaching modifications even among the races over which it still holds sway. The social and technical advances in human history have affected taboos far less than the totem.

An attempt is made in this volume to deduce the original meaning of totemism from the vestiges remaining of it in childhood from the hints of it which emerge in the course of the growth of our own children. The close connection between totems and taboos carries us a step further along the path towards the hypothesis presented in these pages; and if in the end that hypothesis bears a highly improbable appearance, that need be no argument against the possibility of its approximating more or less closely to the reality which it is so hard to reconstruct.

Among the Australians the place of all the religious and social institutions which they lack is taken by the system of 'totemism'. Australian tribes fall into smaller divisions, or clans, each of which is named after its totem. What is a totem? It is as a rule an animal (whether edible and harmless or dangerous and feared) and more rarely a plant or a natural phenomenon (such as rain or water), which stands in a peculiar relation to the whole clan. In the first place, the totem is the common ancestor of the clan; at the same time it is their guardian spirit and helper, which sends them oracles and, if dangerous to others, recognizes and spares its own children. Conversely, the clansmen are under a sacred obligation (subject to automatic sanctions) not to kill of destroy their totem and to avoid eating its flesh (or deriving benefit from it in other ways). The totemic character is inherent, not in some individual animal or entity, but in all the individuals of a given class. From time to time festivals are celebrated at which the clansmen represent or imitate the motions and attributes of their totem in ceremonial dances.
The totem may be inherited either through the female or through the male line. It is possible that originally the former method of descent prevailed everywhere and was only subsequently replaced by the latter. An Australian's relation to his totem is the basis of all his social obligations: it overrides on the one hand his tribal membership and on the other hand his blood relationships.¹

² This highly condensed summary of the totemic system must necessarily be subject to further comments and qualifications. The word 'totem' was first introduced in 1791 (in the form 'totam') from the North American Indians by an Englishman, J. Long. The subject itself has gradually attracted great scientific interest and has produced a copious literature, from which I may select as works of capital importance J. G. Frazer's four-volume *Totemism and Exogamy* (1910) and the writings of Andrew Lang, e.g. *The Secret of the Totem* (1905). The merit of having been the first to recognize the importance of totemism for human prehistory lies with a Scotsman, John Ferguson McLennan (1869-70). Totemic institutions were, or still are, to be observed in operation, not only among the Australians, but also among the North American Indians, among the peoples of Oceania, in the East Indies and in a large part of Africa. It may also be inferred from certain vestigial remains, for which it is otherwise hard to account, that totemism existed at one time among the Aryan and Semitic aboriginal races of Europe and Asia. Many investigators are therefore inclined to regard it as a necessary phase of human development which has been passed through universally.

How did prehistoric men come to adopt totems? How, that is, did they come to make the fact of their being descended from one animal or another the basis of their social obligations and, as we shall see presently, of their sexual restrictions? There are numerous theories on the subject - of which Wundt (1906) has given an epitome for German readers - but no agreement. It is my intention to devote a special study before long to the problem of totemism, in which I shall attempt to solve it by the help of a psycho-analytic line of approach. (See the fourth essay in this work.)

Not only, however, is the theory of totemism a matter of dispute; the facts themselves are scarcely capable of being expressed in general terms as I have tried to do in the text above. There is scarcely a statement which does not call for exceptions or contradictions. But it must not be forgotten that even the most primitive and conservative races are in some sense ancient races and have a long past history behind them during which their original conditions of life have been subject to much development and distortion. So it comes about that in those races in which totemism exists to-day, we may find it in various stages of decay and disintegration or in the process of transition to other social and religious institutions, or again in a stationary condition which may differ greatly from the original one. The difficulty in this last case is to decide whether we should regard the present state of things as a true picture of the significant features of the past or as a secondary distortion of them.

And now we come at last to the characteristic of the totemic system which has attracted the interest of psycho-analysts. In almost every place where we find totems we also find a law against persons of the same totem having sexual relations with one another and consequently against their marrying. This, then, is 'exogamy', an institution related to totemism.

Strictly enforced as it is, this prohibition is a remarkable one. There is nothing in the concept or attributes of the totem which I have so far mentioned to lead us to anticipate it; so that it is hard to understand how it has become involved in the totemic system. We cannot, therefore, feel surprised that some investigators actually suppose that exogamy had originally - in the earliest times and in its true meaning - nothing to do with totemism, but became attached to it (without there being any underlying connection) at some time when marriage restrictions became necessary. However this may be, the bond between totemism and exogamy exists and is clearly a very firm one.
(a) The violation of the prohibition is not left to what might be called the ‘automatic’ punishment of the guilty parties, as in the case of other totem prohibitions, such as that against killing the totem animal. It is avenged in the most energetic fashion by the whole clan, as though it were a question of averting some danger that threatened the whole community or some guilt that was pressing upon it. A few sentences from Frazer (1910, 1, 54) will show how severely such misdeeds are treated by savages who are otherwise far from being moral by our standards:

[1912-1913, 2653]

(b) Since the same severe punishment is inflicted in the case of passing love-affairs which have not resulted in any children, it seems unlikely that the reasons for the prohibition are of a practical nature.

[1912-1913, 2653]

¹ On the other hand, at all events so far as this prohibition is concerned, the father, who is a Kangaroo, is free to commit incest with his daughters, who are Emus. If the totem descended through the male line, however, the Kangaroo father would be prohibited from incest with his daughters (since all his children would be Kangaroos), whereas the son would be free to commit incest with his mother. These implications of totem prohibitions suggest that descent through the female line is older than that through the male, since there are grounds for thinking that totem prohibitions were principally directed against the incestuous desires of the son.

[1912-1913, 2653]

(d) But a little more reflection will show that exogamy linked with the totem effects more (and therefore aims at more) than the prevention of incest with a man’s mother and sisters. It makes sexual intercourse impossible for a man with all the women of his own clan (that is to say with a number of women who are not his blood-relatives) by treating them all as though they were his blood-relatives. It is difficult at first sight to see the psychological justification for this very extensive restriction, which goes far beyond anything comparable among civilized peoples. It may be gathered from this, however, that the part played by the totem as common ancestor is taken very seriously. All those who are descended from the same totem are blood relations. They form a single family, and within that family even the most distant degree of kinship is regarded as an absolute hindrance to sexual intercourse.

[1912-1913, 2654]

We see, then, that these savages have an unusually great horror of incest, or are sensitive on the subject to an unusual degree, and that they combine this with a peculiarity which remains obscure to us - of replacing real blood-relationship by totem kinship. This latter contrast must not, however, be too much exaggerated, and we must remember that the totem prohibitions include that against real incest as a special case.

[1912-1913, 2654]

The riddle of how it came about that the real family was replaced by the totem clan must perhaps remain unsolved till the nature of the totem itself can be explained. At the same time, it is to be observed that if there were a certain degree of freedom of sexual intercourse outside marriage, blood-relationship, and consequently the prevention of incest, would become so uncertain that the prohibition would stand in need of a wider basis. It is therefore worth remarking that Australian customs permit the occurrence, in certain social situations and during certain festivals, of breaches in a man’s exclusive conjugal rights over a woman.

[1912-1913, 2654]
But when once we have put group marriage in the place of individual marriage, the apparently excessive degree of avoidance of incest which we have come across among the same peoples becomes intelligible. Totemic exogamy, the prohibition of sexual intercourse between members of the same clan, appears to have been the appropriate means for preventing group incest; it thus became established and persisted long after its raison d'être had ceased.

[1912-1913, 2655]

It may seem that we have thus discovered the motives the led the Australian natives to set up their marriage restrictions; but we have now to learn that the actual state of affairs reveals a far greater, and at first sight a bewildering, complexity. For there are few races in Australia in which the totem barrier is the sole prohibition. Most of them are organized in such a way as to fall into two divisions, known as marriage-classes or 'phratries'. Each of these phratries is exogamous and comprises a number of totem clans. As a rule each phratry is further subdivided into two 'sub-phratries', the whole tribe being thus divided into four, with the sub-phratries intermediate between the phratries and the totem clans.

[1912-1913, 2656]

The historical relation between the marriage-classes (of which in some tribes there are as many as eight) and the totem clans is completely obscure. It is merely evident that these arrangements are directed towards the same aim as totemic exogamy and pursue it still further. While, however, totemic exogamy gives one the impression of being a sacred ordinance of unknown origin - in short, of being a custom - the complicated institution of the marriage-classes, with their subdivisions and the regulations attaching to them, look more like the result of deliberate legislation, which may perhaps have taken up the task of preventing incest afresh because the influence of the totem was waning. And, while the totemic system is, as we know, the basis of all the other social obligations and moral restrictions of the tribe, the significance of the phratries seems in general not to extend beyond the regulation of marriage choice which is its aim.

[1912-1913, 2657]

It would be little to our purpose if we were to follow in detail the extraordinarily involved and obscure discussions on the origin and significance of the marriage-classes and on their relation to the totem. For our purpose it is enough to draw attention to the great care which is devoted by the Australians, as well as by other savage peoples, to the prevention of incest.¹ It must be admitted that these savages are even more sensitive on the subject of incest than we are. They are probably liable to a greater temptation to it and for that reason stand in need of fuller protection.

[1912-1913, 2657]

But the horror of incest shown by these peoples is not satisfied by the erection of the institutions which I have described and which seem to be directed principally against group incest. We must add to them a number of 'customs' which regulate the dealings of individuals with their near relatives in our sense of the term, customs which are enforced literally with religious strictness and the purpose of which can scarcely be doubted. These customs or customary prohibitions have been termed 'avoidances'. They extend far beyond the totemic races of Australia; but once again I must ask my readers to be content with a fragmentary extract from the copious material.

[1912-1913, 2658]

The most ancient and important taboo prohibitions are the two basic laws of totemism: not to kill the totem animal and to avoid sexual intercourse with members of the totem clan of the opposite sex.

[1912-1913, 2680]
The two fundamental prohibitions of taboo are, as I have already remarked, inaccessible to our analysis owing to their connection with totemism; while certain others of its injunctions are of a secondary nature and consequently useless for our purpose. For taboo has become the ordinary method of legislation in the communities affected by it and it has come to serve social purposes which are certainly more recent than taboo itself: such, for instance, are the taboos imposed by chiefs and priests for the protection of their own property and privileges. There nevertheless remain a large group of observances on which our investigation can be made. From these I shall select the taboos attaching (a) to enemies, (b) to chiefs and (c) to the dead; and I shall take the material for our examination from the excellent collection included by Frazer in Taboo and the Perils of the Soul (1911b), the second part of his great work The Golden Bough.

[1912-1913, 2684]

In the first of this series of essays we became acquainted with the concept of totemism. We heard that totemism is a system which takes the place of a religion among certain primitive peoples of Australia, America and Africa, and provides the basis of their social organization. As we have heard, it was a Scotsman, McLennan, who in 1869 first drew general attention to the phenomena of totemism (which had hitherto been regarded as mere curiosities) by giving voice to a suspicion that a large number of customs and usages current in various societies ancient and modern were to be explained as remnants of a totemic age. Since that date science has fully accepted his estimate of totemism. Let me quote, as one of the most recent statements on the subject, a passage from Wundt's Elemente der Völkerpsychologie (1912, 139): 'In the light of all these facts, the conclusion appears highly probable that at some time totemic culture everywhere paved the way for a more advanced civilization, and, thus, that it represents a transitional stage between the age of primitive men and the era of heroes and gods.'

[1912-1913, 2741]

The purpose of the present essays obliges us to enter more deeply into the nature of totemism. For reasons which will presently become clear I will begin with an account given by Reinach, who, in 1900,¹ sketched out a 'Code du totémisme' in twelve Articles - a catechism, as it were, of the totemic religion:

[1912-1913, 2742]

To obtain a correct picture of the nature of totemism we must turn to another author, who has devoted a four-volume work to the subject, which combines the fullest collection of the relevant observations with the most detailed discussion of the problems they raise. We shall remain indebted to J. G. Frazer, the author of Totemism and Exogamy (1910), both for enjoyment and instruction, even if psycho-analytic research may lead to conclusions which differ widely from his.¹

[1912-1913, 2743]

'A totem', wrote Frazer in his first essay on the subject,⁴ 'is a class of material objects which a savage regards with superstitious respect, believing that there exists between him and every member of the class an intimate and altogether special relation . . . The connection between a man and his totem is mutually beneficent; the totem protects the man, and the man shows his respect for the totem in various ways, by not killing it if it be an animal, and not cutting or gathering it if it be a plant. As distinguished from a fetish, a totem is never an isolated individual, but always a class of objects, generally a species of animals or of plants, more rarely a class of inanimate natural objects, very rarely a class of artificial objects. . . .

[1912-1913, 2744]
'The clan totem is reverenced by a body of men and women who call themselves by the name of the totem, believe themselves to be of one blood, descendants of a common ancestor, and are bound together by common obligations to each other and by a common faith in the totem. Totemism is thus both a religious and a social system. In its religious aspect it consists of the relations of mutual respect and protection between a man and his totem; in its social aspect it consists of the relations of the clansmen to each other and to men of other clans. In the later history of totemism these two sides, the religious and the social, tend to part company; the social system sometimes survives the religious; and, on the other hand, religion sometimes bears traces of totemism in countries where the social system based on totemism has disappeared. How in the origin of totemism these two sides were related to each other it is, in our ignorance of that origin, impossible to say with certainty. But on the whole the evidence points strongly to the conclusion that the two sides were originally inseparable; that, in other words, the farther we go back, the more we should find that the clansman regards himself and his totem as beings of the same species, and the less he distinguishes between conduct towards his totem and towards his fellow-clansmen.'

In giving particulars of totemism as a religious system, Frazer begins by stating that the members of a totem clan call themselves by the name of their totem, and commonly believe themselves to be actually descended from it. It follows from this belief that they will not hunt the totem animal or kill or eat it and, if it is something other than an animal, they refrain from making use of it in other ways. The rules against killing or eating the totem are not the only taboos; sometimes they are forbidden to touch it, or even to look at it; in a number of cases the totem may not be spoken of by its proper name. Any violation of the taboos that protect the totem are automatically punished by severe illness or death.¹

In particular important circumstances the clansman seeks to emphasize his kinship with the totem by making himself resemble it externally, by dressing in the skin of the animal, by incising a picture of the totem upon his own body, and so on. This identification with the totem is carried into effect in actions and words on the ceremonial occasions of birth, initiation and burial. Various magical and religious purposes are served by dances in which all the clansmen disguise themselves as their totem and imitate its behaviour. Lastly, there are ceremonies in which the totem animal is ceremoniously killed.¹
To Frazer's account of totemism - one of the earliest in the literature of the subject - I will add a few extracts from one of the most recent ones. In his *Elemente der Völkerpsychologie*, Wundt (1912, 116 ff.) writes as follows: "The totem animal is also usually regarded as the ancestral animal of the group in question. "Totem" is, on the one hand a group name, and, on the other, a name indicative of ancestry. In the latter connection it has also a mythological significance. These various ideas, however, interplay in numerous ways. Some of the meanings may recede, so that totems have frequently become a mere nomenclature of tribal divisions, while at other times the idea of ancestry, or, perhaps also, the cult significance, predominates. . . . The concept of the totem has a decisive influence upon tribal division and tribal organization, which are subject to certain norms of custom. These norms, and their fixed place in the beliefs and feelings of the tribal members, are connected with the fact that originally, at all events, the totem animal was regarded, for the most part, as having not merely given its name to a group of tribal members but as having actually been its fore father. . . . Bound up with this is the further fact that these animal ancestors possessed a cult. . . . Aside from specific ceremonies and ceremonial festivals, this animal cult originally found expression primarily in the relations maintained towards the totem animal. It was not merely a particular animal that was to a certain extent held sacred, but every representative of the species. The totem members were forbidden to eat the flesh of the totem animal, or were allowed to do so only under specific conditions. A significant counter-phenomenon, not irreconcilable with this, is the fact that on certain occasions the eating of the totem flesh constituted a sort of ceremony. . . ."

If we seek to penetrate to the original nature of totemism, without regard to subsequent accretions or attenuations, we find that its essential characteristics are these: Originally, all totems were animals, and were regarded as the ancestors of the different clans. Totems were inherited only through the female line. There was a prohibition against killing the totem (or - which, under primitive conditions, is the same thing - against eating it). Members of a totem clan were forbidden to practise sexual intercourse with one another.¹

¹ The picture of totemism given by Frazer in his second work on it ('The Origin of Totemism', published in the *Fortnightly Revue* in 1899) agrees with what I have written above: "Thus, Totemism has commonly been treated as a primitive system both of religion and of society. As a system of religion it embraces the mystic union of the savage with his totem; as a system of society it comprises the relations in which men and women of the same totem stand to each other and to the members of other totemic groups. And corresponding to these two sides of the system are two rough and ready tests or canons of Totemism: first, the rule that a man may not kill or eat his totem animal or plant; and second, the rule that he may not marry or cohabit with a woman of the same totem." Frazer then proceeds (thus plunging us into the middle of the controversies on totemism): 'Whether the two sides - the religious and the social - have always co-existed or are essentially independent, is a question which has been variously answered.'

The more incontestable became the conclusion that totemism constitutes a regular phase in all cultures, the more urgent became the need for arriving at an understanding of it and for throwing light upon the puzzle of its essential nature. Everything connected with totemism seems to be puzzling: the decisive problems concern the origin of the idea of descent from the totem and the reasons for exogamy (or rather for the taboo upon incest of which exogamy is the expression), as well as the relation between these two institutions, totemic organization and prohibition of incest. Any satisfactory explanation should be at once a historical and a psychological one. It should tell us under what conditions this peculiar institution developed and to what psychical needs in men it has given expression.
It is plausible to suppose that an understanding of the essential nature of totemism and exogamy would best be arrived at, if it were possible to come nearer to the origins of the two institutions. But in this connection we must bear in mind Andrew Lang's warning that even primitive peoples have not retained the original forms of those institutions nor the conditions which gave rise to them; so that we have nothing whatever but hypotheses to fall back upon as a substitute for the observations which we are without.¹ Some of the attempted explanations seem, in the judgement of a psychologist, inadequate at the very outset: they are too rational and take no account of the emotional character of the matters to be explained. Others are based on assumptions which are unconfirmed by observation. Yet others rely upon material which would be better interpreted in another way. There is generally little difficulty in refuting the various views put forward: the authorities are as usual more effective in their criticisms of one another's work than in their own productions. The conclusion upon most of the points raised must be a non liquet. It is not surprising, therefore, that in the most recent literature on the subject (which is for the most part passed over in the present work) an unmistakable tendency emerges to reject any general solution of totemic problems as impracticable. (See, for instance, Goldenweiser, 1910.) In the discussion of these conflicting hypotheses which follows, I have ventured to disregard their chronological sequence.

¹ My accounts of these theories will justify my having brought them together under the title I have adopted.

Lord Avebury (better known under his earlier name of Sir John Lubbock) gives a very similar account of the origin of totemism, though without insisting upon the element of misunderstanding. If, he says, we wish to explain animal-worship, we must not forget how often human names are borrowed from animals. The children and followers of a man who was called 'Bear' or 'Lion' naturally turned his name into a clan-name. Thence it came about that the animal itself would come to be regarded 'first with interest, then with respect and at length with a sort of awe'.

Lang's explanation falls into two parts. One part of it traces the totemic system as a matter of psychological necessity from the fact of the totems having animal names - always presupposing that the origin of these names had been forgotten. The second part of his theory goes on to try to explain how the names in fact originated; as we shall see, it is of a very different character from the first part.

Reinach, who has been successful in tracing survivals of the totemic system in the cults and usages of later periods but who has always attached small importance to the factor of descent from the totem, remarks confidently in one passage that in his opinion totemism is nothing more than 'un hypertrophie de l'instinct social'. (Reinach, 1905-12, 1, 41.) A similar view seems to run through the recent book by Durkheim (1912). The totem, he argues, is the visible representative of social religion among the races concerned: it embodies the community, which is the true object of their worship.

The first of the three theories on the origin of totemism which Frazer himself has supported at different times was a psychological one, and I shall deal with it later. His second theory, with which we are here concerned, took form under the influence of a momentous publication by two men who had made researches among the natives of Central Australia.
By focusing his judgement of totemism upon the *intichiuma* ceremony, Frazer came all at once to see the totemic system in an entirely new light: as a purely practical organization for meeting the most natural of human needs. (Cf. Haddon's theory above.)¹ The system was simply an example upon a large scale of 'co-operative magic'. Primitive men set up what might be described as a magical producers' and consumers' union. Each totem clan undertook the business of guaranteeing the plentiful supply of one particular article of food. Where non-edible totems were concerned (such as dangerous animals, or rain, wind, etc.) the duty of the totem clan lay in controlling the natural force in question and in counteracting its injurious possibilities. The achievements of each clan were to the advantage of all the rest. Since each clan might eat none, or only very little, of its own totem, it provided that valuable material for the other clans and was itself provided in exchange with what they produced as their social totemic duty. In the light of the insight which he thus obtained from the *intichiuma* ceremony, Frazer came to believe that the prohibition against eating one's own totem had blinded people to the more important element in the situation, namely the injunction to produce as much as possible of an edible totem to meet the needs of other people.

[1912-1913, 2756]

The theory based by Frazer on the *intichiuma* ceremony stands or falls with the assertion of the primitive character of the Arunta institutions. But in face of the objections raised by Durkheim¹ and Lang (1903 and 1905), that assertion appears untenable. On the contrary, the Arunta seem to be the most highly developed of the Australian tribes and to represent a stage of totemism in dissolution rather than its beginnings. The myths which impressed Frazer so deeply because, in contrast to the conditions that rule to-day, they lay stress upon liberty to eat the totem and to marry within the totem - these myths are easily explicable as wishful phantasies which, like the myth of a Golden Age, have been projected back into the past.

[1912-1913, 2757]

Frazer himself subsequently abandoned this theory that totemism was derived from a belief in souls; and, after coming to know of Spencer and Gillen's observations, adopted the sociological theory which I have already discussed. But he came to see himself that the motive from which that second theory derived totemism was too 'rational' and that it implied a social organization which was too complicated to be described as primitive.¹ The magical co-operative societies now seemed to him to be the fruit rather than the seed of totemism. He sought for some simpler factor, some primitive superstitious behind these structures, to which the origin of totemism might be traced back. At last he found this original factor in the Arunta's remarkable story of conception.

[1912-1913, 2758]

Accordingly, the ultimate source of totemism would be the savages' ignorance of the process by which men and animals reproduce their kind; and, in particular, ignorance of the part played by the male in fertilization. This ignorance must have been facilitated by the long interval between the act of fertilization and the birth of the child (or the first perception of its movements). Thus totemism would be a creation of the feminine rather than of the masculine mind: its roots would lie in 'the sick fancies of pregnant women'. 'Anything indeed that struck a woman at that mysterious moment of her life when she first knows herself to be a mother might easily be identified by her with the child in her womb. Such maternal fancies, so natural and seemingly so universal, appear to be the root of totemism.' (Frazer, 1910, 4, 63.)

[1912-1913, 2759]
Yet another theory of totemism is held by some eminent American ethnologists, Franz Boas, C. Hill-Tout, and others. It is based upon observations on North American Indian totemic clans and maintains that the totem was originally the guardian spirit of an ancestor, who acquired it in a dream and transmitted it to his descendants. We have already heard the difficulties which stand in the way of the view that totems are inherited from single individuals; but apart from this, the Australian evidence lends no support to the theory that totems are derived from guardian spirits. (Frazer, 1910, 4, 48 ff.)

I have set out the different theories about totemism in some detail, though even so compression has been inevitable and I fear that my account may have suffered in consequence. In what follows, however, I shall venture, for my readers' sake, to be still more condensed. The discussions on the exogamy practised by totemic peoples are, owing to the nature of the material with which they deal, particularly complicated and diffuse one might even say confused. The purposes of the present work make it possible for me to limit myself to tracing certain of the main lines of dispute, while referring those who wish to enter into the subject more deeply to the specialized writings from which I have so frequently quoted.

As regards the chronological relations between the two institutions, most of the authorities agree that totemism is the older of them and that exogamy arose later.¹

But the fact that exogamous sexual restrictions were imposed intentionally throws no light on the motive which led to their imposition. What is the ultimate source of the horror of incest which must be recognized as the root of exogamy? To explain it by the existence of an instinctive dislike of sexual intercourse with blood relatives - that is to say, by an appeal to the fact that there is a horror of incest - is clearly unsatisfactory; for social experience shows that, in spite of this supposed instinct, incest is no uncommon event even in our present-day society, and history tells us of cases in which incestuous marriage between privileged persons was actually the rule.

This attempt is based upon a hypothesis of Charles Darwin's upon the social state of primitive men. Darwin deduced from the habits of the higher apes that men, too, originally lived in comparatively small groups or hordes within which the jealousy of the oldest and strongest male prevented sexual promiscuity. 'We may indeed conclude from what we know of the jealousy of all male quadrupeds, armed, as many of them are, with special weapons for battling with their rivals, that promiscuous intercourse in a state of nature is extremely improbable. . . . Therefore, if we look far enough back in the stream of time, . . . judging from the social habits of man as he now exists . . . the most probable view is that primaeval man aboriginally lived in small communities, each with as many wives as he could support and obtain, whom he would have jealously guarded against all other men. Or he may have lived with several wives by himself, like the Gorilla; for all the natives "agree that but one adult male is seen in a band; when the young male grows up, a contest takes place for mastery, and the strongest, by killing and driving out the others, establishes himself as the head of the community". (Dr. Savage, in Boston Journal of Nat. Hist., vol. v, 1845-7, p. 423.) The younger males, being thus expelled and wandering about, would, when at last successful in finding a partner, prevent too close interbreeding within the limits of the same family.' (Darwin, 1871, 2, 362 ff.)
Atkinson (1903) seems to have been the first to realize that the practical consequence of the conditions obtaining in Darwin's primal horde must be exogamy for the young males. Each of them might, after being driven out, establish a similar horde, in which the same prohibition upon sexual intercourse would rule owing to its leader's jealousy. In course of time this would produce what grew into a conscious law: 'No sexual relations between those who share a common home.' After the establishment of totemism this regulation would assume another form and would run: 'No sexual relations within the totem.'

I recently published (1909b) an 'Analysis of a Phobia in a Five-Year-Old Boy', the material of which was supplied to me by the little patient's father. The boy had a phobia of horses, and as a result he refused to go out in the street. He expressed a fear that the horse would come into the room and bite him; and it turned out that this must be the punishment for a wish that the horse might fall down (that is, die). After the boy's fear of his father had been removed by reassurances, it became evident that he was struggling against wishes which had as their subject the idea of his father being absent (going away on a journey, dying). He regarded his father (as he made all too clear) as a competitor for the favours of his mother, towards whom the obscure foreshadowings of his budding sexual wishes were aimed. Thus he was situated in the typical attitude of a male child towards his parents to which we have given the name of the 'Oedipus complex' and which we regard in general as the nuclear complex of the neuroses. The new fact that we have learnt from the analysis of 'little Hans' - a fact with an important bearing upon totemism - is that in such circumstances children displace some of their feelings from their father on to an animal.

It may fairly be said that in these children's phobias some of the features of totemism reappear, but reversed into their negative. We are, however, indebted to Ferenczi (1913a) for an interesting history of a single case which can only be described as an instance of positive totemism in a child. It is true that in the case of little Árpád (the subject of Ferenczi's report) his totemic interests did not arise in direct relation with his Oedipus complex but on the basis of its narcissistic precondition, the fear of castration. But any attentive reader of the story of little Hans will find abundant evidence that he, too, admired his father as possessing a big penis and feared him as threatening his own. The same part is played by the father alike in the Oedipus and the castration complexes - the part of a dreaded enemy to the sexual interests of childhood. The punishment which he threatens is castration, or its substitute, blinding.¹

Later on we shall be able to assess the worth of this observation more completely. At the moment I will only emphasize two features in it which offer valuable points of agreement with totemism: the boy's complete identification with his totem animal¹ and his ambivalent emotional attitude to it. These observations justify us, in my opinion, in substituting the father for the totem animal in the formula for totemism (in the case of males). It will be observed that there is nothing new or particularly daring in this step forward. Indeed, primitive men say the very same thing themselves, and, where the totemic system is still in force to-day, they describe the totem as their common ancestor and primal father. All we have done is to take at its literal value an expression used by these people, of which the anthropologists have been able to make very little and which they have therefore been glad to keep in the background. Psycho-analysis, on the contrary, leads us to put special stress upon this same point and to take it as the starting-point of our attempt at explaining totemism.²
The first consequence of our substitution is most remarkable. If the totem animal is the father, then the two principal ordinances of totemism, the two taboo prohibitions which constitute its core - not to kill the totem and not to have sexual relations with a woman of the same totem - coincide in their content with the two crimes of Oedipus, who killed his father and married his mother, as well as with the two primal wishes of children, the insufficient repression or the re-awakening of which forms the nucleus of perhaps every psychoneurosis. If this equation is anything more than a misleading trick of chance, it must enable us to throw a light upon the origin of totemism in the inconceivably remote past. In other words, it would enable us to make it probable that the totemic system - like little Hans's animal phobia and little Árpád's poultry perversion - was a product of the conditions involved in the Oedipus complex. In order to pursue this possibility, we shall have, in the following pages, to study a feature of the totemic system (or, as we might say, of the totemic religion) which I have hitherto scarcely found an opportunity of mentioning.

William Robertson Smith, who died in 1894 - physicist, philologist, Bible critic and archaeologist - was a man of many-sided interests, clear-sighted and liberal-minded. In his book on the Religion of the Semites (first published in 1889) he put forward the hypothesis that a peculiar ceremony known as the 'totem meal' had from the very first formed an integral part of the totemic system. At that time he had only a single piece of evidence in support of his theory: an account of a procedure of the kind dating from the fifth century A.D. But by an analysis of the nature of sacrifice among the ancient Semites he was able to lend his hypothesis a high degree of probability. Since sacrifice implies a divinity, it was a question of arguing back from a comparatively high phase of religious ritual to the lowest one, that is, to totemism.

I will now attempt to extract from Robertson Smith's admirable work those of his statements on the origin and meaning of the ritual of sacrifice which are of decisive interest for us. In so doing I must omit all the details, often so fascinating, and neglect all the later developments. It is quite impossible for an abstract such as this to give my readers any notion of the lucidity and convincing force of the original.

The oldest form of sacrifice, then, older than the use of fire or the knowledge of agriculture, was the sacrifice of animals, whose flesh and blood were enjoyed in common by the god and his worshippers. It was essential that each one of the participants should have his share of the meal.

But why is this binding force attributed to eating and drinking together? In primitive societies there was only one kind of bond which was absolute and inviolable - that of kinship. The solidarity of such a fellowship was complete. 'A kin was a group of persons whose lives were so bound up together, in what must be called a physical unity, that they could be treated as parts of one common life... In a case of homicide Arabian tribesmen do not say, "The blood of M. or N. has been spilt", naming the man; they say, "Our blood has been spilt". In Hebrew the phrase by which one claims kinship is "I am your bone and your flesh". Thus kinship implies participation in a common substance. It is therefore natural that it is not merely based on the fact that a man is a part of his mother's substance, having been born of her and having been nourished by her milk, but that it can be acquired and strengthened by food which a man eats later and with which his body is renewed. If a man shared a meal with his god he was expressing a conviction that they were of one substance; and he would never share a meal with one whom he regarded as a stranger.
The sacrificial meal, then, was originally a feast of kinsmen, in accordance with the law that only kinsmen eat together. In our own society the members of a family have their meals in common; but the sacrificial meal bears no relation to the family. Kinship is an older thing than family life, and in the most primitive societies known to us the family contained members of more than one kindred. The man married a woman of another clan and the children inherited their mother's clan; so that there was no communion of kin between the man and the other members of the family. In a family of such a kind there was no common meal. To this day, savages eat apart and alone and the religious food prohibitions of totemism often make it impossible for them to eat in common with their wives and children.

Let us now turn to the sacrificial animal. As we have heard, there is no gathering of a clan without an animal sacrifice, nor - and this now becomes significant - any slaughter of an animal except upon these ceremonial occasions. While game and the milk of domestic animals might be consumed without any qualms, religious scruples made it impossible to kill a domestic animal for private purposes. There cannot be the slightest doubt, says Robertson Smith, that the slaughter of a victim was originally among the acts which 'are illegal to an individual, and can only be justified when the whole clan shares the responsibility of the deed.'¹ So far as I know, there is only one class of actions recognized by early nations to which this description applies, viz. actions which involve an invasion of the sanctity of the tribal blood. In fact, a life which no single tribesman is allowed to invade, and which can be sacrificed only by the consent and common action of the kin, stands on the same footing with the life of the fellow-tribesman.' The rule that every participant at the sacrificial meal must eat a share of the flesh of the victim has the same meaning as the provision that the execution of a guilty tribesman must be carried out by the tribe as a whole. In other words, the sacrificial animal was treated as a member of the tribe; the sacrificing community, the god and the sacrificial animal were of the same blood and members of one clan.

Robertson Smith brings forward copious evidence for identifying the sacrificial animal with the primitive totem animal. In later antiquity there were two classes of sacrifice: one in which the victims were domestic animals of the kinds habitually used for eating, and the other extraordinary sacrifices of animals which were unclean and whose consumption was forbidden. Investigation shows that these unclean animals were sacred animals, that they were offered as sacrifices to the gods to whom they were sacred, that originally they were identical with the gods themselves, and that by means of the sacrifice the worshippers in some way laid stress upon their blood kinship with the animal and the god. But in still earlier times this distinction between ordinary and 'mystic' sacrifices disappears. Originally all animals were sacred, their flesh was forbidden meat and might only be consumed on ceremonial occasions and with the participation of the whole clan. The slaughter of an animal was equivalent to a shedding of the tribal blood and could occur subject only to the same precautions and the same insurances against incurring reproach.
The domestication of animals and the introduction of cattle-breeding seems everywhere to have brought to an end the strict and unadulterated totemism of primaeval days.¹ But such sacred character as remained to domestic animals under what had then become 'pastoral' religion is obvious enough to allow us to infer its original totemic nature. Even in late classical times ritual prescribed in many places that the sacrificial priest must take to flight after performing the sacrifice, as though to escape retribution. The idea that slaughtering oxen was a crime must at one time have prevailed generally in Greece. At the Athenian festival of Buphonia a regular trial was instituted after the sacrifice, and all the participants were called as witnesses. At the end of it, it was agreed that the responsibility for the murder should be placed upon the knife; and this was accordingly cast into the sea. [1912-1913, 2777]

In spite of the ban protecting the lives of sacred animals in their quality of fellow-clansmen, a necessity arose for killing one of them from time to time in solemn communion and for dividing its flesh and blood among the members of the clan. The compelling motive for this deed reveals the deepest meaning of the nature of sacrifice. We have heard how in later times, whenever food is eaten in common, the participation in the same substance establishes a sacred bond between those who consume it when it has entered their bodies. In ancient times this result seems only to have been effected by participation in the substance of a sacrosanct victim. The holy mystery of sacrificial death 'is justified by the consideration that only in this way can the sacred cement be procured which creates or keeps alive a living bond of union between the worshippers and their god'.²(Ibid., 313.) [1912-1913, 2777]

This bond is nothing else than the life of the sacrificial animal, which resides in its flesh and in its blood and is distributed among all the participants in the sacrificial meal. A notion of this kind lies at the root of all the blood covenants by which men made compacts with each other even at a late period of history. This completely literal way of regarding blood-kinship as identity of substance makes it easy to understand the necessity for renewing it from time to time by the physical process of the sacrificial meal. [1912-1913, 2777]

At this point I will interrupt my survey of Robertson Smith's line of thought and restate the gist of it in the most concise terms. With the establishment of the idea of private property sacrifice came to be looked upon as a gift to the deity, as a transference of property from men to the god. But this interpretation left unexplained all the peculiarities of the ritual of sacrifice. In the earliest times the sacrificial animal had itself been sacred and its life untouchable; it might only be killed if all the members of the clan participated in the deed and shared their guilt in the presence of the god, so that the sacred substance could be yielded up and consumed by the clansmen and thus ensure their identity with one another and with the deity. The sacrifice was a sacrament and the sacrificial animal was itself a member of the clan. It was in fact the ancient totem animal, the primitive god himself, by the killing and consuming of which the clansmen renewed and assured their likeness to the god. [1912-1913, 2778]
From this analysis of the nature of sacrifice Robertson Smith draws the conclusion that the periodic killing and eating of the totem in times before the worship of anthropomorphic deities had been an important element in totemic religion. The ceremonial of a totem meal of this kind is, he suggests, to be found in a description of a sacrifice of comparatively late date. St. Nilus records a sacrificial ritual current among the Bedouin of the Sinai Desert at the end of the fourth century A.D. The victim of the sacrifice, a camel, 'is bound upon a rude altar of stones piled together, and when the leader of the band has thrice led the worshippers round the altar in a solemn procession accompanied with chants, he inflicts the first wound . . . and in all haste drinks of the blood that gushes forth. Forthwith the whole company fall on the victim with their swords, hacking off pieces of the quivering flesh and devouring them raw with such wild haste, that in the short interval between the rise of the day star¹ which marked the hour for the service to begin, and the disappearance of its rays before the rising sun, the entire camel, body and bones, skin, blood and entrails, is wholly devoured.' All the evidence goes to show that this barbaric ritual, which bears every sign of extreme antiquity, was no isolated instance but was everywhere the original form taken by totemic sacrifice, though later toned down in many different directions.

[1912-1913, 2778]

Many authorities have refused to attach importance to the concept of the totem meal, because it was not supported by any direct observation at the level of totemism. Robertson Smith himself pointed to instances in which the sacramental significance of the sacrifice seemed to be assured: for instance, the human sacrifices of the Aztecs, and others which recall the circumstances of the totem meal - the sacrifice of bears by the Bear clan of the Ouataouak tribe in America and the bear feast of the Aino in Japan. These and similar cases have been reported in detail by Frazer in the Fifth Part of his great work (1912, 2). An American Indian tribe in California, which worship a large bird of prey (a buzzard), kill it once a year at a solemn festival, after which it is mourned and its skin and feathers are preserved. The Zuni Indians of New Mexico behave in a similar way to their sacred turtles.

[1912-1913, 2779]

A feature has been observed in the intichiuma ceremonies of the Central Australian tribes which agrees admirably with Robertson Smith's conjectures. Each clan, when it is performing magic for the multiplication of its totem (which it itself is normally prohibited from consuming), is obliged during the ceremony to eat a small portion of its own totem before making it accessible to the other clans. According to Frazer (ibid., 2, 590) the clearest example of a sacramental consumption of an otherwise prohibited totem is to be found among the Bini of West Africa in connection with their funeral ceremonies.

[1912-1913, 2779]

Accordingly, I propose that we should adopt Robertson Smith's hypothesis that the sacramental killing and communal eating of the totem animal, whose consumption was forbidden on all other occasions, was an important feature of totemic religion.¹

[1912-1913, 2779]
Let us call up the spectacle of a totem meal of the kind we have been discussing, amplified by a few probable features which we have not yet been able to consider. The clan is celebrating the ceremonial occasion by the cruel slaughter of its totem animal and is devouring it raw - blood, flesh and bones. The clansmen are there, dressed in the likeness of the totem and imitating it in sound and movement, as though they are seeking to stress their identity with it. Each man is conscious that he is performing an act forbidden to the individual and justifiable only through the participation of the whole clan; nor may any one absent himself from the killing and the meal. When the deed is done, the slaughtered animal is lamented and bewailed. The mourning is obligatory, imposed by dread of a threatened retribution. As Robertson Smith (1894, 412) remarks of an analogous occasion, its chief purpose is to disclaim responsibility for the killing.

What are we to make, though, of the prelude to this festive joy - the mourning over the death of the animal? If the clansmen rejoice over the killing of the totem - a normally forbidden act - why do they mourn over it as well?

As we have seen, the clansmen acquire sanctity by consuming the totem: they reinforce their identification with it and with one another. Their festive feelings and all that follows from them might well be explained by the fact that they have taken into themselves the sacred life of which the substance of the totem is the vehicle.

Psycho-analysis has revealed that the totem animal is in reality a substitute for the father; and this tallies with the contradictory fact that, though the killing of the animal is as a rule forbidden, yet its killing is a festive occasion - with the fact that it is killed and yet mourned. The ambivalent emotional attitude, which to this day characterizes the father-complex in our children and which often persists into adult life, seems to extend to the totem animal in its capacity as substitute for the father.

If, now, we bring together the psycho-analytic translation of the totem with the fact of the totem meal and with Darwin's theories of the earliest state of human society, the possibility of a deeper understanding emerges - a glimpse of a hypothesis which may seem fantastic but which offers the advantage of establishing an unsuspected correlation between groups of phenomena that have hitherto been disconnected.

There is, of course, no place for the beginnings of totemism in Darwin's primal horde. All that we find there is a violent and jealous father who keeps all the females for himself and drives away his sons as they grow up. This earliest state of society has never been an object of observation. The most primitive kind of organization that we actually come across - and one that is in force to this day in certain tribes - consists of bands of males; these bands are composed of members with equal rights and are subject to the restrictions of the totemic system, including inheritance through the mother. Can this form of organization have developed out of the other one? and if so along what lines?
If we call the celebration of the totem meal to our help, we shall be able to find an answer. One day¹ the brothers who had been driven out came together, killed and devoured their father and so made an end of the patriarchal horde. United, they had the courage to do and succeeded in doing what would have been impossible for them individually. (Some cultural advance, perhaps, command over some new weapon, had given them a sense of superior strength.) Cannibal savages as they were, it goes without saying that they devoured their victim as well as killing him. The violent primal father had doubtless been the feared and envied model of each one of the company of brothers: and in the act of devouring him they accomplished their identification with him, and each one of them acquired a portion of his strength. The totem meal, which is perhaps mankind's earliest festival, would thus be a repetition and a commemoration of this memorable and criminal deed, which was the beginning of so many things - of social organization, of moral restrictions and of religion.¹

² This hypothesis, which has such a monstrous air, of the tyrannical father being overwhelmed and killed by a combination of his exiled sons, was also arrived at by Atkinson (1903, 220 f.) as a direct implication of the state of affairs in Darwin's primal horde: 'The patriarch had only one enemy whom he should dread... a youthful band of brothers living together in forced celibacy, or at most in polyanous relation with some single female captive. A horde as yet weak in their impubescence they are, but they would, when strength was gained with time, inevitably wrench by combined attacks, renewed again and again, both wife and life from the paternal tyrant.' Atkinson, who incidentally passed his whole life in New Caledonia and had unusual opportunities for studying the natives, also pointed out that the conditions which Darwin assumed to prevail in the primal horde may easily be observed in herds of wild oxen and horses and regularly lead to the killing of the father of the herd. He further supposed that, after the father had been disposed of, the horde would be disintegrated by a bitter struggle between the victorious sons. Thus any new organization of society would be precluded: there would be 'an ever-recurring violent succession to the solitary paternal tyrant, by sons whose parricidal hands were so soon again clenched in fratricidal strife.' (Ibid., 228.) Atkinson, who had no psycho-analytic hints to help him and who was ignorant of Robertson Smith's studies, found a less violent transition from the primal horde to the next social stage, at which numbers of males live together in a peaceable community. He believed that through the intervention of maternal love the sons - to begin with only the youngest, but later others as well - were allowed to remain with the horde, and that in return for this toleration the sons acknowledged their father's sexual privilege by renouncing all claim to their mother and sisters.

² In order that these latter consequences may seem plausible, leaving their premises on one side, we need only suppose that the tumultuous mob of brothers were filled with the same contradictory feelings which we can see at work in the ambivalent father-complexes of our children and of our neurotic patients. They hated their father, who presented such a formidable obstacle to their craving for power and their sexual desires; but they loved and admired him too. After they had got rid of him, had satisfied their hatred and had put into effect their wish to identify themselves with him, the affection which had all this time been pushed under was bound to make itself felt.¹ It did so in the form of remorse. A sense of guilt made its appearance, which in this instance coincided with the remorse felt by the whole group. The dead father became stronger than the living one had been - for events took the course we so often see them follow in human affairs to this day. What had up to then been prevented by his actual existence was thenceforward prohibited by the sons themselves, in accordance with the psychological procedure so familiar to us in psycho-analyses under the name of 'deferred obedience'. They revoked their deed by forbidding the killing of the totem, the substitute for their father; and they renounced its fruits by resigning their claim to the women who had now been set free. They thus created out of their filial sense of guilt the two fundamental taboos of totemism, which for that very reason inevitably corresponded to the two repressed wishes of the Oedipus complex. Whoever contravened those taboos be came guilty of the only two crimes with which primitive society concerned itself.²

[1912-1913, 2782]

[1912-1913, 2783]
This fresh emotional attitude must also have been assisted by the fact that the deed cannot have given complete satisfaction to those who did it. From one point of view it had been done in vain. Not one of the sons had in fact been able to put his original wish - of taking his father's place - into effect. And, as we know, failure is far more propitious for a moral reaction than satisfaction.

The two taboos of totemism with which human morality has its beginning are not on a par psychologically. The first of them, the law protecting the totem animal, is founded wholly on emotional motives: the father had actually been eliminated, and in no real sense could the deed be undone. But the second rule, the prohibition of incest, has a powerful practical basis as well. Sexual desires do not unite men but divide them. Though the brothers had banded together in order to overcome their father, they were all one another's rivals in regard to the women. Each of them would have wished, like his father, to have all the women to himself. The new organization would have collapsed in a struggle of all against all, for none of them was of such over-mastering strength as to be able to take on his father's part with success. Thus the brothers had no alternative, if they were to live together, but - not, perhaps, until they had passed through many dangerous crises - to institute the law against incest, by which they all alike renounced the women whom they desired and who had been their chief motive for despatching their father. In this way they rescued the organization which had made them strong - and which may have been based on homosexual feelings and acts, originating perhaps during the period of their expulsion from the horde. Here, too, may perhaps have been the germ of the institution of matriarchy, described by Bachofen, which was in turn replaced by the patriarchal organization of the family.

On the other hand, the claim of totemism to be regarded as a first attempt at a religion is based on the first of these two taboos - that upon taking the life of the totem animal. The animal struck the sons as a natural and obvious substitute for their father; but the treatment of it which they found imposed on themselves expressed more than the need to exhibit their remorse. They could attempt, in their relation to this surrogate father, to allay their burning sense of guilt, to bring about a kind of reconciliation with their father. The totemic system was, as it were, a covenant with their father, in which he promised them everything that a childish imagination may expect from a father - protection, care and indulgence - while on their side they undertook to respect his life, that is to say, not to repeat the deed which had brought destruction on their real father. Totemism, moreover, contained an attempt at self-justification: 'If our father had treated us in the way the totem does, we should never have felt tempted to kill him.' In this fashion totemism helped to smooth things over and to make it possible to forget the event to which it owed its origin.

Features were thus brought into existence which continued thenceforward to have a determining influence on the nature of religion. Totemic religion arose from the filial sense of guilt, in an attempt to allay that feeling and to appease the father by deferred obedience to him. All later religions are seen to be attempts at solving the same problem. They vary according to the stage of civilization at which they arise and according to the methods which they adopt; but all have the same end in view and are reactions to the same great event with which civilization began and which, since it occurred, has not allowed mankind a moment's rest.
There is another feature which was already present in totemism and which has been preserved unaltered in religion. The tension of ambivalence was evidently too great for any contrivance to be able to counteract it; or it is possible that psychological conditions in general are unfavourable to getting rid of these antithetical emotions. However that may be, we find that the ambivalence implicit in the father-complex persists in totemism and in religions generally. Totemic religion not only comprised expressions of remorse and attempts at atonement, it also served as a remembrance of the triumph over the father. Satisfaction over that triumph led to the institution of the memorial festival of the totem meal, in which the restrictions of deferred obedience no longer held. Thus it became a duty to repeat the crime of parricide again and again in the sacrifice of the totem animal, whenever, as a result of the changing conditions of life, the cherished fruit of the crime - appropriation of the paternal attributes - threatened to disappear. We shall not be surprised to find that the element of filial rebelliousness also emerges, in the later products of religion, often in the strangest disguises and transformations.

Hitherto we have followed the developments of the affectionate current of feeling towards the father, transformed into remorse, as we find them in religion and in moral ordinances (which are not sharply distinguished in totemism). But we must not overlook the fact that it was in the main with the impulses that led to parricide that the victory lay. For a long time afterwards, the social fraternal feelings, which were the basis of the whole transformation, continued to exercise a profound influence on the development of society. They found expression in the sanctification of the blood tie, in the emphasis upon the solidarity of all life within the same clan. In thus guaranteeing one another's lives, the brothers were declaring that no one of them must be treated by another as their father was treated by them all jointly. They were precluding the possibility of a repetition of their father's fate. To the religiously-based prohibition against killing the totem was now added the socially-based prohibition against fratricide. It was not until long afterwards that the prohibition ceased to be limited to members of the clan and assumed the simple form: 'Thou shalt do no murder.' The patriarchal horde was replaced in the first instance by the fraternal clan, whose existence was assured by the blood tie. Society was now based on complicity in the common crime; religion was based on the sense of guilt and the remorse attaching to it; while morality was based partly on the exigencies of this society and partly on the penance demanded by the sense of guilt.

Thus psycho-analysis, in contradiction to the more recent views of the totemic system but in agreement with the earlier ones, requires us to assume that totemism and exogamy were intimately connected and had a simultaneous origin.

A great number of powerful motives restrain me from any attempt at picturing the further development of religions from their origin in totemism to their condition to-day. I will only follow two threads whose course I can trace with especial clarity as they run through the pattern: the theme of the totemic sacrifice and the relation of son to father.¹

Robertson Smith has shown us that the ancient totem meal recurs in the original form of sacrifice. The meaning of the act is the same: sanctification through participation in a common meal. The sense of guilt, which can only be averted by the solidarity of all the participants, also persists. What is new is the clan deity, in whose supposed presence the sacrifice is performed, who participates in the meal as though he were a clansman, and with whom those who consume the meal become identified. How does the god come to be in a situation to which he was originally a stranger?
We know that there are a multiplicity of relations between the god and the sacred animal (the totem or the sacrificial victim). (1) Each god usually has an animal (and quite often several animals) sacred to him. (2) In the case of certain specially sacred sacrifices - 'mystic' sacrifices - the victim was precisely the animal sacred to the god (Smith, 1894). (3) The god was often worshipped in the shape of an animal (or, to look at it in another way, animals were worshipped as gods) long after the age of totemism. (4) In myths the god often transforms himself into an animal, and frequently into the animal that is sacred to him.

It therefore seems plausible to suppose that the god himself was the totem animal, and that he developed out of it at a later stage of religious feeling. But we are relieved from the necessity for further discussion by the consideration that the totem is nothing other than a surrogate of the father. Thus, while the totem may be the first form of father-surrogate, the god will be a later one, in which the father has regained his human shape. A new creation such as this, derived from what constitutes the root of every form of religion - a longing for the father - might occur if in the process of time some fundamental change had taken place in man's relation to the father, and perhaps, too, in his relation to animals.

Signs of the occurrence of changes of this kind may easily be seen, even if we leave on one side the beginning of a mental estrangement from animals and the disrupting of totemism owing to domestication. (See above, p2777 f.) There was one factor in the state of affairs produced by the elimination of the father which was bound in the course of time to cause an enormous increase in the longing felt for him. Each single one of the brothers who had banded together for the purpose of killing their father was inspired by a wish to become like him and had given expression to it by incorporating parts of their father's surrogate in the totem meal. But, in consequence of the pressure exercised upon each participant by the fraternal clan as a whole, that wish could not be fulfilled. For the future no one could or might ever again attain the father's supreme power, even though that was what all of them had striven for. Thus after a long lapse of time their bitterness against their father, which had driven them to their deed, grew less, and their longing for him increased; and it became possible for an ideal to emerge which embodied the unlimited power of the primal father against whom they had once fought as well as their readiness to submit to him. As a result of decisive cultural changes, the original democratic equality that had prevailed among all the individual clansmen became untenable; and there developed at the same time an inclination, based on veneration felt for particular human individuals, to revive the ancient paternal ideal by creating gods. The notion of a man becoming a god or of a god dying strikes us to-day as shockingly presumptuous; but even in classical antiquity there was nothing revolting in it.¹ The elevation of the father who had once been murdered into a god from whom the clan claimed descent was a far more serious attempt at atonement than had been the ancient covenant with the totem.

We see, then, that in the scene of sacrifice before the god of the clan the father is in fact represented twice over - as the god and as the totemic animal victim. But in our attempts at understanding this situation we must beware of interpretations which seek to translate it in a two-dimensional fashion as though it were an allegory, and which in so doing forget its historical stratification. The two-fold presence of the father corresponds to the two chronologically successive meanings of the scene. The ambivalent attitude towards the father has found a plastic expression in it, and so, too, has the victory of the son's affectionate emotions over his hostile ones. The scene of the father's vanquishment, of his greatest defeat, has become the stuff for the representation of his supreme triumph. The importance which is everywhere, without exception, ascribed to sacrifice lies in the fact that it offers satisfaction to the father for the outrage inflicted on him in the same act in which that deed is commemorated.

¹
As time went on, the animal lost its sacred character and the sacrifice lost its connection with the totem feast; it became a simple offering to the deity, an act of renunciation in favour of the god. God Himself had become so far exalted above mankind that He could only be approached through an intermediary the priest. At the same time divine kings made their appearance in the social structure and introduced the patriarchal system into the state. It must be confessed that the revenge taken by the deposed and restored father was a harsh one: the dominance of authority was at its climax. The subjugated sons made use of the new situation in order to unburden themselves still further of their sense of guilt. They were no longer in any way responsible for the sacrifice as it now was. It was God Himself who demanded it and regulated it. This is the phase in which we find myths showing the god himself killing the animal which is sacred to him and which is in fact himself. Here we have the most extreme denial of the great crime which was the beginning of society and of the sense of guilt. But there is a second meaning to this last picture of sacrifice which is unmistakable. It expresses satisfaction at the earlier father-surrogate having been abandoned in favour of the superior concept of God. At this point the psycho-analytic interpretation of the scene coincides approximately with the allegorical, surface translation of it, which represents the god as overcoming the animal side of his own nature.¹

In his great work, The Golden Bough, Frazer puts forward the view that the earliest kings of the Latin tribes were foreigners who played the part of a god and were solemnly executed at a particular festival. The annual sacrifice (or, as a variant, self-sacrifice) of a god seems to have been an essential element in the Semitic religions. The ceremonials of human sacrifice, performed in the most different parts of the inhabited globe, leave very little doubt that the victims met their end as representatives of the deity; and these sacrificial rites can be traced into late times, with an inanimate effigy or puppet taking the place of the living human being. The theanthropic sacrifice of the god, into which it is unfortunately impossible for me to enter here as fully as into animal sacrifice, throws a searching retrospective light upon the meaning of the older forms of sacrifice. It confesses, with a frankness that could hardly be excelled, to the fact that the object of the act of sacrifice has always been the same - namely what is now worshipped as God, that is to say, the father. The problem of the relation between animal and human sacrifice thus admits of a simple solution. The original animal sacrifice was already a substitute for a human sacrifice - for the ceremonial killing of the father; so that, when the father-surrogate once more resumed its human shape, the animal sacrifice too could be changed back into a human sacrifice.²

Let us assume it to be a fact, then, that in the course of the later development of religions the two driving factors, the son's sense of guilt and the son’s rebelliousness, never became extinct. Whatever attempt was made at solving the religious problem, whatever kind of reconciliation was effected between these two opposing mental forces, sooner or later broke down, under the combined influence, no doubt, of historical events, cultural changes and internal psychical modifications.

An event such as the elimination of the primal father by the company of his sons must inevitably have left ineradicable traces in the history of humanity; and the less it itself was recollected, the more numerous must have been the substitutes to which it gave rise.³ I shall resist the temptation of pointing out these traces in mythology, where they are not hard to find, and shall turn in another direction and take up a suggestion made by Salomon Reinach in a most instructive essay on the death of Orpheus.²

¹ [1912-1913, 2790]
² [1912-1913, 2791]
³ [1912-1913, 2792]
May not the same have been true of primitive men? We are justified in believing that, as one of the phenomena of their narcissistic organization, they overvalued their psychical acts to an extraordinary degree.² Accordingly the mere hostile impulse against the father, the mere existence of a wishful phantasy of killing and devouring him, would have been enough to produce the moral reaction that created totemism and taboo. In this way we should avoid the necessity for deriving the origin of our cultural legacy, of which we justly feel so proud, from a hideous crime, revolting to all our feelings. No damage would thus be done to the causal chain stretching from the beginning to the present day, for psychical reality would be strong enough to bear the weight of these consequences. To this it may be objected that an alteration in the form of society from a patriarchal horde to a fraternal clan did actually take place. This is a powerful argument, but not a conclusive one. The alteration might have been effected in a less violent fashion and none the less have been capable of determining the appearance of the moral reaction. So long as the pressure exercised by the primal father could be felt, the hostile feelings towards him were justified, and remorse on their account would have to await a later day. And if it is further argued that everything derived from the ambivalent relation to the father - taboo and the sacrificial ordinance - is characterized by the deepest seriousness and the most complete reality, this further objection carries just as little weight. For the ceremonials and inhibitions of obsessional neurotics show these same characteristics and are nevertheless derived only from psychical reality - from intentions and not from their execution. We must avoid transplanting a contempt for what is merely thought or wished from our commonplace world, with its wealth of material values, into the world of primitive men and neurotics, of which the wealth lies only within themselves.

[1912-1913, 2798]

In the four essays with the title *Totem and Taboo* I have made an attempt to deal with the problems of social anthropology in the light of analysis; this line of investigation leads direct to the origins of the most important institutions of our civilization, of the structure of the state, of morality and religion, and, moreover, of the prohibition against incest and of conscience. It is no doubt too early to decide how far the conclusions thus reached will be able to withstand criticism.

[1914d, 2903]

An examination of the first question held out the promise of bringing us information about the source of mankind's sense of guilt in general. The invariable outcome of analytic work was to show that this obscure sense of guilt derived from the Oedipus complex and was a reaction to the two great criminal intentions of killing the father and having sexual relations with the mother. In comparison with these two, the crimes committed in order to fix the sense of guilt to something came as a relief to the sufferers. We must remember in this connection that parricide and incest with the mother are the two great human crimes, the only ones which, as such, are pursued and abhorred in primitive communities. And we must remember, too, how close other investigations have brought us to the hypothesis that the conscience of mankind, which now appears as an inherited mental force, was acquired in connection with the Oedipus complex.

[1916d, 3118]
The transformation did not occur spontaneously, through internal development, but through an outside influence. Its visible effect was that the patient's relation to his father, which stood in the foreground, and which had so far found expression in the wolf phobia, was now manifested in obsessional piety. I cannot refrain from pointing out that the course of events in this part of the patient's history affords an unmistakable confirmation of an assertion which I made in Totem and Taboo upon the relation of the totem animal to the deity.¹ I there decided in favour of the view that the idea of God was not a development from the totem, but replaced it after arising independently from a root common to both ideas. The totem, I maintained, was the first father-surrogate, and the god was a later one, in which the father had regained his human shape. And we find the same thing with our patient. In his wolf phobia he had gone through the stage of the totemic father-surrogate; but that stage was now broken off, and, as a result of new relations between him and his father, was replaced by a phase of religious piety.

(b) In the course of the development of civilization man acquired a dominating position over his fellow-creatures in the animal kingdom. Not content with this supremacy, however, he began to place a gulf between his nature and theirs. He denied the possession of reason to them, and to himself he attributed an immortal soul, and made claims to a divine descent which permitted him to break the bond of community between him and the animal kingdom. Curiously enough, this piece of arrogance is still foreign to children, just as it is to primitive and primaeval man. It is the result of a later, more pretentious stage of development. At the level of totemism primitive man had no repugnance to tracing his descent from an animal ancestor. In myths, which contain the precipitate of this ancient attitude of mind, the gods take animal shapes, and in the art of earliest times they are portrayed with animals' heads. A child can see no difference between his own nature and that of animals. He is not astonished at animals thinking and talking in fairy-tales; he will transfer an emotion of fear which he feels for his human father onto a dog or a horse, without intending any derogation of his father by it. Not until he is grown up does he become so far estranged from animals as to use their names in vilification of human beings.

To find the starting-point for the psycho-analytic view of religious life we must go a step further. What is to-day the heritage of the individual was once a new acquisition and has been handed on from one to another of a long series of generations. Thus the Oedipus complex too may have had stages of development, and the study of prehistory may enable us to trace them out. Investigation suggests that life in the human family took a quite different form in those remote days from that with which we are now familiar. And this idea is supported by findings based on observations of contemporary primitive races. If the prehistoric and ethnological material on this subject is worked over psycho-analytically, we arrive at an unexpectedly precise result: namely that God the Father once walked upon earth in bodily form and exercised his sovereignty as chieftain of the primal human horde until his sons united to slay him. It emerges further that this crime of liberation and the reactions to it had as their result the appearance of the first social ties, the basic moral restrictions and the oldest form of religion, totemism. But the later religions too have the same content, and on the one hand they are concerned with obliterating the traces of that crime or with expiating it by bringing forward other solutions of the struggle between the father and sons, while on the other hand they cannot avoid repeating once more the elimination of the father. Incidentally, an echo of this monstrous event, which overshadowed the whole course of human development, is also to be found in myths.
In 1912 I took up a conjecture of Darwin's to the effect that the primitive form of human society was that of a horde ruled over despotically by a powerful male. I attempted to show that the fortunes of this horde have left indestructible traces upon the history of human descent; and, especially, that the development of totemism, which comprises in itself the beginnings of religion, morality, and social organization, is connected with the killing of the chief by violence and the transformation of the paternal horde into a community of brothers.¹ To be sure, this is only a hypothesis, like so many others with which archaeologists endeavour to lighten the darkness of prehistoric times - a 'Just-So Story', as it was amusingly called by a not unkind English critic; but I think it is creditable to such a hypothesis if it proves able to bring coherence and understanding into more and more new regions.

[1921c, 3814]

For this purpose we must return for a moment to the scientific myth of the father of the primal horde. He was later on exalted into the creator of the world, and with justice, for he had produced all the sons who composed the first group. He was the ideal of each one of them, at once feared and honoured, a fact which led later to the idea of taboo. These many individuals eventually banded themselves together, killed him and cut him in pieces. None of the group of victors could take his place, or, if one of them did, the battles began afresh, until they understood that they must all renounce their father's heritage. They then formed the totemic community of brothers, all with equal rights and united by the totem prohibitions which were to preserve and to expiate the memory of the murder. But the dissatisfaction with what had been achieved still remained, and it became the source of new developments. The persons who were united in this group of brothers gradually came towards a revival of the old state of things at a new level. The male became once more the chief of a family, and broke down the prerogatives of the gynaecocracy which had become established during the fatherless period. As a compensation for this he may at that time have acknowledged the mother deities, whose priests were castrated for the mother's protection, after the example that had been given by the father of the primal horde. And yet the new family was only a shadow of the old one; there were numbers of fathers and each one was limited by the rights of the others.

[1921c, 3826]
The Non-Medical Applications and Correlations of Psycho-analysis. - Any estimate of psychoanalysis would be incomplete if it failed to make clear that, alone among the medical disciplines, it has the most extensive relations with the mental sciences, and that it is in a position to play a part of the same importance in the studies of religious and cultural history and in the sciences of mythology and literature as it is in psychiatry. This may seem strange when we reflect that originally its only object was the understanding and improvement of neurotic symptoms. But it is easy to indicate the starting-point of the bridge that leads over to the mental sciences. The analysis of dreams gave us an insight into the unconscious processes of the mind and showed us that the mechanisms which produce pathological symptoms are also operative in the normal mind. Thus psychoanalysis became a depth-psychology and capable as such of being applied to the mental sciences, and it was able to answer a good number of questions with which the academic psychology of consciousness was helpless to deal. At quite an early stage problems of human phylogenesis arose. It became clear that pathological function was often nothing more than a regression to an earlier stage in the development of normal function. C. G. Jung was the first to draw explicit attention to the striking similarity between the disordered phantasies of sufferers from dementia praecox and the myths of primitive peoples; while the present writer pointed out that the two wishes which combine to form the Oedipus complex coincide precisely with the two principal prohibitions imposed by totemism (not to kill the tribal ancestor and not to marry any woman belonging to one’s own clan) and drew far-reaching conclusions from this fact. The significance of the Oedipus complex began to grow to gigantic proportions and it looked as though social order, morals, justice and religion had arisen together in the primaeval ages of mankind as reaction-formations against the Oedipus complex. Otto Rank threw a brilliant light upon mythology and the history of literature by the application of psycho-analytic views, as did Theodor Reik upon the history of morals and religions, while Dr. Pfister, of Zurich, aroused the interest of religious and secular teachers and demonstrated the importance of the psycho-analytic standpoint for education. Further discussion of these applications of psycho-analysis would be out of place here, and it is enough to say that the limits of their influence are not yet in sight.

¹ An interesting parallel to the replacement of object-choice by identification is to be found in the belief of primitive peoples, and in the prohibitions based upon it, that the attributes of animals which are incorporated as nourishment persist as part of the character of those who eat them. As is well known, this belief is one of the roots of cannibalism and its effects have continued through the series of usages of the totem meal down to Holy Communion. The consequences ascribed by this belief to oral mastery of the object do in fact follow in the case of the later sexual object-choice.

[1923a, 3929]

[1923b, 3963]
It is true that it is by no means easy to demonstrate the traces of this satanic view of the father in the mental life of the individual. When a boy draws grotesque faces and caricatures, we may no doubt be able to show that he is jeering at his father in them; and when a person of either sex is afraid of robbers and burglars at night, it is not hard to recognize these as split off portions of the father.¹ The animals, too, which appear in children's animal phobias are most often father-substitutes, as were the totem animals of primaeval times. But that the Devil is a duplicate of the father and can act as a substitute for him has not been shown so clearly elsewhere as in the demonological neurosis of this seventeenth-century painter. That is why, at the beginning of this paper, I foretold that a demonological case history of this kind would yield in the form of pure metal material which, in the neuroses of a later epoch (no longer superstitious but hypochondriacal instead) has to be laboriously extracted by analytic work from the ore of free associations and symptoms.² A deeper penetration into the analysis of our painter's illness will probably bring stronger conviction. It is no unusual thing for a man to acquire a melancholic depression and an inhibition in his work as a result of his father's death. When this happens, we conclude that the man had been attached to his father with an especially strong love, and we remember how often a severe melancholia appears as a neurotic form of mourning.

[1923d, 4011]

Erotogenic masochism accompanies the libido through all its developmental phases and derives from them its changing psychical coatings. The fear of being eaten up by the totem animal (the father) originates from the primitive oral organization; the wish to be beaten by the father comes from the sadistic-anal phase which follows it; castration, although it is later disavowed, enters into the content of masochistic phantasies as a precipitate of the phallic stage or organization;¹ and from the final genital organization there arise, of course, the situations of being copulated with and of giving birth, which are characteristic of femaleness. The part played in masochism by the nates, too, is easily understandable, apart from its obvious basis in reality. The nates are the part of the body which is given erotogenic preference in the sadistic-anal phase, like the breast in the oral phase and the penis in the genital phase.

[1924c, 4077]

I myself set a higher value on my contributions to the psychology of religion, which began with the establishment of a remarkable similarity between obsessive actions and religious practices or ritual (1907b). Without as yet understanding the deeper connections, I described the obsessional neurosis as a distorted private religion and religion as a kind of universal obsessional neurosis. Later on, in 1912, Jung's forcible indication of the far-reaching analogies between the mental products of neurotics and of primitive peoples led me to turn my attention to that subject. In four essays, which were collected into a book with the title of *Totem and Taboo*, I showed that the horror of incest was even more marked among primitive than among civilized races and had given rise to very special measures of defence against it. I examined the relations between taboo-prohibitions (the earliest form in which moral restrictions make their appearance) and emotional ambivalence; and I discovered under the primitive scheme of the universe known as 'animism' the principle of the over-estimation of the importance of psychical reality - the belief in 'the omnipotence of thoughts' - which lies at the root of magic as well. I developed the comparison with the obsessional neurosis at every point, and showed how many of the postulates of primitive mental life are still in force in that remarkable illness. Above all, however, I was attracted by totemism, the first system of organization in primitive tribes, a system in which the beginnings of social order are united with a rudimentary religion and the implacable domination of a small number of taboo-prohibitions. The being that is revered is ultimately always an animal, from which the clan also claims to be descended. Many indications pointed to the conclusion that every race, even the most highly developed, had once passed through the stage of totemism.

[1925d, 4239]
The chief literary sources of my studies in this field were the well-known works of J. G. Frazer (Totemism and Exogamy and The Golden Bough), a mine of valuable facts and opinions. But Frazer effected little towards elucidating the problems of totemism; he had several times fundamentally altered his views on the subject, and the other ethnologists and prehistorians seemed in equal uncertainty and disagreement. My starting-point was the striking correspondence between the two taboo-ordinances of totemism (not to kill the totem and not to have sexual relations with any woman of the same totem-clan) and the two elements of the Oedipus complex (getting rid of the father and taking the mother to wife). I was therefore tempted to equate the totem-animal with the father; and in fact primitive peoples themselves do this explicitly, by honouring it as the forefather of the clan. There next came to my help two facts from psycho-analysis, a lucky observation of a child made by Ferenczi, which enabled me to speak of an 'infantile return of totemism', and the analysis of early animal-phobias in children, which so often showed that the animal was a substitute for the father, a substitute on to which the fear of the father derived from the Oedipus complex had been displaced. Not much was lacking to enable me to recognize the killing of the father as the nucleus of totemism and the starting-point in the formation of religion.

[1925d, 4240]

This missing element was supplied when I became acquainted with W. Robertson Smith's work, The Religion of the Semites. Its author (a man of genius who was both a physicist and an expert in biblical researches) introduced the so-called 'totem meal' as an essential part of the totemic religion. Once a year the totem animal, which was at other times regarded as sacred, was solemnly killed in the presence of all the members of the clan, was devoured and was then mourned over. The mourning was followed by a great festival. When I further took into account Darwin's conjecture that men originally lived in hordes, each under the domination of a single powerful, violent and jealous male, there rose before me out of all these components the following hypothesis, or, I would rather say, vision. The father of the primal horde, since he was an unlimited despot, had seized all the women for himself; his sons, being dangerous to him as rivals, had been killed or driven away. One day, however, the sons came together and united to overwhelm, kill, and devour their father, who had been their enemy but also their ideal. After the deed they were unable to take over their heritage since they stood in one another's way. Under the influence of failure and remorse they learned to come to an agreement among themselves; they banded themselves into a clan of brothers by the help of the ordinances of totemism, which aimed at preventing a repetition of such a deed, and they jointly undertook to forgo the possession of the women on whose account they had killed their father. They were then driven to finding strange women, and this was the origin of the exogamy which is so closely bound up with totemism. The totem meal was the festival commemorating the fearful deed from which sprang man's sense of guilt (or 'original sin') and which was the beginning at once of social organization, of religion and of ethical restrictions.

[1925d, 4240]

Now whether we suppose that such a possibility was a historical event or not, it brings the formation of religion within the circle of the father-complex and bases it upon the ambivalence which dominates that complex. After the totem animal had ceased to serve as a substitute for him, the primal father, at once feared and hated, revered and envied, became the prototype of God himself. The son's rebelliousness and his affection for his father struggled against each other through a constant succession of compromises, which sought on the one hand to atone for the act of parricide and on the other to consolidate the advantages it had brought. This view of religion throws a particularly clear light upon the psychological basis of Christianity, in which, as we know, the ceremony of the totem meal still survives with but little distortion, in the form of Communion. I should like explicitly to mention that this last observation was not made by me but is to be found in the works of Robertson Smith and Frazer.

[1925d, 4241]
With pleasure. I was only waiting for this invitation. But is it really a transformation? In *Totem and Taboo* it was not my purpose to explain the origin of religions but only of totemism. Can you, from any of the views known to you, explain the fact that the first shape in which the protecting deity revealed itself to men should have been that of an animal, that there was a prohibition against killing and eating this animal and that nevertheless the solemn custom was to kill and eat it communally once a year? This is precisely what happens in totemism. And it is hardly to the purpose to argue about whether totemism ought to be called a religion. It has intimate connections with the later god-religions. The totem animals become the sacred animals of the gods; and the earliest, but most fundamental moral restrictions - the prohibitions against murder and incest - originate in totemism. Whether or not you accept the conclusions of *Totem and Taboo*, I hope you will admit that a number of very remarkable, disconnected facts are brought together in it into a consistent whole.

[1927c, 4435]

After primal man had discovered that it lay in his own hands, literally, to improve his lot on earth by working, it cannot have been a matter of indifference to him whether another man worked with or against him. The other man acquired the value for him of a fellow-worker, with whom it was useful to live together. Even earlier, in his ape-like prehistory, man had adopted the habit of forming families, and the members of his family were probably his first helpers. One may suppose that the founding of families was connected with the fact that a moment came when the need for genital satisfaction no longer made its appearance like a guest who drops in suddenly, and, after his departure, is heard of no more for a long time, but instead took up its quarters as a permanent lodger. When this happened, the male acquired a motive for keeping the female, or, speaking more generally, his sexual objects, near him; while the female, who did not want to be separated from her helpless young, was obliged, in their interests, to remain with the stronger male.¹ In this primitive family one essential feature of civilization is still lacking. The arbitrary will of its head, the father, was unrestricted. In *Totem and Taboo* I have tried to show how the way led from this family to the succeeding stage of communal life in the form of bands of brothers. In overpowering their father, the sons had made the discovery that a combination can be stronger than a single individual. The totemic culture is based on the restrictions which the sons had to impose on one another in order to keep this new state of affairs in being. The taboo-observances were the first 'right' or 'law. The communal life of human beings had, therefore, a two-fold foundation: the compulsion to work, which was created by external necessity, and the power of love, which made the man unwilling to be deprived of his sexual object - the woman -, and made the woman unwilling to be deprived of the part of herself which had been separated off from her - her child. Eros and Ananke have become the parents of human civilization too. The first result of civilization was that even a fairly large number of people were now able to live together in a community. And since these two great powers were co-operating in this, one might expect that the further development of civilization would proceed smoothly towards an even better control over the external world and towards a further extension of the number of people included in the community. Nor is it easy to understand how this civilization could act upon its participants otherwise than to make them happy.

[1930a, 4495]
The tendency on the part of civilization to restrict sexual life is no less clear than its other tendency to expand the cultural unit. Its first, totemic, phase already brings with it the prohibition against an incestuous choice of object, and this is perhaps the most drastic mutilation which man's erotic life has in all time experienced. Taboos, laws and customs impose further restrictions, which affect both men and women. Not all civilizations go equally far in this; and the economic structure of the society also influences the amount of sexual freedom that remains. Here, as we already know, civilization is obeying the laws of economic necessity, since a large amount of the psychical energy which it uses for its own purposes has to be withdrawn from sexuality. In this respect civilization behaves towards sexuality as a people or a stratum of its population does which has subjected another one to its exploitation. Fear of a revolt by the suppressed elements drives it to stricter precautionary measures. A high-water mark in such a development has been reached in our Western European civilization. A cultural community is perfectly justified, psychologically, in starting by proscribing manifestations of the sexual life of children, for there would be no prospect of curbing the sexual lusts of adults if the ground had not been prepared for it in childhood. But such a community cannot in any way be justified in going to the length of actually disavowing such easily demonstrable, and, indeed, striking phenomena. As regards the sexually mature individual, the choice of an object is restricted to the opposite sex, and most extra-genital satisfactions are forbidden as perversions. The requirement, demonstrated in these prohibitions, that there shall be a single kind of sexual life for everyone, disregards the dissimilarities, whether innate or acquired, in the sexual constitution of human beings; it cuts off a fair number of them from sexual enjoyment, and so becomes the source of serious injustice. The result of such restrictive measures might be that in people who are normal - who are not prevented by their constitution - the whole of their sexual interests would flow without loss into the channels that are left open. But heterosexual genital love, which has remained exempt from outlawry, is itself restricted by further limitations, in the shape of insistence upon legitimacy and monogamy. Present-day civilization makes it plain that it will only permit sexual relationships on the basis of a solitary, indissoluble bond between one man and one woman, and that it does not like sexuality as a source of pleasure in its own right and is only prepared to tolerate it because there is so far no substitute for it as a means of propagating the human race.

[1930a, 4498]

One thing is remarkable: in the aura of the epileptic attack, one moment of supreme bliss is experienced. This may very well be a record of the triumph and sense of liberation felt on hearing the news of the death, to be followed immediately by an all the more cruel punishment. We have divined just such a sequence of triumph and mourning, of festive joy and mourning, in the brothers of the primal horde who murdered their father, and we find it repeated in the ceremony of the totem meal.¹ If it proved to be the case that Dostoevsky was free from his attacks in Siberia, that would merely substantiate the view that they were his punishment. He did not need them any longer when he was being punished in another way. But that cannot be proved. Rather does this necessity for punishment on the part of Dostoevsky's mental economy explain the fact that he passed unbroken through these years of misery and humiliation. Dostoevsky's condemnation as a political prisoner was unjust and he must have known it, but he accepted the undeserved punishment at the hands of the Little Father, the Tsar, as a substitute for the punishment he deserved for his sin against his real father. Instead of punishing himself, he got himself punished by his father's deputy. Here we have a glimpse of the psychological justification of the punishments inflicted by society. It is a fact that large groups of criminals want to be punished. Their super-ego demands it and so saves itself the necessity for inflicting the punishment itself.

[1928b, 4562]
The remarkable combination in religion of instruction, consolation and requirements can only be understood if it is subjected to a genetic analysis. This may be approached from the most striking point of the aggregate, from its instruction on the origin of the universe; for why, we may ask, should a cosmogony be a regular component of religious systems? The doctrine is, then, that the universe was created by a being resembling a man, but magnified in every respect, in power, wisdom, and the strength of his passions - an idealized super-man. Animals as creators of the universe point to the influence of totemism, upon which we shall have a few words at least to say presently. It is an interesting fact that this creator is always only a single being, even when there are believed to be many gods. It is interesting, too, that the creator is usually a man, though there is far from being a lack of indications of female deities; and some mythologies actually make the creation begin with a male god getting rid of a female deity, who is degraded into being a monster. Here the most interesting problems of detail open out; but we must hurry on. Our further path is made easy to recognize, for this god-creator is undisguisedly called 'father'. Psycho-analysis infers that he really is the father, with all the magnificence in which he once appeared to the small child. A religious man pictures the creation of the universe just as he pictures his own origin.

It would be well worth knowing what brought about the transition from animism to religion, but you may imagine the obscurity which to-day still veils these praeval ages of the evolution of the human spirit. It appears to be a fact that the first form assumed by religion was the remarkable phenomenon of totemism, the worship of animals, in whose train the first ethical commandments, the taboos, made their appearance. In a volume called Totem and Taboo, I once elaborated a notion which traced this transformation back to a revolution in the circumstances of the human family. The main achievement of religion as compared with animism lies in the psychical binding of the fear of demons. Nevertheless a vestige of this praeval age, the Evil Spirit, has kept a place in the religious system.

It must be supposed that after the parricide a considerable time elapsed during which the brothers disputed with one another for their father's heritage, which each of them wanted for himself alone. A realization of the dangers and uselessness of these struggles, a recollection of the act of liberation which they had accomplished together, and the emotional ties with one another which had arisen during the period of their expulsion, led at last to an agreement among them, a sort of social contract. The first form of a social organization came about with a renunciation of instinct, a recognition of mutual obligations, the introduction of definite institutions, pronounced inviolable (holy) - that is to say, the beginnings of morality and justice. Each individual renounced his ideal of acquiring his father's position for himself and of possessing his mother and sisters. Thus the taboo on incest and the injunction to exogamy came about. A fair amount of the absolute power liberated by the removal of the father passed over to the women; there came a period of matriarchy. Recollection of their father persisted at this period of the 'fraternal alliance'. A powerful animal - at first, perhaps, always one that was feared as well - was chosen as a substitute for the father. A choice of this kind may seem strange, but the gulf which men established later between themselves and animals did not exist for primitive peoples; nor does it exist for our children, whose animal phobias we have been able to understand as fear of their father. In relation to the totem animal the original dichotomy in the emotional relation to the father (ambivalence) was wholly retained. On the one hand the totem was regarded as the clan's blood ancestor and protective spirit, who must be worshipped and protected, and on the other hand a festival was appointed at which the same fate was prepared for him that the primal father had met with. He was killed and devoured by all the tribesmen in common. (The totem meal, according to Robertson Smith.) This great festival was in fact a triumphant celebration of the combined sons' victory over their father.
What is the place of religion in this connection? I think we are completely justified in regarding totemism, with its worship of a father-substitute, with its ambivalence as shown by the totem meal, with its institution of memorial festivals and of prohibitions whose infringement was punished by death - we are justified, I say, in regarding totemism as the first form in which religion was manifested in human history and in confirming the fact of its having been linked from the first with social regulations and moral obligations. Here we can only give the most summary survey of the further developments of religion. They no doubt proceeded in parallel with the cultural advances of the human race and with the changes in the structure of human communities.

[1939a, 4907]

It must be admitted that this historical survey has gaps in it and is uncertain at some points. But anyone who is inclined to pronounce our construction of primaeval history purely imaginary would be gravely under-estimating the wealth and evidential value of the material contained in it. Large portions of the past, which have been linked together here into a whole, are historically attested: totemism and the male confederacies, for instance. Other portions have survived in excellent replicas. Thus authorities have often been struck by the faithful way in which the sense and content of the old totem meal is repeated in the rite of the Christian Communion, in which the believer incorporates the blood and flesh of his god in symbolic form. Numerous relics of the forgotten primaeval age have survived in popular legends and fairy tales, and the analytic study of the mental life of children has provided an unexpected wealth of material for filling the gaps in our knowledge of the earliest times. As contributions to our understanding of the son's relation to the father which is of such great importance, I need only bring forward animal phobias, the fear, which strikes us as so strange, of being eaten by the father, and the enormous intensity of the dread of being castrated. There is nothing wholly fabricated in our construction, nothing which could not be supported on solid foundations.

[1939a, 4908]

This is the place, however, for an interpolation, in order to avoid a misunderstanding. Even though it may seem that instinctual renunciation and the ethics founded on it do not form part of the essential content of religion, yet genetically they are most intimately connected with it. Totemism, which is the earliest form of a religion which we recognize, carries with it, as indispensable constituents of its system, a number of commands and prohibitions which have no other significance, of course, than as instinctual renunciations: the worship of the totem, which includes a prohibition against injuring or killing it, exogamy - that is, renunciation of the passionately desired mothers and sisters in the horde - the granting of equal rights to all the members of the fraternal alliance - that is, restricting the inclination to violent rivalry among them. In these regulations are to be seen the first beginnings of a moral and social order. It does not escape us that two different motives are at work here. The first two prohibitions operate on the side of the father who has been got rid of: they carry on his will, as it were. The third command - the granting of equal rights to the allied brothers - disregards the father's will; it is justified by an appeal to the necessity for permanently maintaining the new order which succeeded the father's removal. Otherwise a relapse into the earlier state would have become inevitable. It is here that social commands diverge from the others which, as we might say, are derived directly from religious connections.

[1939a, 4938]
In 1912 I attempted, in my Totem and Taboo, to reconstruct the ancient situation from which these consequences followed. In doing so, I made use of some theoretical ideas put forward by Darwin, Atkinson and particularly by Robertson Smith, and combined them with the findings and indications derived from psycho-analysis. From Darwin I borrowed the hypothesis that human beings originally lived in small hordes, each of which was under the despotical rule of an older male who appropriated all the females and castigated or disposed of the younger males, including his sons. From Atkinson I took, in continuation of this account, the idea that this patriarchal system ended in a rebellion by the sons, who banded together against their father, overcame him and devoured him in common. Basing myself on Robertson Smith's totem theory, I assumed that subsequently the father-horde gave place to the totemic brother-clan. In order to be able to live in peace with one another, the victorious brothers renounced the women on whose account they had, after all, killed their father, and instituted exogamy. The power of fathers was broken and the families were organized as a matriarchy. The ambivalent emotional attitude of the sons to their father remained in force during the whole of later development. A particular animal was set up in the father's place as a totem. It was regarded as ancestor and protective spirit and might not be injured or killed. But once a year the whole male community came together to a ceremonial meal at which the totem animal (worshipped at all other times) was torn to pieces and devoured in common. No one might absent himself from this meal: it was the ceremonial repetition of the killing of the father, with which social order, moral laws and religion had taken their start. The conformity between Robertson Smith's totem meal and the Christian Lord's Supper had struck a number of writers before me.

[1939a, 4948]

The return of the repressed took place slowly and certainly not spontaneously but under the influence of all the changes in conditions of life which fill the history of human civilization. I cannot give a survey here of these determinants nor more than a fragmentary enumeration of the stages of this return. The father once more became the head of the family, but was not by any means so absolute as the father of the primal horde had been. The totem animal was replaced by a god in a series of transitions which are still very plain. To begin with, the god in human form still bore an animal's head; later he turned himself by preference into that particular animal, and afterwards it became sacred to him and was his favourite attendant; or he killed the animal and himself bore its name as an epithet. Between the totem animal and the god, the hero emerged, often as a preliminary step towards deification. The idea of a supreme deity seems to have started early, at first only in a shadowy manner without intruding into men's daily interests. As tribes and peoples came together into larger unities, the gods too organized themselves into families and into hierarchies. One of them was often elevated into being supreme lord over gods and men. After this, the further step was hesitatingly taken of paying respect to only one god, and finally the decision was taken of giving all power to a single god and of tolerating no other gods beside him. Only thus was it that the supremacy of the father of the primal horde was re-established and that the emotions relating to him could be repeated.

[1939a, 4950]
Mother-incest was one of the crimes of Oedipus, parricide was the other. It may be remarked in passing that they are also the two great crimes proscribed by totemism, the first socio-religious institution of mankind.
[1916-1917, 3401]

*The Non-Medical Applications and Correlations of Psycho-analysis.* - Any estimate of psycho-analysis would be incomplete if it failed to make clear that, alone among the medical disciplines, it has the most extensive relations with the mental sciences, and that it is in a position to play a part of the same importance in the studies of religious and cultural history and in the sciences of mythology and literature as it is in psychiatry. This may seem strange when we reflect that originally its only object was the understanding and improvement of neurotic symptoms. But it is easy to indicate the starting-point of the bridge that leads over to the mental sciences. The analysis of dreams gave us an insight into the unconscious processes of the mind and showed us that the mechanisms which produce pathological symptoms are also operative in the normal mind. Thus psychoanalysis became a depth-psychology and capable as such of being applied to the mental sciences, and it was able to answer a good number of questions with which the academic psychology of consciousness was helpless to deal. At quite an early stage problems of human *phylogenesis* arose. It became clear that pathological function was often nothing more than a regression to an earlier stage in the development of normal function. C. G. Jung was the first to draw explicit attention to the striking similarity between the disordered phantasies of sufferers from dementia praecox and the myths of primitive peoples; while the present writer pointed out that the two wishes which combine to form the Oedipus complex coincide precisely with the two principal prohibitions imposed by *totemism* (not to kill the tribal ancestor and not to marry any woman belonging to one's own clan) and drew far-reaching conclusions from this fact. The significance of the Oedipus complex began to grow to gigantic proportions and it looked as though social order, morals, justice and religion had arisen together in the primeval ages of mankind as reaction-formations against the Oedipus complex. Otto Rank threw a brilliant light upon mythology and the history of literature by the application of psycho-analytic views, as did Theodor Reik upon the history of morals and religions, while Dr. Pfister, of Zurich, aroused the interest of religious and secular teachers and demonstrated the importance of the psycho-analytic standpoint for education. Further discussion of these applications of psycho-analysis would be out of place here, and it is enough to say that the limits of their influence are not yet in sight.
[1923a, 3929]

The chief literary sources of my studies in this field were the well-known works of J. G. Frazer (*Totemism and Exogamy* and *The Golden Bough*), a mine of valuable facts and opinions. But Frazer effected little towards elucidating the problems of totemism; he had several times fundamentally altered his views on the subject, and the other ethnologists and prehistorians seemed in equal uncertainty and disagreement. My starting-point was the striking correspondence between the two taboo-ordinances of totemism (not to kill the totem and not to have sexual relations with any woman of the same totem-clan) and the two elements of the Oedipus complex (getting rid of the father and taking the mother to wife). I was therefore tempted to equate the totem-animal with the father; and in fact primitive peoples themselves do this explicitly, by honouring it as the forefather of the clan. There next came to my help two facts from psycho-analysis, a lucky observation of a child made by Ferenczi, which enabled me to speak of an 'infantile return of totemism', and the analysis of early animal-phobias in children, which so often showed that the animal was a substitute for the father, a substitute on to which the fear of the father derived from the Oedipus complex had been displaced. Not much was lacking to enable me to recognize the killing of the father as the nucleus of totemism and the starting-point in the formation of religion.
[1925d, 4240]
This missing element was supplied when I became acquainted with W. Robertson Smith's work, *The Religion of the Semites*. Its author (a man of genius who was both a physicist and an expert in biblical researches) introduced the so-called 'totem meal' as an essential part of the totemic religion. Once a year the totem animal, which was at other times regarded as sacred, was solemnly killed in the presence of all the members of the clan, was devoured and was then mourned over. The mourning was followed by a great festival. When I further took into account Darwin's conjecture that men originally lived in hordes, each under the domination of a single powerful, violent and jealous male, there rose before me out of all these components the following hypothesis, or, I would rather say, vision. The father of the primal horde, since he was an unlimited despot, had seized all the women for himself; his sons, being dangerous to him as rivals, had been killed or driven away. One day, however, the sons came together and united to overwhelm, kill, and devour their father, who had been their enemy but also their ideal. After the deed they were unable to take over their heritage since they stood in one another's way. Under the influence of failure and remorse they learned to come to an agreement among themselves; they banded themselves into a clan of brothers by the help of the ordinances of totemism, which aimed at preventing a repetition of such a deed, and they jointly undertook to forgo the possession of the women on whose account they had killed their father. They were then driven to finding strange women, and this was the origin of the exogamy which is so closely bound up with totemism. The totem meal was the festival commemorating the fearful deed from which sprang man's sense of guilt (or 'original sin') and which was the beginning at once of social organization, of religion and of ethical restrictions.

[1925d, 4240]

With pleasure. I was only waiting for this invitation. But is it really a transformation? In *Totem and Taboo* it was not my purpose to explain the origin of religions but only of totemism. Can you, from any of the views known to you, explain the fact that the first shape in which the protecting deity revealed itself to men should have been that of an animal, that there was a prohibition against killing and eating this animal and that nevertheless the solemn custom was to kill and eat it communally once a year? This is precisely what happens in totemism. And it is hardly to the purpose to argue about whether totemism ought to be called a religion. It has intimate connections with the later god-religions. The totem animals become the sacred animals of the gods; and the earliest, but most fundamental moral restrictions - the prohibitions against murder and incest - originate in totemism. Whether or not you accept the conclusions of *Totem and Taboo*, I hope you will admit that a number of very remarkable, disconnected facts are brought together in it into a consistent whole.

[1927c, 4435]
After primal man had discovered that it lay in his own hands, literally, to improve his lot on earth by working, it cannot have been a matter of indifference to him whether another man worked with or against him. The other man acquired the value for him of a fellow-worker, with whom it was useful to live together. Even earlier, in his ape-like prehistory, man had adopted the habit of forming families, and the members of his family were probably his first helpers. One may suppose that the founding of families was connected with the fact that a moment came when the need for genital satisfaction no longer made its appearance like a guest who drops in suddenly, and, after his departure, is heard of no more for a long time, but instead took up its quarters as a permanent lodger. When this happened, the male acquired a motive for keeping the female, or, speaking more generally, his sexual objects, near him; while the female, who did not want to be separated from her helpless young, was obliged, in their interests, to remain with the stronger male.¹ In this primitive family one essential feature of civilization is still lacking. The arbitrary will of its head, the father, was unrestricted. In Totem and Taboo I have tried to show how the way led from this family to the succeeding stage of communal life in the form of bands of brothers. In overpowering their father, the sons had made the discovery that a combination can be stronger than a single individual. The totemic culture is based on the restrictions which the sons had to impose on one another in order to keep this new state of affairs in being. The taboo-observances were the first 'right' or 'law. The communal life of human beings had, therefore, a two-fold foundation: the compulsion to work, which was created by external necessity, and the power of love, which made the man unwilling to be deprived of his sexual object - the woman -, and made the woman unwilling to be deprived of the part of herself which had been separated off from her - her child. Eros and Ananke have become the parents of human civilization too. The first result of civilization was that even a fairly large number of people were now able to live together in a community. And since these two great powers were co-operating in this, one might expect that the further development of civilization would proceed smoothly towards an even better control over the external world and towards a further extension of the number of people included in the community. Nor is it easy to understand how this civilization could act upon its participants otherwise than to make them happy.

[1930a, 4495]
The tendency on the part of civilization to restrict sexual life is no less clear than its other
tendency to expand the cultural unit. Its first, totemic, phase already brings with it the prohibition
against an incestuous choice of object, and this is perhaps the most drastic mutilation which
man's erotic life has in all time experienced. Taboos, laws and customs impose further
restrictions, which affect both men and women. Not all civilizations go equally far in this; and the
economic structure of the society also influences the amount of sexual freedom that remains.
Here, as we already know, civilization is obeying the laws of economic necessity, since a large
amount of the psychical energy which it uses for its own purposes has to be withdrawn from
sexuality. In this respect civilization behaves towards sexuality as a people or a stratum of its
population does which has subjected another one to its exploitation. Fear of a revolt by the
suppressed elements drives it to stricter precautionary measures. A high-water mark in such a
development has been reached in our Western European civilization. A cultural community is
perfectly justified, psychologically, in starting by proscribing manifestations of the sexual life of
children, for there would be no prospect of curbing the sexual lusts of adults if the ground had
not been prepared for it in childhood. But such a community cannot in any way be justified in
going to the length of actually disavowing such easily demonstrable, and, indeed, striking
phenomena. As regards the sexually mature individual, the choice of an object is restricted to
the opposite sex, and most extra-genital satisfactions are forbidden as perversions. The
requirement, demonstrated in these prohibitions, that there shall be a single kind of sexual life
for everyone, disregards the dissimilarities, whether innate or acquired, in the sexual
constitution of human beings; it cuts off a fair number of them from sexual enjoyment, and so
becomes the source of serious injustice. The result of such restrictive measures might be that in
people who are normal - who are not prevented by their constitution - the whole of their sexual
interests would flow without loss into the channels that are left open. But heterosexual genital
love, which has remained exempt from outlawry, is itself restricted by further limitations, in the
shape of insistence upon legitimacy and monogamy. Present-day civilization makes it plain that
it will only permit sexual relationships on the basis of a solitary, indissoluble bond between one
man and one woman, and that it does not like sexuality as a source of pleasure in its own right
and is only prepared to tolerate it because there is so far no substitute for it as a means of
propagating the human race.
[1930a, 4498]

What is the place of religion in this connection? I think we are completely justified in regarding
totemism, with its worship of a father-substitute, with its ambivalence as shown by the totem
meal, with its institution of memorial festivals and of prohibitions whose infringement was
punished by death - we are justified, I say, in regarding totemism as the first form in which
religion was manifested in human history and in confirming the fact of its having been linked
from the first with social regulations and moral obligations. Here we can only give the most
summary survey of the further developments of religion. They no doubt proceeded in parallel
with the cultural advances of the human race and with the changes in the structure of human
communities.
[1939a, 4907]
This is the place, however, for an interpolation, in order to avoid a misunderstanding. Even though it may seem that instinctual renunciation and the ethics founded on it do not form part of the essential content of religion, yet genetically they are most intimately connected with it. Totemism, which is the earliest form of a religion which we recognize, carries with it, as indispensable constituents of its system, a number of commands and prohibitions which have no other significance, of course, than as instinctual renunciations: the worship of the totem, which includes a prohibition against injuring or killing it, exogamy - that is, renunciation of the passionately desired mothers and sisters in the horde - the granting of equal rights to all the members of the fraternal alliance - that is, restricting the inclination to violent rivalry among them. In these regulations are to be seen the first beginnings of a moral and social order. It does not escape us that two different motives are at work here. The first two prohibitions operate on the side of the father who has been got rid of: they carry on his will, as it were. The third command - the granting of equal rights to the allied brothers - disregards the father's will; it is justified by an appeal to the necessity for permanently maintaining the new order which succeeded the father's removal. Otherwise a relapse into the earlier state would have become inevitable. It is here that social commands diverge from the others which, as we might say, are derived directly from religious connections.

[1939a, 4938]

In 1912 I attempted, in my *Totem and Taboo*, to reconstruct the ancient situation from which these consequences followed. In doing so, I made use of some theoretical ideas put forward by Darwin, Atkinson and particularly by Robertson Smith, and combined them with the findings and indications derived from psycho-analysis. From Darwin I borrowed the hypothesis that human beings originally lived in small hordes, each of which was under the despotic rule of an older male who appropriated all the females and castigated or disposed of the younger males, including his sons. The conformity between Robertson Smith's totem meal and the Christian Lord's Supper had struck a number of writers before me.

[1939a, 4948]
This and very much else of a similar nature will be shown to you by the direct observation of children and by the consideration of clearly retained memories from childhood uninfluenced by analysis. From this you will conclude among other things that the position of a child in the family order is a factor of extreme importance in determining the shape of his later life and should deserve consideration in every life-history. But, what is more important, in view of this information which can be so easily obtained, you will not be able to recall without a smile the pronouncements of science in explanation of the prohibition of incest. There is no end to what has been invented on the subject. It has been said that sexual inclination is diverted from members of the same family who are of the opposite sex by the fact of having lived together from childhood; or, again, that a biological purpose of avoiding inbreeding is represented psychically by an innate horror of incest. In all this the fact is entirely overlooked that such an inexorable prohibition of it in law and custom would not be needed if there were any reliable natural barriers against the temptation to incest. The truth is just the opposite. A human being's first choice of an object is regularly an incestuous one, aimed, in the case of the male, at his mother and sister; and it calls for the severest prohibitions to deter this persistent infantile tendency from realization. Among the primitive races still living to-day, among savages, the prohibitions against incest are even very much stricter than among ourselves, and Theodor Reik has only recently shown in a brilliant work that the puberty rites of savages, which represent a re-birth, have the sense of releasing the boy from his incestuous bond with his mother and of reconciling him with his father.

The Non-Medical Applications and Correlations of Psycho-analysis. - Any estimate of psycho-analysis would be incomplete if it failed to make clear that, alone among the medical disciplines, it has the most extensive relations with the mental sciences, and that it is in a position to play a part of the same importance in the studies of religious and cultural history and in the sciences of mythology and literature as it is in psychiatry. This may seem strange when we reflect that originally its only object was the understanding and improvement of neurotic symptoms. But it is easy to indicate the starting-point of the bridge that leads over to the mental sciences. The analysis of dreams gave us an insight into the unconscious processes of the mind and showed us that the mechanisms which produce pathological symptoms are also operative in the normal mind. Thus psychoanalysis became a depth-psychology and capable as such of being applied to the mental sciences, and it was able to answer a good number of questions with which the academic psychology of consciousness was helpless to deal. At quite an early stage problems of human phylogenes are arose. It became clear that pathological function was often nothing more than a regression to an earlier stage in the development of normal function. C. G. Jung was the first to draw explicit attention to the striking similarity between the disordered phantasies of sufferers from dementia praecox and the myths of primitive peoples; while the present writer pointed out that the two wishes which combine to form the Oedipus complex coincide precisely with the two principal prohibitions imposed by totemism (not to kill the tribal ancestor and not to marry any woman belonging to one's own clan) and drew far-reaching conclusions from this fact. The significance of the Oedipus complex began to grow to gigantic proportions and it looked as though social order, morals, justice and religion had arisen together in the primeval ages of mankind as reaction-formations against the Oedipus complex. Otto Rank threw a brilliant light upon mythology and the history of literature by the application of psycho-analytic views, as did Theodor Reik upon the history of morals and religions, while Dr. Pfister, of Zurich, aroused the interest of religious and secular teachers and demonstrated the importance of the psycho-analytic standpoint for education. Further discussion of these applications of psycho-analysis would be out of place here, and it is enough to say that the limits of their influence are not yet in sight.

[1916-1917, 3400]

[1923a, 3929]
Religion, morality, and a social sense - the chief elements in the higher side of man¹ - were originally one and the same thing. According to the hypothesis which I put forward in Totem and Taboo they were acquired phylogenetically out of the father-complex: religion and moral restraint through the process of mastering the Oedipus complex itself, and social feeling through the necessity for overcoming the rivalry that then remained between the members of the younger generation. The male sex seems to have taken the lead in all these moral acquisitions; and they seem to have then been transmitted to women by cross-inheritance. Even to-day the social feelings arise in the individual as a superstructure built upon impulses of jealous rivalry against his brothers and sisters. Since the hostility cannot be satisfied, an identification with the former rival develops. The study of mild cases of homosexuality confirms the suspicion that in this instance, too, the identification is a substitute for an affectionate object-choice which has taken the place of the aggressive, hostile attitude.²
[1923b, 3971]

By its theory of the instincts psycho-analysis offended the feelings of individuals in so far as they regarded themselves as members of the social community; another branch of its theory was calculated to hurt every single person at the tenderest point of his own psychical development. Psycho-analysis disposed once and for all of the fairy tale of an asexual childhood. It demonstrated the fact that sexual interests and activities occur in small children from the beginning of their lives. It showed what transformations those activities pass through, how at about the age of five they succumb to inhibition and how from puberty onwards they enter the service of the reproductive function. It recognized that early infantile sexual life reaches its peak in what is known as the Oedipus complex (an emotional attachment of the child to the parent of the opposite sex accompanied by an attitude of rivalry to the parent of the same sex) and that at that period of life this impulsion extends uninhibited into a straightforward sexual desire. This can be confirmed so easily that only the greatest efforts could make it possible to overlook it. Every individual has in fact gone through this phase but has afterwards energetically repressed its purport and succeeded in forgetting it. A horror of incest and an enormous sense of guilt are left over from this prehistoric epoch of the individual's existence. It may be that something quite similar occurred in the prehistoric epoch of the human species as a whole and that the beginnings of morality, religion and social order were intimately connected with the surmounting of that praeval era. To adults their prehistory seems so inglorious that they refuse to allow themselves to be reminded of it: they were infuriated when psycho-analysis tried to lift the veil of amnesia from their years of childhood. There was only one way out: what psycho-analysis asserted must be false and what posed as a new science must be a tissue of fancies and distortions.
[1925e, 4128]
The chief literary sources of my studies in this field were the well-known works of J. G. Frazer (To
temism and Exogamy and The Golden Bough), a mine of valuable facts and opinions. But Frazer
effected little towards elucidating the problems of totemism; he had several times
fundamentally altered his views on the subject, and the other ethnologists and prehistorians
seemed in equal uncertainty and disagreement. My starting-point was the striking
correspondence between the two taboo-ordinances of totemism (not to kill the totem and not to
have sexual relations with any woman of the same totem-clan) and the two elements of the
Oedipus complex (getting rid of the father and taking the mother to wife). I was therefore
tempted to equate the totem-animal with the father; and in fact primitive peoples themselves do
this explicitly, by honouring it as the forefather of the clan. There next came to my help two facts
from psycho-analysis, a lucky observation of a child made by Ferenczi, which enabled me to
speak of an 'infantile return of totemism', and the analysis of early animal-phobias in children,
which so often showed that the animal was a substitute for the father, a substitute on to which
the fear of the father derived from the Oedipus complex had been displaced. Not much was
lacking to enable me to recognize the killing of the father as the nucleus of totemism and the
starting-point in the formation of religion.

This missing element was supplied when I became acquainted with W. Robertson Smith's
work, The Religion of the Semites. Its author (a man of genius who was both a physicist and an
expert in biblical researches) introduced the so-called 'totem meal' as an essential part of the
totemic religion. Once a year the totem animal, which was at other times regarded as sacred,
was solemnly killed in the presence of all the members of the clan, was devoured and was then
mourned over. The mourning was followed by a great festival. When I further took into account
Darwin's conjecture that men originally lived in hordes, each under the domination of a single
powerful, violent and jealous male, there rose before me out of all these components the
following hypothesis, or, I would rather say, vision. The father of the primal horde, since he was
an unlimited despot, had seized all the women for himself; his sons, being dangerous to him as
rivals, had been killed or driven away. One day, however, the sons came together and united to
overwhelm, kill, and devour their father, who had been their enemy but also their ideal. After the
deed they were unable to take over their heritage since they stood in one another's way. Under
the influence of failure and remorse they learned to come to an agreement among themselves;
they banded themselves into a clan of brothers by the help of the ordinances of totemism, which
aimed at preventing a repetition of such a deed, and they jointly undertook to forgo the
possession of the women on whose account they had killed their father. They were then driven
to finding strange women, and this was the origin of the exogamy which is so closely bound up
with totemism. The totem meal was the festival commemorating the fearful deed from which
sprang man's sense of guilt (or 'original sin') and which was the beginning at once of social
organization, of religion and of ethical restrictions.

[1925d, 4240]
We now observe that the store of religious ideas includes not only wish-fulfilments but important historical recollections. This concurrent influence of past and present must give religion a truly incomparable wealth of power. But perhaps with the help of an analogy yet another discovery may begin to dawn on us. Though it is not a good plan to transplant ideas far from the soil in which they grew up, yet here is a conformity which we cannot avoid pointing out. We know that a human child cannot successfully complete its development to the civilized stage without passing through a phase of neurosis sometimes of greater and sometimes of less distinctness. This is because so many instinctual demands which will later be unserviceable cannot be suppressed by the rational operation of the child's intellect but have to be tamed by acts of repression, behind which, as a rule, lies the motive of anxiety. Most of these infantile neuroses are overcome spontaneously in the course of growing up, and this is especially true of the obsessional neuroses of childhood. The remainder can be cleared up later still by psychoanalytic treatment. In just the same way, one might assume, humanity as a whole, in its development through the ages, fell into states analogous to the neuroses, and for the same reasons - namely because in the times of its ignorance and intellectual weakness the instinctual renunciations indispensable for man's communal existence had only been achieved by it by means of purely affective forces. The precipitates of these processes resembling repression which took place in prehistoric times still remained attached to civilization for long periods. Religion would thus be the universal obsessional neurosis of humanity; like the obsessional neurosis of children, it arose out of the Oedipus complex, out of the relation to the father. If this view is right, it is to be supposed that a turning-away from religion is bound to occur with the fatal inevitability of a process of growth, and that we find ourselves at this very juncture in the middle of that phase of development. Our behaviour should therefore be modelled on that of a sensible teacher who does not oppose an impending new development but seeks to ease its path and mitigate the violence of its irruption. Our analogy does not, to be sure, exhaust the essential nature of religion. If, on the one hand, religion brings with it obsessional restrictions, exactly as an individual obsessional neurosis does, on the other hand it comprises a system of wishful illusions together with a disavowal of reality, such as we find in an isolated form nowhere else but in amentia, in a state of blissful hallucinatory confusion. But these are only analogies, by the help of which we endeavour to understand a social phenomenon; the pathology of the individual does not supply us with a fully valid counterpart.
[1927c, 4452]
And now we come at last to the characteristic of the totemic system which has attracted the
interest of psycho-analysts. In almost every place where we find totems we also find a law
against persons of the same totem having sexual relations with one another and consequently
against their marrying. This, then, is 'exogamy', an institution related to totemism.
[1912-1913, 2653]

(d) But a little more reflection will show that exogamy linked with the totem effects more (and
therefore aims at more) than the prevention of incest with a man's mother and sisters. It makes
sexual intercourse impossible for a man with all the women of his own clan (that is to say with a
number of women who are not his blood-relatives) by treating them all as though they were his
blood-relatives. It is difficult at first sight to see the psychological justification for this very
extensive restriction, which goes far beyond anything comparable among civilized peoples. It
may be gathered from this, however, that the part played by the totem as common ancestor is
taken very seriously. All those who are descended from the same totem are blood relations.
They form a single family, and within that family even the most distant degree of kinship is
regarded as an absolute hindrance to sexual intercourse.
[1912-1913, 2654]

We see, then, that these savages have an unusually great horror of incest, or are sensitive on
the subject to an unusual degree, and that they combine this with a peculiarity which remains
obscure to us - of replacing real blood-relationship by totem kinship. This latter contrast must
not, however, be too much exaggerated, and we must remember that the totem prohibitions
include that against real incest as a special case.
[1912-1913, 2654]

But when once we have put group marriage in the place of individual marriage, the apparently
excessive degree of avoidance of incest which we have come across among the same peoples
becomes intelligible. Totemic exogamy, the prohibition of sexual intercourse between members
of the same clan, appears to have been the appropriate means for preventing group incest; it
thus became established and persisted long after its raison d'être had ceased.
[1912-1913, 2655]

It would be little to our purpose if we were to follow in detail the extraordinarily involved and
obscure discussions on the origin and significance of the marriage-classes and on their relation
to the totem. For our purpose it is enough to draw attention to the great care which is devoted
by the Australians, as well as by other savage peoples, to the prevention of incest.¹ It must be
admitted that these savages are even more sensitive on the subject of incest than we are. They
are probably liable to a greater temptation to it and for that reason stand in need of fuller
protection.
[1912-1913, 2657]

But the horror of incest shown by these peoples is not satisfied by the erection of the
institutions which I have described and which seem to be directed principally against group
incest. We must add to them a number of 'customs' which regulate the dealings of individuals
with their near relatives in our sense of the term, customs which are enforced literally with
religious strictness and the purpose of which can scarcely be doubted. These customs or
customary prohibitions have been termed 'avoidances'. They extend far beyond the totemic
races of Australia; but once again I must ask my readers to be content with a fragmentary
extract from the copious material.
[1912-1913, 2658]
In Melanesia restrictive prohibitions of this sort govern a boy's intercourse with his mother and sisters. Thus, for instance, in Lepers' Island, one of the New Hebrides, when a boy has reached a certain age he no longer lives at home, but takes up his quarters in the 'club-house', where he now regularly eats and sleeps. It is true that he may still go to his father's house to ask for food, but if his sister is at home he must go away before eating; if no sister is there he may sit down near the door and eat. If by chance a brother and sister meet in the open, she must run away or hide. If a boy knows that certain footprints in the road are his sister's, he will not follow them, nor will she follow his. Indeed, he will not even utter her name, and will avoid the use of a common word if it forms part of her name. This avoidance begins with the puberty ceremonies and is maintained throughout life. The reserve between a son and his mother increases as the boy grows up and is much more on her side than on his. If his mother brings him food, she does not give it him but puts it down for him to take. In speaking to him she does not *tutoyer* him, but uses the more distant plural forms.¹

In New Mecklenburg cousins of one kind are subject to similar restrictions, as are brothers and sisters. They may not come near each other, may not shake hands and may not give each other presents; but they are allowed to speak to each other at a distance of some paces. The penalty for incest with a sister is death by hanging.¹

In Fiji these avoidance rules are particularly strict; they affect not only blood sisters but tribal sisters as well. It must strike us as all the more puzzling to hear that these same savages practise sacred orgies, in which precisely these forbidden degrees of kinship seek sexual intercourse - puzzling, that is, unless we prefer to regard the contrast as an explanation of the prohibition.²

Among the Battas of Sumatra the rules of avoidance apply to all near relations. 'A Batta, for example, would think it shocking were a brother to escort his sister to an evening party. Even in the presence of others a Batta brother and sister feel embarrassed. If one of them comes into the house, the other will go away. Further, a father may never be alone in the house with his daughter, nor a mother with her son... The Dutch missionary who reports these customs adds that he is sorry to say that from what he knows of the Battas he believes the maintenance of most of these rules to be very necessary.' These people assume as a matter of course that a solitary meeting between a man and a woman will lead to an improper intimacy between them. And since they believe that intercourse between near relations will lead to punishments and calamities of all sorts, they are right to avoid any temptation to transgress these prohibitions.³

Curiously enough, among the Barongo of Delagoa Bay, in South Africa, the strictest rules affect a man's relations with his sister-in-law, the wife of his wife's brother. If he meets this formidable person anywhere, he carefully avoids her. He does not eat out of the same dish with her, he speaks to her with embarrassment, does not venture into her hut and greets her in a trembling voice.⁴

A rule of avoidance with which one would have expected to meet more frequently operates among the A-kamba (or Wa kamba) of British East Africa. A girl has to avoid her father between the age of puberty and the time of her marriage. If they meet in the road, she hides while he passes, and she may never go and sit near him. This holds good until the moment of her betrothal. After her marriage she does not avoid her father in any way.¹

¹ [1912-1913, 2658]
² [1912-1913, 2659]
³ [1912-1913, 2659]
⁴ [1912-1913, 2659]
By far the most widespread and strictest avoidance (and the most interesting from the point of view of civilized races) is that which restricts a man's intercourse with his mother-in-law. It is quite general in Australia and also extends over Melanesia, Polynesia and the Negro races of Africa, wherever traces of totemism and the classificatory system of relationship are found and probably still further. In some of these places there are similar prohibitions against a woman having innocent intercourse with her father-in-law; but they are far less usual and severe. In a few isolated cases both parents-in-law are subject to avoidance. Since we are less concerned with the ethnographical extent of this avoidance than with its substance and purpose, I shall once again restrict myself to quoting a few examples.

Among the Melanesians of the Banks' Islands 'these rules of avoidance are very strict and minute. A man will not come near his wife's mother and she will not come near him. If the two chance to meet in a path, the woman will step out of it and stand with her back turned till he has gone by, or perhaps, if it be more convenient, he will move out of the way. At Vanua Lava, in Port Patteson, a man would not even follow his mother-in-law along the beach until the rising tide had washed her foot prints from the sand. Yet a man and his mother-in-law may talk to each other at a distance; but a woman will on no account mention the name of her daughter's husband, nor will he name hers.²

Among the Eastern Bantu 'custom requires that a man should "be ashamed of" his wife's mother, that is to say, he must studiously shun her society. He may not enter the same hut with her, and if by chance they meet on a path, one or other turns aside, she perhaps hiding behind a bush, while he screens his face with a shield. If they cannot thus avoid each other, and the mother-in-law has nothing else to cover herself with, she will tie a wisp of grass round her head as a token of ceremonial avoidance. All correspondence between the two has to be carried on either through a third party or by shouting to each other at a distance with some barrier, such as the kraal fence, interposed between them. They may not even pronounce each other's proper name.' (Frazer, 1910, 2, 385.)

While there can be no doubt as to the purpose and significance of the other avoidances between near relations, and they are universally regarded as protective measures against incest, the prohibitions affecting a man's intercourse with his mother-in-law have received another interpretation in some quarters. It was with justice regarded as incomprehensible that all these different peoples should feel such great fear of the temptation presented to a man by an elderly woman, who might have been, but in fact was not, his mother. (Crawley, 1902, 405.)

Tylor believes that the treatment given to a son-in-law by his mother-in-law is merely a form of 'cutting' or non-recognition by the wife's family: the man is regarded as an 'outsider' until the first child is born. In the first place, however, the prohibition is not always brought to an end when this occurs. But, apart from this, it may be objected that this explanation throws no light on the fact that the prohibition centres particularly on the mother-in-law - that the explanation overlooks the factor of sex. Moreover, it takes no account of the attitude of religious horror expressed in the prohibition. (Crawley, 1902, 407.)
Some of those impulses are obvious enough. On the side of the mother-in-law there is reluctance to give up the possession of her daughter, distrust of the stranger to whom she is to be handed over, an impulse to retain the dominating position which she has occupied in her own house. On the man's side there is a determination not to submit any longer to someone else's will, jealousy of anyone who possessed his wife's affection before he did, and, last but not least, an unwillingness to allow anything to interfere with the illusory overvaluation bred of his sexual feelings. The figure of his mother-in-law usually causes such an interference, for she has many features which remind him of her daughter and yet lacks all the charms of youth, beauty and spiritual freshness which endear his wife to him.

I can see nothing against the presumption that it is precisely this incestuous factor in the relation that provides savages with the motive for their rules of avoidance between son-in-law and mother-in-law. Thus the explanation which we should adopt for these strictly enforced avoidances among primitive peoples is that put forward by Fison, which regards them merely as a further protection against possible incest. The same explanation holds good of all other avoidances, between both blood and tribal relations. The only difference would be that in the case of blood relations the possibility of incest is an immediate one and the intention to prevent it may be conscious; in the other cases, including that of a man's relation to his mother-in-law, the possibility of incest would seem to be a temptation in phantasy set in motion through the agency of unconscious connecting links.

There has been little opportunity in the preceding pages for showing how new light can be thrown upon the facts of social psychology by the adoption of a psycho-analytic method of approach: for the horror of incest displayed by savages has long been recognized as such and stands in need of no further interpretation. All that I have been able to add to our understanding of it is to emphasize the fact that it is essentially an infantile feature and that it reveals a striking agreement with the mental life of neurotic patients. Psycho-analysis has taught us that a boy's earliest choice of objects for his love is incestuous and that those objects are forbidden ones - his mother and his sister. We have learnt, too, the manner in which, as he grows up, he liberates himself from this incestuous attraction. A neurotic, on the other hand, invariably exhibits some degree of psychical infantilism. He has either failed to get free from the psychosexual conditions that prevailed in his childhood or he has returned to them - two possibilities which may be summed up as developmental inhibition and regression. Thus incestuous fixations of libido continue to play (or begin once more to play) the principal part in his unconscious mental life. We have arrived at the point of regarding a child's relation to his parents, dominated as it is by incestuous longings, as the nuclear complex of neurosis by adults and normal people. Similar expressions of disbelief, for instance, inevitably greet the writings of Otto Rank, which have brought more and more evidence to show the extent to which the interest of creative writers centres round the theme of incest and how the same theme, in countless variations and distortions, provides the subject-matter of poetry. We are driven to believe that this rejection is principally a product of the distaste which human beings feel for their early incestuous wishes, now over taken by repression. It is therefore of no small importance that we are able to show that these same incestuous wishes, which are later destined to become unconscious, are still regarded by savage peoples as immediate perils against which the most severe measures of defence must be enforced.

The most ancient and important taboo prohibitions are the two basic laws of totemism: not to kill the totem animal and to avoid sexual intercourse with members of the totem clan of the opposite sex.
The corresponding taboo restriction prohibits members of the same totem clan from marrying or having sexual intercourse with each other. Here we have the notorious and mysterious correlate of totemism - exogamy. I have devoted the whole of the first essay in the present work to that subject, so that here I need only repeat that it originates from the intensification among savages of the horror of incest, that it would be fully explained as an assurance against incest under conditions of group marriage, and that it is primarily aimed at restraining the younger generation from incest and that only as a later development does it interfere with the older generation.

If we seek to penetrate to the original nature of totemism, without regard to subsequent accretions or attenuations, we find that its essential characteristics are these: Originally, all totems were animals, and were regarded as the ancestors of the different clans. Totems were inherited only through the female line. There was a prohibition against killing the totem (or - which, under primitive conditions, is the same thing - against eating it). Members of a totem clan were forbidden to practise sexual intercourse with one another.¹

The more incontestable became the conclusion that totemism constitutes a regular phase in all cultures, the more urgent became the need for arriving at an understanding of it and for throwing light upon the puzzle of its essential nature. Everything connected with totemism seems to be puzzling: the decisive problems concern the origin of the idea of descent from the totem and the reasons for exogamy (or rather for the taboo upon incest of which exogamy is the expression), as well as the relation between these two institutions, totemic organization and prohibition of incest. Any satisfactory explanation should be at once a historical and a psychological one. It should tell us under what conditions this peculiar institution developed and to what psychical needs in men it has given expression.

It is plausible to suppose that an understanding of the essential nature of totemism and exogamy would best be arrived at, if it were possible to come nearer to the origins of the two institutions. But in this connection we must bear in mind Andrew Lang's warning that even primitive peoples have not retained the original forms of those institutions nor the conditions which gave rise to them; so that we have nothing whatever but hypotheses to fall back upon as a substitute for the observations which we are without.¹ Some of the attempted explanations seem, in the judgement of a psychologist, inadequate at the very outset: they are too rational and take no account of the emotional character of the matters to be explained. Others are based on assumptions which are unconfirmed by observation. Yet others rely upon material which would be better interpreted in another way. There is generally little difficulty in refuting the various views put forward: the authorities are as usual more effective in their criticisms of one another's work than in their own productions. The conclusion upon most of the points raised must be a non liquet. It is not surprising, therefore, that in the most recent literature on the subject (which is for the most part passed over in the present work) an unmistakable tendency emerges to reject any general solution of totemic problems as impracticable. (See, for instance, Goldenweiser, 1910.) In the discussion of these conflicting hypotheses which follows, I have ventured to disregard their chronological sequence.
Andrew Lang regards it as initially a matter of indifference how clans obtained their animal names. It is only necessary to assume that they awoke one day to the consciousness that they bore such names and could give no account of how this had come about. The origin of the names had been forgotten. They would then attempt to arrive at an explanation by speculating on the subject; and, in view of their belief in the importance of names, they were bound to reach all the ideas contained in the totemic system. Primitive races (as well as modern savages and even our own children\(^\text{*}\)) do not, like us, regard names as something indifferent and conventional, but as significant and essential. A man's name is a principal component of his personality, perhaps even a portion of his soul. The fact of a primitive man bearing the same name as an animal must lead him to assume the existence of a mysterious and significant bond between himself and that particular species of animal. What other bond could it be than one of blood relationship? Once the similarity of names had led to this conclusion, the blood taboo would immediately involve all the totemic ordinances, including exogamy. 'No more than these three things - a group animal name of unknown origin; belief in a transcendental connection between all bearers, human and bestial, of the same name; and belief in the blood superstitions - was needed to give rise to all the totemic creeds and practices, including exogamy.' (Lang, 1905, 125 f.)

I have set out the different theories about totemism in some detail, though even so compression has been inevitable and I fear that my account may have suffered in consequence. In what follows, however, I shall venture, for my readers' sake, to be still more condensed. The discussions on the exogamy practised by totemic peoples are, owing to the nature of the material with which they deal, particularly complicated and diffuse one might even say confused. The purposes of the present work make it possible for me to limit myself to tracing certain of the main lines of dispute, while referring those who wish to enter into the subject more deeply to the specialized writings from which I have so frequently quoted.

The attitude taken by an author on the problems of exogamy must naturally depend to some extent on the position he has adopted towards the various theories of totemism. Some of the explanations of totemism exclude any connection with exogamy, so that the two institutions fall completely apart. Thus we find two opposing views: one which seeks to maintain the original presumption that exogamy forms an inherent part of the totemic system, and the other which denies that there is any such connection and holds that the convergence between these two features of the oldest cultures is a chance one. This latter opinion has been adopted without qualification by Frazer in his later works: 'I must request the reader to bear constantly in mind', he writes, 'that the two institutions of totemism and exogamy are fundamentally distinct in origin and nature, though they have accidentally crossed and blended in many tribes.' (Frazer, 1910, 1, xii.) He gives an explicit warning that the opposite view must be a source of endless difficulties and misunderstandings.
Other writers have, on the contrary, found a means of regarding exogamy as an inevitable consequence of the basic principles of totemism. Durkheim (1898, 1902 and 1905) has put forward the view that the taboo attached to totems was bound to involve prohibition against practising sexual intercourse with a woman of the same totem. The totem is of the same blood as the man and consequently the ban upon shedding blood (in connection with defloration and menstruation) prohibits him from sexual relations with a woman belonging to his totem. Andrew Lang (1905, 125), who agrees with Durkheim on this subject, believes that the prohibition against women of the same clan might operate even without any blood taboo. The general totem taboo (which, for instance, forbids a man to sit under his own totem tree) would, in Lang's opinion, have been sufficient. Incidentally, he complicates this with another explanation of exogamy (see below) and omits to show how the two explanations are related to each other.

As regards the chronological relations between the two institutions, most of the authorities agree that totemism is the older of them and that exogamy arose later.

McLennan (1865) ingeniously inferred the existence of exogamy from the vestiges of customs which seemed to indicate the earlier practice of marriage by capture. He formed a hypothesis that in the earliest times it had been a general usage for men to obtain their wives from another group and that marriage with a woman of their own group gradually 'came to be considered improper because it was unusual'. He accounted for the prevalence of exogamy by supposing that the practice of killing the majority of female children at birth had led to a scarcity of women in primitive societies. We are not here concerned with the question of how far these assumptions of McLennan's are supported by the actual findings. What interests us far more is the fact that his hypotheses fail to explain why the male members of a group should refuse themselves access to the few remaining women of their own blood - the fact that he entirely overlooks the problem of incest. (Frazer, 1910, 4, 71-92.)

Other students of exogamy, on the contrary, and evidently with greater justice, have seen in exogamy an institution for the prevention of incest. When one considers the gradually increasing complication of the Australian restrictions upon marriage, it is impossible not to accept the opinions of Morgan (1877), Frazer (1910, 4, 105 ff.), Howitt and Baldwin Spencer that those regulations bear (in Frazer's words) 'the impress of deliberate design' and that they aimed at achieving the result they have in fact achieved. 'In no other way does it seem possible to explain in all its details a system at once so complex and so regular.' (Frazer, ibid., 106.)

But the fact that exogamous sexual restrictions were imposed intentionally throws no light on the motive which led to their imposition. What is the ultimate source of the horror of incest which must be recognized as the root of exogamy? To explain it by the existence of an instinctive dislike of sexual intercourse with blood relatives - that is to say, by an appeal to the fact that there is a horror of incest - is clearly unsatisfactory; for social experience shows that, in spite of this supposed instinct, incest is no uncommon event even in our present-day society, and history tells us of cases in which incestuous marriage between privileged persons was actually the rule.
Westermarck (1906-8, 2, 368)¹ has explained the horror of incest on the ground that 'there is an innate aversion to sexual intercourse between persons living very closely together from early youth, and that, as such persons are in most cases related by blood, this feeling would naturally display itself in custom and law as a horror of intercourse between near kin'. Havelock Ellis, though he disputed the instinctiveness of the aversion, subscribed to this explanation in the main: 'The normal failure of the pairing instinct to manifest itself in the case of brothers and sisters, or of boys and girls brought up together from infancy, is a merely negative phenomenon due to the inevitable absence in those circumstances of the conditions which evoke the pairing instinct... Between those who have been brought up together from childhood all the sensory stimuli of vision, hearing and touch have been dulled by use, trained to the calm level of affection, and deprived of their potency to arouse the erethistic excitement which produces sexual tumescence.' [1912-1913, 2763]

It seems to me very remarkable that Westermarck should consider that this innate aversion to sexual intercourse with those with whom one has been intimate in childhood is also the equivalent in psychical terms of the biological fact that inbreeding is detrimental to the species. A biological instinct of the kind suggested would scarcely have gone so far astray in its psychological expression that, instead of applying to blood relatives (intercourse with whom might be injurious to reproduction), it affected persons who were totally innocuous in this respect, merely because they shared a common home. I cannot resist referring, too, to Frazer's admirable criticism of Westermarck's theory. Frazer finds it inexplicable that to-day there should be scarcely any sexual aversion to intercourse with house-mates, whereas the horror of incest, which on Westermarck's theory is only a derivative of that aversion, should have increased so enormously. But some further comments of Frazer's go deeper, and these I shall reproduce in full, since they are in essential agreement with the arguments which I put forward in my essay on taboo: [1912-1913, 2764]

Thus the view which explains the horror of incest as an innate instinct must be abandoned. Nor can anything more favourable be said of another, widely held explanation of the law against incest, according to which primitive peoples noticed at an early date the dangers with which their race was threatened by inbreeding and for that reason deliberately adopted the prohibition. There are a host of objections to this theory. (Cf. Durkheim, 1898.) Not only must the prohibition against incest be older than any domestication of animals which might have enabled men to observe the effects of inbreeding upon racial characters, but even to-day the detrimental results of inbreeding are not established with certainty and cannot easily be demonstrated in man. Moreover, everything that we know of contemporary savages makes it highly improbable that their most remote ancestors were already concerned with the question of preserving their later progeny from injury. Indeed it is almost absurd to attribute to such improvident creatures motives of hygiene and eugenics to which consideration is scarcely paid in our own present-day civilization.¹ [1912-1913, 2765]

Lastly, account must be taken of the fact that a prohibition against inbreeding, based upon practical motives of hygiene, on the ground of its tending to racial enfeeblement, seems quite inadequate to explain the profound abhorrence shown towards incest in our society. As I have shown elsewhere,² this feeling seems to be even more active and intense among contemporary primitive peoples than among civilized ones. [1912-1913, 2765]
It might have been expected that here again we should have before us a choice between sociological, biological and psychological explanations. (In this connection the psychological motives should perhaps be regarded as representing biological forces.) Nevertheless, at the end of our inquiry, we can only subscribe to Frazer's resigned conclusion. We are ignorant of the origin of the horror of incest and cannot even tell in what direction to look for it. None of the solutions of the enigma that have been proposed seems satisfactory.³

I must, however, mention one other attempt at solving it. It is of a kind quite different from any that we have so far considered, and might be described as 'historical'.

Atkinson (1903) seems to have been the first to realize that the practical consequence of the conditions obtaining in Darwin's primal horde must be exogamy for the young males. Each of them might, after being driven out, establish a similar horde, in which the same prohibition upon sexual intercourse would rule owing to its leader's jealousy. In course of time this would produce what grew into a conscious law: 'No sexual relations between those who share a common home.' After the establishment of totemism this regulation would assume another form and would run: 'No sexual relations within the totem.'

The first consequence of our substitution is most remarkable. If the totem animal is the father, then the two principal ordinances of totemism, the two taboo prohibitions which constitute its core - not to kill the totem and not to have sexual relations with a woman of the same totem - coincide in their content with the two crimes of Oedipus, who killed his father and married his mother, as well as with the two primal wishes of children, the insufficient repression or the re-awakening of which forms the nucleus of perhaps every psychoneurosis. If this equation is anything more than a misleading trick of chance, it must enable us to throw a light upon the origin of totemism in the inconceivably remote past. In other words, it would enable us to make it probable that the totemic system - like little Hans's animal phobia and little Árpád's poultry perversion - was a product of the conditions involved in the Oedipus complex. In order to pursue this possibility, we shall have, in the following pages, to study a feature of the totemic system (or, as we might say, of the totemic religion) which I have hitherto scarcely found an opportunity of mentioning.

The two taboos of totemism with which human morality has its beginning are not on a par psychologically. The first of them, the law protecting the totem animal, is founded wholly on emotional motives: the father had actually been eliminated, and in no real sense could the deed be undone. But the second rule, the prohibition of incest, has a powerful practical basis as well. Sexual desires do not unite men but divide them. Though the brothers had banded together in order to overcome their father, they were all one another's rivals in regard to the women. Each of them would have wished, like his father, to have all the women to himself. The new organization would have collapsed in a struggle of all against all, for none of them was of such over-mastering strength as to be able to take on his father's part with success. Thus the brothers had no alternative, if they were to live together, but - not, perhaps, until they had passed through many dangerous crises - to institute the law against incest, by which they all alike renounced the women whom they desired and who had been their chief motive for despatching their father. In this way they rescued the organization which had made them strong - and which may have been based on homosexual feelings and acts, originating perhaps during the period of their expulsion from the horde. Here, too, may perhaps have been the germ of the institution of matriarchy, described by Bachofen, which was in turn replaced by the patriarchal organization of the family.
Thus psycho-analysis, in contradiction to the more recent views of the totemic system but in agreement with the earlier ones, requires us to assume that totemism and exogamy were intimately connected and had a simultaneous origin.
[1912-1913, 2786]

An examination of the first question held out the promise of bringing us information about the source of mankind's sense of guilt in general. The invariable outcome of analytic work was to show that this obscure sense of guilt derived from the Oedipus complex and was a reaction to the two great criminal intentions of killing the father and having sexual relations with the mother. In comparison with these two, the crimes committed in order to fix the sense of guilt to something came as a relief to the sufferers. We must remember in this connection that parricide and incest with the mother are the two great human crimes, the only ones which, as such, are pursued and abhorred in primitive communities. And we must remember, too, how close other investigations have brought us to the hypothesis that the conscience of mankind, which now appears as an inherited mental force, was acquired in connection with the Oedipus complex.
[1916d, 3118]

The ego, freed from all ethical bonds, also finds itself at one with all the demands of sexual desire, even those which have long been condemned by our aesthetic upbringing and those which contradict all the requirements of moral restraint. The desire for pleasure - the 'libido', as we call it - chooses its objects without inhibition, and by preference, indeed, the forbidden ones: not only other men's wives, but above all incestuous objects, objects sanctified by the common agreement of mankind, a man's mother and sister, a woman's father and brother. (The dream of our fifty-year-old lady, too, was incestuous; her libido was unmistakably directed to her son.) Lusts which we think of as remote from human nature show themselves strong enough to provoke dreams. Hatred, too, rages without restraint. Wishes for revenge and death directed against those who are nearest and dearest in waking life, against the dreamer's parents, brothers and sisters, husband or wife, and his own children are nothing unusual. These censored wishes appear to rise up out of a positive Hell; after they have been interpreted when we are awake, no censorship of them seems to us too severe.
[1916-1917, 3237]

Among these forbidden wishes special emphasis deserves to be further laid on the incestuous ones - that is, on those aiming at sexual intercourse with parents and brothers and sisters. You know what horror is felt, or at least professed, in human society at such intercourse, and what stress is laid on the prohibitions directed against it. Tremendous efforts have been made to explain this horror of incest. Some people have supposed that breeding considerations on the part of Nature have found psychical representation in this prohibition, since inbreeding would impair racial characters. Others have maintained that, as a result of living together from early childhood onwards, sexual desire has been diverted from the people in question. In both these cases, it may be remarked, an avoidance of incest would be secured automatically, and it would not be clear why such severe prohibitions were called for, which would point rather to the presence of a strong desire for it. Psycho-analytic researches have shown unmistakably that the choice of an incestuous love-object is, on the contrary, the first and invariable one, and that it is not until later that resistance to it sets in; it is no doubt impossible to trace back this resistance to individual psychology.
[1916-1917, 3298]
This and very much else of a similar nature will be shown to you by the direct observation of children and by the consideration of clearly retained memories from childhood uninfluenced by analysis. From this you will conclude among other things that the position of a child in the family order is a factor of extreme importance in determining the shape of his later life and should deserve consideration in every life-history. But, what is more important, in view of this information which can be so easily obtained, you will not be able to recall without a smile the pronouncements of science in explanation of the prohibition of incest. There is no end to what has been invented on the subject. It has been said that sexual inclination is diverted from members of the same family who are of the opposite sex by the fact of having lived together from childhood; or, again, that a biological purpose of avoiding inbreeding is represented psychically by an innate horror of incest. In all this the fact is entirely overlooked that such an inexorable prohibition of it in law and custom would not be needed if there were any reliable natural barriers against the temptation to incest. The truth is just the opposite. A human being's first choice of an object is regularly an incestuous one, aimed, in the case of the male, at his mother and sister; and it calls for the severest prohibitions to deter this persistent infantile tendency from realization. Among the primitive races still living to-day, among savages, the prohibitions against incest are even very much stricter than among ourselves, and Theodor Reik has only recently shown in a brilliant work that the puberty rites of savages, which represent a re-birth, have the sense of releasing the boy from his incestuous bond with his mother and of reconciling him with his father.

[1916-1917, 3400]

Mythology will teach you that incest, which is supposed to be so much detested by humans, is unhesitatingly allowed to the gods. And you may learn from ancient history that incestuous sister marriage was a sanctified injunction upon the person of the Ruler (among the Egyptian Pharaohs and the Incas of Peru). What was in question was thus a privilege forbidden to the common herd.

[1916-1917, 3401]

Mother-incest was one of the crimes of Oedipus, parricide was the other. It may be remarked in passing that they are also the two great crimes proscribed by totemism, the first socio-religious institution of mankind.

[1916-1917, 3401]
By its theory of the instincts psycho-analysis offended the feelings of individuals in so far as they regarded themselves as members of the social community; another branch of its theory was calculated to hurt every single person at the tenderest point of his own psychical development. Psycho-analysis disposed once and for all of the fairy tale of an asexual childhood. It demonstrated the fact that sexual interests and activities occur in small children from the beginning of their lives. It showed what transformations those activities pass through, how at about the age of five they succumb to inhibition and how from puberty onwards they enter the service of the reproductive function. It recognized that early infantile sexual life reaches its peak in what is known as the Oedipus complex (an emotional attachment of the child to the parent of the opposite sex accompanied by an attitude of rivalry to the parent of the same sex) and that at that period of life this impulsion extends uninhibited into a straightforward sexual desire. This can be confirmed so easily that only the greatest efforts could make it possible to overlook it. Every individual has in fact gone through this phase but has afterwards energetically repressed its purport and succeeded in forgetting it. A horror of incest and an enormous sense of guilt are left over from this prehistoric epoch of the individual's existence. It may be that something quite similar occurred in the prehistoric epoch of the human species as a whole and that the beginnings of morality, religion and social order were intimately connected with the surmounting of that primaeval era. To adults their prehistory seems so inglorious that they refuse to allow themselves to be reminded of it: they were infuriated when psycho-analysis tried to lift the veil of amnesia from their years of childhood. There was only one way out: what psycho-analysis asserted must be false and what posed as a new science must be a tissue of fancies and distortions.

I myself set a higher value on my contributions to the psychology of religion, which began with the establishment of a remarkable similarity between obsessive actions and religious practices or ritual (1907b). Without as yet understanding the deeper connections, I described the obsessional neurosis as a distorted private religion and religion as a kind of universal obsessional neurosis. Later on, in 1912, Jung's forcible indication of the far-reaching analogies between the mental products of neurotics and of primitive peoples led me to turn my attention to that subject. In four essays, which were collected into a book with the title of Totem and Taboo, I showed that the horror of incest was even more marked among primitive than among civilized races and had given rise to very special measures of defence against it. I examined the relations between taboo-prohibitions (the earliest form in which moral restrictions make their appearance) and emotional ambivalence; and I discovered under the primitive scheme of the universe known as 'animism' the principle of the over-estimation of the importance of psychical reality - the belief in 'the omnipotence of thoughts' - which lies at the root of magic as well. I developed the comparison with the obsessional neurosis at every point, and showed how many of the postulates of primitive mental life are still in force in that remarkable illness. Above all, however, I was attracted by totemism, the first system of organization in primitive tribes, a system in which the beginnings of social order are united with a rudimentary religion and the implacable domination of a small number of taboo-prohibitions. The being that is revered is ultimately always an animal, from which the clan also claims to be descended. Many indications pointed to the conclusion that every race, even the most highly developed, had once passed through the stage of totemism.
The chief literary sources of my studies in this field were the well-known works of J. G. Frazer (Totemism and Exogamy and The Golden Bough), a mine of valuable facts and opinions. But Frazer effected little towards elucidating the problems of totemism; he had several times fundamentally altered his views on the subject, and the other ethnologists and prehistorians seemed in equal uncertainty and disagreement. My starting-point was the striking correspondence between the two taboo-ordinances of totemism (not to kill the totem and not to have sexual relations with any woman of the same totem-clan) and the two elements of the Oedipus complex (getting rid of the father and taking the mother to wife). I was therefore tempted to equate the totem-animal with the father; and in fact primitive peoples themselves do this explicitly, by honouring it as the forefather of the clan. There next came to my help two facts from psycho-analysis, a lucky observation of a child made by Ferenczi, which enabled me to speak of an 'infantile return of totemism', and the analysis of early animal-phobias in children, which so often showed that the animal was a substitute for the father, a substitute on to which the fear of the father derived from the Oedipus complex had been displaced. Not much was lacking to enable me to recognize the killing of the father as the nucleus of totemism and the starting-point in the formation of religion.

[1925d, 4240]

This missing element was supplied when I became acquainted with W. Robertson Smith's work, The Religion of the Semites. Its author (a man of genius who was both a physicist and an expert in biblical researches) introduced the so-called 'totem meal' as an essential part of the totemic religion. Once a year the totem animal, which was at other times regarded as sacred, was solemnly killed in the presence of all the members of the clan, was devouried and was then mourned over. The mourning was followed by a great festival. When I further took into account Darwin's conjecture that men originally lived in hordes, each under the domination of a single powerful, violent and jealous male, there rose before me out of all these components the following hypothesis, or, I would rather say, vision. The father of the primal horde, since he was an unlimited despot, had seized all the women for himself; his sons, being dangerous to him as rivals, had been killed or driven away. One day, however, the sons came together and united to overwhelm, kill, and devour their father, who had been their enemy but also their ideal. After the deed they were unable to take over their heritage since they stood in one another's way. Under the influence of failure and remorse they learned to come to an agreement among themselves; they banded themselves into a clan of brothers by the help of the ordinances of totemism, which aimed at preventing a repetition of such a deed, and they jointly undertook to forgo the possession of the women on whose account they had killed their father. They were then driven to finding strange women, and this was the origin of the exogamy which is so closely bound up with totemism. The totem meal was the festival commemorating the fearful deed from which sprang man's sense of guilt (or 'original sin') and which was the beginning at once of social organization, of religion and of ethical restrictions.

[1925d, 4240]

With pleasure. I was only waiting for this invitation. But is it really a transformation? In Totem and Taboo it was not my purpose to explain the origin of religions but only of totemism. Can you, from any of the views known to you, explain the fact that the first shape in which the protecting deity revealed itself to men should have been that of an animal, that there was a prohibition against killing and eating this animal and that nevertheless the solemn custom was to kill and eat it communally once a year? This is precisely what happens in totemism. And it is hardly to the purpose to argue whether totemism ought to be called a religion. It has intimate connections with the later god-religions. The totem animals become the sacred animals of the gods; and the earliest, but most fundamental moral restrictions - the prohibitions against murder and incest - originate in totemism. Whether or not you accept the conclusions of Totem and Taboo, I hope you will admit that a number of very remarkable, disconnected facts are brought together in it into a consistent whole.

[1927c, 4435]
The tendency on the part of civilization to restrict sexual life is no less clear than its other tendency to expand the cultural unit. Its first, totemic, phase already brings with it the prohibition against an incestuous choice of object, and this is perhaps the most drastic mutilation which man's erotic life has in all time experienced. Taboos, laws and customs impose further restrictions, which affect both men and women. Not all civilizations go equally far in this; and the economic structure of the society also influences the amount of sexual freedom that remains. Here, as we already know, civilization is obeying the laws of economic necessity, since a large amount of the psychical energy which it uses for its own purposes has to be withdrawn from sexuality. In this respect civilization behaves towards sexuality as a people or a stratum of its population does which has subjected another one to its exploitation. Fear of a revolt by the suppressed elements drives it to stricter precautionary measures. A high-water mark in such a development has been reached in our Western European civilization. A cultural community is perfectly justified, psychologically, in starting by proscribing manifestations of the sexual life of children, for there would be no prospect of curbing the sexual lusts of adults if the ground had not been prepared for it in childhood. But such a community cannot in any way be justified in going to the length of actually disavowing such easily demonstrable, and, indeed, striking phenomena. As regards the sexually mature individual, the choice of an object is restricted to the opposite sex, and most extra-genital satisfactions are forbidden as perversions. The requirement, demonstrated in these prohibitions, that there shall be a single kind of sexual life for everyone, disregards the dissimilarities, whether innate or acquired, in the sexual constitution of human beings; it cuts off a fair number of them from sexual enjoyment, and so becomes the source of serious injustice. The result of such restrictive measures might be that in people who are normal - who are not prevented by their constitution - the whole of their sexual interests would flow without loss into the channels that are left open. But heterosexual genital love, which has remained exempt from outlawry, is itself restricted by further limitations, in the shape of insistence upon legitimacy and monogamy. Present-day civilization makes it plain that it will only permit sexual relationships on the basis of a solitary, indissoluble bond between one man and one woman, and that it does not like sexuality as a source of pleasure in its own right and is only prepared to tolerate it because there is so far no substitute for it as a means of propagating the human race.

[1930a, 4498]
It must be supposed that after the parricide a considerable time elapsed during which the brothers disputed with one another for their father's heritage, which each of them wanted for himself alone. A realization of the dangers and uselessness of these struggles, a recollection of the act of liberation which they had accomplished together, and the emotional ties with one another which had arisen during the period of their expulsion, led at last to an agreement among them, a sort of social contract. The first form of a social organization came about with a renunciation of instinct, a recognition of mutual obligations, the introduction of definite institutions, pronounced inviolable (holy) - that is to say, the beginnings of morality and justice. Each individual renounced his ideal of acquiring his father's position for himself and of possessing his mother and sisters. Thus the taboo on incest and the injunction to exogamy came about. A fair amount of the absolute power liberated by the removal of the father passed over to the women; there came a period of matriarchy. Recollection of their father persisted at this period of the 'fraternal alliance'. A powerful animal - at first, perhaps, always one that was feared as well - was chosen as a substitute for the father. A choice of this kind may seem strange, but the gulf which men established later between themselves and animals did not exist for primitive peoples; nor does it exist for our children, whose animal phobias we have been able to understand as fear of their father. In relation to the totem animal the original dichotomy in the emotional relation to the father (ambivalence) was wholly retained. On the one hand the totem was regarded as the clan's blood ancestor and protective spirit, who must be worshipped and protected, and on the other hand a festival was appointed at which the same fate was prepared for him that the primal father had met with. He was killed and devoured by all the tribesmen in common. (The totem meal, according to Robertson Smith.) This great festival was in fact a triumphant celebration of the combined sons' victory over their father. [1939a, 4906]

That the redeemer had sacrificed himself without guilt was evidently a tendentious distortion, which offered difficulties to logical understanding. For how could someone guiltless of the act of murder take on himself the guilt of the murderers by allowing himself to be killed? In the historical reality there was no such contradiction. The 'redeemer' could be none other than the most guilty person, the ringleader of the company of brothers who had overpowered their father. We must in my judgement leave it undecided whether there was such a chief rebel and ringleader. That is possible; but we must also bear in mind that each one of the company of brothers certainly had a wish to commit the deed by himself alone and so to create an exceptional position for himself and to find a substitute for his identification with the father which was having to be given up and which was becoming merged in the community. If there was no such ringleader, then Christ was the heir to a wishful phantasy which remained unfulfilled; if there was one, then he was his successor and his reincarnation. But no matter whether what we have here is a phantasy or the return of a forgotten reality, in any case the origin of the concept of a hero is to be found at this point - the hero who always rebels against his father and kills him in some shape or other.¹ Here too is the true basis for the 'tragic guilt' of the hero of drama, which is otherwise hard to explain. It can scarcely be doubted that the hero and chorus in Greek drama represent the same rebellious hero and company of brothers; and it is not without significance that in the Middle Ages what the theatre started with afresh was the representation of the story of the Passion. [1939a, 4911]
This is the place, however, for an interpolation, in order to avoid a misunderstanding. Even though it may seem that instinctual renunciation and the ethics founded on it do not form part of the essential content of religion, yet genetically they are most intimately connected with it. Totemism, which is the earliest form of a religion which we recognize, carries with it, as indispensable constituents of its system, a number of commands and prohibitions which have no other significance, of course, than as instinctual renunciations: the worship of the totem, which includes a prohibition against injuring or killing it, exogamy - that is, renunciation of the passionately desired mothers and sisters in the horde - the granting of equal rights to all the members of the fraternal alliance - that is, restricting the inclination to violent rivalry among them. In these regulations are to be seen the first beginnings of a moral and social order. It does not escape us that two different motives are at work here. The first two prohibitions operate on the side of the father who has been got rid of: they carry on his will, as it were. The third command - the granting of equal rights to the allied brothers - disregards the father's will; it is justified by an appeal to the necessity for permanently maintaining the new order which succeeded the father's removal. Otherwise a relapse into the earlier state would have become inevitable. It is here that social commands diverge from the others which, as we might say, are derived directly from religious connections.

[1939a, 4938]

Our construction of prehistory forces us to another explanation. The command in favour of exogamy, of which the horror of incest is the negative expression, was a product of the will of the father and carried this will on after he had been removed. Hence come the strength of its emotional tone and the impossibility of finding a rational basis for it - that is, its sacredness. We confidently expect that an investigation of all the other cases of a sacred prohibition would lead to the same conclusion as in that of the horror of incest: that what is sacred was originally nothing other than the prolongation of the will of the primal father. This would also throw light on the hitherto incomprehensible ambivalence of the words which express the concept of sacredness. It is the ambivalence which in general dominates the relation to the father. [The Latin] 'sacer' means not only 'sacred', 'consecrated', but also something that we can only translate as 'infamous', 'detestable' (e.g. 'auri sacra fames'). But the father's will was not only something one might not touch, which one had to hold in high respect, but also something one trembled before, because it demanded a painful instinctual renunciation. When we hear that Moses made his people holy by introducing the custom of circumcision we now understand the deep meaning of that assertion. Circumcision is the symbolic substitute for the castration which the primal father once inflicted upon his sons in the plenitude of his absolute power, and whoever accepted that symbol was showing by it that he was prepared to submit to the father's will, even if it imposed the most painful sacrifice on him.

[1939a, 4940]
This attempt is based upon a hypothesis of Charles Darwin's upon the social state of primitive men. Darwin deduced from the habits of the higher apes that men, too, originally lived in comparatively small groups or hordes within which the jealousy of the oldest and strongest male prevented sexual promiscuity. 'We may indeed conclude from what we know of the jealousy of all male quadrupeds, armed, as many of them are, with special weapons for battling with their rivals, that promiscuous intercourse in a state of nature is extremely improbable. . . . Therefore, if we look far enough back in the stream of time, . . . judging from the social habits of man as he now exists . . . the most probable view is that primaeval man aboriginally lived in small communities, each with as many wives as he could support and obtain, whom he would have jealously guarded against all other men. Or he may have lived with several wives by himself, like the Gorilla; for all the natives "agree that but one adult male is seen in a band; when the young male grows up, a contest takes place for mastery, and the strongest, by killing and driving out the others, establishes himself as the head of the community". (Dr. Savage, in Boston Journal of Nat. Hist., vol. v, 1845-7, p. 423.) The younger males, being thus expelled and wandering about, would, when at last successful in finding a partner, prevent too close interbreeding within the limits of the same family.' (Darwin, 1871, 2, 362 f.)

Features were thus brought into existence which continued thenceforward to have a determining influence on the nature of religion. Totemic religion arose from the filial sense of guilt, in an attempt to allay that feeling and to appease the father by deferred obedience to him. All later religions are seen to be attempts at solving the same problem. They vary according to the stage of civilization at which they arise and according to the methods which they adopt; but all have the same end in view and are reactions to the same great event with which civilization began and which, since it occurred, has not allowed mankind a moment's rest.

There is another feature which was already present in totemism and which has been preserved unaltered in religion. The tension of ambivalence was evidently too great for any contrivance to be able to counteract it; or it is possible that psychological conditions in general are unfavourable to getting rid of these antithetical emotions. However that may be, we find that the ambivalence implicit in the father-complex persists in totemism and in religions generally. Totemic religion not only comprised expressions of remorse and attempts at atonement, it also served as a remembrance of the triumph over the father. Satisfaction over that triumph led to the institution of the memorial festival of the totem meal, in which the restrictions of deferred obedience no longer held. Thus it became a duty to repeat the crime of parricide again and again in the sacrifice of the totem animal, whenever, as a result of the changing conditions of life, the cherished fruit of the crime - appropriation of the paternal attributes - threatened to disappear. We shall not be surprised to find that the element of filial rebelliousness also emerges, in the later products of religion, often in the strangest disguises and transformations.

It therefore seems plausible to suppose that the god himself was the totem animal, and that he developed out of it at a later stage of religious feeling. But we are relieved from the necessity for further discussion by the consideration that the totem is nothing other than a surrogate of the father. Thus, while the totem may be the first form of father-surrogate, the god will be a later one, in which the father has regained his human shape. A new creation such as this, derived from what constitutes the root of every form of religion - a longing for the father - might occur if in the process of time some fundamental change had taken place in man's relation to the father, and perhaps, too, in his relation to animals.
Signs of the occurrence of changes of this kind may easily be seen, even if we leave on one side the beginning of a mental estrangement from animals and the disrupting of totemism owing to domestication. (See above, p2777 f.) There was one factor in the state of affairs produced by the elimination of the father which was bound in the course of time to cause an enormous increase in the longing felt for him. Each single one of the brothers who had banded together for the purpose of killing their father was inspired by a wish to become like him and had given expression to it by incorporating parts of their father's surrogate in the totem meal. But, in consequence of the pressure exercised upon each participant by the fraternal clan as a whole, that wish could not be fulfilled. For the future no one could or might ever again attain the father's supreme power, even though that was what all of them had striven for. Thus after a long lapse of time their bitterness against their father, which had driven them to their deed, grew less, and their longing for him increased; and it became possible for an ideal to emerge which embodied the unlimited power of the primal father against whom they had once fought as well as their readiness to submit to him. As a result of decisive cultural changes, the original democratic equality that had prevailed among all the individual clansmen became untenable; and there developed at the same time an inclination, based on veneration felt for particular human individuals, to revive the ancient paternal ideal by creating gods. The notion of a man becoming a god or of a god dying strikes us to-day as shockingly presumptuous; but even in classical antiquity there was nothing revolting in it.¹ The elevation of the father who had once been murdered into a god from whom the clan claimed descent was a far more serious attempt at atonement than had been the ancient covenant with the totem.

[1912-1913, 2788]

As time went on, the animal lost its sacred character and the sacrifice lost its connection with the totem feast; it became a simple offering to the deity, an act of renunciation in favour of the god. God Himself had become so far exalted above mankind that He could only be approached through an intermediary the priest. At the same time divine kings made their appearance in the social structure and introduced the patriarchal system into the state. It must be confessed that the revenge taken by the deposed and restored father was a harsh one: the dominance of authority was at its climax. The subjugated sons made use of the new situation in order to unburden themselves still further of their sense of guilt. They were no longer in any way responsible for the sacrifice as it now was. It was God Himself who demanded it and regulated it. This is the phase in which we find myths showing the god himself killing the animal which is sacred to him and which is in fact himself. Here we have the most extreme denial of the great crime which was the beginning of society and of the sense of guilt. But there is a second meaning to this last picture of sacrifice which is unmistakable. It expresses satisfaction at the earlier father-surrogate having been abandoned in favour of the superior concept of God. At this point the psycho-analytic interpretation of the scene coincides approximately with the allegorical, surface translation of it, which represents the god as overcoming the animal side of his own nature.³

[1912-1913, 2790]

Nevertheless it would be a mistake to suppose that the hostile impulses inherent in the father-complex were completely silenced during this period of revived paternal authority. On the contrary, the first phases of the dominance of the two new father surrogates - gods and kings - show the most energetic signs of the ambivalence that remains a characteristic of religion.

[1912-1913, 2791]
In his great work, *The Golden Bough*, Frazer puts forward the view that the earliest kings of the Latin tribes were foreigners who played the part of a god and were solemnly executed at a particular festival. The annual sacrifice (or, as a variant, self-sacrifice) of a god seems to have been an essential element in the Semitic religions. The ceremonials of human sacrifice, performed in the most different parts of the inhabited globe, leave very little doubt that the victims met their end as representatives of the deity; and these sacrificial rites can be traced into late times, with an inanimate effigy or puppet taking the place of the living human being. The theanthropic sacrifice of the god, into which it is unfortunately impossible for me to enter here as fully as into animal sacrifice, throws a searching retrospective light upon the meaning of the older forms of sacrifice. It confesses, with a frankness that could hardly be excelled, to the fact that the object of the act of sacrifice has always been the same - namely what is now worshipped as God, that is to say, the father. The problem of the relation between animal and human sacrifice thus admits of a simple solution. The original animal sacrifice was already a substitute for a human sacrifice - for the ceremonial killing of the father; so that, when the father-surrogate once more resumed its human shape, the animal sacrifice too could be changed back into a human sacrifice.

The memory of the first great act of sacrifice thus proved indestructible, in spite of every effort to forget it; and at the very point at which men sought to be at the farthest distance from the motives that led to it, its undistorted reproduction emerged in the form of the sacrifice of the god. I need not enlarge here upon the developments of religious thought which, in the shape of rationalizations, made this recurrence possible. Robertson Smith, who had no thought of our derivation of sacrifice from the great event in human prehistory, states that the ceremonies at the festivals in which the ancient Semites celebrated the death of a deity ‘were currently interpreted as the commemoration of a mythical tragedy’. ‘The mourning’, he declares, ‘is not a spontaneous expression of sympathy with the divine tragedy, but obligatory and enforced by fear of supernatural anger. And a chief object of the mourners is to disclaim responsibility for the god’s death - a point which his already come before us in connection with theanthropic sacrifices, such as the “ox-murder at Athens”’. (Ibid., 412.) It seems most probable that these ‘current interpretations’ were correct and that the feelings of the celebrants were fully explained by the underlying situation.

Let us assume it to be a fact, then, that in the course of the later development of religions the two driving factors, the son’s sense of guilt and the son’s rebelliousness, never became extinct. Whatever attempt was made at solving the religious problem, whatever kind of reconciliation was effected between these two opposing mental forces, sooner or later broke down, under the combined influence, no doubt, of historical events, cultural changes and internal psychical modifications.

[1912-1913, 2791]
The son's efforts to put himself in the place of the father-god became ever more obvious. The introduction of agriculture increased the son's importance in the patriarchal family. He ventured upon new demonstrations of his incestuous libido, which found symbolic satisfaction in his cultivation of Mother Earth. Divine figures such as Attis, Adonis and Tammuz emerged, spirits of vegetation and at the same time youthful divinities enjoying the favours of mother goddesses and committing incest with their mother in defiance of their father. But the sense of guilt, which was not allayed by these creations, found expression in myths which granted only short lives to these youthful favourites of the mother-goddesses and decreed their punishment byemasculaton or by the wrath of the father in the form of an animal. Adonis was killed by a wild boar, the sacred animal of Aphrodite; Attis, beloved of Cybele, perished by castration.¹ The mourning for these gods and the rejoicings over their resurrection passed over into the ritual of another son-deity who was destined to lasting success.

[1912-1913, 2792]

In the Christian doctrine, therefore, men were acknowledging in the most undisguised manner the guilty primaevol deed, since they found the fullest atonement for it in the sacrifice of this one son. Atonement with the father was all the more complete since the sacrifice was accompanied by a total renunciation of the women on whose account the rebellion against the father was started. But at that point the inexorable psychological law of ambivalence stepped in. The very deed in which the son offered the greatest possible atonement to the father brought him at the same time to the attainment of his wishes against the father. He himself became God, beside, or, more correctly, in place of, the father. A son-religion displaced the father-religion. As a sign of this substitution the ancient totem meal was revived in the form of communion, in which the company of brothers consumed the flesh and blood of the son - no longer the father - obtained sanctity thereby and identified themselves with him. Thus we can trace through the ages the identity of the totem meal with animal sacrifice, with theanthropic human sacrifice and with the Christian Eucharist, and we can recognize in all these rituals the effect of the crime by which men were so deeply weighed down but of which they must none the less feel so proud. The Christian communion, however, is essentially a fresh elimination of the father, a repetition of the guilty deed. We can see the full justice of Frazer's pronouncement that 'the Christian communion has absorbed within itself a sacrament which is doubtless far older than Christianity'.²

[1912-1913, 2794]

An event such as the elimination of the primal father by the company of his sons must inevitably have left ineradicable traces in the history of humanity; and the less it itself was recollected, the more numerous must have been the substitutes to which it gave rise.¹ I shall resist the temptation of pointing out these traces in mythology, where they are not hard to find, and shall turn in another direction and take up a suggestion made by Salomon Reinach in a most instructive essay on the death of Orpheus.²

[1912-1913, 2795]
At the conclusion, then, of this exceedingly condensed inquiry, I should like to insist that its outcome shows that the beginnings of religion, morals, society and art converge in the Oedipus complex. This is in complete agreement with the psycho-analytic finding that the same complex constitutes the nucleus of all neuroses, so far as our present knowledge goes. It seems to me a most surprising discovery that the problems of social psychology, too, should prove soluble on the basis of one single concrete point - man's relation to his father. It is even possible that yet another psychological problem belongs in this same connection. I have often had occasion to point out that emotional ambivalence in the proper sense of the term - that is, the simultaneous existence of love and hate towards the same object - lies at the root of many important cultural institutions. We know nothing of the origin of this ambivalence. One possible assumption is that it is a fundamental phenomenon of our emotional life. But it seems to me quite worth considering another possibility, namely that originally it formed no part of our emotional life but was acquired by the human race in connection with their father-complex, precisely where the psycho-analytic examination of modern individuals still finds it revealed at its strongest.

May not the same have been true of primitive men? We are justified in believing that, as one of the phenomena of their narcissistic organization, they overvalued their psychical acts to an extraordinary degree. Accordingly the mere hostile impulse against the father, the mere existence of a wishful phantasy of killing and devouring him, would have been enough to produce the moral reaction that created totemism and taboo. In this way we should avoid the necessity for deriving the origin of our cultural legacy, of which we justly feel so proud, from a hideous crime, revolting to all our feelings. No damage would thus be done to the causal chain stretching from the beginning to the present day, for psychical reality would be strong enough to bear the weight of these consequences. To this it may be objected that an alteration in the form of society from a patriarchal horde to a fraternal clan did actually take place. This is a powerful argument, but not a conclusive one. The alteration might have been effected in a less violent fashion and none the less have been capable of determining the appearance of the moral reaction. So long as the pressure exercised by the primal father could be felt, the hostile feelings towards him were justified, and remorse on their account would have to await a later day. And if it is further argued that everything derived from the ambivalent relation to the father - taboo and the sacrificial ordinance - is characterized by the deepest seriousness and the most complete reality, this further objection carries just as little weight. For the ceremonials and inhibitions of obsessional neurotics show these same characteristics and are nevertheless derived only from psychical reality - from intentions and not from their execution. We must avoid transplanting a contempt for what is merely thought or wished from our commonplace world, with its wealth of material values, into the world of primitive men and neurotics, of which the wealth lies only within themselves.

Hence the primaeval history of mankind is filled with murder. Even to-day, the history of the world which our children learn at school is essentially a series of murders of peoples. The obscure sense of guilt to which mankind has been subject since prehistoric times, and which in some religions has been condensed into the doctrine of primal guilt, of original sin, is probably the outcome of a blood-guilt incurred by prehistoric man. In my book Totem and Taboo (1912-13) I have, following clues given by Robertson Smith, Atkinson and Charles Darwin, tried to guess the nature of this primal guilt, and I believe, too, that the Christian doctrine of to-day enables us to deduce it. If the Son of God was obliged to sacrifice his life to redeem mankind from original sin, then by the law of talion, the requital of like by like, that sin must have been a killing, a murder. Nothing else could call for the sacrifice of a life for its expiation. And the original sin was an offence against God the Father, the primal crime of mankind must have been a parricide, the killing of the primal father of the primitive human horde, whose mnemonic image was later transfigured into a deity.

[1912-1913, 2796]

[1912-1913, 2798]

[1915b, 3084]
Mother-incest was one of the crimes of Oedipus, parricide was the other. It may be remarked in passing that they are also the two great crimes proscribed by totemism, the first socio-religious institution of mankind. [1916-1917, 3401]

The transformation did not occur spontaneously, through internal development, but through an outside influence. Its visible effect was that the patient's relation to his father, which stood in the foreground, and which had so far found expression in the wolf phobia, was now manifested in obsessional piety. I cannot refrain from pointing out that the course of events in this part of the patient's history affords an unmistakable confirmation of an assertion which I made in Totem and Taboo upon the relation of the totem animal to the deity.¹ I there decided in favour of the view that the idea of God was not a development from the totem, but replaced it after arising independently from a root common to both ideas. The totem, I maintained, was the first father-surrogate, and the god was a later one, in which the father had regained his human shape. And we find the same thing with our patient. In his wolf phobia he had gone through the stage of the totemic father-surrogate; but that stage was now broken off, and, as a result of new relations between him and his father, was replaced by a phase of religious piety. [1918b, 3590]

To find the starting-point for the psycho-analytic view of religious life we must go a step further. What is to-day the heritage of the individual was once a new acquisition and has been handed on from one to another of a long series of generations. Thus the Oedipus complex too may have had stages of development, and the study of prehistory may enable us to trace them out. Investigation suggests that life in the human family took a quite different form in those remote days from that with which we are now familiar. And this idea is supported by findings based on observations of contemporary primitive races. If the prehistoric and ethnological material on this subject is worked over psycho-analytically, we arrive at an unexpectedly precise result: namely that God the Father once walked upon earth in bodily form and exercised his sovereignty as chieftain of the primal human horde until his sons united to slay him. It emerges further that this crime of liberation and the reactions to it had as its result the appearance of the first social ties, the basic moral restrictions and the oldest form of religion, totemism. But the later religions too have the same content, and on the one hand they are concerned with obliterating the traces of that crime or with expiating it by bringing forward other solutions of the struggle between the father and sons, while on the other hand they cannot avoid repeating once more the elimination of the father. Incidentally, an echo of this monstrous event, which overshadowed the whole course of human development, is also to be found in myths. [1919g, 3705]

¹ We are very well aware that we have not exhausted the nature of identification with these examples taken from pathology, and that we have consequently left part of the riddle of group formations untouched. A far more fundamental and comprehensive psychological analysis would have to intervene at this point. A path leads from identification by way of imitation to empathy, that is, to the comprehension of the mechanism by means of which we are enabled to take up any attitude at all towards another mental life. Moreover there is still much to be explained in the manifestations of existing identifications. These result among other things in a person limiting his aggressiveness towards those with whom he has identified himself, and in his sparing them and giving them help. The study of such identifications, like those, for instance which lie at the root of clan feeling, led Robertson Smith (Kinship and Marriage, 1885) to the surprising discovery that they rest upon the acknowledgement of the possession of a common substance, and may even therefore be created by a meal eaten in common. This feature makes it possible to connect this kind of identification with the early history of the human family which I constructed in Totem and Taboo. [1921c, 3802]
In 1912 I took up a conjecture of Darwin's to the effect that the primitive form of human society was that of a horde ruled over despotically by a powerful male. I attempted to show that the fortunes of this horde have left indestructible traces upon the history of human descent; and, especially, that the development of totemism, which comprises in itself the beginnings of religion, morality, and social organization, is connected with the killing of the chief by violence and the transformation of the paternal horde into a community of brothers.¹ To be sure, this is only a hypothesis, like so many others with which archaeologists endeavour to lighten the darkness of prehistoric times - a 'Just-So Story', as it was amusingly called by a not unkind English critic; but I think it is creditable to such a hypothesis if it proves able to bring coherence and understanding into more and more new regions.

[1921c, 3814]

By the measures that he takes, then, the hypnotist awakens in the subject a portion of his archaic heritage which had also made him compliant towards his parents and which had experienced an individual re-animation in his relation to his father; what is thus awakened is the idea of a paramount and dangerous personality, towards whom only a passive-masochistic attitude is possible, to whom one's will has to be surrendered, - while to be alone with him, 'to look him in the face', appears a hazardous enterprise. It is only in some such way as this that we can picture the relation of the individual member of the primal horde to the primal father. As we know from other reactions, individuals have preserved a variable degree of personal aptitude for reviving old situations of this kind. Some knowledge that in spite of everything hypnosis is only a game, a deceptive renewal of these old impressions, may, however, remain behind and take care that there is a resistance against any too serious consequences of the suspension of the will in hypnosis.

[1921c, 3819]

For this purpose we must return for a moment to the scientific myth of the father of the primal horde. He was later on exalted into the creator of the world, and with justice, for he had produced all the sons who composed the first group. He was the ideal of each one of them, at once feared and honoured, a fact which led later to the idea of taboo. These many individuals eventually banded themselves together, killed him and cut him in pieces. None of the group of victors could take his place, or, if one of them did, the battles began afresh, until they understood that they must all renounce their father's heritage. They then formed the totemic community of brothers, all with equal rights and united by the totem prohibitions which were to preserve and to expiate the memory of the murder. But the dissatisfaction with what had been achieved still remained, and it became the source of new developments. The persons who were united in this group of brothers gradually came towards a revival of the old state of things at a new level. The male became once more the chief of a family, and broke down the prerogatives of the gynaecocracy which had become established during the fatherless period. As a compensation for this he may at that time have acknowledged the mother deities, whose priests were castrated for the mother's protection, after the example that had been given by the father of the primal horde. And yet the new family was only a shadow of the old one; there were numbers of fathers and each one was limited by the rights of the others.

[1921c, 3826]
Religion, morality, and a social sense - the chief elements in the higher side of man¹ - were originally one and the same thing. According to the hypothesis which I put forward in Totem and Taboo they were acquired phylogenetically out of the father-complex: religion and moral restraint through the process of mastering the Oedipus complex itself, and social feeling through the necessity for overcoming the rivalry that then remained between the members of the younger generation. The male sex seems to have taken the lead in all these moral acquisitions; and they seem to have then been transmitted to women by cross-inheritance. Even to-day the social feelings arise in the individual as a superstructure built upon impulses of jealous rivalry against his brothers and sisters. Since the hostility cannot be satisfied, an identification with the former rival develops. The study of mild cases of homosexuality confirms the suspicion that in this instance, too, the identification is a substitute for an affectionate object-choice which has taken the place of the aggressive, hostile attitude.²

[1923b, 3971]

With the mention of phylogenesis, however, fresh problems arise, from which one is tempted to draw cautiously back. But there is no help for it, the attempt must be made - in spite of a fear that it will lay bare the inadequacy of our whole effort. The question is: which was it, the ego of primitive man or his id, that acquired religion and morality in those early days out of the father-complex? If it was his ego, why do we not speak simply of these things being inherited by the ego? If it was the id, how does that agree with the character of the id? Or are we wrong in carrying the differentiation between ego, super-ego, and id back into such early times? Or should we not honestly confess that our whole conception of the processes in the ego is of no help in understanding phylogenesis and cannot be applied to it?

[1923b, 3972]

Let us answer first what is easiest to answer. The differentiation between ego and id must be attributed not only to primitive man but even to much simpler organisms, for it is the inevitable expression of the influence of the external world. The super-ego, according to our hypothesis, actually originated from the experiences that led to totemism. The question whether it was the ego or the id that experienced and acquired these things soon comes to nothing. Reflection at once shows us that no external vicissitudes can be experienced or undergone by the id, except by way of the ego, which is the representative of the external world to the id. Nevertheless it is not possible to speak of direct inheritance in the ego. It is here that the gulf between an actual individual and the concept of a species becomes evident. Moreover, one must not take the difference between ego and id in too hard-and-fast a sense, nor forget that the ego is a specially differentiated part of the id. The experiences of the ego seem at first to be lost for inheritance; but, when they have been repeated often enough and with sufficient strength in many individuals in successive generations, they transform themselves, so to say, into experiences of the id, the impressions of which are preserved by heredity. Thus in the id, which is capable of being inherited, are harboured residues of the existences of countless egos; and, when the ego forms its super-ego out of the id, it may perhaps only be reviving shapes of former egos and be bringing them to resurrection.

[1923b, 3972]
We have here an example of the process, with which we are familiar, by which an idea that has a contradictory - an ambivalent - content becomes divided into two sharply contrasted opposites. The contradictions in the original nature of God are, however, a reflection of the ambivalence which governs the relation of the individual to his personal father. If the benevolent and righteous God is a substitute for his father, it is not to be wondered at that his hostile attitude to his father, too, which is one of hating and fearing him and of making complaints against him, should have come to expression in the creation of Satan. Thus the father, it seems, is the individual prototype of both God and the Devil. But we should expect religions to bear ineffaceable marks of the fact that the primitive primal father was a being of unlimited evil - a being less like God than the Devil. [1923d, 4010]

It is true that it is by no means easy to demonstrate the traces of this satanic view of the father in the mental life of the individual. When a boy draws grotesque faces and caricatures, we may no doubt be able to show that he is jeering at his father in them; and when a person of either sex is afraid of robbers and burglars at night, it is not hard to recognize these as split off portions of the father.¹ The animals, too, which appear in children's animal phobias are most often father-substitutes, as were the totem animals of primitive times. But that the Devil is a duplicate of the father and can act as a substitute for him has not been shown so clearly elsewhere as in the demonological neurosis of this seventeenth-century painter. That is why, at the beginning of this paper, I foretold that a demonological case history of this kind would yield in the form of pure metal material which, in the neuroses of a later epoch (no longer superstitious but hypochondriacal instead) has to be laboriously extracted by analytic work from the ore of free associations and symptoms.² A deeper penetration into the analysis of our painter's illness will probably bring stronger conviction. It is no unusual thing for a man to acquire a melancholic depression and an inhibition in his work as a result of his father's death. When this happens, we conclude that the man had been attached to his father with an especially strong love, and we remember how often a severe melancholia appears as a neurotic form of mourning. [1923d, 4011]

By its theory of the instincts psycho-analysis offended the feelings of individuals in so far as they regarded themselves as members of the social community; another branch of its theory was calculated to hurt every single person at the tenderest point of his own psychical development. Psycho-analysis disposed once and for all of the fairy tale of an asexual childhood. It demonstrated the fact that sexual interests and activities occur in small children from the beginning of their lives. It showed what transformations those activities pass through, how at about the age of five they succumb to inhibition and how from puberty onwards they enter the service of the reproductive function. It recognized that early infantile sexual life reaches its peak in what is known as the Oedipus complex (an emotional attachment of the child to the parent of the opposite sex accompanied by an attitude of rivalry to the parent of the same sex) and that at that period of life this impulsion extends uninhibited into a straightforward sexual desire. This can be confirmed so easily that only the greatest efforts could make it possible to overlook it. Every individual has in fact gone through this phase but has afterwards energetically repressed its purport and succeeded in forgetting it. A horror of incest and an enormous sense of guilt are left over from this prehistoric epoch of the individual's existence. It may be that something quite similar occurred in the prehistoric epoch of the human species as a whole and that the beginnings of morality, religion and social order were intimately connected with the surmounting of that primaeval era. To adults their prehistory seems so inglorious that they refuse to allow themselves to be reminded of it: they were infuriated when psycho-analysis tried to lift the veil of amnesia from their years of childhood. There was only one way out: what psycho-analysis asserted must be false and what posed as a new science must be a tissue of fancies and distortions. [1925e, 4128]
The chief literary sources of my studies in this field were the well-known works of J. G. Frazer (Totemism and Exogamy and The Golden Bough), a mine of valuable facts and opinions. But Frazer effected little towards elucidating the problems of totemism; he had several times fundamentally altered his views on the subject, and the other ethnologists and prehistorians seemed in equal uncertainty and disagreement. My starting-point was the striking correspondence between the two taboo-ordinances of totemism (not to kill the totem and not to have sexual relations with any woman of the same totem-clan) and the two elements of the Oedipus complex (getting rid of the father and taking the mother to wife). I was therefore tempted to equate the totem-animal with the father; and in fact primitive peoples themselves do this explicitly, by honouring it as the forefather of the clan. There next came to my help two facts from psycho-analysis, a lucky observation of a child made by Ferenczi, which enabled me to speak of an 'infantile return of totemism', and the analysis of early animal-phobias in children, which so often showed that the animal was a substitute for the father, a substitute on to which the fear of the father derived from the Oedipus complex had been displaced. Not much was lacking to enable me to recognize the killing of the father as the nucleus of totemism and the starting-point in the formation of religion.

[1925d, 4240]

This missing element was supplied when I became acquainted with W. Robertson Smith's work, The Religion of the Semites. Its author (a man of genius who was both a physicist and an expert in biblical researches) introduced the so-called 'totem meal' as an essential part of the totemic religion. Once a year the totem animal, which was at other times regarded as sacred, was solemnly killed in the presence of all the members of the clan, was devoured and was then mourned over. The mourning was followed by a great festival. When I further took into account Darwin's conjecture that men originally lived in hordes, each under the domination of a single powerful, violent and jealous male, there rose before me out of all these components the following hypothesis, or, I would rather say, vision. The father of the primal horde, since he was an unlimited despot, had seized all the women for himself; his sons, being dangerous to him as rivals, had been killed or driven away. One day, however, the sons came together and united to overwhelm, kill, and devour their father, who had been their enemy but also their ideal. After the deed they were unable to take over their heritage since they stood in one another's way. Under the influence of failure and remorse they learned to come to an agreement among themselves; they banded themselves into a clan of brothers by the help of the ordinances of totemism, which aimed at preventing a repetition of such a deed, and they jointly undertook to forgo the possession of the women on whose account they had killed their father. They were then driven to finding strange women, and this was the origin of the exogamy which is so closely bound up with totemism. The totem meal was the festival commemorating the fearful deed from which sprang man's sense of guilt (or 'original sin') and which was the beginning at once of social organization, of religion and of ethical restrictions.

[1925d, 4241]

Now whether we suppose that such a possibility was a historical event or not, it brings the formation of religion within the circle of the father-complex and bases it upon the ambivalence which dominates that complex. After the totem animal had ceased to serve as a substitute for him, the primal father, at once feared and hated, revered and envied, became the prototype of God himself. The son's rebelliousness and his affection for his father struggled against each other through a constant succession of compromises, which sought on the one hand to atone for the act of parricide and on the other to consolidate the advantages it had brought. This view of religion throws a particularly clear light upon the psychological basis of Christianity, in which, as we know, the ceremony of the totem meal still survives with but little distortion, in the form of Communion. I should like explicitly to mention that this last observation was not made by me but is to be found in the works of Robertson Smith and Frazer.

[1925d, 4241]
The question of why in the long run the animal god did not suffice, and was replaced by a human one, was hardly touched on in *Totem and Taboo*, and other problems concerning the formation of religion were not mentioned in the book at all. Do you regard a limitation of that kind as the same thing as a denial? My work is a good example of the strict isolation of the particular contribution which psycho-analytic discussion can make to the solution of the problem of religion. If I am now trying to add the other, less deeply concealed part, you should not accuse me of contradicting myself, just as before you accused me of being one-sided. It is, of course, my duty to point out the connecting links between what I said earlier and what I put forward now, between the deeper and the manifest motives, between the father-complex and man's helplessness and need for protection.

[1927c, 4435]

But here our plea for ascribing purely rational reasons to the precepts of civilization - that is to say, for deriving them from social necessity - is interrupted by a sudden doubt. We have chosen as our example the origin of the prohibition against murder. But does our account of it tally with historical truth? We fear not; it appears to be nothing but a rationalistic construction. With the help of psycho-analysis, we have made a study of precisely this piece of the cultural history of mankind, and, basing ourselves on it, we are bound to say that in reality things happened otherwise. Even in present-day man purely reasonable motives can effect little against passionate impulsions. How much weaker then must they have been in the human animal of primaeval times! Perhaps his descendants would even now kill one another without inhibition, if it were not that among those murderous acts there was one - the killing of the primitive father - which evoked an irresistible emotional reaction with momentous consequences. From it arose the commandment: Thou shalt not kill. Under totemism this commandment was restricted to the father-substitute; but it was later extended to other people, though even to-day it is not universally obeyed.

[1927c, 4451]

But, as was shown by arguments which I need not repeat here, the primal father was the original image of God, the model on which later generations have shaped the figure of God. Hence the religious explanation is right, God actually played a part in the genesis of that prohibition; it was His influence, not any insight into social necessity, which created it. And the displacement of man's will on to God is fully justified. For men knew that they had disposed of their father by violence, and in their reaction to that impious deed, they determined to respect his will thenceforward. Thus religious doctrine tells us the historical truth - though subject, it is true, to some modification and disguise - whereas our rational account disavows it.

[1927c, 4451]
We now observe that the store of religious ideas includes not only wish-fulfilments but important historical recollections. This concurrent influence of past and present must give religion a truly incomparable wealth of power. But perhaps with the help of an analogy yet another discovery may begin to dawn on us. Though it is not a good plan to transplant ideas far from the soil in which they grew up, yet here is a conformity which we cannot avoid pointing out. We know that a human child cannot successfully complete its development to the civilized stage without passing through a phase of neurosis sometimes of greater and sometimes of less distinctness. This is because so many instinctual demands which will later be unserviceable cannot be suppressed by the rational operation of the child's intellect but have to be tamed by acts of repression, behind which, as a rule, lies the motive of anxiety. Most of these infantile neuroses are overcome spontaneously in the course of growing up, and this is especially true of the obsessional neuroses of childhood. The remainder can be cleared up later still by psycho-analytic treatment. In just the same way, one might assume, humanity as a whole, in its development through the ages, fell into states analogous to the neuroses, and for the same reasons - namely because in the times of its ignorance and intellectual weakness the instinctual renunciations indispensable for man's communal existence had only been achieved by it by means of purely affective forces. The precipitates of these processes resembling repression which took place in prehistoric times still remained attached to civilization for long periods. Religion would thus be the universal obsessional neurosis of humanity; like the obsessional neurosis of children, it arose out of the Oedipus complex, out of the relation to the father. If this view is right, it is to be supposed that a turning-away from religion is bound to occur with the fatal inevitability of a process of growth, and that we find ourselves at this very juncture in the middle of that phase of development. Our behaviour should therefore be modelled on that of a sensible teacher who does not oppose an impending new development but seeks to ease its path and mitigate the violence of its irruption. Our analogy does not, to be sure, exhaust the essential nature of religion. If, on the one hand, religion brings with it obsessional restrictions, exactly as an individual obsessional neurosis does, on the other hand it comprises a system of wishful illusions together with a disavowal of reality, such as we find in an isolated form nowhere else but in amentia, in a state of blissful hallucinatory confusion. But these are only analogies, by the help of which we endeavour to understand a social phenomenon; the pathology of the individual does not supply us with a fully valid counterpart.

[1927c, 4452]
After primal man had discovered that it lay in his own hands, literally, to improve his lot on earth by working, it cannot have been a matter of indifference to him whether another man worked with or against him. The other man acquired the value for him of a fellow-worker, with whom it was useful to live together. Even earlier, in his ape-like prehistory, man had adopted the habit of forming families, and the members of his family were probably his first helpers. One may suppose that the founding of families was connected with the fact that a moment came when the need for genital satisfaction no longer made its appearance like a guest who drops in suddenly, and, after his departure, is heard of no more for a long time, but instead took up its quarters as a permanent lodger. When this happened, the male acquired a motive for keeping the female, or, speaking more generally, his sexual objects, near him; while the female, who did not want to be separated from her helpless young, was obliged, in their interests, to remain with the stronger male.¹ In this primitive family one essential feature of civilization is still lacking. The arbitrary will of its head, the father, was unrestricted. In Totem and Taboo I have tried to show how the way led from this family to the succeeding stage of communal life in the form of bands of brothers. In overpowering their father, the sons had made the discovery that a combination can be stronger than a single individual. The totemic culture is based on the restrictions which the sons had to impose on one another in order to keep this new state of affairs in being. The taboo-observances were the first 'right' or 'law. The communal life of human beings had, therefore, a two-fold foundation: the compulsion to work, which was created by external necessity, and the power of love, which made the man unwilling to be deprived of his sexual object - the woman -, and made the woman unwilling to be deprived of the part of herself which had been separated off from her - her child. Eros and Ananke have become the parents of human civilization too. The first result of civilization was that even a fairly large number of people were now able to live together in a community. And since these two great powers were co-operating in this, one might expect that the further development of civilization would proceed smoothly towards an even better control over the external world and towards a further extension of the number of people included in the community. Nor is it easy to understand how this civilization could act upon its participants otherwise than to make them happy.

[1930a, 4495]
In the first place, I suspect that the reader has the impression that our discussions on the sense of guilt disrupt the framework of this essay: that they take up too much space, so that the rest of its subject-matter, with which they are not always closely connected, is pushed to one side. This may have spoilt the structure of my paper; but it corresponds faithfully to my intention to represent the sense of guilt as the most important problem in the development of civilization and to show that the price we pay for our advance in civilization is a loss of happiness through the heightening of the sense of guilt.¹ Anything that still sounds strange about this statement, which is the final conclusion of our investigation, can probably be traced to the quite peculiar relationship - as yet completely unexplained - which the sense of guilt has to our consciousness. In the common case of remorse, which we regard as normal, this feeling makes itself clearly enough perceptible to consciousness. Indeed, we are accustomed to speak of a 'consciousness of guilt' instead of a 'sense of guilt'. Our study of the neuroses, to which, after all we owe the most valuable pointers to an understanding of normal conditions, brings us up against some contradictions. In one of those affections, obsessional neurosis, the sense of guilt makes itself noisily heard in consciousness; it dominates the clinical picture and the patient's life as well, and it hardly allows anything else to appear alongside of it. But in most other cases and forms of neurosis it remains completely unconscious, without on that account producing any less important effects. Our patients do not believe us when we attribute an 'unconscious sense of guilt' to them. In order to make ourselves at all intelligible to them, we tell them of an unconscious need for punishment, in which the sense of guilt finds expression. But its connection with a particular form of neurosis must not be over-estimated. Even in obsessional neurosis there are types of patients who are not aware of their sense of guilt, or who only feel it as a tormenting uneasiness, a kind of anxiety, if they are prevented from carrying out certain actions. It ought to be possible eventually to understand these things; but as yet we cannot. Here perhaps we may be glad to have it pointed out that the sense of guilt is at bottom nothing else but a topographical variety of anxiety; in its later phases it coincides completely with fear of the super-ego. And the relations of anxiety to consciousness exhibit the same extraordinary variations. Anxiety is always present somewhere or other behind every symptom; but at one time it takes noisy possession of the whole of consciousness, while at another it conceals itself so completely that we are obliged to speak of unconscious anxiety or, if we want to have a clearer psychological conscience, since anxiety is in the first instance simply a feeling, of possibilities of anxiety. Consequently it is very conceivable that the sense of guilt produced by civilization is not perceived as such either, and remains to a large extent unconscious, or appears as a sort of malaise, a dissatisfaction, for which people seek other motivations. Religions, at any rate, have never overlooked the part played in civilization by a sense of guilt. Furthermore - a point which I failed to appreciate elsewhere² - they claim to redeem mankind from this sense of guilt, which they call sin. From the manner in which, in Christianity, this redemption is achieved - by the sacrificial death of a single person, who in this manner takes upon himself a guilt that is common to everyone - we have been able to infer what the first occasion may have been on which this primal guilt, which was also the beginning of civilization, was acquired.³

¹[1930a, 4523]
The analogy between the process of civilization and the path of individual development may be extended in an important respect. It can be asserted that the community, too, evolves a super-ego under whose influence cultural development proceeds. It would be a tempting task for anyone who has a knowledge of human civilizations to follow out this analogy in detail. I will confine myself to bringing forward a few striking points. The super-ego of an epoch of civilization has an origin similar to that of an individual. It is based on the impression left behind by the personalities of great leaders - men of overwhelming force of mind or men in whom one of the human impulsions has found its strongest and purest, and therefore often its most one-sided, expression. In many instances the analogy goes still further, in that during their lifetime these figures were - often enough, even if not always - mocked and maltreated by others and even despatched in a cruel fashion. In the same way, indeed, the primal father did not attain divinity until long after he had met his death by violence. The most arresting example of this fateful conjunction is to be seen in the figure of Jesus Christ - if, indeed, that figure is not a part of mythology, which called it into being from an obscure memory of that primal event. Another point of agreement between the cultural and the individual super-ego is that the former, just like the latter, sets up strict ideal demands, disobedience to which is visited with 'fear of conscience'. Here, indeed, we come across the remarkable circumstance that the mental processes concerned are actually more familiar to us and more accessible to consciousness as they are seen in the group than they can be in the individual man. In him, when tension arises, it is only the aggressiveness of the super-ego which, in the form of reproaches, makes itself noisily heard; its actual demands often remain unconscious in the background. If we bring them to conscious knowledge, we find that they coincide with the precepts of the prevailing cultural super-ego. At this point the two processes, that of the cultural development of the group and that of the cultural development of the individual, are, as it were, always interlocked. For that reason some of the manifestations and properties of the super-ego can be more easily detected in its behaviour in the cultural community than in the separate individual. [1930a, 4529]

Parricide, according to a well-known view, is the principal and primal crime of humanity as well as of the individual. (See my Totem and Taboo 1912-13.) It is in any case the main source of the sense of guilt, though we do not know if it is the only one: researches have not yet been able to establish with certainty the mental origin of guilt and the need for expiation. But it is not necessary for it to be the only one. The psychological situation is complicated and requires elucidation. The relation of a boy to his father is, as we say, an 'ambivalent' one. In addition to the hate which seeks to get rid of the father as a rival, a measure of tenderness for him is also habitually present. The two attitudes of mind combine to produce identification with the father; the boy wants to be in his father's place because he admires him and wants to be like him, and also because he wants to put him out of the way. This whole development now comes up against a powerful obstacle. At a certain moment the child comes to understand that an attempt to remove his father as a rival would be punished by him with castration. So from fear of castration - that is, in the interests of preserving his masculinity - he gives up his wish to possess his mother and get rid of his father. In so far as this wish remains in the unconscious it forms the basis of the sense of guilt. We believe that what we have here been describing are normal processes, the normal fate of the so-called 'Oedipus complex'; nevertheless it requires an important amplification. [1928b, 4559]
One thing is remarkable: in the aura of the epileptic attack, one moment of supreme bliss is experienced. This may very well be a record of the triumph and sense of liberation felt on hearing the news of the death, to be followed immediately by an all the more cruel punishment. We have divined just such a sequence of triumph and mourning, of festive joy and mourning, in the brothers of the primal horde who murdered their father, and we find it repeated in the ceremony of the totem meal.¹ If it proved to be the case that Dostoevsky was free from his attacks in Siberia, that would merely substantiate the view that they were his punishment. He did not need them any longer when he was being punished in another way. But that cannot be proved. Rather does this necessity for punishment on the part of Dostoevsky's mental economy explain the fact that he passed unbroken through these years of misery and humiliation. Dostoevsky's condemnation as a political prisoner was unjust and he must have known it, but he accepted the undeserved punishment at the hands of the Little Father, the Tsar, as a substitute for the punishment he deserved for his sin against his real father. Instead of punishing himself, he got himself punished by his father's deputy. Here we have a glimpse of the psychological justification of the punishments inflicted by society. It is a fact that large groups of criminals want to be punished. Their super-ego demands it and so saves itself the necessity for inflicting the punishment itself. [1928b, 4562]

Everyone who is familiar with the complicated transformation of meaning undergone by hysterical symptoms will understand that no attempt can be made here to follow out the meaning of Dostoevsky's attacks beyond this beginning.¹ It is enough that we may assume that their original meaning remained unchanged behind all later accretions. We can safely say that Dostoevsky never got free from the feelings of guilt arising from his intention of murdering his father. They also determined his attitude in the two other spheres in which the father-relation is the decisive factor, his attitude towards the authority of the State and towards belief in God. In the first of these he ended up with complete submission to his Little Father, the Tsar, who had once performed with him in reality the comedy of killing which his attacks had so often represented in play. Here penitence gained the upper hand. In the religious sphere he retained more freedom: according to apparently trustworthy reports he wavered, up to the last moment of his life, between faith and atheism. His great intellect made it impossible for him to overlook any of the intellectual difficulties to which faith leads. By an individual recapitulation of a development in world-history he hoped to find a way out and a liberation from guilt in the Christ ideal, and even to make use of his sufferings as a claim to be playing a Christ-like role. If on the whole he did not achieve freedom and became a reactionary, that was because the filial guilt, which is present in human beings generally and on which religious feeling is built, had in him attained a super-individual intensity and remained insurmountable even to his great intelligence. In writing this we are laying ourselves open to the charge of having abandoned the impartiality of analysis and of subjecting Dostoevsky to judgements that can only be justified from the partisan standpoint of a particular Weltanschaung. A conservative would take the side of the Grand Inquisitor and would judge Dostoevsky differently. The objection is just; and one can only say in extenuation that Dostoevsky's decision has every appearance of having been determined by an intellectual inhibition due to his neurosis. [1928b, 4563]
It must be supposed that after the parricide a considerable time elapsed during which the brothers disputed with one another for their father's heritage, which each of them wanted for himself alone. A realization of the dangers and uselessness of these struggles, a recollection of the act of liberation which they had accomplished together, and the emotional ties with one another which had arisen during the period of their expulsion, led at last to an agreement among them, a sort of social contract. The first form of a social organization came about with a renunciation of instinct, a recognition of mutual obligations, the introduction of definite institutions, pronounced inviolable (holy) - that is to say, the beginnings of morality and justice. Each individual renounced his ideal of acquiring his father's position for himself and of possessing his mother and sisters. Thus the taboo on incest and the injunction to exogamy came about. A fair amount of the absolute power liberated by the removal of the father passed over to the women; there came a period of matriarchy. Recollection of their father persisted at this period of the 'fraternal alliance'. A powerful animal - at first, perhaps, always one that was feared as well - was chosen as a substitute for the father. A choice of this kind may seem strange, but the gulf which men established later between themselves and animals did not exist for primitive peoples; nor does it exist for our children, whose animal phobias we have been able to understand as fear of their father. In relation to the totem animal the original dichotomy in the emotional relation to the father (ambivalence) was wholly retained. On the one hand the totem was regarded as the clan's blood ancestor and protective spirit, who must be worshipped and protected, and on the other hand a festival was appointed at which the same fate was prepared for him that the primal father had met with. He was killed and devoured by all the tribesmen in common. (The totem meal, according to Robertson Smith.) This great festival was in fact a triumphant celebration of the combined sons' victory over their father.

[1939a, 4906]

The re-establishment of the primal father in his historic rights was a great step forward but it could not be the end. The other portions of the prehistoric tragedy insisted on being recognized. It is not easy to discern what set this process in motion. It appears as though a growing sense of guilt had taken hold of the Jewish people, or perhaps of the whole civilized world of the time, as a precursor to the return of the repressed material. Till at last one of these Jewish people found, in justifying a politico-religious agitator, the occasion for detaching a new - the Christian - religion from Judaism. Paul, a Roman Jew from Tarsus, seized upon this sense of guilt and traced it back correctly to its original source. He called this the 'original sin'; it was a crime against God and could only be atoned for by death. With the original sin death came into the world. In fact this crime deserving death had been the murder of the primal father who was later deified. But the murder was not remembered: instead of it there was a phantasy of its atonement, and for that reason this phantasy could be hailed as a message of redemption (evangelium). A son of God had allowed himself to be killed without guilt and had thus taken on himself the guilt of all men. It had to be a son, since it had been the murder of a father. It is probable that traditions from oriental and Greek mysteries had had an influence on the phantasy of redemption. What was essential in it seems to have been Paul's own contribution. In the most proper sense he was a man of an innately religious disposition: the dark traces of the past lurked in his mind, ready to break through into its more conscious regions.

[1939a, 4910]
That the redeemer had sacrificed himself without guilt was evidently a tendentious distortion, which offered difficulties to logical understanding. For how could someone guiltless of the act of murder take on himself the guilt of the murderers by allowing himself to be killed? In the historical reality there was no such contradiction. The 'redeemer' could be none other than the most guilty person, the ringleader of the company of brothers who had overpowered their father. We must in my judgement leave it undecided whether there was such a chief rebel and ringleader. That is possible; but we must also bear in mind that each one of the company of brothers certainly had a wish to commit the deed by himself alone and so to create an exceptional position for himself and to find a substitute for his identification with the father which was having to be given up and which was becoming merged in the community. If there was no such ringleader, then Christ was the heir to a wishful phantasy which remained unfulfilled; if there was one, then he was his successor and his reincarnation. But no matter whether what we have here is a phantasy or the return of a forgotten reality, in any case the origin of the concept of a hero is to be found at this point - the hero who always rebels against his father and kills him in some shape or other.¹ Here too is the true basis for the 'tragic guilt' of the hero of drama, which is otherwise hard to explain. It can scarcely be doubted that the hero and chorus in Greek drama represent the same rebellious hero and company of brothers; and it is not without significance that in the Middle Ages what the theatre started with afresh was the representation of the story of the Passion.

[1939a, 4911]

We have already said that the Christian ceremony of Holy Communion, in which the believer incorporates the Saviour's blood and flesh, repeats the content of the old totem meal - no doubt only in its affectionate meaning, expressive of veneration, and not in its aggressive meaning. The ambivalence that dominates the relation to the father was clearly shown, however, in the final outcome of the religious novelty. Ostensibly aimed at propitiating the father god, it ended in his being dethroned and got rid of. Judaism had been a religion of the father; Christianity became a religion of the son. The old God the Father fell back behind Christ; Christ, the Son, took his place, just as every son had hoped to do in primeval times. Paul, who carried Judaism on, also destroyed it. No doubt he owed his success in the first instance to the fact that, through the idea of the redeemer, he exorcized humanity's sense of guilt; but he owed it as well to the circumstance that he abandoned the 'chosen' character of his people and its visible mark - circumcision - so that the new religion could be a universal one, embracing all men. Though a part may have been played in Paul's taking this step by his personal desire for revenge for the rejection of his innovation in Jewish circles, yet it also restored a feature of the old Aten religion - it removed a restriction which that religion had acquired when it was handed over to a new vehicle, the Jewish people.

[1939a, 4911]
It would be worth while to understand how it was that the monotheist idea made such a deep impression precisely on the Jewish people and that they were able to maintain it so tenaciously. It is possible, I think, to find an answer. Fate had brought the great deed and misdeed of primaeval days, the killing of the father, closer to the Jewish people by causing them to repeat it on the person of Moses, an outstanding father-figure. It was a case of 'acting out' instead of remembering, as happens so often with neurotics during the work of analysis. To the suggestion that they should remember, which was made to them by the doctrine of Moses, they reacted, however, by disavowing their action; they remained halted at the recognition of the great father and thus blocked their access to the point from which Paul was later to start his continuation of the primal history. It is scarcely a matter of indifference or of chance that the violent killing of another great man became the starting-point of Paul's new religious creation as well. This was a man whom a small number of adherents in Judaea regarded as the Son of God and as the Messiah who had been announced, and to whom, too, a part of the childhood story invented for Moses was later carried over, but of whom in fact we know scarcely more with certainty than of Moses - whether he was really the great teacher portrayed by the Gospels or whether, rather, it was not the fact and circumstances of his death which were decisive for the importance which his figure acquired. Paul, who became his apostle, had not known him himself.

[1939a, 4912]

The killing of Moses by his Jewish people, recognized by Sellin from traces of it in tradition (and also, strange to say, accepted by the young Goethe without any evidence¹) thus becomes an indispensable part of our construction, an important link between the forgotten event of primaeval times and its later emergence in the form of the monotheist religions.² It is plausible to conjecture that remorse for the murder of Moses provided the stimulus for the wishful phantasy of the Messiah, who was to return and lead his people to redemption and the promised world-dominion. If Moses was this first Messiah, Christ became his substitute and successor, and Paul could exclaim to the peoples with some historical justification: "Look! the Messiah has really come: he has been murdered before your eyes!" Then, too, there is a piece of historical truth in Christ's resurrection, for he was the resurrected Moses and behind him the returned primal father of the primitive horde, transfigured and, as the son, put in the place of the father.

[1939a, 4913]
The poor Jewish people, who with their habitual stubbornness continued to disavow the father's murder, atoned heavily for it in the course of time. They were constantly met with the reproach 'You killed our God!' And this reproach is true, if it is correctly translated. If it is brought into relation with the history of religions, it runs: 'You will not admit that you murdered God (the primal picture of God, the primal father, and his later reincarnations).' There should be an addition declaring: 'We did the same thing, to be sure, but we have admitted it and since then we have been absolved.' Not all the reproaches with which anti-semitism persecutes the descendants of the Jewish people can appeal to a similar justification. A phenomenon of such intensity and permanence as the people's hatred of the Jews must of course have more than one ground. It is possible to find a whole number of grounds, some of them clearly derived from reality, which call for no interpretation, and others, lying deeper and derived from hidden sources, which might be regarded as the specific reasons. Of the former, the reproach of being aliens is perhaps the weakest, since in many places dominated by anti-semitism to-day the Jews were among the oldest portions of the population or had even been there before the present inhabitants. This applies, for instance, to the city of Cologne, to which the Jews came with the Romans, before it was occupied by the Germans. Other grounds for hating the Jews are stronger - thus, the circumstances that they live for the most part as minorities among other peoples, for the communal feeling of groups requires, in order to complete it, hostility towards some extraneous minority, and the numerical weakness of this excluded minority encourages its suppression. There are, however, two other characteristics of the Jews which are quite unforgivable. First is the fact that in some respects they are different from their 'host' nations. They are not fundamentally different, for they are not Asiatics of a foreign race, as their enemies maintain, but composed for the most part of remnants of the Mediterranean peoples and heirs of the Mediterranean civilization. But they are none the less different, often in an indefinable way different, especially from the Nordic peoples, and the intolerance of groups is often, strangely enough, exhibited more strongly against small differences than against fundamental ones. The other point has a still greater effect: namely, that they defy all oppression, that the most cruel persecutions have not succeeded in exterminating them, and, indeed, that on the contrary they show a capacity for holding their own in commercial life and, where they are admitted, for making valuable contributions to every form of cultural activity.

[1939a, 4913]

After this discussion I have no hesitation in declaring that men have always known (in this special way) that they once possessed a primal father and killed him.

[1939a, 4922]

Two further questions must now be answered. First, under what conditions does a memory of this kind enter the archaic heritage? And, secondly, in what circumstances can it become active - that is, can it advance to consciousness from its unconscious state in the id, even though in an altered and distorted shape? The answer to the first question is easy to formulate: the memory enters the archaic heritage if the event was important enough, or repeated often enough, or both. In the case of parricide both conditions are fulfilled. On the second question there is this to be said. A whole number of influences may be concerned, not all of which are necessarily known. A spontaneous development is also conceivable, on the analogy of what happens in some neuroses. What is certainly of decisive importance, however, is the awakening of the forgotten memory trace by a recent real repetition of the event. The murder of Moses was a repetition of this kind and, later, the supposed judicial murder of Christ: so that these events come into the foreground as causes. It seems as though the genesis of monotheism could not do without these occurrences. We are reminded of the poet's words:

[1939a, 4922]
And lastly a remark which brings up a psychological argument. A tradition that was based only on communication could not lead to the compulsive character that attaches to religious phenomena. It would be listened to, judged, and perhaps dismissed, like any other piece of information from outside; it would never attain the privilege of being liberated from the constraint of logical thought. It must have undergone the fate of being repressed, the condition of lingering in the unconscious, before it is able to display such powerful effects on its return, to bring the masses under its spell, as we have seen with astonishment and hitherto without comprehension in the case of religious tradition. And this consideration weighs heavily in favour of our believing that things really happened in the way we have tried to picture them or at least in some similar way. [1939a, 4923]

Our construction of prehistory forces us to another explanation. The command in favour of exogamy, of which the horror of incest is the negative expression, was a product of the will of the father and carried this will on after he had been removed. Hence come the strength of its emotional tone and the impossibility of finding a rational basis for it - that is, its sacredness. We confidently expect that an investigation of all the other cases of a sacred prohibition would lead to the same conclusion as in that of the horror of incest: that what is sacred was originally nothing other than the prolongation of the will of the primal father. This would also throw light on the hitherto incomprehensible ambivalence of the words which express the concept of sacredness. It is the ambivalence which in general dominates the relation to the father. [The Latin] 'sacer' means not only 'sacred', 'consecrated', but also something that we can only translate as 'infamous', 'detestable' (e.g. 'auri sacra fames'). But the father's will was not only something which one might not touch, which one had to hold in high respect, but also something one trembled before, because it demanded a painful instinctual renunciation. When we hear that Moses made his people holy by introducing the custom of circumcision we now understand the deep meaning of that assertion. Circumcision is the symbolic substitute for the castration which the primal father once inflicted upon his sons in the plenitude of his absolute power, and whoever accepted that symbol was showing by it that he was prepared to submit to the father's will, even if it imposed the most painful sacrifice on him. [1939a, 4940]

In 1912 I attempted, in my Totem and Taboo, to reconstruct the ancient situation from which these consequences followed. In doing so, I made use of some theoretical ideas put forward by Darwin, Atkinson and particularly by Robertson Smith, and combined them with the findings and indications derived from psycho-analysis. From Darwin I borrowed the hypothesis that human beings originally lived in small hordes, each of which was under the despotic rule of an older male who appropriated all the females and castigated or disposed of the younger males, including his sons. From Atkinson I took, in continuation of this account, the idea that this patriarchal system ended in a rebellion by the sons, who banded together against their father, overcame him and devoured him in common. Basing myself on Robertson Smith's totem theory, I assumed that subsequently the father-horde gave place to the totemic brother-clan. In order to be able to live in peace with one another, the victorious brothers renounced the women on whose account they had, after all, killed their father, and instituted exogamy. The power of fathers was broken and the families were organized as a matriarchy. The ambivalent emotional attitude of the sons to their father remained in force during the whole of later development. A particular animal was set up in the father's place as a totem. It was regarded as ancestor and protective spirit and might not be injured or killed. But once a year the whole male community came together to a ceremonial meal at which the totem animal (worshipped at all other times) was torn to pieces and devoured in common. No one might absent himself from this meal: it was the ceremonial repetition of the killing of the father, with which social order, moral laws and religion had taken their start. The conformity between Robertson Smith's totem meal and the Christian Lord's Supper had struck a number of writers before me. [1939a, 4948]
The direction to be taken by this father-religion was in this way laid down for all time. Yet this did not bring its development to an end. Ambivalence is a part of the essence of the relation to the father: in the course of time the hostility too could not fail to stir, which had once driven the sons into killing their admired and dreaded father. There was no place in the framework of the religion of Moses for a direct expression of the murderous hatred of the father. All that could come to light was a mighty reaction against it - a sense of guilt on account of that hostility, a bad conscience for having sinned against God and for not ceasing to sin. This sense of guilt, which was uninterruptedly kept awake by the Prophets, and which soon formed an essential part of the religious system, had yet another superficial motivation, which neatly disguised its true origin. Things were going badly for the people; the hopes resting on the favour of God failed in fulfilment; it was not easy to maintain the illusion, loved above all else, of being God's chosen people. If they wished to avoid renouncing that happiness, a sense of guilt on account of their own sinfulness offered a welcome means of exculpating God: they deserved no better than to be punished by him since they had not obeyed his commandments. And, driven by the need to satisfy this sense of guilt, which was insatiable and came from sources so much deeper, they must make those commandments grow ever stricter, more meticulous and even more trivial. In a fresh rapture of moral asceticism they imposed more and more new instinctual renunciations on themselves and in that way reached - in doctrine and precept, at least - ethical heights which had remained inaccessible to the other peoples of antiquity. Many Jews regard this attainment of ethical heights as the second main characteristic and the second great achievement of their religion. The way in which it was connected with the first one - the idea of a single god - should be plain from our remarks. These ethical ideas cannot, however, disavow their origin from the sense of guilt felt on account of a suppressed hostility to God. They possess the characteristic - uncompleted and incapable of completion - of obsessional neurotic reaction-formations; we can guess, too, that they serve the secret purposes of punishment.
[1939a, 4951]
Robertson Smith explains that sacrifice at the altar was the essential feature in the ritual of ancient religions. It plays the same part in all religions, so that its origin must be traced back to very general causes, operating everywhere in the same manner. Sacrifice - the sacred act *par excellence* (*sacrificium*, ἱερούργία) - originally had a somewhat different meaning, however, from its later one of making an offering to the deity in order to propitiate him or gain his favour. (The non-religious usage of the word followed from this subsidiary sense of 'renunciation'.) It can be shown that, to begin with, sacrifice was nothing other than 'an act of fellowship between the deity and his worshippers'.

[1912-1913, 2773]

Hitherto we have followed the developments of the *affectionate* current of feeling towards the father, transformed into remorse, as we find them in religion and in moral ordinances (which are not sharply distinguished in totemism). But we must not overlook the fact that it was in the main with the impulses that led to parricide that the victory lay. For a long time afterwards, the social fraternal feelings, which were the basis of the whole transformation, continued to exercise a profound influence on the development of society. They found expression in the sanctification of the blood tie, in the emphasis upon the solidarity of all life within the same clan. In thus guaranteeing one another's lives, the brothers were declaring that no one of them must be treated by another as their father was treated by them all jointly. They were precluding the possibility of a repetition of their father's fate. To the religiously-based prohibition against killing the totem was now added the socially-based prohibition against fratricide. It was not until long afterwards that the prohibition ceased to be limited to members of the clan and assumed the simple form: 'Thou shalt do no murder.' The patriarchal horde was replaced in the first instance by the fraternal clan, whose existence was assured by the blood tie. Society was now based on complicity in the common crime; religion was based on the sense of guilt and the remorse attaching to it; while morality was based partly on the exigencies of this society and partly on the penance demanded by the sense of guilt.

[1912-1913, 2786]

Robertson Smith has shown us that the ancient totem meal recurs in the original form of sacrifice. The meaning of the act is the same: sanctification through participation in a common meal. The sense of guilt, which can only be allayed by the solidarity of all the participants, also persists. What is new is the clan deity, in whose supposed presence the sacrifice is performed, who participates in the meal as though he were a clansman, and with whom those who consume the meal become identified. How does the god come to be in a situation to which he was originally a stranger?

[1912-1913, 2787]

It therefore seems plausible to suppose that the god himself was the totem animal, and that he developed out of it at a later stage of religious feeling. But we are relieved from the necessity for further discussion by the consideration that the totem is nothing other than a surrogate of the father. Thus, while the totem may be the *first* form of father-surrogate, the god will be a later one, in which the father has regained his human shape. A new creation such as this, derived from what constitutes the root of every form of religion - a longing for the father - might occur if in the process of time some fundamental change had taken place in man's relation to the father, and perhaps, too, in his relation to animals.

[1912-1913, 2788]
As time went on, the animal lost its sacred character and the sacrifice lost its connection with the totem feast; it became a simple offering to the deity, an act of renunciation in favour of the god. God Himself had become so far exalted above mankind that He could only be approached through an intermediary the priest. At the same time divine kings made their appearance in the social structure and introduced the patriarchal system into the state. It must be confessed that the revenge taken by the deposed and restored father was a harsh one: the dominance of authority was at its climax. The subjugated sons made use of the new situation in order to unburden themselves still further of their sense of guilt. They were no longer in any way responsible for the sacrifice as it now was. It was God Himself who demanded it and regulated it. This is the phase in which we find myths showing the god himself killing the animal which is sacred to him and which is in fact himself. Here we have the most extreme denial of the great crime which was the beginning of society and of the sense of guilt. But there is a second meaning to this last picture of sacrifice which is unmistakable. It expresses satisfaction at the earlier father-surrogate having been abandoned in favour of the superior concept of God. At this point the psycho-analytic interpretation of the scene coincides approximately with the allegorical, surface translation of it, which represents the god as overcoming the animal side of his own nature.¹

Let us assume it to be a fact, then, that in the course of the later development of religions the two driving factors, the son's sense of guilt and the son's rebelliousness, never became extinct. Whatever attempt was made at solving the religious problem, whatever kind of reconciliation was effected between these two opposing mental forces, sooner or later broke down, under the combined influence, no doubt, of historical events, cultural changes and internal psychical modifications.

No one can have failed to observe, in the first place, that I have taken as the basis of my whole position the existence of a collective mind, in which mental processes occur just as they do in the mind of an individual. In particular, I have supposed that the sense of guilt for an action has persisted for many thousands of years and has remained operative in generations which can have had no knowledge of that action. I have supposed that an emotional process, such as might have developed in generations of sons who were ill-treated by their father, has extended to new generations which were exempt from such treatment for the very reason that their father had been eliminated. It must be admitted that these are grave difficulties; and any explanation that could avoid presumptions of such a kind would seem to be preferable.

Another difficulty might actually be brought forward from psycho-analytic quarters. The earliest moral precepts and restrictions in primitive society have been explained by us as reactions to a deed which gave those who performed it the concept of 'crime'. They felt remorse for the deed and decided that it should never be repeated and that its performance should bring no advantage. This creative sense of guilt still persists among us. We find it operating in an asocial manner in neurotics, and producing new moral precepts and persistent restrictions, as an atonement for crimes that have been committed and as a precaution against the committing of new ones.¹ If, however, we inquire among these neurotics to discover what were the deeds which provoked these reactions, we shall be disappointed. We find no deeds, but only impulses and emotions, set upon evil ends but held back from their achievement. What lie behind the sense of guilt of neurotics are always psychological realities and never factual ones. What characterizes neurotics is that they prefer psychical to factual reality and react just as seriously to thoughts as normal people do to realities.
Hence the primaeval history of mankind is filled with murder. Even to-day, the history of the world which our children learn at school is essentially a series of murders of peoples. The obscure sense of guilt to which mankind has been subject since prehistoric times, and which in some religions has been condensed into the doctrine of primal guilt, of original sin, is probably the outcome of a blood-guilt incurred by prehistoric man. In my book *Totem and Taboo* (1912-13) I have, following clues given by Robertson Smith, Atkinson and Charles Darwin, tried to guess the nature of this primal guilt, and I believe, too, that the Christian doctrine of to-day enables us to deduce it. If the Son of God was obliged to sacrifice his life to redeem mankind from original sin, then by the law of talion, the requital of like by like, that sin must have been a killing, a murder. Nothing else could call for the sacrifice of a life for its expiation. And the original sin was an offence against God the Father, the primal crime of mankind must have been a parricide, the killing of the primal father of the primitive human horde, whose mnemonic image was later transfigured into a deity.¹

What came into existence beside the dead body of the loved one was not only the doctrine of the soul, the belief in immortality and a powerful source of man's sense of guilt, but also the earliest ethical commandments. The first and most important prohibition made by the awakening conscience was: 'Thou shalt not kill.' It was acquired in relation to dead people who were loved, as a reaction against the satisfaction of the hatred hidden behind the grief for them; and it was gradually extended to strangers who were not loved, and finally even to enemies. [1915b, 3087]

This missing element was supplied when I became acquainted with W. Robertson Smith's work, *The Religion of the Semites*. Its author (a man of genius who was both a physicist and an expert in biblical researches) introduced the so-called 'totem meal' as an essential part of the totemic religion. Once a year the totem animal, which was at other times regarded as sacred, was solemnly killed in the presence of all the members of the clan, was devoured and was then mourned over. The mourning was followed by a great festival. When I further took into account Darwin's conjecture that men originally lived in hordes, each under the domination of a single powerful, violent and jealous male, there rose before me out of all these components the following hypothesis, or, I would rather say, vision. The father of the primal horde, since he was an unlimited despot, had seized all the women for himself; his sons, being dangerous to him as rivals, had been killed or driven away. One day, however, the sons came together and united to overwhelm, kill, and devour their father, who had been their enemy but also their ideal. After the deed they were unable to take over their heritage since they stood in one another's way. Under the influence of failure and remorse they learned to come to an agreement among themselves; they banded themselves into a clan of brothers by the help of the ordinances of totemism, which aimed at preventing a repetition of such a deed, and they jointly undertook to forgo the possession of the women on whose account they had killed their father. They were then driven to finding strange women, and this was the origin of the exogamy which is so closely bound up with totemism. The totem meal was the festival commemorating the fearful deed from which sprang man's sense of guilt (or 'original sin') and which was the beginning at once of social organization, of religion and of ethical restrictions. [1925d, 4240]
Now whether we suppose that such a possibility was a historical event or not, it brings the formation of religion within the circle of the father-complex and bases it upon the ambivalence which dominates that complex. After the totem animal had ceased to serve as a substitute for him, the primal father, at once feared and hated, revered and envied, became the prototype of God himself. The son's rebelliousness and his affection for his father struggled against each other through a constant succession of compromises, which sought on the one hand to atone for the act of parricide and on the other to consolidate the advantages it had brought. This view of religion throws a particularly clear light upon the psychological basis of Christianity, in which, as we know, the ceremony of the totem meal still survives with but little distortion, in the form of Communion. I should like explicitly to mention that this last observation was not made by me but is to be found in the works of Robertson Smith and Frazer.

[1925d, 4241]

It can also be asserted that when a child reacts to his first great instinctual frustrations with excessively strong aggressiveness and with a correspondingly severe super-ego, he is following a phylogenetic model and is going beyond the response that would be currently justified; for the father of prehistoric times was undoubtedly terrible, and an extreme amount of aggressiveness may be attributed to him. Thus, if one shifts over from individual to phylogenetic development, the differences between the two theories of the genesis of conscience are still further diminished. On the other hand, a new and important difference makes its appearance between these two developmental processes. We cannot get away from the assumption that man's sense of guilt springs from the Oedipus complex and was acquired at the killing of the father by the brothers banded together. On that occasion an act of aggression was not suppressed but carried out; but it was the same act of aggression whose suppression in the child is supposed to be the source of his sense of guilt. At this point I should not be surprised if the reader were to exclaim angrily: 'So it makes no difference whether one kills one's father or not - one gets a feeling of guilt in either case! We may take leave to raise a few doubts here. Either it is not true that the sense of guilt comes from suppressed aggressiveness, or else the whole story of the killing of the father is a fiction and the children of primaeval man did not kill their fathers any more often than children do nowadays. Besides, if it is not fiction but a plausible piece of history, it would be a case of something happening which everyone expects to happen - namely, of a person feeling guilty because he really has done something which cannot be justified. And of this event, which is after all an everyday occurrence, psycho-analysis has not yet given any explanation.'

[1930a, 4521]
But if the human sense of guilt goes back to the killing of the primal father, that was after all a case of 'remorse'. Are we to assume that a conscience and a sense of guilt were not, as we have presupposed, in existence before the deed? If not, where, in this case, did the remorse come from? There is no doubt that this case should explain the secret of the sense of guilt to us and put an end to our difficulties. And I believe it does. This remorse was the result of the primordial ambivalence of feeling towards the father. His sons hated him, but they loved him, too. After their hatred had been satisfied by their act of aggression, their love came to the fore in their remorse for the deed. It set up the super-ego by identification with the father; it gave that agency the father's power, as though as a punishment for the deed of aggression they had carried out against him, and it created the restrictions which were intended to prevent a repetition of the deed. And since the inclination to aggressiveness against the father was repeated in the following generations, the sense of guilt, too, persisted, and it was reinforced once more by every piece of aggressiveness that was suppressed and carried over to the super-ego. Now, I think, we can at last grasp two things perfectly clearly: the part played by love in the origin of conscience and the fatal inevitability of the sense of guilt. Whether one has killed one's father or has abstained from doing so is not really the decisive thing. One is bound to feel guilty in either case, for the sense of guilt is an expression of the conflict due to ambivalence, of the eternal struggle between Eros and the instinct of destruction or death. This conflict is set going as soon as men are faced with the task of living together. So long as the community assumes no other form than that of the family, the conflict is bound to express itself in the Oedipus complex, to establish the conscience and to create the first sense of guilt. When an attempt is made to widen the community, the same conflict is continued in forms which are dependent on the past; and it is strengthened and results in a further intensification of the sense of guilt. Since civilization obeys an internal erotic impulsion which causes human beings to unite in a closely-knit group, it can only achieve this aim through an ever-increasing reinforcement of the sense of guilt. What began in relation to the father is completed in relation to the group. If civilization is a necessary course of development from the family to humanity as a whole, then - as a result of the inborn conflict arising from ambivalence, of the eternal struggle between the trends of love and death - there is inextricably bound up with it an increase of the sense of guilt, which will perhaps reach heights that the individual finds hard to tolerate. One is reminded of the great poet's moving arraignment of the 'Heavenly Powers':-

[1930a, 4522]
In the first place, I suspect that the reader has the impression that our discussions on the sense of guilt disrupt the framework of this essay: that they take up too much space, so that the rest of its subject-matter, with which they are not always closely connected, is pushed to one side. This may have spoilt the structure of my paper; but it corresponds faithfully to my intention to represent the sense of guilt as the most important problem in the development of civilization and to show that the price we pay for our advance in civilization is a loss of happiness through the heightening of the sense of guilt.¹ Anything that still sounds strange about this statement, which is the final conclusion of our investigation, can probably be traced to the quite peculiar relationship - as yet completely unexplained - which the sense of guilt has to our consciousness. In the common case of remorse, which we regard as normal, this feeling makes itself clearly enough perceptible to consciousness. Indeed, we are accustomed to speak of a 'consciousness of guilt' instead of a 'sense of guilt'. Our study of the neuroses, to which, after all we owe the most valuable pointers to an understanding of normal conditions, brings us up against some contradictions. In one of those affections, obsessional neurosis, the sense of guilt makes itself noisily heard in consciousness; it dominates the clinical picture and the patient's life as well, and it hardly allows anything else to appear alongside of it. But in most other cases and forms of neurosis it remains completely unconscious, without on that account producing any less important effects. Our patients do not believe us when we attribute an 'unconscious sense of guilt' to them. In order to make ourselves at all intelligible to them, we tell them of an unconscious need for punishment, in which the sense of guilt finds expression. But its connection with a particular form of neurosis must not be over-estimated. Even in obsessional neurosis there are types of patients who are not aware of their sense of guilt, or who only feel it as a tormenting uneasiness, a kind of anxiety, if they are prevented from carrying out certain actions. It ought to be possible eventually to understand these things; but as yet we cannot. Here perhaps we may be glad to have it pointed out that the sense of guilt is at bottom nothing else but a topographical variety of anxiety; in its later phases it coincides completely with fear of the super-ego. And the relations of anxiety to consciousness exhibit the same extraordinary variations. Anxiety is always present somewhere or other behind every symptom; but at one time it takes noisy possession of the whole of consciousness, while at another it conceals itself so completely that we are obliged to speak of unconscious anxiety or, if we want to have a clearer psychological conscience, since anxiety is in the first instance simply a feeling, of possibilities of anxiety. Consequently it is very conceivable that the sense of guilt produced by civilization is not perceived as such either, and remains to a large extent unconscious, or appears as a sort of malaise, a dissatisfaction, for which people seek other motivations. Religions, at any rate, have never overlooked the part played in civilization by a sense of guilt. Furthermore - a point which I failed to appreciate elsewhere² - they claim to redeem mankind from this sense of guilt, which they call sin. From the manner in which, in Christianity, this redemption is achieved - by the sacrificial death of a single person, who in this manner takes upon himself a guilt that is common to everyone - we have been able to infer what the first occasion may have been on which this primal guilt, which was also the beginning of civilization, was acquired.³

[1930a, 4523]
Nor will it do any harm if we once more review the contradictions which have for a while perplexed us during our enquiry. Thus, at one point the sense of guilt was the consequence of acts of aggression that had been abstained from; but at another point - and precisely at its historical beginning, the killing of the father - it was the consequence of an act of aggression that had been carried out. But a way out of this difficulty was found. For the institution of the internal authority, the super-ego, altered the situation radically. Before this, the sense of guilt coincided with remorse. (We may remark, incidentally, that the term 'remorse' should be reserved for the reaction after an act of aggression has actually been carried out.) After this, owing to the omniscience of the super-ego, the difference between an aggression intended and an aggression carried out lost its force. Henceforward a sense of guilt could be produced not only by an act of violence that is actually carried out (as all the world knows), but also by one that is merely intended (as psycho-analysis has discovered). Irrespective of this alteration in the psychological situation, the conflict arising from ambivalence - the conflict between the two primal instincts - leaves the same result behind. We are tempted to look here for the solution of the problem of the varying relation in which the sense of guilt stands to consciousness. It might be thought that a sense of guilt arising from remorse for an evil deed must always be conscious, whereas a sense of guilt arising from the perception of an evil impulse may remain unconscious. But the answer is not so simple as that. Obsessional neurosis speaks energetically against it.
[1930a, 4525]

Parricide, according to a well-known view, is the principal and primal crime of humanity as well as of the individual. (See my Totem and Taboo 1912-13.) It is in any case the main source of the sense of guilt, though we do not know if it is the only one: researches have not yet been able to establish with certainty the mental origin of guilt and the need for expiation. But it is not necessary for it to be the only one. The psychological situation is complicated and requires elucidation. The relation of a boy to his father is, as we say, an 'ambivalent' one. In addition to the hate which seeks to get rid of the father as a rival, a measure of tenderness for him is also habitually present. The two attitudes of mind combine to produce identification with the father; the boy wants to be in his father's place because he admires him and wants to be like him, and also because he wants to put him out of the way. This whole development now comes up against a powerful obstacle. At a certain moment the child comes to understand that an attempt to remove his father as a rival would be punished by him with castration. So from fear of castration - that is, in the interests of preserving his masculinity - he gives up his wish to possess his mother and get rid of his father. In so far as this wish remains in the unconscious it forms the basis of the sense of guilt. We believe that what we have here been describing are normal processes, the normal fate of the so-called 'Oedipus complex'; nevertheless it requires an important amplification.
[1928b, 4559]
The re-establishment of the primal father in his historic rights was a great step forward but it could not be the end. The other portions of the prehistoric tragedy insisted on being recognized. It is not easy to discern what set this process in motion. It appears as though a growing sense of guilt had taken hold of the Jewish people, or perhaps of the whole civilized world of the time, as a precursor to the return of the repressed material. Till at last one of these Jewish people found, in justifying a politico-religious agitator, the occasion for detaching a new - the Christian - religion from Judaism. Paul, a Roman Jew from Tarsus, seized upon this sense of guilt and traced it back correctly to its original source. He called this the 'original sin'; it was a crime against God and could only be atoned for by death. With the original sin death came into the world. In fact this crime deserving death had been the murder of the primal father who was later deified. But the murder was not remembered: instead of it there was a phantasy of its atonement, and for that reason this phantasy could be hailed as a message of redemption (evangelium). A son of God had allowed himself to be killed without guilt and had thus taken on himself the guilt of all men. It had to be a son, since it had been the murder of a father. It is probable that traditions from oriental and Greek mysteries had had an influence on the phantasy of redemption. What was essential in it seems to have been Paul's own contribution. In the most proper sense he was a man of an innately religious disposition: the dark traces of the past lurked in his mind, ready to break through into its more conscious regions.

[1939a, 4910]

That the redeemer had sacrificed himself without guilt was evidently a tendentious distortion, which offered difficulties to logical understanding. For how could someone guiltless of the act of murder take on himself the guilt of the murderers by allowing himself to be killed? In the historical reality there was no such contradiction. The 'redeemer' could be none other than the most guilty person, the ringleader of the company of brothers who had overpowered their father. We must in my judgement leave it undecided whether there was such a chief rebel and ringleader. That is possible; but we must also bear in mind that each one of the company of brothers certainly had a wish to commit the deed by himself alone and so to create an exceptional position for himself and to find a substitute for his identification with the father which was having to be given up and which was becoming merged in the community. If there was no such ringleader, then Christ was the heir to a wishful phantasy which remained unfulfilled; if there was one, then he was his successor and his reincarnation. But no matter whether what we have here is a phantasy or the return of a forgotten reality, in any case the origin of the concept of a hero is to be found at this point - the hero who always rebels against his father and kills him in some shape or other.¹ Here too is the true basis for the 'tragic guilt' of the hero of drama, which is otherwise hard to explain. It can scarcely be doubted that the hero and chorus in Greek drama represent the same rebellious hero and company of brothers; and it is not without significance that in the Middle Ages what the theatre started with afresh was the representation of the story of the Passion.

[1939a, 4911]
We have already said that the Christian ceremony of Holy Communion, in which the believer incorporates the Saviour's blood and flesh, repeats the content of the old totem meal - no doubt only in its affectionate meaning, expressive of veneration, and not in its aggressive meaning. The ambivalence that dominates the relation to the father was clearly shown, however, in the final outcome of the religious novelty. Ostensibly aimed at propitiating the father god, it ended in his being dethroned and got rid of. Judaism had been a religion of the father; Christianity became a religion of the son. The old God the Father fell back behind Christ; Christ, the Son, took his place, just as every son had hoped to do in primaeval times. Paul, who carried Judaism on, also destroyed it. No doubt he owed his success in the first instance to the fact that, through the idea of the redeemer, he exorcized humanity's sense of guilt; but he owed it as well to the circumstance that he abandoned the 'chosen' character of his people and its visible mark - circumcision - so that the new religion could be a universal one, embracing all men. Though a part may have been played in Paul's taking this step by his personal desire for revenge for the rejection of his innovation in Jewish circles, yet it also restored a feature of the old Aten religion - it removed a restriction which that religion had acquired when it was handed over to a new vehicle, the Jewish people.

[1939a, 4911]

The killing of Moses by his Jewish people, recognized by Sellin from traces of it in tradition (and also, strange to say, accepted by the young Goethe without any evidence¹) thus becomes an indispensable part of our construction, an important link between the forgotten event of primaeval times and its later emergence in the form of the monotheist religions.² It is plausible to conjecture that remorse for the murder of Moses provided the stimulus for the wishful phantasy of the Messiah, who was to return and lead his people to redemption and the promised world-dominion. If Moses was this first Messiah, Christ became his substitute and successor, and Paul could exclaim to the peoples with some historical justification: 'Look! the Messiah has really come: he has been murdered before your eyes!' Then, too, there is a piece of historical truth in Christ's resurrection, for he was the resurrected Moses and behind him the returned primal father of the primitive horde, transfigured and, as the son, put in the place of the father.

[1939a, 4913]
The direction to be taken by this father-religion was in this way laid down for all time. Yet this did not bring its development to an end. Ambivalence is a part of the essence of the relation to the father: in the course of time the hostility too could not fail to stir, which had once driven the sons into killing their admired and dreaded father. There was no place in the framework of the religion of Moses for a direct expression of the murderous hatred of the father. All that could come to light was a mighty reaction against it - a sense of guilt on account of that hostility, a bad conscience for having sinned against God and for not ceasing to sin. This sense of guilt, which was uninterruptedly kept awake by the Prophets, and which soon formed an essential part of the religious system, had yet another superficial motivation, which neatly disguised its true origin. Things were going badly for the people; the hopes resting on the favour of God failed in fulfilment; it was not easy to maintain the illusion, loved above all else, of being God's chosen people. If they wished to avoid renouncing that happiness, a sense of guilt on account of their own sinfulness offered a welcome means of exculpating God: they deserved no better than to be punished by him since they had not obeyed his commandments. And, driven by the need to satisfy this sense of guilt, which was insatiable and came from sources so much deeper, they must make those commandments grow ever stricter, more meticulous and even more trivial. In a fresh rapture of moral asceticism they imposed more and more new instinctual renunciations on themselves and in that way reached - in doctrine and precept, at least - ethical heights which had remained inaccessible to the other peoples of antiquity. Many Jews regard this attainment of ethical heights as the second main characteristic and the second great achievement of their religion. The way in which it was connected with the first one - the idea of a single god - should be plain from our remarks. These ethical ideas cannot, however, disavow their origin from the sense of guilt felt on account of a suppressed hostility to God. They possess the characteristic - uncompleted and incapable of completion - of obsessional neurotic reaction- formations; we can guess, too, that they serve the secret purposes of punishment.

[1939a, 4951]
To-day we find taboos among primitive peoples already elaborated into an intricate system of just the sort that neurotics among ourselves develop in their phobias, and we find old motifs replaced by new ones that fit together harmoniously. Leaving aside these genetic problems, then, we will go back to the idea that primitive man institutes a taboo where he fears some danger. Taking it generally this danger is a psychical one, for primitive man is not impelled at this point to make two distinctions, which to us it seems cannot be disregarded. He does not separate material from psychical danger, nor real from imaginary. In his consistently applied animistic view of the universe, every danger springs from the hostile intention of some being with a soul like himself, and this is as much the case with dangers which threaten him from some natural force as it is with those from other human beings or animals. But on the other hand he is accustomed to project his own internal impulses of hostility on to the external world, to ascribe them, that is, to the objects which he feels to be disagreeable or even merely strange. In this way women also are regarded as being a source of such dangers, and the first act of sexual intercourse with a woman stands out as a danger of particular intensity.

[1918a, 2356]

Thus the first picture which man formed of the world - animism - was a psychological one. It needed no scientific basis as yet, since science only begins after it has been realized that the world is unknown and that means must therefore be sought for getting to know it. Animism came to primitive man naturally and as a matter of course. He knew what things were like in the world, namely just as he felt himself to be. We are thus prepared to find that primitive man transposed the structural conditions of his own mind¹ into the external world; and we may attempt to reverse the process and put back into the human mind what animism teaches as to the nature of things.

[1912-1913, 2734]

The technique of animism, magic, reveals in the clearest and most unmistakable way an intention to impose the laws governing mental life upon real things; in this, spirits need not as yet play any part, though spirits may be taken as objects of magical treatment. Thus the assumptions of magic are more fundamental and older than the doctrine of spirits, which forms the kernel of animism. Our psycho-analytic point of view coincides here with a theory put forward by R. R. Marett (1900), who postulates a pre-animistic stage before animism, the character of which is best indicated by the term 'animatism', the doctrine of the universality of life. Experience has little light to throw on pre-animism, since no race has yet been discovered which is without the concept of spirits. (Cf. Wundt, 1906, 171 ff.)

[1912-1913, 2734]
The answer might be that in the meantime the concept of God had emerged - from some unknown source - and had taken control of the whole of religious life; and that, like everything else that was to survive, the totem meal had been obliged to find a point of contact with the new system. The psycho-analysis of individual human beings, however, teaches us with quite special insistence that the god of each of them is formed in the likeness of his father, that his personal relation to God depends on his relation to his father in the flesh and oscillates and changes along with that relation, and that at bottom God is nothing other than an exalted father. As in the case of totemism, psycho-analysis recommends us to have faith in the believers who call God their father, just as the totem was called the tribal ancestor. If psycho-analysis deserves any attention, then - without prejudice to any other sources or meanings of the concept of God, upon which psycho-analysis can throw no light - the paternal element in that concept must be a most important one. But in that case the father is represented twice over in the situation of primitive sacrifice: once as God and once as the totemic animal victim. And, even granting the restricted number of explanations open to psycho-analysis, one must ask whether this is possible and what sense it can have.

It therefore seems plausible to suppose that the god himself was the totem animal, and that he developed out of it at a later stage of religious feeling. But we are relieved from the necessity for further discussion by the consideration that the totem is nothing other than a surrogate of the father. Thus, while the totem may be the first form of father-surrogate, the god will be a later one, in which the father has regained his human shape. A new creation such as this, derived from what constitutes the root of every form of religion - a longing for the father - might occur if in the process of time some fundamental change had taken place in man's relation to the father, and perhaps, too, in his relation to animals.

Of all the imagos of a childhood which, as a rule, is no longer remembered, none is more important for a youth or a man than that of his father. Organic necessity introduces into a man's relation to his father an emotional ambivalence which we have found most strikingly expressed in the Greek myth of King Oedipus. A little boy is bound to love and admire his father, who seems to him the most powerful, the kindest and the wisest creature in the world. God himself is after all only an exaltation of this picture of a father as he is represented in the mind of early childhood. But soon the other side of this emotional relationship emerges. One's father is recognized as the paramount disturber of one's instinctual life; he becomes a model not only to imitate but also to get rid of, in order to take his place. Thenceforward affectionate and hostile impulses towards him persist side by side, often to the end of one's life, without either of them being able to do away with the other. It is in this existence of contrary feelings side by side that lies the essential character of what we call emotional ambivalence.
It does indeed sound strange that the Devil should be chosen as a substitute for a loved father. But this is only so at first sight, for we know a good many things which lessen our surprise. To begin with, we know that God is a father-substitute; or, more correctly, that he is an exalted father; or, yet again, that he is a copy of a father as he is seen and experienced in childhood - by individuals in their own childhood and by mankind in its prehistory as the father of the primitive and primal horde. Later on in life the individual sees his father as something different and lesser. But the ideational image belonging to his childhood is preserved and becomes merged with the inherited memory-traces of the primal father to form the individual's idea of God. We also know, from the secret life of the individual which analysis uncovers, that his relation to his father was perhaps ambivalent from the outset, or, at any rate, soon became so. That is to say, it contained two sets of emotional impulses that were opposed to each other: it contained not only impulses of an affectionate and submissive nature, but also hostile and defiant ones. It is our view that the same ambivalence governs the relations of mankind to its Deity. The unresolved conflict between, on the one hand, a longing for the father and, on the other, a fear of him and a son's defiance of him, has furnished us with an explanation of important characteristics of religion and decisive vicissitudes in it.

We have here an example of the process, with which we are familiar, by which an idea that has a contradictory - an ambivalent - content becomes divided into two sharply contrasted opposites. The contradictions in the original nature of God are, however, a reflection of the ambivalence which governs the relation of the individual to his personal father. If the benevolent and righteous God is a substitute for his father, it is not to be wondered at that his hostile attitude to his father, too, which is one of hating and fearing him and of making complaints against him, should have come to expression in the creation of Satan. Thus the father, it seems, is the individual prototype of both God and the Devil. But we should expect religions to bear ineffaceable marks of the fact that the primitive primal father was a being of unlimited evil - a being less like God than the Devil.

Now whether we suppose that such a possibility was a historical event or not, it brings the formation of religion within the circle of the father-complex and bases it upon the ambivalence which dominates that complex. After the totem animal had ceased to serve as a substitute for him, the primal father, at once feared and hated, revered and envied, became the prototype of God himself. The son's rebelliousness and his affection for his father struggled against each other through a constant succession of compromises, which sought on the one hand to atone for the act of parricide and on the other to consolidate the advantages it had brought. This view of religion throws a particularly clear light upon the psychological basis of Christianity, in which, as we know, the ceremony of the totem meal still survives with but little distortion, in the form of Communion. I should like explicitly to mention that this last observation was not made by me but is to be found in the works of Robertson Smith and Frazer.

'And now here is yet a third point. You have dealt with the origin of religion once before, in your book Totem and Taboo. But there it appeared in a different light. Everything was the son-father relationship. God was the exalted father, and the longing for the father was the root of the need for religion. Since then, it seems, you have discovered the factor of human weakness and helplessness, to which indeed the chief role in the formation of religion is generally assigned, and now you transpose everything that was once the father complex into terms of helplessness. May I ask you to explain this transformation?'
But here our plea for ascribing purely rational reasons to the precepts of civilization - that is to say, for deriving them from social necessity - is interrupted by a sudden doubt. We have chosen as our example the origin of the prohibition against murder. But does our account of it tally with historical truth? We fear not; it appears to be nothing but a rationalistic construction. With the help of psycho-analysis, we have made a study of precisely this piece of the cultural history of mankind, and, basing ourselves on it, we are bound to say that in reality things happened otherwise. Even in present-day man purely reasonable motives can effect little against passionate impulsions. How much weaker then must they have been in the human animal of primaeval times! Perhaps his descendants would even now kill one another without inhibition, if it were not that among those murderous acts there was one - the killing of the primitive father - which evoked an irresistible emotional reaction with momentous consequences. From it arose the commandment: Thou shalt not kill. Under totemism this commandment was restricted to the father-substitute; but it was later extended to other people, though even to-day it is not universally obeyed.

But, as was shown by arguments which I need not repeat here, the primal father was the original image of God, the model on which later generations have shaped the figure of God. Hence the religious explanation is right, God actually played a part in the genesis of that prohibition; it was His influence, not any insight into social necessity, which created it. And the displacement of man's will on to God is fully justified. For men knew that they had disposed of their father by violence, and in their reaction to that impious deed, they determined to respect his will thenceforward. Thus religious doctrine tells us the historical truth - though subject, it is true, to some modification and disguise - whereas our rational account disavows it.

The re-establishment of the primal father in his historic rights was a great step forward but it could not be the end. The other portions of the prehistoric tragedy insisted on being recognized. It is not easy to discern what set this process in motion. It appears as though a growing sense of guilt had taken hold of the Jewish people, or perhaps of the whole civilized world of the time, as a precursor to the return of the repressed material. Till at last one of these Jewish people found, in justifying a politico-religious agitator, the occasion for detaching a new - the Christian - religion from Judaism. Paul, a Roman Jew from Tarsus, seized upon this sense of guilt and traced it back correctly to its original source. He called this the 'original sin'; it was a crime against God and could only be atoned for by death. With the original sin death came into the world. In fact this crime deserving death had been the murder of the primal father who was later deified. But the murder was not remembered: instead of it there was a phantasy of its atonement, and for that reason this phantasy could be hailed as a message of redemption (evangelium). A son of God had allowed himself to be killed without guilt and had thus taken on himself the guilt of all men. It had to be a son, since it had been the murder of a father. It is probable that traditions from oriental and Greek mysteries had had an influence on the phantasy of redemption. What was essential in it seems to have been Paul's own contribution. In the most proper sense he was a man of an innately religious disposition: the dark traces of the past lurked in his mind, ready to break through into its more conscious regions.
It will be found that the two principal themes from which the title of this little book is derived - totems and taboos - have not received the same treatment. The analysis of taboos is put forward as an assured and exhaustive attempt at the solution of the problem. The investigation of totemism does no more than declare that 'here is what psycho-analysis can at the moment contribute towards elucidating the problem of the totem'. The difference is related to the fact that taboos still exist among us. Though expressed in a negative form and directed towards another subject-matter, they do not differ in their psychological nature from Kant's 'categorical imperative', which operates in a compulsive fashion and rejects any conscious motives. Totemism, on the contrary, is something alien to our contemporary feelings - a religio-social institution which has been long abandoned as an actuality and replaced by newer forms. It has left only the slightest traces behind it in the religions, manners and customs of the civilized peoples of to-day and has been subject to far-reaching modifications even among the races over which it still holds sway. The social and technical advances in human history have affected taboos far less than the totem.

[1912-1913, 2648]

Thus it is an experience of a quite special kind for such an author when a book of his is translated into the Hebrew language and put into the hands of readers for whom that historic idiom is a living tongue: a book, moreover, which deals with the origin of religion and morality, though it adopts no Jewish standpoint and makes no exceptions in favour of Jewry. The author hopes, however, that he will be at one with his readers in the conviction that unprejudiced science cannot remain a stranger to the spirit of the new Jewry.

[1912-1913, 2649]

'The clan totem is revered by a body of men and women who call themselves by the name of the totem, believe themselves to be of one blood, descendants of a common ancestor, and are bound together by common obligations to each other and by a common faith in the totem. Totemism is thus both a religious and a social system. In its religious aspect it consists of the relations of mutual respect and protection between a man and his totem; in its social aspect it consists of the relations of the clansmen to each other and to men of other clans. In the later history of totemism these two sides, the religious and the social, tend to part company; the social system sometimes survives the religious; and, on the other hand, religion sometimes bears traces of totemism in countries where the social system based on totemism has disappeared. How in the origin of totemism these two sides were related to each other it is, in our ignorance of that origin, impossible to say with certainty. But on the whole the evidence points strongly to the conclusion that the two sides were originally inseparable; that, in other words, the farther we go back, the more we should find that the clansman regards himself and his totem as beings of the same species, and the less he distinguishes between conduct towards his totem and towards his fellow-clansmen.'

[1912-1913, 2744]

¹ The picture of totemism given by Frazer in his second work on it ('The Origin of Totemism', published in the *Fortnightly Revue* in 1899) agrees with what I have written above: 'Thus, Totemism has commonly been treated as a primitive system both of religion and of society. As a system of religion it embraces the mystic union of the savage with his totem; as a system of society it comprises the relations in which men and women of the same totem stand to each other and to the members of other totemic groups. And corresponding to these two sides of the system are two rough and ready tests or canons of Totemism: first, the rule that a man may not kill or eat his totem animal or plant; and second, the rule that he may not marry or cohabit with a woman of the same totem.' Frazer then proceeds (thus plunging us into the middle of the controversies on totemism): 'Whether the two sides - the religious and the social - have always co-existed or are essentially independent, is a question which has been variously answered.'

[1912-1913, 2748]
Hitherto we have followed the developments of the affectionate current of feeling towards the father, transformed into remorse, as we find them in religion and in moral ordinances (which are not sharply distinguished in totemism). But we must not overlook the fact that it was in the main with the impulses that led to parricide that the victory lay. For a long time afterwards, the social fraternal feelings, which were the basis of the whole transformation, continued to exercise a profound influence on the development of society. They found expression in the sanctification of the blood tie, in the emphasis upon the solidarity of all life within the same clan. In thus guaranteeing one another's lives, the brothers were declaring that no one of them must be treated by another as their father was treated by them all jointly. They were precluding the possibility of a repetition of their father's fate. To the religiously-based prohibition against killing the totem was now added the socially-based prohibition against fratricide. It was not until long afterwards that the prohibition ceased to be limited to members of the clan and assumed the simple form: 'Thou shalt do no murder.' The patriarchal horde was replaced in the first instance by the fraternal clan, whose existence was assured by the blood tie. Society was now based on complicity in the common crime; religion was based on the sense of guilt and the remorse attaching to it; while morality was based partly on the exigencies of this society and partly on the penance demanded by the sense of guilt.

Signs of the occurrence of changes of this kind may easily be seen, even if we leave on one side the beginning of a mental estrangement from animals and the disrupting of totemism owing to domestication. (See above, p2777 f.) There was one factor in the state of affairs produced by the elimination of the father which was bound in the course of time to cause an enormous increase in the longing felt for him. Each single one of the brothers who had banded together for the purpose of killing their father was inspired by a wish to become like him and had given expression to it by incorporating parts of their father's surrogate in the totem meal. But, in consequence of the pressure exercised upon each participant by the fraternal clan as a whole, that wish could not be fulfilled. For the future no one could or might ever again attain the father's supreme power, even though that was what all of them had striven for. Thus after a long lapse of time their bitterness against their father, which had driven them to their deed, grew less, and their longing for him increased; and it became possible for an ideal to emerge which embodied the unlimited power of the primal father against whom they had once fought as well as their readiness to submit to him. As a result of decisive cultural changes, the original democratic equality that had prevailed among all the individual clansmen became untenable; and there developed at the same time an inclination, based on veneration felt for particular human individuals, to revive the ancient paternal ideal by creating gods. The notion of a man becoming a god or of a god dying strikes us to-day as shockingly presumptuous; but even in classical antiquity there was nothing revolting in it.¹ The elevation of the father who had once been murdered into a god from whom the clan claimed descent was a far more serious attempt at atonement than had been the ancient covenant with the totem.

I cannot suggest at what point in this process of development a place is to be found for the great mother-goddesses, who may perhaps in general have preceded the father-gods. It seems certain, however, that the change in attitude to the father was not restricted to the sphere of religion but that it extended in a consistent manner to that other side of human life which had been affected by the father's removal - to social organization. With the introduction of father-deities a fatherless society gradually changed into one organized on a patriarchal basis. The family was a restoration of the former primal horde and it gave back to fathers a large portion of their former rights. There were once more fathers, but the social achievements of the fraternal clan had not been abandoned; and the gulf between the new fathers of a family and the unrestricted primal father of the horde was wide enough to guarantee the continuance of the religious craving, the persistence of an unappeased longing for the father.
As time went on, the animal lost its sacred character and the sacrifice lost its connection with the totem feast; it became a simple offering to the deity, an act of renunciation in favour of the god. God Himself had become so far exalted above mankind that He could only be approached through an intermediary the priest. At the same time divine kings made their appearance in the social structure and introduced the patriarchal system into the state. It must be confessed that the revenge taken by the deposed and restored father was a harsh one: the dominance of authority was at its climax. The subjugated sons made use of the new situation in order to unburden themselves still further of their sense of guilt. They were no longer in any way responsible for the sacrifice as it now was. It was God Himself who demanded it and regulated it. This is the phase in which we find myths showing the god himself killing the animal which is sacred to him and which is in fact himself. Here we have the most extreme denial of the great crime which was the beginning of society and of the sense of guilt. But there is a second meaning to this last picture of sacrifice which is unmistakable. It expresses satisfaction at the earlier father-surrogate having been abandoned in favour of the superior concept of God. At this point the psycho-analytic interpretation of the scene coincides approximately with the allegorical, surface translation of it, which represents the god as overcoming the animal side of his own nature.¹

At the conclusion, then, of this exceedingly condensed inquiry, I should like to insist that its outcome shows that the beginnings of religion, morals, society and art converge in the Oedipus complex. This is in complete agreement with the psycho-analytic finding that the same complex constitutes the nucleus of all neuroses, so far as our present knowledge goes. It seems to me a most surprising discovery that the problems of social psychology, too, should prove soluble on the basis of one single concrete point - man's relation to his father. It is even possible that yet another psychological problem belongs in this same connection. I have often had occasion to point out that emotional ambivalence in the proper sense of the term - that is, the simultaneous existence of love and hate towards the same object - lies at the root of many important cultural institutions. We know nothing of the origin of this ambivalence. One possible assumption is that it is a fundamental phenomenon of our emotional life. But it seems to me quite worth considering another possibility, namely that originally it formed no part of our emotional life but was acquired by the human race in connection with their father-complex,¹ precisely where the psycho-analytic examination of modern individuals still finds it revealed at its strongest.²

² Since I am used to being misunderstood, I think it worth while to insist explicitly that the derivations which I have proposed in these pages do not in the least overlook the complexity of the phenomena under review. All that they claim is to have added a new factor to the sources, known or still unknown, of religion, morality and society - a factor based on a consideration of the implications of psycho-analysis. I must leave to others the task of synthesizing the explanation into a unity. It does, however, follow from the nature of the new contribution that it could not play any other than a central part in such a synthesis, even though powerful emotional resistance might have to be overcome before its great importance was recognized.

A similar application of its points of view, its hypotheses and its findings has enabled psycho-analysis to throw light on the origins of our great cultural institutions - on religion, morality, justice and philosophy.² By examining the primitive psychological situations which were able to provide the motive for creations of this kind, it has been in a position to reject certain attempts at an explanation that were based on too superficial a psychology and to replace them by a more penetrating insight.
An investigation of primitive peoples shows mankind caught up, to begin with, in a childish belief in its own omnipotence.¹ A whole number of mental structures can thus be understood as attempts to deny whatever might disturb this feeling of omnipotence and so to prevent emotional life from being affected by reality until the latter could be better controlled and used for purposes of satisfaction. The principle of avoiding unpleasure dominates human actions until it is replaced by the better one of adaptation to the external world. *Pari passu* with men's progressive control over the world goes a development in their *Weltanschauung*, their view of the universe as a whole. They turn away more and more from their original belief in their own omnipotence, rising from an animistic phase through a religious to a scientific one. Myths, religion and morality find their place in this scheme as attempts to seek a compensation for the lack of satisfaction of human wishes.

In the four essays with the title *Totem and Taboo* I have made an attempt to deal with the problems of social anthropology in the light of analysis; this line of investigation leads direct to the origins of the most important institutions of our civilization, of the structure of the state, of morality and religion, and, moreover, of the prohibition against incest and of conscience. It is no doubt too early to decide how far the conclusions thus reached will be able to withstand criticism.

Mother-incest was one of the crimes of Oedipus, parricide was the other. It may be remarked in passing that they are also the two great crimes proscribed by totemism, the first socio-religious institution of mankind.

In 1912 I took up a conjecture of Darwin's to the effect that the primitive form of human society was that of a horde ruled over despotically by a powerful male. I attempted to show that the fortunes of this horde have left indestructible traces upon the history of human descent; and, especially, that the development of totemism, which comprises in itself the beginnings of religion, morality, and social organization, is connected with the killing of the chief by violence and the transformation of the paternal horde into a community of brothers.¹ To be sure, this is only a hypothesis, like so many others with which archaeologists endeavour to lighten the darkness of prehistoric times - a 'Just-So Story', as it was amusingly called by a not unkind English critic; but I think it is creditable to such a hypothesis if it proves able to bring coherence and understanding into more and more new regions.
The Non-Medical Applications and Correlations of Psycho-analysis. - Any estimate of psycho-analysis would be incomplete if it failed to make clear that, alone among the medical disciplines, it has the most extensive relations with the mental sciences, and that it is in a position to play a part of the same importance in the studies of religious and cultural history and in the sciences of mythology and literature as it is in psychiatry. This may seem strange when we reflect that originally its only object was the understanding and improvement of neurotic symptoms. But it is easy to indicate the starting-point of the bridge that leads over to the mental sciences. The analysis of dreams gave us an insight into the unconscious processes of the mind and showed us that the mechanisms which produce pathological symptoms are also operative in the normal mind. Thus psychoanalysis became a depth-psychology and capable as such of being applied to the mental sciences, and it was able to answer a good number of questions with which the academic psychology of consciousness was helpless to deal. At quite an early stage problems of human phylogenesis arose. It became clear that pathological function was often nothing more than a regression to an earlier stage in the development of normal function. C. G. Jung was the first to draw explicit attention to the striking similarity between the disordered phantasies of sufferers from dementia praecox and the myths of primitive peoples; while the present writer pointed out that the two wishes which combine to form the Oedipus complex coincide precisely with the two principal prohibitions imposed by totemism (not to kill the tribal ancestor and not to marry any woman belonging to one's own clan) and drew far-reaching conclusions from this fact. The significance of the Oedipus complex began to grow to gigantic proportions and it looked as though social order, morals, justice and religion had arisen together in the primaeval ages of mankind as reaction-formations against the Oedipus complex. Otto Rank threw a brilliant light upon mythology and the history of literature by the application of psycho-analytic views, as did Theodor Reik upon the history of morals and religions, while Dr. Pfister, of Zurich, aroused the interest of religious and secular teachers and demonstrated the importance of the psycho-analytic standpoint for education. Further discussion of these applications of psycho-analysis would be out of place here, and it is enough to say that the limits of their influence are not yet in sight.

By its theory of the instincts psycho-analysis offended the feelings of individuals in so far as they regarded themselves as members of the social community; another branch of its theory was calculated to hurt every single person at the tenderest point of his own psychical development. Psycho-analysis disposed once and for all of the fairy tale of an asexual childhood. It demonstrated the fact that sexual interests and activities occur in small children from the beginning of their lives. It showed what transformations those activities pass through, how at about the age of five they succumb to inhibition and how from puberty onwards they enter the service of the reproductive function. It recognized that early infantile sexual life reaches its peak in what is known as the Oedipus complex (an emotional attachment of the child to the parent of the opposite sex accompanied by an attitude of rivalry to the parent of the same sex) and that at that period of life this impulsion extends uninhibited into a straightforward sexual desire. This can be confirmed so easily that only the greatest efforts could make it possible to overlook it. Every individual has in fact gone through this phase but has afterwards energetically repressed its purport and succeeded in forgetting it. A horror of incest and an enormous sense of guilt are left over from this prehistoric epoch of the individual's existence. It may be that something quite similar occurred in the prehistoric epoch of the human species as a whole and that the beginnings of morality, religion and social order were intimately connected with the surmounting of that primaeval era. To adults their prehistory seems so inglorious that they refuse to allow themselves to be reminded of it: they were infuriated when psycho-analysis tried to lift the veil of amnesia from their years of childhood. There was only one way out: what psycho-analysis asserted must be false and what posed as a new science must be a tissue of fancies and distortions.
I myself set a higher value on my contributions to the psychology of religion, which began with the establishment of a remarkable similarity between obsessive actions and religious practices or ritual (1907b). Without as yet understanding the deeper connections, I described the obsessional neurosis as a distorted private religion and religion as a kind of universal obsessional neurosis. Later on, in 1912, Jung's forcible indication of the far-reaching analogies between the mental products of neurotics and of primitive peoples led me to turn my attention to that subject. In four essays, which were collected into a book with the title of Totem and Taboo, I showed that the horror of incest was even more marked among primitive than among civilized races and had given rise to very special measures of defence against it. I examined the relations between taboo-prohibitions (the earliest form in which moral restrictions make their appearance) and emotional ambivalence; and I discovered under the primitive scheme of the universe known as 'animism' the principle of the over-estimation of the importance of psychical reality - the belief in 'the omnipotence of thoughts' - which lies at the root of magic as well. I developed the comparison with the obsessional neurosis at every point, and showed how many of the postulates of primitive mental life are still in force in that remarkable illness. Above all, however, I was attracted by totemism, the first system of organization in primitive tribes, a system in which the beginnings of social order are united with a rudimentary religion and the implacable domination of a small number of taboo-prohibitions. The being that is revered is ultimately always an animal, from which the clan also claims to be descended. Many indications pointed to the conclusion that every race, even the most highly developed, had once passed through the stage of totemism. [1925d, 4239]

This missing element was supplied when I became acquainted with W. Robertson Smith's work, The Religion of the Semites. Its author (a man of genius who was both a physicist and an expert in biblical researches) introduced the so-called 'totem meal' as an essential part of the totemic religion. Once a year the totem animal, which was at other times regarded as sacred, was solemnly killed in the presence of all the members of the clan, was devoured and was then mourned over. The mourning was followed by a great festival. When I further took into account Darwin's conjecture that men originally lived in hordes, each under the domination of a single powerful, violent and jealous male, there rose before me out of all these components the following hypothesis, or, I would rather say, vision. The father of the primal horde, since he was an unlimited despot, had seized all the women for himself; his sons, being dangerous to him as rivals, had been killed or driven away. One day, however, the sons came together and united to overwhelm, kill, and devour their father, who had been their enemy but also their ideal. After the deed they were unable to take over their heritage since they stood in one another's way. Under the influence of failure and remorse they learned to come to an agreement among themselves; they banded themselves into a clan of brothers by the help of the ordinances of totemism, which aimed at preventing a repetition of such a deed, and they jointly undertook to forgo the possession of the women on whose account they had killed their father. They were then driven to finding strange women, and this was the origin of the exogamy which is so closely bound up with totemism. The totem meal was the festival commemorating the fearful deed from which sprang man's sense of guilt (or 'original sin') and which was the beginning at once of social organization, of religion and of ethical restrictions. [1925d, 4240]
With pleasure. I was only waiting for this invitation. But is it really a transformation? In *Totem and Taboo* it was not my purpose to explain the origin of religions but only of totemism. Can you, from any of the views known to you, explain the fact that the first shape in which the protecting deity revealed itself to men should have been that of an animal, that there was a prohibition against killing and eating this animal and that nevertheless the solemn custom was to kill and eat it communally once a year? This is precisely what happens in totemism. And it is hardly to the purpose to argue about whether totemism ought to be called a religion. It has intimate connections with the later god-religions. The totem animals become the sacred animals of the gods; and the earliest, but most fundamental moral restrictions - the prohibitions against murder and incest - originate in totemism. Whether or not you accept the conclusions of *Totem and Taboo*, I hope you will admit that a number of very remarkable, disconnected facts are brought together in it into a consistent whole.

[1927c, 4435]

After primal man had discovered that it lay in his own hands, literally, to improve his lot on earth by working, it cannot have been a matter of indifference to him whether another man worked with or against him. The other man acquired the value for him of a fellow-worker, with whom it was useful to live together. Even earlier, in his ape-like prehistory, man had adopted the habit of forming families, and the members of his family were probably his first helpers. One may suppose that the founding of families was connected with the fact that a moment came when the need for genital satisfaction no longer made its appearance like a guest who drops in suddenly, and, after his departure, is heard of no more for a long time, but instead took up its quarters as a permanent lodger. When this happened, the male acquired a motive for keeping the female, or, speaking more generally, his sexual objects, near him; while the female, who did not want to be separated from her helpless young, was obliged, in their interests, to remain with the stronger male.¹ In this primitive family one essential feature of civilization is still lacking. The arbitrary will of its head, the father, was unrestricted. In *Totem and Taboo* I have tried to show how the way led from this family to the succeeding stage of communal life in the form of bands of brothers. In overpowering their father, the sons had made the discovery that a combination can be stronger than a single individual. The totemic culture is based on the restrictions which the sons had to impose on one another in order to keep this new state of affairs in being. The taboo-observances were the first 'right' or 'law. The communal life of human beings had, therefore, a two-fold foundation: the compulsion to work, which was created by external necessity, and the power of love, which made the man unwilling to be deprived of his sexual object - the woman -, and made the woman unwilling to be deprived of the part of herself which had been separated off from her - her child. Eros and Ananke have become the parents of human civilization too. The first result of civilization was that even a fairly large number of people were now able to live together in a community. And since these two great powers were co-operating in this, one might expect that the further development of civilization would proceed smoothly towards an even better control over the external world and towards a further extension of the number of people included in the community. Nor is it easy to understand how this civilization could act upon its participants otherwise than to make them happy.

[1930a, 4495]

It would be well worth knowing what brought about the transition from animism to religion, but you may imagine the obscurity which to-day still veils these primaeval ages of the evolution of the human spirit. It appears to be a fact that the first form assumed by religion was the remarkable phenomenon of totemism, the worship of animals, in whose train the first ethical commandments, the taboos, made their appearance. In a volume called *Totem and Taboo*, I once elaborated a notion which traced this transformation back to a revolution in the circumstances of the human family. The main achievement of religion as compared with animism lies in the psychical binding of the fear of demons. Nevertheless a vestige of this primaeval age, the Evil Spirit, has kept a place in the religious system.

[1933a, 4764]
It must be supposed that after the parricide a considerable time elapsed during which the brothers disputed with one another for their father's heritage, which each of them wanted for himself alone. A realization of the dangers and uselessness of these struggles, a recollection of the act of liberation which they had accomplished together, and the emotional ties with one another which had arisen during the period of their expulsion, led at last to an agreement among them, a sort of social contract. The first form of a social organization came about with a renunciation of instinct, a recognition of mutual obligations, the introduction of definite institutions, pronounced inviolable (holy) - that is to say, the beginnings of morality and justice. Each individual renounced his ideal of acquiring his father's position for himself and of possessing his mother and sisters. Thus the taboo on incest and the injunction to exogamy came about. A fair amount of the absolute power liberated by the removal of the father passed over to the women; there came a period of matriarchy. Recollection of their father persisted at this period of the 'fraternal alliance'. A powerful animal - at first, perhaps, always one that was feared as well - was chosen as a substitute for the father. A choice of this kind may seem strange, but the gulf which men established later between themselves and animals did not exist for primitive peoples; nor does it exist for our children, whose animal phobias we have been able to understand as fear of their father. In relation to the totem animal the original dichotomy in the emotional relation to the father (ambivalence) was wholly retained. On the one hand the totem was regarded as the clan's blood ancestor and protective spirit, who must be worshipped and protected, and on the other hand a festival was appointed at which the same fate was prepared for him that the primal father had met with. He was killed and devoured by all the tribesmen in common. (The totem meal, according to Robertson Smith.) This great festival was in fact a triumphant celebration of the combined sons' victory over their father.

What is the place of religion in this connection? I think we are completely justified in regarding totemism, with its worship of a father-substitute, with its ambivalence as shown by the totem meal, with its institution of memorial festivals and of prohibitions whose infringement was punished by death - we are justified, I say, in regarding totemism as the first form in which religion was manifested in human history and in confirming the fact of its having been linked from the first with social regulations and moral obligations. Here we can only give the most summary survey of the further developments of religion. They no doubt proceeded in parallel with the cultural advances of the human race and with the changes in the structure of human communities.

This is the place, however, for an interpolation, in order to avoid a misunderstanding. Even though it may seem that instinctual renunciation and the ethics founded on it do not form part of the essential content of religion, yet genetically they are most intimately connected with it. Totemism, which is the earliest form of a religion which we recognize, carries with it, as indispensable constituents of its system, a number of commands and prohibitions which have no other significance, of course, than as instinctual renunciations: the worship of the totem, which includes a prohibition against injuring or killing it, exogamy - that is, renunciation of the passionately desired mothers and sisters in the horde - the granting of equal rights to all the members of the fraternal alliance - that is, restricting the inclination to violent rivalry among them. In these regulations are to be seen the first beginnings of a moral and social order. It does not escape us that two different motives are at work here. The first two prohibitions operate on the side of the father who has been got rid of: they carry on his will, as it were. The third command - the granting of equal rights to the allied brothers - disregards the father's will; it is justified by an appeal to the necessity for permanently maintaining the new order which succeeded the father's removal. Otherwise a relapse into the earlier state would have become inevitable. It is here that social commands diverge from the others which, as we might say, are derived directly from religious connections.
Going back to ethics, we may say in conclusion that a part of its precepts are justified rationally by the necessity for delimiting the rights of society as against the individual, the rights of the individual as against society and those of individuals as against one another. But what seems to us so grandiose about ethics, so mysterious and, in a mystical fashion, so self-evident, owes these characteristics to its connection with religion, its origin from the will of the father.

[1939a, 4940]

In 1912 I attempted, in my *Totem and Taboo*, to reconstruct the ancient situation from which these consequences followed. In doing so, I made use of some theoretical ideas put forward by Darwin, Atkinson and particularly by Robertson Smith, and combined them with the findings and indications derived from psycho-analysis. From Darwin I borrowed the hypothesis that human beings originally lived in small hordes, each of which was under the despotic rule of an older male who appropriated all the females and castigated or disposed of the younger males, including his sons. From Atkinson I took, in continuation of this account, the idea that this patriarchal system ended in a rebellion by the sons, who banded together against their father, overcame him and devoured him in common. Basing myself on Robertson Smith's totem theory, I assumed that subsequently the father-horde gave place to the totemic brother-clan. In order to be able to live in peace with one another, the victorious brothers renounced the women on whose account they had, after all, killed their father, and instituted exogamy. The power of fathers was broken and the families were organized as a matriarchy. The ambivalent emotional attitude of the sons to their father remained in force during the whole of later development. A particular animal was set up in the father's place as a totem. It was regarded as ancestor and protective spirit and might not be injured or killed. But once a year the whole male community came together to a ceremonial meal at which the totem animal (worshipped at all other times) was torn to pieces and devoured in common. No one might absent himself from this meal: it was the ceremonial repetition of the killing of the father, with which social order, moral laws and religion had taken their start. The conformity between Robertson Smith's totem meal and the Christian Lord's Supper had struck a number of writers before me.

[1939a, 4948]
It will be found that the two principal themes from which the title of this little book is derived - totems and taboos - have not received the same treatment. The analysis of taboos is put forward as an assured and exhaustive attempt at the solution of the problem. The investigation of totemism does no more than declare that 'here is what psycho-analysis can at the moment contribute towards elucidating the problem of the totem'. The difference is related to the fact that taboos still exist among us. Though expressed in a negative form and directed towards another subject-matter, they do not differ in their psychological nature from Kant's 'categorical imperative', which operates in a compulsive fashion and rejects any conscious motives.

Totemism, on the contrary, is something alien to our contemporary feelings - a religio-social institution which has been long abandoned as an actuality and replaced by newer forms. It has left only the slightest traces behind it in the religions, manners and customs of the civilized peoples of to-day and has been subject to far-reaching modifications even among the races over which it still holds sway. The social and technical advances in human history have affected taboos far less than the totem.

Thus it is an experience of a quite special kind for such an author when a book of his is translated into the Hebrew language and put into the hands of readers for whom that historic idiom is a living tongue: a book, moreover, which deals with the origin of religion and morality, though it adopts no Jewish standpoint and makes no exceptions in favour of Jewry. The author hopes, however, that he will be at one with his readers in the conviction that unprejudiced science cannot remain a stranger to the spirit of the new Jewry.

'The clan totem is reverenced by a body of men and women who call themselves by the name of the totem, believe themselves to be of one blood, descendants of a common ancestor, and are bound together by common obligations to each other and by a common faith in the totem. Totemism is thus both a religious and a social system. In its religious aspect it consists of the relations of mutual respect and protection between a man and his totem; in its social aspect it consists of the relations of the clansmen to each other and to men of other clans. In the later history of totemism these two sides, the religious and the social, tend to part company; the social system sometimes survives the religious; and, on the other hand, religion sometimes bears traces of totemism in countries where the social system based on totemism has disappeared. How in the origin of totemism these two sides were related to each other it is, in our ignorance of that origin, impossible to say with certainty. But on the whole the evidence points strongly to the conclusion that the two sides were originally inseparable; that, in other words, the farther we go back, the more we should find that the clansman regards himself and his totem as beings of the same species, and the less he distinguishes between conduct towards his totem and towards his fellow-clansmen.'

In giving particulars of totemism as a religious system, Frazer begins by stating that the members of a totem clan call themselves by the name of their totem, and commonly believe themselves to be actually descended from it. It follows from this belief that they will not hunt the totem animal or kill or eat it and, if it is something other than an animal, they refrain from making use of it in other ways. The rules against killing or eating the totem are not the only taboos; sometimes they are forbidden to touch it, or even to look at it; in a number of cases the totem may not be spoken of by its proper name. Any violation of the taboos that protect the totem are automatically punished by severe illness or death.
<197>

¹ The picture of totemism given by Frazer in his second work on it ('The Origin of Totemism', published in the *Fortnightly Revue* in 1899) agrees with what I have written above: 'Thus, Totemism has commonly been treated as a primitive system both of religion and of society. As a system of religion it embraces the mystic union of the savage with his totem; as a system of society it comprises the relations in which men and women of the same totem stand to each other and to the members of other totemic groups. And corresponding to these two sides of the system are two rough and ready tests or canons of Totemism: first, the rule that a man may not kill or eat his totem animal or plant; and second, the rule that he may not marry or cohabit with a woman of the same totem.' Frazer then proceeds (thus plunging us into the middle of the controversies on totemism): 'Whether the two sides - the religious and the social - have always co-existed or are essentially independent, is a question which has been variously answered.'

[1912-1913, 2748]

On the other hand, the claim of totemism to be regarded as a first attempt at a religion is based on the first of these two taboos - that upon taking the life of the totem animal. The animal struck the sons as a natural and obvious substitute for their father; but the treatment of it which they found imposed on themselves expressed more than the need to exhibit their remorse. They could attempt, in their relation to this surrogate father, to allay their burning sense of guilt, to bring about a kind of reconciliation with their father. The totemic system was, as it were, a covenant with their father, in which he promised them everything that a childish imagination may expect from a father - protection, care and indulgence - while on their side they undertook to respect his life, that is to say, not to repeat the deed which had brought destruction on their real father. Totemism, moreover, contained an attempt at self-justification: 'If our father had treated us in the way the totem does, we should never have felt tempted to kill him.' In this fashion totemism helped to smooth things over and to make it possible to forget the event to which it owed its origin.

[1912-1913, 2784]

Features were thus brought into existence which continued thenceforward to have a determining influence on the nature of religion. Totemic religion arose from the filial sense of guilt, in an attempt to allay that feeling and to appease the father by deferred obedience to him. All later religions are seen to be attempts at solving the same problem. They vary according to the stage of civilization at which they arise and according to the methods which they adopt; but all have the same end in view and are reactions to the same great event with which civilization began and which, since it occurred, has not allowed mankind a moment's rest.

[1912-1913, 2785]

In 1912 I took up a conjecture of Darwin's to the effect that the primitive form of human society was that of a horde ruled over despotically by a powerful male. I attempted to show that the fortunes of this horde have left indestructible traces upon the history of human descent; and, especially, that the development of totemism, which comprises in itself the beginnings of religion, morality, and social organization, is connected with the killing of the chief by violence and the transformation of the paternal horde into a community of brothers.¹ To be sure, this is only a hypothesis, like so many others with which archaeologists endeavour to lighten the darkness of prehistoric times - a 'Just-So Story', as it was amusingly called by a not unkind English critic; but I think it is creditable to such a hypothesis if it proves able to bring coherence and understanding into more and more new regions.

[1921c, 3814]
The chief literary sources of my studies in this field were the well-known works of J. G. Frazer (Totemism and Exogamy and The Golden Bough), a mine of valuable facts and opinions. But Frazer effected little towards elucidating the problems of totemism; he had several times fundamentally altered his views on the subject, and the other ethnologists and prehistorians seemed in equal uncertainty and disagreement. My starting-point was the striking correspondence between the two taboo-ordinances of totemism (not to kill the totem and not to have sexual relations with any woman of the same totem-clan) and the two elements of the Oedipus complex (getting rid of the father and taking the mother to wife). I was therefore tempted to equate the totem-animal with the father; and in fact primitive peoples themselves do this explicitly, by honouring it as the forefather of the clan. There next came to my help two facts from psycho-analysis, a lucky observation of a child made by Ferenczi, which enabled me to speak of an 'infantile return of totemism', and the analysis of early animal-phobias in children, which so often showed that the animal was a substitute for the father, a substitute on to which the fear of the father derived from the Oedipus complex had been displaced. Not much was lacking to enable me to recognize the killing of the father as the nucleus of totemism and the starting-point in the formation of religion.

This missing element was supplied when I became acquainted with W. Robertson Smith's work, The Religion of the Semites. Its author (a man of genius who was both a physicist and an expert in biblical researches) introduced the so-called 'totem meal' as an essential part of the totemic religion. Once a year the totem animal, which was at other times regarded as sacred, was solemnly killed in the presence of all the members of the clan, was devoured and was then mourned over. The mourning was followed by a great festival. When I further took into account Darwin's conjecture that men originally lived in hordes, each under the domination of a single powerful, violent and jealous male, there rose before me out of all these components the following hypothesis, or, I would rather say, vision. The father of the primal horde, since he was an unlimited despot, had seized all the women for himself; his sons, being dangerous to him as rivals, had been killed or driven away. One day, however, the sons came together and united to overwhelm, kill, and devour their father, who had been their enemy but also their ideal. After the deed they were unable to take over their heritage since they stood in one another's way. Under the influence of failure and remorse they learned to come to an agreement among themselves; they banded themselves into a clan of brothers by the help of the ordinances of totemism, which aimed at preventing a repetition of such a deed, and they jointly undertook to forgo the possession of the women on whose account they had killed their father. They were then driven to finding strange women, and this was the origin of the exogamy which is so closely bound up with totemism. The totem meal was the festival commemorating the fearful deed from which sprang man's sense of guilt (or 'original sin') and which was the beginning at once of social organization, of religion and of ethical restrictions.

Now whether we suppose that such a possibility was a historical event or not, it brings the formation of religion within the circle of the father-complex and bases it upon the ambivalence which dominates that complex. After the totem animal had ceased to serve as a substitute for him, the primal father, at once feared and hated, revered and envied, became the prototype of God himself. The son's rebelliousness and his affection for his father struggled against each other through a constant succession of compromises, which sought on the one hand to atone for the act of parricide and on the other to consolidate the advantages it had brought. This view of religion throws a particularly clear light upon the psychological basis of Christianity, in which, as we know, the ceremony of the totem meal still survives with but little distortion, in the form of Communion. I should like explicitly to mention that this last observation was not made by me but is to be found in the works of Robertson Smith and Frazer.
With pleasure. I was only waiting for this invitation. But is it really a transformation? In *Totem and Taboo* it was not my purpose to explain the origin of religions but only of totemism. Can you, from any of the views known to you, explain the fact that the first shape in which the protecting deity revealed itself to men should have been that of an animal, that there was a prohibition against killing and eating this animal and that nevertheless the solemn custom was to kill and eat it communally once a year? This is precisely what happens in totemism. And it is hardly to the purpose to argue about whether totemism ought to be called a religion. It has intimate connections with the later god-religions. The totem animals become the sacred animals of the gods; and the earliest, but most fundamental moral restrictions - the prohibitions against murder and incest - originate in totemism. Whether or not you accept the conclusions of *Totem and Taboo*, I hope you will admit that a number of very remarkable, disconnected facts are brought together in it into a consistent whole.

[1927c, 4435]

The question of why in the long run the animal god did not suffice, and was replaced by a human one, was hardly touched on in *Totem and Taboo*, and other problems concerning the formation of religion were not mentioned in the book at all. Do you regard a limitation of that kind as the same thing as a denial? My work is a good example of the strict isolation of the particular contribution which psycho-analytic discussion can make to the solution of the problem of religion. If I am now trying to add the other, less deeply concealed part, you should not accuse me of contradicting myself, just as before you accused me of being one-sided. It is, of course, my duty to point out the connecting links between what I said earlier and what I put forward now, between the deeper and the manifest motives, between the father-complex and man's helplessness and need for protection.

[1927c, 4435]

It would be well worth knowing what brought about the transition from animism to religion, but you may imagine the obscurity which to-day still veils these primaeval ages of the evolution of the human spirit. It appears to be a fact that the first form assumed by religion was the remarkable phenomenon of totemism, the worship of animals, in whose train the first ethical commandments, the taboos, made their appearance. In a volume called *Totem and Taboo*, I once elaborated a notion which traced this transformation back to a revolution in the circumstances of the human family. The main achievement of religion as compared with animism lies in the psychical binding of the fear of demons. Nevertheless a vestige of this primaeval age, the Evil Spirit, has kept a place in the religious system.

[1933a, 4764]

What is the place of religion in this connection? I think we are completely justified in regarding totemism, with its worship of a father-substitute, with its ambivalence as shown by the totem meal, with its institution of memorial festivals and of prohibitions whose infringement was punished by death - we are justified, I say, in regarding totemism as the first form in which religion was manifested in human history and in confirming the fact of its having been linked from the first with social regulations and moral obligations. Here we can only give the most summary survey of the further developments of religion. They no doubt proceeded in parallel with the cultural advances of the human race and with the changes in the structure of human communities.

[1939a, 4907]
The first step away from totemism was the humanizing of the being who was worshipped. In place of the animals, human gods appear, whose derivation from the totem is not concealed. The god is still represented either in the form of an animal or at least with an animal's face, or the totem becomes the god's favourite companion, inseparable from him, or legend tells us that the god slew this precise animal, which was after all only a preliminary stage of himself. At a point in this evolution which is not easily determined great mother-goddesses appeared, probably even before the male gods, and afterwards persisted for a long time beside them. In the meantime a great social revolution had occurred. Matriarchy was succeeded by the re-establishment of a patriarchal order. The new fathers, it is true, never achieved the omnipotence of the primal father; there were many of them, who lived together in associations larger than the horde had been. They were obliged to be on good terms with one another, and remained under the limitation of social ordinances. It is likely that the mother-goddesses originated at the time of the curtailment of the matriarchy, as a compensation for the slight upon the mothers. The male deities appear first as sons beside the great mothers and only later clearly assume the features of father-figures. These male gods of polytheism reflect the conditions during the patriarchal age. They are numerous, mutually restrictive, and are occasionally subordinated to a superior high god. The next step, however, leads us to the theme with which we are here concerned - to the return of a single father-god of unlimited dominion.

[1939a, 4907]

No other portion of the history of religion has become so clear to us as the introduction of monotheism into Judaism and its continuation in Christianity - if we leave on one side the development which we can trace no less uninterruptedly, from the animal totem to the human god with his regular companions. (Each of the four Christian evangelists still has his own favourite animal.) If we provisionally accept the world-empire of the Pharaohs as the determining cause of the emergence of the monotheist idea, we see that that idea, released from its native soil and transferred to another people was, after a long period of latency, taken hold of by them, preserved by them as a precious possession and, in turn, itself kept them alive by giving them pride in being a chosen people: it was the religion of their primal father to which were attached their hope of reward, of distinction and finally of world-dominion. This last wishful phantasy, long abandoned by the Jewish people, still survives among that people's enemies in a belief in a conspiracy by the 'Elders of Zion'. We reserve for discussion in later pages how the special peculiarities of the monotheist religion borrowed from Egypt affected the Jewish people and how it was bound to leave a permanent imprint on their character through its rejection of magic and mysticism, its invitation to advances in intellectuality and its encouragement of sublimations; how the people, enraptured by the possession of the truth, overwhelmed by the consciousness of being chosen, came to have a high opinion of what is intellectual and to lay stress on what is moral, and how their melancholy destinies and their disappointments in reality served only to intensify all these trends. For the moment we will follow their development in another direction.

[1939a, 4909]
We have already said that the Christian ceremony of Holy Communion, in which the believer incorporates the Saviour's blood and flesh, repeats the content of the old totem meal - no doubt only in its affectionate meaning, expressive of veneration, and not in its aggressive meaning. The ambivalence that dominates the relation to the father was clearly shown, however, in the final outcome of the religious novelty. Ostensibly aimed at propitiating the father god, it ended in his being dethroned and got rid of. Judaism had been a religion of the father; Christianity became a religion of the son. The old God the Father fell back behind Christ; Christ, the Son, took his place, just as every son had hoped to do in primaeval times. Paul, who carried Judaism on, also destroyed it. No doubt he owed his success in the first instance to the fact that, through the idea of the redeemer, he exorcized humanity's sense of guilt; but he owed it as well to the circumstance that he abandoned the 'chosen' character of his people and its visible mark - circumcision - so that the new religion could be a universal one, embracing all men. Though a part may have been played in Paul's taking this step by his personal desire for revenge for the rejection of his innovation in Jewish circles, yet it also restored a feature of the old Aten religion - it removed a restriction which that religion had acquired when it was handed over to a new vehicle, the Jewish people.

[1939a, 4911]

The return of the repressed took place slowly and certainly not spontaneously but under the influence of all the changes in conditions of life which fill the history of human civilization. I cannot give a survey here of these determinants nor more than a fragmentary enumeration of the stages of this return. The father once more became the head of the family, but was not by any means so absolute as the father of the primal horde had been. The totem animal was replaced by a god in a series of transitions which are still very plain. To begin with, the god in human form still bore an animal's head; later he turned himself by preference into that particular animal, and afterwards it became sacred to him and was his favourite attendant; or he killed the animal and himself bore its name as an epithet. Between the totem animal and the god, the hero emerged, often as a preliminary step towards deification. The idea of a supreme deity seems to have started early, at first only in a shadowy manner without intruding into men's daily interests. As tribes and peoples came together into larger unities, the gods too organized themselves into families and into hierarchies. One of them was often elevated into being supreme lord over gods and men. After this, the further step was hesitatingly taken of paying respect to only one god, and finally the decision was taken of giving all power to a single god and of tolerating no other gods beside him. Only thus was it that the supremacy of the father of the primal horde was re-established and that the emotions relating to him could be repeated.

[1939a, 4950]
A progressive renunciation of constitutional instincts, whose activation might afford the ego primary pleasure, appears to be one of the foundations of the development of human civilization. Some part of this instinctual repression is effected by its religions, in that they require the individual to sacrifice his instinctual pleasure to the Deity: ‘Vengeance is mine, saith the Lord.’ In the development of the ancient religions one seems to discern that many things which man kind had renounced as ‘iniquities’ had been surrendered to the Deity and were still permitted in his name, so that the handing over to him of bad and socially harmful instincts was the means by which man freed himself from their domination. For this reason, it is surely no accident that all the attributes of man, along with the misdeeds that follow from them, were to an unlimited amount ascribed to the ancient gods. Nor is it a contradiction of this that nevertheless man was not permitted to justify his own iniquities by appealing to divine example. [1907b, 1909]

People will not reach a proper understanding of the activities of children’s sexuality and will probably take refuge in declaring that what has been said here is incredible, so long as they cling to the attitude taken up by our civilization of depreciating the genitals and the sexual functions. To understand the mental life of children we require analogies from primitive times. Through a long series of generations the genitals have been for us the ‘pudenda’, objects of shame, and even (as a result of further successful sexual repression) of disgust. If one makes a broad survey of the sexual life of our time and in particular of the classes who sustain human civilization, one is tempted to declare that it is only with reluctance that the majority of those alive to-day obey the command to propagate their kind; they feel that their dignity as human beings suffers and is degraded in the process. What is to be found among us in the way of another view of sexual life is confined to the uncultivated lower strata of society; among the higher and more refined classes it is concealed, since it is considered culturally inferior, and it ventures to put itself into practice only in the face of a bad conscience. In the primeval days of the human race it was a different story. The laborious compilations of the student of civilization provide convincing evidence that originally the genitals were the pride and hope of living beings; they were worshipped as gods and transmitted the divine nature of their functions to all newly learned human activities. As a result of the sublimation of their basic nature there arose innumerable divinities; and at the time when the connection between official religions and sexual activity was already hidden from the general consciousness, secret cults devoted themselves to keeping it alive among a number of initiates. In the course of cultural development so much of the divine and sacred was ultimately extracted from sexuality that the exhausted remnant fell into contempt. But in view of the indelibility that is characteristic of all mental traces, it is surely not surprising that even the most primitive forms of genital-worship can be shown to have existed in very recent times and that the language, customs and superstitions of mankind to-day contain survivals from every phase of this process of development.² [1910c, 2271]
Impressive analogies from biology have prepared us to find that the individual's mental development repeats the course of human development in an abbreviated form; and the conclusions which psycho-analytic research into the child's mind has reached concerning the high value set on the genitals in infancy will not therefore strike us as improbable. The child's assumption that his mother has a penis is thus the common source from which are derived the androgynously-formed mother goddesses such as the Egyptian Mut and the vultures' 'coda' in Leonardo's childhood phantasy. It is in fact only due to a misunderstanding that we describe these representations of gods as hermaphrodite in the medical sense of the word. In none of them is there a combination of the true genitals of both sexes - a combination which, to the abhorrence of all beholders, is found in some cases of malformation; all that has happened is that the male organ has been added to the breasts which are the mark of a mother, just as it was present in the child's first idea of his mother's body. This form of the mother's body, the revered creation of primaeval phantasy, has been preserved for the faithful by mythology. We can now provide the following translation of the emphasis given to the vulture's tail in Leonardo's phantasy: 'That was a time when my fond curiosity was directed to my mother, and when I still believed she had a genital organ like my own.' Here is more evidence of Leonardo's early sexual researches, which in our opinion had a decisive effect on the whole of his later life.

Such a father as this was by no means unsuitable for transfiguration into a God in the affectionate memory of the son from whom he had been so early separated by death. It is true that we cannot help feeling that there is an impassable gulf between the personality of God and that of any human being, however eminent he may be. But we must remember that this has not always been so. The gods of the peoples of antiquity stood in a closer human relationship to them. The Romans used to deify their dead emperors as a matter of routine; and the Emperor Vespasian, a sensible and competent man, exclaimed when he was first taken ill: 'Alas! Methinks I am becoming a God!'²

To find the starting-point for the psycho-analytic view of religious life we must go a step further. What is to-day the heritage of the individual was once a new acquisition and has been handed on from one to another of a long series of generations. Thus the Oedipus complex too may have had stages of development, and the study of prehistory may enable us to trace them out. Investigation suggests that life in the human family took a quite different form in those remote days from that with which we are now familiar. And this idea is supported by findings based on observations of contemporary primitive races. If the prehistoric and ethnological material on this subject is worked over psycho-analytically, we arrive at an unexpectedly precise result: namely that God the Father once walked upon earth in bodily form and exercised his sovereignty as chieftain of the primal human horde until his sons united to slay him. It emerges further that this crime of liberation and the reactions to it had as their result the appearance of the first social ties, the basic moral restrictions and the oldest form of religion, totemism. But the later religions too have the same content, and on the one hand they are concerned with obliterating the traces of that crime or with expiating it by bringing forward other solutions of the struggle between the father and sons, while on the other hand they cannot avoid repeating once more the elimination of the father. Incidentally, an echo of this monstrous event, which overshadowed the whole course of human development, is also to be found in myths.

[1910c, 2272]

[1911c, 2423]

[1919g, 3705]
Whether the one or the other of these two views seems to us to throw more light on the question, the discussion of bewilderment and enlightenment brings us closer to a particular discovery. For if the comic effect of Heine’s ‘famillionairely’ depends on the solution of the apparently meaningless word, the ‘joke’ must no doubt be ascribed to the formation of that word and to the characteristics of the word thus formed.

Another peculiarity of jokes, quite unrelated to what we have just been considering, is recognized by all the authorities as essential to them. ‘Brevity is the body and the soul of wit, it is its very self,’ says Jean Paul (1804, Part II, Paragraph 42), merely modifying what the old chatterbox Polonius says in Shakespeare’s *Hamlet* (II, 2):

In this connection the account given by Lipps (1898, 90) of the brevity of jokes is significant: ‘A joke says what it has to say, not always in few words, but in too few words – that is, in words that are insufficient by strict logic or by common modes of thought and speech. It may even actually say what it has to say by not saying it.’

We have already learnt from the connection of jokes with caricature that they ‘must bring forward something that is concealed or hidden’ (Fischer, 1889, 51). I lay stress on this determinant once more, because it too has more to do with the nature of jokes than with their being part of the comic.
At this second stage of development, the conscience exhibits a peculiarity which was absent from the first stage and which is no longer easy to account for. For the more virtuous a man is, the more severe and distrustful is its behaviour, so that ultimately it is precisely those people who have carried saintliness furthest who reproach themselves with the worst sinfulness. This means that virtue forfeits some part of its promised reward; the docile and continent ego does not enjoy the trust of its mentor, and strives in vain, it would seem, to acquire it. The objection will at once be made that these difficulties are artificial ones, and it will be said that a stricter and more vigilant conscience is precisely the hallmark of a moral man. Moreover, when saints call themselves sinners, they are not so wrong, considering the temptations to instinctual satisfaction to which they are exposed in a specially high degree - since, as is well known, temptations are merely increased by constant frustration, whereas an occasional satisfaction of them causes them to diminish, at least for the time being. The field of ethics, which is so full of problems, presents us with another fact: namely that ill-luck - that is, external frustration - so greatly enhances the power of the conscience in the super-ego. As long as things to well with a man, his conscience is lenient and lets the ego do all sorts of things; but when misfortune befalls him, he searches his soul, acknowledges his sinfulness, heightens the demands of his conscience, imposes abstinences on himself and punished himself with penances.¹ Whole peoples have behaved in this way, and still do. This, however, is easily explained by the original infantile stage of conscience, which, as we see, is not given up after the introjection into the super-ego, but persists alongside of it and behind it. Fate is regarded as a substitute for the parental agency. If a man is unfortunate it means that he is no longer loved by this highest power; and, threatened by such a loss of love, he once more bows to the parental representative in his super-ego - a representative whom, in his days of good fortune, he was ready to neglect. This becomes especially clear where Fate is looked upon in the strictly religious sense of being nothing else than an expression of the Divine Will. The people of Israel had believed themselves to be the favourite child of God, and when the great Father caused misfortune after misfortune to rain down upon this people of his, they were never shaken in their belief in his relationship to them or questioned his power or righteousness. Instead, they produced the prophets, who held up their sinfulness before them; and out of their sense of guilt they created the over-strict commandments of their priestly religion. It is remarkable how differently a primitive man behaves. If he has met with a misfortune, he does not throw the blame on himself but on his fetish, which has obviously not done its duty, and he gives it a thrashing instead of punishing himself.

[1930a, 4516]

And although practical Marxism has mercilessly cleared away all idealistic systems and illusions, it has itself developed illusions which are no less questionable and unprovable than the earlier ones. It hopes in the course of a few generations so to alter human nature that people will live together almost without friction in the new order of society, and that they will undertake the duties of work without any compulsion. Meanwhile it shifts elsewhere the instinctual restrictions which are essential in society; it diverts the aggressive tendencies which threaten all human communities to the outside and finds support in the hostility of the poor against the rich and of the hitherto powerless against the former rulers. But a transformation of human nature such as this is highly improbable. The enthusiasm with which the mass of the people follow the Bolshevist instigation at present, so long as the new order is incomplete and is threatened from outside, gives no certainty for a future in which it would be fully built up and in no danger. In just the same way as religion, Bolshevism too must compensate its believers for the sufferings and deprivations of their present life by promises of a better future in which there will no longer be any unsatisfied need. This Paradise, however, is to be in this life, instituted on earth and thrown open within a foreseeable time. But we must remember that the Jews as well, whose religion knows nothing of an after-life, expected the arrival of a Messiah on earth, and that the Christian Middle Ages at many times believed that the Kingdom of God was at hand.

[1933a, 4776]
We must not expect the mythical structures of religion to pay too much attention to logical coherence. Otherwise popular feeling might have taken justified offence against a deity who made a covenant with their forefathers with mutual obligations and then, for centuries on end, paid no attention to his human partners, till it suddenly occurred to him to manifest himself anew to their descendants. Even more puzzling is the notion of a god's all at once 'choosing' a people, declaring them to be his people and himself to be their god. I believe this is the only instance of its sort in the history of human religions. Ordinarily god and people are indissolubly linked, they are one from the very beginning of things. No doubt we sometimes hear of a people taking on a different god, but never of a god seeking a different people. We may perhaps understand this unique event better if we recall the relations between Moses and the Jewish people. Moses had stooped to the Jews, had made them his people: they were his 'chosen people'.¹

[1939a, 4874]

No other portion of the history of religion has become so clear to us as the introduction of monotheism into Judaism and its continuation in Christianity - if we leave on one side the development which we can trace no less uninterruptedly, from the animal totem to the human god with his regular companions. (Each of the four Christian evangelists still has his own favourite animal.) If we provisionally accept the world-empire of the Pharaohs as the determining cause of the emergence of the monotheist idea, we see that that idea, released from its native soil and transferred to another people was, after a long period of latency, taken hold of by them, preserved by them as a precious possession and, in turn, itself kept them alive by giving them pride in being a chosen people: it was the religion of their primal father to which were attached their hope of reward, of distinction and finally of world-dominion. This last wishful phantasy, long abandoned by the Jewish people, still survives among that people's enemies in a belief in a conspiracy by the 'Elders of Zion'. We reserve for discussion in later pages how the special peculiarities of the monotheist religion borrowed from Egypt affected the Jewish people and how it was bound to leave a permanent imprint on their character through its rejection of magic and mysticism, its invitation to advances in intellectuality and its encouragement of sublimations; how the people, enraptured by the possession of the truth, overwhelmed by the consciousness of being chosen, came to have a high opinion of what is intellectual and to lay stress on what is moral; and how their melancholy destinies and their disappointments in reality served only to intensify all these trends. For the moment we will follow their development in another direction.

[1939a, 4909]

We have already said that the Christian ceremony of Holy Communion, in which the believer incorporates the Saviour's blood and flesh, repeats the content of the old totem meal - no doubt only in its affectionate meaning, expressive of veneration, and not in its aggressive meaning. The ambivalence that dominates the relation to the father was clearly shown, however, in the final outcome of the religious novelty. Ostensibly aimed at propitiating the father god, it ended in his being dethroned and got rid of. Judaism had been a religion of the father; Christianity became a religion of the son. The old God the Father fell back behind Christ; Christ, the Son, took his place, just as every son had hoped to do in primaeval times. Paul, who carried Judaism on, also destroyed it. No doubt he owed his success in the first instance to the fact that, through the idea of the redeemer, he exorcized humanity's sense of guilt; but he owed it as well to the circumstance that he abandoned the 'chosen' character of his people and its visible mark - circumcision - so that the new religion could be a universal one, embracing all men. Though a part may have been played in Paul's taking this step by his personal desire for revenge for the rejection of his innovation in Jewish circles, yet it also restored a feature of the old Aten religion - it removed a restriction which that religion had acquired when it was handed over to a new vehicle, the Jewish people.

[1939a, 4911]
In some respects the new religion meant a cultural regression as compared with the older, Jewish one, as regularly happens when a new mass of people, of a lower level, break their way in or are given admission. The Christian religion did not maintain the high level in things of the mind to which Judaism had soared. It was no longer strictly monotheist, it took over numerous symbolic rituals from surrounding peoples, it re-established the great mother-goddess and found room to introduce many of the divine figures of polytheism only lightly veiled, though in subordinate positions. Above all, it did not, like the Aten religion and the Mosaic one which followed it, exclude the entry of superstitious, magical and mystical elements, which were to prove a severe inhibition upon the intellectual development of the next two thousand years.

[1939a, 4912]

It may encourage us to enquire whether the religion of Moses brought the people nothing else besides an enhancement of their self-esteem owing to their consciousness of having been chosen. And indeed another factor can easily be found. That religion also brought the Jews a far grander conception of God, or, as we might put it more modestly, the conception of a grander God. Anyone who believed in this God had some kind of share in his greatness, might feel exalted himself. For an unbeliever this is not entirely self-evident; but we may perhaps make it easier to understand if we point to the sense of superiority felt by a Briton in a foreign country which has been made insecure owing to an insurrection - a feeling that is completely absent in a citizen of any small continental state. For the Briton counts on the fact that his Government will send along a warship if a hair of his head is hurt, and that the rebels understand that very well - whereas the small state possesses no warship at all. Thus, pride in the greatness of the British Empire has a root as well in the consciousness of the greater security - the protection - enjoyed by the individual Briton. This may resemble the conception of a grand God. And, since one can scarcely claim to assist God in the administration of the world, the pride in God's greatness fuses with the pride in being chosen by him.

[1939a, 4933]

Among the precepts of the Moses religion there is one that is of greater importance than appears to begin with. This is the prohibition against making an image of God - the compulsion to worship a God whom one cannot see. In this, I suspect, Moses was outdoing the strictness of the Aten religion. Perhaps he merely wanted to be consistent: his God would in that case have neither a name nor a countenance. Perhaps it was a fresh measure against magical abuses. But if this prohibition were accepted, it must have a profound effect. For it meant that a sensory perception was given second place to what may be called an abstract idea - a triumph of intellectuality over sensuality or, strictly speaking, an instinctual renunciation, with all its necessary psychological consequences.

[1939a, 4933]

This much is generally known and accepted. All I have wanted to do is to add that this characteristic development of the Jewish nature was introduced by the Mosaic prohibition against worshipping God in a visible form.

[1939a, 4935]
These are certainly not very fruitful considerations, and it might be thought that they have nothing at all to do with our enquiry as to what has determined the character of the Jewish people. That would only be to our advantage; but a certain connection with our problem is betrayed nevertheless by a fact which will concern us still more later on. The religion which began with the prohibition against making an image of God develops more and more in the course of centuries into a religion of instinctual renunciations. It is not that it would demand sexual abstinence; it is content with a marked restriction of sexual freedom. God, however, becomes entirely removed from sexuality and elevated into the ideal of ethical perfection. But ethics is a limitation of instinct. The Prophets are never tired of asseverating that God requires nothing other from his people than a just and virtuous conduct of life - that is, abstention from every instinctual satisfaction which is still condemned as vicious by our morality to-day as well. And even the demand for belief in him seems to take a second place in comparison with the seriousness of these ethical requirements. In this way instinctual renunciation seems to play a prominent part in the religion, even if it did not stand out in it from the first.

[1939a, 4938]
And thus a store of ideas is created, born from man's need to make his helplessness tolerable and built up from the material of memories of the helplessness of his own childhood and the childhood of the human race. It can clearly be seen that the possession of these ideas protects him in two directions - against the dangers of nature and Fate, and against the injuries that threaten him from human society itself. Here is the gist of the matter. Life in this world serves a higher purpose; no doubt it is not easy to guess what that purpose is, but it certainly signifies a perfecting of man's nature. It is probably the spiritual part of man, the soul, which in the course of time has so slowly and unwillingly detached itself from the body, that is the object of this elevation and exaltation. Everything that happens in this world is an expression of the intentions of an intelligence superior to us, which in the end, though its ways and byways are difficult to follow, orders everything for the best - that is, to make it enjoyable for us. Over each one of us there watches a benevolent Providence which is only seemingly stern and which will not suffer us to become a plaything of the overmighty and pitiless forces of nature. Death itself is not extinction, is not a return to inorganic lifelessness, but the beginning of a new kind of existence which lies on the path of development to something higher. And, looking in the other direction, this view announces that the same moral laws which our civilizations have set up govern the whole universe as well, except that they are maintained by a supreme court of justice with incomparably more power and consistency. In the end all good is rewarded and all evil punished, if not actually in this form of life then in the later existences that begin after death. In this way all the terrors, the sufferings and the hardships of life are destined to be obliterated. Life after death, which continues life on earth just as the invisible part of the spectrum joins on to the visible part, brings us all the perfection that we may perhaps have missed here. And the superior wisdom which directs this course of things, the infinite goodness that expresses itself in it, the justice that achieves its aim in it - these are the attributes of the divine beings who also created us and the world as a whole, or rather, of the one divine being into which, in our civilization, all the gods of antiquity have been condensed. The people which first succeeded in thus concentrating the divine attributes was not a little proud of the advance. It had laid open to view the father who had all along been hidden behind every divine figure as its nucleus. Fundamentally this was a return to the historical beginnings of the idea of God. Now that God was a single person, man's relations to him could recover the intimacy and intensity of the child's relation to his father. But if one had done so much for one's father, one wanted to have a reward, or at least to be his only beloved child, his Chosen People. Very much later, pious America laid claim to being 'God's own Country'; and, as regards one of the shapes in which men worship the deity, the claim is undoubtedly valid.

It is time to raise the question of whether there is any need whatever to call in the influence of Moses as a cause of the final form taken by the Jewish idea of God, or whether it would not be enough to assume a spontaneous development to higher intellectuality during a cultural life extending over hundreds of years. There are two things to be said about this possible explanation which would put an end to all our puzzling conjectures. First, that it explains nothing. In the case of the Greeks - unquestionably a most highly gifted people - the same conditions did not lead to monotheism but to a disintegration of their polytheist religion and to the beginning of philosophical thought. In Egypt, so far as we can understand, monotheism grew up as a by-product of imperialism: God was a reflection of the Pharaoh who was the absolute ruler of a great world empire. With the Jews, political conditions were highly unfavourable for the development from the idea of an exclusive national god to that of a universal ruler of the world. And where did this tiny and powerless nation find the arrogance to declare itself the favourite child of the great Lord? The problem of the origin of monotheism among the Jews would thus remain unsolved, or we should have to be content with the common answer that it is the expression of the peculiar religious genius of that people. Genius is well known to be incomprehensible and irresponsible, and we ought therefore not to bring it up as an explanation till every other solution has failed us.¹

[1927c, 4431]

[1939a, 4891]
In addition to this, we come upon the fact that Jewish records and historical writings themselves point us the way, by asserting most definitely - this time without contradicting themselves - that the idea of a single god was brought to the people by Moses. If there is an objection to the trustworthiness of this assurance, it is that the priestly revision of the text we have before us obviously traces far too much back to Moses. Institutions such as the ritual ordinances, which date unmistakably from later times, are given out as Mosaic commandments with the plain intention of lending them authority. This certainly gives us ground for suspicion, but not enough for a rejection. For the deeper motive for an exaggeration of this kind is obvious. The priestly narrative seeks to establish continuity between its contemporary period and the remote Mosaic past; it seeks to disavow precisely what we have described as the most striking fact about Jewish religious history, namely that there is a yawning gap between the law-giving of Moses and the later Jewish religion - a gap which was at first filled by the worship of Yahweh, and was only slowly patched up afterwards. It disputes this course of events by every possible means, though its historical correctness is established beyond any doubt, since, in the particular treatment given to the Biblical text, superabundant evidence has been left to prove it. Here the priestly revision has attempted something similar to the tendentious distortion which made the new god Yahweh into the god of the Patriarchs. If we take this motive of the Priestly Code into account, we shall find it hard to withhold our belief from the assertion that Moses really did himself give the monotheist idea to the Jews. We should be all the readier to give our assent since we can say where Moses derived this idea from, which the Jewish priests certainly knew no longer.

And here someone might ask what we gain by tracing Jewish to Egyptian monotheism. It merely pushes the problem a little way further back: it tells us nothing more of the genesis of the monotheist idea. The answer is that the question is not one of gain but of investigation. Perhaps we may learn something from it if we discover the real course of events.

We confess the belief, therefore, that the idea of a single god, as well as the rejection of magically effective ceremonial and the stress upon ethical demands made in his name, were in fact Mosaic doctrines, to which no attention was paid to begin with, but which, after a long interval had elapsed, came into operation and eventually became permanently established. How are we to explain a delayed effect of this kind and where do we meet with a similar phenomenon? It occurs to us at once that such things are not infrequently to be found in the most various spheres and that they probably come about in a number of ways which are understandable with greater or less ease. Let us take, for instance, the history of a new scientific theory, such as Darwin's theory of evolution. At first it met with embittered rejection and was violently disputed for decades; but it took no longer than a generation for it to be recognized as a great step forward towards truth. Darwin himself achieved the honour of a grave or cenotaph in Westminster Abbey. A case such as that leaves us little to unravel. The new truth awoke emotional resistances; these found expression in arguments by which the evidence in favour of the unpopular theory could be disputed; the struggle of opinions took up a certain length of time; from the first there were adherents and opponents; the number as well as the weight of the former kept on increasing till at last they gained the upper hand; during the whole time of the struggle the subject with which it was concerned was never forgotten. We are scarcely surprised that the whole course of events took a considerable length of time; and we probably do not sufficiently appreciate that what we are concerned with is a process in group psychology.
Two further questions must now be answered. First, under what conditions does a memory of this kind enter the archaic heritage? And, secondly, in what circumstances can it become active - that is, can it advance to consciousness from its unconscious state in the id, even though in an altered and distorted shape? The answer to the first question is easy to formulate: the memory enters the archaic heritage if the event was important enough, or repeated often enough, or both. In the case of parricide both conditions are fulfilled. On the second question there is this to be said. A whole number of influences may be concerned, not all of which are necessarily known. A spontaneous development is also conceivable, on the analogy of what happens in some neuroses. What is certainly of decisive importance, however, is the awakening of the forgotten memory trace by a recent real repetition of the event. The murder of Moses was a repetition of this kind and, later, the supposed judicial murder of Christ: so that these events come into the foreground as causes. It seems as though the genesis of monotheism could not do without these occurrences. We are reminded of the poet's words:

[1939a, 4922]

We cannot follow the chain of events further, but if we have rightly recognized these first steps, the monotheist idea returned like a boomerang to the land of its origin. Thus it seems unfruitful to try to fix the credit due to an individual in connection with a new idea. It is clear that many have shared in its development and made contributions to it. And, again, it would obviously be unjust to break off the chain of causes at Moses and to neglect what was effected by those who succeeded him and carried on his ideas, the Jewish Prophets. The seed of monotheism failed to ripen in Egypt. The same thing might have happened in Israel after the people had thrown off the burdensome and exacting religion. But there constantly arose from the Jewish people men who revived the fading tradition, who renewed the admonitions and demands made by Moses, and who did not rest till what was lost had been established once again. In the course of constant efforts over centuries, and finally owing to two great reforms, one before and one after the Babylonian exile, the transformation was accomplished of the popular god Yahweh into the God whose worship had been forced upon the Jews by Moses. And evidence of the presence of a peculiar psychical aptitude in the masses who had become the Jewish people is revealed by the fact that they were able to produce so many individuals prepared to take on the burdens of the religion of Moses in return for the reward of being the chosen people and perhaps for some other prizes of a similar degree.

[1939a, 4932]
The direction to be taken by this father-religion was in this way laid down for all time. Yet this
did not bring its development to an end. Ambivalence is a part of the essence of the relation to
the father: in the course of time the hostility too could not fail to stir, which had once driven the
sons into killing their admired and dreaded father. There was no place in the framework of the
religion of Moses for a direct expression of the murderous hatred of the father. All that could
come to light was a mighty reaction against it - a sense of guilt on account of that hostility, a bad
conscience for having sinned against God and for not ceasing to sin. This sense of guilt, which
was uninterruptedly kept awake by the Prophets, and which soon formed an essential part of
the religious system, had yet another superficial motivation, which neatly disguised its true
origin. Things were going badly for the people; the hopes resting on the favour of God failed in
fulfilment; it was not easy to maintain the illusion, loved above all else, of being God's chosen
people. If they wished to avoid renouncing that happiness, a sense of guilt on account of their
own sinfulness offered a welcome means of exculpating God: they deserved no better than to
be punished by him since they had not obeyed his commandments. And, driven by the need to
satisfy this sense of guilt, which was insatiable and came from sources so much deeper, they
must make those commandments grow ever stricter, more meticulous and even more trivial. In
a fresh rapture of moral asceticism they imposed more and more new instinctual renunciations
on themselves and in that way reached - in doctrine and precept, at least - ethical heights which
had remained inaccessible to the other peoples of antiquity. Many Jews regard this attainment
of ethical heights as the second main characteristic and the second great achievement of their
religion. The way in which it was connected with the first one - the idea of a single god - should
be plain from our remarks. These ethical ideas cannot, however, disavow their origin from the
sense of guilt felt on account of a suppressed hostility to God. They possess the characteristic-
uncompleted and incapable of completion - of obsessional neurotic reaction-formations; we can
guess, too, that they serve the secret purposes of punishment.
[1939a, 4951]
This first difficulty is promptly followed by another. We must not forget that Moses was not only the political leader of the Jews settled in Egypt but was also their law-giver and educator and forced them into the service of a new religion, which to this very day is known after him as the Mosaic one. But is it so easy for one single man to create a new religion? And if anyone wishes to influence another person's religion, would he not most naturally convert him to his own? The Jewish people in Egypt were certainly not without a religion of some form or other; and if Moses, who gave them a new one, was an Egyptian, the presumption cannot be put aside that this other new religion was the Egyptian one.

[1939a, 4849]

There is something that stands in the way of this possibility: the fact of there being the most violent contrast between the Jewish religion which is attributed to Moses and the religion of Egypt. The former is a rigid monotheism on the grand scale: there is only one God, he is the sole God, omnipotent, unapproachable; his aspect is more than human eyes can tolerate, no image must be made of him, even his name may not be spoken. In the Egyptian religion there is an almost innumerable host of deities of varying dignity and origin: a few personifications of great natural forces such as heaven and earth, sun and moon, an occasional abstraction such as Ma'at (truth or justice) or a caricature such as the dwarf-like Bes; but most of them local gods, dating from the period when the country was divided into numerous provinces, with the shape of animals, as though they had not yet completed their evolution from the old totem animals, with no sharp distinctions between them, and scarcely differing in the functions allotted to them. The hymns in honour of these gods say almost the same things about all of them, and identify them with one another unhesitatingly, in a manner hopelessly confusing to us. The names of gods are combined with one another, so that one of them may almost be reduced to being an epithet of the other. Thus, in the heyday of the 'New Kingdom' the principal god of the city of Thebes was called Amen-Re'; the first part of this compound stands for the ram-headed god of the city, while Re' is the name of the falcon-headed sun-god of On. Magical and ceremonial acts, charms and amulets dominated the service of these gods as they did the daily life of the Egyptians.

[1939a, 4849]

The Jews possess a copious literature apart from the Bible, in which the legends and myths are to be found which grew up in the course of centuries round the imposing figure of their first leader and the founder of their religion, and which have both illuminated and obscured it. Scattered in this material there may be fragments of trustworthy tradition for which no room was found in the Pentateuch. A legend of this sort gives an engaging account of how the ambition of the man Moses found expression even in his childhood. Once when Pharaoh had taken him in his arms and playfully lifted him high in the air, the little three-year-old boy snatched the crown from the king's head and put it on his own. This portent alarmed the king, who did not fail to consult his wise men about it.¹ There are stories elsewhere of his victorious military actions as an Egyptian general in Ethiopia, and, in this connection, how he fled from Egypt because he had reason to be afraid of the envy of a party at Court or of Pharaoh himself. The Biblical account itself attributes some features to Moses to which credence may well be given. It describes him as being of an irascible nature, flaring up easily, as when, in indignation, he slew the brutal overseer who was ill-treating a Jewish workman, or when in his anger at the people's apostasy he broke the Tables of the Law which he had brought down from the Mount of God; indeed God himself punished him in the end for an impatient deed, but we are not told what it was. Since a trait of this kind is not one that would serve for his glorification, it may perhaps correspond to a historical truth. Nor can the possibility be excluded that some of the character traits which the Jews included in their early picture of their God - describing him as jealous, severe and ruthless - may have been at bottom derived from a recollection of Moses; for in fact it was not an invisible God but the man Moses who brought them out of Egypt.

[1939a, 4862]
We must not expect the mythical structures of religion to pay too much attention to logical coherence. Otherwise popular feeling might have taken justified offence against a deity who made a covenant with their forefathers with mutual obligations and then, for centuries on end, paid no attention to his human partners, till it suddenly occurred to him to manifest himself anew to their descendants. Even more puzzling is the notion of a god's all at once 'choosing' a people, declaring them to be his people and himself to be their god. I believe this is the only instance of its sort in the history of human religions. Ordinarily god and people are indissolubly linked, they are one from the very beginning of things. No doubt we sometimes hear of a people taking on a different god, but never of a god seeking a different people. We may perhaps understand this unique event better if we recall the relations between Moses and the Jewish people. Moses had stooped to the Jews, had made them his people: they were his 'chosen people'.¹

[1939a, 4874]

It is time to raise the question of whether there is any need whatever to call in the influence of Moses as a cause of the final form taken by the Jewish idea of God, or whether it would not be enough to assume a spontaneous development to higher intellectuality during a cultural life extending over hundreds of years. There are two things to be said about this possible explanation which would put an end to all our puzzling conjectures. First, that it explains nothing. In the case of the Greeks - unquestionably a most highly gifted people - the same conditions did not lead to monotheism but to a disintegration of their polytheist religion and to the beginning of philosophical thought. In Egypt, so far as we can understand, monotheism grew up as a by-product of imperialism: God was a reflection of the Pharaoh who was the absolute ruler of a great world empire. With the Jews, political conditions were highly unfavourable for the development from the idea of an exclusive national god to that of a universal ruler of the world. And where did this tiny and powerless nation find the arrogance to declare itself the favourite child of the great Lord? The problem of the origin of monotheism among the Jews would thus remain unsolved, or we should have to be content with the common answer that it is the expression of the peculiar religious genius of that people. Genius is well known to be incomprehensible and irresponsible, and we ought therefore not to bring it up as an explanation till every other solution has failed us.¹

[1939a, 4891]

In addition to this, we come upon the fact that Jewish records and historical writings themselves point us the way, by asserting most definitely - this time without contradicting themselves - that the idea of a single god was brought to the people by Moses. If there is an objection to the trustworthiness of this assurance, it is that the priestly revision of the text we have before us obviously traces far too much back to Moses. Institutions such as the ritual ordinances, which date unmistakably from later times, are given out as Mosaic commandments with the plain intention of lending them authority. This certainly gives us ground for suspicion, but not enough for a rejection. For the deeper motive for an exaggeration of this kind is obvious. The priestly narrative seeks to establish continuity between its contemporary period and the remote Mosaic past; it seeks to disavow precisely what we have described as the most striking fact about Jewish religious history, namely that there is a yawning gap between the law-giving of Moses and the later Jewish religion - a gap which was at first filled by the worship of Yahweh, and was only slowly patched up afterwards. It disputes this course of events by every possible means, though its historical correctness is established beyond any doubt, since, in the particular treatment given to the Biblical text, superabundant evidence has been left to prove it. Here the priestly revision has attempted something similar to the tendentious distortion which made the new god Yahweh into the god of the Patriarchs. If we take this motive of the Priestly Code into account, we shall find it hard to withhold our belief from the assertion that Moses really did himself give the monotheist idea to the Jews. We should be all the readier to give our assent since we can say where Moses derived this idea from, which the Jewish priests certainly knew no longer.

[1939a, 4891]
We confess the belief, therefore, that the idea of a single god, as well as the rejection of magically effective ceremonial and the stress upon ethical demands made in his name, were in fact Mosaic doctrines, to which no attention was paid to begin with, but which, after a long interval had elapsed, came into operation and eventually became permanently established. How are we to explain a delayed effect of this kind and where do we meet with a similar phenomenon? It occurs to us at once that such things are not infrequently to be found in the most various spheres and that they probably come about in a number of ways which are understandable with greater or less ease. Let us take, for instance, the history of a new scientific theory, such as Darwin's theory of evolution. At first it met with embittered rejection and was violently disputed for decades; but it took no longer than a generation for it to be recognized as a great step forward towards truth. Darwin himself achieved the honour of a grave or cenotaph in Westminster Abbey. A case such as that leaves us little to unravel. The new truth awoke emotional resistances; these found expression in arguments by which the evidence in favour of the unpopular theory could be disputed; the struggle of opinions took up a certain length of time; from the first there were adherents and opponents; the number as well as the weight of the former kept on increasing till at last they gained the upper hand; during the whole time of the struggle the subject with which it was concerned was never forgotten. We are scarcely surprised that the whole course of events took a considerable length of time; and we probably do not sufficiently appreciate that what we are concerned with is a process in group psychology.

It would be worth while to understand how it was that the monotheist idea made such a deep impression precisely on the Jewish people and that they were able to maintain it so tenaciously. It is possible, I think, to find an answer. Fate had brought the great deed and misdeed of primaeval days, the killing of the father, closer to the Jewish people by causing them to repeat it on the person of Moses, an outstanding father-figure. It was a case of 'acting out' instead of remembering, as happens so often with neurotics during the work of analysis. To the suggestion that they should remember, which was made to them by the doctrine of Moses, they reacted, however, by disavowing their action; they remained halted at the recognition of the great father and thus blocked their access to the point from which Paul was later to start his continuation of the primal history. It is scarcely a matter of indifference or of chance that the violent killing of another great man became the starting-point of Paul's new religious creation as well. This was a man whom a small number of adherents in Judaea regarded as the Son of God and as the Messiah who had been announced, and to whom, too, a part of the childhood story invented for Moses was later carried over, but of whom in fact we know scarcely more with certainty than of Moses - whether he was really the great teacher portrayed by the Gospels or whether, rather, it was not the fact and circumstances of his death which were decisive for the importance which his figure acquired. Paul, who became his apostle, had not known him himself.

There is no doubt that it was a mighty prototype of a father which, in the person of Moses, stooped to the poor Jewish bondsmen to assure them that they were his dear children. And no less overwhelming must have been the effect upon them of the idea of an only, eternal, almighty God, to whom they were not too mean for him to make a covenant with them and who promised to care for them if they remained loyal to his worship. It was probably not easy for them to distinguish the image of the man Moses from that of his God; and their feeling was right in this, for Moses may have introduced traits of his own personality into the character of his God - such as his wrathful temper and his relentlessness. And if, this being so, they killed their great man one day, they were only repeating a misdeed which in ancient times had been committed, as prescribed by law, against the Divine King and which, as we know, went back to a still more ancient prototype.
If on the one hand we thus see the figure of the great man grown to divine proportions, yet on the other hand we must recall that the father too was once a child. The great religious idea for which the man Moses stood was, on our view, not his own property: he had taken it over from King Akhenaten. And he, whose greatness as the founder of a religion is unequivocally established, may perhaps have been following hints which had reached him - from near or distant parts of Asia - through the medium of his mother or by other paths.

[1939a, 4931]

We cannot follow the chain of events further, but if we have rightly recognized these first steps, the monotheist idea returned like a boomerang to the land of its origin. Thus it seems unfruitful to try to fix the credit due to an individual in connection with a new idea. It is clear that many have shared in its development and made contributions to it. And, again, it would obviously be unjust to break off the chain of causes at Moses and to neglect what was effected by those who succeeded him and carried on his ideas, the Jewish Prophets. The seed of monotheism failed to ripen in Egypt. The same thing might have happened in Israel after the people had thrown off the burdensome and exacting religion. But there constantly arose from the Jewish people men who revived the fading tradition, who renewed the admonitions and demands made by Moses, and who did not rest till what was lost had been established once again. In the course of constant efforts over centuries, and finally owing to two great reforms, one before and one after the Babylonian exile, the transformation was accomplished of the popular god Yahweh into the God whose worship had been forced upon the Jews by Moses. And evidence of the presence of a peculiar psychical aptitude in the masses who had become the Jewish people is revealed by the fact that they were able to produce so many individuals prepared to take on the burdens of the religion of Moses in return for the reward of being the chosen people and perhaps for some other prizes of a similar degree.

[1939a, 4932]

In order to bring about lasting psychical results in a people, it is clearly not enough to assure them that they have been chosen by the deity. The fact must also be proved to them in some way if they are to believe it and to draw consequences from the belief. In the religion of Moses the Exodus from Egypt served as the proof; God, or Moses in his name, was never tired of appealing to this evidence of favour. The feast of the Passover was introduced in order to maintain the memory of that event, or, rather, an old-established feast was injected with the contents of that memory. Nevertheless, it was only a memory: the Exodus belonged to a hazy past. In the present, signs of God's favour were decidedly scanty; the people's history pointed rather to his disfavour. Primitive peoples used to depose their gods or even to castigate them, if they failed to do their duty in securing them victory, happiness and comfort. In all periods kings have been treated in no way differently from gods; an ancient identity is thus revealed: an origin from a common root. Thus, modern peoples, too, are in the habit of expelling their kings if the glory of their reign is spoilt by defeats and the corresponding losses in territory and money. Why the people of Israel, however, clung more and more submissively to their God the worse they were treated by him - that is a problem which for the moment we must leave on one side.

[1939a, 4933]
It may encourage us to enquire whether the religion of Moses brought the people nothing else besides an enhancement of their self-esteem owing to their consciousness of having been chosen. And indeed another factor can easily be found. That religion also brought the Jews a far grander conception of God, or, as we might put it more modestly, the conception of a grander God. Anyone who believed in this God had some kind of share in his greatness, might feel exalted himself. For an unbeliever this is not entirely self-evident; but we may perhaps make it easier to understand if we point to the sense of superiority felt by a Briton in a foreign country which has been made insecure owing to an insurrection - a feeling that is completely absent in a citizen of any small continental state. For the Briton counts on the fact that his Government will send along a warship if a hair of his head is hurt, and that the rebels understand that very well - whereas the small state possesses no warship at all. Thus, pride in the greatness of the British Empire has a root as well in the consciousness of the greater security - the protection - enjoyed by the individual Briton. This may resemble the conception of a grand God. And, since one can scarcely claim to assist God in the administration of the world, the pride in God's greatness fuses with the pride in being chosen by him.

[1939a, 4933]

Among the precepts of the Moses religion there is one that is of greater importance than appears to begin with. This is the prohibition against making an image of God - the compulsion to worship a God whom one cannot see. In this, I suspect, Moses was outdoing the strictness of the Aten religion. Perhaps he merely wanted to be consistent: his God would in that case have neither a name nor a countenance. Perhaps it was a fresh measure against magical abuses. But if this prohibition were accepted, it must have a profound effect. For it meant that a sensory perception was given second place to what may be called an abstract idea - a triumph of intellectuality over sensuality or, strictly speaking, an instinctual renunciation, with all its necessary psychological consequences.

[1939a, 4933]

The Mosaic prohibition elevated God to a higher degree of intellectuality, and the way was opened to further alterations in the idea of God which we have still to describe. But we may first consider another effect of the prohibition. All such advances in intellectuality have as their consequence that the individual's self-esteem is increased, that he is made proud - so that he feels superior to other people who have remained under the spell of sensuality. Moses, as we know, conveyed to the Jews an exalted sense of being a chosen people. The dematerialization of God brought a fresh and valuable contribution to their secret treasure. The Jews retained their inclination to intellectual interests. The nation's political misfortune taught it to value at its true worth the one possession that remained to it - its literature. Immediately after the destruction of the Temple in Jerusalem by Titus, the Rabbi Jochanan ben Zakkai asked permission to open the first Torah school in Jabneh. From that time on, the Holy Writ and intellectual concern with it were what held the scattered people together.

[1939a, 4935]

This much is generally known and accepted. All I have wanted to do is to add that this characteristic development of the Jewish nature was introduced by the Mosaic prohibition against worshipping God in a visible form.

[1939a, 4935]
What help does this explanation of the satisfaction arising from instinctual renunciation give us towards understanding the processes that we want to study - the elevation of self-regard when there are advances in intellectuality? Very little, it seems. The circumstances are quite different. There is no question of any instinctual renunciation and there is no second person or agency for whose sake the sacrifice is made. We shall soon feel doubts about this last assertion. It can be said that the great man is precisely the authority for whose sake the achievement is carried out; and, since the great man himself operates by virtue of his similarity to the father, there is no need to feel surprise if in group psychology the role of the super-ego falls to him. So that this would apply too to the man Moses in relation to the Jewish people. As regards the other point, however, no proper analogy can be established. An advance in intellectuality consists in deciding against direct sense-perception in favour of what are known as the higher intellectual processes - that is, memories, reflections and inferences. It consists, for instance, in deciding that paternity is more important than maternity, although it cannot, like the latter, be established by the evidence of the senses, and that for that reason the child should bear his father's name and be his heir. Or it declares that our God is the greatest and mightiest, although he is invisible like a gale of wind or like the soul. The rejection of a sexual or aggressive instinctual demand seems to be something quite different from this. Moreover, in the case of some advances in intellectuality - for instance, in the case of the victory of patriarchy - we cannot point to the authority which lays down the standard which is to be regarded as higher. It cannot in this case be the father, since he is only elevated into being an authority by the advance itself. Thus we are faced by the phenomenon that in the course of the development of humanity sensuality is gradually overpowered by intellectuality and that men feel proud and exalted by every such advance. But we are unable to say why this should be so. It further happens later on that intellectuality itself is overpowered by the very puzzling emotional phenomenon of faith. Here we have the celebrated 'credo quia absurdum', and, once more, anyone who has succeeded in this regards it as a supreme achievement. Perhaps the common element in all these psychological situations is something else. Perhaps men simply pronounce that what is more difficult is higher, and their pride is merely their narcissism augmented by the consciousness of a difficulty overcome.

[1939a, 4937]
To deprive a people of the man whom they take pride in as the greatest of their sons is not a thing to be gladly or carelessly undertaken, least of all by someone who is himself one of them. But we cannot allow any such reflection to induce us to put the truth aside in favour of what are supposed to be national interests; and, moreover, the clarification of a set of facts may be expected to bring us a gain in knowledge.
[1939a, 4838]

The man Moses, who set the Jewish people free, who gave them their laws and founded their religion, dates from such remote times that we cannot evade a preliminary enquiry as to whether he was a historical personage or a creature of legend. If he lived, it was in the thirteenth, though it may have been in the fourteenth, century before Christ. We have no information about him except from the sacred books of the Jews and their traditions as recorded in writing. Although a decision on the question thus lacks final certainty, an overwhelming majority of historians have nevertheless pronounced in favour of the view that Moses was a real person and that the Exodus from Egypt associated with him did in fact take place. It is justly argued that the later history of the people of Israel would be incomprehensible if this premiss were not accepted. Indeed, science to-day has become altogether more circumspect and handles traditions far more indulgently than in the early days of historical criticism.
[1939a, 4838]

The first thing that attracts our attention about the figure of Moses is his name, which is 'Mosheh' in Hebrew. 'What is its origin?' we may ask, 'and what does it mean?' As we know, the account in the second chapter of Exodus already provides an answer. We are told there that the Egyptian princess who rescued the infant boy from exposure in the Nile gave him that name, putting forward an etymological reason: 'because I drew him out of the water'. This explanation, however, is clearly inadequate. 'The Biblical interpretation of the name as "he who was drawn out of the water"', argues a writer in the Jüdisches Lexicon,¹ 'is popular etymology, with which, to begin with, it is impossible to harmonize the active form of the Hebrew word - for "Mosheh" can at most only mean "he who draws out".' We can support this rejection by two further arguments: in the first place, it is absurd to attribute to an Egyptian princess a derivation of the name from the Hebrew, and secondly, the water out of which the child was drawn was most probably not the water of the Nile.
[1939a, 4838]

On the other hand, a suspicion has long been expressed, and in many different quarters, that the name 'Moses' is derived from the Egyptian vocabulary. Instead of enumerating all the authorities who have argued in this sense, I will quote the relevant passage from a comparatively recent book, The Dawn of Conscience (1934), by J. H. Breasted, a writer whose History of Egypt (1906) is regarded as a standard work: 'It is important to notice that his name, Moses, was Egyptian. It is simply the Egyptian word "mose" meaning "child", and is an abridgement of a fuller form of such names as "Amen-mose" meaning "Amon-a-child" or "Ptah-mose" meaning "Ptah-a-child", these forms themselves being likewise abbreviations for the complete form "Amon-(has-given)-a-child" or "Ptah-(has given)-a-child". The abbreviation "child" early became a convenient rapid form for the cumbersome full name, and the name Mose, "child", is not uncommon on the Egyptian monuments. The father of Moses without doubt prefixed to his son's name that of an Egyptian god like Amon or Ptah, and this divine name was gradually lost in current usage, till the boy was called "Mose". (The final s is an addition drawn from the Greek translation of the Old Testament. It is not in the Hebrew which has "Mosheh").'¹ I have repeated this passage word for word and I am by no means ready to share responsibility for its details. I am also rather surprised that Breasted has failed to mention precisely the analogous theophorous names which figure in the list of Egyptian kings, such as Ahmose, Thoth-mose and Ra-mose.
[1939a, 4839]
Now we should have expected that one of the many people who have recognized that 'Moses' is an Egyptian name would also have drawn the conclusion or would at least have considered the possibility that the person who bore this Egyptian name may himself have been an Egyptian. In relation to modern times we have no hesitation in drawing such conclusions, though nowadays people bear not one name but two - a family name and a personal name - and though a change of name or the adoption of a similar one in fresh circumstances is not beyond possibility. Thus we are not in the least surprised to find it confirmed that the poet Chamisso was French by birth, that Napoleon Buonaparte, on the other hand, was of Italian extraction and that Benjamin Disraeli was indeed an Italian Jew, as we should expect from his name. In relation to ancient and primitive times, one would have thought that a conclusion such as this as to a person's nationality based on his name would have seemed far more reliable and in fact unimpeachable. Nevertheless, so far as I know, no historian has drawn this conclusion in the case of Moses - not even any of those who, once again like Breasted himself (1934, 354), are ready to assume that 'Moses was learned in all the wisdom of the Egyptians'.¹

What prevented their doing so cannot be judged with certainty. Possibly their reverence for Biblical tradition was invincible. Possibly the notion that the man Moses might have been anything but a Hebrew seemed too monstrous. However that may be, it emerges that the recognition that the name of Moses is Egyptian has not been looked upon as affording decisive evidence of his origin, and that no further conclusions have been drawn from it. If the question of this great man's nationality is regarded as important, it would seem to be desirable to bring forward fresh material that would help towards answering it.

¹ Although the suspicion that Moses was an Egyptian has been voiced often enough without reference to his name, from the earliest times up to the present.

A moment's reflection, however, tells us that an original legend of Moses like this, one no longer deviating from the other legends, cannot have existed. For it was either of Egyptian or of Jewish origin. The first alternative is ruled out: the Egyptians had no motive for glorifying Moses, since he was no hero to them. We are to suppose, then, that the legend was created among the Jewish people - that is to say, that it was attached in its familiar form to the figure of their leader. But it was totally unsuitable for that purpose, for what would be the use to a people of a legend which made their great man into a foreigner?

The legend of Moses, in the form in which we have it to-day, falls notably short of its secret intention. If Moses was not of royal birth, the legend could not stamp him as a hero; if it left him as a Jewish child, it had done nothing to raise his social standing. Only one small fragment of the entire myth remains effective: the assurance that the child had survived in the face of powerful external forces. (This feature recurs in the story of the childhood of Jesus, in which King Herod takes over the role of Pharaoh.) Thus we are in fact free to suppose that some later and clumsy adapter of the material of the legend found an opportunity for introducing into the story of his hero Moses something which resembled the classical exposure legends marking out a hero, but which, on account of the special circumstances of the case, was not applicable to Moses,
Our investigations might have had to rest content with this inconclusive and, moreover, uncertain outcome, and they might have done nothing towards answering the question of whether Moses was an Egyptian. There is, however, another and perhaps more hopeful line of approach to an assessment of the legend of exposure.

Let us return to the two families of the myth. At the level of analytic interpretation they are, as we know, identical; whereas at the level of the myth they are differentiated into an aristocratic family and a humble one. Where, however, the figure to whom the myth is attached is a historical one, there is a third level - that of reality. One of the families is the real one, in which the person in question (the great man) was actually born and grew up; the other is fictitious, fabricated by the myth in pursuit of its own intentions. As a rule the humble family is the real one and the aristocratic family the fabricated one. The situation in the case of Moses seemed somehow different. And here the new line of approach will perhaps lead to a clarification: in every instance which it has been possible to test, the first family, the one from which the child was exposed, was the invented one, and the second one, in which he was received and grew up, was the real one. If we have the courage to recognize this assertion as universally true and as applying also to the legend of Moses, then all at once we see things clearly: Moses was an Egyptian - probably an aristocrat - whom the legend was designed to turn into a Jew. And that would be our conclusion. The exposure in the water was at its correct point in the story; but, in order to fit in with the fresh purpose, its aim had to be somewhat violently twisted. From being a way of sacrificing the child, it was turned into a means of rescuing him.

The deviation of the legend of Moses from all the others of its kind can be traced back to a special feature of his history. Whereas normally a hero, in the course of his life, rises above his humble beginnings, the heroic life of the man Moses began with his stepping down from his exalted position and descending to the level of the Children of Israel.

We started on this brief enquiry in the expectation of deriving a fresh argument from it in support of the suspicion that Moses was an Egyptian. We have seen that the first argument, based on his name, failed with many people to carry conviction.¹ We must be prepared to find that this new argument, based on an analysis of the legend of exposure, may have no better success. It will no doubt be objected that the circumstances of the construction and transformation of legends are, after all, too obscure to justify a conclusion such as ours and that the traditions surrounding the heroic figure of Moses - with all their confusion and contradictions and their unmistakable signs of centuries of continuous and tendentious revisions and superimpositions - are bound to baffle every effort to bring to light the kernel of historical truth that lies behind them. I do not myself share this dissenting attitude but neither am I in a position to refute it.
If no more certainty could be reached than this, why, it may be asked, have I brought this enquiry into public notice at all? I am sorry to say that even my justification for doing so cannot go beyond hints. For if one allows oneself to be carried away by the two arguments which I have put forward here, and if one sets out to take the hypothesis seriously that Moses was an aristocratic Egyptian, very interesting and far-reaching prospects are opened up. With the help of some not very remote assumptions, we shall, I believe, be able to understand the motives which led Moses in the unusual step he took and, closely related to this, to obtain a grasp of the possible basis of a number of the characteristics and peculiarities of the laws and religion which he gave to the Jewish people; and we shall even be led on to important considerations regarding the origin of monotheist religions in general. Such weighty conclusions cannot, however, be founded on psychological probabilities alone. Even if one accepts the fact of Moses being an Egyptian as a first historical foothold, one would need to have at least a second firm fact in order to defend the wealth of emerging possibilities against the criticism of their being a product of the imagination and too remote from reality. Objective evidence of the period to which the life of Moses and with it the Exodus from Egypt are to be referred would perhaps have fulfilled this requirement. But this has not been obtainable, and it will therefore be better to leave unmentioned any further implications of the discovery that Moses was an Egyptian.

In an earlier contribution to this periodical,¹ I attempted to bring up a fresh argument in support of the hypothesis that the man Moses, the liberator and law-giver of the Jewish people, was not a Jew but an Egyptian. It had long been observed that his name was derived from the Egyptian vocabulary, though the fact had not been properly appreciated. What I added was that the interpretation of the myth of exposure which was linked with Moses necessarily led to the inference that he was an Egyptian whom the needs of a people sought to make into a Jew. I remarked at the end of my paper that important and far-reaching implications followed from the hypothesis that Moses was an Egyptian, but that I was not prepared to argue publicly in favour of these implications, since they were based only on psychological probabilities and lacked any objective proof. The greater the importance of the views arrived at in this way, the more strongly one feels the need to beware of exposing them without a secure basis to the critical assaults of the world around one - like a bronze statue with feet of clay. Not even the most tempting probability is a protection against error; even if all the parts of a problem seem to fit together like the pieces of a jig-saw puzzle, one must reflect that what is probable is not necessarily the truth and that the truth is not always probable. And lastly, it did not seem attractive to find oneself classed with the schoolmen and Talmudists who delight in exhibiting their ingenuity without regard to how remote from reality their thesis may be.

If, then, Moses was an Egyptian - our first yield from this hypothesis is a fresh enigma and one which it is hard to solve. If a people or a tribe¹ sets out upon a great undertaking, it is only to be expected that one of its members will take his place as their leader or will be chosen for that post. But it is not easy to guess what could induce an aristocratic Egyptian - a prince, perhaps, or a priest or high official - to put himself at the head of a crowd of immigrant foreigners at a backward level of civilization and to leave his country with them. The well known contempt felt by the Egyptians for foreign nationals makes such a proceeding particularly unlikely. Indeed I could well believe that this has been precisely why even those historians who have recognized that the man's name was Egyptian, and who have ascribed to him all the wisdom of the Egyptians, have been unwilling to accept the obvious possibility that Moses was an Egyptian.

[1939a, 4847]

[1939a, 4848]
This first difficulty is promptly followed by another. We must not forget that Moses was not only the political leader of the Jews settled in Egypt but was also their law-giver and educator and forced them into the service of a new religion, which to this very day is known after him as the Mosaic one. But is it so easy for one single man to create a new religion? And if anyone wishes to influence another person's religion, would he not most naturally convert him to his own? The Jewish people in Egypt were certainly not without a religion of some form or other; and if Moses, who gave them a new one, was an Egyptian, the presumption cannot be put aside that this other new religion was the Egyptian one.
[1939a, 4849]

It was our hope that the hypothesis that Moses was an Egyptian would turn out to be fruitful and illuminating in various directions. But the first conclusion we drew from that hypothesis - that the new religion which he gave to the Jews was his own Egyptian one - has been invalidated by our realization of the different, and indeed contradictory, character of the two religions.
[1939a, 4850]

I should now like to venture on this conclusion: if Moses was an Egyptian and if he communicated his own religion to the Jews, it must have been Akhenaten's, the Aten religion.
[1939a, 4856]
Moses did not only give the Jews a new religion; it can be stated with equal certainty that he introduced the custom of circumcision to them. This fact is of decisive importance for our problem and has scarcely ever been considered. It is true that the Biblical account contradicts this more than once. On the one hand it traces circumcision back to the patriarchal age as a mark of a covenant between God and Abraham; on the other hand it describes in a quite particularly obscure passage how God was angry with Moses for having neglected a custom which had become holy,¹ and sought to kill him; but that his wife, a Midianite, saved her husband from God's wrath by quickly performing the operation. These, however, are distortions, which should not lead us astray; later on we shall discover the reason for them. The fact remains that there is only one answer to the question of where the Jews derived the custom of circumcision from - namely, from Egypt. Herodotus, the 'father of history', tells us that the custom of circumcision had long been indigenous in Egypt, and his statements are confirmed by the findings in mummies and indeed by pictures on the walls of tombs. No other people of the Eastern Mediterranean, so far as we know, practised this custom; it may safely be presumed that the Semites, Babylonians and Sumerians were uncircumcised. The Bible story itself says this is so of the inhabitants of Canaan; it is a necessary premiss to the adventure of Jacob's daughter and the prince of Shechem.² The possibility that the Jews acquired the custom of circumcision during their sojourn in Egypt in some way other than in connection with the religious teaching of Moses may be rejected as completely without foundation. Now, taking it as certain that circumcision was a universal popular custom in Egypt, let us for a moment adopt the ordinary hypothesis that Moses was a Jew, who sought to free his compatriots from bondage in Egypt and lead them to develop an independent and self-conscious national existence in another country - which was what in fact happened. What sense could it have, in that case, that he should at the same time impose on them a troublesome custom which even, to some extent, made them into Egyptians and which must keep permanently alive their memory of Egypt - whereas his efforts could only be aimed in the opposite direction, towards alienating his people from the land of their bondage and overcoming their longing for the "flesh-pots of Egypt"? No, the fact from which we started and the hypothesis which we added to it are so incompatible with each other that we may be bold enough to reach this conclusion: if Moses gave the Jews not only a new religion but also the commandment for circumcision, he was not a Jew but an Egyptian, and in that case the Mosaic religion was probably an Egyptian one and, in view of its contrast to the popular religion, the religion of the Aten, with which the later Jewish religion agrees in some remarkable respects.

[1939a, 4858]
I have pointed out that my hypothesis that Moses was not a Jew but an Egyptian created a fresh riddle. His course of conduct, which seemed easily intelligible in a Jew, was ununderstandable in an Egyptian. If, however, we place Moses in the time of Akhenaten and suppose him in contact with that Pharaoh, the riddle vanishes and the possibility is revealed of motives which will answer all our questions. Let us start from the assumption that Moses was an aristocratic and prominent man, perhaps in fact a member of the royal house, as the legend says of him. He was undoubtedly aware of his great capacities, ambitious and energetic; he may even have played with the notion of one day being the leader of his people, of becoming the kingdom's ruler. Being close to the Pharaoh, he was a convinced adherent of the new religion, whose basic thoughts he had made his own. When the king died and the reaction set in, he saw all his hopes and prospects destroyed; if he was not prepared to abjure all the convictions that were so dear to him, Egypt had nothing more to offer him - he had lost his country. In this predicament he found an unusual solution. Akhenaten the dreamer had alienated his people and let his empire fall to pieces. The more energetic nature of Moses was more at home with the plan of founding a new kingdom, of finding a new people to whom he would present for their worship the religion which Egypt had disdained. It was, we can see, a heroic attempt to combat destiny, to compensate in two directions for the losses in which Akhenaten's catastrophe had involved him. Perhaps he was at that time Governor of the frontier province (Goshen) in which certain Semitic tribes had settled (perhaps as early as in the Hyksos period). These he chose to be his new people - a historic decision.¹ He came to an agreement with them, put himself at their head and carried the Exodus through 'by strength of hand'. In complete contrast to the Biblical tradition, we may presume that this Exodus took place peacefully and unpursued. The authority of Moses made this possible and at that time there was no central administration which might have interfered with it.

[1939a, 4859]

The motives which we have discovered for the Exodus as a whole apply also to the introduction of circumcision. We are familiar with the attitude adopted by people (both nations and individuals) to this primal usage, which is scarcely understood any longer. Those who do not practise it look on it as very strange and are a little horrified by it, but those who have adopted circumcision are proud of it. They feel exalted by it, ennobled, as it were, and look down with contempt on the others, whom they regard as unclean. Even to this day a Turk will abuse a Christian as an 'uncircumcised dog'. It may be supposed that Moses, who, being an Egyptian, was himself circumcised, shared this attitude. The Jews with whom he departed from his country were to serve him as a superior substitute for the Egyptians he had left behind. On no account must the Jews be inferior to them. He wished to make them into a 'holy nation', as is expressly stated in the Biblical text, and as a mark of this consecration he introduced among them too the custom which made them at least the equals of the Egyptians. And he could only welcome it if they were to be isolated by such a sign and kept apart from the foreign peoples among whom their wanderings would lead them, just as the Egyptians themselves had kept apart from all foreigners.¹

[1939a, 4860]

At this point I expect to be met by an objection to my hypothesis. This placed Moses, an Egyptian, in the Akhenaten period. It derived his decision to take over the Jewish people from the political circumstances in the country at that time, and it recognized the religion that he presented to or imposed on his protégés as the Aten religion, which had actually collapsed in Egypt itself. I expect to be told that I have brought forward this structure of conjectures with too much positiveness, for which there is no basis in the material. This objection is, I think, unjustified. I have already laid stress on the factor of doubt in my introductory remarks; I have, as it were, placed that factor outside the brackets and I may be allowed to save myself the trouble of repeating it in connection with each item inside them.

[1939a, 4861]
Another trait attributed to Moses has a special claim to our interest. Moses is said to have been 'slow of speech': he must have suffered from an inhibition or disorder of speech. Consequently, in his supposed dealings with Pharaoh, he needed the support of Aaron, who is called his brother. This again may be a historical truth and would make a welcome contribution to presenting a lively picture of the great man. But it may also have another and more important significance. It may recall, slightly distorted, the fact that Moses spoke another language and could not communicate with his Semitic neo-Egyptians without an interpreter, at all events at the beginning of their relations - a fresh confirmation, then, of the thesis that Moses was an Egyptian.

[1939a, 4863]

Now, however, or so it seems, our work has reached a provisional end. For the moment we can draw no further conclusions from our hypothesis that Moses was an Egyptian, whether it has been proved or not. No historian can regard the Biblical account of Moses and the Exodus as anything other than a pious piece of imaginative fiction, which has recast a remote tradition for the benefit of its own tendentious purposes. The original form of that tradition is unknown to us; we should be glad to discover what the distorting purposes were, but we are kept in the dark by our ignorance of the historical events. The fact that our reconstruction leaves no room for a number of show-pieces in the Bible story, such as the ten plagues, the passage of the Red Sea and the solemn law-giving on Mount Sinai - this does not disconcert us. But we cannot treat it as a matter of indifference if we find ourselves in contradiction to the findings of the sober historical researches of the present day.

[1939a, 4863]
The union of the tribes into a nation through the adoption of a common religion, whenever it
may have taken place, might easily have turned out quite an unimportant happening in world
history. The new religion would have been carried away by the current of events, Yahweh would
have had to take his place in the procession of departed gods in Flaubert's vision, and all twelve
of his tribes would have been 'lost' and not only the ten of them which the Anglo-Saxons have
been in search of for so long. The god Yahweh, to whom the Midianite Moses then presented a
new people, was probably in no respect a prominent being. A coarse, narrow-minded, local god,
vicious and bloodthirsty, he had promised his followers to give them 'a land flowing with milk and
honey' and urged them to exterminate its present inhabitants 'with the edge of the sword'. It is
astonishing how much remains, in spite of all the revisions of the Biblical narratives, that allows
us to recognize his original nature. It is not even certain that his religion was a genuine
monotheism, that it denied the divinity of the deities of other peoples. It was enough probably
that his people regarded their own god as more powerful than any foreign god. If, nevertheless,
in the sequel everything took a different course from what such beginnings would have led one
to expect, the cause can be found in only one fact. The Egyptian Moses had given to one
portion of the people a more highly spiritualized notion of god, the idea of a single deity
embracing the whole world, who was not less all-loving than all-powerful, who was averse to all
ceremonial and magic and set before men as their highest aim a life in truth and justice. For,
however incomplete may be the accounts we have of the ethical side of the Aten religion, it can
be no unimportant fact that Akhenaten regularly referred to himself in his inscriptions as 'living in
Ma'at' (truth, justice).¹ In the long run it made no difference that the people rejected the teaching
of Moses (probably after a short time) and killed him himself. The tradition of it remained and its
influence achieved (only gradually, it is true, in the course of centuries) what was denied to
Moses himself. The god Yahweh had arrived at undeserved honour when, from the time of
Kadesh onwards, he was credited with the deed of liberation which had been performed by
Moses; but he had to pay heavily for this usurpation. The shadow of the god whose place he
had taken became stronger than himself; by the end of the process of evolution, the nature of
the forgotten god of Moses had come to light behind his own. No one can doubt that it was only
the idea of this other god that enabled the people of Israel to survive all the blows of fate and
that kept them alive to our own days.

[1939a, 4879]

It is no longer possible to estimate the share taken by the Levites in the final victory of the
Mosaic god over Yahweh. They had taken the side of Moses in the past, when the compromise
was reached at Kadesh, in a still live memory of the master whose retinue and compatriots they
had been. During the centuries since then they had become merged with the people or with the
priesthood, and it had become the main function of the priests to develop and supervise the
ritual, and besides this to preserve the holy writ and revise it in accordance with their aims. But
was not all sacrifice and all ceremonial at bottom only magic and sorcery, such as had been
unconditionally rejected by the old Mosaic teaching? Thereupon there arose from among the
midst of the people an unending succession of men who were not linked to Moses in their origin
but were enthralled by the great and mighty tradition which had grown up little by little in
obscurity: and it was these men, the Prophets, who tirelessly preached the old Mosaic doctrine
that the deity disdained sacrifice and ceremonial and asked only for faith and a life in truth and
justice (Ma'at). The efforts of the Prophets had a lasting success; the doctrines with which they
re-established the old faith became the permanent content of the Jewish religion. It is honour
enough to the Jewish people that they could preserve such a tradition and produce men who
gave it a voice - even though the initiative to it came from outside, from a great foreigner.

[1939a, 4880]
I should not feel secure in giving this account, if I could not appeal to the judgement of other enquirers with a specialist knowledge who see the significance of Moses for the Jewish religion in the same light as I do, even though they do not recognize his Egyptian origin. Thus, for instance, Sellin (1922, 52) writes: 'Consequently we must picture the true religion of Moses - his belief in the one moral God whom he preaches - as thenceforward necessarily the property of a small circle of the people. We must necessarily not expect to meet with it in the official cult, in the religion of the priests or in the beliefs of the people. We can necessarily only reckon to find an occasional spark emerging, now here and now there, from the spiritual torch which he once kindled, to find that his ideas have not entirely perished but have been silently at work here and there upon beliefs and customs, till sooner or later, through the effect of special experiences or of persons specially moved by his spirit, it has broken out more strongly once more and gained influence on wider masses of the population. It is from this point of view that the history of the ancient religion of Israel is necessarily to be regarded. Anyone who sought to construct the Mosaic religion on the lines of the religion we meet with, according to the chronicles, in the life of the people during their first five hundred years in Canaan, would be committing the gravest methodological error.' Volz (1907, 64) speaks even more clearly: it is his belief that 'the exalted work of Moses was understood and carried through to begin with only feebly and scantily, till, in the course of centuries, it penetrated more and more, and at length in the great Prophets it met with like spirits who continued the lonely man's work.'

And here, it seems, I have reached the conclusion of my study, which was directed to the single aim of introducing the figure of an Egyptian Moses into the nexus of Jewish history. Our findings may be thus expressed in the most concise formula. Jewish history is familiar to us for its dualities: two groups of people who came together to form the nation, two kingdoms into which this nation fell apart, two gods' names in the documentary sources of the Bible. To these we add two fresh ones: the foundation of two religions - the first repressed by the second but nevertheless later emerging victoriously behind it, and two religious founders, who are both called by the same name of Moses and whose personalities we have to distinguish from each other. All of these dualities are the necessary consequences of the first one: the fact that one portion of the people had an experience which must be regarded as traumatic and which the other portion escaped. Beyond this there would be a very great deal to discuss, to explain and to assert. Only thus would an interest in our purely historical study find its true justification. What the real nature of a tradition resides in, and what its special power rests on, how impossible it is to dispute the personal influence upon world-history of individual great men, what sacrilege one commits against the splendid diversity of human life if one recognizes only those motives which arise from material needs, from what sources some ideas (and particularly religious ones) derive their power to subject both men and peoples to their yoke - to study all this in the special case of Jewish history would be an alluring task. To continue my work on such lines as these would be to find a link with the statements I put forward twenty-five years ago in Totem and Taboo. But I no longer feel that I have the strength to do so.

[1939a, 4881]
Thus far what is established historically; and now our hypothetical sequel begins. Among those in Akhenaten's entourage there was a man who was perhaps called Tuthmosis, like many other people at that time¹ - the name is not of great importance except that its second component must have been ‘-mose’. He was in a high position and a convinced adherent of the Aten religion, but, in contrast to the meditative king, he was energetic and passionate. For him the death of Akhenaten and the abolition of his religion meant the end of all his expectations. He could remain in Egypt only as an outlaw or as a renegade. Perhaps as governor of the frontier province he had come in contact with a Semitic tribe which had immigrated into it a few generations earlier. Under the necessity of his disappointment and loneliness he turned to these foreigners and with them sought compensation for his losses. He chose them as his people and tried to realize his ideals in them. After he had left Egypt with them, accompanied by his followers, he made them holy by the mark of circumcision, gave them laws and introduced them into the doctrines of the Aten religion, which the Egyptians had just thrown off. The precepts which this man Moses gave to his Jews may have been even harsher than those of his master and teacher Akhenaten, and he may, too, have given up dependence on the sun-god of On, to which Akhenaten had continued to adhere.

[1939a, 4887]
The first thing that attracts our attention about the figure of Moses is his name, which is 'Mosheh' in Hebrew. 'What is its origin?' we may ask, 'and what does it mean?' As we know, the account in the second chapter of *Exodus* already provides an answer. We are told there that the Egyptian princess who rescued the infant boy from exposure in the Nile gave him that name, putting forward an etymological reason: 'because I drew him out of the water'. This explanation, however, is clearly inadequate. 'The Biblical interpretation of the name as "he who was drawn out of the water"', argues a writer in the *Jüdisches Lexicon*,¹ 'is popular etymology, with which, to begin with, it is impossible to harmonize the active form of the Hebrew word - for "Mosheh" can at most only mean "he who draws out".' We can support this rejection by two further arguments: in the first place, it is absurd to attribute to an Egyptian princess a derivation of the name from the Hebrew, and secondly, the water out of which the child was drawn was most probably not the water of the Nile.

[1939a, 4838]

We started on this brief enquiry in the expectation of deriving a fresh argument from it in support of the suspicion that Moses was an Egyptian. We have seen that the first argument, based on his name, failed with many people to carry conviction.¹ We must be prepared to find that this new argument, based on an analysis of the legend of exposure, may have no better success. It will no doubt be objected that the circumstances of the construction and transformation of legends are, after all, too obscure to justify a conclusion such as ours and that the traditions surrounding the heroic figure of Moses - with all their confusion and contradictions and their unmistakable signs of centuries of continuous and tendentious revisions and superimpositions - are bound to baffle every effort to bring to light the kernel of historical truth that lies behind them. I do not myself share this dissenting attitude but neither am I in a position to refute it.

[1939a, 4846]
The first thing that attracts our attention about the figure of Moses is his name, which is 'Mosheh' in Hebrew. 'What is its origin?' we may ask, 'and what does it mean?' As we know, the account in the second chapter of Exodus already provides an answer. We are told there that the Egyptian princess who rescued the infant boy from exposure in the Nile gave him that name, putting forward an etymological reason: 'because I drew him out of the water'. This explanation, however, is clearly inadequate. 'The Biblical interpretation of the name as "he who was drawn out of the water"', argues a writer in the Jüdisches Lexikon,¹ 'is popular etymology, with which, to begin with, it is impossible to harmonize the active form of the Hebrew word - for "Mosheh" can at most only mean "he who draws out".' We can support this rejection by two further arguments: in the first place, it is absurd to attribute to an Egyptian princess a derivation of the name from the Hebrew, and secondly, the water out of which the child was drawn was most probably not the water of the Nile.

On the other hand, a suspicion has long been expressed, and in many different quarters, that the name 'Moses' is derived from the Egyptian vocabulary. Instead of enumerating all the authorities who have argued in this sense, I will quote the relevant passage from a comparatively recent book, The Dawn of Conscience (1934), by J. H. Breasted, a writer whose History of Egypt (1906) is regarded as a standard work: 'It is important to notice that his name, Moses, was Egyptian. It is simply the Egyptian word "mose" meaning "child", and is an abridgement of a fuller form of such names as "Amen-mose" meaning "Amon-a-child" or "Ptah-mose" meaning "Ptah-a-child", these forms themselves being likewise abbreviations for the complete form "Amon-(has-given)-a-child" or "Ptah-(has given)-a-child". The abbreviation "child" early became a convenient rapid form for the cumbersome full name, and the name Mose, "child", is not uncommon on the Egyptian monuments. The father of Moses without doubt prefixed to his son's name that of an Egyptian god like Amon or Ptah, and this divine name was gradually lost in current usage, till the boy was called "Mose". (The final s is an addition drawn from the Greek translation of the Old Testament. It is not in the Hebrew which has "Mosheh").'¹ I have repeated this passage word for word and I am by no means ready to share responsibility for its details. I am also rather surprised that Breasted has failed to mention precisely the analogous theophorous names which figure in the list of Egyptian kings, such as Ahmose, Thoth-mose and Ra-mose.

Now we should have expected that one of the many people who have recognized that 'Moses' is an Egyptian name would also have drawn the conclusion or would at least have considered the possibility that the person who bore this Egyptian name may himself have been an Egyptian. In relation to modern times we have no hesitation in drawing such conclusions, though nowadays people bear not one name but two - a family name and a personal name - and though a change of name or the adoption of a similar one in fresh circumstances is not beyond possibility. Thus we are not in the least surprised to find it confirmed that the poet Chamisso was French by birth, that Napoleon Buonaparte, on the other hand, was of Italian extraction and that Benjamin Disraeli was indeed an Italian Jew, as we should expect from his name. In relation to ancient and primitive times, one would have thought that a conclusion such as this as to a person's nationality based on his name would have seemed far more reliable and in fact unimpeachable. Nevertheless, so far as I know, no historian has drawn this conclusion in the case of Moses - not even any of those who, once again like Breasted himself (1934, 354), are ready to assume that 'Moses was learned in all the wisdom of the Egyptians'.¹

[1939a, 4838]

[1939a, 4839]

[1939a, 4840]
What prevented their doing so cannot be judged with certainty. Possibly their reverence for Biblical tradition was invincible. Possibly the notion that the man Moses might have been anything but a Hebrew seemed too monstrous. However that may be, it emerges that the recognition that the name of Moses is Egyptian has not been looked upon as affording decisive evidence of his origin, and that no further conclusions have been drawn from it. If the question of this great man's nationality is regarded as important, it would seem to be desirable to bring forward fresh material that would help towards answering it.

¹ Although the suspicion that Moses was an Egyptian has been voiced often enough without reference to his name, from the earliest times up to the present.

We started on this brief enquiry in the expectation of deriving a fresh argument from it in support of the suspicion that Moses was an Egyptian. We have seen that the first argument, based on his name, failed with many people to carry conviction.¹ We must be prepared to find that this new argument, based on an analysis of the legend of exposure, may have no better success. It will no doubt be objected that the circumstances of the construction and transformation of legends are, after all, too obscure to justify a conclusion such as ours and that the traditions surrounding the heroic figure of Moses - with all their confusion and contradictions and their unmistakable signs of centuries of continuous and tendentious revisions and superimpositions - are bound to baffle every effort to bring to light the kernel of historical truth that lies behind them. I do not myself share this dissenting attitude but neither am I in a position to refute it.

¹ Thus Eduard Meyer writes (1905, 651): 'The name "Moses" is probably Egyptian, and the name "Pinchas" in the priestly family of Shiloh . . . is undoubtedly Egyptian. Of course this does not prove that these families were of Egyptian origin, but, no doubt, that they had connections with Egypt.' We may ask, to be sure, what sort of connections this is supposed to make us think of.

In an earlier contribution to this periodical,¹ I attempted to bring up a fresh argument in support of the hypothesis that the man Moses, the liberator and law-giver of the Jewish people, was not a Jew but an Egyptian. It had long been observed that his name was derived from the Egyptian vocabulary, though the fact had not been properly appreciated. What I added was that the interpretation of the myth of exposure which was linked with Moses necessarily led to the inference that he was an Egyptian whom the needs of a people sought to make into a Jew. I remarked at the end of my paper that important and far-reaching implications followed from the hypothesis that Moses was an Egyptian, but that I was not prepared to argue publicly in favour of these implications, since they were based only on psychological probabilities and lacked any objective proof. The greater the importance of the views arrived at in this way, the more strongly one feels the need to beware of exposing them without a secure basis to the critical assaults of the world around one - like a bronze statue with feet of clay. Not even the most tempting probability is a protection against error; even if all the parts of a problem seem to fit together like the pieces of a jig-saw puzzle, one must reflect that what is probable is not necessarily the truth and that the truth is not always probable. And lastly, it did not seem attractive to find oneself classed with the schoolmen and Talmudists who delight in exhibiting their ingenuity without regard to how remote from reality their thesis may be.
If, then, Moses was an Egyptian - our first yield from this hypothesis is a fresh enigma and one which it is hard to solve. If a people or a tribe sets out upon a great undertaking, it is only to be expected that one of its members will take his place as their leader or will be chosen for that post. But it is not easy to guess what could induce an aristocratic Egyptian - a prince, perhaps, or a priest or high official - to put himself at the head of a crowd of immigrant foreigners at a backward level of civilization and to leave his country with them. The well known contempt felt by the Egyptians for foreign nationals makes such a proceeding particularly unlikely. Indeed I could well believe that this has been precisely why even those historians who have recognized that the man's name was Egyptian, and who have ascribed to him all the wisdom of the Egyptians, have been unwilling to accept the obvious possibility that Moses was an Egyptian.

[1939a, 4849]
Artemidorus, the dream-interpreter of antiquity, was certainly right in maintaining that the meaning of a dream depends on who the dreamer happens to be. Under the laws governing the expression of unconscious thoughts, the meaning of rescuing may vary, depending on whether the author of the phantasy is a man or a woman. It can equally mean (in a man) making a child, i.e. causing it to be born, or (in a woman) giving birth oneself to a child. These various meanings of rescuing in dreams and phantasies can be recognized particularly clearly when they are found in connection with water. A man rescuing a woman from the water in a dream means that he makes her a mother, which in the light of the preceding discussion amounts to making her his own mother. A woman rescuing someone else (a child) from the water acknowledges herself in this way as the mother who bore him, like Pharaoh's daughter in the legend of Moses (Rank, 1909). At times there is also a tender meaning contained in rescue-phantasies directed towards the father. In such cases they aim at expressing the subject's wish to have his father as a son - that is, to have a son who is like his father.

In myths about the birth of heroes - to which Otto Rank has devoted a comparative study, the oldest being that of King Sargon of Agade (about 2800 B.C.) - a predominant part is played by exposure in the water and rescue from the water. Rank has perceived that these are representations of birth, analogous to those that are usual in dreams. If one rescues someone from the water in a dream, one is making oneself into his mother, or simply into a mother. In myths a person who rescues a baby from the water is admitting that she is the baby's true mother. There is a well-known comic anecdote according to which an intelligent Jewish boy was asked who the mother of Moses was. He replied without hesitation: 'The Princess.' 'No', he was told, 'she only took him out of the water.' 'That's what she says', he replied, and so proved that he had found the correct interpretation of the myth.

The first thing that attracts our attention about the figure of Moses is his name, which is 'Mosheh' in Hebrew. 'What is its origin?' we may ask, 'and what does it mean?' As we know, the account in the second chapter of Exodus already provides an answer. We are told there that the Egyptian princess who rescued the infant boy from exposure in the Nile gave him that name, putting forward an etymological reason: 'because I drew him out of the water'. This explanation, however, is clearly inadequate. 'The Biblical interpretation of the name as "he who was drawn out of the water"', argues a writer in the Jüdisches Lexicon,¹ 'is popular etymology, with which, to begin with, it is impossible to harmonize the active form of the Hebrew word - for "Mosheh" can at most only mean "he who draws out".' We can support this rejection by two further arguments: in the first place, it is absurd to attribute to an Egyptian princess a derivation of the name from the Hebrew, and secondly, the water out of which the child was drawn was most probably not the water of the Nile.

We may fairly say that these explanations make the widespread and uniform nature of myths of the birth of heroes fully intelligible. For that reason it is all the more deserving of interest that the legend of the birth and exposure of Moses occupies a special position and, indeed, in one essential respect contradicts the rest.

¹ Jüdisches Lexicon
With Moses things were quite different. In his case the first family, elsewhere the aristocratic one, was sufficiently modest. He was the child of Jewish Levites. But the place of the second family, elsewhere the humble one, was taken by the royal house of Egypt; the princess brought him up as her own son. This deviation from type has puzzled many people. Eduard Meyer, and others following him, assumed that originally the legend was different. Pharaoh, according to them, had been warned by a prophetic dream⁴ that a son born to his daughter would bring danger to him and his kingdom. He therefore had the child exposed in the Nile after his birth. But he was rescued by Jewish people and brought up as their child. For 'nationalist motives' (as Rank puts it⁵) the legend would then have been given the modified form in which we know it.

Let us return to the two families of the myth. At the level of analytic interpretation they are, as we know, identical; whereas at the level of the myth they are differentiated into an aristocratic family and a humble one. Where, however, the figure to whom the myth is attached is a historical one, there is a third level - that of reality. One of the families is the real one, in which the person in question (the great man) was actually born and grew up; the other is fictitious, fabricated by the myth in pursuit of its own intentions. As a rule the humble family is the real one and the aristocratic family the fabricated one. The situation in the case of Moses seemed somehow different. And here the new line of approach will perhaps lead to a clarification: in every instance which it has been possible to test, the first family, the one from which the child was exposed, was the invented one, and the second one, in which he was received and grew up, was the real one. If we have the courage to recognize this assertion as universally true and as applying also to the legend of Moses, then all at once we see things clearly: Moses was an Egyptian - probably an aristocrat - whom the legend was designed to turn into a Jew. And that would be our conclusion. The exposure in the water was at its correct point in the story; but, in order to fit in with the fresh purpose, its aim had to be somewhat violently twisted. From being a way of sacrificing the child, it was turned into a means of rescuing him.

We started on this brief enquiry in the expectation of deriving a fresh argument from it in support of the suspicion that Moses was an Egyptian. We have seen that the first argument, based on his name, failed with many people to carry conviction.⁶ We must be prepared to find that this new argument, based on an analysis of the legend of exposure, may have no better success. It will no doubt be objected that the circumstances of the construction and transformation of legends are, after all, too obscure to justify a conclusion such as ours and that the traditions surrounding the heroic figure of Moses - with all their confusion and contradictions and their unmistakable signs of centuries of continuous and tendentious revisions and superimpositions - are bound to baffle every effort to bring to light the kernel of historical truth that lies behind them. I do not myself share this dissenting attitude but neither am I in a position to refute it.
In an earlier contribution to this periodical,¹ I attempted to bring up a fresh argument in support of the hypothesis that the man Moses, the liberator and law-giver of the Jewish people, was not a Jew but an Egyptian. ¹[1939a, 4848]

As regards internal difficulties, a political revolution and a change of domicile could alter nothing. No less than before, I feel uncertain in the face of my own work; I lack the consciousness of unity and of belonging together which should exist between an author and his work. It is not as though there were an absence of conviction in the correctness of my conclusion. I acquired that a quarter of a century ago when in 1912 I wrote my book about Totem and Taboo, and it has only grown firmer since. From that time I have never doubted that religious phenomena are only to be understood on the pattern of the individual neurotic symptoms familiar to us - as the return of long since forgotten, important events in the primaeval history of the human family - and that they have to thank precisely this origin for their compulsive character and that, accordingly, they are effective on human beings by force of the historical truth of their content. My uncertainty sets in only when I ask myself whether I have succeeded in proving these theses in the example which I have chosen here of Jewish monotheism. To my critical sense this book, which takes its start from the man Moses, appears like a dancer balancing on the tip of one toe. If I could not find support in an analytic interpretation of the exposure myth and could not pass from there to Sellin's suspicion about the end of Moses, the whole thing would have had to remain unwritten. In any case, let us now take the plunge.

¹[1939a, 4885]
Another trait attributed to Moses has a special claim to our interest. Moses is said to have been 'slow of speech': he must have suffered from an inhibition or disorder of speech. Consequently, in his supposed dealings with Pharaoh, he needed the support of Aaron, who is called his brother. This again may be a historical truth and would make a welcome contribution to presenting a lively picture of the great man. But it may also have another and more important significance. It may recall, slightly distorted, the fact that Moses spoke another language and could not communicate with his Semitic neo-Egyptians without an interpreter, at all events at the beginning of their relations - a fresh confirmation, then, of the thesis that Moses was an Egyptian.

[1939a, 4863]
We must now make an attempt at elucidating the chronological relations of these events. We have put the Exodus in the period after the end of the Eighteenth Dynasty (1350 B.C.). It may have occurred then or a little later, since the Egyptian chroniclers have included the succeeding years of anarchy in the reign of Haremhab, which brought them to an end and lasted till 1315 B.C. The next (but also the only) fixed point for the chronology is afforded by the stela of Merenptah (1225-15 B.C.), which boasts of his victory over Isiraal (Israel) and the laying waste of her seed (?). The sense to be attached to this inscription is unfortunately doubtful, it is supposed to prove that the Israelite tribes were already at that time settled in Canaan.¹ Eduard Meyer rightly concludes from this stela that Merenptah cannot have been the Pharaoh of the Exodus, as had been lightly assumed previously. The date of the Exodus must have been earlier. The question of who was the Pharaoh of the Exodus seems to me altogether an idle one. There was no Pharaoh of the Exodus, for it occurred during an interregnum. Nor does the discovery of the stela of Merenptah throw any light on the possible date of the union and founding of the religion at Kadesh. All that we can say with certainty is that it was some time between 1350 and 1215 B.C. We suspect that the Exodus comes somewhere very near the beginning of this hundred years and the events at Kadesh not too far away from its end. We should like to claim the greater part of this period for the interval between the two occurrences. For we need a comparatively long time for the passions of the returning tribes to have cooled down after the murder of Moses and for the influence of his followers, the Levites, to have become as great as is implied by the compromise at Kadesh. Two generations, sixty years, might about suffice for this, but it is a tight fit. What is inferred from the stela of Merenptah comes too early for us, and since we recognize that in this hypothesis of ours one supposition is only based on another, we must admit that this discussion reveals a weak side of our construction. It is unlucky that everything relating to the settlement of the Jewish people in Canaan is so obscure and confused. Our only resort, perhaps, is to suppose that the name on the 'Israel' stela does not relate to the tribes whose fortunes we are trying to follow and which combined to form the later people of Israel. After all, the name of ‘Habiru’ (Hebrews) was transferred to these same people in the Amarna period. [1939a, 4878]

We must take the period of the interregnum after 1350 B.C. as the date of the Exodus from Egypt. The interval of time which followed, up to the completion of the occupation of the land of Canaan, is particularly inscrutable. Modern historical research has been able to extract two facts from the obscurity which the biblical narrative has left, or rather created, at this point. The first of these facts, discovered by Ernst Sellin, is that the Jews, who, even by the account in the Bible, were headstrong and unruly towards their law-giver and leader, rose against him one day, killed him and threw off the religion of the Aten which had been imposed on them, just as the Egyptians had thrown it off earlier. The second fact, demonstrated by Eduard Meyer, is that those Jews who had returned from Egypt united later on with closely related tribes in the region between Palestine, the Sinai Peninsula and Arabia, and that there, in a well-watered locality named Kadesh, under the influence of the Arabian Midianites, they took on a new religion, the worship of the volcano god Yahweh. Soon after this they were ready to invade Canaan as conquerors. [1939a, 4887]
The chronological relations of these two events to each other and to the Exodus from Egypt are very uncertain. The closest historical point of reference is provided by a stela of the Pharaoh Merenptah (who reigned till 1215 B.C.) which in the course of a report on campaigns in Syria and Palestine names 'Israel' among the defeated enemy. If we take the date of this stela as a terminus ad quem, we are left with about a century (from after 1350 to before 1215 B.C.) for the whole course of events, starting from the Exodus. It is possible, however, that the name 'Israel' did not yet relate to the tribes whose fortunes we are following and that in fact we have a longer interval at our disposal. The settlement in Canaan of what was later the Jewish people was certainly no rapidly completed conquest but took place in waves and over considerable periods of time. If we free ourselves from the limitation imposed by the Merenptah stela, we can all the more easily assign one generation (thirty years) to the period of Moses,¹ and allow at least two generations, but probably more, to elapse up to the time of the union at Kadesh.² The interval between Kadesh and the irruption into Canaan need only be short. The Jewish tradition, as was shown in the preceding essay, had good grounds for shortening the interval between the Exodus and the founding of the religion at Kadesh, while the reverse is in the interest of our account.

We have already repeatedly described what happened at Kadesh when the two portions of what was later to be the Jewish people came together to receive a new religion. In those, on the one hand, who had been in Egypt, memories of the Exodus and of the figure of Moses were still so strong and vivid that they demanded their inclusion in an account of early times. They were grandchildren, perhaps, of people who had known Moses himself, and some of them still felt themselves Egyptians and bore Egyptian names. But they had good motives for repressing the memory of the fate with which their leader and lawgiver had met. The determining purpose of the other portion of the people was to glorify the new god and to dispute his being foreign. Both portions had the same interest in disavowing the fact of their having had an earlier religion and the nature of its content. So it was that the first compromise came about, and it was probably soon recorded in writing. The people who had come from Egypt had brought writing and the desire to write history along with them; but it was to be a long time before historical writing realized that it was pledged to unswerving truthfulness. To begin with it had no scruples about shaping its narratives according to the needs and purposes of the moment, as though it had not yet recognized the concept of falsification. As a result of these circumstances a discrepancy was able to grow up between the written record and the oral transmission of the same material - tradition. What had been omitted or changed in the written record might very well have been preserved intact in tradition. Tradition was a supplement but at the same time a contradiction to historical writing. It was less subjected to the influence of distorting purposes and perhaps at some points quite exempt from them, and it might therefore be more truthful than the account that had been recorded in writing. Its trustworthiness, however, suffered from the fact that it was less stable and definite than the written account and exposed to numerous changes and alterations when it was handed on from one generation to another by oral communication. A tradition of such a kind might meet with various sorts of fate. What we should most expect would be that it would be crushed by the written account, would be unable to stand up against it, would become more and more shadowy and would finally pass into oblivion. But it might meet with other fates: one of these would be that the tradition itself would end in a written record, and we shall have to deal with yet others as we proceed.

[1939a, 4888]

[1939a, 4894]
In order to bring about lasting psychical results in a people, it is clearly not enough to assure them that they have been chosen by the deity. The fact must also be proved to them in some way if they are to believe it and to draw consequences from the belief. In the religion of Moses the Exodus from Egypt served as the proof; God, or Moses in his name, was never tired of appealing to this evidence of favour. The feast of the Passover was introduced in order to maintain the memory of that event, or, rather, an old-established feast was injected with the contents of that memory. Nevertheless, it was only a memory: the Exodus belonged to a hazy past. In the present, signs of God's favour were decidedly scanty; the people's history pointed rather to his disfavour. Primitive peoples used to depose their gods or even to castigate them, if they failed to do their duty in securing them victory, happiness and comfort. In all periods kings have been treated in no way differently from gods; an ancient identity is thus revealed: an origin from a common root. Thus, modern peoples, too, are in the habit of expelling their kings if the glory of their reign is spoilt by defeats and the corresponding losses in territory and money. Why the people of Israel, however, clung more and more submissively to their God the worse they were treated by him - that is a problem which for the moment we must leave on one side.

[1939a, 4933]
Of all the events of early times which later poets, priests and historians undertook to work over, one stood out, the suppression of which was enjoined by the most immediate and best human motives. This was the murder of Moses, the great leader and liberator, which Sellin discovered from hints in the writings of the Prophets. Sellin's hypothesis cannot be called fantastic - it is probable enough. Moses, deriving from the school of Akhenaten, employed no methods other than did the king; he commanded, he forced his faith upon the people.¹ The doctrine of Moses may have been even harsher than that of his master. He had no need to retain the sun-god as a support: the school of On had no significance for his alien people. Moses, like Akhenaten, met with the same fate that awaits all enlightened despots. The Jewish people under Moses were just as little able to tolerate such a highly spiritualized religion and find satisfaction of their needs in what it had to offer as had been the Egyptians of the Eighteenth Dynasty. The same thing happened in both cases: those who had been dominated and kept in want rose and threw off the burden of the religion that had been imposed on them. But while the tame Egyptians waited till fate had removed the sacred figure of their Pharaoh, the savage Semites took fate into their own hands and rid themselves of their tyrant.²

Nor can it be maintained that the surviving text of the Bible gives us no warning of such an end to Moses. The account of the ‘wandering in the wilderness’, which may stand for the period during which Moses ruled, describes a succession of serious revolts against his authority which were also, by Yahweh's command, suppressed with bloody punishment. It is easy to imagine that one such rebellion ended in a way different from what the text suggests. The people’s defection from the new religion is also described in the text - only as an episode, it is true: namely in the story of the golden calf. In this, by an ingenious turn, the breaking of the tables of the law (which is to be understood symbolically: 'he has broken the law') is transposed on to Moses himself, and his furious indignation is assigned as its motive.

There came a time when people began to regret the murder of Moses and to seek to forget it. This was certainly so at the time of the union of the two portions of the people at Kadesh. But when the Exodus and the foundation of the religion at the oasis were brought closer together, and Moses was represented as being concerned in the latter instead of the other man, not only were the demands of the followers of Moses satisfied but the distressing fact of his violent end was successfully disavowed. In actual fact it is most unlikely that Moses could have taken part in the proceedings at Kadesh even if his life had not been cut short.
We must now make an attempt at elucidating the chronological relations of these events. We have put the Exodus in the period after the end of the Eighteenth Dynasty (1350 B.C.). It may have occurred then or a little later, since the Egyptian chroniclers have included the succeeding years of anarchy in the reign of Haremhab, which brought them to an end and lasted till 1315 B.C. The next (but also the only) fixed point for the chronology is afforded by the stela of Merenptah (1225-15 B.C.), which boasts of his victory over Isiraal (Israel) and the laying waste of her seed (?). The sense to be attached to this inscription is unfortunately doubtful, it is supposed to prove that the Israelite tribes were already at that time settled in Canaan.¹ Eduard Meyer rightly concludes from this stela that Merenptah cannot have been the Pharaoh of the Exodus, as had been lightly assumed previously. The date of the Exodus must have been earlier. The question of who was the Pharaoh of the Exodus seems to me altogether an idle one. There was no Pharaoh of the Exodus, for it occurred during an interregnum. Nor does the discovery of the stela of Merenptah throw any light on the possible date of the union and founding of the religion at Kadesh. All that we can say with certainty is that it was some time between 1350 and 1215 B.C. We suspect that the Exodus comes somewhere very near the beginning of this hundred years and the events at Kadesh not too far away from its end. We should like to claim the greater part of this period for the interval between the two occurrences. For we need a comparatively long time for the passions of the returning tribes to have cooled down after the murder of Moses and for the influence of his followers, the Levites, to have become as great as is implied by the compromise at Kadesh. Two generations, sixty years, might about suffice for this, but it is a tight fit. What is inferred from the stela of Merenptah comes too early for us, and since we recognize that in this hypothesis of ours one supposition is only based on another, we must admit that this discussion reveals a weak side of our construction. It is unlucky that everything relating to the settlement of the Jewish people in Canaan is so obscure and confused. Our only resort, perhaps, is to suppose that the name on the 'Israel' stela does not relate to the tribes whose fortunes we are trying to follow and which combined to form the later people of Israel. After all, the name of ‘Habiru’ (Hebrews) was transferred to these same people in the Amarna period.

[1939a, 4878]
The union of the tribes into a nation through the adoption of a common religion, whenever it may have taken place, might easily have turned out quite an unimportant happening in world history. The new religion would have been carried away by the current of events, Yahweh would have had to take his place in the procession of departed gods in Flaubert's vision, and all twelve of his tribes would have been 'lost' and not only the ten of them which the Anglo-Saxons have been in search of for so long. The god Yahweh, to whom the Midianite Moses then presented a new people, was probably in no respect a prominent being. A coarse, narrow-minded, local god, violent and bloodthirsty, he had promised his followers to give them 'a land flowing with milk and honey' and urged them to exterminate its present inhabitants 'with the edge of the sword'. It is astonishing how much remains, in spite of all the revisions of the Biblical narratives, that allows us to recognize his original nature. It is not even certain that his religion was a genuine monotheism, that it denied the divinity of the deities of other peoples. It was enough probably that his people regarded their own god as more powerful than any foreign god. If, nevertheless, in the sequel everything took a different course from what such beginnings would have led one to expect, the cause can be found in only one fact. The Egyptian Moses had given to one portion of the people a more highly spiritualized notion of god, the idea of a single deity embracing the whole world, who was not less all-loving than all-powerful, who was averse to all ceremonial and magic and set before men as their highest aim a life in truth and justice. For, however incomplete may be the accounts we have of the ethical side of the Aten religion, it can be no unimportant fact that Akhenaten regularly referred to himself in his inscriptions as 'living in Ma'at' (truth, justice).¹ In the long run it made no difference that the people rejected the teaching of Moses (probably after a short time) and killed him himself. The tradition of it remained and its influence achieved (only gradually, it is true, in the course of centuries) what was denied to Moses himself. The god Yahweh had arrived at undeserved honour when, from the time of Kadesh onwards, he was credited with the deed of liberation which had been performed by Moses; but he had to pay heavily for this usurpation. The shadow of the god whose place he had taken became stronger than himself; by the end of the process of evolution, the nature of the forgotten god of Moses had come to light behind his own. No one can doubt that it was only the idea of this other god that enabled the people of Israel to survive all the blows of fate and that kept them alive to our own days.

[1939a, 4879]

And here, it seems, I have reached the conclusion of my study, which was directed to the single aim of introducing the figure of an Egyptian Moses into the nexus of Jewish history. Our findings may be thus expressed in the most concise formula. Jewish history is familiar to us for its dualities: two groups of people who came together to form the nation, two kingdoms into which this nation fell apart, two gods' names in the documentary sources of the Bible. To these we add two fresh ones: the foundation of two religions - the first repressed by the second but nevertheless later emerging victoriously behind it, and two religious founders, who are both called by the same name of Moses and whose personalities we have to distinguish from each other. All of these dualities are the necessary consequences of the first one: the fact that one portion of the people had an experience which must be regarded as traumatic and which the other portion escaped. Beyond this there would be a very great deal to discuss, to explain and to assert. Only thus would an interest in our purely historical study find its true justification. What the real nature of a tradition resides in, and what its special power rests on, how impossible it is to dispute the personal influence upon world-history of individual great men, what sacrilege one commits against the splendid diversity of human life if one recognizes only those motives which arise from material needs, from what sources some ideas (and particularly religious ones) derive their power to subject both men and peoples to their yoke - to study all this in the special case of Jewish history would be an alluring task. To continue my work on such lines as these would be to find a link with the statements I put forward twenty-five years ago in *Totem and Taboo*. But I no longer feel that I have the strength to do so.

[1939a, 4881]
As regards internal difficulties, a political revolution and a change of domicile could alter nothing. No less than before, I feel uncertain in the face of my own work; I lack the consciousness of unity and of belonging together which should exist between an author and his work. It is not as though there were an absence of conviction in the correctness of my conclusion. I acquired that a quarter of a century ago when in 1912 I wrote my book about *Totem and Taboo*, and it has only grown firmer since. From that time I have never doubted that religious phenomena are only to be understood on the pattern of the individual neurotic symptoms familiar to us - as the return of long since forgotten, important events in the primaeval history of the human family - and that they have to thank precisely this origin for their compulsive character and that, accordingly, they are effective on human beings by force of the historical truth of their content. My uncertainty sets in only when I ask myself whether I have succeeded in proving these theses in the example which I have chosen here of Jewish monotheism. To my critical sense this book, which takes its start from the man Moses, appears like a dancer balancing on the tip of one toe. If I could not find support in an analytic interpretation of the exposure myth and could not pass from there to Sellin's suspicion about the end of Moses, the whole thing would have had to remain unwritten. In any case, let us now take the plunge.

[1939a, 4885]

We must take the period of the interregnum after 1350 B.C. as the date of the Exodus from Egypt. The interval of time which followed, up to the completion of the occupation of the land of Canaan, is particularly inscrutable. Modern historical research has been able to extract two facts from the obscurity which the biblical narrative has left, or rather created, at this point. The first of these facts, discovered by Ernst Sellin, is that the Jews, who, even by the account in the Bible, were headstrong and unruly towards their law-giver and leader, rose against him one day, killed him and threw off the religion of the Aten which had been imposed on them, just as the Egyptians had thrown it off earlier. The second fact, demonstrated by Eduard Meyer, is that those Jews who had returned from Egypt united later on with closely related tribes in the region between Palestine, the Sinai Peninsula and Arabia, and that there, in a well-watered locality named Kadesh, under the influence of the Arabian Midianites, they took on a new religion, the worship of the volcano god Yahweh. Soon after this they were ready to invade Canaan as conquerors.

[1939a, 4887]
All this, however, is still history, an attempt to fill up the gaps in our historical knowledge and in part a repetition of my second essay in *Imago*. Our interest follows the fortunes of Moses and of his doctrines, to which the rising of the Jews had only apparently put an end. From the account given by the Yahwist, which was written down in about 1000 B.C. but was certainly based on earlier records, we have discovered that the union and the founding of the religion at Kadesh were accompanied by a compromise in which the two sides are still easily distinguishable. The one partner was only concerned to disavow the novelty and foreign character of the god Yahweh and to increase his claim to the people's devotion; the other partner was anxious not to sacrifice to him precious memories of the liberation from Egypt and of the grand figure of the leader, Moses. The second side succeeded, too, in introducing both the fact and the man into the new account of prehistory, in retaining at least the external mark of the religion of Moses - circumcision - and possibly in establishing certain restrictions in the use of the name of the new god. As we have said, the representatives of these claims were the descendants of the followers of Moses, the Levites, who were separated from his contemporaries and compatriots by only a few generations and were still attached to his memory by a living recollection. The poetically embellished narrative which we attribute to the Yahwist, and to his later rival the Elohist, were like mausoleums beneath which, withdrawn from the knowledge of later generations, the true account of those early things - of the nature of the Mosaic religion and of the violent end of the great man - was, as it were, to find its eternal rest. And if we have guessed what happened correctly, there is nothing left about it that is puzzling; but it might very well have signified the final end of the Moses episode in the history of the Jewish people.

[1939a, 4889]

We have already repeatedly described what happened at Kadesh when the two portions of what was later to be the Jewish people came together to receive a new religion. In those, on the one hand, who had been in Egypt, memories of the Exodus and of the figure of Moses were still so strong and vivid that they demanded their inclusion in an account of early times. They were grandchildren, perhaps, of people who had known Moses himself, and some of them still felt themselves Egyptians and bore Egyptian names. But they had good motives for repressing the memory of the fate with which their leader and lawgiver had met. The determining purpose of the other portion of the people was to glorify the new god and to dispute his being foreign. Both portions had the same interest in disavowing the fact of their having had an earlier religion and the nature of its content. So it was that the first compromise came about, and it was probably soon recorded in writing. The people who had come from Egypt had brought writing and the desire to write history along with them; but it was to be a long time before historical writing realized that it was pledged to unswerving truthfulness. To begin with it had no scruples about shaping its narratives according to the needs and purposes of the moment, as though it had not yet recognized the concept of falsification. As a result of these circumstances a discrepancy was able to grow up between the written record and the oral transmission of the same material - *tradition*. What had been omitted or changed in the written record might very well have been preserved intact in tradition. Tradition was a supplement but at the same time a contradiction to historical writing. It was less subjected to the influence of distorting purposes and perhaps at some points quite exempt from them, and it might therefore be more truthful than the account that had been recorded in writing. Its trustworthiness, however, suffered from the fact that it was less stable and definite than the written account and exposed to numerous changes and alterations when it was handed on from one generation to another by oral communication. A tradition of such a kind might meet with various sorts of fate. What we should most expect would be that it would be crushed by the written account, would be unable to stand up against it, would become more and more shadowy and would finally pass into oblivion. But it might meet with other fates: one of these would be that the tradition itself would end in a written record, and we shall have to deal with yet others as we proceed.

[1939a, 4894]
The phenomenon of latency in the history of the Jewish religion, with which we are dealing, may be explained, then, by the circumstance that the facts and ideas which were intentionally disavowed by what may be called the official historians were in fact never lost. Information about them persisted in traditions which survived among the people. As we are assured by Sellin, indeed, there was actually a tradition about the end of Moses which flatly contradicted the official account and was far nearer the truth. The same, we may assume, also applied to other things which apparently ceased to exist at the same time as Moses - to some of the contents of the Mosaic religion, which had been unacceptable to the majority of his contemporaries.

[1939a, 4895]

It would be worth while to understand how it was that the monotheist idea made such a deep impression precisely on the Jewish people and that they were able to maintain it so tenaciously. It is possible, I think, to find an answer. Fate had brought the great deed and misdeed of primaeval days, the killing of the father, closer to the Jewish people by causing them to repeat it on the person of Moses, an outstanding father-figure. It was a case of 'acting out' instead of remembering, as happens so often with neurotics during the work of analysis. To the suggestion that they should remember, which was made to them by the doctrine of Moses, they reacted, however, by disavowing their action; they remained halted at the recognition of the great father and thus blocked their access to the point from which Paul was later to start his continuation of the primal history. It is scarcely a matter of indifference or of chance that the violent killing of another great man became the starting-point of Paul's new religious creation as well. This was a man whom a small number of adherents in Judaea regarded as the Son of God and as the Messiah who had been announced, and to whom, too, a part of the childhood story invented for Moses was later carried over, but of whom in fact we know scarcely more with certainty than of Moses - whether he was really the great teacher portrayed by the Gospels or whether, rather, it was not the fact and circumstances of his death which were decisive for the importance which his figure acquired. Paul, who became his apostle, had not known him himself.

[1939a, 4912]

The killing of Moses by his Jewish people, recognized by Sellin from traces of it in tradition (and also, strange to say, accepted by the young Goethe without any evidence¹) thus becomes an indispensable part of our construction, an important link between the forgotten event of primaeval times and its later emergence in the form of the monotheist religions.² It is plausible to conjecture that remorse for the murder of Moses provided the stimulus for the wishful phantasy of the Messiah, who was to return and lead his people to redemption and the promised world-dominion. If Moses was this first Messiah, Christ became his substitute and successor, and Paul could exclaim to the peoples with some historical justification: 'Look! the Messiah has really come: he has been murdered before your eyes!' Then, too, there is a piece of historical truth in Christ's resurrection, for he was the resurrected Moses and behind him the returned primal father of the primitive horde, transfigured and, as the son, put in the place of the father.

[1939a, 4913]
The poor Jewish people, who with their habitual stubbornness continued to disavow the father's murder, atoned heavily for it in the course of time. They were constantly met with the reproach 'You killed our God!' And this reproach is true, if it is correctly translated. If it is brought into relation with the history of religions, it runs: 'You will not admit that you murdered God (the primal picture of God, the primal father, and his later reincarnations). There should be an addition declaring: 'We did the same thing, to be sure, but we have admitted it and since then we have been absolved.' Not all the reproaches with which anti-semitism persecutes the descendants of the Jewish people can appeal to a similar justification. A phenomenon of such intensity and permanence as the people's hatred of the Jews must of course have more than one ground. It is possible to find a whole number of grounds, some of them clearly derived from reality, which call for no interpretation, and others, lying deeper and derived from hidden sources, which might be regarded as the specific reasons. Of the former, the reproach of being aliens is perhaps the weakest, since in many places dominated by anti-semitism to-day the Jews were among the oldest portions of the population or had even been there before the present inhabitants. This applies, for instance, to the city of Cologne, to which the Jews came with the Romans, before it was occupied by the Germans. Other grounds for hating the Jews are stronger - thus, the circumstances that they live for the most part as minorities among other peoples, for the communal feeling of groups requires, in order to complete it, hostility towards some extraneous minority, and the numerical weakness of this excluded minority encourages its suppression. There are, however, two other characteristics of the Jews which are quite unforgivable. First is the fact that in some respects they are different from their 'host' nations. They are not fundamentally different, for they are not Asiatics of a foreign race, as their enemies maintain, but composed for the most part of remnants of the Mediterranean peoples and heirs of the Mediterranean civilization. But they are none the less different, often in an indefinable way different, especially from the Nordic peoples, and the intolerance of groups is often, strangely enough, exhibited more strongly against small differences than against fundamental ones. The other point has a still greater effect: namely, that they defy all oppression, that the most cruel persecutions have not succeeded in exterminating them, and, indeed, that on the contrary they show a capacity for holding their own in commercial life and, where they are admitted, for making valuable contributions to every form of cultural activity.

[1939a, 4913]
The first of these is that we have here dealt with only a single instance from the copious phenomenology of religions and have thrown no light on any others. I must regrettfully admit that I am unable to give more than this one example and that my expert knowledge is insufficient to complete the enquiry. From my limited information I may perhaps add that the case of the founding of the Mahommedan religion seems to me like an abbreviated repetition of the Jewish one, of which it emerged as an imitation. It appears, indeed, that the Prophet intended originally to accept Judaism completely for himself and his people. The recapture of the single great primal father brought the Arabs an extraordinary exaltation of their self-confidence, which led to great worldly successes but exhausted itself in them. Allah showed himself far more grateful to his chosen people than Yahweh did to his. But the internal development of the new religion soon came to a stop, perhaps because it lacked the depth which had been caused in the Jewish case by the murder of the founder of their religion. The apparently rationalistic religions of the East are in their core ancestor-worship and so come to a halt, too, at an early stage of the reconstruction of the past. If it is true that in primitive peoples of to-day the recognition of a supreme being is the only content of their religion, we can only regard this as an atrophy of religious development and bring it into relation with the countless cases of rudimentary neuroses which are to be observed in the other field. Why it is that in the one case just as in the other things have gone no further, our knowledge is in both cases insufficient to tell us. We can only attribute the responsibility to the individual endowment of these peoples, the direction taken by their activity and their general social condition. Moreover, it is a good rule in the work of analysis to be content to explain what is actually before one and not to seek to explain what has not happened.

[1939a, 4915]

The second difficulty about this transference to group psychology is far more important, because it poses a fresh problem of a fundamental nature. It raises the question in what form the operative tradition in the life of peoples is present - a question which does not occur with individuals, since there it is solved by the existence in the unconscious of memory-traces of the past. Let us return to our historical example. We have attributed the compromise at Kadesh to the survival of a powerful tradition among those who had returned from Egypt. This case involves no problem. According to our theory, a tradition of this kind was based on conscious memories of oral communications which people then living had received from their ancestors only two or three generations back who had themselves been participants and eye-witnesses of the events in question. But can we believe the same thing of the later centuries - that the tradition still had its basis in a knowledge normally handed on from grandfather to grandchild? It is no longer possible to say, as it was in the earlier case, who the people were who preserved this knowledge and handed it on by word of mouth. According to Sellin the tradition of the murder of Moses was always in the possession of priestly circles till eventually it found expression in writing which alone enabled Sellin to discover it. But it can only have been known to a few people; it was not public property. And is that enough to explain its effect? Is it possible to attribute to knowledge held like this by a few people the power to produce such a lasting emotion in the masses when it came to their notice? It seems, rather, as though there must have been something present in the ignorant masses, too, which was in some way akin to the knowledge of the few and went half way to meet it when it was uttered.

[1939a, 4916]
Two further questions must now be answered. First, under what conditions does a memory of this kind enter the archaic heritage? And, secondly, in what circumstances can it become active - that is, can it advance to consciousness from its unconscious state in the id, even though in an altered and distorted shape? The answer to the first question is easy to formulate: the memory enters the archaic heritage if the event was important enough, or repeated often enough, or both. In the case of parricide both conditions are fulfilled. On the second question there is this to be said. A whole number of influences may be concerned, not all of which are necessarily known. A spontaneous development is also conceivable, on the analogy of what happens in some neuroses. What is certainly of decisive importance, however, is the awakening of the forgotten memory trace by a recent real repetition of the event. The murder of Moses was a repetition of this kind and, later, the supposed judicial murder of Christ: so that these events come into the foreground as causes. It seems as though the genesis of monotheism could not do without these occurrences. We are reminded of the poet's words:

[1939a, 4922]

There is no doubt that it was a mighty prototype of a father which, in the person of Moses, stooped to the poor Jewish bondsmen to assure them that they were his dear children. And no less overwhelming must have been the effect upon them of the idea of an only, eternal, almighty God, to whom they were not too mean for him to make a covenant with them and who promised to care for them if they remained loyal to his worship. It was probably not easy for them to distinguish the image of the man Moses from that of his God; and their feeling was right in this, for Moses may have introduced traits of his own personality into the character of his God - such as his wrathful temper and his relentlessness. And if, this being so, they killed their great man one day, they were only repeating a misdeed which in ancient times had been committed, as prescribed by law, against the Divine King and which, as we know, went back to a still more ancient prototype.¹

[1939a, 4931]
(b) The function of nutrition is most frequently disturbed by a disinclination to eat, brought about by a withdrawal of libido. An increase in the desire to eat is also a not uncommon thing. The compulsion to eat is attributed to a fear of starving; but this is a subject which has been but little studied. The symptom of vomiting is known to us as a hysterical defence against eating. Refusal to eat owing to anxiety is a concomitant of psychotic states (delusions of being poisoned).

[1926d, 4249]

The remarkable thing, however, is that that was not the case - that the most powerful effects of the people's experience were to come to light only later and to force their way into reality in the course of many centuries. It is unlikely that Yahweh differed much in character from the gods of the surrounding peoples and tribes. It is true that he struggled with them, just as the peoples themselves fought with one another, but we cannot suppose that it came into the head of a Yahweh-worshipper of those days to deny the existence of the gods of Canaan or Moab or Amalek, and so on, any more than to deny the existence of the peoples who believed in them.

[1939a, 4889]

We confess the belief, therefore, that the idea of a single god, as well as the rejection of magically effective ceremonial and the stress upon ethical demands made in his name, were in fact Mosaic doctrines, to which no attention was paid to begin with, but which, after a long interval had elapsed, came into operation and eventually became permanently established. How are we to explain a delayed effect of this kind and where do we meet with a similar phenomenon? It occurs to us at once that such things are not infrequently to be found in the most various spheres and that they probably come about in a number of ways which are understandable with greater or less ease. Let us take, for instance, the history of a new scientific theory, such as Darwin's theory of evolution. At first it met with embittered rejection and was violently disputed for decades; but it took no longer than a generation for it to be recognized as a great step forward towards truth. Darwin himself achieved the honour of a grave or cenotaph in Westminster Abbey. A case such as that leaves us little to unravel. The new truth awoke emotional resistances; these found expression in arguments by which the evidence in favour of the unpopular theory could be disputed; the struggle of opinions took up a certain length of time; from the first there were adherents and opponents; the number as well as the weight of the former kept on increasing till at last they gained the upper hand; during the whole time of the struggle the subject with which it was concerned was never forgotten. We are scarcely surprised that the whole course of events took a considerable length of time; and we probably do not sufficiently appreciate that what we are concerned with is a process in group psychology.

[1939a, 4892]
The next example we turn to appears to have even less in common with our problem. It may happen that a man who has experienced some frightful accident - a railway collision, for instance - leaves the scene of the event apparently uninjured. In the course of the next few weeks, however, he develops a number of severe psychical and motor symptoms which can only be traced to his shock, the concussion or whatever else it was. He now has a 'traumatic neurosis'. It is a quite unintelligible - that is to say, a new - fact. The time that has passed between the accident and the first appearance of the symptoms is described as the 'incubation period', in a clear allusion to the pathology of infectious diseases. On reflection, it must strike us that, in spite of the fundamental difference between the two cases - the problem of traumatic neurosis and that of Jewish monotheism - there is nevertheless one point of agreement: namely, in the characteristic that might be described as 'latency'. According to our assured hypothesis, in the history of the Jewish religion there was a long period after the defection from the religion of Moses during which no sign was to be detected of the monotheist idea, of the contempt for ceremonial or of the great emphasis on ethics. We are thus prepared for the possibility that the solution of our problem is to be looked for in a particular psychological situation.

[1939a, 4893]

The phenomenon of latency in the history of the Jewish religion, with which we are dealing, may be explained, then, by the circumstance that the facts and ideas which were intentionally disavowed by what may be called the official historians were in fact never lost. Information about them persisted in traditions which survived among the people. As we are assured by Sellin, indeed, there was actually a tradition about the end of Moses which flatly contradicted the official account and was far nearer the truth. The same, we may assume, also applied to other things which apparently ceased to exist at the same time as Moses - to some of the contents of the Mosaic religion, which had been unacceptable to the majority of his contemporaries.

[1939a, 4895]

The remarkable fact with which we are here confronted is, however, that these traditions, instead of becoming weaker with time, became more and more powerful in the course of centuries, forced their way into the later revisions of the official accounts and finally showed themselves strong enough to have a decisive influence on the thoughts and actions of the people. The determinants which made this outcome possible are for the moment, it is true, outside our knowledge.

[1939a, 4895]

This fact is so remarkable that we feel justified in looking at it once again. Our problem is comprised in it. The Jewish people had abandoned the Aten religion brought to them by Moses and had turned to the worship of another god who differed little from the Baalim of the neighbouring peoples. All the tendentious efforts of later times failed to disguise this shameful fact. But the Mosaic religion had not vanished without leaving a trace; some sort of memory of it had kept alive - a possibly obscured and distorted tradition. And it was this tradition of a great past which continued to operate (from the background, as it were), which gradually acquired more and more power over people's minds and which in the end succeeded in changing the god Yahweh into the Mosaic god and in re-awakening into life the religion of Moses that had been introduced and then abandoned long centuries before. That a tradition thus sunk in oblivion should exercise such a powerful effect on the mental life of a people is an unfamiliar idea to us. We find ourselves here in the field of group psychology, where we do not feel at home. We shall look about for analogies, for facts that are at least of a similar nature, even though in different fields. And facts of that sort are, I believe, to be found.

[1939a, 4895]
During the period at which, among the Jews, the return of the religion of Moses was in preparation, the Greek people found themselves in possession of an exceedingly rich store of tribal legends and hero-myths. It is believed that the ninth or eighth century B.C. saw the origin of the two Homeric epics, which drew their material from this circle of legends. With our present psychological insight we could, long before Schliemann and Evans, have raised the question of where it was that the Greeks obtained all the legendary material which was worked over by Homer and the great Attic dramatists in their masterpieces. The answer would have had to be that this people had probably experienced in their prehistory a period of external brilliance and cultural efflorescence which had perished in a historical catastrophe and of which an obscure tradition survived in these legends. The archaeological researches of our days have now confirmed this suspicion, which in the past would certainly have been pronounced too daring. These researches have uncovered the evidences of the impressive Minoan-Mycenaean civilization, which had probably already come to an end on the mainland of Greece before 1250 B.C. There is scarcely a hint at it to be found in the Greek historians of a later age: at most a remark that there was a time when the Cretans exercised command of the sea, and the name of King Minos and of his palace, the Labyrinth. That is all, and beyond it nothing has remained but the traditions which were seized on by the poets.

[1939a, 4896]

The only satisfying analogy to the remarkable course of events that we have found in the history of the Jewish religion lies in an apparently remote field; but it is very complete, and approaches identity. In it we once more come upon the phenomenon of latency, the emergence of unintelligible manifestations calling for an explanation and an early, and later forgotten, event as a necessary determinant. We also find the characteristic of compulsion, which forces itself on the mind along with an overpowering of logical thought - a feature which did not come into account, for instance, in the genesis of the epic.

[1939a, 4898]
The killing of Moses by his Jewish people, recognized by Sellin from traces of it in tradition (and also, strange to say, accepted by the young Goethe without any evidence¹) thus becomes an indispensable part of our construction, an important link between the forgotten event of primaeval times and its later emergence in the form of the monotheist religions.² It is plausible to conjecture that remorse for the murder of Moses provided the stimulus for the wishful phantasy of the Messiah, who was to return and lead his people to redemption and the promised world-dominion. If Moses was this first Messiah, Christ became his substitute and successor, and Paul could exclaim to the peoples with some historical justification: 'Look! the Messiah has really come: he has been murdered before your eyes!' Then, too, there is a piece of historical truth in Christ's resurrection, for he was the resurrected Moses and behind him the returned primal father of the primitive horde, transfigured and, as the son, put in the place of the father. [1939a, 4913]

[1939a, 4913]
If no more certainty could be reached than this, why, it may be asked, have I brought this enquiry into public notice at all? I am sorry to say that even my justification for doing so cannot go beyond hints. For if one allows oneself to be carried away by the two arguments which I have put forward here, and if one sets out to take the hypothesis seriously that Moses was an aristocratic Egyptian, very interesting and far-reaching prospects are opened up. With the help of some not very remote assumptions, we shall, I believe, be able to understand the motives which led Moses in the unusual step he took and, closely related to this, to obtain a grasp of the possible basis of a number of the characteristics and peculiarities of the laws and religion which he gave to the Jewish people; and we shall even be led on to important considerations regarding the origin of monotheist religions in general. Such weighty conclusions cannot, however, be founded on psychological probabilities alone. Even if one accepts the fact of Moses being an Egyptian as a first historical foothold, one would need to have at least a second firm fact in order to defend the wealth of emerging possibilities against the criticism of their being a product of the imagination and too remote from reality. Objective evidence of the period to which the life of Moses and with it the Exodus from Egypt are to be referred would perhaps have fulfilled this requirement. But this has not been obtainable, and it will therefore be better to leave unmentioned any further implications of the discovery that Moses was an Egyptian. [1939a, 4847]

In an earlier contribution to this periodical,¹ I attempted to bring up a fresh argument in support of the hypothesis that the man Moses, the liberator and law-giver of the Jewish people, was not a Jew but an Egyptian. It had long been observed that his name was derived from the Egyptian vocabulary, though the fact had not been properly appreciated. What I added was that the interpretation of the myth of exposure which was linked with Moses necessarily led to the inference that he was an Egyptian whom the needs of a people sought to make into a Jew. I remarked at the end of my paper that important and far-reaching implications followed from the hypothesis that Moses was an Egyptian, but that I was not prepared to argue publicly in favour of these implications, since they were based only on psychological probabilities and lacked any objective proof. The greater the importance of the views arrived at in this way, the more strongly one feels the need to beware of exposing them without a secure basis to the critical assaults of the world around one - like a bronze statue with feet of clay. Not even the most tempting probability is a protection against error; even if all the parts of a problem seem to fit together like the pieces of a jig-saw puzzle, one must reflect that what is probable is not necessarily the truth and that the truth is not always probable. And lastly, it did not seem attractive to find oneself classed with the schoolmen and Talmudists who delight in exhibiting their ingenuity without regard to how remote from reality their thesis may be. [1939a, 4848]
It was our hope that the hypothesis that Moses was an Egyptian would turn out to be fruitful and illuminating in various directions. But the first conclusion we drew from that hypothesis - that the new religion which he gave to the Jews was his own Egyptian one - has been invalidated by our realization of the different, and indeed contradictory, character of the two religions.

Another possibility is opened to us by a remarkable event in the history of the Egyptian religion, an event which has only lately been recognized and appreciated. It remains possible that the religion which Moses gave to his Jewish people was nevertheless his own - that it was an Egyptian religion, though not the Egyptian religion.

I should now like to venture on this conclusion: if Moses was an Egyptian and if he communicated his own religion to the Jews, it must have been Akhenaten's, the Aten religion.

I have already compared the Jewish religion with the popular religion of Egypt and shown the opposition between them, I must now make a comparison between the Jewish and the Aten religions in the expectation of proving their original identity. This, I am aware, will present no easy task. Thanks to the vindictiveness of the priests of Amun we may perhaps know too little of the Aten religion. We only know the Mosaic religion in its final shape, as it was fixed by the Jewish priesthood some eight hundred years later in post-exilic times. If, in spite of this unfavourable state of the material, we find a few indications which favour our hypothesis, we shall be able to set a high value on them.

There would be a short path to proving our thesis that the Mosaic religion was none other than that of the Aten - namely, if we had a confession of faith, a declaration. But I fear we shall be told that this path is closed to us. The Jewish confession of faith, as is well known, runs: 'Schema Jisroel Adonai Elohenu Adonai Echod.' If it is not merely by chance that the name of the Egyptian Aten (or Atum) sounds like the Hebrew word Adonai and the name of the Syrian deity Adonis, but if it is due to a primaeval kinship of speech and meaning, then the Jewish formula might be translated thus: 'Hear, O Israel: our god Aten (Adonai) is a sole god.' Unfortunately I am totally incompetent to answer this question, and I have been able to find but little about it in the literature of the subject. But in all probability this is making things too easy for us. In any case we shall have to come back once more to the problems concerning the name of the god.
Moses did not only give the Jews a new religion; it can be stated with equal certainty that he introduced the custom of circumcision to them. This fact is of decisive importance for our problem and has scarcely ever been considered. It is true that the Biblical account contradicts this more than once. On the one hand it traces circumcision back to the patriarchal age as a mark of a covenant between God and Abraham; on the other hand it describes in a quite particularly obscure passage how God was angry with Moses for having neglected a custom which had become holy,¹ and sought to kill him; but that his wife, a Midianite, saved her husband from God's wrath by quickly performing the operation. These, however, are distortions, which should not lead us astray; later on we shall discover the reason for them. The fact remains that there is only one answer to the question of where the Jews derived the custom of circumcision from - namely, from Egypt. Herodotus, the 'father of history', tells us that the custom of circumcision had long been indigenous in Egypt, and his statements are confirmed by the findings in mummies and indeed by pictures on the walls of tombs. No other people of the Eastern Mediterranean, so far as we know, practised this custom; it may safely be presumed that the Semites, Babylonians and Sumerians were uncircumcised. The Bible story itself says this is so of the inhabitants of Canaan; it is a necessary premiss to the adventure of Jacob's daughter and the prince of Shechem.² The possibility that the Jews acquired the custom of circumcision during their sojourn in Egypt in some way other than in connection with the religious teaching of Moses may be rejected as completely without foundation. Now, taking it as certain that circumcision was a universal popular custom in Egypt and lead them to develop an independent and self-conscious national existence in another country - which was what in fact happened. What sense could it have, in that case, that he should at the same time impose on them a troublesome custom which even, to some extent, made them into Egyptians and which must keep permanently alive their memory of Egypt - whereas his efforts could only be aimed in the opposite direction, towards alienating his people from the land of their bondage and overcoming their longing for the 'flesh-pots of Egypt'? No, the fact from which we started and the hypothesis which we added to it are so incompatible with each other that we may be bold enough to reach this conclusion: if Moses gave the Jews not only a new religion but also the commandment for circumcision, he was not a Jew but an Egyptian, and in that case the Mosaic religion was probably an Egyptian one and, in view of its contrast to the popular religion, the religion of the Aten, with which the later Jewish religion agrees in some remarkable respects.

Later on, however, Jewish tradition behaved as though it were put at a disadvantage by the inference we have been drawing. If it were to be admitted that circumcision was an Egyptian custom introduced by Moses, that would be almost as much as to recognize that the religion delivered to them by Moses was an Egyptian one too. There were good reasons for denying that fact, so the truth about circumcision must also be contradicted.

At this point I expect to be met by an objection to my hypothesis. This placed Moses, an Egyptian, in the Akhenaten period. It derived his decision to take over the Jewish people from the political circumstances in the country at that time, and it recognized the religion that he presented to or imposed on his protégés as the Aten religion, which had actually collapsed in Egypt itself. I expect to be told that I have brought forward this structure of conjectures with too much positiveness, for which there is no basis in the material. This objection is, I think, unjustified. I have already laid stress on the factor of doubt in my introductory remarks; I have, as it were, placed that factor outside the brackets and I may be allowed to save myself the trouble of repeating it in connection with each item inside them.
I may continue the discussion with a few critical remarks of my own. The kernel of my hypothesis - the dependence of Jewish monotheism on the monotheist episode in Egyptian history - has been suspected and mentioned by various writers. I spare myself the trouble of quoting these opinions here, since none of them is able to indicate how this influence can have come into operation. Even though in our view that influence remains linked to the figure of Moses, we ought also to mention some other possibilities in addition to the one we prefer. It must not be supposed that the fall of the official Aten religion brought the monotheist current in Egypt to a complete stop. The priesthood at On, from which it started, survived the catastrophe and may have continued to bring under the sway of its trend of ideas generations after Akhenaten's. Thus the action taken by Moses is still conceivable even if he did not live at the time of Akhenaten and did not fall under his personal influence, if he was only an adherent or perhaps a member of the priesthood of On. This possibility would postpone the date of the Exodus and bring it closer to the date which is usually adopted (in the thirteenth century); but it has nothing else to recommend it. Our insight into the motives of Moses would be lost and the facilitation of the Exodus by the prevailing anarchy in the country would no longer apply. The succeeding kings of the Nineteenth Dynasty established a strong régime. It was only during the period immediately after the heretic king's death that there was a convergence of all the conditions, external and internal alike, that were favourable to the Exodus.

[1939a, 4861]

The union of the tribes into a nation through the adoption of a common religion, whenever it may have taken place, might easily have turned out quite an unimportant happening in world history. The new religion would have been carried away by the current of events, Yahweh would have had to take his place in the procession of departed gods in Flaubert's vision, and all twelve of his tribes would have been 'lost' and not only the ten of them which the Anglo-Saxons have been in search of for so long. The god Yahweh, to whom the Midianite Moses then presented a new people, was probably in no respect a prominent being. A coarse, narrow-minded, local god, violent and bloodthirsty, he had promised his followers to give them 'a land flowing with milk and honey' and urged them to exterminate its present inhabitants 'with the edge of the sword'. It is astonishing how much remains, in spite of all the revisions of the Biblical narratives, that allows us to recognize his original nature. It is not even certain that his religion was a genuine monotheism, that it denied the divinity of the deities of other peoples. It was enough probably that his people regarded their own god as more powerful than any foreign god. If, nevertheless, in the sequel everything took a different course from what such beginnings would have led one to expect, the cause can be found in only one fact. The Egyptian Moses had given to one portion of the people a more highly spiritualized notion of god, the idea of a single deity embracing the whole world, who was not less all-loving than all-powerful, who was averse to all ceremonial and magic and set before men as their highest aim a life in truth and justice. For, however incomplete may be the accounts we have of the ethical side of the Aten religion, it can be no unimportant fact that Akhenaten regularly referred to himself in his inscriptions as 'living in Ma'at' (truth, justice).¹ In the long run it made no difference that the people rejected the teaching of Moses (probably after a short time) and killed him himself. The tradition of it remained and its influence achieved (only gradually, it is true, in the course of centuries) what was denied to Moses himself. The god Yahweh had arrived at undeserved honour when, from the time of Kadesh onwards, he was credited with the deed of liberation which had been performed by Moses; but he had to pay heavily for this usurpation. The shadow of the god whose place he had taken became stronger than himself; by the end of the process of evolution, the nature of the forgotten god of Moses had come to light behind his own. No one can doubt that it was only the idea of this other god that enabled the people of Israel to survive all the blows of fate and that kept them alive to our own days.

[1939a, 4879]
Thus far what is established historically; and now our hypothetical sequel begins. Among those in Akhenaten's entourage there was a man who was perhaps called Tuthmosis, like many other people at that time¹ - the name is not of great importance except that its second component must have been 'mose'. He was in a high position and a convinced adherent of the Aten religion, but, in contrast to the meditative king, he was energetic and passionate. For him the death of Akhenaten and the abolition of his religion meant the end of all his expectations. He could remain in Egypt only as an outlaw or as a renegade. Perhaps as governor of the frontier province he had come in contact with a Semitic tribe which had immigrated into it a few generations earlier. Under the necessity of his disappointment and loneliness he turned to these foreigners and with them sought compensation for his losses. He chose them as his people and tried to realize his ideals in them. After he had left Egypt with them, accompanied by his followers, he made them holy by the mark of circumcision, gave them laws and introduced them into the doctrines of the Aten religion, which the Egyptians had just thrown off. The precepts which this man Moses gave to his Jews may have been even harsher than those of his master and teacher Akhenaten, and he may, too, have given up dependence on the sun-god of On, to which Akhenaten had continued to adhere.

[1939a, 4887]

In Egypt Aten had begun to dominate during a fortunate period of established possession, and even when the empire began to totter, his worshippers had been able to turn away from the disturbance and continued to praise and to enjoy his creations. The Jewish people were fated to experience a series of grave trials and painful events; their god became harsh and severe and, as it were, wrapped in gloom. He retained the characteristic of being a universal god, reigning over all countries and peoples, but the fact that his worship had passed over from the Egyptians to the Jews found expression in the additional belief that the Jews were his chosen people whose special obligations would eventually meet with a special reward as well. It may not have been easy for the people to reconcile a belief in being preferred by their omnipotent god with the sad experiences of their unfortunate destiny. But they did not allow themselves to be shaken in their convictions; they increased their own sense of guilt in order to stifle their doubts of God, and it may be that they pointed at last to the 'inscrutable decrees of Providence', as pious people do to this day. If they felt inclined to wonder at his allowing one violent aggressor after another to arise and overthrow and maltreat them - Assyrians, Babylonians, Persians - they could yet recognize his power in the fact that all these evil foes were themselves conquered in turn and that their empires vanished.

[1939a, 4890]

And here someone might ask what we gain by tracing Jewish to Egyptian monotheism. It merely pushes the problem a little way further back: it tells us nothing more of the genesis of the monotheist idea. The answer is that the question is not one of gain but of investigation. Perhaps we may learn something from it if we discover the real course of events.

[1939a, 4892]
No other portion of the history of religion has become so clear to us as the introduction of monotheism into Judaism and its continuation in Christianity - if we leave on one side the development which we can trace no less uninterruptedly, from the animal totem to the human god with his regular companions. (Each of the four Christian evangelists still has his own favourite animal.) If we provisionally accept the world-empire of the Pharaohs as the determining cause of the emergence of the monotheist idea, we see that that idea, released from its native soil and transferred to another people was, after a long period of latency, taken hold of by them, preserved by them as a precious possession and, in turn, itself kept them alive by giving them pride in being a chosen people: it was the religion of their primal father to which were attached their hope of reward, of distinction and finally of world-dominion. This last wishful phantasy, long abandoned by the Jewish people, still survives among that people's enemies in a belief in a conspiracy by the 'Elders of Zion'. We reserve for discussion in later pages how the special peculiarities of the monotheist religion borrowed from Egypt affected the Jewish people and how it was bound to leave a permanent imprint on their character through its rejection of magic and mysticism, its invitation to advances in intellectuality and its encouragement of sublimations; how the people, enraptured by the possession of the truth, overwhelmed by the consciousness of being chosen, came to have a high opinion of what is intellectual and to lay stress on what is moral; and how their melancholy destinies and their disappointments in reality served only to intensify all these trends. For the moment we will follow their development in another direction. [1939a, 4909]

We have already said that the Christian ceremony of Holy Communion, in which the believer incorporates the Saviour's blood and flesh, repeats the content of the old totem meal - no doubt only in its affectionate meaning, expressive of veneration, and not in its aggressive meaning. The ambivalence that dominates the relation to the father was clearly shown, however, in the final outcome of the religious novelty. Ostensibly aimed at propitiating the father god, it ended in his being dethroned and got rid of. Judaism had been a religion of the father; Christianity became a religion of the son. The old God the Father fell back behind Christ; Christ, the Son, took his place, just as every son had hoped to do in primaeval times. Paul, who carried Judaism on, also destroyed it. No doubt he owed his success in the first instance to the fact that, through the idea of the redeemer, he exorcized humanity's sense of guilt; but he owed it as well to the circumstance that he abandoned the 'chosen' character of his people and its visible mark - circumcision - so that the new religion could be a universal one, embracing all men. Though a part may have been played in Paul's taking this step by his personal desire for revenge for the rejection of his innovation in Jewish circles, yet it also restored a feature of the old Aten religion - it removed a restriction which that religion had acquired when it was handed over to a new vehicle, the Jewish people. [1939a, 4911]
We cannot follow the chain of events further, but if we have rightly recognized these first steps, the monotheist idea returned like a boomerang to the land of its origin. Thus it seems unfruitful to try to fix the credit due to an individual in connection with a new idea. It is clear that many have shared in its development and made contributions to it. And, again, it would obviously be unjust to break off the chain of causes at Moses and to neglect what was effected by those who succeeded him and carried on his ideas, the Jewish Prophets. The seed of monotheism failed to ripen in Egypt. The same thing might have happened in Israel after the people had thrown off the burdensome and exacting religion. But there constantly arose from the Jewish people men who revived the fading tradition, who renewed the admonitions and demands made by Moses, and who did not rest till what was lost had been established once again. In the course of constant efforts over centuries, and finally owing to two great reforms, one before and one after the Babylonian exile, the transformation was accomplished of the popular god Yahweh into the God whose worship had been forced upon the Jews by Moses. And evidence of the presence of a peculiar psychical aptitude in the masses who had become the Jewish people is revealed by the fact that they were able to produce so many individuals prepared to take on the burdens of the religion of Moses in return for the reward of being the chosen people and perhaps for some other prizes of a similar degree.

Original sin and redemption by the sacrifice of a victim became the foundation stones of the new religion founded by Paul. It must remain uncertain whether there was a ringleader and instigator to the murder among the band of brothers who rebelled against the primal father, or whether such a figure was created later by the imagination of creative artists in order to turn themselves into heroes, and was then introduced into the tradition. After the Christian doctrine had burst the framework of Judaism, it took up components from many other sources, renounced a number of characteristics of pure monotheism and adapted itself in many details to the rituals of the other Mediterranean peoples. It was as though Egypt was taking vengeance once more on the heirs of Akhenaten. It is worth noticing how the new religion dealt with the ancient ambivalence in the relation to the father. Its main content was, it is true, reconciliation with God the Father, atonement for the crime committed against him; but the other side of the emotional relation showed itself in the fact that the son, who had taken the atonement on himself, became a god himself beside the father and, actually, in place of the father. Christianity, having arisen out of a father-religion, became a son-religion. It has not escaped the fate of having to get rid of the father.
There is something that stands in the way of this possibility: the fact of there being the most violent contrast between the Jewish religion which is attributed to Moses and the religion of Egypt. The former is a rigid monotheism on the grand scale: there is only one God, he is the sole God, omnipotent, unapproachable; his aspect is more than human eyes can tolerate, no image must be made of him, even his name may not be spoken. In the Egyptian religion there is an almost innumerable host of deities of varying dignity and origin: a few personifications of great natural forces such as heaven and earth, sun and moon, an occasional abstraction such as Ma’at (truth or justice) or a caricature such as the dwarf-like Bes; but most of them local gods, dating from the period when the country was divided into numerous provinces, with the shape of animals, as though they had not yet completed their evolution from the old totem animals, with no sharp distinctions between them, and scarcely differing in the functions allotted to them. The hymns in honour of these gods say almost the same things about all of them, and identify them with one another unhesitatingly, in a manner hopelessly confusing to us. The names of gods are combined with one another, so that one of them may almost be reduced to being an epithet of the other. Thus, in the heyday of the 'New Kingdom' the principal god of the city of Thebes was called Amen-Re’; the first part of this compound stands for the ram-headed god of the city, while Re’ is the name of the falcon-headed sun-god of On. Magical and ceremonial acts, charms and amulets dominated the service of these gods as they did the daily life of the Egyptians.
[1939a, 4849]
This first difficulty is promptly followed by another. We must not forget that Moses was not only the political leader of the Jews settled in Egypt but was also their law-giver and educator and forced them into the service of a new religion, which to this very day is known after him as the Mosaic one. But is it so easy for one single man to create a new religion? And if anyone wishes to influence another person's religion, would he not most naturally convert him to his own? The Jewish people in Egypt were certainly not without a religion of some form or other; and if Moses, who gave them a new one, was an Egyptian, the presumption cannot be put aside that this other new religion was the Egyptian one.

[1939a, 4849]

There is something that stands in the way of this possibility: the fact of there being the most violent contrast between the Jewish religion which is attributed to Moses and the religion of Egypt. The former is a rigid monotheism on the grand scale: there is only one God, he is the sole God, omnipotent, unapproachable; his aspect is more than human eyes can tolerate, no image must be made of him, even his name may not be spoken. In the Egyptian religion there is an almost innumerable host of deities of varying dignity and origin: a few personifications of great natural forces such as heaven and earth, sun and moon, an occasional abstraction such as Ma'at (truth or justice) or a caricature such as the dwarf-like Bes; but most of them local gods, dating from the period when the country was divided into numerous provinces, with the shape of animals, as though they had not yet completed their evolution from the old totem animals, with no sharp distinctions between them, and scarcely differing in the functions allotted to them. The hymns in honour of these gods say almost the same things about all of them, and identify them with one another unhesitatingly, in a manner hopelessly confusing to us. The names of gods are combined with one another, so that one of them may almost be reduced to being an epithet of the other. Thus, in the heyday of the 'New Kingdom' the principal god of the city of Thebes was called Amen-Re'; the first part of this compound stands for the ram-headed god of the city, while Re' is the name of the falcon-headed sun-god of On. Magical and ceremonial acts, charms and amulets dominated the service of these gods as they did the daily life of the Egyptians.

[1939a, 4849]

It was our hope that the hypothesis that Moses was an Egyptian would turn out to be fruitful and illuminating in various directions. But the first conclusion we drew from that hypothesis - that the new religion which he gave to the Jews was his own Egyptian one - has been invalidated by our realization of the different, and indeed contradictory, character of the two religions.

[1939a, 4850]

Another possibility is opened to us by a remarkable event in the history of the Egyptian religion, an event which has only lately been recognized and appreciated. It remains possible that the religion which Moses gave to his Jewish people was nevertheless his own - that it was an Egyptian religion, though not the Egyptian religion.

[1939a, 4851]

I should now like to venture on this conclusion: if Moses was an Egyptian and if he communicated his own religion to the Jews, it must have been Akhenaten's, the Aten religion.

[1939a, 4856]
I have already compared the Jewish religion with the popular religion of Egypt and shown the opposition between them, I must now make a comparison between the Jewish and the Aten religions in the expectation of proving their original identity. This, I am aware, will present no easy task. Thanks to the vindictiveness of the priests of Amun we may perhaps know too little of the Aten religion. We only know the Mosaic religion in its final shape, as it was fixed by the Jewish priesthood some eight hundred years later in post-exilic times. If, in spite of this unfavourable state of the material, we find a few indications which favour our hypothesis, we shall be able to set a high value on them.

There would be a short path to proving our thesis that the Mosaic religion was none other than that of the Aten - namely, if we had a confession of faith, a declaration. But I fear we shall be told that this path is closed to us. The Jewish confession of faith, as is well known, runs: ‘Schema Jisroel Adonai Elohenu Adonai Echod.’ If it is not merely by chance that the name of the Egyptian Aten (or Atum) sounds like the Hebrew word Adonai and the name of the Syrian deity Adonis, but if it is due to a primaeval kinship of speech and meaning, then the Jewish formula might be translated thus: ‘Hear, O Israel: our god Aten (Adonai) is a sole god.’ Unfortunately I am totally incompetent to answer this question, and I have been able to find but little about it in the literature of the subject.¹ But in all probability this is making things too easy for us. In any case we shall have to come back once more to the problems concerning the name of the god.

The similarities as well as the differences between the two religions are easily discernible without giving us much light. Both of them were forms of a strict monotheism, and we shall be inclined a priori to trace back what they had in common to this fundamental characteristic. Jewish monotheism behaved in some respects even more harshly than the Egyptian: for instance in forbidding pictorial representations of any kind. The most essential difference is to be seen (apart from their gods' names) in the fact that the Jewish religion was entirely without sun worship, in which the Egyptian one still found support. When we were making the comparison with the popular religion of Egypt, we had an impression that, apart from the fundamental contrast, a factor of intentional contradiction played a part in the difference between the two religions. This impression seems to be justified if now, in making the comparison, we replace the Jewish religion by the Aten religion which, as we know, was developed by Akhenaten in deliberate hostility to the popular one. We were rightly surprised to find that the Jewish religion would have nothing to do with the next world or a life after death, though a doctrine of that kind would have been compatible with the strictest monotheism. But this surprise vanishes if we turn back from the Jewish to the Aten religion and suppose that this refusal was taken over from it, since for Akhenaten it was a necessity in his fight against the popular religion, in which Osiris, the god of the dead, played a greater part, perhaps, than any god in the upper world. The agreement between the Jewish and the Aten religions on this important point is the first strong argument in favour of our thesis. We shall learn that it is not the only one.

[1939a, 4856]

[1939a, 4857]
At this point I expect to be met by an objection to my hypothesis. This placed Moses, an Egyptian, in the Akhenaten period. It derived his decision to take over the Jewish people from the political circumstances in the country at that time, and it recognized the religion that he presented to or imposed on his protégés as the Aten religion, which had actually collapsed in Egypt itself. I expect to be told that I have brought forward this structure of conjectures with too much positiveness, for which there is no basis in the material. This objection is, I think, unjustified. I have already laid stress on the factor of doubt in my introductory remarks; I have, as it were, placed that factor outside the brackets and I may be allowed to save myself the trouble of repeating it in connection with each item inside them.

[1939a, 4861]

The union of the tribes into a nation through the adoption of a common religion, whenever it may have taken place, might easily have turned out quite an unimportant happening in world history. The new religion would have been carried away by the current of events, Yahweh would have had to take his place in the procession of departed gods in Flaubert's vision, and all twelve of his tribes would have been 'lost' and not only the ten of them which the Anglo-Saxons have been in search of for so long. The god Yahweh, to whom the Midianite Moses then presented a new people, was probably in no respect a prominent being. A coarse, narrow-minded, local god, violent and bloodthirsty, he had promised his followers to give them 'a land flowing with milk and honey' and urged them to exterminate its present inhabitants 'with the edge of the sword'. It is astonishing how much remains, in spite of all the revisions of the Biblical narratives, that allows us to recognize his original nature. It is not even certain that his religion was a genuine monotheism, that it denied the divinity of the deities of other peoples. It was enough probably that his people regarded their own god as more powerful than any foreign god. If, nevertheless, in the sequel everything took a different course from what such beginnings would have led one to expect, the cause can be found in only one fact. The Egyptian Moses had given to one portion of the people a more highly spiritualized notion of god, the idea of a single deity embracing the whole world, who was not less all-loving than all-powerful, who was averse to all ceremonial and magic and set before men as their highest aim a life in truth and justice. For, however incomplete may be the accounts we have of the ethical side of the Aten religion, it can be no unimportant fact that Akhenaten regularly referred to himself in his inscriptions as 'living in Ma'at' (truth, justice).¹ In the long run it made no difference that the people rejected the teaching of Moses (probably after a short time) and killed him himself. The tradition of it remained and its influence achieved (only gradually, it is true, in the course of centuries) what was denied to Moses himself. The god Yahweh had arrived at undeserved honour when, from the time of Kadesh onwards, he was credited with the deed of liberation which had been performed by Moses; but he had to pay heavily for this usurpation. The shadow of the god whose place he had taken became stronger than himself; by the end of the process of evolution, the nature of the forgotten god of Moses had come to light behind his own. No one can doubt that it was only the idea of this other god that enabled the people of Israel to survive all the blows of fate and that kept them alive to our own days.

[1939a, 4879]
Thus far what is established historically; and now our hypothetical sequel begins. Among those in Akhenaten’s entourage there was a man who was perhaps called Tuthmosis, like many other people at that time¹ - the name is not of great importance except that its second component must have been ‘-mose’. He was in a high position and a convinced adherent of the Aten religion, but, in contrast to the meditative king, he was energetic and passionate. For him the death of Akhenaten and the abolition of his religion meant the end of all his expectations. He could remain in Egypt only as an outlaw or as a renegade. Perhaps as governor of the frontier province he had come in contact with a Semitic tribe which had immigrated into it a few generations earlier. Under the necessity of his disappointment and loneliness he turned to these foreigners and with them sought compensation for his losses. He chose them as his people and tried to realize his ideals in them. After he had left Egypt with them, accompanied by his followers, he made them holy by the mark of circumcision, gave them laws and introduced them into the doctrines of the Aten religion, which the Egyptians had just thrown off. The precepts which this man Moses gave to his Jews may have been even harsher than those of his master and teacher Akhenaten, and he may, too, have given up dependence on the sun-god of On, to which Akhenaten had continued to adhere.

¹ [1939a, 4887]

I have already said - and on that point I have been glad to be able to claim agreement with other writers - that the central fact of the development of the Jewish religion was that in the course of time the god Yahweh lost his own characteristics and grew more and more to resemble the old god of Moses, the Aten. It is true that differences remained to which one would be inclined at a first glance to attribute great importance; but these can easily be explained.

² [1939a, 4890]

In Egypt Aten had begun to dominate during a fortunate period of established possession, and even when the empire began to totter, his worshippers had been able to turn away from the disturbance and continued to praise and to enjoy his creations. The Jewish people were fated to experience a series of grave trials and painful events; their god became harsh and severe and, as it were, wrapped in gloom. He retained the characteristic of being a universal god, reigning over all countries and peoples, but the fact that his worship had passed over from the Egyptians to the Jews found expression in the additional belief that the Jews were his chosen people whose special obligations would eventually meet with a special reward as well. It may not have been easy for the people to reconcile a belief in being preferred by their omnipotent god with the sad experiences of their unfortunate destiny. But they did not allow themselves to be shaken in their convictions; they increased their own sense of guilt in order to stifle their doubts of God, and it may be that they pointed at last to the ‘inscrutable decrees of Providence’, as pious people do to this day. If they felt inclined to wonder at his allowing one violent aggressor after another to arise and overthrow and maltreat them - Assyrians, Babylonians, Persians - they could yet recognize his power in the fact that all these evil foes were themselves conquered in turn and that their empires vanished.
³ [1939a, 4890]
This fact is so remarkable that we feel justified in looking at it once again. Our problem is comprised in it. The Jewish people had abandoned the Aten religion brought to them by Moses and had turned to the worship of another god who differed little from the Baalim of the neighbouring peoples. All the tendentious efforts of later times failed to disguise this shameful fact. But the Mosaic religion had not vanished without leaving a trace; some sort of memory of it had kept alive - a possibly obscured and distorted tradition. And it was this tradition of a great past which continued to operate (from the background, as it were), which gradually acquired more and more power over people's minds and which in the end succeeded in changing the god Yahweh into the Mosaic god and in re-awakening into life the religion of Moses that had been introduced and then abandoned long centuries before. That a tradition thus sunk in oblivion should exercise such a powerful effect on the mental life of a people is an unfamiliar idea to us. We find ourselves here in the field of group psychology, where we do not feel at home. We shall look about for analogies, for facts that are at least of a similar nature, even though in different fields. And facts of that sort are, I believe, to be found.

If on the one hand we thus see the figure of the great man grown to divine proportions, yet on the other hand we must recall that the father too was once a child. The great religious idea for which the man Moses stood was, on our view, not his own property: he had taken it over from King Akhenaten. And he, whose greatness as the founder of a religion is unequivocally established, may perhaps have been following hints which had reached him - from near or distant parts of Asia - through the medium of his mother or by other paths.

Among the precepts of the Moses religion there is one that is of greater importance than appears to begin with. This is the prohibition against making an image of God - the compulsion to worship a God whom one cannot see. In this, I suspect, Moses was outdoing the strictness of the Aten religion. Perhaps he merely wanted to be consistent: his God would in that case have neither a name nor a countenance. Perhaps it was a fresh measure against magical abuses. But if this prohibition were accepted, it must have a profound effect. For it meant that a sensory perception was given second place to what may be called an abstract idea - a triumph of intellectuality over sensuality or, strictly speaking, an instinctual renunciation, with all its necessary psychological consequences.

Original sin and redemption by the sacrifice of a victim became the foundation stones of the new religion founded by Paul. It must remain uncertain whether there was a ringleader and instigator to the murder among the band of brothers who rebelled against the primal father, or whether such a figure was created later by the imagination of creative artists in order to turn themselves into heroes, and was then introduced into the tradition. After the Christian doctrine had burst the framework of Judaism, it took up components from many other sources, renounced a number of characteristics of pure monotheism and adapted itself in many details to the rituals of the other Mediterranean peoples. It was as though Egypt was taking vengeance once more on the heirs of Akhenaten. It is worth noticing how the new religion dealt with the ancient ambivalence in the relation to the father. Its main content was, it is true, reconciliation with God the Father, atonement for the crime committed against him; but the other side of the emotional relation showed itself in the fact that the son, who had taken the atonement on himself, became a god himself beside the father and, actually, in place of the father. Christianity, having arisen out of a father-religion, became a son-religion. It has not escaped the fate of having to get rid of the father.
There is something that stands in the way of this possibility: the fact of there being the most violent contrast between the Jewish religion which is attributed to Moses and the religion of Egypt. The former is a rigid monotheism on the grand scale: there is only one God, he is the sole God, omnipotent, unapproachable; his aspect is more than human eyes can tolerate, no image must be made of him, even his name may not be spoken. In the Egyptian religion there is an almost innumerable host of deities of varying dignity and origin: a few personifications of great natural forces such as heaven and earth, sun and moon, an occasional abstraction such as Ma'at (truth or justice) or a caricature such as the dwarf-like Bes; but most of them local gods, dating from the period when the country was divided into numerous provinces, with the shape of animals, as though they had not yet completed their evolution from the old totem animals, with no sharp distinctions between them, and scarcely differing in the functions allotted to them. The hymns in honour of these gods say almost the same things about all of them, and identify them with one another unhesitatingly, in a manner hopelessly confusing to us. The names of gods are combined with one another, so that one of them may almost be reduced to being an epithet of the other. Thus, in the heyday of the 'New Kingdom' the principal god of the city of Thebes was called Amen-Re'; the first part of this compound stands for the ram-headed god of the city, while Re' is the name of the falcon-headed sun-god of On. Magical and ceremonial acts, charms and amulets dominated the service of these gods as they did the daily life of the Egyptians. [1939a, 4849]

Some of these differences may easily be derived from the fundamental contrast between a strict monotheism and an unrestricted polytheism. Others are evidently the result of a difference in spiritual and intellectual level, since one of these religions is very close to primitive phases, while the other has risen to the heights of sublime abstraction. It may be due to these two factors that one occasionally has an impression that the contrast between the Mosaic and the Egyptian religions is a deliberate one and has been intentionally heightened - when, for instance, one of them condemns magic and sorcery in the severest terms, while in the other they proliferate with the greatest luxuriance, or when the insatiable appetite of the Egyptians for embodying their gods in clay, stone and metal (to which our museums owe so much to-day) is confronted with the harsh prohibition against making an image of any living or imagined creature. [1939a, 4850]

But there is still another contrast between the two religions which is not met by the explanations we have attempted. No other people of antiquity did so much to deny death or took such pains to make existence in the next world possible. And accordingly Osiris, the god of the dead, the ruler of this other world, was the most popular and undisputed of all the gods of Egypt. On the other hand the ancient Jewish religion renounced immortality entirely; the possibility of existence continuing after death is nowhere and never mentioned. And this is all the more remarkable since later experiences have shown that belief in an after-life is perfectly well compatible with a monotheist religion. [1939a, 4850]
His hallucination of the severed finger was instigated, as he reported later on, by the story that a female relation of his had been born with six toes and that the extra one had immediately afterwards been chopped off with an axe. Women, then, had no penis because it was taken away from them at birth. In this manner he came, at the period of the obsessional neurosis, to accept what he had already learned during the dream but had at the time rejected by repression. He must also have become acquainted, during the readings and discussions of the sacred story, with the ritual circumcision of Christ and of the Jews in general.

[1918b, 3568]

But we have not made any mention at all so far of what the real danger is that the child is afraid of as a result of being in love with his mother. The danger is the punishment of being castrated, of losing his genital organ. You will of course object that after all that is not a real danger. Our boys are not castrated because they are in love with their mothers during the phase of the Oedipus complex. But the matter cannot be dismissed so simply. Above all, it is not a question of whether castration is really carried out; what is decisive is that the danger is one that threatens from outside and that the child believes in it. He has some ground for this, for people threaten him often enough with cutting off his penis during the phallic phase, at the time of his early masturbation, and hints at that punishment must regularly find a phylogenetic reinforcement in him. It is our suspicion that during the human family's primaeval period castration used actually to be carried out by a jealous and cruel father upon growing boys, and that circumcision, which so frequently plays a part in puberty rites among primitive peoples, is a clearly recognizable relic of it. We are aware that here we are diverging widely from the general opinion; but we must hold fast to the view that fear of castration is one of the commonest and strongest motives for repression and thus for the formation of neuroses. The analysis of cases in which circumcision, though not, it is true, castration, has been carried out on boys as a cure or punishment for masturbation (a far from rare occurrence in Anglo-American society) has given our conviction a last degree of certainty. It is very tempting at this point to go more deeply into the castration complex, but I will stick to our subject.

[1933a, 4693]
Moses did not only give the Jews a new religion; it can be stated with equal certainty that he introduced the custom of circumcision to them. This fact is of decisive importance for our problem and has scarcely ever been considered. It is true that the Biblical account contradicts this more than once. On the one hand it traces circumcision back to the patriarchal age as a mark of a covenant between God and Abraham; on the other hand it describes in a quite particularly obscure passage how God was angry with Moses for having neglected a custom which had become holy,¹ and sought to kill him; but that his wife, a Midianite, saved her husband from God's wrath by quickly performing the operation. These, however, are distortions, which should not lead us astray; later on we shall discover the reason for them. The fact remains that there is only one answer to the question of where the Jews derived the custom of circumcision from - namely, from Egypt. Herodotus, the 'father of history', tells us that the custom of circumcision had long been indigenous in Egypt, and his statements are confirmed by the findings in mummies and indeed by pictures on the walls of tombs. No other people of the Eastern Mediterranean, so far as we know, practised this custom; it may safely be presumed that the Semites, Babylonians and Sumerians were uncircumcised. The Bible story itself says this is so of the inhabitants of Canaan; it is a necessary premiss to the adventure of Jacob's daughter and the prince of Shechem.² The possibility that the Jews acquired the custom of circumcision during their sojourn in Egypt in some way other than in connection with the religious teaching of Moses may be rejected as completely without foundation. Now, taking it as certain that circumcision was a universal popular custom in Egypt, let us for a moment adopt the ordinary hypothesis that Moses was a Jew, who sought to free his compatriots from bondage in Egypt and lead them to develop an independent and self-conscious national existence in another country - which was what in fact happened. What sense could it have, in that case, that he should at the same time impose on them a troublesome custom which even, to some extent, made them into Egyptians and which must keep permanently alive their memory of Egypt - whereas his efforts could only be aimed in the opposite direction, towards alienating his people from the land of their bondage and overcoming their longing for the 'flesh-pots of Egypt'? No, the fact from which we started and the hypothesis which we added to it are so incompatible with each other that we may be bold enough to reach this conclusion: if Moses gave the Jews not only a new religion but also the commandment for circumcision, he was not a Jew but an Egyptian, and in that case the Mosaic religion was probably an Egyptian one and, in view of its contrast to the popular religion, the religion of the Aten, with which the later Jewish religion agrees in some remarkable respects.

¹[1939a, 4858]

The motives which we have discovered for the Exodus as a whole apply also to the introduction of circumcision. We are familiar with the attitude adopted by people (both nations and individuals) to this primaeval usage, which is scarcely understood any longer. Those who do not practise it look on it as very strange and are a little horrified by it, but those who have adopted circumcision are proud of it. They feel exalted by it, ennobled, as it were, and look down with contempt on the others, whom they regard as unclean. Even to this day a Turk will abuse a Christian as an 'uncircumcised dog'. It may be supposed that Moses, who, being an Egyptian, was himself circumcised, shared this attitude. The Jews with whom he departed from his country were to serve him as a superior substitute for the Egyptians he had left behind. On no account must the Jews be inferior to them. He wished to make them into a 'holy nation', as is expressly stated in the Biblical text, and as a mark of this consecration he introduced among them too the custom which made them at least the equals of the Egyptians. And he could only welcome it if they were to be isolated by such a sign and kept apart from the foreign peoples among whom their wanderings would lead them, just as the Egyptians themselves had kept apart from all foreigners.¹

²[1939a, 4860]
Later on, however, Jewish tradition behaved as though it were put at a disadvantage by the
inference we have been drawing. If it were to be admitted that circumcision was an Egyptian
custom introduced by Moses, that would be almost as much as to recognize that the religion
delivered to them by Moses was an Egyptian one too. There were good reasons for denying
that fact, so the truth about circumcision must also be contradicted.

[1939a, 4860]

Here we may once again call on the evidence afforded by circumcision, which has repeatedly
been of help to us, like, as it were, a key-fossil. This custom became obligatory in the Yahweh
religion as well and, since it was indissolubly linked with Egypt, its adoption can only have been
a concession to the followers of Moses, who - or the Levites among them - would not renounce
this mark of their holiness. So much of their old religion they wished to rescue, and in return for
it they were prepared to accept the new deity and what the priests of Midian told them about it.
They may possibly have gained yet other concessions. We have already mentioned that Jewish
ritual prescribed certain restrictions on the use of God's name. Instead of 'Yahweh' the word
'Adonai' must be spoken. It is tempting to bring this prescription into our context, but that is only
a conjecture without any other basis. The prohibition upon a god's name is, as is well known, a
taboo of primaeval age. We do not understand why it was revived precisely in the Jewish Law; it
is not impossible that this happened under the influence of a fresh motive. There is no need to
suppose that the prohibition was carried through consistently; in the construction of theophorous
personal names - that is, in compounds - the name of the God Yahweh might be freely used
(e.g. Jochanan, Jehu, Joshua). There were, however, special circumstances connected with
this name. As we know, critical Biblical research supposes that the Hexateuch has two
documentary sources. These are distinguished as J and E, because one of them uses 'Jahve'
as the name of God and the other 'Elohim': 'Elohim', to be sure, not 'Adonai'. But we may bear
in mind a remark by one of our authorities: "The different names are a clear indication of two
originally different gods."

[1939a, 4869]

Thus far what is established historically; and now our hypothetical sequel begins. Among
those in Akhenaten's entourage there was a man who was perhaps called Tuthmosis, like many
other people at that time - the name is not of great importance except that its second
component must have been 'mose'. He was in a high position and a convinced adherent of the
Aten religion, but, in contrast to the meditative king, he was energetic and passionate. For him
the death of Akhenaten and the abolition of his religion meant the end of all his expectations. He
could remain in Egypt only as an outlaw or as a renegade. Perhaps as governor of the frontier
province he had come in contact with a Semitic tribe which had immigrated into it a few
generations earlier. Under the necessity of his disappointment and loneliness he turned to these
foreigners and with them sought compensation for his losses. He chose them as his people and
tried to realize his ideals in them. After he had left Egypt with them, accompanied by his
followers, he made them holy by the mark of circumcision, gave them laws and introduced them
into the doctrines of the Aten religion, which the Egyptians had just thrown off. The precepts
which this man Moses gave to his Jews may have been even harsher than those of his master
and teacher Akhenaten, and he may, too, have given up dependence on the sun-god of On, to
which Akhenaten had continued to adhere.

[1939a, 4887]
The deeper motives for hatred of the Jews are rooted in the remotest past ages; they operate from the unconscious of the peoples, and I am prepared to find that at first they will not seem credible. I venture to assert that jealousy of the people which declared itself the first-born, favourite child of God the Father, has not yet been surmounted among other peoples even today: it is as though they had thought there was truth in the claim. Further, among the customs by which the Jews made themselves separate, that of circumcision has made a disagreeable, uncanny impression, which is to be explained, no doubt, by its recalling the dreaded castration and along with it a portion of the primaevul past which is gladly forgotten. And finally, as the latest motive in this series, we must not forget that all those peoples who excel to-day in their hatred of Jews became Christians only in late historic times, often driven to it by bloody coercion. It might be said that they are all 'mis-baptized'. They have been left, under a thin veneer of Christianity, what their ancestors were, who worshipped a barbarous polytheism. They have not got over a grudge against the new religion which was imposed on them; but they have displaced the grudge on to the source from which Christianity reached them. The fact that the Gospels tell a story which is set among Jews, and in fact deals only with Jews, has made this displacement easy for them. Their hatred of Jews is at bottom a hatred of Christians, and we need not be surprised that in the German National-Socialist revolution this intimate relation between the two monotheist religions finds such a clear expression in the hostile treatment of both of them.

[1939a, 4914]

Our construction of prehistory forces us to another explanation. The command in favour of exogamy, of which the horror of incest is the negative expression, was a product of the will of the father and carried this will on after he had been removed. Hence come the strength of its emotional tone and the impossibility of finding a rational basis for it - that is, its sacredness. We confidently expect that an investigation of all the other cases of a sacred prohibition would lead to the same conclusion as in that of the horror of incest: that what is sacred was originally nothing other than the prolongation of the will of the primal father. This would also throw light on the hitherto incomprehensible ambivalence of the words which express the concept of sacredness. It is the ambivalence which in general dominates the relation to the father. [The Latin] 'sacer' means not only 'sacred', 'consecrated', but also something that we can only translate as 'infamous', 'detestable' (e.g. 'auri sacra fames'). But the father's will was not only something which one might not touch, which one had to hold in high respect, but also something one trembled before, because it demanded a painful instinctual renunciation. When we hear that Moses made his people holy by introducing the custom of circumcision we now understand the deep meaning of that assertion. Circumcision is the symbolic substitute for the castration which the primal father once inflicted upon his sons in the plenitude of his absolute power, and whoever accepted that symbol was showing by it that he was prepared to submit to the father's will, even if it imposed the most painful sacrifice on him.

[1939a, 4940]

¹ Castration has a place too in the Oedipus legend, for the blinding with which Oedipus punishes himself after the discovery of his crime is, by the evidence of dreams, a symbolic substitute for castration. The possibility cannot be excluded that a phylogenetic memory-trace may contribute to the extraordinarily terrifying effect of the threat - a memory-trace from the prehistory of the primal family, where the jealous father actually robbed his son of his genitals if the latter became troublesome to him as a rival with a woman. The primaevul custom of circumcision, another symbolic substitute for castration, can only be understood as an expression of submission to the father's will. (Cf. the puberty rites of primitive peoples.) No investigation has yet been made of the form taken by the events described above among peoples and in civilizations which do not suppress masturbation in children.

[1940a [1938], 4997]
I have pointed out that my hypothesis that Moses was not a Jew but an Egyptian created a fresh riddle. His course of conduct, which seemed easily intelligible in a Jew, was ununderstandable in an Egyptian. If, however, we place Moses in the time of Akhenaten and suppose him in contact with that Pharaoh, the riddle vanishes and the possibility is revealed of motives which will answer all our questions. Let us start from the assumption that Moses was an aristocratic and prominent man, perhaps in fact a member of the royal house, as the legend says of him. He was undoubtedly aware of his great capacities, ambitious and energetic; he may even have played with the notion of one day being the leader of his people, of becoming the kingdom's ruler. Being close to the Pharaoh, he was a convinced adherent of the new religion, whose basic thoughts he had made his own. When the king died and the reaction set in, he saw all his hopes and prospects destroyed; if he was not prepared to abjure all the convictions that were so dear to him, Egypt had nothing more to offer him - he had lost his country. In this predicament he found an unusual solution. Akhenaten the dreamer had alienated his people and let his empire fall to pieces. The more energetic nature of Moses was more at home with the plan of founding a new kingdom, of finding a new people to whom he would present for their worship the religion which Egypt had disdained. It was, we can see, a heroic attempt to combat destiny, to compensate in two directions for the losses in which Akhenaten's catastrophe had involved him. Perhaps he was at that time Governor of the frontier province (Goshen) in which certain Semitic tribes had settled (perhaps as early as in the Hyksos period). These he chose to be his new people - a historic decision.¹ He came to an agreement with them, put himself at their head and carried the Exodus through 'by strength of hand'. In complete contrast to the Biblical tradition, we may presume that this Exodus took place peacefully and unpursued. The authority of Moses made this possible and at that time there was no central administration which might have interfered with it. [1939a, 4859]

At this point I expect to be met by an objection to my hypothesis. This placed Moses, an Egyptian, in the Akhenaten period. It derived his decision to take over the Jewish people from the political circumstances in the country at that time, and it recognized the religion that he presented to or imposed on his protégés as the Aten religion, which had actually collapsed in Egypt itself. I expect to be told that I have brought forward this structure of conjectures with too much positiveness, for which there is no basis in the material. This objection is, I think, unjustified. I have already laid stress on the factor of doubt in my introductory remarks; I have, as it were, placed that factor outside the brackets and I may be allowed to save myself the trouble of repeating it in connection with each item inside them. [1939a, 4861]

Thus far what is established historically; and now our hypothetical sequel begins. Among those in Akhenaten's entourage there was a man who was perhaps called Tuthmosis, like many other people at that time¹ - the name is not of great importance except that its second component must have been 'mose'. He was in a high position and a convinced adherent of the Aten religion, but, in contrast to the meditative king, he was energetic and passionate. For him the death of Akhenaten and the abolition of his religion meant the end of all his expectations. He could remain in Egypt only as an outlaw or as a renegade. Perhaps as governor of the frontier province he had come in contact with a Semitic tribe which had immigrated into it a few generations earlier. Under the necessity of his disappointment and loneliness he turned to these foreigners and with them sought compensation for his losses. He chose them as his people and tried to realize his ideals in them. After he had left Egypt with them, accompanied by his followers, he made them holy by the mark of circumcision, gave them laws and introduced them into the doctrines of the Aten religion, which the Egyptians had just thrown off. The precepts which this man Moses gave to his Jews may have been even harsher than those of his master and teacher Akhenaten, and he may, too, have given up dependence on the sun-god of On, to which Akhenaten had continued to adhere. [1939a, 4887]
This page intentionally left blank
The union of the tribes into a nation through the adoption of a common religion, whenever it may have taken place, might easily have turned out quite an unimportant happening in world history. The new religion would have been carried away by the current of events, Yahweh would have had to take his place in the procession of departed gods in Flaubert's vision, and all twelve of his tribes would have been 'lost' and not only the ten of them which the Anglo-Saxons have been in search of for so long. The god Yahweh, to whom the Midianite Moses then presented a new people, was probably in no respect a prominent being. A coarse, narrow-minded, local god, violent and bloodthirsty, he had promised his followers to give them 'a land flowing with milk and honey' and urged them to exterminate its present inhabitants 'with the edge of the sword'. It is astonishing how much remains, in spite of all the revisions of the Biblical narratives, that allows us to recognize his original nature. It is not even certain that his religion was a genuine monotheism, that it denied the divinity of the deities of other peoples. It was enough probably that his people regarded their own god as more powerful than any foreign god. If, nevertheless, in the sequel everything took a different course from what such beginnings would have led one to expect, the cause can be found in only one fact. The Egyptian Moses had given to one portion of the people a more highly spiritualized notion of god, the idea of a single deity embracing the whole world, who was not less all-loving than all-powerful, who was averse to all ceremonial and magic and set before men as their highest aim a life in truth and justice. For, however incomplete may be the accounts we have of the ethical side of the Aten religion, it can be no unimportant fact that Akhenaten regularly referred to himself in his inscriptions as 'living in Ma'at' (truth, justice).¹ In the long run it made no difference that the people rejected the teaching of Moses (probably after a short time) and killed him himself. The tradition of it remained and its influence achieved (only gradually, it is true, in the course of centuries) what was denied to Moses himself. The god Yahweh had arrived at undeserved honour when, from the time of Kadesh onwards, he was credited with the deed of liberation which had been performed by Moses; but he had to pay heavily for this usurpation. The shadow of the god whose place he had taken became stronger than himself; by the end of the process of evolution, the nature of the forgotten god of Moses had come to light behind his own. No one can doubt that it was only the idea of this other god that enabled the people of Israel to survive all the blows of fate and that kept them alive to our own days.

[1939a, 4879]

It is no longer possible to estimate the share taken by the Levites in the final victory of the Mosaic god over Yahweh. They had taken the side of Moses in the past, when the compromise was reached at Kadesh, in a still live memory of the master whose retinue and compatriots they had been. During the centuries since then they had become merged with the people or with the priesthood, and it had become the main function of the priests to develop and supervise the ritual, and beside this to preserve the holy writ and revise it in accordance with their aims. But was not all sacrifice and all ceremonial at bottom only magic and sorcery, such as had been unconditionally rejected by the old Mosaic teaching? Thereupon there arose from among the midst of the people an unending succession of men who were not linked to Moses in their origin but were enthralled by the great and mighty tradition which had grown up little by little in obscurity: and it was these men, the Prophets, who tirelessly preached the old Mosaic doctrine that the deity disdained sacrifice and ceremonial and asked only for faith and a life in truth and justice (Ma'at). The efforts of the Prophets had a lasting success; the doctrines with which they re-established the old faith became the permanent content of the Jewish religion. It is honour enough to the Jewish people that they could preserve such a tradition and produce men who gave it a voice - even though the initiative to it came from outside, from a great foreigner.

[1939a, 4880]
And here, it seems, I have reached the conclusion of my study, which was directed to the single aim of introducing the figure of an Egyptian Moses into the nexus of Jewish history. Our findings may be thus expressed in the most concise formula. Jewish history is familiar to us for its dualities: two groups of people who came together to form the nation, two kingdoms into which this nation fell apart, two gods’ names in the documentary sources of the Bible. To these we add two fresh ones: the foundation of two religions - the first repressed by the second but nevertheless later emerging victoriously behind it, and two religious founders, who are both called by the same name of Moses and whose personalities we have to distinguish from each other. All of these dualities are the necessary consequences of the first one: the fact that one portion of the people had an experience which must be regarded as traumatic and which the other portion escaped. Beyond this there would be a very great deal to discuss, to explain and to assert. Only thus would an interest in our purely historical study find its true justification. What the real nature of a tradition resides in, and what its special power rests on, how impossible it is to dispute the personal influence upon world-history of individual great men, what sacrilege one commits against the splendid diversity of human life if one recognizes only those motives which arise from material needs, from what sources some ideas (and particularly religious ones) derive their power to subject both men and peoples to their yoke - to study all this in the special case of Jewish history would be an alluring task. To continue my work on such lines as these would be to find a link with the statements I put forward twenty-five years ago in *Totem and Taboo*. But I no longer feel that I have the strength to do so.

[1939a, 4881]

In Egypt Aten had begun to dominate during a fortunate period of established possession, and even when the empire began to totter, his worshippers had been able to turn away from the disturbance and continued to praise and to enjoy his creations. The Jewish people were fated to experience a series of grave trials and painful events; their god became harsh and severe and, as it were, wrapped in gloom. He retained the characteristic of being a universal god, reigning over all countries and peoples, but the fact that his worship had passed over from the Egyptians to the Jews found expression in the additional belief that the Jews were his chosen people whose special obligations would eventually meet with a special reward as well. It may not have been easy for the people to reconcile a belief in being preferred by their omnipotent god with the sad experiences of their unfortunate destiny. But they did not allow themselves to be shaken in their convictions; they increased their own sense of guilt in order to stifle their doubts of God, and it may be that they pointed at last to the 'inscrutable decrees of Providence', as pious people do to this day. If they felt inclined to wonder at his allowing one violent aggressor after another to arise and overthrow and maltreat them - Assyrians, Babylonians, Persians - they could yet recognize his power in the fact that all these evil foes were themselves conquered in turn and that their empires vanished.

[1939a, 4890]

In three important respects the later god of the Jews became in the end like the old Mosaic god. The first and decisive point is that he was truly acknowledged as the only god, beside whom any other god was unthinkable. Akhenaten’s monotheism was taken seriously by an entire people; indeed, that people clung so much to this idea that it became the main content of their intellectual life and left them no interest for other things. On this the people and the priesthood who had become dominant among them were at one. But whereas the priests exhausted their efforts in erecting the ceremonial for his worship, they came in opposition to intense currents among the people which sought to revive two others of the doctrines of Moses about his god. The voices of the Prophets never tired of declaring that God despised ceremonial and sacrifice and required only that people should believe in him and lead a life in truth and justice. And when they praised the simplicity and holiness of life in the wilderness they were certainly under the influence of the Mosaic ideals.

[1939a, 4890]
It is time to raise the question of whether there is any need whatever to call in the influence of Moses as a cause of the final form taken by the Jewish idea of God, or whether it would not be enough to assume a spontaneous development to higher intellectuality during a cultural life extending over hundreds of years. There are two things to be said about this possible explanation which would put an end to all our puzzling conjectures. First, that it explains nothing. In the case of the Greeks - unquestionably a most highly gifted people - the same conditions did not lead to monotheism but to a disintegration of their polytheist religion and to the beginning of philosophical thought. In Egypt, so far as we can understand, monotheism grew up as a by-product of imperialism: God was a reflection of the Pharaoh who was the absolute ruler of a great world empire. With the Jews, political conditions were highly unfavourable for the development from the idea of an exclusive national god to that of a universal ruler of the world. And where did this tiny and powerless nation find the arrogance to declare itself the favourite child of the great Lord? The problem of the origin of monotheism among the Jews would thus remain unsolved, or we should have to be content with the common answer that it is the expression of the peculiar religious genius of that people. Genius is well known to be incomprehensible and irresponsible, and we ought therefore not to bring it up as an explanation till every other solution has failed us.¹

[1939a, 4891]

In addition to this, we come upon the fact that Jewish records and historical writings themselves point us the way, by asserting most definitely - this time without contradicting themselves - that the idea of a single god was brought to the people by Moses. If there is an objection to the trustworthiness of this assurance, it is that the priestly revision of the text we have before us obviously traces far too much back to Moses. Institutions such as the ritual ordinances, which date unmistakably from later times, are given out as Mosaic commandments with the plain intention of lending them authority. This certainly gives us ground for suspicion, but not enough for a rejection. For the deeper motive for an exaggeration of this kind is obvious. The priestly narrative seeks to establish continuity between its contemporary period and the remote Mosaic past; it seeks to disavow precisely what we have described as the most striking fact about Jewish religious history, namely that there is a yawning gap between the law-giving of Moses and the later Jewish religion - a gap which was at first filled by the worship of Yahweh, and was only slowly patched up afterwards. It disputes this course of events by every possible means, though its historical correctness is established beyond any doubt, since, in the particular treatment given to the Biblical text, superabundant evidence has been left to prove it. Here the priestly revision has attempted something similar to the tendentious distortion which made the new god Yahweh into the god of the Patriarchs. If we take this motive of the Priestly Code into account, we shall find it hard to withhold our belief from the assertion that Moses really did himself give the monotheist idea to the Jews. We should be all the readier to give our assent since we can say where Moses derived this idea from, which the Jewish priests certainly knew no longer.

[1939a, 4891]
No other portion of the history of religion has become so clear to us as the introduction of monotheism into Judaism and its continuation in Christianity - if we leave on one side the development which we can trace no less uninterruptedly, from the animal totem to the human god with his regular companions. (Each of the four Christian evangelists still has his own favourite animal.) If we provisionally accept the world-empire of the Pharaohs as the determining cause of the emergence of the monotheist idea, we see that that idea, released from its native soil and transferred to another people was, after a long period of latency, taken hold of by them, preserved by them as a precious possession and, in turn, itself kept them alive by giving them pride in being a chosen people: it was the religion of their primal father to which were attached their hope of reward, of distinction and finally of world-dominion. This last wishful phantasy, long abandoned by the Jewish people, still survives among that people's enemies in a belief in a conspiracy by the 'Elders of Zion'. We reserve for discussion in later pages how the special peculiarities of the monotheist religion borrowed from Egypt affected the Jewish people and how it was bound to leave a permanent imprint on their character through its rejection of magic and mysticism, its invitation to advances in intellectuality and its encouragement of sublimations; how the people, enraptured by the possession of the truth, overwhelmed by the consciousness of being chosen, came to have a high opinion of what is intellectual and to lay stress on what is moral; and how their melancholy destinies and their disappointments in reality served only to intensify all these trends. For the moment we will follow their development in another direction.

The re-establishment of the primal father in his historic rights was a great step forward but it could not be the end. The other portions of the prehistoric tragedy insisted on being recognized. It is not easy to discern what set this process in motion. It appears as though a growing sense of guilt had taken hold of the Jewish people, or perhaps of the whole civilized world of the time, as a precursor to the return of the repressed material. Till at last one of these Jewish people found, in justifying a politico-religious agitator, the occasion for detaching a new - the Christian - religion from Judaism. Paul, a Roman Jew from Tarsus, seized upon this sense of guilt and traced it back correctly to its original source. He called this the 'original sin'; it was a crime against God and could only be atoned for by death. With the original sin death came into the world. In fact this crime deserving death had been the murder of the primal father who was later deified. But the murder was not remembered: instead of it there was a phantasy of its atonement, and for that reason this phantasy could be hailed as a message of redemption (evangelium). A son of God had allowed himself to be killed without guilt and had thus taken on himself the guilt of all men. It had to be a son, since it had been the murder of a father. It is probable that traditions from oriental and Greek mysteries had had an influence on the phantasy of redemption. What was essential in it seems to have been Paul's own contribution. In the most proper sense he was a man of an innately religious disposition: the dark traces of the past lurked in his mind, ready to break through into its more conscious regions.
We have already said that the Christian ceremony of Holy Communion, in which the believer incorporates the Saviour's blood and flesh, repeats the content of the old totem meal - no doubt only in its affectionate meaning, expressive of veneration, and not in its aggressive meaning. The ambivalence that dominates the relation to the father was clearly shown, however, in the final outcome of the religious novelty. Ostensibly aimed at propitiating the father god, it ended in his being dethroned and got rid of. Judaism had been a religion of the father; Christianity became a religion of the son. The old God the Father fell back behind Christ; Christ, the Son, took his place, just as every son had hoped to do in primal days. Paul, who carried Judaism on, also destroyed it. No doubt he owed his success in the first instance to the fact that, through the idea of the redeemer, he exorcized humanity's sense of guilt; but he owed it as well to the circumstance that he abandoned the 'chosen' character of his people and its visible mark - circumcision - so that the new religion could be a universal one, embracing all men. Though a part may have been played in Paul's taking this step by his personal desire for revenge for the rejection of his innovation in Jewish circles, yet it also restored a feature of the old Aten religion - it removed a restriction which that religion had acquired when it was handed over to a new vehicle, the Jewish people.

It would be worth while to understand how it was that the monotheist idea made such a deep impression precisely on the Jewish people and that they were able to maintain it so tenaciously. It is possible, I think, to find an answer. Fate had brought the great deed and misdeed of primal days, the killing of the father, closer to the Jewish people by causing them to repeat it on the person of Moses, an outstanding father-figure. It was a case of 'acting out' instead of remembering, as happens so often with neurotics during the work of analysis. To the suggestion that they should remember, which was made to them by the doctrine of Moses, they reacted, however, by disavowing their action; they remained halted at the recognition of the great father and thus blocked their access to the point from which Paul was later to start his continuation of the primal history. It is scarcely a matter of indifference or of chance that the violent killing of another great man became the starting-point of Paul's new religious creation as well. This was a man whom a small number of adherents in Judæa regarded as the Son of God and as the Messiah who had been announced, and to whom, too, a part of the childhood story invented for Moses was later carried over, but of whom in fact we know scarcely more with certainty than of Moses - whether he was really the great teacher portrayed by the Gospels or whether, rather, it was not the fact and circumstances of his death which were decisive for the importance which his figure acquired. Paul, who became his apostle, had not known him himself.

The killing of Moses by his Jewish people, recognized by Sellin from traces of it in tradition (and also, strange to say, accepted by the young Goethe without any evidence¹) thus becomes an indispensable part of our construction, an important link between the forgotten event of primal days and its later emergence in the form of the monotheist religions.² It is plausible to conjecture that remorse for the murder of Moses provided the stimulus for the wishful phantasy of the Messiah, who was to return and lead his people to redemption and the promised world-dominion. If Moses was this first Messiah, Christ became his substitute and successor, and Paul could exclaim to the peoples with some historical justification: 'Look! the Messiah has really come: he has been murdered before your eyes!' Then, too, there is a piece of historical truth in Christ's resurrection, for he was the resurrected Moses and behind him the returned primal father of the primitive horde, transfigured and, as the son, put in the place of the father.
The poor Jewish people, who with their habitual stubbornness continued to disavow the father's murder, atoned heavily for it in the course of time. They were constantly met with the reproach 'You killed our God!' And this reproach is true, if it is correctly translated. If it is brought into relation with the history of religions, it runs: 'You will not admit that you murdered God (the primal picture of God, the primal father, and his later reincarnations).’ There should be an addition declaring: 'We did the same thing, to be sure, but we have admitted it and since then we have been absolved.' Not all the reproaches with which anti-semitism persecutes the descendants of the Jewish people can appeal to a similar justification. A phenomenon of such intensity and permanence as the people's hatred of the Jews must of course have more than one ground. It is possible to find a whole number of grounds, some of them clearly derived from reality, which call for no interpretation, and others, lying deeper and derived from hidden sources, which might be regarded as the specific reasons. Of the former, the reproach of being aliens is perhaps the weakest, since in many places dominated by anti-semitism to-day the Jews were among the oldest portions of the population or had even been there before the present inhabitants. This applies, for instance, to the city of Cologne, to which the Jews came with the Romans, before it was occupied by the Germans. Other grounds for hating the Jews are stronger - thus, the circumstances that they live for the most part as minorities among other peoples, for the communal feeling of groups requires, in order to complete it, hostility towards some extraneous minority, and the numerical weakness of this excluded minority encourages its suppression. There are, however, two other characteristics of the Jews which are quite unforgivable. First is the fact that in some respects they are different from their 'host' nations. They are not fundamentally different, for they are not Asiatics of a foreign race, as their enemies maintain, but composed for the most part of remnants of the Mediterranean peoples and heirs of the Mediterranean civilization. But they are none the less different, often in an indefinable way different, especially from the Nordic peoples, and the intolerance of groups is often, strangely enough, exhibited more strongly against small differences than against fundamental ones. The other point has a still greater effect: namely, that they defy all oppression, that the most cruel persecutions have not succeeded in exterminating them, and, indeed, that on the contrary they show a capacity for holding their own in commercial life and, where they are admitted, for making valuable contributions to every form of cultural activity.

[1939a, 4913]
The first of these is that we have here dealt with only a single instance from the copious phenomenology of religions and have thrown no light on any others. I must regrettfully admit that I am unable to give more than this one example and that my expert knowledge is insufficient to complete the enquiry. From my limited information I may perhaps add that the case of the founding of the Mahommedan religion seems to me like an abbreviated repetition of the Jewish one, of which it emerged as an imitation. It appears, indeed, that the Prophet intended originally to accept Judaism completely for himself and his people. The recapture of the single great primal father brought the Arabs an extraordinary exaltation of their self-confidence, which led to great worldly successes but exhausted itself in them. Allah showed himself far more grateful to his chosen people than Yahweh did to his. But the internal development of the new religion soon came to a stop, perhaps because it lacked the depth which had been caused in the Jewish case by the murder of the founder of their religion. The apparently rationalistic religions of the East are in their core ancestor-worship and so come to a halt, too, at an early stage of the reconstruction of the past. If it is true that in primitive peoples of to-day the recognition of a supreme being is the only content of their religion, we can only regard this as an atrophy of religious development and bring it into relation with the countless cases of rudimentary neuroses which are to be observed in the other field. Why it is that in the one case just as in the other things have gone no further, our knowledge is in both cases insufficient to tell us. We can only attribute the responsibility to the individual endowment of these peoples, the direction taken by their activity and their general social condition. Moreover, it is a good rule in the work of analysis to be content to explain what is actually before one and not to seek to explain what has not happened.

[1939a, 4915]

We cannot follow the chain of events further, but if we have rightly recognized these first steps, the monotheist idea returned like a boomerang to the land of its origin. Thus it seems unfruitful to try to fix the credit due to an individual in connection with a new idea. It is clear that many have shared in its development and made contributions to it. And, again, it would obviously be unjust to break off the chain of causes at Moses and to neglect what was effected by those who succeeded him and carried on his ideas, the Jewish Prophets. The seed of monotheism failed to ripen in Egypt. The same thing might have happened in Israel after the people had thrown off the burdensome and exacting religion. But there constantly arose from the Jewish people men who revived the fading tradition, who renewed the admonitions and demands made by Moses, and who did not rest till what was lost had been established once again. In the course of constant efforts over centuries, and finally owing to two great reforms, one before and one after the Babylonian exile, the transformation was accomplished of the popular god Yahweh into the God whose worship had been forced upon the Jews by Moses. And evidence of the presence of a peculiar psychical aptitude in the masses who had become the Jewish people is revealed by the fact that they were able to produce so many individuals prepared to take on the burdens of the religion of Moses in return for the reward of being the chosen people and perhaps for some other prizes of a similar degree.

[1939a, 4932]
In order to bring about lasting psychical results in a people, it is clearly not enough to assure them that they have been chosen by the deity. The fact must also be proved to them in some way if they are to believe it and to draw consequences from the belief. In the religion of Moses the Exodus from Egypt served as the proof; God, or Moses in his name, was never tired of appealing to this evidence of favour. The feast of the Passover was introduced in order to maintain the memory of that event, or, rather, an old-established feast was injected with the contents of that memory. Nevertheless, it was only a memory: the Exodus belonged to a hazy past. In the present, signs of God's favour were decidedly scanty; the people's history pointed rather to his disfavour. Primitive peoples used to depose their gods or even to castigate them, if they failed to do their duty in securing them victory, happiness and comfort. In all periods kings have been treated in no way differently from gods; an ancient identity is thus revealed: an origin from a common root. Thus, modern peoples, too, are in the habit of expelling their kings if the glory of their reign is spoilt by defeats and the corresponding losses in territory and money. Why the people of Israel, however, clung more and more submissively to their God the worse they were treated by him - that is a problem which for the moment we must leave on one side.

[1939a, 4933]

It may encourage us to enquire whether the religion of Moses brought the people nothing else besides an enhancement of their self-esteem owing to their consciousness of having been chosen. And indeed another factor can easily be found. That religion also brought the Jews a far grander conception of God, or, as we might put it more modestly, the conception of a grander God. Anyone who believed in this God had some kind of share in his greatness, might feel exalted himself. For an unbeliever this is not entirely self-evident; but we may perhaps make it easier to understand if we point to the sense of superiority felt by a Briton in a foreign country which has been made insecure owing to an insurrection - a feeling that is completely absent in a citizen of any small continental state. For the Briton counts on the fact that his Government will send along a warship if a hair of his head is hurt, and that the rebels understand that very well - whereas the small state possesses no warship at all. Thus, pride in the greatness of the British Empire has a root as well in the consciousness of the greater security - the protection - enjoyed by the individual Briton. This may resemble the conception of a grand God. And, since one can scarcely claim to assist God in the administration of the world, the pride in God's greatness fuses with the pride in being chosen by him.

[1939a, 4933]

Among the precepts of the Moses religion there is one that is of greater importance than appears to begin with. This is the prohibition against making an image of God - the compulsion to worship a God whom one cannot see. In this, I suspect, Moses was outdoing the strictness of the Aten religion. Perhaps he merely wanted to be consistent: his God would in that case have neither a name nor a countenance. Perhaps it was a fresh measure against magical abuses. But if this prohibition were accepted, it must have a profound effect. For it meant that a sensory perception was given second place to what may be called an abstract idea - a triumph of intellectuality over sensuality or, strictly speaking, an instinctual renunciation, with all its necessary psychological consequences.

[1939a, 4933]
The Mosaic prohibition elevated God to a higher degree of intellectuality, and the way was opened to further alterations in the idea of God which we have still to describe. But we may first consider another effect of the prohibition. All such advances in intellectuality have as their consequence that the individual's self-esteem is increased, that he is made proud - so that he feels superior to other people who have remained under the spell of sensuality. Moses, as we know, conveyed to the Jews an exalted sense of being a chosen people. The dematerialization of God brought a fresh and valuable contribution to their secret treasure. The Jews retained their inclination to intellectual interests. The nation's political misfortune taught it to value at its true worth the one possession that remained to it - its literature. Immediately after the destruction of the Temple in Jerusalem by Titus, the Rabbi Jochanan ben Zakkai asked permission to open the first Torah school in Jabneh. From that time on, the Holy Writ and intellectual concern with it were what held the scattered people together.

[1939a, 4935]

This much is generally known and accepted. All I have wanted to do is to add that this characteristic development of the Jewish nature was introduced by the Mosaic prohibition against worshipping God in a visible form.

[1939a, 4935]

The pre-eminence given to intellectual labours throughout some two thousand years in the life of the Jewish people has, of course, had its effect. It has helped to check the brutality and the tendency to violence which are apt to appear where the development of muscular strength is the popular ideal. Harmony in the cultivation of intellectual and physical activity, such as was achieved by the Greek people, was denied to the Jews. In this dichotomy their decision was at least in favour of the worthier alternative.

[1939a, 4935]

These are certainly not very fruitful considerations, and it might be thought that they have nothing at all to do with our enquiry as to what has determined the character of the Jewish people. That would only be to our advantage; but a certain connection with our problem is betrayed nevertheless by a fact which will concern us still more later on. The religion which began with the prohibition against making an image of God develops more and more in the course of centuries into a religion of instinctual renunciations. It is not that it would demand sexual abstinence; it is content with a marked restriction of sexual freedom. God, however, becomes entirely removed from sexuality and elevated into the ideal of ethical perfection. But ethics is a limitation of instinct. The Prophets are never tired of asseverating that God requires nothing other from his people than a just and virtuous conduct of life - that is, abstention from every instinctual satisfaction which is still condemned as vicious by our morality to-day as well. And even the demand for belief in him seems to take a second place in comparison with the seriousness of these ethical requirements. In this way instinctual renunciation seems to play a prominent part in the religion, even if it did not stand out in it from the first.

[1939a, 4938]
Our construction of prehistory forces us to another explanation. The command in favour of
exogamy, of which the horror of incest is the negative expression, was a product of the will of
the father and carried this will on after he had been removed. Hence come the strength of its
emotional tone and the impossibility of finding a rational basis for it - that is, its sacredness. We
confidently expect that an investigation of all the other cases of a sacred prohibition would lead
to the same conclusion as in that of the horror of incest: that what is sacred was originally
nothing other than the prolongation of the will of the primal father. This would also throw light on
the hitherto incomprehensible ambivalence of the words which express the concept of
sacredness. It is the ambivalence which in general dominates the relation to the father. [The
Latin] 'sacer' means not only 'sacred', 'consecrated', but also something that we can only
translate as 'infamous', 'detestable' (e.g. 'auri sacra fames'). But the father's will was not only
something which one might not touch, which one had to hold in high respect, but also
something one trembled before, because it demanded a painful instinctual renunciation. When
we hear that Moses made his people holy by introducing the custom of circumcision we now
understand the deep meaning of that assertion. Circumcision is the symbolic substitute for the
castration which the primal father once inflicted upon his sons in the plenitude of his absolute
power, and whoever accepted that symbol was showing by it that he was prepared to submit to
the father's will, even if it imposed the most painful sacrifice on him.
[1939a, 4940]

Let us return to the more modest problem which has occupied us hitherto. We wanted to
explain the origin of the special character of the Jewish people, a character which is probably
what has made their survival to the present day possible. We found that the man Moses
impressed this character on them by giving them a religion which increased their self-esteem so
much that they thought themselves superior to all other peoples. Thereafter they survived by
keeping apart from others. Mixtures of blood interfered little with this, since what held them
together was an ideal factor, the possession in common of certain intellectual and emotional
wealth. The religion of Moses led to this result because (1) it allowed the people to take a share
in the grandeur of a new idea of God, (2) it asserted that this people had been chosen by this
great God and were destined to receive evidences of his special favour and (3) it forced upon
the people an advance in intellectual power, and whoever accepted that symbol was showing by it that he was prepared to submit to
the father's will, even if it imposed the most painful sacrifice on him.
[1939a, 4941]

Access to this deeper motivation would seem to be given at a particular point in the previous
discussions. The religion of Moses did not produce its effects immediately but in a remarkably
indirect manner. This does not mean to say simply that it did not work at once, that it took long
periods of time, hundreds of years, to deploy its full effect, for that is self-evident when it is a
question of the imprinting of a people's character. But the restriction relates to a fact which we
have derived from the history of the Jewish religion or, if you like, have introduced into it. We
have said that after a certain time the Jewish people rejected the religion of Moses once more -
whether they did so completely or retained some of its precepts we cannot guess. If we
suppose that in the long period of the seizure of Canaan and the struggle with the peoples
inhabiting it the Yahweh religion did not differ essentially from the worship of the other Baalim,
we shall be on historical ground in spite of all the later tendentious efforts to throw a veil over
this shaming state of things.
[1939a, 4942]
The religion of Moses, however, had not disappeared without leaving a trace. A kind of memory of it had survived, obscured and distorted, supported, perhaps, among individual members of the priestly caste by ancient records. And it was this tradition of a great past which continued to work in the background, as it were, which gradually gained more and more power over men's minds, and which finally succeeded in transforming the god Yahweh into the god of Moses and in calling back to life the religion of Moses which had been established and then abandoned long centuries earlier.

The direction to be taken by this father-religion was in this way laid down for all time. Yet this did not bring its development to an end. Ambivalence is a part of the essence of the relation to the father: in the course of time the hostility too could not fail to stir, which had once driven the sons into killing their admired and dreaded father. There was no place in the framework of the religion of Moses for a direct expression of the murderous hatred of the father. All that could come to light was a mighty reaction against it - a sense of guilt on account of that hostility, a bad conscience for having sinned against God and for not ceasing to sin. This sense of guilt, which was uninterruptedly kept awake by the Prophets, and which soon formed an essential part of the religious system, had yet another superficial motivation, which neatly disguised its true origin. Things were going badly for the people; the hopes resting on the favour of God failed in fulfilment; it was not easy to maintain the illusion, loved above all else, of being God's chosen people. If they wished to avoid renouncing that happiness, a sense of guilt on account of their own sinfulness offered a welcome means of exculpating God: they deserved no better than to be punished by him since they had not obeyed his commandments. And, driven by the need to satisfy this sense of guilt, which was insatiable and came from sources so much deeper, they must make those commandments grow ever stricter, more meticulous and even more trivial. In a fresh rapture of moral asceticism they imposed more and more new instinctual renunciations on themselves and in that way reached - in doctrine and precept, at least - ethical heights which had remained inaccessible to the other peoples of antiquity. Many Jews regard this attainment of ethical heights as the second main characteristic and the second great achievement of their religion. The way in which it was connected with the first one - the idea of a single god - should be plain from our remarks. These ethical ideas cannot, however, disavow their origin from the sense of guilt felt on account of a suppressed hostility to God. They possess the characteristic - uncompleted and incapable of completion - of obsessional neurotic reaction-formations; we can guess, too, that they serve the secret purposes of punishment.

Only a portion of the Jewish people accepted the new doctrine. Those who refused to are still called Jews to-day. Owing to this cleavage, they have become even more sharply divided from other peoples than before. They were obliged to hear the new religious community (which, besides Jews, included Egyptians, Greeks, Syrians, Romans and eventually Germans) reproach them with having murdered God. In full, this reproach would run as follows: 'They will not accept it as true that they murdered God, whereas we admit it and have been cleansed of that guilt.' It is easy therefore to see how much truth lies behind this reproach. A special enquiry would be called for to discover why it has been impossible for the Jews to join in this forward step which was implied, in spite of all its distortions, by the admission of having murdered God. In a certain sense they have in that way taken a tragic load of guilt on themselves; they have been made to pay heavy penance for it.
Our investigation may perhaps have thrown a little light on the question of how the Jewish people have acquired the characteristics which distinguish them. Less light has been thrown on the problem of how it is that they have been able to retain their individuality till the present day. But exhaustive answers to such riddles cannot in fairness be either demanded or expected. A contribution, to be judged in view of the limitations which I mentioned at the start, is all that I can offer.

[1939a, 4953]
There can be no doubt that very different elements came together in the construction of the Jewish people; but what must have made the greatest difference among these tribes was whether they had experienced or not the sojourn in Egypt and what followed it. Having regard to this point, we may say that the nation arose out of a union of two component parts; and it fits in with this that, after a short period of political unity, it split into two pieces - the kingdom of Israel and the kingdom of Judah. History is fond of reinstatements like this, where a later fusion is undone and an earlier separation re-emerges. The most impressive example of this was afforded, as is well known, by the Reformation, which, after an interval of over a thousand years, brought to light once more the frontier between the Germany which had at one time been Roman and the Germany which had remained independent. In the instance of the Jewish people it is not possible to point to such a faithful reproduction of the old state of things; our knowledge of those times is too uncertain to allow us to assert that the settled tribes were once more to be found together in the Northern Kingdom and those who had returned from Egypt in the Southern Kingdom; but here too the later split cannot have been unrelated to the earlier joining up. The former Egyptians were probably fewer in numbers than the others, but showed themselves culturally the stronger. They exercised a more powerful influence on the further evolution of the people, because they brought along with them a tradition which the others lacked.

[1939a, 4868]

We must now make an attempt at elucidating the chronological relations of these events. We have put the Exodus in the period after the end of the Eighteenth Dynasty (1350 B.C.). It may have occurred then or a little later, since the Egyptian chroniclers have included the succeeding years of anarchy in the reign of Haremhab, which brought them to an end and lasted till 1315 B.C. The next (but also the only) fixed point for the chronology is afforded by the stela of Merenptah (1225-15 B.C.), which boasts of his victory over Isiraal (Israel) and the laying waste of her seed (?). The sense to be attached to this inscription is unfortunately doubtful, it is supposed to prove that the Israelite tribes were already at that time settled in Canaan.¹ Eduard Meyer rightly concludes from this stela that Merenptah cannot have been the Pharaoh of the Exodus, as had been lightly assumed previously. The date of the Exodus must have been earlier. The question of who was the Pharaoh of the Exodus seems to me altogether an idle one. There was no Pharaoh of the Exodus, for it occurred during an interregnum. Nor does the discovery of the stela of Merenptah throw any light on the possible date of the union and founding of the religion at Kadesh. All that we can say with certainty is that it was some time between 1350 and 1215 B.C. We suspect that the Exodus comes somewhere very near the beginning of this hundred years and the events at Kadesh not too far away from its end. We should like to claim the greater part of this period for the interval between the two occurrences. For we need a comparatively long time for the passions of the returning tribes to have cooled down after the murder of Moses and for the influence of his followers, the Levites, to have become as great as is implied by the compromise at Kadesh. Two generations, sixty years, might about suffice for this, but it is a tight fit. What is inferred from the stela of Merenptah comes too early for us, and since we recognize that in this hypothesis of ours one supposition is only based on another, we must admit that this discussion reveals a weak side of our construction. It is unlucky that everything relating to the settlement of the Jewish people in Canaan is so obscure and confused. Our only resort, perhaps, is to suppose that the name on the 'Israel' stela does not relate to the tribes whose fortunes we are trying to follow and which combined to form the later people of Israel. After all, the name of 'Habiru' (Hebrews) was transferred to these same people in the Amarna period.

[1939a, 4878]
The union of the tribes into a nation through the adoption of a common religion, whenever it may have taken place, might easily have turned out quite an unimportant happening in world history. The new religion would have been carried away by the current of events, Yahweh would have had to take his place in the procession of departed gods in Flaubert's vision, and all twelve of his tribes would have been 'lost' and not only the ten of them which the Anglo-Saxons have been in search of for so long. The god Yahweh, to whom the Midianite Moses then presented a new people, was probably in no respect a prominent being. A coarse, narrow-minded, local god, violent and bloodthirsty, he had promised his followers to give them 'a land flowing with milk and honey' and urged them to exterminate its present inhabitants 'with the edge of the sword'. It is astonishing how much remains, in spite of all the revisions of the Biblical narratives, that allows us to recognize his original nature. It is not even certain that his religion was a genuine monotheism, that it denied the divinity of the deities of other peoples. It was enough probably that his people regarded their own god as more powerful than any foreign god. If, nevertheless, in the sequel everything took a different course from what such beginnings would have led one to expect, the cause can be found in only one fact. The Egyptian Moses had given to one portion of the people a more highly spiritualized notion of god, the idea of a single deity embracing the whole world, who was not less all-loving than all-powerful, who was averse to all ceremonial and magic and set before men as their highest aim a life in truth and justice. For, however incomplete may be the accounts we have of the ethical side of the Aten religion, it can be no unimportant fact that Akhenaten regularly referred to himself in his inscriptions as 'living in Ma'at' (truth, justice).¹ In the long run it made no difference that the people rejected the teaching of Moses (probably after a short time) and killed him himself. The tradition of it remained and its influence achieved (only gradually, it is true, in the course of centuries) what was denied to Moses himself. The god Yahweh had arrived at undeserved honour when, from the time of Kadesh onwards, he was credited with the deed of liberation which had been performed by Moses; but he had to pay heavily for this usurpation. The shadow of the god whose place he had taken became stronger than himself; by the end of the process of evolution, the nature of the forgotten god of Moses had come to light behind his own. No one can doubt that it was only the idea of this other god that enabled the people of Israel to survive all the blows of fate and that kept them alive to our own days.

[1939a, 4879]

And here, it seems, I have reached the conclusion of my study, which was directed to the single aim of introducing the figure of an Egyptian Moses into the nexus of Jewish history. Our findings may be thus expressed in the most concise formula. Jewish history is familiar to us for its dualities: two groups of people who came together to form the nation, two kingdoms into which this nation fell apart, two gods' names in the documentary sources of the Bible. To these we add two fresh ones: the foundation of two religions - the first repressed by the second but nevertheless later emerging victoriously behind it, and two religious founders, who are both called by the same name of Moses and whose personalities we have to distinguish from each other. All of these dualities are the necessary consequences of the first one: the fact that one portion of the people had an experience which must be regarded as traumatic and which the other portion escaped. Beyond this there would be a very great deal to discuss, to explain and to assert. Only thus would an interest in our purely historical study find its true justification. What the real nature of a tradition resides in, and what its special power rests on, how impossible it is to dispute the personal influence upon world-history of individual great men, what sacrilege one commits against the splendid diversity of human life if one recognizes only those motives which arise from material needs, from what sources some ideas (and particularly religious ones) derive their power to subject both men and peoples to their yoke - to study all this in the special case of Jewish history would be an alluring task. To continue my work on such lines as these would be to find a link with the statements I put forward twenty-five years ago in Totem and Taboo. But I no longer feel that I have the strength to do so.

[1939a, 4881]
We must take the period of the interregnum after 1350 B.C. as the date of the Exodus from Egypt. The interval of time which followed, up to the completion of the occupation of the land of Canaan, is particularly inscrutable. Modern historical research has been able to extract two facts from the obscurity which the biblical narrative has left, or rather created, at this point. The first of these facts, discovered by Ernst Sellin, is that the Jews, who, even by the account in the Bible, were headstrong and unruly towards their law-giver and leader, rose against him one day, killed him and threw off the religion of the Aten which had been imposed on them, just as the Egyptians had thrown it off earlier. The second fact, demonstrated by Eduard Meyer, is that those Jews who had returned from Egypt united later on with closely related tribes in the region between Palestine, the Sinai Peninsula and Arabia, and that there, in a well-watered locality named Kadesh, under the influence of the Arabian Midianites, they took on a new religion, the worship of the volcano god Yahweh. Soon after this they were ready to invade Canaan as conquerors.

[1939a, 4887]

The chronological relations of these two events to each other and to the Exodus from Egypt are very uncertain. The closest historical point of reference is provided by a stela of the Pharaoh Merenptah (who reigned till 1215 B.C.) which in the course of a report on campaigns in Syria and Palestine names 'Israel' among the defeated enemy. If we take the date of this stela as a terminus ad quem, we are left with about a century (from after 1350 to before 1215 B.C.) for the whole course of events, starting from the Exodus. It is possible, however, that the name 'Israel' did not yet relate to the tribes whose fortunes we are following and that in fact we have a longer interval at our disposal. The settlement in Canaan of what was later the Jewish people was certainly no rapidly completed conquest but took place in waves and over considerable periods of time. If we free ourselves from the limitation imposed by the Merenptah stela, we can all the more easily assign one generation (thirty years) to the period of Moses,¹ and allow at least two generations, but probably more, to elapse up to the time of the union at Kadesh.² The interval between Kadesh and the irruption into Canaan need only be short. The Jewish tradition, as was shown in the preceding essay, had good grounds for shortening the interval between the Exodus and the founding of the religion at Kadesh, while the reverse is in the interest of our account.

[1939a, 4888]
We have already repeatedly described what happened at Kadesh when the two portions of what was later to be the Jewish people came together to receive a new religion. In those, on the one hand, who had been in Egypt, memories of the Exodus and of the figure of Moses were still so strong and vivid that they demanded their inclusion in an account of early times. They were grandchildren, perhaps, of people who had known Moses himself, and some of them still felt themselves Egyptians and bore Egyptian names. But they had good motives for repressing the memory of the fate with which their leader and lawgiver had met. The determining purpose of the other portion of the people was to glorify the new god and to dispute his being foreign. Both portions had the same interest in disavowing the fact of their having had an earlier religion and the nature of its content. So it was that the first compromise came about, and it was probably soon recorded in writing. The people who had come from Egypt had brought writing and the desire to write history along with them; but it was to be a long time before historical writing realized that it was pledged to unswerving truthfulness. To begin with it had no scruples about shaping its narratives according to the needs and purposes of the moment, as though it had not yet recognized the concept of falsification. As a result of these circumstances a discrepancy was able to grow up between the written record and the oral transmission of the same material - tradition. What had been omitted or changed in the written record might very well have been preserved intact in tradition. Tradition was a supplement but at the same time a contradiction to historical writing. It was less subjected to the influence of distorting purposes and perhaps at some points quite exempt from them, and it might therefore be more truthful than the account that had been recorded in writing. Its trustworthiness, however, suffered from the fact that it was less stable and definite than the written account and exposed to numerous changes and alterations when it was handed on from one generation to another by oral communication. A tradition of such a kind might meet with various sorts of fate. What we should most expect would be that it would be crushed by the written account, would be unable to stand up against it, would become more and more shadowy and would finally pass into oblivion. But it might meet with other fates: one of these would be that the tradition itself would end in a written record, and we shall have to deal with yet others as we proceed.

[1939a, 4894]
Perhaps they brought something else with them more tangible than a tradition. One of the greatest enigmas of Jewish prehistory is that of the origin of the Levites. They are traced back to one of the twelve tribes of Israel - that of Levi - but no tradition has ventured to say where that tribe was originally located or what portion of the conquered land of Canaan was allotted to it. They filled the most important priestly offices, but they were distinct from the priests. A Levite is not necessarily a priest; nor is it the name of a caste. Our hypothesis about the figure of Moses suggests an explanation. It is incredible that a great lord, like Moses the Egyptian, should have joined this alien people unaccompanied. He certainly must have brought a retinue with him - his closest followers, his scribes, his domestic servants. This is who the Levites originally were. The tradition which alleges that Moses was a Levite seems to be a clear distortion of the fact: the Levites were the followers of Moses. This solution is supported by the fact which I have already mentioned in my earlier essay that it is only among the Levites that Egyptian names occur later.¹ It is to be presumed that a fair number of these followers of Moses escaped the catastrophe which descended on him himself and the religion he founded. They multiplied in the course of the next generations, became fused with the people they lived among, but remained loyal to their master, preserved his memory and carried out the tradition of his doctrines. At the time of the union with the disciples of Yahweh they formed an influential minority, culturally superior to the rest.

[1939a, 4868]

It is no longer possible to estimate the share taken by the Levites in the final victory of the Mosaic god over Yahweh. They had taken the side of Moses in the past, when the compromise was reached at Kadesh, in a still live memory of the master whose retinue and compatriots they had been. During the centuries since then they had become merged with the people or with the priesthood, and it had become the main function of the priests to develop and supervise the ritual, and besides this to preserve the holy writ and revise it in accordance with their aims. But was not all sacrifice and all ceremonial at bottom only magic and sorcery, such as had been unconditionally rejected by the old Mosaic teaching? Thereupon there arose from among the midst of the people an unending succession of men who were not linked to Moses in their origin but were enthralled by the great and mighty tradition which had grown up little by little in obscurity: and it was these men, the Prophets, who tirelessly preached the old Mosaic doctrine that the deity disdained sacrifice and ceremonial and asked only for faith and a life in truth and justice (Ma'at). The efforts of the Prophets had a lasting success; the doctrines with which they re-established the old faith became the permanent content of the Jewish religion. It is honour enough to the Jewish people that they could preserve such a tradition and produce men who gave it a voice - even though the initiative to it came from outside, from a great foreigner.

[1939a, 4880]
On the basis of our earlier discussions, we may now assert that it was the man Moses who imprinted this trait - significant for all time - upon the Jewish people. He raised their self-esteem by assuring them that they were God's chosen people, he enjoined them to holiness and pledged them to be apart from others. Not that other peoples were lacking in self-esteem. Just as to-day, so in those days each nation thought itself better than any other. But the self-esteem of the Jews was given a religious anchorage by Moses: it became a part of their religious faith. Owing to their especially intimate relation to their God they acquired a share in his grandeur. And since we know that behind the God who had chosen the Jews and freed them from Egypt stands the figure of Moses, who had done precisely that, ostensibly at God's command, we venture to declare that it was this one man Moses who created the Jews. It is to him that this people owes its tenacity of life but also much of the hostility it has experienced and still experiences.

[1939a, 4927]

How is it possible for a single man to evolve such extraordinary effectiveness that he can form a people out of random individuals and families, can stamp them with their definitive character and determine their fate for thousands of years? Is not a hypothesis such as this a relapse into the mode of thought which led to myths of a creator and to the worship of heroes, into times in which the writing of history was nothing more than a report of the deeds and destinies of single individuals, of rulers or conquerors? The modern tendency is rather towards tracing back the events of human history to more concealed, general and impersonal factors, to the compelling influence of economic conditions, to alterations in food habits, to advances in the use of materials and tools, to migrations brought about by increases in population and climatic changes. Individuals have no other part to play in this than as exponents or representatives of group trends, which are bound to find expression and do so in these particular individuals largely by chance.

[1939a, 4928]

The Mosaic prohibition elevated God to a higher degree of intellectuality, and the way was opened to further alterations in the idea of God which we have still to describe. But we may first consider another effect of the prohibition. All such advances in intellectuality have as their consequence that the individual's self-esteem is increased, that he is made proud - so that he feels superior to other people who have remained under the spell of sensuality. Moses, as we know, conveyed to the Jews an exalted sense of being a chosen people. The dematerialization of God brought a fresh and valuable contribution to their secret treasure. The Jews retained their inclination to intellectual interests. The nation's political misfortune taught it to value at its true worth the one possession that remained to it - its literature. Immediately after the destruction of the Temple in Jerusalem by Titus, the Rabbi Jochanan ben Zakkai asked permission to open the first Torah school in Jabneh. From that time on, the Holy Writ and intellectual concern with it were what held the scattered people together.

[1939a, 4935]

This much is generally known and accepted. All I have wanted to do is to add that this characteristic development of the Jewish nature was introduced by the Mosaic prohibition against worshipping God in a visible form.

[1939a, 4935]
Let us return to the more modest problem which has occupied us hitherto. We wanted to explain the origin of the special character of the Jewish people, a character which is probably what has made their survival to the present day possible. We found that the man Moses impressed this character on them by giving them a religion which increased their self-esteem so much that they thought themselves superior to all other peoples. Thereafter they survived by keeping apart from others. Mixtures of blood interfered little with this, since what held them together was an ideal factor, the possession in common of certain intellectual and emotional wealth. The religion of Moses led to this result because (1) it allowed the people to take a share in the grandeur of a new idea of God, (2) it asserted that this people had been chosen by this great God and were destined to receive evidences of his special favour and (3) it forced upon the people an advance in intellectuality which, important enough in itself, opened the way, in addition, to the appreciation of intellectual work and to further renunciations of instinct.

[1939a, 4941]
And here, it seems, I have reached the conclusion of my study, which was directed to the single aim of introducing the figure of an Egyptian Moses into the nexus of Jewish history. Our findings may be thus expressed in the most concise formula. Jewish history is familiar to us for its dualities: two groups of people who came together to form the nation, two kingdoms into which this nation fell apart, two gods’ names in the documentary sources of the Bible. To these we add two fresh ones: the foundation of two religions - the first repressed by the second but nevertheless later emerging victoriously behind it, and two religious founders, who are both called by the same name of Moses and whose personalities we have to distinguish from each other. All of these dualities are the necessary consequences of the first one: the fact that one portion of the people had an experience which must be regarded as traumatic and which the other portion escaped. Beyond this there would be a very great deal to discuss, to explain and to assert. Only thus would an interest in our purely historical study find its true justification. What the real nature of a tradition resides in, and what its special power rests on, how impossible it is to dispute the personal influence upon world-history of individual great men, what sacrilege one commits against the splendid diversity of human life if one recognizes only those motives which arise from material needs, from what sources some ideas (and particularly religious ones) derive their power to subject both men and peoples to their yoke - to study all this in the special case of Jewish history would be an alluring task. To continue my work on such lines as these would be to find a link with the statements I put forward twenty-five years ago in *Totem and Taboo*. But I no longer feel that I have the strength to do so.

[1939a, 4881]
So the fable of the single sex of vultures and their mode of conception remained something very far from an unimportant anecdote like the analogous tale of the scarabaeus beetle; it had been seized on by the Fathers of the Church so that they could have at their disposal a proof drawn from natural history to confront those who doubted sacred history. If vultures were described in the best accounts of antiquity as depending on the wind for impregnation, why could not the same thing have also happened on one occasion with a human female? Since the fable of the vulture could be turned to this account 'almost all' the Fathers of the Church made a practice of telling it, and thus it can hardly be doubted that Leonardo too came to know of it through its being favoured by so wide a patronage.

[1910c, 2265]

The fact that the curb put upon love by civilization involves a universal tendency to debase sexual objects will perhaps lead us to turn our attention from the object to the instincts themselves. The damage caused by the initial frustration of sexual pleasure is seen in the fact that the freedom later given to that pleasure in marriage does not bring full satisfaction. But at the same time, if sexual freedom is unrestricted from the outset the result is no better. It can easily be shown that the psychical value of erotic needs is reduced as soon as their satisfaction becomes easy. An obstacle is required in order to heighten libido; and where natural resistances to satisfaction have not been sufficient men have at all times erected conventional ones so as to be able to enjoy love. This is true both of individuals and of nations. In times in which there were no difficulties standing in the way of sexual satisfaction, such as perhaps during the decline of the ancient civilizations, love became worthless and life empty, and strong reaction-formations were required to restore indispensable affective values. In this connection it may be claimed that the ascetic current in Christianity created psychical values for love which pagan antiquity was never able to confer on it. This current assumed its greatest importance with the ascetic monks, whose lives were almost entirely occupied with the struggle against libidinal temptation.

[1912d, 2344]

The question of why the emotional attitude towards rulers includes such a powerful unconscious element of hostility raises a very interesting problem, but one that lies outside the limits of the present study. I have already hinted at the fact that the child's complex of emotions towards his father - the father-complex - has a bearing on the subject, and I may add that more information on the early history of the kingship would throw a decisive light on it. Frazer (1911a) has put forward impressive reasons, though, as he himself admits, not wholly conclusive ones, for supposing that the earliest kings were foreigners who, after a brief reign, were sacrificed with solemn festivities as representatives of the deity. It is possible that the course taken by the evolution of kings may also have had an influence upon the myths of Christendom.

[1912-1913, 2697]

The main objection to this third of Frazer's theories is the same as has already been brought against the second or sociological one. The Arunta seem to be far removed from the beginnings of totemism. Their denial of paternity does not appear to rest upon primitive ignorance; in some respects they themselves make use of descent through the father. They seem to have sacrificed paternity for the sake of some sort of speculation designed to honour the souls of their ancestors.¹ They have enlarged the myth of the impregnation of a virgin by the spirit into a general theory of conception; but that is no reason why ignorance of the conditions governing fertilization should be imputed to them any more than to the peoples of antiquity at the time of the origin of the Christian myths.

[1912-1913, 2759]
When Christianity first penetrated into the ancient world it met with competition from the religion of Mithras and for a time it was doubtful which of the two deities would gain the victory. In spite of the halo of light surrounding his form, the youthful Persian god remains obscure to us. We may perhaps infer from the sculptures of Mithras slaying a bull that he represented a son who was alone in sacrificing his father and thus redeemed his brothers from their burden of complicity in the deed. There was an alternative method of allaying their guilt and this was first adopted by Christ. He sacrificed his own life and so redeemed the company of brothers from original sin.

The doctrine of original sin was of Orphic origin. It formed a part of the mysteries, and spread from them to the schools of philosophy of ancient Greece. (Reinach, 1905-12, 2, 75 ff.) Mankind, it was said, were descended from the Titans, who had lulled the young Dionysus-Zagreus and had torn him to pieces. The burden of this crime weighed on them. A fragment of Anaximander relates how the unity of the world was broken by a primaeval sin,¹ and that whatever issued from it must bear the punishment. The tumultuous mobbing, the killing and the tearing in pieces by the Titans reminds us clearly enough of the totemic sacrifice described by St. Nilus - as, for the matter of that, do many other ancient myths, including, for instance, that of the death of Orpheus himself. Nevertheless, there is a disturbing difference in the fact of the murder having been committed on a youthful god.

It is otherwise in the Catholic Church. Every Christian loves Christ as his ideal and feels himself united with all other Christians by the tie of identification. But the Church requires more of him. He has also to identify himself with Christ and love all other Christians as Christ loved them. At both points, therefore, the Church requires that the position of the libido which is given by group formation should be supplemented. Identification has to be added where object-choice has taken place, and object-love where there is identification. This addition evidently goes beyond the constitution of the group. One can be a good Christian and yet be far from the idea of putting oneself in Christ's place and of having like him an all-embracing love for mankind. One need not think oneself capable, weak mortal that one is, of the Saviour's largeness of soul and strength of love. But this further development in the distribution of libido in the group is probably the factor upon which Christianity bases its claim to have reached a higher ethical level.

² The fact that in our analyses we so seldom succeed in finding the Devil as a father-substitute may be an indication that for those who come to us for analysis this figure from mediaeval mythology has long since played out its part. For the pious Christian of earlier centuries belief in the Devil was no less a duty than belief in God. In point of fact, he needed the Devil in order to be able to keep hold of God. The later decrease in faith has, for various reasons, first and foremost affected the figure of the Devil.

Now whether we suppose that such a possibility was a historical event or not, it brings the formation of religion within the circle of the father-complex and bases it upon the ambivalence which dominates that complex. After the totem animal had ceased to serve as a substitute for him, the primal father, at once feared and hated, revered and envied, became the prototype of God himself. The son's rebelliousness and his affection for his father struggled against each other through a constant succession of compromises, which sought on the one hand to atone for the act of parricide and on the other to consolidate the advantages it had brought. This view of religion throws a particularly clear light upon the psychological basis of Christianity, in which, as we know, the ceremony of the totem meal still survives with but little distortion, in the form of Communion. I should like explicitly to mention that this last observation was not made by me but is to be found in the works of Robertson Smith and Frazer.

[1921c, 3825]

[1923d, 4011]

[1925d, 4241]
How has it happened that so many people have come to take up this strange attitude of hostility to civilization? I believe that the basis of it was a deep and long-standing dissatisfaction with the then existing state of civilization and that on that basis a condemnation of it was built up, occasioned by certain specific historical events. I think I know what the last and the last but one of those occasions were. I am not learned enough to trace the chain of them far back enough in the history of the human species; but a factor of this kind hostile to civilization must already have been at work in the victory of Christendom over the heathen religions. For it was very closely related to the low estimation put upon earthly life by the Christian doctrine. The last but one of these occasions was when the progress of voyages of discovery led to contact with primitive peoples and races. In consequence of insufficient observation and a mistaken view of their manners and customs, they appeared to Europeans to be leading a simple, happy life with few wants, a life such as was unattainable by their visitors with their superior civilization. Later experience has corrected some of those judgements. In many cases the observers had wrongly attributed to the absence of complicated cultural demands what was in fact due to the bounty of nature and the ease with which the major human needs were satisfied. The last occasion is especially familiar to us. It arose when people came to know about the mechanism of the neuroses, which threaten to undermine the modicum of happiness enjoyed by civilized men. It was discovered that a person becomes neurotic because he cannot tolerate the amount of frustration which society imposes on him in the service of its cultural ideals, and it was inferred from this that the abolition or reduction of those demands would result in a return to possibilities of happiness.
[1930a, 4485]
In the first place, I suspect that the reader has the impression that our discussions on the sense of guilt disrupt the framework of this essay: that they take up too much space, so that the rest of its subject-matter, with which they are not always closely connected, is pushed to one side. This may have spoiled the structure of my paper; but it corresponds faithfully to my intention to represent the sense of guilt as the most important problem in the development of civilization and to show that the price we pay for our advance in civilization is a loss of happiness through the heightening of the sense of guilt. Anything that still sounds strange about this statement, which is the final conclusion of our investigation, can probably be traced to the quite peculiar relationship - as yet completely unexplained - which the sense of guilt has to our consciousness. In the common case of remorse, which we regard as normal, this feeling makes itself clearly enough perceptible to consciousness. Indeed, we are accustomed to speak of a ‘consciousness of guilt’ instead of a ‘sense of guilt’. Our study of the neuroses, to which, after all we owe the most valuable pointers to an understanding of normal conditions, brings us up against some contradictions. In one of those affections, obsessional neurosis, the sense of guilt makes itself noisily heard in consciousness; it dominates the clinical picture and the patient’s life as well, and it hardly allows anything else to appear alongside of it. But in most other cases and forms of neurosis it remains completely unconscious, without on that account producing any less important effects. Our patients do not believe us when we attribute an ‘unconscious sense of guilt’ to them. In order to make ourselves at all intelligible to them, we tell them of an unconscious need for punishment, in which the sense of guilt finds expression. But its connection with a particular form of neurosis must not be over-estimated. Even in obsessional neurosis there are types of patients who are not aware of their sense of guilt, or who only feel it as a tormented uneasiness, a kind of anxiety, if they are prevented from carrying out certain actions. It ought to be possible eventually to understand these things; but as yet we cannot. Here perhaps we may be glad to have it pointed out that the sense of guilt is at bottom nothing else but a topographical variety of anxiety; in its later phases it coincides completely with fear of the super-ego. And the relations of anxiety to consciousness exhibit the same extraordinary variations. Anxiety is always present somewhere or other behind every symptom; but at one time it takes noisy possession of the whole of consciousness, while at another it conceals itself so completely that we are obliged to speak of unconscious anxiety or, if we want to have a clearer psychological conscience, since anxiety is in the first instance simply a feeling, of possibilities of anxiety. Consequently it is very conceivable that the sense of guilt produced by civilization is not perceived as such either, and remains to a large extent unconscious, or appears as a sort of malaise, a dissatisfaction, for which people seek other motivations. Religions, at any rate, have never overlooked the part played in civilization by a sense of guilt. Furthermore - a point which I failed to appreciate elsewhere² - they claim to redeem mankind from this sense of guilt, which they call sin. From the manner in which, in Christianity, this redemption is achieved - by the sacrificial death of a single person, who in this manner takes upon himself a guilt that is common to everyone - we have been able to infer what the first occasion may have been on which this primal guilt, which was also the beginning of civilization, was acquired.³

[1930a, 4523]
And although practical Marxism has mercilessly cleared away all idealistic systems and illusions, it has itself developed illusions which are no less questionable and unprovable than the earlier ones. It hopes in the course of a few generations so to alter human nature that people will live together almost without friction in the new order of society, and that they will undertake the duties of work without any compulsion. Meanwhile it shifts elsewhere the instinctual restrictions which are essential in society; it diverts the aggressive tendencies which threaten all human communities to the outside and finds support in the hostility of the poor against the rich and of the hitherto powerless against the former rulers. But a transformation of human nature such as this is highly improbable. The enthusiasm with which the mass of the people follow the Bolshevist instigation at present, so long as the new order is incomplete and is threatened from outside, gives no certainty for a future in which it would be fully built up and in no danger. In just the same way as religion, Bolshevism too must compensate its believers for the sufferings and deprivations of their present life by promises of a better future in which there will no longer be any unsatisfied need. This Paradise, however, is to be in this life, instituted on earth and thrown open within a foreseeable time. But we must remember that the Jews as well, whose religion knows nothing of an after-life, expected the arrival of a Messiah on earth, and that the Christian Middle Ages at many times believed that the Kingdom of God was at hand. [1933a, 4776]
If we turn to our own times, we arrive at the same conclusion which you have reached by a shorter path. Wars will only be prevented with certainty if mankind unites in setting up a central authority to which the right of giving judgement upon all conflicts of interest shall be handed over. There are clearly two separate requirements involved in this: the creation of a supreme agency and its endowment with the necessary power. One without the other would be useless. The League of Nations is designed as an agency of this kind, but the second condition has not been fulfilled: the League of Nations has no power of its own and can only acquire it if the members of the new union, the separate States, are ready to resign it. And at the moment there seems very little prospect of this. The institution of the League of Nations would, however, be wholly unintelligible if one ignored the fact that here was a bold attempt such as has seldom (perhaps, indeed, never on such a scale) been made before. It is an attempt to base upon an appeal to certain idealistic attitudes of mind the authority (that is, the coercive influence) which otherwise rests on the possession of power. We have seen that a community is held together by two things: the compelling force of violence and the emotional ties (identifications is the technical name) between its members. If one of the factors is absent, the community may possibly be held together by the other. The ideas that are appealed to can, of course, only have any significance if they give expression to important affinities between the members, and the question arises of how much strength such ideas can exert. History teaches us that they have been to some extent effective. For instance, the Panhellenic idea, the sense of being superior to the surrounding barbarians - an idea which was so powerfully expressed in the Amphictyonic Council, the Oracles and the Games - was sufficiently strong to mitigate the customs of war among Greeks, though evidently not sufficiently strong to prevent warlike disputes between the different sections of the Greek nation or even to restrain a city or confederation of cities from allying itself with the Persian foe in order to gain an advantage over a rival. The community of feeling among Christians, powerful though it was, was equally unable at the time of the Renaissance to deter Christian States, whether large or small, from seeking the Sultan's aid in their wars with one another. Nor does any idea exist to-day which could be expected to exert a unifying authority of the sort. Indeed it is all too clear that the national ideals by which nations are at present swayed operate in a contrary direction. Some people are inclined to prophesy that it will not be possible to make an end of war until Communist ways of thinking have found universal acceptance. But that aim is in any case a very remote one to-day, and perhaps it could only be reached after the most fearful civil wars. Thus the attempt to replace actual force by the force of ideas seems at present to be doomed to failure. We shall be making a false calculation if we disregard the fact that law was originally brute violence and that even to-day it cannot do without the support of violence.

[1933b, 4797]
The re-establishment of the primal father in his historic rights was a great step forward but it could not be the end. The other portions of the prehistoric tragedy insisted on being recognized. It is not easy to discern what set this process in motion. It appears as though a growing sense of guilt had taken hold of the Jewish people, or perhaps of the whole civilized world of the time, as a precursor to the return of the repressed material. Till at last one of these Jewish people found, in justifying a politico-religious agitator, the occasion for detaching a new - the Christian - religion from Judaism. Paul, a Roman Jew from Tarsus, seized upon this sense of guilt and traced it back correctly to its original source. He called this the 'original sin'; it was a crime against God and could only be atoned for by death. With the original sin death came into the world. In fact this crime deserving death had been the murder of the primal father who was later deified. But the murder was not remembered: instead of it there was a phantasy of its atonement, and for that reason this phantasy could be hailed as a message of redemption (evangelium). A son of God had allowed himself to be killed without guilt and had thus taken on himself the guilt of all men. It had to be a son, since it had been the murder of a father. It is probable that traditions from oriental and Greek mysteries had had an influence on the phantasy of redemption. What was essential in it seems to have been Paul's own contribution. In the most proper sense he was a man of an innately religious disposition: the dark traces of the past lurked in his mind, ready to break through into its more conscious regions.

That the redeemer had sacrificed himself without guilt was evidently a tendentious distortion, which offered difficulties to logical understanding. For how could someone guiltless of the act of murder take on himself the guilt of the murderers by allowing himself to be killed? In the historical reality there was no such contradiction. The 'redeemer' could be none other than the most guilty person, the ringleader of the company of brothers who had overpowered their father. We must in my judgement leave it undecided whether there was such a chief rebel and ringleader. That is possible; but we must also bear in mind that each one of the company of brothers certainly had a wish to commit the deed by himself alone and so to create an exceptional position for himself and to find a substitute for his identification with the father which was having to be given up and which was becoming merged in the community. If there was no such ringleader, then Christ was the heir to a wishful phantasy which remained unfulfilled; if there was one, then he was his successor and his reincarnation. But no matter whether what we have here is a phantasy or the return of a forgotten reality, in any case the origin of the concept of a hero is to be found at this point - the hero who always rebels against his father and kills him in some shape or other.¹ Here too is the true basis for the 'tragic guilt' of the hero of drama, which is otherwise hard to explain. It can scarcely be doubted that the hero and chorus in Greek drama represent the same rebellious hero and company of brothers; and it is not without significance that in the Middle Ages what the theatre started with afresh was the representation of the story of the Passion.

[1939a, 4910-4911]
We have already said that the Christian ceremony of Holy Communion, in which the believer incorporates the Saviour's blood and flesh, repeats the content of the old totem meal - no doubt only in its affectionate meaning, expressive of veneration, and not in its aggressive meaning. The ambivalence that dominates the relation to the father was clearly shown, however, in the final outcome of the religious novelty. Ostensibly aimed at propitiating the father god, it ended in his being dethroned and got rid of. Judaism had been a religion of the father; Christianity became a religion of the son. The old God the Father fell back behind Christ; Christ, the Son, took his place, just as every son had hoped to do in primeval times. Paul, who carried Judaism on, also destroyed it. No doubt he owed his success in the first instance to the fact that, through the idea of the redeemer, he exorcized humanity's sense of guilt; but he owed it as well to the circumstance that he abandoned the 'chosen' character of his people and its visible mark - circumcision - so that the new religion could be a universal one, embracing all men. Though a part may have been played in Paul's taking this step by his personal desire for revenge for the rejection of his innovation in Jewish circles, yet it also restored a feature of the old Aten religion - it removed a restriction which that religion had acquired when it was handed over to a new vehicle, the Jewish people.

In some respects the new religion meant a cultural regression as compared with the older, Jewish one, as regularly happens when a new mass of people, of a lower level, break their way in or are given admission. The Christian religion did not maintain the high level in things of the mind to which Judaism had soared. It was no longer strictly monotheist, it took over numerous symbolic rituals from surrounding peoples, it re-established the great mother-goddess and found room to introduce many of the divine figures of polytheism only lightly veiled, though in subordinate positions. Above all, it did not, like the Aten religion and the Mosaic one which followed it, exclude the entry of superstitious, magical and mystical elements, which were to prove a severe inhibition upon the intellectual development of the next two thousand years.

The further development takes us beyond Judaism. The remainder of what returned from the tragic drama of the primal father was no longer reconcilable in any way with the religion of Moses. The sense of guilt of those days was very far from being any longer restricted to the Jewish people; it had caught hold of all the Mediterranean peoples as a dull malaise, a premonition of calamity for which no one could suggest a reason. Historians of our day speak of an ageing of ancient civilization, but I suspect that they have only grasped accidental and contributory causes of this depressed mood of the peoples. The elucidation of this situation of depression sprang from Jewry. Irrespectively of all the approximations and preparations in the surrounding world, it was after all a Jewish man, Saul of Tarsus (who, as a Roman citizen, called himself Paul), in whose spirit the realization first emerged: 'the reason we are so unhappy is that we have killed God the father.' And it is entirely understandable that he could only grasp this piece of truth in the delusional disguise of the glad tidings: 'we are freed from all guilt since one of us has sacrificed his life to absolve us.' In this formula the killing of God was of course not mentioned, but a crime that had to be atoned by the sacrifice of a victim could only have been a murder. And the intermediate step between the delusion and the historical truth was provided by the assurance that the victim of the sacrifice had been God's son. With the strength which it derived from the source of historical truth, this new faith overthrew every obstacle. The blissful sense of being chosen was replaced by the liberating sense of redemption. But the fact of the parricide, in returning to the memory of mankind, had to overcome greater resistances than the other fact, which had constituted the subject-matter of monotheism; it was also obliged to submit to a more powerful distortion. The unnameable crime was replaced by the hypothesis of what must be described as a shadowy 'original sin'.

[1939a, 4911]

[1939a, 4912]
Original sin and redemption by the sacrifice of a victim became the foundation stones of the new religion founded by Paul. It must remain uncertain whether there was a ringleader and instigator to the murder among the band of brothers who rebelled against the primal father, or whether such a figure was created later by the imagination of creative artists in order to turn themselves into heroes, and was then introduced into the tradition. After the Christian doctrine had burst the framework of Judaism, it took up components from many other sources, renounced a number of characteristics of pure monotheism and adapted itself in many details to the rituals of the other Mediterranean peoples. It was as though Egypt was taking vengeance once more on the heirs of Akhenaten. It is worth noticing how the new religion dealt with the ancient ambivalence in the relation to the father. Its main content was, it is true, reconciliation with God the Father, atonement for the crime committed against him; but the other side of the emotional relation showed itself in the fact that the son, who had taken the atonement on himself, became a god himself beside the father and, actually, in place of the father. Christianity, having arisen out of a father-religion, became a son-religion. It has not escaped the fate of having to get rid of the father.
[1939a, 4953]

Only a portion of the Jewish people accepted the new doctrine. Those who refused to are still called Jews today. Owing to this cleavage, they have become even more sharply divided from other peoples than before. They were obliged to hear the new religious community (which, besides Jews, included Egyptians, Greeks, Syrians, Romans and eventually Germans) reproach them with having murdered God. In full, this reproach would run as follows: 'They will not accept it as true that they murdered God, whereas we admit it and have been cleansed of that guilt.' It is easy therefore to see how much truth lies behind this reproach. A special enquiry would be called for to discover why it has been impossible for the Jews to join in this forward step which was implied, in spite of all its distortions, by the admission of having murdered God. In a certain sense they have in that way taken a tragic load of guilt on themselves; they have been made to pay heavy penance for it.
[1939a, 4953]
No other portion of the history of religion has become so clear to us as the introduction of monotheism into Judaism and its continuation in Christianity - if we leave on one side the development which we can trace no less uninterruptedly, from the animal totem to the human god with his regular companions. (Each of the four Christian evangelists still has his own favourite animal.) If we provisionally accept the world-empire of the Pharaohs as the determining cause of the emergence of the monotheist idea, we see that that idea, released from its native soil and transferred to another people was, after a long period of latency, taken hold of by them, preserved by them as a precious possession and, in turn, itself kept them alive by giving them pride in being a chosen people: it was the religion of their primal father to which were attached their hope of reward, of distinction and finally of world-dominion. This last wishful phantasy, long abandoned by the Jewish people, still survives among that people's enemies in a belief in a conspiracy by the 'Elders of Zion'. We reserve for discussion in later pages how the special peculiarities of the monotheist religion borrowed from Egypt affected the Jewish people and how it was bound to leave a permanent imprint on their character through its rejection of magic and mysticism, its invitation to advances in intellectuality and its encouragement of sublimations; how the people, enraptured by the possession of the truth, overwhelmed by the consciousness of being chosen, came to have a high opinion of what is intellectual and to lay stress on what is moral; and how their melancholy destinies and their disappointments in reality served only to intensify all these trends. For the moment we will follow their development in another direction.

The re-establishment of the primal father in his historic rights was a great step forward but it could not be the end. The other portions of the prehistoric tragedy insisted on being recognized. It is not easy to discern what set this process in motion. It appears as though a growing sense of guilt had taken hold of the Jewish people, or perhaps of the whole civilized world of the time, as a precursor to the return of the repressed material. Till at last one of these Jewish people found, in justifying a politico-religious agitator, the occasion for detaching a new - the Christian - religion from Judaism. Paul, a Roman Jew from Tarsus, seized upon this sense of guilt and traced it back correctly to its original source. He called this the 'original sin'; it was a crime against God and could only be atoned for by death. With the original sin death came into the world. In fact this crime deserving death had been the murder of the primal father who was later deified. But the murder was not remembered: instead of it there was a phantasy of its atonement, and for that reason this phantasy could be hailed as a message of redemption (evangelium). A son of God had allowed himself to be killed without guilt and had thus taken on himself the guilt of all men. It had to be a son, since it had been the murder of a father. It is probable that traditions from oriental and Greek mysteries had had an influence on the phantasy of redemption. What was essential in it seems to have been Paul's own contribution. In the most proper sense he was a man of an innately religious disposition: the dark traces of the past lurked in his mind, ready to break through into its more conscious regions.
Original sin and redemption by the sacrifice of a victim became the foundation stones of the new religion founded by Paul. Its main content was, it is true, reconciliation with God the Father, atonement for the crime committed against him; but the other side of the emotional relation showed itself in the fact that the son, who had taken the atonement on himself, became a god himself beside the father and, actually, in place of the father. Christianity, having arisen out of a father-religion, became a son-religion. It has not escaped the fate of having to get rid of the father.

[1939a, 4953]
We can now reconstruct the origin of Leonardo's vulture phantasy. He once happened to read in one of the Fathers or in a book on natural history the statement that all vultures were females and could reproduce their kind without any assistance from a male: and at that point a memory sprang to his mind, which was transformed into the phantasy we have been discussing, but which meant to signify that he also had been such a vulture-child - he had had a mother, but no father. With this memory was associated, in the only way in which impressions of so great an age can find expression, an echo of the pleasure he had had at his mother's breast. The allusion made by the Fathers of the Church to the idea of the Blessed Virgin and her child - an idea cherished by every artist - must have played its part in helping the phantasy to appear valuable and important to him. Indeed in this way he was able to identify himself with the child Christ, the comforter and saviour not of this one woman alone.

The analogy between the process of civilization and the path of individual development may be extended in an important respect. It can be asserted that the community, too, evolves a super-ego under whose influence cultural development proceeds. It would be a tempting task for anyone who has a knowledge of human civilizations to follow out this analogy in detail. I will confine myself to bringing forward a few striking points. The super-ego of an epoch of civilization has an origin similar to that of an individual. It is based on the impression left behind by the personalities of great leaders - men of overwhelming force of mind or men in whom one of the human impulses has found its strongest and purest, and therefore often its most one-sided, expression. In many instances the analogy goes still further, in that during their lifetime these figures were - often enough, even if not always - mocked and maltreated by others and even despatched in a cruel fashion. In the same way, indeed, the primal father did not attain divinity until long after he had met his death by violence. The most arresting example of this fateful conjunction is to be seen in the figure of Jesus Christ - if, indeed, that figure is not a part of mythology, which called it into being from an obscure memory of that primal event. Another point of agreement between the cultural and the individual super-ego is that the former, just like the latter, sets up strict ideal demands, disobedience to which is visited with 'fear of conscience'. Here, indeed, we come across the remarkable circumstance that the mental processes concerned are actually more familiar to us and more accessible to consciousness as they are seen in the group than they can be in the individual man. In him, when tension arises, it is only the aggressiveness of the super-ego which, in the form of reproaches, makes itself noisily heard; its actual demands often remain unconscious in the background. If we bring them to conscious knowledge, we find that they coincide with the precepts of the prevailing cultural super-ego. At this point the two processes, that of the cultural development of the group and that of the cultural development of the individual, are, as it were, always interlocked. For that reason some of the manifestations and properties of the super-ego can be more easily detected in its behaviour in the cultural community than in the separate individual.

The legend of Moses, in the form in which we have it to-day, falls notably short of its secret intention. If Moses was not of royal birth, the legend could not stamp him as a hero; if it left him as a Jewish child, it had done nothing to raise his social standing. Only one small fragment of the entire myth remains effective: the assurance that the child had survived in the face of powerful external forces. (This feature recurs in the story of the childhood of Jesus, in which King Herod takes over the role of Pharaoh.) Thus we are in fact free to suppose that some later and clumsy adapter of the material of the legend found an opportunity for introducing into the story of his hero Moses something which resembled the classical exposure legends marking out a hero, but which, on account of the special circumstances of the case, was not applicable to Moses.
That the redeemer had sacrificed himself without guilt was evidently a tendentious distortion, which offered difficulties to logical understanding. For how could someone guiltless of the act of murder take on himself the guilt of the murderers by allowing himself to be killed? In the historical reality there was no such contradiction. The 'redeemer' could be none other than the most guilty person, the ringleader of the company of brothers who had overpowered their father. We must in my judgement leave it undecided whether there was such a chief rebel and ringleader. That is possible; but we must also bear in mind that each one of the company of brothers certainly had a wish to commit the deed by himself alone and so to create an exceptional position for himself and to find a substitute for his identification with the father which was having to be given up and which was becoming merged in the community. If there was no such ringleader, then Christ was the heir to a wishful phantasy which remained unfulfilled; if there was one, then he was his successor and his reincarnation. But no matter whether what we have here is a phantasy or the return of a forgotten reality, in any case the origin of the concept of a hero is to be found at this point - the hero who always rebels against his father and kills him in some shape or other.¹ Here too is the true basis for the 'tragic guilt' of the hero of drama, which is otherwise hard to explain. It can scarcely be doubted that the hero and chorus in Greek drama represent the same rebellious hero and company of brothers; and it is not without significance that in the Middle Ages what the theatre started with afresh was the representation of the story of the Passion.

[1939a, 4911]

It would be worth while to understand how it was that the monotheist idea made such a deep impression precisely on the Jewish people and that they were able to maintain it so tenaciously. It is possible, I think, to find an answer. Fate had brought the great deed and misdeed of primaeval days, the killing of the father, closer to the Jewish people by causing them to repeat it on the person of Moses, an outstanding father-figure. It was a case of 'acting out' instead of remembering, as happens so often with neurotics during the work of analysis. To the suggestion that they should remember, which was made to them by the doctrine of Moses, they reacted, however, by disavowing their action; they remained halted at the recognition of the great father and thus blocked their access to the point from which Paul was later to start his continuation of the primal history. It is scarcely a matter of indifference or of chance that the violent killing of another great man became the starting-point of Paul's new religious creation as well. This was a man whom a small number of adherents in Judaea regarded as the Son of God and as the Messiah who had been announced, and to whom, too, a part of the childhood story invented for Moses was later carried over, but of whom in fact we know scarcely more with certainty than of Moses - whether he was really the great teacher portrayed by the Gospels or whether, rather, it was not the fact and circumstances of his death which were decisive for the importance which his figure acquired. Paul, who became his apostle, had not known him himself.

[1939a, 4912]

The killing of Moses by his Jewish people, recognized by Sellin from traces of it in tradition (and also, strange to say, accepted by the young Goethe without any evidence¹) thus becomes an indispensable part of our construction, an important link between the forgotten event of primaeval times and its later emergence in the form of the monotheist religions.² It is plausible to conjecture that remorse for the murder of Moses provided the stimulus for the wishful phantasy of the Messiah, who was to return and lead his people to redemption and the promised world-dominion. If Moses was this first Messiah, Christ became his substitute and successor, and Paul could exclaim to the peoples with some historical justification: 'Look! the Messiah has really come: he has been murdered before your eyes!' Then, too, there is a piece of historical truth in Christ's resurrection, for he was the resurrected Moses and behind him the returned primal father of the primitive horde, transfigured and, as the son, put in the place of the father.

[1939a, 4913]
Two further questions must now be answered. First, under what conditions does a memory of this kind enter the archaic heritage? And, secondly, in what circumstances can it become active - that is, can it advance to consciousness from its unconscious state in the id, even though in an altered and distorted shape? The answer to the first question is easy to formulate: the memory enters the archaic heritage if the event was important enough, or repeated often enough, or both. In the case of parricide both conditions are fulfilled. On the second question there is this to be said. A whole number of influences may be concerned, not all of which are necessarily known. A spontaneous development is also conceivable, on the analogy of what happens in some neuroses. What is certainly of decisive importance, however, is the awakening of the forgotten memory trace by a recent real repetition of the event. The murder of Moses was a repetition of this kind and, later, the supposed judicial murder of Christ: so that these events come into the foreground as causes. It seems as though the genesis of monotheism could not do without these occurrences. We are reminded of the poet's words:

[1939a, 4922]
It is clearly not easy for men to give up the satisfaction of this inclination to aggression. They do not feel comfortable without it. The advantage which a comparatively small cultural group offers of allowing this instinct an outlet in the form of hostility against intruders is not to be despised. It is always possible to bind together a considerable number of people in love, so long as there are other people left over to receive the manifestations of their aggressiveness. I once discussed the phenomenon that it is precisely communities with adjoining territories, and related to each other in other ways as well, who are engaged in constant feuds and in ridiculing each other - like the Spaniards and Portuguese, for instance, the North Germans and South Germans, the English and Scotch, and so on. I gave this phenomenon the name of 'the narcissism of minor differences', a name which does not do much to explain it. We can now see that it is a convenient and relatively harmless satisfaction of the inclination to aggression, by means of which cohesion between the members of the community is made easier. In this respect the Jewish people, scattered everywhere, have rendered most useful services to the civilizations of the countries that have been their hosts; but unfortunately all the massacres of the Jews in the Middle Ages did not suffice to make that period more peaceful and secure for their Christian fellows. When once the Apostle Paul had posited universal love between men as the foundation of his Christian community, extreme intolerance on the part of Christendom towards those who remained outside it became the inevitable consequence. To the Romans, who had not founded their communal life as a State upon love, religious intolerance was something foreign, although with them religion was a concern of the State and the State was permeated by religion. Neither was it an unaccountable chance that the dream of a Germanic world-dominion called for anti-Semitism as its complement; and it is intelligible that the attempt to establish a new, communist civilization in Russia should find its psychological support in the persecution of the bourgeois. One only wonders, with concern, what the Soviets will do after they have wiped out their bourgeois.

[1930a, 4506]

The re-establishment of the primal father in his historic rights was a great step forward but it could not be the end. The other portions of the prehistoric tragedy insisted on being recognized. It is not easy to discern what set this process in motion. It appears as though a growing sense of guilt had taken hold of the Jewish people, or perhaps of the whole civilized world of the time, as a precursor to the return of the repressed material. Till at last one of these Jewish people found, in justifying a politico-religious agitator, the occasion for detaching a new - the Christian - religion from Judaism. Paul, a Roman Jew from Tarsus, seized upon this sense of guilt and traced it back correctly to its original source. He called this the 'original sin'; it was a crime against God and could only be atoned for by death. With the original sin death came into the world. In fact this crime deserving death had been the murder of the primal father who was later deified. But the murder was not remembered: instead of it there was a phantasy of its atonement, and for that reason this phantasy could be hailed as a message of redemption (evangelium). A son of God had allowed himself to be killed without guilt and had thus taken on himself the guilt of all men. It had to be a son, since it had been the murder of a father. It is probable that traditions from oriental and Greek mysteries had had an influence on the phantasy of redemption. What was essential in it seems to have been Paul's own contribution. In the most proper sense he was a man of an innately religious disposition: the dark traces of the past lurked in his mind, ready to break through into its more conscious regions.

[1939a, 4910]
We have already said that the Christian ceremony of Holy Communion, in which the believer incorporates the Saviour's blood and flesh, repeats the content of the old totem meal - no doubt only in its affectionate meaning, expressive of veneration, and not in its aggressive meaning. The ambivalence that dominates the relation to the father was clearly shown, however, in the final outcome of the religious novelty. Ostensibly aimed at propitiating the father god, it ended in his being dethroned and got rid of. Judaism had been a religion of the father; Christianity became a religion of the son. The old God the Father fell back behind Christ; Christ, the Son, took his place, just as every son had hoped to do in primaeval times. Paul, who carried Judaism on, also destroyed it. No doubt he owed his success in the first instance to the fact that, through the idea of the redeemer, he exorcized humanity's sense of guilt; but he owed it as well to the circumstance that he abandoned the 'chosen' character of his people and its visible mark - circumcision - so that the new religion could be a universal one, embracing all men. Though a part may have been played in Paul's taking this step by his personal desire for revenge for the rejection of his innovation in Jewish circles, yet it also restored a feature of the old Aten religion - it removed a restriction which that religion had acquired when it was handed over to a new vehicle, the Jewish people.

[1939a, 4911]

It would be worth while to understand how it was that the monotheist idea made such a deep impression precisely on the Jewish people and that they were able to maintain it so tenaciously. It is possible, I think, to find an answer. The elucidation of this situation of depression sprang from Jewry. Irrespectively of all the approximations and preparations in the surrounding world, it was after all a Jewish man, Saul of Tarsus (who, as a Roman citizen, called himself Paul), in whose spirit the realization first emerged: 'the reason we are so unhappy is that we have killed God the father.' And it is entirely understandable that he could only grasp this piece of truth in the delusional disguise of the glad tidings: 'we are freed from all guilt since one of us has sacrificed his life to absolve us.' In this formula the killing of God was of course not mentioned, but a crime that had to be atoned by the sacrifice of a victim could only have been a murder. And the intermediate step between the delusion and the historical truth was provided by the assurance that the victim of the sacrifice had been God's son. With the strength which it derived from the source of historical truth, this new faith overthrew every obstacle. The blissful sense of being chosen was replaced by the liberating sense of redemption. But the fact of the parricide, in returning to the memory of mankind, had to overcome greater resistances than the other fact, which had constituted the subject-matter of monotheism; it was also obliged to submit to a more powerful distortion. The unnameable crime was replaced by the hypothesis of what must be described as a shadowy 'original sin'.

Original sin and redemption by the sacrifice of a victim became the foundation stones of the new religion founded by Paul. It must remain uncertain whether there was a ringleader and instigator to the murder among the band of brothers who rebelled against the primal father, or whether such a figure was created later by the imagination of creative artists in order to turn themselves into heroes, and was then introduced into the tradition. After the Christian doctrine had burst the framework of Judaism, it took up components from many other sources, renounced a number of characteristics of pure monotheism and adapted itself in many details to the rituals of the other Mediterranean peoples. It was as though Egypt was taking vengeance once more on the heirs of Akhenaten. It is worth noticing how the new religion dealt with the ancient ambivalence in the relation to the father. Its main content was, it is true, reconciliation with God the Father, atonement for the crime committed against him; but the other side of the emotional relation showed itself in the fact that the son, who had taken the atonement on himself, became a god himself beside the father and, actually, in place of the father. Christianity, having arisen out of a father-religion, became a son-religion. It has not escaped the fate of having to get rid of the father.
When Christianity first penetrated into the ancient world it met with competition from the religion of Mithras and for a time it was doubtful which of the two deities would gain the victory. In spite of the halo of light surrounding his form, the youthful Persian god remains obscure to us. We may perhaps infer from the sculptures of Mithras slaying a bull that he represented a son who was alone in sacrificing his father and thus redeemed his brothers from their burden of complicity in the deed. There was an alternative method of allaying their guilt and this was first adopted by Christ. He sacrificed his own life and so redeemed the company of brothers from original sin.

There can be no doubt that in the Christian myth the original sin was one against God the Father. If, however, Christ redeemed mankind from the burden of original sin by the sacrifice of his own life, we are driven to conclude that the sin was a murder. The law of talion, which is so deeply rooted in human feelings, lays it down that a murder can only be expiated by the sacrifice of another life: self-sacrifice points back to blood-guilt.¹ And if this sacrifice of a life brought about atonement with God the Father, the crime to be expiated can only have been the murder of the father.

In the Christian doctrine, therefore, men were acknowledging in the most undisguised manner the guilty primaeval deed, since they found the fullest atonement for it in the sacrifice of this one son. Atonement with the father was all the more complete since the sacrifice was accompanied by a total renunciation of the women on whose account the rebellion against the father was started. But at that point the inexorable psychological law of ambivalence stepped in. The very deed in which the son offered the greatest possible atonement to the father brought him at the same time to the attainment of his wishes against the father. He himself became God, beside, or, more correctly, in place of, the father. A son-religion displaced the father-religion. As a sign of this substitution the ancient totem meal was revived in the form of communion, in which the company of brothers consumed the flesh and blood of the son - no longer the father - obtained sanctity thereby and identified themselves with him. Thus we can trace through the ages the identity of the totem meal with animal sacrifice, with theanthropic human sacrifice and with the Christian Eucharist, and we can recognize in all these rituals the effect of the crime by which men were so deeply weighed down but of which they must none the less feel so proud. The Christian communion, however, is essentially a fresh elimination of the father, a repetition of the guilty deed. We can see the full justice of Frazer's pronouncement that 'the Christian communion has absorbed within itself a sacrament which is doubtless far older than Christianity'.²

Hence the primaeval history of mankind is filled with murder. Even to-day, the history of the world which our children learn at school is essentially a series of murders of peoples. The obscure sense of guilt to which mankind has been subject since prehistoric times, and which in some religions has been condensed into the doctrine of primal guilt, of original sin, is probably the outcome of a blood-guilt incurred by prehistoric man. In my book Totem and Taboo (1912-13) I have, following clues given by Robertson Smith, Atkinson and Charles Darwin, tried to guess the nature of this primal guilt, and I believe, too, that the Christian doctrine of to-day enables us to deduce it. If the Son of God was obliged to sacrifice his life to redeem mankind from original sin, then by the law of talion, the requital of like by like, that sin must have been a killing, a murder. Nothing else could call for the sacrifice of a life for its expiation. And the original sin was an offence against God the Father, the primal crime of mankind must have been a parricide, the killing of the primal father of the primitive human horde, whose mnemonic image was later transfigured into a deity.¹

¹ [1912-1913, 2794]
² [1912-1913, 2794]
It is otherwise in the Catholic Church. Every Christian loves Christ as his ideal and feels himself united with all other Christians by the tie of identification. But the Church requires more of him. He has also to identify himself with Christ and love all other Christians as Christ loved them. At both points, therefore, the Church requires that the position of the libido which is given by group formation should be supplemented. Identification has to be added where object-choice has taken place, and object-love where there is identification. This addition evidently goes beyond the constitution of the group. One can be a good Christian and yet be far from the idea of putting oneself in Christ's place and of having like him an all-embracing love for mankind. One need not think oneself capable, weak mortal that one is, of the Saviour's largeness of soul and strength of love. But this further development in the distribution of libido in the group is probably the factor upon which Christianity bases its claim to have reached a higher ethical level.
[1921c, 3825]

The re-establishment of the primal father in his historic rights was a great step forward but it could not be the end. The other portions of the prehistoric tragedy insisted on being recognized. It is not easy to discern what set this process in motion. It appears as though a growing sense of guilt had taken hold of the Jewish people, or perhaps of the whole civilized world of the time, as a precursor to the return of the repressed material. Till at last one of these Jewish people found, in justifying a politico-religious agitator, the occasion for detaching a new - the Christian - religion from Judaism. Paul, a Roman Jew from Tarsus, seized upon this sense of guilt and traced it back correctly to its original source. He called this the 'original sin'; it was a crime against God and could only be atoned for by death. With the original sin death came into the world. In fact this crime deserving death had been the murder of the primal father who was later deified. But the murder was not remembered: instead of it there was a phantasy of its atonement, and for that reason this phantasy could be hailed as a message of redemption (evangelium). A son of God had allowed himself to be killed without guilt and had thus taken on himself the guilt of all men. It had to be a son, since it had been the murder of a father. It is probable that traditions from oriental and Greek mysteries had had an influence on the phantasy of redemption. What was essential in it seems to have been Paul's own contribution. In the most proper sense he was a man of an innately religious disposition: the dark traces of the past lurked in his mind, ready to break through into its more conscious regions.
[1939a, 4910]

That the redeemer had sacrificed himself without guilt was evidently a tendentious distortion, which offered difficulties to logical understanding. For how could someone guiltless of the act of murder take on himself the guilt of the murderers by allowing himself to be killed? In the historical reality there was no such contradiction. The 'redeemer' could be none other than the most guilty person, the ringleader of the company of brothers who had overpowered their father. We must in my judgement leave it undecided whether there was such a chief rebel and ringleader. That is possible; but we must also bear in mind that each one of the company of brothers certainly had a wish to commit the deed by himself alone and so to create an exceptional position for himself and to find a substitute for his identification with the father which was having to be given up and which was becoming merged in the community. If there was no such ringleader, then Christ was the heir to a wishful phantasy which remained unfulfilled; if there was one, then he was his successor and his reincarnation. But no matter whether what we have here is a phantasy or the return of a forgotten reality, in any case the origin of the concept of a hero is to be found at this point - the hero who always rebels against his father and kills him in some shape or other. Here too is the true basis for the 'tragic guilt' of the hero of drama, which is otherwise hard to explain. It can scarcely be doubted that the hero and chorus in Greek drama represent the same rebellious hero and company of brothers; and it is not without significance that in the Middle Ages what the theatre started with afresh was the representation of the story of the Passion.
[1939a, 4911]
We have already said that the Christian ceremony of Holy Communion, in which the believer incorporates the Saviour's blood and flesh, repeats the content of the old totem meal - no doubt only in its affectionate meaning, expressive of veneration, and not in its aggressive meaning. The ambivalence that dominates the relation to the father was clearly shown, however, in the final outcome of the religious novelty. Ostensibly aimed at propitiating the father god, it ended in his being dethroned and got rid of. Judaism had been a religion of the father; Christianity became a religion of the son. The old God the Father fell back behind Christ; Christ, the Son, took his place, just as every son had hoped to do in primaeval times. Paul, who carried Judaism on, also destroyed it. No doubt he owed his success in the first instance to the fact that, through the idea of the redeemer, he exorcized humanity's sense of guilt; but he owed it as well to the circumstance that he abandoned the 'chosen' character of his people and its visible mark - circumcision - so that the new religion could be a universal one, embracing all men. Though a part may have been played in Paul's taking this step by his personal desire for revenge for the rejection of his innovation in Jewish circles, yet it also restored a feature of the old Aten religion - it removed a restriction which that religion had acquired when it was handed over to a new vehicle, the Jewish people.

It would be worth while to understand how it was that the monotheist idea made such a deep impression precisely on the Jewish people and that they were able to maintain it so tenaciously. It is possible, I think, to find an answer. Fate had brought the great deed and misdeed of primaeval days, the killing of the father, closer to the Jewish people by causing them to repeat it on the person of Moses, an outstanding father-figure. It was a case of 'acting out' instead of remembering, as happens so often with neurotics during the work of analysis. To the suggestion that they should remember, which was made to them by the doctrine of Moses, they reacted, however, by disavowing their action; they remained halted at the recognition of the great father and thus blocked their access to the point from which Paul was later to start his continuation of the primal history. It is scarcely a matter of indifference or of chance that the violent killing of another great man became the starting-point of Paul's new religious creation as well. This was a man whom a small number of adherents in Judaea regarded as the Son of God and as the Messiah who had been announced, and to whom, too, a part of the childhood story invented for Moses was later carried over, but of whom in fact we know scarcely more with certainty than of Moses - whether he was really the great teacher portrayed by the Gospels or whether, rather, it was not the fact and circumstances of his death which were decisive for the importance which his figure acquired. Paul, who became his apostle, had not known him himself.

The killing of Moses by his Jewish people, recognized by Sellin from traces of it in tradition (and also, strange to say, accepted by the young Goethe without any evidence¹) thus becomes an indispensable part of our construction, an important link between the forgotten event of primaeval times and its later emergence in the form of the monotheist religions.² It is plausible to conjecture that remorse for the murder of Moses provided the stimulus for the wishful phantasy of the Messiah, who was to return and lead his people to redemption and the promised world-dominion. If Moses was this first Messiah, Christ became his substitute and successor, and Paul could exclaim to the peoples with some historical justification: 'Look! the Messiah has really come: he has been murdered before your eyes!' Then, too, there is a piece of historical truth in Christ's resurrection, for he was the resurrected Moses and behind him the returned primal father of the primitive horde, transfigured and, as the son, put in the place of the father.

[1939a, 4911]

[1939a, 4912]

[1939a, 4913]
The poor Jewish people, who with their habitual stubbornness continued to disavow the father's murder, atoned heavily for it in the course of time. They were constantly met with the reproach 'You killed our God!' And this reproach is true, if it is correctly translated. If it is brought into relation with the history of religions, it runs: 'You will not admit that you murdered God (the primal picture of God, the primal father, and his later reincarnations).' There should be an addition declaring: 'We did the same thing, to be sure, but we have admitted it and since then we have been absolved.' Not all the reproaches with which anti-semitism persecutes the descendants of the Jewish people can appeal to a similar justification. A phenomenon of such intensity and permanence as the people's hatred of the Jews must of course have more than one ground. It is possible to find a whole number of grounds, some of them clearly derived from reality, which call for no interpretation, and others, lying deeper and derived from hidden sources, which might be regarded as the specific reasons. Of the former, the reproach of being aliens is perhaps the weakest, since in many places dominated by anti-semitism to-day the Jews were among the oldest portions of the population or had even been there before the present inhabitants. This applies, for instance, to the city of Cologne, to which the Jews came with the Romans, before it was occupied by the Germans. Other grounds for hating the Jews are stronger - thus, the circumstances that they live for the most part as minorities among other peoples, for the communal feeling of groups requires, in order to complete it, hostility towards some extraneous minority, and the numerical weakness of this excluded minority encourages its suppression. There are, however, two other characteristics of the Jews which are quite unforgivable. First is the fact that in some respects they are different from their 'host' nations. They are not fundamentally different, for they are not Asiatics of a foreign race, as their enemies maintain, but composed for the most part of remnants of the Mediterranean peoples and heirs of the Mediterranean civilization. But they are none the less different, often in an indefinable way different, especially from the Nordic peoples, and the intolerance of groups is often, strangely enough, exhibited more strongly against small differences than against fundamental ones. The other point has a still greater effect: namely, that they defy all oppression, that the most cruel persecutions have not succeeded in exterminating them, and, indeed, that on the contrary they show a capacity for holding their own in commercial life and, where they are admitted, for making valuable contributions to every form of cultural activity.

[1939a, 4913]
The further development takes us beyond Judaism. The remainder of what returned from the tragic drama of the primal father was no longer reconcilable in any way with the religion of Moses. The sense of guilt of those days was very far from being any longer restricted to the Jewish people; it had caught hold of all the Mediterranean peoples as a dull malaise, a premonition of calamity for which no one could suggest a reason. Historians of our day speak of an ageing of ancient civilization, but I suspect that they have only grasped accidental and contributory causes of this depressed mood of the peoples. The elucidation of this situation of depression sprang from Jewry. Irrespectively of all the approximations and preparations in the surrounding world, it was after all a Jewish man, Saul of Tarsus (who, as a Roman citizen, called himself Paul), in whose spirit the realization first emerged: 'the reason we are so unhappy is that we have killed God the father.' And it is entirely understandable that he could only grasp this piece of truth in the delusional disguise of the glad tidings: 'we are freed from all guilt since one of us has sacrificed his life to absolve us.' In this formula the killing of God was of course not mentioned, but a crime that had to be atoned by the sacrifice of a victim could only have been a murder. And the intermediate step between the delusion and the historical truth was provided by the assurance that the victim of the sacrifice had been God's son. With the strength which it derived from the source of historical truth, this new faith overthrew every obstacle. The blissful sense of being chosen was replaced by the liberating sense of redemption. But the fact of the parricide, in returning to the memory of mankind, had to overcome greater resistances than the other fact, which had constituted the subject-matter of monotheism; it was also obliged to submit to a more powerful distortion. The unnameable crime was replaced by the hypothesis of what must be described as a shadowy 'original sin'.

Original sin and redemption by the sacrifice of a victim became the foundation stones of the new religion founded by Paul. It must remain uncertain whether there was a ringleader and instigator to the murder among the band of brothers who rebelled against the primal father, or whether such a figure was created later by the imagination of creative artists in order to turn themselves into heroes, and was then introduced into the tradition. After the Christian doctrine had burst the framework of Judaism, it took up components from many other sources, renounced a number of characteristics of pure monotheism and adapted itself in many details to the rituals of the other Mediterranean peoples. It was as though Egypt was taking vengeance once more on the heirs of Akhenaten. It is worth noticing how the new religion dealt with the ancient ambivalence in the relation to the father. Its main content was, it is true, reconciliation with God the Father, atonement for the crime committed against him; but the other side of the emotional relation showed itself in the fact that the son, who had taken the atonement on himself, became a god himself beside the father and, actually, in place of the father. Christianity, having arisen out of a father-religion, became a son-religion. It has not escaped the fate of having to get rid of the father.

Only a portion of the Jewish people accepted the new doctrine. Those who refused to are still called Jews to-day. Owing to this cleavage, they have become even more sharply divided from other peoples than before. They were obliged to hear the new religious community (which, besides Jews, included Egyptians, Greeks, Syrians, Romans and eventually Germans) reproach them with having murdered God. In full, this reproach would run as follows: 'They will not accept it as true that they murdered God, whereas we admit it and have been cleansed of that guilt.' It is easy therefore to see how much truth lies behind this reproach. A special enquiry would be called for to discover why it has been impossible for the Jews to join in this forward step which was implied, in spite of all its distortions, by the admission of having murdered God. In a certain sense they have in that way taken a tragic load of guilt on themselves; they have been made to pay heavy penance for it.
Hence the primaeval history of mankind is filled with murder. Even to-day, the history of the
world which our children learn at school is essentially a series of murders of peoples. The
obscure sense of guilt to which mankind has been subject since prehistoric times, and which in
some religions has been condensed into the doctrine of primal guilt, of original sin, is probably
the outcome of a blood-guilt incurred by prehistoric man. In my book Totem and Taboo (1912-
13) I have, following clues given by Robertson Smith, Atkinson and Charles Darwin, tried to
guess the nature of this primal guilt, and I believe, too, that the Christian doctrine of to-day
enables us to deduce it. If the Son of God was obliged to sacrifice his life to redeem mankind
from original sin, then by the law of talion, the requital of like by like, that sin must have been a
killing, a murder. Nothing else could call for the sacrifice of a life for its expiation. And the
original sin was an offence against God the Father, the primal crime of mankind must have
been a parricide, the killing of the primal father of the primitive human horde, whose mnemic
image was later transfigured into a deity.¹
[1915b, 3084]

Now whether we suppose that such a possibility was a historical event or not, it brings the
formation of religion within the circle of the father-complex and bases it upon the ambivalence
which dominates that complex. After the totem animal had ceased to serve as a substitute for
him, the primal father, at once feared and hated, revered and envied, became the prototype of
God himself. The son's rebelliousness and his affection for his father struggled against each
other through a constant succession of compromises, which sought on the one hand to atone
for the act of parricide and on the other to consolidate the advantages it had brought. This view
of religion throws a particularly clear light upon the psychological basis of Christianity, in which,
as we know, the ceremony of the totem meal still survives with but little distortion, in the form of
Communion. I should like explicitly to mention that this last observation was not made by me but
is to be found in the works of Robertson Smith and Frazer.
[1925d, 4241]
In the first place, I suspect that the reader has the impression that our discussions on the sense of guilt disrupt the framework of this essay: that they take up too much space, so that the rest of its subject-matter, with which they are not always closely connected, is pushed to one side. This may have spoiled the structure of my paper; but it corresponds faithfully to my intention to represent the sense of guilt as the most important problem in the development of civilization and to show that the price we pay for our advance in civilization is a loss of happiness through the heightening of the sense of guilt.¹ Anything that still sounds strange about this statement, which is the final conclusion of our investigation, can probably be traced to the quite peculiar relationship - as yet completely unexplained - which the sense of guilt has to our consciousness. In the common case of remorse, which we regard as normal, this feeling makes itself clearly enough perceptible to consciousness. Indeed, we are accustomed to speak of a 'consciousness of guilt' instead of a 'sense of guilt'. Our study of the neuroses, to which, after all we owe the most valuable pointers to an understanding of normal conditions, brings us up against some contradictions. In one of those affections, obsessional neurosis, the sense of guilt makes itself noisily heard in consciousness; it dominates the clinical picture and the patient's life as well, and it hardly allows anything else to appear alongside of it. But in most other cases and forms of neurosis it remains completely unconscious, without on that account producing any less important effects. Our patients do not believe us when we attribute an 'unconscious sense of guilt' to them. In order to make ourselves at all intelligible to them, we tell them of an unconscious need for punishment, in which the sense of guilt finds expression. But its connection with a particular form of neurosis must not be over-estimated. Even in obsessional neurosis there are types of patients who are not aware of their sense of guilt, or who only feel it as a tormenting uneasiness, a kind of anxiety, if they are prevented from carrying out certain actions. It ought to be possible eventually to understand these things; but as yet we cannot. Here perhaps we may be glad to have it pointed out that the sense of guilt is at bottom nothing else but a topographical variety of anxiety; in its later phases it coincides completely with fear of the super-ego. And the relations of anxiety to consciousness exhibit the same extraordinary variations. Anxiety is always present somewhere or other behind every symptom; but at one time it takes noisy possession of the whole of consciousness, while at another it conceals itself so completely that we are obliged to speak of unconscious anxiety or, if we want to have a clearer psychological conscience, since anxiety is in the first instance simply a feeling, of possibilities of anxiety. Consequently it is very conceivable that the sense of guilt produced by civilization is not perceived as such either, and remains to a large extent unconscious, or appears as a sort of malaise, a dissatisfaction, for which people seek other motivations. Religions, at any rate, have never overlooked the part played in civilization by a sense of guilt. Furthermore - a point which I failed to appreciate elsewhere² - they claim to redeem mankind from this sense of guilt, which they call sin. From the manner in which, in Christianity, this redemption is achieved - by the sacrificial death of a single person, who in this manner takes upon himself a guilt that is common to everyone - we have been able to infer what the first occasion may have been on which this primal guilt, which was also the beginning of civilization, was acquired.³ [1930a, 4523]
The re-establishment of the primal father in his historic rights was a great step forward but it could not be the end. The other portions of the prehistoric tragedy insisted on being recognized. It is not easy to discern what set this process in motion. It appears as though a growing sense of guilt had taken hold of the Jewish people, or perhaps of the whole civilized world of the time, as a precursor to the return of the repressed material. Till at last one of these Jewish people found, in justifying a politico-religious agitator, the occasion for detaching a new - the Christian - religion from Judaism. Paul, a Roman Jew from Tarsus, seized upon this sense of guilt and traced it back correctly to its original source. He called this the 'original sin'; it was a crime against God and could only be atoned for by death. With the original sin death came into the world. In fact this crime deserving death had been the murder of the primal father who was later deified. But the murder was not remembered: instead of it there was a phantasy of its atonement, and for that reason this phantasy could be hailed as a message of redemption (evangelium). A son of God had allowed himself to be killed without guilt and had thus taken on himself the guilt of all men. It had to be a son, since it had been the murder of a father. It is probable that traditions from oriental and Greek mysteries had had an influence on the phantasy of redemption. What was essential in it seems to have been Paul's own contribution. In the most proper sense he was a man of an innately religious disposition: the dark traces of the past lurked in his mind, ready to break through into its more conscious regions.

That the redeemer had sacrificed himself without guilt was evidently a tendentious distortion, which offered difficulties to logical understanding. For how could someone guiltless of the act of murder take on himself the guilt of the murderers by allowing himself to be killed? In the historical reality there was no such contradiction. The 'redeemer' could be none other than the most guilty person, the ringleader of the company of brothers who had overpowered their father. We must in my judgement leave it undecided whether there was such a chief rebel and ringleader. That is possible; but we must also bear in mind that each one of the company of brothers certainly had a wish to commit the deed by himself alone and so to create an exceptional position for himself and to find a substitute for his identification with the father which was having to be given up and which was becoming merged in the community. If there was no such ringleader, then Christ was the heir to a wishful phantasy which remained unfulfilled; if there was one, then he was his successor and his reincarnation. But no matter whether what we have here is a phantasy or the return of a forgotten reality, in any case the origin of the concept of a hero is to be found at this point - the hero who always rebels against his father and kills him in some shape or other.¹ Here too is the true basis for the 'tragic guilt' of the hero of drama, which is otherwise hard to explain. It can scarcely be doubted that the hero and chorus in Greek drama represent the same rebellious hero and company of brothers; and it is not without significance that in the Middle Ages what the theatre started with afresh was the representation of the story of the Passion.

[1939a, 4910]

[1939a, 4911]
We have already said that the Christian ceremony of Holy Communion, in which the believer incorporates the Saviour's blood and flesh, repeats the content of the old totem meal - no doubt only in its affectionate meaning, expressive of veneration, and not in its aggressive meaning. The ambivalence that dominates the relation to the father was clearly shown, however, in the final outcome of the religious novelty. Ostensibly aimed at propitiating the father god, it ended in his being dethroned and got rid of. Judaism had been a religion of the father; Christianity became a religion of the son. The old God the Father fell back behind Christ; Christ, the Son, took his place, just as every son had hoped to do in primal times. Paul, who carried Judaism on, also destroyed it. Though a part may have been played in Paul's taking this step by his personal desire for revenge for the rejection of his innovation in Jewish circles, yet it also restored a feature of the old Aten religion - it removed a restriction which that religion had acquired when it was handed over to a new vehicle, the Jewish people.

[1939a, 4911]

The killing of Moses by his Jewish people, recognized by Sellin from traces of it in tradition (and also, strange to say, accepted by the young Goethe without any evidence¹) thus becomes an indispensable part of our construction, an important link between the forgotten event of primal times and its later emergence in the form of the monotheist religions.² It is plausible to conjecture that remorse for the murder of Moses provided the stimulus for the wishful phantasy of the Messiah, who was to return and lead his people to redemption and the promised world-dominion. If Moses was this first Messiah, Christ became his substitute and successor, and Paul could exclaim to the peoples with some historical justification: 'Look! the Messiah has really come: he has been murdered before your eyes!' Then, too, there is a piece of historical truth in Christ's resurrection, for he was the resurrected Moses and behind him the returned primal father of the primitive horde, transfigured and, as the son, put in the place of the father.

[1939a, 4913]

The further development takes us beyond Judaism. The remainder of what returned from the tragic drama of the primal father was no longer reconcilable in any way with the religion of Moses. The sense of guilt of those days was very far from being any longer restricted to the Jewish people; it had caught hold of all the Mediterranean peoples as a dull malaise, a premonition of calamity for which no one could suggest a reason. Historians of our day speak of an ageing of ancient civilization, but I suspect that they have only grasped accidental and contributory causes of this depressed mood of the peoples. The elucidation of this situation of depression sprang from Jewry. Irrespectively of all the approximations and preparations in the surrounding world, it was after all a Jewish man, Saul of Tarsus (who, as a Roman citizen, called himself Paul), in whose spirit the realization first emerged: 'the reason we are so unhappy is that we have killed God the father.' And it is entirely understandable that he could only grasp this piece of truth in the delusional disguise of the glad tidings: 'we are freed from all guilt since one of us has sacrificed his life to absolve us.' In this formula the killing of God was of course not mentioned, but a crime that had to be atoned by the sacrifice of a victim could only have been a murder. And the intermediate step between the delusion and the historical truth was provided by the assurance that the victim of the sacrifice had been God's son. With the strength which it derived from the source of historical truth, this new faith overthrew every obstacle. The blissful sense of being chosen was replaced by the liberating sense of redemption. But the fact of the parricide, in returning to the memory of mankind, had to overcome greater resistances than the other fact, which had constituted the subject-matter of monotheism; it was also obliged to submit to a more powerful distortion. The unnameable crime was replaced by the hypothesis of what must be described as a shadowy 'original sin'.

[1939a, 4952]
In the Christian doctrine, therefore, men were acknowledging in the most undisguised manner the guilty primaeval deed, since they found the fullest atonement for it in the sacrifice of this one son. Atonement with the father was all the more complete since the sacrifice was accompanied by a total renunciation of the women on whose account the rebellion against the father was started. But at that point the inexorable psychological law of ambivalence stepped in. The very deed in which the son offered the greatest possible atonement to the father brought him at the same time to the attainment of his wishes against the father. He himself became God, beside, or, more correctly, in place of, the father. A son-religion displaced the father-religion. As a sign of this substitution the ancient totem meal was revived in the form of communion, in which the company of brothers consumed the flesh and blood of the son - no longer the father - obtained sanctity thereby and identified themselves with him. Thus we can trace through the ages the identity of the totem meal with animal sacrifice, with theanthropic human sacrifice and with the Christian Eucharist, and we can recognize in all these rituals the effect of the crime by which men were so deeply weighed down but of which they must none the less feel so proud. The Christian communion, however, is essentially a fresh elimination of the father, a repetition of the guilty deed. We can see the full justice of Frazer's pronouncement that 'the Christian communion has absorbed within itself a sacrament which is doubtless far older than Christianity'.

² Frazer (1912, 2, 51). No one familiar with the literature of the subject will imagine that the derivation of Christian communion from the totem meal is an idea originating from the author of the present essay.

¹ An interesting parallel to the replacement of object-choice by identification is to be found in the belief of primitive peoples, and in the prohibitions based upon it, that the attributes of animals which are incorporated as nourishment persist as part of the character of those who eat them. As is well known, this belief is one of the roots of cannibalism and its effects have continued through the series of usages of the totem meal down to Holy Communion. The consequences ascribed by this belief to oral mastery of the object do in fact follow in the case of the later sexual object-choice.

Now whether we suppose that such a possibility was a historical event or not, it brings the formation of religion within the circle of the father-complex and bases it upon the ambivalence which dominates that complex. After the totem animal had ceased to serve as a substitute for him, the primal father, at once feared and hated, revered and envied, became the prototype of God himself. The son's rebelliousness and his affection for his father struggled against each other through a constant succession of compromises, which sought on the one hand to atone for the act of parricide and on the other to consolidate the advantages it had brought. This view of religion throws a particularly clear light upon the psychological basis of Christianity, in which, as we know, the ceremony of the totem meal still survives with but little distortion, in the form of Communion. I should like explicitly to mention that this last observation was not made by me but is to be found in the works of Robertson Smith and Frazer.
It must be admitted that this historical survey has gaps in it and is uncertain at some points. But anyone who is inclined to pronounce our construction of primaeval history purely imaginary would be gravely under-estimating the wealth and evidential value of the material contained in it. Large portions of the past, which have been linked together here into a whole, are historically attested: totemism and the male confederacies, for instance. Other portions have survived in excellent replicas. Thus authorities have often been struck by the faithful way in which the sense and content of the old totem meal is repeated in the rite of the Christian Communion, in which the believer incorporates the blood and flesh of his god in symbolic form. Numerous relics of the forgotten primaeval age have survived in popular legends and fairy tales, and the analytic study of the mental life of children has provided an unexpected wealth of material for filling the gaps in our knowledge of the earliest times. As contributions to our understanding of the son's relation to the father which is of such great importance, I need only bring forward animal phobias, the fear, which strikes us as so strange, of being eaten by the father, and the enormous intensity of the dread of being castrated. There is nothing wholly fabricated in our construction, nothing which could not be supported on solid foundations.

[1939a, 4908]

We have already said that the Christian ceremony of Holy Communion, in which the believer incorporates the Saviour's blood and flesh, repeats the content of the old totem meal - no doubt only in its affectionate meaning, expressive of veneration, and not in its aggressive meaning. The ambivalence that dominates the relation to the father was clearly shown, however, in the final outcome of the religious novelty. Ostensibly aimed at propitiating the father god, it ended in his being dethroned and got rid of. Judaism had been a religion of the father; Christianity became a religion of the son. The old God the Father fell back behind Christ; Christ, the Son, took his place, just as every son had hoped to do in primaeval times. Paul, who carried Judaism on, also destroyed it. No doubt he owed his success in the first instance to the fact that, through the idea of the redeemer, he exorcized humanity's sense of guilt; but he owed it as well to the circumstance that he abandoned the 'chosen' character of his people and its visible mark - circumcision - so that the new religion could be a universal one, embracing all men. Though a part may have been played in Paul's taking this step by his personal desire for revenge for the rejection of his innovation in Jewish circles, yet it also restored a feature of the old Aten religion - it removed a restriction which that religion had acquired when it was handed over to a new vehicle, the Jewish people.

[1939a, 4911]
In 1912 I attempted, in my *Totem and Taboo*, to reconstruct the ancient situation from which these consequences followed. In doing so, I made use of some theoretical ideas put forward by Darwin, Atkinson and particularly by Robertson Smith, and combined them with the findings and indications derived from psycho-analysis. From Darwin I borrowed the hypothesis that human beings originally lived in small hordes, each of which was under the despotic rule of an older male who appropriated all the females and castigated or disposed of the younger males, including his sons. From Atkinson I took, in continuation of this account, the idea that this patriarchal system ended in a rebellion by the sons, who banded together against their father, overcame him and devoured him in common. Basing myself on Robertson Smith's totem theory, I assumed that subsequently the father-horde gave place to the totemic brother-clan. In order to be able to live in peace with one another, the victorious brothers renounced the women on whose account they had, after all, killed their father, and instituted exogamy. The power of fathers was broken and the families were organized as a matriarchy. The ambivalent emotional attitude of the sons to their father remained in force during the whole of later development. A particular animal was set up in the father's place as a totem. It was regarded as ancestor and protective spirit and might not be injured or killed. But once a year the whole male community came together to a ceremonial meal at which the totem animal (worshipped at all other times) was torn to pieces and devoured in common. No one might absent himself from this meal: it was the ceremonial repetition of the killing of the father, with which social order, moral laws and religion had taken their start. The conformity between Robertson Smith's totem meal and the Christian Lord's Supper had struck a number of writers before me.

[1939a, 4948]
Here, from the outset, we come upon the same situation. Since our individual childhood, and, similarly, since the childhood of human civilization, hostile impulses against our fellow men have been subject to the same restrictions, the same progressive repression, as our sexual urges. We have not yet got so far as to be able to love our enemies or to offer our left cheek after being struck on the right. Furthermore, all moral rules for the restriction of active hatred give the clearest evidence to this day that they were originally framed for a small society of fellow clansmen. In so far as we are all able to feel that we are members of one people, we allow ourselves to disregard most of these restrictions in relation to a foreign people. Nevertheless, within our own circle we have made some advances in the control of hostile impulses. As Lichtenberg puts it in drastic terms: 'Where we now say "Excuse me!" we used to give a box on the ears.' Brutal hostility, forbidden by law, has been replaced by verbal invective; and a better knowledge of the interlinking of human impulses is more and more robbing us - by its consistent 'tout comprendre c'est tout pardonner' - of the capacity for feeling angry with a fellow man who gets in our way. Though as children we are still endowed with a powerful inherited disposition to hostility, we are later taught by a higher personal civilization that it is an unworthy thing to use abusive language; and even where fighting has in itself remained permissible, the number of things which may not be employed as methods of fighting has extraordinarily increased. Since we have been obliged to renounce the expression of hostility by deeds - held back by the passionless third person, in whose interest it is that personal security shall be preserved - we have, just as in the case of sexual aggressiveness, developed a new technique of invective, which aims at enlisting this third person against our enemy. By making our enemy small, inferior, despicable or comic, we achieve in a roundabout way the enjoyment of overcoming him - to which the third person, who has made no efforts, bears witness by his laughter.

[1905c, 1697]

The fact that the curb put upon love by civilization involves a universal tendency to debase sexual objects will perhaps lead us to turn our attention from the object to the instincts themselves. The damage caused by the initial frustration of sexual pleasure is seen in the fact that the freedom later given to that pleasure in marriage does not bring full satisfaction. But at the same time, if sexual freedom is unrestricted from the outset the result is no better. It can easily be shown that the psychical value of erotic needs is reduced as soon as their satisfaction becomes easy. An obstacle is required in order to heighten libido; and where natural resistances to satisfaction have not been sufficient men have at all times erected conventional ones so as to be able to enjoy love. This is true both of individuals and of nations. In times in which there were no difficulties standing in the way of sexual satisfaction, such as perhaps during the decline of the ancient civilizations, love became worthless and life empty, and strong reaction-formations were required to restore indispensable affective values. In this connection it may be claimed that the ascetic current in Christianity created psychical values for love which pagan antiquity was never able to confer on it. This current assumed its greatest importance with the ascetic monks, whose lives were almost entirely occupied with the struggle against libidinal temptation.

[1912d, 2344]

Crawley, in language which differs only slightly from the current terminology of psychoanalysis, declares that each individual is separated from the others by a 'taboo of personal isolation', and that it is precisely the minor differences in people who are otherwise alike that form the basis of feelings of strangeness and hostility between them. It would be tempting to pursue this idea and to derive from this 'narcissism of minor differences' the hostility which in every human relation we see fighting successfully against feelings of fellowship and overpowering the commandment that all men should love one another. Psycho-analysis believes that it has discovered a large part of what underlies the narcissistic rejection of women by men, which is so much mixed up with despising them, in drawing attention to the castration complex and its influence on the opinion in which women are held.

[1918a, 2355]
What came into existence beside the dead body of the loved one was not only the doctrine of the soul, the belief in immortality and a powerful source of man's sense of guilt, but also the earliest ethical commandments. The first and most important prohibition made by the awakening conscience was: 'Thou shalt not kill.' It was acquired in relation to dead people who were loved, as a reaction against the satisfaction of the hatred hidden behind the grief for them; and it was gradually extended to strangers who were not loved, and finally even to enemies. [1915b, 3087]

A small minority are enabled by their constitution to find happiness, in spite of everything, along the path of love. But far-reaching mental changes in the function of love are necessary before this can happen. These people make themselves independent of their object's acquiescence by displacing what they mainly value from being loved on to loving; they protect themselves against the loss of the object by directing their love, not to single objects but to all men alike; and they avoid the uncertainties and disappointments of genital love by turning away from its sexual aims and transforming the instinct into an impulse with an inhibited aim. What they bring about in themselves in this way is a state of evenly suspended, steadfast, affectionate feeling, which has little external resemblance any more to the stormy agitations of genital love, from which it is nevertheless derived. Perhaps St. Francis of Assisi went furthest in thus exploiting love for the benefit of an inner feeling of happiness. Moreover, what we have recognized as one of the techniques for fulfilling the pleasure principle has often been brought into connection with religion; this connection may lie in the remote regions where the distinction between the ego and objects or between objects themselves is neglected. According to one ethical view, whose deeper motivation will become clear to us presently, this readiness for a universal love of mankind and the world represents the highest standpoint which man can reach. Even at this early stage of the discussion I should like to bring forward my two main objections to this view. A love that does not discriminate seems to me to forfeit a part of its own value, by doing an injustice to its object; and secondly, not all men are worthy of love. [1930a, 4496]

The clue may be supplied by one of the ideal demands, as we have called them, of civilized society. It runs: 'Thou shalt love thy neighbour as thyself.' It is known throughout the world and is undoubtedly older than Christianity, which puts it forward as its proudest claim. Yet it is certainly not very old; even in historical times it was still strange to mankind. Let us adopt a naïve attitude towards it, as though we were hearing it for the first time; we shall be unable then to suppress a feeling of surprise and bewilderment. Why should we do it? What good will it do us? But, above all, how shall we achieve it? How can it be possible? My love is something valuable to me which I ought not to throw away without reflection. It imposes duties on me for whose fulfilment I must be ready to make sacrifices. If I love someone, he must deserve it in some way. (I leave out of account the use he may be to me, and also his possible significance for me as a sexual object, for neither of these two kinds of relationship comes into question where the precept to love my neighbour is concerned.) He deserves it if he is so like me in important ways that I can love myself in him; and he deserves it if he is so much more perfect than myself that I can love my ideal of my own self in him. Again, I have to love him if he is my friend's son, since the pain my friend would feel if any harm came to him would be my pain too - I should have to share it. But if he is a stranger to me and if he cannot attract me by any worth of his own or any significance that he may already have acquired for my emotional life, it will be hard for me to love him. Indeed, I should be wrong to do so, for my love is valued by all my own people as a sign of my preferring them, and it is an injustice to them if I put a stranger on a par with them. But if I am to love him (with this universal love) merely because he, too, is an inhabitant of this earth, like an insect, an earth-worm or a grass-snake, then I fear that only a small modicum of my love will fall to his share - not by any possibility as much as, by the judgement of my reason, I am entitled to retain for myself. What is the point of a precept enunciated with so much solemnity if its fulfilment cannot be recommended as reasonable? [1930a, 4501]
On closer inspection, I find still further difficulties. Not merely is this stranger in general
unworthy of my love; I must honestly confess that he has more claim to my hostility and even
my hatred. He seems not to have the least trace of love for me and shows me not the slightest
consideration. If it will do him any good he has no hesitation in injuring me, nor does he ask
himself whether the amount of advantage he gains bears any proportion to the extent of the
harm he does to me. Indeed, he need not even obtain an advantage; if he can satisfy any sort
of desire by it, he thinks nothing of jeering at me, insulting me, slandering me and showing his
superior power; and the more secure he feels and the more helpless I am, the more certainly I
can expect him to behave like this to me. If he behaves differently, if he shows me consideration
and forbearance as a stranger, I am ready to treat him in the same way, in any case and quite
apart from any precept. Indeed, if this grandiose commandment had run 'Love thy neighbour as
thy neighbour loves thee', I should not take exception to it. And there is a second
commandment, which seems to me even more incomprehensible and arouses still stronger
opposition in me. It is 'Love thine enemies'. If I think it over, however, I see that I am wrong in
treating it as a greater imposition. At bottom it is the same thing.¹

I think I can now hear a dignified voice admonishing me: 'It is precisely because your
neighbour is not worthy of love, and is on the contrary your enemy, that you should love him as
yourself.' I then understand that the case is one like that of Credo quia absurdum.

Now it is very probable that my neighbour, when he is enjoined to love me as himself, will
answer exactly as I have done and will repel me for the same reasons. I hope he will not have
the same objective grounds for doing so, but he will have the same idea as I have. Even so, the
behaviour of human beings shows differences, which ethics, disregarding the fact that such
differences are determined, classifies as 'good' or 'bad'. So long as these undeniable
differences have not been removed, obedience to high ethical demands entails damage to the
aims of civilization, for it puts a positive premium on being bad. One is irresistibly reminded of
an incident in the French Chamber when capital punishment was being debated. A member had
been passionately supporting its abolition and his speech was being received with tumultuous
applause, when a voice from the hall called out: 'Que messieurs les assassins commencent!'

The element of truth behind all this, which people are so ready to disavow, is that men are not
gentle creatures who want to be loved, and who at the most can defend themselves if they are
attacked; they are, on the contrary, creatures among whose instinctual endowments is to be
reckoned a powerful share of aggressiveness. As a result, their neighbour is for them not only a
potential helper or sexual object, but also someone who tempts them to satisfy their
aggressiveness on him, to exploit his capacity for work without compensation, to use him
sexually without his consent, to seize his possessions, to humiliate him, to cause him pain, to
torture and to kill him. Homo homini lupus. Who, in the face of all his experience of life and of
history, will have the courage to dispute this assertion? As a rule this cruel aggressiveness
waits for some provocation or puts itself at the service of some other purpose, whose goal might
also have been reached by milder measures. In circumstances that are favourable to it, when
the mental counter-forces which ordinarily inhibit it are out of action, it also manifests itself
spontaneously and reveals man as a savage beast to whom consideration towards his own kind
is something alien. Anyone who calls to mind the atrocities committed during the racial
migrations or the invasions of the Huns, or by the people known as Mongols under Jenghiz
Khan and Tamerlane, or at the capture of Jerusalem by the pious Crusaders, or even, indeed,
the horrors of the recent World War - anyone who calls these things to mind will have to bow
humbly before the truth of this view.
The existence of this inclination to aggression, which we can detect in ourselves and justly assume to be present in others, is the factor which disturbs our relations with our neighbour and which forces civilization into such a high expenditure. In consequence of this primary mutual hostility of human beings, civilized society is perpetually threatened with disintegration. The interest of work in common would not hold it together; instinctual passions are stronger than reasonable interests. Civilization has to use its utmost efforts in order to set limits to man's aggressive instincts and to hold the manifestations of them in check by psychical reaction-formations. Hence, therefore, the use of methods intended to incite people into identifications and aim-inhibited relationships of love, hence the restriction upon sexual life, and hence too the ideal's commandment to love one's neighbour as oneself - a commandment which is really justified by the fact that nothing else runs so strongly counter to the original nature of man. In spite of every effort, these endeavours of civilization have not so far achieved very much. It hopes to prevent the crudest excesses of brutal violence by itself assuming the right to use violence against criminals, but the law is not able to lay hold of the more cautious and refined manifestations of human aggressiveness. The time comes when each one of us has to give up as illusions the expectations which, in his youth, he penned upon his fellow men, and when he may learn how much difficulty and pain has been added to his life by their ill-will. At the same time, it would be unfair to reproach civilization with trying to eliminate strife and competition from human activity. These things are undoubtedly indispensable. But opposition is not necessarily enmity; it is merely misused and made an occasion for enmity.

[1930a, 4504]

It is clearly not easy for men to give up the satisfaction of this inclination to aggression. They do not feel comfortable without it. The advantage which a comparatively small cultural group offers of allowing this instinct an outlet in the form of hostility against intruders is not to be despised. It is always possible to bind together a considerable number of people in love, so long as there are other people left over to receive the manifestations of their aggressiveness. I once discussed the phenomenon that it is precisely communities with adjoining territories, and related to each other in other ways as well, who are engaged in constant feuds and in ridiculing each other - like the Spaniards and Portuguese, for instance, the North Germans and South Germans, the English and Scotch, and so on. I gave this phenomenon the name of 'the narcissism of minor differences', a name which does not do much to explain it. We can now see that it is a convenient and relatively harmless satisfaction of the inclination to aggression, by means of which cohesion between the members of the community is made easier. In this respect the Jewish people, scattered everywhere, have rendered most useful services to the civilizations of the countries that have been their hosts; but unfortunately all the massacres of the Jews in the Middle Ages did not suffice to make that period more peaceful and secure for their Christian fellows. When once the Apostle Paul had posited universal love between men as the foundation of his Christian community, extreme intolerance on the part of Christendom towards those who remained outside it became the inevitable consequence. To the Romans, who had not founded their communal life as a State upon love, religious intolerance was something foreign, although with them religion was a concern of the State and the State was permeated by religion. Neither was it an unaccountable chance that the dream of a Germanic world-dominion called for anti-Semitism as its complement; and it is intelligible that the attempt to establish a new, communist civilization in Russia should find its psychological support in the persecution of the bourgeois. One only wonders, with concern, what the Soviets will do after they have wiped out their bourgeois.

[1930a, 4506]
The cultural super-ego has developed its ideals and set up its demands. Among the latter, those which deal with the relations of human beings to one another are comprised under the heading of ethics. People have at all times set the greatest value on ethics, as though they expected that it in particular would produce especially important results. And it does in fact deal with a subject which can easily be recognized as the sorest spot in every civilization. Ethics is thus to be regarded as a therapeutic attempt - as an endeavour to achieve, by means of a command of the super-ego, something which has so far not been achieved by means of any other cultural activities. As we already know, the problem before us is how to get rid of the greatest hindrance to civilization - namely, the constitutional inclination of human beings to be aggressive towards one another; and for that very reason we are especially interested in what is probably the most recent of the cultural commands of the super-ego, the commandment to love one's neighbour as oneself. In our research into, and therapy of, a neurosis, we are led to make two reproaches against the super-ego of the individual. In the severity of its commands and prohibitions it troubles itself too little about the happiness of the ego, in that it takes insufficient account of the resistances against obeying them - of the instinctual strength of the id, and of the difficulties presented by the real external environment. Consequently we are very often obliged, for therapeutic purposes, to oppose the super-ego, and we endeavour to lower its demands. Exactly the same objections can be made against the ethical demands of the cultural super-ego. It, too, does not trouble itself enough about the facts of the mental constitution of human beings. It issues a command and does not ask whether it is possible for people to obey it. On the contrary, it assumes that a man's ego is psychologically capable of anything that is required of it, that his ego has unlimited mastery over his id. This is a mistake; and even in what are known as normal people the id cannot be controlled beyond certain limits. If more is demanded of a man, a revolt will be produced in him or a neurosis, or he will be made unhappy. The commandment, 'Love thy neighbour as thyself', is the strongest defence against human aggressiveness and an excellent example of the unpsychological proceedings of the cultural super-ego. The commandment is impossible to fulfil; such an enormous inflation of love can only lower its value, not get rid of the difficulty. Civilization pays no attention to all this; it merely admonishes us that the harder it is to obey the precept the more meritorious it is to do so. But anyone who follows such a precept in present-day civilization only puts himself at a disadvantage vis-à-vis the person who disregards it. What a potent obstacle to civilization aggressiveness must be, if the defence against it can cause as much unhappiness as aggressiveness itself! 'Natural' ethics, as it is called, has nothing to offer here except the narcissistic satisfaction of being able to think oneself better than others. At this point the ethics based on religion introduces its promises of a better after-life. But so long as virtue is not rewarded here on earth, ethics will, I fancy, preach in vain. I too think it quite certain that a real change in the relations of human beings to possessions would be of more help in this direction than any ethical commands; but the recognition of this fact among socialists has been obscured and made useless for practical purposes by a fresh idealistic misconception of human nature.

Our mythological theory of instincts makes it easy for us to find a formula for indirect methods of combating war. If willingness to engage in war is an effect of the destructive instinct, the most obvious plan will be to bring Eros, its antagonist, into play against it. Anything that encourages the growth of emotional ties between men must operate against war. These ties may be of two kinds. In the first place they may be relations resembling those towards a loved object, though without having a sexual aim. There is no need for psycho-analysis to be ashamed to speak of love in this connection, for religion itself uses the same words: 'Thou shalt love thy neighbour as thyself.' This, however, is more easily said than done. The second kind of emotional tie is by means of identification. Whatever leads men to share important interests produces this community of feeling, these identifications. And the structure of human society is to a large extent based on them.
We have already said that the Christian ceremony of Holy Communion, in which the believer incorporates the Saviour's blood and flesh, repeats the content of the old totem meal - no doubt only in its affectation meaning, expressive of veneration, and not in its aggressive meaning. The ambivalence that dominates the relation to the father was clearly shown, however, in the final outcome of the religious novelty. Ostensibly aimed at propitiating the father god, it ended in his being dethroned and got rid of. Judaism had been a religion of the father; Christianity became a religion of the son. The old God the Father fell back behind Christ; Christ, the Son, took his place, just as every son had hoped to do in primaeval times. Paul, who carried Judaism on, also destroyed it. No doubt he owed his success in the first instance to the fact that, through the idea of the redeemer, he exorcized humanity's sense of guilt; but he owed it as well to the circumstance that he abandoned the 'chosen' character of his people and its visible mark - circumcision - so that the new religion could be a universal one, embracing all men. Though a part may have been played in Paul's taking this step by his personal desire for revenge for the rejection of his innovation in Jewish circles, yet it also restored a feature of the old Aten religion - it removed a restriction which that religion had acquired when it was handed over to a new vehicle, the Jewish people.

[1939a, 4911]

In some respects the new religion meant a cultural regression as compared with the older, Jewish one, as regularly happens when a new mass of people, of a lower level, break their way in or are given admission. The Christian religion did not maintain the high level in things of the mind to which Judaism had soared. It was no longer strictly monotheist, it took over numerous symbolic rituals from surrounding peoples, it re-established the great mother-goddess and found room to introduce many of the divine figures of polytheism only lightly veiled, though in subordinate positions. Above all, it did not, like the Aten religion and the Mosaic one which followed it, exclude the entry of superstitious, magical and mystical elements, which were to prove a severe inhibition upon the intellectual development of the next two thousand years.

[1939a, 4912]

The triumph of Christianity was a fresh victory for the priests of Amun over Akhenaten's god after an interval of fifteen hundred years and on a wider stage. And yet in the history of religion - that is, as regards the return of he repressed - Christianity was an advance and from that time on the Jewish religion was to some extent a fossil.

[1939a, 4912]

It would be worth while to understand how it was that the monotheist idea made such a deep impression precisely on the Jewish people and that they were able to maintain it so tenaciously. It is possible, I think, to find an answer. Fate had brought the great deed and misdeed of primaeval days, the killing of the father, closer to the Jewish people by causing them to repeat it on the person of Moses, an outstanding father-figure. It was a case of 'acting out' instead of remembering, as happens so often with neurotics during the work of analysis. To the suggestion that they should remember, which was made to them by the doctrine of Moses, they reacted, however, by disavowing their action; they remained halted at the recognition of the great father and thus blocked their access to the point from which Paul was later to start his continuation of the primal history. It is scarcely a matter of indifference or of chance that the violent killing of another great man became the starting-point of Paul's new religious creation as well. This was a man whom a small number of adherents in Judaea regarded as the Son of God and as the Messiah who had been announced, and to whom, too, a part of the childhood story invented for Moses was later carried over, but of whom in fact we know scarcely more with certainty than of Moses - whether he was really the great teacher portrayed by the Gospels or whether, rather, it was not the fact and circumstances of his death which were decisive for the importance which his figure acquired. Paul, who became his apostle, had not known him himself.

[1939a, 4912]
The killing of Moses by his Jewish people, recognized by Sellin from traces of it in tradition (and also, strange to say, accepted by the young Goethe without any evidence¹) thus becomes an indispensible part of our construction, an important link between the forgotten event of primaeval times and its later emergence in the form of the monotheist religions.² It is plausible to conjecture that remorse for the murder of Moses provided the stimulus for the wishful phantasy of the Messiah, who was to return and lead his people to redemption and the promised world-dominion. If Moses was this first Messiah, Christ became his substitute and successor, and Paul could exclaim to the peoples with some historical justification: 'Look! the Messiah has really come: he has been murdered before your eyes!' Then, too, there is a piece of historical truth in Christ's resurrection, for he was the resurrected Moses and behind him the returned primal father of the primitive horde, transfigured and, as the son, put in the place of the father. [1939a, 4913]

The poor Jewish people, who with their habitual stubbornness continued to disavow the father's murder, atoned heavily for it in the course of time. They were constantly met with the reproach 'You killed our God!' And this reproach is true, if it is correctly translated. If it is brought into relation with the history of religions, it runs: 'You will not admit that you murdered God (the primal picture of God, the primal father, and his later reincarnations).' There should be an addition declaring: 'We did the same thing, to be sure, but we have admitted it and since then we have been absolved.' Not all the reproaches with which anti-semitism persecutes the descendants of the Jewish people can appeal to a similar justification. A phenomenon of such intensity and permanence as the people's hatred of the Jews must of course have more than one ground. It is possible to find a whole number of grounds, some of them clearly derived from reality, which call for no interpretation, and others, lying deeper and derived from hidden sources, which might be regarded as the specific reasons. Of the former, the reproach of being aliens is perhaps the weakest, since in many places dominated by anti-semitism to-day the Jews were among the oldest portions of the population or had even been there before the present inhabitants. This applies, for instance, to the city of Cologne, to which the Jews came with the Romans, before it was occupied by the Germans. Other grounds for hating the Jews are stronger - thus, the circumstances that they live for the most part as minorities among other peoples, for the communal feeling of groups requires, in order to complete it, hostility towards some extraneous minority, and the numerical weakness of this excluded minority encourages its suppression. There are, however, two other characteristics of the Jews which are quite unforgivable. First is the fact that in some respects they are different from their 'host' nations. They are not fundamentally different, for they are not Asiatics of a foreign race, as their enemies maintain, but composed for the most part of remnants of the Mediterranean peoples and heirs of the Mediterranean civilization. But they are none the less different, often in an indefinable way different, especially from the Nordic peoples, and the intolerance of groups is often, strangely enough, exhibited more strongly against small differences than against fundamental ones. The other point has a still greater effect: namely, that they defy all oppression, that the most cruel persecutions have not succeeded in exterminating them, and, indeed, that on the contrary they show a capacity for holding their own in commercial life and, where they are admitted, for making valuable contributions to every form of cultural activity. [1939a, 4913]
The further development takes us beyond Judaism. The remainder of what returned from the tragic drama of the primal father was no longer reconcilable in any way with the religion of Moses. The sense of guilt of those days was very far from being any longer restricted to the Jewish people; it had caught hold of all the Mediterranean peoples as a dull malaise, a premonition of calamity for which no one could suggest a reason. Historians of our day speak of an ageing of ancient civilization, but I suspect that they have only grasped accidental and contributory causes of this depressed mood of the peoples. The elucidation of this situation of depression sprang from Jewry. Irrespectively of all the approximations and preparations in the surrounding world, it was after all a Jewish man, Saul of Tarsus (who, as a Roman citizen, called himself Paul), in whose spirit the realization first emerged: 'the reason we are so unhappy is that we have killed God the father.' And it is entirely understandable that he could only grasp this piece of truth in the delusional disguise of the glad tidings: 'we are freed from all guilt since one of us has sacrificed his life to absolve us.' In this formula the killing of God was of course not mentioned, but a crime that had to be atoned by the sacrifice of a victim could only have been a murder. And the intermediate step between the delusion and the historical truth was provided by the assurance that the victim of the sacrifice had been God's son. With the strength which it derived from the source of historical truth, this new faith overthrew every obstacle. The blissful sense of being chosen was replaced by the liberating sense of redemption. But the fact of the parricide, in returning to the memory of mankind, had to overcome greater resistances than the other fact, which had constituted the subject-matter of monotheism; it was also obliged to submit to a more powerful distortion. The unnameable crime was replaced by the hypothesis of what must be described as a shadowy 'original sin'.

Original sin and redemption by the sacrifice of a victim became the foundation stones of the new religion founded by Paul. It must remain uncertain whether there was a ringleader and instigator to the murder among the band of brothers who rebelled against the primal father, or whether such a figure was created later by the imagination of creative artists in order to turn themselves into heroes, and was then introduced into the tradition. After the Christian doctrine had burst the framework of Judaism, it took up components from many other sources, renounced a number of characteristics of pure monotheism and adapted itself in many details to the rituals of the other Mediterranean peoples. It was as though Egypt was taking vengeance once more on the heirs of Akhenaten. It is worth noticing how the new religion dealt with the ancient ambivalence in the relation to the father. Its main content was, it is true, reconciliation with God the Father, atonement for the crime committed against him; but the other side of the emotional relation showed itself in the fact that the son, who had taken the atonement on himself, became a god himself beside the father and, actually, in place of the father. Christianity, having arisen out of a father-religion, became a son-religion. It has not escaped the fate of having to get rid of the father.
The newly achieved discovery of the far-reaching importance of economic relations brought with it a temptation not to leave alterations in them to the course of historical development but to put them into effect oneself by revolutionary action. Theoretical Marxism, as realized in Russian Bolshevism, has acquired the energy and the self-contained and exclusive character of a Weltanschauung, but at the same time an uncanny likeness to what it is fighting against. Though originally a portion of science and built up, in its implementation, upon science and technology, it has created a prohibition of thought which is just as ruthless as was that of religion in the past. Any critical examination of Marxist theory is forbidden, doubts of its correctness are punished in the same way as heresy was once punished by the Catholic Church. The writings of Marx have taken the place of the Bible and the Koran as a source of revelation, though they would seem to be no more free from contradictions and obscurities than those older sacred books.

[1933a, 4776]

The first of these is that we have here dealt with only a single instance from the copious phenomenology of religions and have thrown no light on any others. I must regretfully admit that I am unable to give more than this one example and that my expert knowledge is insufficient to complete the enquiry. From my limited information I may perhaps add that the case of the founding of the Mahomedan religion seems to me like an abbreviated repetition of the Jewish one, of which it emerged as an imitation. It appears, indeed, that the Prophet intended originally to accept Judaism completely for himself and his people. The recapture of the single great primal father brought the Arabs an extraordinary exaltation of their self-confidence, which led to great worldly successes but exhausted itself in them. Allah showed himself far more grateful to his chosen people than Yahweh did to his. But the internal development of the new religion soon came to a stop, perhaps because it lacked the depth which had been caused in the Jewish case by the murder of the founder of their religion. The apparently rationalistic religions of the East are in their core ancestor-worship and so come to a halt, too, at an early stage of the reconstruction of the past. If it is true that in primitive peoples of to-day the recognition of a supreme being is the only content of their religion, we can only regard this as an atrophy of religious development and bring it into relation with the countless cases of rudimentary neuroses which are to be observed in the other field. Why it is that in the one case just as in the other things have gone no further, our knowledge is in both cases insufficient to tell us. We can only attribute the responsibility to the individual endowment of these peoples, the direction taken by their activity and their general social condition. Moreover, it is a good rule in the work of analysis to be content to explain what is actually before one and not to seek to explain what has not happened.

[1939a, 4915]

We can only attribute the responsibility to the individual endowment of these peoples, the direction taken by their activity and their general social condition. Moreover, it is a good rule in the work of analysis to be content to explain what is actually before one and not to seek to explain what has not happened. [1939a, 4915]
Where, then, does the libido find the fixations which it requires in order to break through the repressions? In the activities and experiences of infantile sexuality, in the abandoned component trends, in the objects of childhood which have been given up. It is to them, accordingly, that the libido returns. The significance of this period of childhood is twofold: on the one hand, during it the instinctual trends which the child has inherited with his innate disposition first become manifest, and secondly, others of his instincts are for the first time awakened and made active by external impressions and accidental experiences. There is no doubt, I think, that we are justified in making this twofold division. The manifestation of the innate disposition is indeed not open to any critical doubts, but analytic experience actually compels us to assume that purely chance experiences in childhood are able to leave fixations of the libido behind them. Nor do I see any theoretical difficulty in this. Constitutional dispositions are also undoubtedly after-effects of experiences by ancestors in the past; they too were once acquired. Without such acquisition there would be no heredity. And is it conceivable that acquisition such as this, leading to inheritance, would come to an end precisely with the generation we are considering? The significance of infantile experiences should not be totally neglected, as people like doing, in comparison with the experiences of the subject's ancestors and of his own maturity; on the contrary, they call for particular consideration. They are all the more momentous because they occur in times of incomplete development and are for that very reason liable to have traumatic effects. The studies on developmental mechanics by Roux and others have shown that the prick of a needle into an embryonic germinal layer in the act of cell-division results in a severe disturbance of development. The same injury inflicted on a larval or fully grown animal would do no damage.

[1916-1917, 3419]

The only impression we gain is that these events of childhood are somehow demanded as a necessity, that they are among the essential elements of a neurosis. If they have occurred in reality, so much to the good; but if they have been withheld by reality, they are put together from hints and supplemented by phantasy. The outcome is the same, and up to the present we have not succeeded in pointing to any difference in the consequences, whether phantasy or reality has had the greater share in these events of childhood. Here we simply have once again one of the complementary relations that I have so often mentioned; moreover it is the strangest of all we have met with. Whence comes the need for these phantasies and the material for them? There can be no doubt that their sources lie in the instincts; but it has still to be explained why the same phantasies with the same content are created on every occasion. I am prepared with an answer which I know will seem daring to you. I believe these primal phantasies, as I should like to call them, and no doubt a few others as well, are a phylogenetic endowment. In them the individual reaches beyond his own experience into primaeval experience at points where his own experience has been too rudimentary. It seems to me quite possible that all the things that are told to us to-day in analysis as phantasy - the seduction of children, the inflaming of sexual excitement by observing parental intercourse, the threat of castration (or rather castration itself) - were once real occurrences in the primaeval times of the human family, and that children in their phantasies are simply filling in the gaps in individual truth with prehistoric truth. I have repeatedly been led to suspect that the psychology of the neuroses has stored up in it more of the antiquities of human development than any other source.

[1916-1917, 3427]
A certain ambiguity and indefiniteness in the use of the word 'Angst' will not have escaped you. By 'anxiety' we usually understand the subjective state into which we are put by perceiving the 'generation of anxiety' and we call this an affect. And what is an affect in the dynamic sense? It is in any case something highly composite. An affect includes in the first place particular motor innervations or discharges and secondly certain feelings; the latter are of two kinds - perceptions of the motor actions that have occurred and the direct feelings of pleasure and unpleasure which, as we say, give the affect its keynote. But I do not think that with this enumeration we have arrived at the essence of an affect. We seem to see deeper in the case of some affects and to recognize that the core which holds the combination we have described together is the repetition of some particular significant experience. This experience could only be a very early impression of a very general nature, placed in the prehistory not of the individual but of the species. To make myself more intelligible - an affective state would be constructed in the same way as a hysterical attack; and, like it, would be the precipitate of a reminiscence. A hysterical attack may thus be likened to a freshly constructed individual affect, and a normal affect to the expression of a general hysteria which has become a heritage.

[1916-1917, 3444]

¹ It is very remarkable that the reaction of shame should be so intimately connected with involuntary emptying of the bladder (whether in the day-time or at night) and not equally so, as one would have expected, with incontinence of the bowels. Experience leaves no room for doubt upon the point. The regular relation that is found to exist between incontinence of the bladder and fire also provides matter for reflection. It is possible that these reactions and relations represent precipitates from the history of human civilization derived from a lower stratum than anything that is preserved for us in the traces surviving in myths or folklore.

[1918b, 3574]

I will now turn from this unsatisfactory conclusion to a consideration of the problem which I have attempted in my Introductory Lectures on Psycho-Analysis. I should myself be glad to know whether the primal scene in my present patient's case was a phantasy or a real experience; but, taking other similar cases into account, I must admit that the answer to this question is not in fact a matter of very great importance. These scenes of observing parental intercourse, of being seduced in childhood, and of being threatened with castration are unquestionably an inherited endowment, a phylogenetic heritage, but they may just as easily be acquired by personal experience. With my patient, his seduction by his elder sister was an indisputable reality; why should not the same have been true of his observation of his parents' intercourse?

[1918b, 3577]

All that we find in the prehistory of neuroses is that a child catches hold of this phylogenetic experience where his own experience fails him. He fills in the gaps in individual truth with prehistoric truth; he replaces occurrences in his own life by occurrences in the life of his ancestors. I fully agree with Jung ¹ in recognizing the existence of this phylogenetic heritage; but I regard it as a methodological error to seize on a phylogenetic explanation before the ontogenetic possibilities have been exhausted. I cannot see any reason for obstinately disputing the importance of infantile prehistory while at the same time freely acknowledging the importance of ancestral prehistory. Nor can I overlook the fact that phylogenetic motives and productions themselves stand in need of elucidation, and that in quite a number of instances this is afforded by factors in the childhood of the individual. And, finally, I cannot feel surprised that what was originally produced by certain circumstances in prehistoric times and was then transmitted in the shape of a predisposition to its re-acquirement should, since the same circumstances persist, emerge once more as a concrete event in the experience of the individual.

[1918b, 3577]
I have now come to the end of what I had to say about this case. There remain two problems, of the many that it raises, which seem to me to deserve special emphasis. The first relates to the phylogenetically inherited schemata, which, like the categories of philosophy, are concerned with the business of ‘placing’ the impressions derived from actual experience. I am inclined to take the view that they are precipitates from the history of human civilization. The Oedipus complex, which comprises a child's relation to his parents, is one of them - is, in fact, the best known member of the class. Wherever experiences fail to fit in with the hereditary schema, they become remodelled in the imagination - a process which might very profitably be followed out in detail. It is precisely such cases that are calculated to convince us of the independent existence of the schema. We are often able to see the schema triumphing over the experience of the individual; as when in our present case the boy's father became the castrator and the menace of his infantile sexuality in spite of what was in other respects an inverted Oedipus complex. A similar process is at work where a nurse comes to play the mother's part or where the two become fused together. The contradictions between experience and the schema seem to supply the conflicts of childhood with an abundance of material. [1918b, 3594]

If human beings too possessed an instinctive endowment such as this, it would not be surprising that it should be very particularly concerned with the processes of sexual life, even though it could not be by any means confined to them. This instinctive factor would then be the nucleus of the unconscious, a primitive kind of mental activity, which would later be dethroned and overlaid by human reason, when that faculty came to be acquired, but which in some people, perhaps in every one, would retain the power of drawing down to it the higher mental processes. Repression would be the return to this instinctive stage, and man would thus be paying for his great new acquisition with his liability to neurosis, and would be bearing witness by the possibility of the neuroses to the existence of those earlier, instinct-like, preliminary stages. The significance of the traumas of early childhood would lie in their contributing material to this unconscious which would save it from being worn away by the subsequent course of development. [1918b, 3595]

I am aware that expression has been given in many quarters to thoughts like these, which emphasize the hereditary, phylogenetically acquired factor in mental life. In fact, I am of opinion that people have been far too ready to find room for them and ascribe importance to them in psycho-analysis. I consider that they are only admissible when psycho-analysis strictly observes the correct order of precedence, and, after forcing its way through the strata of what has been acquired by the individual, comes at last upon traces of what has been inherited.¹ [1918b, 3596]

The theory of psycho-analysis (a theory based on observation) holds firmly to the view that the motive forces of repression must not be sexualized. Man's archaic heritage forms the nucleus of the unconscious mind; and whatever part of that heritage has to be left behind in the advance to later phases of development, because it is unserviceable or incompatible with what is new and harmful to it, falls a victim to the process of repression. This selection is made more successfully with one group of instincts than with the other. In virtue of special circumstances which have often been pointed out already, the latter group, that of the sexual instincts, are able to defeat the intentions of repression, and to enforce their representation by substitutive formations of a disturbing kind. For this reason infantile sexuality, which is held under repression, acts as the chief motive force in the formation of symptoms; and the essential part of its content, the Oedipus complex, is the nuclear complex of neuroses. I hope that in this paper I have raised an expectation that the sexual aberrations of childhood, as well as those of mature life, are ramifications of the same complex. [1919e, 3662]
In 1913 Otto Rank and Hanns Sachs, in an extremely interesting work, brought together the results which had been achieved up to that time in the application of psycho-analysis to the mental sciences. The most easily accessible branches of those sciences seem to be mythology and the history of literature and religion. No final formula has yet been found enabling us to give an appropriate place to myths in this connection. Otto Rank, in a large volume on the incest complex (1912), has produced evidence of the surprising fact that the choice of subject matter, especially for dramatic works, is principally determined by the ambit of what psycho-analysis has termed the 'Oedipus complex'. By working it over with the greatest variety of modifications, distortions and disguises, the dramatist seeks to deal with his own most personal relations to this emotional theme. It is in attempting to master the Oedipus complex - that is to say, a person's emotional attitude towards his family, or in a narrower sense towards his father and mother - that individual neurotics come to grief, and for this reason that complex habitually forms the nucleus of their neuroses. It does not owe its importance to any unintelligible conjunction; the emphasis laid upon the relation of children to their parents is an expression of the biological facts that the young of the human race pass through a long period of dependence and are slow in reaching maturity, as well as that their capacity for love undergoes a complicated course of development. Consequently, the overcoming of the Oedipus complex coincides with the most efficient way of mastering the archaic, animal heritage of humanity. It is true that that heritage comprises all the forces that are required for the subsequent cultural development of the individual, but they must first be sorted out and worked over. This archaic heirloom is not fit to be used for the purposes of civilized social life in the form in which it is inherited by the individual.

[1919g, 3704]

¹ There is some difference between Le Bon's view and ours owing to his concept of the unconscious not quite coinciding with the one adopted by psycho-analysis. Le Bon's unconscious more especially contains the most deeply buried features of the racial mind, which as a matter of fact lies outside the scope of psycho-analysis. We do not fail to recognize, indeed, that the ego's nucleus, which comprises the 'archaic heritage' of the human mind, is unconscious; but in addition to this we distinguish the 'unconscious repressed', which arose from a portion of that heritage. This concept of the repressed is not to be found in Le Bon.

[1921c, 3769]

Through the forming of the ideal, what biology and the vicissitudes of the human species have created in the id and left behind in it is taken over by the ego and re-experienced in relation to itself as an individual. Owing to the way in which the ego ideal is formed, it has the most abundant links with the phylogenetic acquisition of each individual - his archaic heritage. What has belonged to the lowest part of the mental life of each of us is changed, through the formation of the ideal, into what is highest in the human mind by our scale of values. It would be vain, however, to attempt to localize the ego ideal, even in the sense in which we have localized the ego, or to work it into any of the analogies with the help of which we have tried to picture the relation between the ego and the id.

[1923b, 3970]
Religion, morality, and a social sense - the chief elements in the higher side of man¹ - were originally one and the same thing. According to the hypothesis which I put forward in *Totem and Taboo* they were acquired phylogenetically out of the father-complex: religion and moral restraint through the process of mastering the Oedipus complex itself, and social feeling through the necessity for overcoming the rivalry that then remained between the members of the younger generation. The male sex seems to have taken the lead in all these moral acquisitions; and they seem to have then been transmitted to women by cross-inheritance. Even to-day the social feelings arise in the individual as a superstructure built upon impulses of jealous rivalry against his brothers and sisters. Since the hostility cannot be satisfied, an identification with the former rival develops. The study of mild cases of homosexuality confirms the suspicion that in this instance, too, the identification is a substitute for an affectionate object-choice which has taken the place of the aggressive, hostile attitude.²

Let us answer first what is easiest to answer. The differentiation between ego and id must be attributed not only to primitive man but even to much simpler organisms, for it is the inevitable expression of the influence of the external world. The super-ego, according to our hypothesis, actually originated from the experiences that led to totemism. The question whether it was the ego or the id that experienced and acquired these things soon comes to nothing. Reflection at once shows us that no external vicissitudes can be experienced or undergone by the id, except by way of the ego, which is the representative of the external world to the id. Nevertheless it is not possible to speak of direct inheritance in the ego. It is here that the gulf between an actual individual and the concept of a species becomes evident. Moreover, one must not take the difference between ego and id in too hard-and-fast a sense, nor forget that the ego is a specially differentiated part of the id. The experiences of the ego seem at first to be lost for inheritance; but, when they have been repeated often enough and with sufficient strength in many individuals in successive generations, they transform themselves, so to say, into experiences of the id, the impressions of which are preserved by heredity. Thus in the id, which is capable of being inherited, are harboured residues of the existences of countless egos; and, when the ego forms its super-ego out of the id, it may perhaps only be reviving shapes of former egos and be bringing them to resurrection.

But the derivation of the super-ego from the first object-cathexes of the id, from the Oedipus complex, signifies even more for it. This derivation, as we have already shown, brings it into relation with the phylogenetic acquisitions of the id and makes it a reincarnation of former ego-structures which have left their precipitates behind in the id. Thus the super-ego is always close to the id and can act as its representative vis-à-vis the ego. It reaches deep down into the id and for that reason is farther from consciousness than the ego is.¹

Theodor Reik and G. Róheim, the ethnologist, have taken up the line of thought which I developed in *Totem and Taboo* and, in a series of important works, have extended it, deepened it, or corrected it. I myself have since returned to it more than once, in the course of my investigations into the 'unconscious sense of guilt' (which also plays such an important part among the motives of neurotic suffering) and in my attempts at forming a closer connection between social psychology and the psychology of the individual.¹ I have moreover made use of the idea of an archaic heritage from the 'primal horde' epoch of mankind's development in explaining susceptibility to hypnosis.
Shortly before I wrote this study it seemed as though my life would soon be brought to an end by the recurrence of a malignant disease; but surgical skill saved me in 1923 and I was able to continue my life and my work, though no longer in freedom from pain. In the period of more than ten years that has passed since then, I have never ceased my analytic work nor my writing - as is proved by the completion of the twelfth volume of the German edition of my collected works. But I myself find that a significant change has come about. Threads which in the course of my development had become intertangled have now begun to separate; interests which I had acquired in the later part of my life have receded, while the older and original ones become prominent once more. It is true that in this last decade I have carried out some important pieces of analytic work, such as the revision of the problem of anxiety in my book Inhibitions, Symptoms and Anxiety (1926d) or the simple explanation of sexual ‘fetishism’ which I was able to make a year later (1927e). Nevertheless it would be true to say that, since I put forward my hypothesis of the existence of two classes of instinct (Eros and the death instinct) and since I proposed a division of the mental personality into an ego, a super-ego, and an id (1923b), I have made no further decisive contributions to psycho-analysis: what I have written on the subject since then has been either unessential or would soon have been supplied by someone else. This circumstance is connected with an alteration in myself, with what might be described as a phase of regressive development. My interest, after making a lifelong détour through the natural sciences, medicine and psychotherapy, returned to the cultural problems which had fascinated me long before, when I was a youth scarcely old enough for thinking. At the very climax of my psycho-analytic work, in 1912, I had already attempted in Totem and Taboo to make use of the newly discovered findings of analysis in order to investigate the origins of religion and morality. I now carried this work a stage further in two later essays, The Future of an Illusion (1927c) and Civilization and its Discontents (1930a). I perceived ever more clearly that the events of human history, the interactions between human nature, cultural development and the precipitates of primateval experiences (the most prominent example of which is religion) are no more than a reflection of the dynamic conflicts between the ego, the id and the super-ego, which psycho-analysis studies in the individual - are the very same processes repeated upon a wider stage. In The Future of an Illusion I expressed an essentially negative valuation of religion. Later, I found a formula which did better justice to it: while granting that its power lies in the truth which it contains, I showed that that truth was not a material but a historical truth.

The second difficulty about this transference to group psychology is far more important, because it poses a fresh problem of a fundamental nature. It raises the question in what form the operative tradition in the life of peoples is present - a question which does not occur with individuals, since there it is solved by the existence in the unconscious of memory-traces of the past. Let us return to our historical example. We have attributed the compromise at Kadesh to the survival of a powerful tradition among those who had returned from Egypt. This case involves no problem. According to our theory, a tradition of this kind was based on conscious memories of oral communications which people then living had received from their ancestors only two or three generations back who had themselves been participants and eye-witnesses of the events in question. But can we believe the same thing of the later centuries - that the tradition still had its basis in a knowledge normally handed on from grandfather to grandchild? It is no longer possible to say, as it was in the earlier case, who the people were who preserved this knowledge and handed it on by word of mouth. According to Sellin the tradition of the murder of Moses was always in the possession of priestly circles till eventually it found expression in writing which alone enabled Sellin to discover it. But it can only have been known to a few people; it was not public property. And is that enough to explain its effect? Is it possible to attribute to knowledge held like this by a few people the power to produce such a lasting emotion in the masses when it came to their notice? It seems, rather, as though there must have been something present in the ignorant masses, too, which was in some way akin to the knowledge of the few and went half way to meet it when it was uttered.
A decision is made still more difficult when we turn to the analogous case in primaeval times. It is quite certain that in the course of thousands of years the fact was forgotten that there had been a primal father with the characteristics we know and what his fate had been; nor can we suppose that there was any oral tradition of it, as we can in the case of Moses. In what sense, then, does a tradition come in question at all? In what form can it have been present?

[1939a, 4917]

In order to make it easier for readers who do not desire or are not prepared to plunge into a complicated psychological state of affairs, I will anticipate the outcome of the investigation that is to follow. In my opinion there is an almost complete conformity in this respect between the individual and the group: in the group too an impression of the past is retained in unconscious memory-traces.

[1939a, 4917]

The impressions of early traumas, from which we started out, are either not translated into the preconscious or are quickly put back by repression into the id-condition. Their mnemonic residues are in that case unconscious and operate from the id. We believe we can easily follow their further vicissitudes so long as it is a question of what has been experienced by the subject himself. But a fresh complication arises when we become aware of the probability that what may be operative in an individual's psychical life may include not only what he has experienced himself but also things that were innately present in him at his birth, elements with a phylogenetic origin - an archeaic heritage. The questions then arise of what this consists in, what it contains and what is the evidence for it.

[1939a, 4920]

The immediate and most certain answer is that it consists in certain dispositions such as are characteristic of all living organisms: in the capacity and tendency, that is, to enter particular lines of development and to react in a particular manner to certain excitations, impressions and stimuli. Since experience shows that there are distinctions in this respect between individuals of the human species, the archaic heritage must include these distinctions; they represent what we recognize as the constitutional factor in the individual. Now, since all human beings, at all events in their early days, have approximately the same experiences, they react to them, too, in a similar manner; a doubt was therefore able to arise whether we should not include these reactions, along with their individual distinctions, in the archaic heritage. This doubt should be put on one side: our knowledge of the archaic heritage is not enlarged by the fact of this similarity.

[1939a, 4920]
Nevertheless, analytic research has brought us a few results which give us cause for thought. There is, in the first place, the universality of symbolism in language. The symbolic representation of one object by another - the same thing applies to actions - is familiar to all our children and comes to them, as it were, as a matter of course. We cannot show in regard to them how they have learnt it and must admit that in many cases learning it is impossible. It is a question of an original knowledge which adults afterwards forget. It is true that an adult makes use of the same symbols in his dreams, but he does not understand them unless an analyst interprets them to him, and even then he is reluctant to believe the translation. If he makes use of one of the very common figures of speech in which this symbolism is recorded, he is obliged to admit that its true sense has completely escaped him. Moreover, symbolism disregards differences of language; investigations would probably show that it is ubiquitous - the same for all peoples. Here, then, we seem to have an assured instance of an archaic heritage dating from the period at which language developed. But another explanation might still be attempted. It might be said that we are dealing with thought-connections between ideas - connections which had been established during the historical development of speech and which have to be repeated now every time the development of speech has to be gone through in an individual. It would thus be a case of the inheritance of an intellectual disposition similar to the ordinary inheritance of an instinctual disposition - and once again it would be no contribution to our problem.

[1939a, 4920]

The work of analysis has, however, brought something else to light which exceeds in its importance what we have so far considered. When we study the reactions to early traumas, we are quite often surprised to find that they are not strictly limited to what the subject himself has really experienced but diverge from it in a way which fits in much better with the model of a phylogenetic event and, in general, can only be explained by such an influence. The behaviour of neurotic children towards their parents in the Oedipus and castration complex abounds in such reactions, which seem unjustified in the individual case and only become intelligible phylogenetically - by their connection with the experience of earlier generations. It would be well worth while to place this material, which I am able to appeal to here, before the public in a collected form. Its evidential value seems to me strong enough for me to venture on a further step and to posit the assertion that the archaic heritage of human beings comprises not only dispositions but also subject-matter - memory-traces of the experience of earlier generations. In this way the compass as well as the importance of the archaic heritage would be significantly extended.

[1939a, 4921]

On further reflection I must admit that I have behaved for a long time as though the inheritance of memory-traces of the experience of our ancestors, independently of direct communication and of the influence of education by the setting of an example, were established beyond question. When I spoke of the survival of a tradition among a people or of the formation of a people's character, I had mostly in mind an inherited tradition of this kind and not one transmitted by communication. Or at least I made no distinction between the two and was not clearly aware of my audacity in neglecting to do so. My position, no doubt, is made more difficult by the present attitude of biological science, which refuses to hear of the inheritance of acquired characters by succeeding generations. I must, however, in all modesty confess that nevertheless I cannot do without this factor in biological evolution. The same thing is not in question, indeed, in the two cases: in the one it is a matter of acquired characters which are hard to grasp, in the other of memory-traces of external events - something tangible, as it were. But it may well be that at bottom we cannot imagine one without the other.

[1939a, 4921]
If we assume the survival of these memory-traces in the archaic heritage, we have bridged the gulf between individual and group psychology: we can deal with peoples as we do with an individual neurotic. Granted that at the time we have no stronger evidence for the presence of memory-traces in the archaic heritage than the residual phenomena of the work of analysis which call for a phylogenetic derivation, yet this evidence seems to us strong enough to postulate that such is the fact. If it is not so, we shall not advance a step further along the path we entered on, either in analysis or in group psychology. The audacity cannot be avoided.

And by this assumption we are effecting something else. We are diminishing the gulf which earlier periods of human arrogance had torn too wide apart between mankind and the animals. If any explanation is to be found of what are called the instincts of animals, which allow them to behave from the first in a new situation in life as though it were an old and familiar one - if any explanation at all is to be found of this instinctive life of animals, it can only be that they bring the experiences of their species with them into their own new existence - that is, that they have preserved memories of what was experienced by their ancestors. The position in the human animal would not at bottom be different. His own archaic heritage corresponds to the instincts of animals even though it is different in its compass and contents.

After this discussion I have no hesitation in declaring that men have always known (in this special way) that they once possessed a primal father and killed him.

Two further questions must now be answered. First, under what conditions does a memory of this kind enter the archaic heritage? And, secondly, in what circumstances can it become active - that is, can it advance to consciousness from its unconscious state in the id, even though in an altered and distorted shape? The answer to the first question is easy to formulate: the memory enters the archaic heritage if the event was important enough, or repeated often enough, or both. In the case of parricide both conditions are fulfilled. On the second question there is this to be said. A whole number of influences may be concerned, not all of which are necessarily known. A spontaneous development is also conceivable, on the analogy of what happens in some neuroses. What is certainly of decisive importance, however, is the awakening of the forgotten memory trace by a recent real repetition of the event. The murder of Moses was a repetition of this kind and, later, the supposed judicial murder of Christ: so that these events come into the foreground as causes. It seems as though the genesis of monotheism could not do without these occurrences. We are reminded of the poet's words:

And lastly a remark which brings up a psychological argument. A tradition that was based only on communication could not lead to the compulsive character that attaches to religious phenomena. It would be listened to, judged, and perhaps dismissed, like any other piece of information from outside; it would never attain the privilege of being liberated from the constraint of logical thought. It must have undergone the fate of being repressed, the condition of lingering in the unconscious, before it is able to display such powerful effects on its return, to bring the masses under its spell, as we have seen with astonishment and hitherto without comprehension in the case of religious tradition. And this consideration weighs heavily in favour of our believing that things really happened in the way we have tried to picture them or at least in some similar way.

[1939a, 4922]
I cannot here repeat the contents of *Totem and Taboo* in greater detail. But I must undertake to fill up the long stretch between that hypothetical primaeval period and the victory of monotheism in historical times. After the institution of the combination of brother-clan, matriarchy, exogamy and totemism, a development began which must be described as a slow 'return of the repressed'. Here I am not using the term 'the repressed' in its proper sense. What is in question is something in a people's life which is past, lost to view, superseded and which we venture to compare with what is repressed in the mental life of an individual. We cannot at first sight say in what form this past existed during the time of its eclipse. It is not easy for us to carry over the concepts of individual psychology into group psychology; and I do not think we gain anything by introducing the concept of a 'collective' unconscious. The content of the unconscious, indeed, is in any case a collective, universal property of mankind. For the moment, then, we will make shift with the use of analogies. The processes in the life of peoples which we are studying here are very similar to those familiar to us in psychopathology, but nevertheless not quite the same. We must finally make up our minds to adopt the hypothesis that the psychic precipitates of the primaeval period became inherited property which, in each fresh generation, called not for acquisition but only for awakening. In this we have in mind the example of what is certainly the 'innate' symbolism which derives from the period of the development of speech, which is familiar to all children without their being instructed, and which is the same among all peoples despite their different languages. What we may perhaps still lack in certainty here is made good by other products of psycho-analytic research. We find that in a number of important relations our children react, not in a manner corresponding to their own experience, but instinctively, like the animals, in a manner that is only explicable as phylogenetic acquisition.

[1939a, 4949]

The evidence of the share taken by the unconscious id in the formation of dreams is abundant and convincing. (a) Memory is far more comprehensive in dreams than in waking life. Dreams bring up recollections which the dreamer has forgotten, which are inaccessible to him when he is awake. (b) Dreams make an unrestricted use of linguistic symbols, the meaning of which is for the most part unknown to the dreamer. Our experience, however, enables us to confirm their sense. They probably originate from earlier phases in the development of speech. (c) Memory very often reproduces in dreams impressions from the dreamer's early childhood of which we can definitely assert not only that they had been forgotten but that they had become unconscious owing to repression. That explains the help - usually indispensable - given us by dreams in the attempts we make during the analytic treatment of neuroses to reconstruct the dreamer's early life. (d) Furthermore, dreams bring to light material which cannot have originated either from the dreamer's adult life or from his forgotten childhood. We are obliged to regard it as part of the *archaic heritage* which a child brings with him into the world, before any experience of his own, influenced by the experiences of his ancestors. We find the counterpart of this phylogenetic material in the earliest human legends and in surviving customs. Thus dreams constitute a source of human prehistory which is not to be despised.

[1940a [1938], 4976]
So long as the ego works in full harmony with the super-ego it is not easy to distinguish between their manifestations; but tensions and estrangements between them make themselves very plainly visible. The torments caused by the reproaches of conscience correspond precisely to a child’s fear of loss of love, a fear the place of which has been taken by the moral agency. On the other hand, if the ego has successfully resisted a temptation to do something which would be objectionable to the super-ego, it feels raised in its self-esteem and strengthened in its pride, as though it had made some precious acquisition. In this way the super-ego continues to play the part of an external world for the ego, although it has become a portion of the internal world. Throughout later life it represents the influence of a person’s childhood, of the care and education given him by his parents and of his dependence on them - a childhood which is prolonged so greatly in human beings by a family life in common. And in all this it is not only the personal qualities of these parents that is making itself felt, but also everything that had a determinizing effect on them themselves, the tastes and standards of the social class in which they lived and the innate dispositions and traditions of the race from which they sprang. Those who have a liking for generalizations and sharp distinctions may say that the external world, in which the individual finds himself exposed after being detached from his parents, represents the power of the present; that his id, with its inherited trends, represents the organic past; and that the super-ego, which comes to join them later, represents more than anything the cultural past, which a child has, as it were, to repeat as an after-experience during the few years of his early life. It is unlikely that such generalizations can be universally correct. Some portion of the cultural acquisitions have undoubtedly left a precipitate behind them in the id; much of what is contributed by the super-ego will awaken an echo in the id; not a few of the child’s new experiences will be intensified because they are repetitions of some primaeval phylogenetic experience.

[1940a [1938], 5011]

The next question we come to is whether every alteration of the ego - in our sense of the term - is acquired during the defensive struggles of the earliest years. There can be no doubt about the answer. We have no reason to dispute the existence and importance of original, innate distinguishing characteristics of the ego. This is made certain by the single fact that each person makes a selection from the possible mechanisms of defence, that he always uses a few only of them and always the same ones. This would seem to indicate that each ego is endowed from the first with individual dispositions and trends, though it is true that we cannot specify their nature or what determines them. Moreover, we know that we must not exaggerate the difference between inherited and acquired characters into an antithesis; what was acquired by our forefathers certainly forms an important part of what we inherit. When we speak of an ‘archaic heritage’ we are usually thinking only of the id and we seem to assume that at the beginning of the individual’s life no ego is as yet in existence. But we shall not overlook the fact that id and ego are originally one; nor does it imply any mystical overvaluation of heredity if we think it credible that, even before the ego has come into existence, the lines of development, trends and reactions which it will later exhibit are already laid down for it. The psychological peculiarities of families, races and nations, even in their attitude to analysis, allow of no other explanation. Indeed, more than this: analytic experience has forced on us a conviction that even particular psychical contents, such as symbolism, have no other sources than hereditary transmission, and researches in various fields of social anthropology, make it plausible to suppose that other, equally specialized precipitates left by early human development are also present in the archaic heritage.

[1937c, 5035]
With the recognition that the properties of the ego which we meet with in the form of resistances can equally well be determined by heredity as acquired in defensive struggles, the topographical distinction between what is ego and what is id loses much of its value for our investigation. If we advance a step further in our analytic experience, we come upon resistances of another kind, which we can no longer localize and which seem to depend on fundamental conditions in the mental apparatus. I can only give a few examples of this type of resistance; the whole field of enquiry is still bewilderingly strange and insufficiently explored. We come across people, for instance, to whom we should be inclined to attribute a special 'adhesiveness of the libido'. The processes which the treatment sets in motion in them are so much slower than in other people because, apparently, they cannot make up their minds to detach libidinal cathexes from one object and displace them on to another, although we can discover no special reason for this cathectic loyalty. One meets with the opposite type of person, too, in whom the libido seems particularly mobile; it enters readily upon the new cathexes suggested by analysis, abandoning its former ones in exchange for them. The difference between the two types is comparable to the one felt by a sculptor, according to whether he works in hard stone or soft clay. Unfortunately, in this second type the results of analysis often turn out to be very impermanent: the new cathexes are soon given up once more, and we have an impression, not of having worked in clay, but of having written on water. In the words of the proverb: "Soon got, soon gone."
Symbolism. - In the course of investigating the form of expression brought about by the
dream-work, the surprising fact emerged that certain objects, arrangements and relations are
represented, in a sense indirectly, by ‘symbols’, which are used by the dreamer without his
understanding them and to which as a rule he offers no associations. Their translation has to be
provided by the analyst, who can himself only discover it empirically by experimentally fitting it
into the context. It was later found that linguistic usage, mythology and folklore afford the most
ample analogies to dream-symbols. Symbols, which raise the most interesting and hitherto
unsolved problems, seem to be a fragment of extremely ancient inherited mental equipment.
The use of a common symbolism extends far beyond the use of a common language.
[1923a, 3919]

There seems to be no end to the problems of dream-life. But this can only be surprising if we
forget that all the problems of mental life recur in dreams with the addition of a few new ones
arising from the special nature of dreams. Many of the things that we study in dreams, because
we meet with them there, have nevertheless little or nothing to do with the psychological
peculiarity of dreams. Thus, for instance, symbolism is not a dream-problem, but a topic
connected with our archaic thinking - our ‘basic language’, as it was aptly called by the paranoic
Schreber. It dominates myths and religious ritual no less than dreams, and dream-symbolism
can scarcely even claim that it is peculiar in that it conceals more particularly things that are
important sexually. Again, it is not to be expected that the explanation of anxiety-dreams will be
found in the theory of dreams. Anxiety is a problem rather of neurosis, and all that remains to be
discussed is how it comes about that anxiety can arise under dream-conditions.
[1925i, 4052]

There is no difficulty in discovering the general function of dreaming. It serves the purpose of
fending off, by a kind of soothing action, external or internal stimuli which would tend to arouse
the sleeper, and thus of securing sleep against interruption. External stimuli are fended off by
being given a new interpretation and by being woven into some harmless situation; internal
stimuli, caused by instinctual demands, are given free play by the sleeper and allowed to find
satisfaction in the formation of dreams, so long as the latent dream-thoughts submit to the
control of the censorship. But if they threaten to break free and the meaning of the dream
becomes too plain, the sleeper cuts short the dream and wakes in a fright. (Dreams of this class
are known as anxiety-dreams.) A similar failure in the function of dreaming occurs if an external
stimulus becomes too strong to be fended off. (This is the class of arousal-dreams.) I have
given the name of dream-work to the process which, with the co-operation of the censorship,
converts the latent thoughts into the manifest content of the dream. It consists of a peculiar way
of treating the preconscious material of thought, so that its component parts become
condensed, its psychical emphasis becomes displaced, and the whole of it is translated into
visual images or dramatized, and completed by a deceptive secondary revision. The dream-
work is an excellent example of the processes occurring in the deeper, unconscious layers of
the mind, which differ considerably from the familiar normal processes of thought. It also
displays a number of archaic characteristics, such as the use of a symbolism (in this case of a
predominantly sexual kind) which it has since also been possible to discover in other spheres of
mental activity.
[1925d, 4220]
Ten years ago, when the *Internationale Zeitschrift* dedicated a special number to Ferenczi on his fiftieth birthday, he had already published most of the works which have made all analysts into his pupils. But he was holding back his most brilliant and most fertile achievement. I knew of it, and in the closing sentence of my contribution I urged him to give it to us. Then, in 1924, his *Versuch einer Genitaltheorie* appeared. This little book is a biological rather than a psycho-analytic study; it is an application of the attitudes and insights associated with psycho-analysis to the biology of the sexual processes and, beyond them, to organic life in general. It was perhaps the boldest application of psycho-analysis that was ever attempted. As its governing thought it lays stress on the conservative nature of the instincts, which seek to re-establish every state of things that has been abandoned owing to an external interference. Symbols are recognized as evidence of ancient connections. Impressive instances are adduced to show how the characteristics of what is psychical preserve traces of primaeval changes in the bodily substance. When one has read this work, one seems to understand many peculiarities of sexual life of which one had never previously been able to obtain a comprehensive view, and one finds oneself the richer for hints that promise a deep insight into wide fields of biology. It is a vain task to attempt already to-day to distinguish what can be accepted as an authentic discovery from what seeks, in the fashion of a scientific phantasy, to guess at future knowledge. We lay the little book aside with a feeling: 'This is almost too much to take in at a first reading; I will read it again after a while.' But it is not only I who feel like this. It is probable that some time in the future there will really be a 'bio-analysis', as Ferenczi has prophesied, and it will have to cast back to the *Versuch einer Genitaltheorie*.

Nevertheless, analytic research has brought us a few results which give us cause for thought. There is, in the first place, the universality of symbolism in language. The symbolic representation of one object by another - the same thing applies to actions - is familiar to all our children and comes to them, as it were, as a matter of course. We cannot show in regard to them how they have learnt it and must admit that in many cases learning it is impossible. It is a question of an original knowledge which adults afterwards forget. It is true that an adult makes use of the same symbols in his dreams, but he does not understand them unless an analyst interprets them to him, and even then he is reluctant to believe the translation. If he makes use of one of the very common figures of speech in which this symbolism is recorded, he is obliged to admit that its true sense has completely escaped him. Moreover, symbolism disregards differences of language; investigations would probably show that it is ubiquitous - the same for all peoples. Here, then, we seem to have an assured instance of an archaic heritage dating from the period at which language developed. But another explanation might still be attempted. It might be said that we are dealing with thought-connections between ideas - connections which had been established during the historical development of speech and which have to be repeated now every time the development of speech has to be gone through in an individual. It would thus be a case of the inheritance of an intellectual disposition similar to the ordinary inheritance of an instinctual disposition - and once again it would be no contribution to our problem.

[1933c, 4815]

[1939a, 4920]
I cannot here repeat the contents of *Totem and Taboo* in greater detail. But I must undertake to fill up the long stretch between that hypothetical primaeval period and the victory of monotheism in historical times. After the institution of the combination of brother-clan, matriarchy, exogamy and totemism, a development began which must be described as a slow 'return if the repressed'. Here I am not using the term 'the repressed' in its proper sense. What is in question is something in a people's life which is past, lost to view, superseded and which we venture to compare with what is repressed in the mental life of an individual. We cannot at first sight say in what form this past existed during the time of its eclipse. It is not easy for us to carry over the concepts of individual psychology into group psychology; and I do not think we gain anything by introducing the concept of a 'collective' unconscious. The content of the unconscious, indeed, is in any case a collective, universal property of mankind. For the moment, then, we will make shift with the use of analogies. The processes in the life of peoples which we are studying here are very similar to those familiar to us in psychopathology, but nevertheless not quite the same. We must finally make up our minds to adopt the hypothesis that the psychical precipitates of the primaeval period became inherited property which, in each fresh generation, called not for acquisition but only for awakening. In this we have in mind the example of what is certainly the 'innate' symbolism which derives from the period of the development of speech, which is familiar to all children without their being instructed, and which is the same among all peoples despite their different languages. What we may perhaps still lack in certainty here is made good by other products of psycho-analytic research. We find that in a number of important relations our children react, not in a manner corresponding to their own experience, but instinctively, like the animals, in a manner that is only explicable as phylogenetic acquisition.

[1939a, 4949]

The next question we come to is whether every alteration of the ego - in our sense of the term - is acquired during the defensive struggles of the earliest years. There can be no doubt about the answer. We have no reason to dispute the existence and importance of original, innate distinguishing characteristics of the ego. This is made certain by the single fact that each person makes a selection from the possible mechanisms of defence, that he always uses a few only of them and always the same ones. This would seem to indicate that each ego is endowed from the first with individual dispositions and trends, though it is true that we cannot specify their nature or what determines them. Moreover, we know that we must not exaggerate the difference between inherited and acquired characters into an antithesis; what was acquired by our forefathers certainly forms an important part of what we inherit. When we speak of an 'archaic heritage' we are usually thinking only of the id and we seem to assume that at the beginning of the individual's life no ego is as yet in existence. But we shall not overlook the fact that id and ego are originally one; nor does it imply any mystical overvaluation of heredity if we think it credible that, even before the ego has come into existence, the lines of development, trends and reactions which it will later exhibit are already laid down for it. The psychological peculiarities of families, races and nations, even in their attitude to analysis, allow of no other explanation. Indeed, more than this: analytic experience has forced on us a conviction that even particular psychical contents, such as symbolism, have no other sources than hereditary transmission, and researches in various fields of social anthropology, make it plausible to suppose that other, equally specialized precipitates left by early human development are also present in the archaic heritage.

[1937c, 5035]
The only impression we gain is that these events of childhood are somehow demanded as a necessity, that they are among the essential elements of a neurosis. If they have occurred in reality, so much to the good; but if they have been withheld by reality, they are put together from hints and supplemented by phantasy. The outcome is the same, and up to the present we have not succeeded in pointing to any difference in the consequences, whether phantasy or reality has had the greater share in these events of childhood. Here we simply have once again one of the complemental relations that I have so often mentioned; moreover it is the strangest of all we have met with. Whence comes the need for these phantasies and the material for them? There can be no doubt that their sources lie in the instincts; but it has still to be explained why the same phantasies with the same content are created on every occasion. I am prepared with an answer which I know will seem daring to you. I believe these primal phantasies, as I should like to call them, and no doubt a few others as well, are a phylogenetic endowment. In them the individual reaches beyond his own experience into primaeval experience at points where his own experience has been too rudimentary. It seems to me quite possible that all the things that are told to us to-day in analysis as phantasy - the seduction of children, the inflaming of sexual excitement by observing parental intercourse, the threat of castration (or rather castration itself) - were once real occurrences in the primaeval times of the human family, and that children in their phantasies are simply filling in the gaps in individual truth with prehistoric truth. I have repeatedly been led to suspect that the psychology of the neuroses has stored up in it more of the antiquities of human development than any other source.

I have now come to the end of what I had to say about this case. There remain two problems, of the many that it raises, which seem to me to deserve special emphasis. The first relates to the phylogenetically inherited schemata, which, like the categories of philosophy, are concerned with the business of 'placing' the impressions derived from actual experience. I am inclined to take the view that they are precipitates from the history of human civilization. The Oedipus complex, which comprises a child's relation to his parents, is one of them - is, in fact, the best known member of the class. Wherever experiences fail to fit in with the hereditary schema, they become remodelled in the imagination - a process which might very profitably be followed out in detail. It is precisely such cases that are calculated to convince us of the independent existence of the schema. We are often able to see the schema triumphing over the experience of the individual; as when in our present case the boy's father became the castrator and the menace of his infantile sexuality in spite of what was in other respects an inverted Oedipus complex. A similar process is at work where a nurse comes to play the mother's part or where the two become fused together. The contradictions between experience and the schema seem to supply the conflicts of childhood with an abundance of material.

This study of the determinants of anxiety has, as it were, shown the defensive behaviour of the ego transfigured in a rational light. Each situation of danger corresponds to a particular period of life or a particular developmental phase of the mental apparatus and appears to be justifiable for it. In early infancy the individual is really not equipped to master psychically the large sums of excitation that reach him whether from without or from within. Again, at a certain period of life his most important interest really is that the people he is dependent on should not withdraw their loving care of him. Later on in his boyhood, when he feels that his father is a powerful rival in regard to his mother and becomes aware of his own aggressive inclinations towards him and of his sexual intentions towards his mother, he really is justified in being afraid of his father; and his fear of being punished by him can find expression through phylogenetic reinforcement in the fear of being castrated. Finally, as he enters into social relationships, it really is necessary for him to be afraid of his super-ego, to have a conscience; and the absence of that factor would give rise to severe conflicts, dangers and so on.
You will be no less surprised to hear that male children suffer from a fear of being robbed of their sexual organ by their father, so that this fear of being castrated has a most powerful influence on the development of their character and in deciding the direction to be followed by their sexuality. And here again mythology may give you the courage to believe psycho-analysis. The same Kronos who swallowed his children also emasculated his father Uranus, and was afterwards himself emasculated in revenge by his son Zeus, who had been rescued though his mother's cunning. If you have felt inclined to suppose that all that psycho-analysis reports about the early sexuality of children is derived from the disordered imagination of the analysts, you must at least admit that their imagination has created the same product as the imaginative activities of primitive man, of which myths and fairy tales are the precipitate. The alternative friendlier, and probably also the more pertinent view would be that in the mental life of children to-day we can still detect the same archaic factors which were once dominant generally in the primaeval days of human civilization. In his mental development the child would be repeating the history of his race in an abbreviated form, just as embryology long since recognized was the case with somatic development.

[1926e, 4354]

The work of analysis has, however, brought something else to light which exceeds in its importance what we have so far considered. When we study the reactions to early traumas, we are quite often surprised to find that they are not strictly limited to what the subject himself has really experienced but diverge from it in a way which fits in much better with the model of a phylogenetic event and, in general, can only be explained by such an influence. The behaviour of neurotic children towards their parents in the Oedipus and castration complex abounds in such reactions, which seem unjustified in the individual case and only become intelligible phylogenetically - by their connection with the experience of earlier generations. It would be well worth while to place this material, which I am able to appeal to here, before the public in a collected form. Its evidential value seems to me strong enough for me to venture on a further step and to posit the assertion that the archaic heritage of human beings comprises not only dispositions but also subject-matter - memory-traces of the experience of earlier generations. In this way the compass as well as the importance of the archaic heritage would be significantly extended.

[1939a, 4921]
I cannot here repeat the contents of *Totem and Taboo* in greater detail. But I must undertake to fill up the long stretch between that hypothetical primaeval period and the victory of monotheism in historical times. After the institution of the combination of brother-clan, matriarchy, exogamy and totemism, a development began which must be described as a slow 'return if the repressed'. Here I am not using the term 'the repressed' in its proper sense. What is in question is something in a people's life which is past, lost to view, superseded and which we venture to compare with what is repressed in the mental life of an individual. We cannot at first sight say in what form this past existed during the time of its eclipse. It is not easy for us to carry over the concepts of individual psychology into group psychology; and I do not think we gain anything by introducing the concept of a 'collective' unconscious. The content of the unconscious, indeed, is in any case a collective, universal property of mankind. For the moment, then, we will make shift with the use of analogies. The processes in the life of peoples which we are studying here are very similar to those familiar to us in psychopathology, but nevertheless not quite the same. We must finally make up our minds to adopt the hypothesis that the psychical precipitates of the primaeval period became inherited property which, in each fresh generation, called not for acquisition but only for awakening. In this we have in mind the example of what is certainly the 'innate' symbolism which derives from the period of the development of speech, which is familiar to all children without their being instructed, and which is the same among all peoples despite their different languages. What we may perhaps still lack in certainty here is made good by other products of psycho-analytic research. We find that in a number of important relations our children react, not in a manner corresponding to their own experience, but instinctively, like the animals, in a manner that is only explicable as phylogenetic acquisition.

[1939a, 4949]
We have heard how the weak and immature ego of the first period of childhood is permanently damaged by the stresses put upon it in its efforts to fend off the dangers that are peculiar to that period of life. Children are protected against the dangers that threaten them from the external world by the solicitude of their parents; they pay for this security by a fear of loss of love which would deliver them over helpless to the dangers of the external world. This factor exerts a decisive influence on the outcome of the conflict when a boy finds himself in the situation of the Oedipus complex, in which the threat to his narcissism by the danger of castration, reinforced from primaeval sources, takes possession of him. Driven by the combined operation of these two influences, the contemporary real danger and the remembered one with its phylogenetic basis, the child embarks on his attempts at defence - repressions - which are effective for the moment but nevertheless turn out to be psychologically inadequate when the later re-animation of sexual life brings a reinforcement to the instinctual demands which have been repudiated in the past. If this is so, it would have to be said from a biological standpoint that the ego comes to grief over the task of mastering the excitations of the early sexual period, at a time when its immaturity makes it incompetent to do so. It is in this lagging of ego development behind libidinal development that we see the essential precondition of neurosis; and we cannot escape the conclusion that neuroses could be avoided if the childish ego were spared this task - if, that is to say, the child's sexual life were allowed free play, as happens among many primitive peoples. It may be that the aetiology of neurotic illnesses is more complicated than we have here described it; if so, we have at least brought out one essential part of the aetiological complex. Nor should we forget the phylogenetic influences, which are represented in some way in the id in forms that we are not yet able to grasp, and which must certainly act upon the ego more powerfully in that early period than later. On the other hand, the realization dawns on us that such an early attempt at damming up the sexual instinct, so decided a partisanship by the young ego in favour of the external as opposed to the internal world, brought about by the prohibition of infantile sexuality, cannot be without its effect on the individual's later readiness for culture. The instinctual demands forced away from direct satisfaction are compelled to enter on new paths leading to substitutive satisfaction, and in the course of these débouts they may become desexualized and their connection with their original instinctual aims may become looser. And at this point we may anticipate the thesis that many of the highly valued assets of our civilization were acquired at the cost of sexuality and by the restriction of sexual motive forces.

[1940a [1938], 5006]
The second problem is not far removed from the first, but it is incomparably more important. If one considers the behaviour of the four-year-old child towards the re-activated primal scene,¹ or even if one thinks of the far simpler reactions of the one-and-a-half-year-old child when the scene was actually experienced, it is hard to dismiss the view that some sort of hardly definable knowledge, something, as it were, preparatory to an understanding, was at work in the child at the time.² We can form no conception of what this may have consisted in; we have nothing at our disposal but the single analogy - and it is an excellent one - of the far-reaching instinctive knowledge of animals.

[1918b, 3595]

If human beings too possessed an instinctive endowment such as this, it would not be surprising that it should be very particularly concerned with the processes of sexual life, even though it could not be by any means confined to them. This instinctive factor would then be the nucleus of the unconscious, a primitive kind of mental activity, which would later be dethroned and overlaid by human reason, when that faculty came to be acquired, but which in some people, perhaps in every one, would retain the power of drawing down to it the higher mental processes. Repression would be the return to this instinctive stage, and man would thus be paying for his great new acquisition with his liability to neurosis, and would be bearing witness by the possibility of the neuroses to the existence of those earlier, instinct-like, preliminary stages. The significance of the traumas of early childhood would lie in their contributing material to this unconscious which would save it from being worn away by the subsequent course of development.

[1918b, 3595]

And by this assumption we are effecting something else. We are diminishing the gulf which earlier periods of human arrogance had torn too wide apart between mankind and the animals. If any explanation is to be found of what are called the instincts of animals, which allow them to behave from the first in a new situation in life as though it were an old and familiar one - if any explanation at all is to be found of this instinctive life of animals, it can only be that they bring the experiences of their species with them into their own new existence - that is, that they have preserved memories of what was experienced by their ancestors. The position in the human animal would not at bottom be different. His own archaic heritage corresponds to the instincts of animals even though it is different in its compass and contents.

[1939a, 4922]
I cannot here repeat the contents of *Totem and Taboo* in greater detail. But I must undertake to fill up the long stretch between that hypothetical primaeval period and the victory of monotheism in historical times. After the institution of the combination of brother-clan, matriarchy, exogamy and totemism, a development began which must be described as a slow 'return if the repressed'. Here I am not using the term 'the repressed' in its proper sense. What is in question is something in a people's life which is past, lost to view, superseded and which we venture to compare with what is repressed in the mental life of an individual. We cannot at first sight say in what form this past existed during the time of its eclipse. It is not easy for us to carry over the concepts of individual psychology into group psychology; and I do not think we gain anything by introducing the concept of a 'collective' unconscious. The content of the unconscious, indeed, is in any case a collective, universal property of mankind. For the moment, then, we will make shift with the use of analogies. The processes in the life of peoples which we are studying here are very similar to those familiar to us in psychopathology, but nevertheless not quite the same. We must finally make up our minds to adopt the hypothesis that the psychical precipitates of the primaeval period became inherited property which, in each fresh generation, called not for acquisition but only for awakening. In this we have in mind the example of what is certainly the 'innate' symbolism which derives from the period of the development of speech, which is familiar to all children without their being instructed, and which is the same among all peoples despite their different languages. What we may perhaps still lack in certainty here is made good by other products of psycho-analytic research. We find that in a number of important relations our children react, not in a manner corresponding to their own experience, but instinctively, like the animals, in a manner that is only explicable as phylogenetic acquisition.

[1939a, 4949]
If we assume the survival of these memory-traces in the archaic heritage, we have bridged the
gulf between individual and group psychology: we can deal with peoples as we do with an
individual neurotic. Granted that at the time we have no stronger evidence for the presence of
memory-traces in the archaic heritage than the residual phenomena of the work of analysis
which call for a phylogenetic derivation, yet this evidence seems to us strong enough to
postulate that such is the fact. If it is not so, we shall not advance a step further along the path
we entered on, either in analysis or in group psychology. The audacity cannot be avoided.
[1939a, 4922]
For this situation is nothing new. It has an infantile prototype, of which it is in fact only the continuation. For once before one has found oneself in a similar state of helplessness: as a small child, in relation to one's parents. One had reason to fear them, and especially one's father; and yet one was sure of his protection against the dangers one knew. Thus it was natural to assimilate the two situations. Here, too, wishing played its part, as it does in dream-life. The sleeper may be seized with a presentiment of death, which threatens to place him in the grave. But the dream-work knows how to select a condition that will turn even that dreaded event into a wish-fulfilment: the dreamer sees himself in an ancient Etruscan grave which he has climbed down into, happy to find his archaeological interests satisfied. In the same way, a man makes the forces of nature not simply into persons with whom he can associate as he would with his equals - that would not do justice to the overpowering impression which those forces make on him - but he gives them the character of a father. He turns them into gods, following in this, as I have tried to show, not only an infantile prototype but a phylogenetic one.

And thus a store of ideas is created, born from man's need to make his helplessness tolerable and built up from the material of memories of the helplessness of his own childhood and the childhood of the human race. It can clearly be seen that the possession of these ideas protects him in two directions - against the dangers of nature and Fate, and against the injuries that threaten him from human society itself. Here is the gist of the matter. Life in this world serves a higher purpose; no doubt it is not easy to guess what that purpose is, but it certainly signifies a perfecting of man's nature. It is probably the spiritual part of man, the soul, which in the course of time has so slowly and unwillingly detached itself from the body, that is the object of this elevation and exaltation. Everything that happens in this world is an expression of the intentions of an intelligence superior to us, which in the end, though its ways and byways are difficult to follow, orders everything for the best - that is, to make it enjoyable for us. Over each one of us there watches a benevolent Providence which is only seemingly stern and which will not suffer us to become a plaything of the overmighty and pitiless forces of nature. Death itself is not extinction, is not a return to inorganic lifelessness, but the beginning of a new kind of existence which lies on the path of development to something higher. And, looking in the other direction, this view announces that the same moral laws which our civilizations have set up govern the whole universe as well, except that they are maintained by a supreme court of justice with incomparably more power and consistency. In the end all good is rewarded and all evil punished, if not actually in this form of life then in the later existences that begin after death. In this way all the terrors, the sufferings and the hardships of life are destined to be obliterated. Life after death, which continues life on earth just as the invisible part of the spectrum joins on to the visible part, brings us all the perfection that we may perhaps have missed here. And the superior wisdom which directs this course of things, the infinite goodness that expresses itself in it, the justice that achieves its aim in it - these are the attributes of the divine beings who also created us and the world as a whole, or rather, of the one divine being into which, in our civilization, all the gods of antiquity have been condensed. The people which first succeeded in thus concentrating the divine attributes was not a little proud of the advance. It had laid open to view the father who had all along been hidden behind every divine figure as its nucleus. Fundamentally this was a return to the historical beginnings of the idea of God. Now that God was a single person, man's relations to him could recover the intimacy and intensity of the child's relation to his father. But if one had done so much for one's father, one wanted to have a reward, or at least to be his only beloved child, his Chosen People. Very much later, pious America laid claim to being 'God's own Country'; and, as regards one of the shapes in which men worship the deity, the claim is undoubtedly valid.
I think, all the same, that I am justified in expressing myself in this way. I have tried to show that religious ideas have arisen from the same need as have all the other achievements of civilization: from the necessity of defending oneself against the crushingly superior force of nature. To this a second motive was added - the urge to rectify the shortcomings of civilization which made themselves painfully felt. Moreover, it is especially apposite to say that civilization gives the individual these ideas, for he finds them there already; they are presented to him ready-made, and he would not be able to discover them for himself. What he is entering into is the heritage of many generations, and he takes it over as he does the multiplication table, geometry, and similar things. There is indeed a difference in this, but that difference lies elsewhere and I cannot examine it yet. The feeling of strangeness that you mention may be partly due to the fact that this body of religious ideas is usually put forward as a divine revelation. But this presentation of it is itself a part of the religious system, and it entirely ignores the known historical development of these ideas and their differences in different epochs and civilizations.

[1927c, 4433]

The second difficulty about this transference to group psychology is far more important, because it poses a fresh problem of a fundamental nature. It raises the question in what form the operative tradition in the life of peoples is present - a question which does not occur with individuals, since there it is solved by the existence in the unconscious of memory-traces of the past. Let us return to our historical example. We have attributed the compromise at Kadesh to the survival of a powerful tradition among those who had returned from Egypt. This case involves no problem. According to our theory, a tradition of this kind was based on conscious memories of oral communications which people then living had received from their ancestors only two or three generations back who had themselves been participants and eye-witnesses of the events in question. But can we believe the same thing of the later centuries - that the tradition still had its basis in a knowledge normally handed on from grandfather to grandchild? It is no longer possible to say, as it was in the earlier case, who the people were who preserved this knowledge and handed it on by word of mouth. According to Sellin the tradition of the murder of Moses was always in the possession of priestly circles till eventually it found expression in writing which alone enabled Sellin to discover it. But it can only have been known to a few people; it was not public property. And is that enough to explain its effect? Is it possible to attribute to knowledge held like this by a few people the power to produce such a lasting emotion in the masses when it came to their notice? It seems, rather, as though there must have been something present in the ignorant masses, too, which was in some way akin to the knowledge of the few and went half way to meet it when it was uttered.

[1939a, 4916]

After this discussion I have no hesitation in declaring that men have always known (in this special way) that they once possessed a primal father and killed him.

[1939a, 4922]

And lastly a remark which brings up a psychological argument. A tradition that was based only on communication could not lead to the compulsive character that attaches to religious phenomena. It would be listened to, judged, and perhaps dismissed, like any other piece of information from outside; it would never attain the privilege of being liberated from the constraint of logical thought. It must have undergone the fate of being repressed, the condition of lingering in the unconscious, before it is able to display such powerful effects on its return, to bring the masses under its spell, as we have seen with astonishment and hitherto without comprehension in the case of religious tradition. And this consideration weighs heavily in favour of our believing that things really happened in the way we have tried to picture them or at least in some similar way.

[1939a, 4923]
I cannot here repeat the contents of *Totem and Taboo* in greater detail. But I must undertake to fill up the long stretch between that hypothetical primaeval period and the victory of monotheism in historical times. After the institution of the combination of brother-clan, matriarchy, exogamy and totemism, a development began which must be described as a slow 'return if the repressed'. Here I am not using the term 'the repressed' in its proper sense. What is in question is something in a people's life which is past, lost to view, superseded and which we venture to compare with what is repressed in the mental life of an individual. We cannot at first sight say in what form this past existed during the time of its eclipse. It is not easy for us to carry over the concepts of individual psychology into group psychology; and I do not think we gain anything by introducing the concept of a 'collective' unconscious. The content of the unconscious, indeed, is in any case a collective, universal property of mankind. For the moment, then, we will make shift with the use of analogies. The processes in the life of peoples which we are studying here are very similar to those familiar to us in psychopathology, but nevertheless not quite the same. We must finally make up our minds to adopt the hypothesis that the psychical precipitates of the primaeval period became inherited property which, in each fresh generation, called not for acquisition but only for awakening. In this we have in mind the example of what is certainly the 'innate' symbolism which derives from the period of the development of speech, which is familiar to all children without their being instructed, and which is the same among all peoples despite their different languages. What we may perhaps still lack in certainty here is made good by other products of psycho-analytic research. We find that in a number of important relations our children react, not in a manner corresponding to their own experience, but instinctively, like the animals, in a manner that is only explicable as phylogenetic acquisition.

[1939a, 4949]
Where, then, does the libido find the fixations which it requires in order to break through the repressions? In the activities and experiences of infantile sexuality, in the abandoned component trends, in the objects of childhood which have been given up. It is to them, accordingly, that the libido returns. The significance of this period of childhood is twofold: on the one hand, during it the instinctual trends which the child has inherited with his innate disposition first become manifest, and secondly, others of his instincts are for the first time awakened and made active by external impressions and accidental experiences. There is no doubt, I think, that we are justified in making this twofold division. The manifestation of the innate disposition is indeed not open to any critical doubts, but analytic experience actually compels us to assume that purely chance experiences in childhood are able to leave fixations of the libido behind them. Nor do I see any theoretical difficulty in this. Constitutional dispositions are also undoubtedly after-effects of experiences by ancestors in the past; they too were once acquired. Without such acquisition there would be no heredity. And is it conceivable that acquisition such as this, leading to inheritance, would come to an end precisely with the generation we are considering? The significance of infantile experiences should not be totally neglected, as people like doing, in comparison with the experiences of the subject's ancestors and of his own maturity; on the contrary, they call for particular consideration. They are all the more momentous because they occur in times of incomplete development and are for that very reason liable to have traumatic effects. The studies on developmental mechanics by Roux and others have shown that the prick of a needle into an embryonic germinal layer in the act of cell-division results in a severe disturbance of development. The same injury inflicted on a larval or fully grown animal would do no damage.

[1916-1917, 3419]

The only impression we gain is that these events of childhood are somehow demanded as a necessity, that they are among the essential elements of a neurosis. If they have occurred in reality, so much to the good; but if they have been withheld by reality, they are put together from hints and supplemented by phantasy. The outcome is the same, and up to the present we have not succeeded in pointing to any difference in the consequences, whether phantasy or reality has had the greater share in these events of childhood. Here we simply have once again one of the complemental relations that I have so often mentioned; moreover it is the strangest of all we have met with. Whence comes the need for these phantasies and the material for them? There can be no doubt that their sources lie in the instincts; but it has still to be explained why the same phantasies with the same content are created on every occasion. I am prepared with an answer which I know will seem daring to you. I believe these *primal phantasies*, as I should like to call them, and no doubt a few others as well, are a phylogenetic endowment. In them the individual reaches beyond his own experience into primaeval experience at points where his own experience as been too rudimentary. It seems to me quite possible that all the things that are told to us to-day in analysis as phantasy - the seduction of children, the inflaming of sexual excitement by observing parental intercourse, the threat of castration (or rather castration itself) - were once real occurrences in the primaeval times of the human family, and that children in their phantasies are simply filling in the gaps in individual truth with prehistoric truth. I have repeatedly been led to suspect that the psychology of the neuroses has stored up in it more of the antiquities of human development than any other source.

[1916-1917, 3427]
I will now turn from this unsatisfactory conclusion to a consideration of the problem which I have attempted in my *Introductory Lectures on Psycho-Analysis*. I should myself be glad to know whether the primal scene in my present patient's case was a phantasy or a real experience; but, taking other similar cases into account, I must admit that the answer to this question is not in fact a matter of very great importance. These scenes of observing parental intercourse, of being seduced in childhood, and of being threatened with castration are unquestionably an inherited endowment, a phylogenetic heritage, but they may just as easily be acquired by personal experience. With my patient, his seduction by his elder sister was an indisputable reality; why should not the same have been true of his observation of his parents' intercourse?

[1918b, 3577]

All that we find in the prehistory of neuroses is that a child catches hold of this phylogenetic experience where his own experience fails him. He fills in the gaps in individual truth with prehistoric truth; he replaces occurrences in his own life by occurrences in the life of his ancestors. I fully agree with Jung ¹ in recognizing the existence of this phylogenetic heritage; but I regard it as a methodological error to seize on a phylogenetic explanation before the ontogenetic possibilities have been exhausted. I cannot see any reason for obstinately disputing the importance of infantile prehistory while at the same time freely acknowledging the importance of ancestral prehistory. Nor can I overlook the fact that phylogenetic motives and productions themselves stand in need of elucidation, and that in quite a number of instances this is afforded by factors in the childhood of the individual. And, finally, I cannot feel surprised that what was originally produced by certain circumstances in prehistoric times and was then transmitted in the shape of a predisposition to its re-acquisition should, since the same circumstances persist, emerge once more as a concrete event in the experience of the individual.

[1918b, 3577]

If human beings too possessed an instinctive endowment such as this, it would not be surprising that it should be very particularly concerned with the processes of sexual life, even though it could not be by any means confined to them. This instinctive factor would then be the nucleus of the unconscious, a primitive kind of mental activity, which would later be dethroned and overlaid by human reason, when that faculty came to be acquired, but which in some people, perhaps in every one, would retain the power of drawing down to it the higher mental processes. Repression would be the return to this instinctive stage, and man would thus be paying for his great new acquisition with his liability to neurosis, and would be bearing witness by the possibility of the neuroses to the existence of those earlier, instinct-like, preliminary stages. The significance of the traumas of early childhood would lie in their contributing material to this unconscious which would save it from being worn away by the subsequent course of development.

[1918b, 3595]
To find the starting-point for the psycho-analytic view of religious life we must go a step further. What is to-day the heritage of the individual was once a new acquisition and has been handed on from one to another of a long series of generations. Thus the Oedipus complex too may have had stages of development, and the study of prehistory may enable us to trace them out. Investigation suggests that life in the human family took a quite different form in those remote days from that with which we are now familiar. And this idea is supported by findings based on observations of contemporary primitive races. If the prehistoric and ethnological material on this subject is worked over psycho-analytically, we arrive at an unexpectedly precise result: namely that God the Father once walked upon earth in bodily form and exercised his sovereignty as chieftain of the primal human horde until his sons united to slay him. It emerges further that this crime of liberation and the reactions to it had as their result the appearance of the first social ties, the basic moral restrictions and the oldest form of religion, totemism. But the later religions too have the same content, and on the one hand they are concerned with obliterating the traces of that crime or with expiating it by bringing forward other solutions of the struggle between the father and sons, while on the other hand they cannot avoid repeating once more the elimination of the father. Incidentally, an echo of this monstrous event, which overshadowed the whole course of human development, is also to be found in myths.

[1919g, 3705]

The work of analysis has, however, brought something else to light which exceeds in its importance what we have so far considered. When we study the reactions to early traumas, we are quite often surprised to find that they are not strictly limited to what the subject himself has really experienced but diverge from it in a way which fits in much better with the model of a phylogenetic event and, in general, can only be explained by such an influence. The behaviour of neurotic children towards their parents in the Oedipus and castration complex abounds in such reactions, which seem unjustified in the individual case and only become intelligible phylogenetically - by their connection with the experience of earlier generations. It would be well worth while to place this material, which I am able to appeal to here, before the public in a collected form. Its evidential value seems to me strong enough for me to venture on a further step and to posit the assertion that the archaic heritage of human beings comprises not only dispositions but also subject-matter - memory-traces of the experience of earlier generations. In this way the compass as well as the importance of the archaic heritage would be significantly extended.

[1939a, 4921]

If we assume the survival of these memory-traces in the archaic heritage, we have bridged the gulf between individual and group psychology: we can deal with peoples as we do with an individual neurotic. Granted that at the time we have no stronger evidence for the presence of memory-traces in the archaic heritage than the residual phenomena of the work of analysis which call for a phylogenetic derivation, yet this evidence seems to us strong enough to postulate that such is the fact. If it is not so, we shall not advance a step further along the path we entered on, either in analysis or in group psychology. The audacity cannot be avoided.

[1939a, 4922]
The next question we come to is whether every alteration of the ego - in our sense of the term - is acquired during the defensive struggles of the earliest years. There can be no doubt about the answer. We have no reason to dispute the existence and importance of original, innate distinguishing characteristics of the ego. This is made certain by the single fact that each person makes a selection from the possible mechanisms of defence, that he always uses a few only of them and always the same ones. This would seem to indicate that each ego is endowed from the first with individual dispositions and trends, though it is true that we cannot specify their nature or what determines them. Moreover, we know that we must not exaggerate the difference between inherited and acquired characters into an antithesis; what was acquired by our forefathers certainly forms an important part of what we inherit. When we speak of an 'archaic heritage' we are usually thinking only of the id and we seem to assume that at the beginning of the individual's life no ego is as yet in existence. But we shall not overlook the fact that id and ego are originally one; nor does it imply any mystical overvaluation of heredity if we think it credible that, even before the ego has come into existence, the lines of development, trends and reactions which it will later exhibit are already laid down for it. The psychological peculiarities of families, races and nations, even in their attitude to analysis, allow of no other explanation. Indeed, more than this: analytic experience has forced on us a conviction that even particular psychical contents, such as symbolism, have no other sources than hereditary transmission, and researches in various fields of social anthropology, make it plausible to suppose that other, equally specialized precipitates left by early human development are also present in the archaic heritage.

[1937c, 5035]

With the recognition that the properties of the ego which we meet with in the form of resistances can equally well be determined by heredity as acquired in defensive struggles, the topographical distinction between what is ego and what is id loses much of its value for our investigation. If we advance a step further in our analytic experience, we come upon resistances of another kind, which we can no longer localize and which seem to depend on fundamental conditions in the mental apparatus. I can only give a few examples of this type of resistance; the whole field of enquiry is still bewilderingly strange and insufficiently explored. We come across people, for instance, to whom we should be inclined to attribute a special 'adhesiveness of the libido'. The processes which the treatment sets in motion in them are so much slower than in other people because, apparently, they cannot make up their minds to detach libidinal cathexes from one object and displace them on to another, although we can discover no special reason for this cathectic loyalty. One meets with the opposite type of person, too, in whom the libido seems particularly mobile; it enters readily upon the new cathexes suggested by analysis, abandoning its former ones in exchange for them. The difference between the two types is comparable to the one felt by a sculptor, according to whether he works in hard stone or soft clay. Unfortunately, in this second type the results of analysis often turn out to be very impermanent: the new cathexes are soon given up once more, and we have an impression, not of having worked in clay, but of having written on water. In the words of the proverb: 'Soon got, soon gone.'

[1937c, 5036]
On further reflection I must admit that I have behaved for a long time as though the inheritance of memory-traces of the experience of our ancestors, independently of direct communication and of the influence of education by the setting of an example, were established beyond question. When I spoke of the survival of a tradition among a people or of the formation of a people's character, I had mostly in mind an inherited tradition of this kind and not one transmitted by communication. Or at least I made no distinction between the two and was not clearly aware of my audacity in neglecting to do so. My position, no doubt, is made more difficult by the present attitude of biological science, which refuses to hear of the inheritance of acquired characters by succeeding generations. I must, however, in all modesty confess that nevertheless I cannot do without this factor in biological evolution. The same thing is not in question, indeed, in the two cases: in the one it is a matter of acquired characters which are hard to grasp, in the other of memory-traces of external events - something tangible, as it were. But it may well be that at bottom we cannot imagine one without the other.

[1939a, 4921]

Two further questions must now be answered. First, under what conditions does a memory of this kind enter the archaic heritage? And, secondly, in what circumstances can it become active - that is, can it advance to consciousness from its unconscious state in the id, even though in an altered and distorted shape? The answer to the first question is easy to formulate: the memory enters the archaic heritage if the event was important enough, or repeated often enough, or both. In the case of parricide both conditions are fulfilled. On the second question there is this to be said. A whole number of influences may be concerned, not all of which are necessarily known. A spontaneous development is also conceivable, on the analogy of what happens in some neuroses. What is certainly of decisive importance, however, is the awakening of the forgotten memory trace by a recent real repetition of the event. The murder of Moses was a repetition of this kind and, later, the supposed judicial murder of Christ: so that these events come into the foreground as causes. It seems as though the genesis of monotheism could not do without these occurrences. We are reminded of the poet's words:

[1939a, 4922]
Nor can we leave the subject of regression in dreams without setting down in words a notion by which we have already repeatedly been struck and which will recur with fresh intensity when we have entered more deeply into the study of the psycho-neuroses: namely that dreaming is on the whole an example of regression to the dreamer's earliest condition, a revival of his childhood, of the instinctual impulses which dominated it and of the methods of expression which were then available to him. Behind this childhood of the individual we are promised a picture of a phylogenetic childhood - a picture of the development of the human race, of which the individual's development is in fact an abbreviated recapitulation influenced by the chance circumstances of life. We can guess how much to the point is Nietzsche's assertion that in dreams 'some primaeval relic of humanity is at work which we can now scarcely reach any longer by a direct path'; and we may expect that the analysis of dreams will lead us to a knowledge of man's archaic heritage, of what is psychically innate in him. Dreams and neuroses seem to have preserved more mental antiquities than we could have imagined possible; so that psycho-analysis may claim a high place among the sciences which are concerned with the reconstruction of the earliest and most obscure periods of the beginnings of the human race. [1900a, 981]

The relation between ontogenesis and phylogenesis is a similar one. Ontogenesis may be regarded as a recapitulation of phylogenesis, in so far as the latter has not been modified by more recent experience. The phylogenetic disposition can be seen at work behind the ontogenetic process. But disposition is ultimately the precipitate of earlier experience of the species to which the more recent experience of the individual, as the sum of the accidental factors, is super-added. [1905d, 1460]

² [Footnote added 1915:] On the other hand, these forces which act like dams upon sexual development - disgust, shame and morality - must also be regarded as historical precipitates of the external inhibitions to which the sexual instinct has been subjected during the psychogenesis of the human race. We can observe the way in which, in the development of individuals, they arise at the appropriate moment, as though spontaneously, when upbringing and external influence give the signal. [1905d, 1487]

² [Footnote added 1915:] The barrier against incest is probably among the historical acquisitions of mankind, and, like other moral taboos, has no doubt already become established in many persons by organic inheritance. (Cf. my Totem and Taboo, 1912-13.) Psycho-analytic investigation shows, however, how intensely the individual struggles with the temptation to incest during his period of growth and how frequently the barrier is transgressed in phantasies and even in reality. [1905d, 1538]
Impressive analogies from biology have prepared us to find that the individual's mental development repeats the course of human development in an abbreviated form; and the conclusions which psycho-analytic research into the child's mind has reached concerning the high value set on the genitals in infancy will not therefore strike us as improbable. The child's assumption that his mother has a penis is thus the common source from which are derived the androgynously-formed mother goddesses such as the Egyptian Mut and the vultures' 'coda' in Leonardo's childhood phantasy. It is in fact only due to a misunderstanding that we describe these representations of gods as hermaphrodite in the medical sense of the word. In none of them is there a combination of the true genitals of both sexes - a combination which, to the abhorrence of all beholders, is found in some cases of malformation; all that has happened is that the male organ has been added to the breasts which are the mark of a mother, just as it was present in the child's first idea of his mother's body. This form of the mother's body, the revered creation of primaeval phantasy, has been preserved for the faithful by mythology. We can now provide the following translation of the emphasis given to the vulture's tail in Leonardo's phantasy: 'That was a time when my fond curiosity was directed to my mother, and when I still believed she had a genital organ like my own.' Here is more evidence of Leonardo's early sexual researches, which in our opinion had a decisive effect on the whole of his later life.

Nevertheless, psycho-analysis and folklore have not allowed themselves to be deterred from transgressing these prohibitions and have been able as a result to teach us all kinds of things that are indispensable for an understanding of human nature. If we limit ourselves here to what has been learnt about the excretory functions, it may be said that the chief finding from psycho-analytic research has been the fact that the human infant is obliged to recapitulate during the early part of his development the changes in the attitude of the human race towards excremental matters which probably had their start when homo sapiens first raised himself off Mother Earth. In the earliest years of infancy there is as yet no trace of shame about the excretory functions or of disgust at excreta. Small children show great interest in these, just as they do in others of their bodily secretions; they like occupying themselves with them and can derive many kinds of pleasure from doing so. Excreta, regarded as parts of a child's own body and as products of his own organism, have a share in the esteem - the narcissistic esteem, as we should call it - with which he regards everything relating to his self. Children are, indeed, proud of their own excretions and make use of them to help in asserting themselves against adults. Under the influence of its upbringing, the child's coprophilic instincts and inclinations gradually succumb to repression; it learns to keep them secret, to be ashamed of them and to feel disgust at their objects. Strictly speaking, however, the disgust never goes so far as to apply to a child's own excretions, but is content with repudiating them when they are the products of other people. The interest which has hitherto been attached to excrement is carried over on to other objects - for instance, from faeces on to money, which is, of course, late in acquiring significance for children. Important constituents in the formation of character are developed, or strengthened, from the repression of coprophilic inclinations.

In the last few years psycho-analytic writers¹ have become aware that the principle that 'ontogeny is a repetition of phylogeny' must be applicable to mental life; and this has led to a fresh extension of psycho-analytic interest.

[1910c, 2272]

[1913k, 2640]

[1913j, 2820]
You may conclude from this that if we study the dream-work further we must succeed in gaining valuable light on the little known beginnings of our intellectual development. I hope it will be so; but this work has not so far been started upon. The prehistory into which the dream-work leads us back is of two kinds - on the one hand, into the individual's prehistory, his childhood, and on the other, in so far as each individual some how recapitulates in an abbreviated form the entire development of the human race, into phylogenetic prehistory too. Shall we succeed in distinguishing which portion of the latent mental processes is derived from the individual prehistoric period and which portion from the phylogenetic one? It is not, I believe, impossible that we shall. It seems to me, for instance, that symbolic connections, which the individual has never acquired by learning, may justly claim to be regarded as a phylogenetic heritage.

I will dwell for a little to-day on yet another point in ego development, partly because I have some remoter aims in view, but also because what follows is precisely calculated to justify the sharp separation between the ego-instincts and the sexual instincts which we favour but which is not self-evident. In forming our judgement of the two courses of development both of the ego and of the libido - we must lay emphasis on a consideration which has not often hitherto been taken into account. For both of them are at bottom heritages, abbreviated recapitulations of the development which all mankind has passed through from its primaeval days over long periods of time. In the case of the development of the libido, this phylogenetic origin is, I venture to think, immediately obvious. Consider how in one class of animals the genital apparatus is brought into the closest relation to the mouth, while in another it cannot be distinguished from the excretory apparatus, and in yet others it is linked to the motor organs - all of which you will find attractively set out in W. Bölsche's valuable book. Among animals one can find, so to speak in petrified form, every species of perversion of the sexual organization. In the case of human beings, however, this phylogenetic point of view is partly veiled by the fact that what is at bottom inherited is nevertheless freshly acquired in the development of the individual, probably because the same conditions which originally necessitated its acquisition persist and continue to operate upon each individual. I should like to add that originally the operation of these conditions was creative but that it is now evocative. Besides this, there is no doubt that the prescribed course of development can be disturbed and altered in each individual by recent external influences. But we know the power which forced a development of this kind upon humanity and maintains its pressure in the same direction to-day. It is, once again, frustration by reality, or, if we are to give it its true, grand name, the pressure of vital needs - Necessity (Άνάγκη). She has been a strict educator and has made much out of us. The neurotics are among those of her children to whom her strictness has brought evil results; but that is a risk with all education. This appreciation of the necessities of life need not, incidentally, weigh against the importance, of 'internal developmental trends', if such can be shown to be present.
This view of instincts strikes us as strange because we have become used to see in them a factor impelling towards change and development, whereas we are now asked to recognize in them the precise contrary - an expression of the conservative nature of living substance. On the other hand we soon call to mind examples from animal life which seem to confirm the view that instincts are historically determined. Certain fishes, for instance, undertake laborious migrations at spawning-time in order to deposit their spawn in particular waters far removed from their customary haunts. In the opinion of many biologists what they are doing is merely to seek out the localities in which their species formerly resided but which in the course of time they have exchanged for others. The same explanation is believed to apply to the migratory flights of birds of passage - but we are quickly relieved of the necessity for seeking for further examples by the reflection that the most impressive proofs of there being an organic compulsion to repeat lie in the phenomena of heredity and the facts of embryology. We see how the germ of a living animal is obliged in the course of its development to recapitulate (even if only in a transient and abbreviated fashion) the structures of all the forms from which it is sprung, instead of proceeding quickly by the shortest path to its final shape. This behaviour is only to a very slight degree attributable to mechanical causes, and the historical explanation cannot accordingly be neglected. So too the power of regenerating a lost organ by growing afresh a precisely similar one extends far up into the animal kingdom.
[1920g, 3739]

By its theory of the instincts psycho-analysis offended the feelings of individuals in so far as they regarded themselves as members of the social community; another branch of its theory was calculated to hurt every single person at the tenderest point of his own psychical development. Psycho-analysis disposed once and for all of the fairy tale of an asexual childhood. It demonstrated the fact that sexual interests and activities occur in small children from the beginning of their lives. It showed what transformations those activities pass through, how at about the age of five they succumb to inhibition and how from puberty onwards they enter the service of the reproductive function. It recognized that early infantile sexual life reaches its peak in what is known as the Oedipus complex (an emotional attachment of the child to the parent of the opposite sex accompanied by an attitude of rivalry to the parent of the same sex) and that at that period of life this impulsion extends uninhibited into a straightforward sexual desire. This can be confirmed so easily that only the greatest efforts could make it possible to overlook it. Every individual has in fact gone through this phase but has afterwards energetically repressed its purport and succeeded in forgetting it. A horror of incest and an enormous sense of guilt are left over from this prehistoric epoch of the individual's existence. It may be that something quite similar occurred in the prehistoric epoch of the human species as a whole and that the beginnings of morality, religion and social order were intimately connected with the surmounting of that primaeval era. To adults their prehistory seems so inglorious that they refuse to allow themselves to be reminded of it: they were infuriated when psycho-analysis tried to lift the veil of amnesia from their years of childhood. There was only one way out: what psycho-analysis asserted must be false and what posed as a new science must be a tissue of fancies and distortions.
[1925e, 4128]
You will be no less surprised to hear that male children suffer from a fear of being robbed of their sexual organ by their father, so that this fear of being castrated has a most powerful influence on the development of their character and in deciding the direction to be followed by their sexuality. And here again mythology may give you the courage to believe psycho-analysis. The same Kronos who swallowed his children also emasculated his father Uranus, and was afterwards himself emasculated in revenge by his son Zeus, who had been rescued though his mother's cunning. If you have felt inclined to suppose that all that psycho-analysis reports about the early sexuality of children is derived from the disordered imagination of the analysts, you must at least admit that their imagination has created the same product as the imaginative activities of primitive man, of which myths and fairy tales are the precipitate. The alternative friendlier, and probably also the more pertinent view would be that in the mental life of children to-day we can still detect the same archaic factors which were once dominant generally in the primaeval days of human civilization. In his mental development the child would be repeating the history of his race in an abbreviated form, just as embryology long since recognized was the case with somatic development.

[1926e, 4354]
It was not for a long time that I learned to appreciate the importance of phantasies and unconscious thoughts about life in the womb. They contain an explanation of the remarkable dread that many people have of being buried alive; and they also afford the deepest unconscious basis for the belief in survival after death, which merely represents a projection into the future of this uncanny life before birth. Moreover, the act of birth is the first experience of anxiety, and thus the source and prototype of the affect of anxiety.

[1900a, 856]

Many people experience the feeling in the highest degree in relation to death and dead bodies, to the return of the dead, and to spirits and ghosts. As we have seen some languages in use to-day can only render the German expression 'an unheimlich house' by 'a haunted house'. We might indeed have begun our investigation with this example, perhaps the most striking of all, of something uncanny, but we refrained from doing so because the uncanny in it is too much intermixed with what is purely gruesome and is in part overlaid by it. There is scarcely any other matter, however, upon which our thoughts and feelings have changed so little since the very earliest times, and in which discarded forms have been so completely preserved under a thin disguise, as our relation to death. Two things account for our conservatism: the strength of our original emotional reaction to death and the insufficiency of our scientific knowledge about it. Biology has not yet been able to decide whether death is the inevitable fate of every living being or whether it is only a regular but yet perhaps avoidable event in life. It is true that the statement 'All men are mortal' is paraded in text-books of logic as an example of a general proposition; but no human being really grasps it, and our unconscious has as little use now as it ever had for the idea of its own mortality. Religions continue to dispute the importance of the undeniable fact of individual death and to postulate a life after death; civil governments still believe that they cannot maintain moral order among the living if they do not uphold the prospect of a better life hereafter as a recompense for mundane existence. In our great cities, placards announce lectures that undertake to tell us how to get into touch with the souls of the departed; and it cannot be denied that not a few of the most able and penetrating minds among our men of science have come to the conclusion, especially towards the close of their own lives, that a contact of this kind is not impossible. Since almost all of us still think as savages do on this topic, it is no matter for surprise that the primitive fear of the dead is still so strong within us and always ready to come to the surface on any provocation. Most likely our fear still implies the old belief that the dead man becomes the enemy of his survivor and seeks to carry him off to share his new life with him. Considering our unchanged attitude towards death, we might rather enquire what has become of the repression, which is the necessary condition of a primitive feeling recurring in the shape of something uncanny. But repression is there, too. All supposedly educated people have ceased to believe officially that the dead can become visible as spirits, and have made any such appearances dependent on improbable and remote conditions; their emotional attitude towards their dead, moreover, once a highly ambiguous and ambivalent one, has been toned down in the higher strata of the mind into an unambiguous feeling of piety.

[1919h, 3692]
And thus a store of ideas is created, born from man's need to make his helplessness tolerable and built up from the material of memories of the helplessness of his own childhood and the childhood of the human race. It can clearly be seen that the possession of these ideas protects him in two directions - against the dangers of nature and Fate, and against the injuries that threaten him from human society itself. Here is the gist of the matter. Life in this world serves a higher purpose; no doubt it is not easy to guess what that purpose is, but it certainly signifies a perfecting of man's nature. It is probably the spiritual part of man, the soul, which in the course of time has so slowly and unwillingly detached itself from the body, that is the object of this elevation and exaltation. Everything that happens in this world is an expression of the intentions of an intelligence superior to us, which in the end, though its ways and byways are difficult to follow, orders everything for the best - that is, to make it enjoyable for us. Over each one of us there watches a benevolent Providence which is only seemingly stern and which will not suffer us to become a plaything of the overmighty and pitiless forces of nature. Death itself is not extinction, is not a return to inorganic lifelessness, but the beginning of a new kind of existence which lies on the path of development to something higher. And, looking in the other direction, this view announces that the same moral laws which our civilizations have set up govern the whole universe as well, except that they are maintained by a supreme court of justice with incomparably more power and consistency. In the end all good is rewarded and all evil punished, if not actually in this form of life then in the later existences that begin after death. In this way all the terrors, the sufferings and the hardships of life are destined to be obliterated. Life after death, which continues life on earth just as the invisible part of the spectrum joins on to the visible part, brings us all the perfection that we may perhaps have missed here. And the superior wisdom which directs this course of things, the infinite goodness that expresses itself in it, the justice that achieves its aim in it - these are the attributes of the divine beings who also created us and the world as a whole, or rather, of the one divine being into which, in our civilization, all the gods of antiquity have been condensed. The people which first succeeded in thus concentrating the divine attributes was not a little proud of the advance. It had laid open to view the father who had all along been hidden behind every divine figure as its nucleus. Fundamentally this was a return to the historical beginnings of the idea of God. Now that God was a single person, man's relations to him could recover the intimacy and intensity of the child's relation to his father. But if one had done so much for one's father, one wanted to have a reward, or at least to be his only beloved child, his Chosen People. Very much later, pious America laid claim to being 'God's own Country'; and, as regards one of the shapes in which men worship the deity, the claim is undoubtedly valid. [1927c, 4431]

I think we have prepared the way sufficiently for an answer to both these questions. It will be found if we turn our attention to the psychical origin of religious ideas. These, which are given out as teachings, are not precipitates of experience or end-results of thinking: they are illusions, fulfilments of the oldest, strongest and most urgent wishes of mankind. The secret of their strength lies in the strength of those wishes. As we already know, the terrifying impression of helplessness in childhood arouses the need for protection - for protection through love which was provided by the father; and the recognition that this helplessness lasts throughout life made it necessary to cling to the existence of a father, but this time a more powerful one. Thus the benevolent rule of a divine Providence allays our fear of the dangers of life; the establishment of a moral world-order ensures the fulfilment of the demands of justice, which have so often remained unfulfilled in human civilization; and the prolongation of earthly existence in a future life provides the local and temporal framework in which these wish-fulfilments shall take place. Answers to the riddles that tempt the curiosity of man, such as how the universe began or what the relation is between body and mind, are developed in conformity with the underlying assumptions of this system. It is an enormous relief to the individual psyche if the conflicts of its childhood arising from the father-complex - conflicts which it has never wholly overcome - are removed from it and brought to a solution which is universally accepted. [1927c, 4441]
When I say that these things are all illusions, I must define the meaning of the word. An illusion is not the same thing as an error; nor is it necessarily an error. Aristotle's belief that vermin are developed out of dung (a belief to which ignorant people still cling) was an error; so was the belief of a former generation of doctors that tabes dorsalis is the result of sexual excess. It would be incorrect to call these errors illusions. On the other hand, it was an illusion of Columbus's that he had discovered a new sea-route to the Indies. The part played by his wish in this error is very clear. One may describe as an illusion the assertion made by certain nationalists that the Indo-Germanic race is the only one capable of civilization; or the belief, which was only destroyed by psycho-analysis, that children are creatures without sexuality. What is characteristic of illusions is that they are derived from human wishes. In this respect they come near to psychiatric delusions. But they differ from them, too, apart from the more complicated structure of delusions. In the case of delusions, we emphasize as essential their being in contradiction with reality. Illusions need not necessarily be false - that is to say, unrealizable or in contradiction to reality. For instance, a middle-class girl may have the illusion that a prince will come and marry her. This is possible; and a few such cases have occurred. That the Messiah will come and found a golden age is much less likely. Whether one classifies this belief as an illusion or as something analogous to a delusion will depend on one's personal attitude. Examples of illusions which have proved true are not easy to find, but the illusion of the alchemists that all metals can be turned into gold might be one of them. The wish to have a great deal of gold, as much gold as possible, has, it is true, been a good deal damped by our present-day knowledge of the determinants of wealth, but chemistry no longer regards the transmutation of metals into gold as impossible. Thus we call a belief an illusion when a wish-fulfilment is a prominent factor in its motivation, and in doing so we disregard its relations to reality, just as the illusion itself sets no store by verification.

To assess the truth-value of religious doctrines does not lie within the scope of the present enquiry. It is enough for us that we have recognized them as being, in their psychological nature, illusions. But we do not have to conceal the fact that this discovery also strongly influences our attitude to the question which must appear to many to be the most important of all. We know approximately at what periods and by what kind of men religious doctrines were created. If in addition we discover the motives which led to this, our attitude to the problem of religion will undergo a marked displacement. We shall tell ourselves that it would be very nice if there were a God who created the world and was a benevolent Providence, and if there were a moral order in the universe and an after-life; but it is a very striking fact that all this is exactly as we are bound to wish it to be. And it would be more remarkable still if our wretched, ignorant and downtrodden ancestors had succeeded in solving all these difficult riddles of the universe.
'Archaeological interests are no doubt most praiseworthy, but no one undertakes an excavation if by doing so he is going to undermine the habitations of the living so that they collapse and bury people under their ruins. The doctrines of religion are not a subject one can quibble about like any other. Our civilization is built up on them, and the maintenance of human society is based on the majority of men's believing in the truth of those doctrines. If men are taught that there is no almighty and all-just God, no divine world-order and no future life, they will feel exempt from all obligation to obey the precepts of civilization. Everyone will, without inhibition or fear, follow his asocial, egoistic instincts and seek to exercise his power; Chaos, which we have banished through many thousands of years of the work of civilization, will come again. Even if we knew, and could prove, that religion was not in possession of the truth, we ought to conceal the fact and behave in the way prescribed by the philosophy of "As if" - and this in the interest of the preservation of us all. And apart from the danger of the undertaking, it would be a purposeless cruelty. Countless people find their one consolation in religious doctrines, and can only bear life with their help. You would rob them of their support, without having anything better to give them in exchange. It is admitted that so far science has not achieved much, but even if it had advanced much further it would not suffice for man. Man has imperative needs of another sort, which can never be satisfied by cold science; and it is very strange - indeed, it is the height of inconsistency - that a psychologist who has always insisted on what a minor part is played in human affairs by the intelligence as compared with the life of the instincts - that such a psychologist should now try to rob mankind of a precious wish-fulfilment and should propose to compensate them for it with intellectual nourishment.'

[1927c, 4443]

The one person this publication may injure is myself. I shall have to listen to the most disagreeable reproaches for my shallowness, narrow-mindedness and lack of idealism or of understanding for the highest interests of mankind. But on the one hand, such remonstrances are not new to me; and on the other, if a man has already learnt in his youth to rise superior to the disapproval of his contemporaries, what can it matter to him in his old age when he is certain soon to be beyond the reach of all favour or disfavour? In former times it was different. Then utterances such as mine brought with them a sure curtailment of one's earthly existence and an effective speeding-up of the opportunity for gaining a personal experience of the after-life. But, I repeat, those times are past and to-day writings such as this bring no more danger to their author than to their readers. The most that can happen is that the translation and distribution of his book will be forbidden in one country or another - and precisely, of course, in a country that is convinced of the high standard of its culture. But if one puts in any plea at all for the renunciation of wishes and for acquiescence in Fate, one must be able to tolerate this kind of injury too.

[1927c, 4445]
Civilization has little to fear from educated people and brain-workers. In them the replacement of religious motives for civilized behaviour by other, secular motives would proceed unobtrusively; moreover, such people are to a large extent themselves vehicles of civilization. But it is another matter with the great mass of the uneducated and oppressed, who have every reason for being enemies of civilization. So long as they do not discover that people no longer believe in God, all is well. But they will discover it, infallibly, even if this piece of writing of mine is not published. And they are ready to accept the results of scientific thinking, but without the change having taken place in them which scientific thinking brings about in people. Is there not a danger here that the hostility of these masses to civilization will throw itself against the weak spot that they have found in their task-mistress? If the sole reason why you must not kill your neighbour is because God has forbidden it and will severely punish you for it in this or the next life then, when you learn that there is no God and that you need not fear His punishment, you will certainly kill your neighbour without hesitation, and you can only be prevented from doing so by mundane force. Thus either these dangerous masses must be held down most severely and kept most carefully away from any chance of intellectual awakening, or else the relationship between civilization and religion must undergo a fundamental revision.

[1927c, 4448]

And there are two points that I must dwell on a little longer. Firstly, the weakness of my position does not imply any strengthening of yours. I think you are defending a lost cause. We may insist as often as we like that man's intellect is powerless in comparison with his instinctual life, and we may be right in this. Nevertheless, there is something peculiar about this weakness. The voice of the intellect is a soft one, but it does not rest till it has gained a hearing. Finally, after a countless succession of rebuffs, it succeeds. This is one of the few points on which one may be optimistic about the future of mankind, but it is in itself a point of no small importance. And from it one can derive yet other hopes. The primacy of the intellect lies, it is true, in a distant, distant future, but probably not in an infinitely distant one. It will presumably set itself the same aims as those whose realization you expect from your God (of course within human limits - so far as external reality, Αναγχη, allows it), namely the love of man and the decrease of suffering. This being so, we may tell ourselves that our antagonism is only a temporary one and not irreconcilable. We desire the same things, but you are more impatient, more exacting, and - why should I not say it? - more self-seeking than I and those on my side. You would have the state of bliss begin directly after death; you expect the impossible from it and you will not surrender the claims of the individual. Our God, Λσγοξ,¹ will fulfil whichever of these wishes nature outside us allows, but he will do it very gradually, only in the unforeseeable future, and for a new generation of men. He promises no compensation for us, who suffer grievously from life. On the way to this distant goal your religious doctrines will have to be discarded, no matter whether the first attempts fail, or whether the first substitutes prove to be untenable. You know why: in the long run nothing can withstand reason and experience, and the contradiction which religion offers to both is all too palpable. Even purified religious ideas cannot escape this fate, so long as they try to preserve anything of the consolation of religion. No doubt if they confine themselves to a belief in a higher spiritual being, whose qualities are indefinable and whose purposes cannot be discerned, they will be proof against the challenge of science; but then they will also lose their hold on human interest.

[1927c, 4460]
In my *Future of an Illusion* I was concerned much less with the deepest sources of the religious feeling than with what the common man understands by his religion - with the system of doctrines and promises which on the one hand explains to him the riddles of this world with enviable completeness, and, on the other, assures him that a careful Providence will watch over his life and will compensate him in a future existence for any frustrations he suffers here. The common man cannot imagine this Providence otherwise than in the figure of an enormously exalted father. Only such a being can understand the needs of the children of men and be softened by their prayers and placated by the signs of their remorse. The whole thing is so patently infantile, so foreign to reality, that to anyone with a friendly attitude to humanity it is painful to think that the great majority of mortals will never be able to rise above this view of life. It is still more humiliating to discover how large a number of people living to-day, who cannot but see that this religion is not tenable, nevertheless try to defend it piece by piece in a series of pitiful rearguard actions. One would like to mix among the ranks of the believers in order to meet these philosophers, who think they can rescue the God of religion by replacing him by an impersonal, shadowy and abstract principle, and to address them with the warning words: 'Thou shalt not take the name of the Lord thy God in Vain!' And if some of the great men of the past acted in the same way, no appeal can be made to their example: we know why they were obliged to.

[1930a, 4473]
The cultural super-ego has developed its ideals and set up its demands. Among the latter, those which deal with the relations of human beings to one another are comprised under the heading of ethics. People have at all times set the greatest value on ethics, as though they expected that it in particular would produce especially important results. And it does in fact deal with a subject which can easily be recognized as the sorest spot in every civilization. Ethics is thus to be regarded as a therapeutic attempt - as an endeavour to achieve, by means of a command of the super-ego, something which has so far not been achieved by means of any other cultural activities. As we already know, the problem before us is how to get rid of the greatest hindrance to civilization - namely, the constitutional inclination of human beings to be aggressive towards one another; and for that very reason we are especially interested in what is probably the most recent of the cultural commands of the super-ego, the commandment to love one's neighbour as oneself. In our research into, and therapy of, a neurosis, we are led to make two reproaches against the super-ego of the individual. In the severity of its commands and prohibitions it troubles itself too little about the happiness of the ego, in that it takes insufficient account of the resistances against obeying them - of the instinctual strength of the id, and of the difficulties presented by the real external environment. Consequently we are very often obliged, for therapeutic purposes, to oppose the super-ego, and we endeavour to lower its demands. Exactly the same objections can be made against the ethical demands of the cultural super-ego. It, too, does not trouble itself enough about the facts of the mental constitution of human beings. It issues a command and does not ask whether it is possible for people to obey it. On the contrary, it assumes that a man's ego is psychologically capable of anything that is required of it, that his ego has unlimited mastery over his id. This is a mistake; and even in what are known as normal people the id cannot be controlled beyond certain limits. If more is demanded of a man, a revolt will be produced in him or a neurosis, or he will be made unhappy. The commandment, 'Love thy neighbour as thyself', is the strongest defence against human aggressiveness and an excellent example of the unpsychological proceedings of the cultural super-ego. The commandment is impossible to fulfil; such an enormous inflation of love can only lower its value, not get rid of the difficulty. Civilization pays no attention to all this; it merely admonishes us that the harder it is to obey the precept the more meritorious it is to do so. But anyone who follows such a precept in present-day civilization only puts himself at a disadvantage vis-à-vis the person who disregards it. What a potent obstacle to civilization aggressiveness must be, if the defence against it can cause as much unhappiness as aggressiveness itself! 'Natural' ethics, as it is called, has nothing to offer here except the narcissistic satisfaction of being able to think oneself better than others. At this point the ethics based on religion introduces its promises of a better after-life. But so long as virtue is not rewarded here on earth, ethics will, I fancy, preach in vain. I too think it quite certain that a real change in the relations of human beings to possessions would be of more help in this direction than any ethical commands; but the recognition of this fact among socialists has been obscured and made useless for practical purposes by a fresh idealistic misconception of human nature. [1930a, 4530]
A more transparent case is offered, once more, by the Jewish jokes, which, as I have already mentioned (p. 1705), are ordinarily made by Jews themselves, while the anecdotes about them from other sources scarcely ever rise above the level of comic stories or of brutal derision. What determines their participating in the jokes themselves seems to be the same as in the case of Heine's 'famillionairely' joke; and its significance seems to lie in the fact that the person concerned finds criticism or aggressiveness difficult so long as they are direct, and possible only along circuitous paths.

[1905c, 1730]

¹ I cannot interrupt the discussion so far as to demonstrate the typical character of the unconscious train of thought which I think there is here reason for attributing to little Hans. The castration complex is the deepest unconscious root of anti-semitism; for even in the nursery little boys hear that a Jew has something cut off his penis - a piece of his penis, they think - and this gives them a right to despise Jews. And there is no stronger unconscious root for the sense of superiority over women. Weininger (the young philosopher who, highly gifted but sexually deranged, committed suicide after producing his remarkable book, Geschlecht und Charakter), in a chapter that attracted much attention, treated Jews and women with equal hostility and overwhelmed them with the same insults. Being a neurotic, Weininger was completely under the sway of his infantile complexes; and from that standpoint what is common to Jews and women is their relation to the castration complex.

[1909b, 2026]

² [Footnote added 1919:] The conclusion strikes me as inescapable that here we may also trace one of the roots of the anti-semitism which appears with such elemental force and finds such irrational expression among the nations of the West. Circumcision is unconsciously equated with castration. If we venture to carry our conjectures back to the primaeval days of the human race we can surmise that originally circumcision must have been a milder substitute, designed to take the place of castration.

[1910c, 2270]
When I speak of disillusionment, everyone will know at once what I mean. One need not be a sentimentalist; one may perceive the biological and psychological necessity for suffering in the economy of human life, and yet condemn war both in its means and ends and long for the cessation of all wars. We have told ourselves, no doubt, that wars can never cease so long as nations live under such widely differing conditions, so long as the value of individual life is so variously assessed among them, and so long as the animosities which divide them represent such powerful motive forces in the mind. We were prepared to find that wars between the primitive and the civilized peoples, between the races who are divided by the colour of their skin - wars, even, against and among the nationalities of Europe whose civilization is little developed or has been lost - would occupy mankind for some time to come. But we permitted ourselves to have other hopes. We had expected the great world-dominating nations of white race upon whom the leadership of the human species has fallen, who were known to have world-wide interests as their concern, to whose creative powers were due not only our technical advances towards the control of nature but the artistic and scientific standards of civilization - we had expected these peoples to succeed in discovering another way of settling misunderstandings and conflicts of interest. Within each of these nations high norms of moral conduct were laid down for the individual, to which his manner of life was bound to conform if he desired to take part in a civilized community. These ordinances, often too stringent, demanded a great deal of him - much self-restraint, much renunciation of instinctual satisfaction. He was above all forbidden to make use of the immense advantages to be gained by the practice of lying and deception in the competition with his fellow-men. The civilized states regarded these moral standards as the basis of their existence. They took serious steps if anyone ventured to tamper with them, and often declared it improper even to subject them to examination by a critical intelligence. It was to be assumed, therefore, that the state itself would respect them, and would not think of undertaking anything against them which would contradict the basis of its own existence. Observation showed, to be sure, that embedded in these civilized states there were remnants of certain other peoples, which were universally unpopular and had therefore been only reluctantly, and even so not fully, admitted to participation in the common work of civilization, for which they had shown themselves suitable enough. But the great nations themselves, it might have been supposed, would have acquired so much comprehension of what they had in common, and so much tolerance for their differences, that 'foreigner' and 'enemy' could no longer be merged, as they still were in classical antiquity, into a single concept.

[1915b, 3068]

For reasons which will be easily understood I cannot communicate very much about these or other case histories. Nor do I propose to go into the obvious analogy between deformities of character resulting from protracted sickliness in childhood and the behaviour of whole nations whose past history has been full of suffering. Instead, however, I will take the opportunity of pointing to a figure created by the greatest of poets - a figure in whose character the claim to be an exception is closely bound up with and is motivated by the circumstance of congenital disadvantage.

[1916d, 3101]
The evidence of psycho-analysis shows that almost every intimate emotional relation between two people which lasts for some time - marriage, friendship, the relations between parents and children⁵ - contains a sediment of feelings of aversion and hostility, which only escapes perception as a result of repression. This is less disguised in the common wrangles between business partners or in the grumbles of a subordinate at his superior. The same thing happens when men come together in larger units. Every time two families become connected by a marriage, each of them thinks itself superior to or of better birth than the other. Of two neighbouring towns each is the other’s most jealous rival; every little canton looks down upon the others with contempt. Closely related races keep one another at arm’s length; the South German cannot endure the North German, the Englishman casts every kind of aspersion upon the Scot, the Spaniard despises the Portuguese. We are no longer astonished that greater differences should lead to an almost insuperable repugnance, such as the Gallic people feel for the German, the Aryan for the Semite, and the white races for the coloured.

[1921c, 3794]

Finally, with all reserve, the question may be raised whether the personality of the present writer as a Jew who has never sought to disguise the fact that he is a Jew may not have had a share in provoking the antipathy of his environment to psycho-analysis. An argument of this kind is not often uttered aloud. But we have unfortunately grown so suspicious that we cannot avoid thinking that this factor may not have not been quite without its effect. Nor is it perhaps entirely a matter of chance that the first advocate of psycho-analysis was a Jew. To profess belief in this new theory called for a certain degree of readiness to accept a situation of solitary opposition - a situation with which no one is more familiar than a Jew.
[1925e, 4130]

Historians have told us that our small nation withstood the destruction of its independence as a State only because it began to transfer in its estimation of values the highest rank to its spiritual possessions, to its religion and its literature.
[1925c, 4181]

We are now living in a time when this people has a prospect of again winning the land of its fathers with the help of a Power that dominates the world, and it celebrates the occasion by the foundation of a University in its ancient capital city.
[1925c, 4181]

A University is a place in which knowledge is taught above all differences of religions and of nations, where investigation is carried on, which is to show mankind how far they understand the world around them and how far they can control it.
[1925c, 4181]

Such an undertaking is a noble witness to the development to which our people has forced its way in two thousand years of unhappy fortune.
[1925c, 4181]
I was born on May 6th, 1856, at Freiberg in Moravia, a small town in what is now Czechoslovakia. My parents were Jews, and I have remained a Jew myself. I have reason to believe that my father's family were settled for a long time on the Rhine (at Cologne), that, as a result of a persecution of the Jews during the fourteenth or fifteenth century, they fled eastwards, and that, in the course of the nineteenth century, they migrated back from Lithuania through Galicia into German Austria. When I was a child of four I came to Vienna, and I went through the whole of my education there. At the 'Gymnasium' I was at the top of my class for seven years; I enjoyed special privileges there, and had scarcely ever to be examined in class. Although we lived in very limited circumstances, my father insisted that, in my choice of a profession, I should follow my own inclinations alone. Neither at that time, nor indeed in my later life, did I feel any particular predilection for the career of a doctor. I was moved, rather, by a sort of curiosity, which was, however, directed more towards human concerns than towards natural objects; nor had I grasped the importance of observation as one of the best means of gratifying it. My deep engrossment in the Bible story (almost as soon as I had learnt the art of reading) had, as I recognized much later, an enduring effect upon the direction of my interest. Under the powerful influence of a school friendship with a boy rather my senior who grew up to be a well-known politician, I developed a wish to study law like him and to engage in social activities. At the same time, the theories of Darwin, which were then of topical interest, strongly attracted me, for they held out hopes of an extraordinary advance in our understanding of the world; and it was hearing Goethe's beautiful essay on Nature read aloud at a popular lecture by Professor Carl Brühl just before I left school that decided me to become a medical student.

[1925d, 4186]

When, in 1873, I first joined the University, I experienced some appreciable disappointments. Above all, I found that I was expected to feel myself inferior and an alien because I was a Jew. I refused absolutely to do the first of these things. I have never been able to see why I should feel ashamed of my descent or, as people were beginning to say, of my 'race'. I put up, without much regret, with my non-acceptance into the community; for it seemed to me that in spite of this exclusion an active fellow-worker could not fail to find some nook or cranny in the framework of humanity. These first impressions at the University, however, had one consequence which was afterwards to prove important; for at an early age I was made familiar with the fate of being in the Opposition and of being put under the ban of the 'compact majority'. The foundations were thus laid for a certain degree of independence of judgement.

[1925d, 4187]
It is clearly not easy for men to give up the satisfaction of this inclination to aggression. They do not feel comfortable without it. The advantage which a comparatively small cultural group offers of allowing this instinct an outlet in the form of hostility against intruders is not to be despised. It is always possible to bind together a considerable number of people in love, so long as there are other people left over to receive the manifestations of their aggressiveness. I once discussed the phenomenon that it is precisely communities with adjoining territories, and related to each other in other ways as well, who are engaged in constant feuds and in ridiculing each other - like the Spaniards and Portuguese, for instance, the North Germans and South Germans, the English and Scotch, and so on. I gave this phenomenon the name of 'the narcissism of minor differences', a name which does not do much to explain it. We can now see that it is a convenient and relatively harmless satisfaction of the inclination to aggression, by means of which cohesion between the members of the community is made easier. In this respect the Jewish people, scattered everywhere, have rendered most useful services to the civilizations of the countries that have been their hosts; but unfortunately all the massacres of the Jews in the Middle Ages did not suffice to make that period more peaceful and secure for their Christian fellows. When once the Apostle Paul had posited universal love between men as the foundation of his Christian community, extreme intolerance on the part of Christendom towards those who remained outside it became the inevitable consequence. To the Romans, who had not founded their communal life as a State upon love, religious intolerance was something foreign, although with them religion was a concern of the State and the State was permeated by religion. Neither was it an unaccountable chance that the dream of a Germanic world-dominion called for anti-Semitism as its complement; and it is intelligible that the attempt to establish a new, communist civilization in Russia should find its psychological support in the persecution of the bourgeois. One only wonders, with concern, what the Soviets will do after they have wiped out their bourgeois.

The assumption of the existence of an instinct of death or destruction has met with resistance even in analytic circles; I am aware that there is a frequent inclination rather to ascribe whatever is dangerous and hostile in love to an original bipolarity in its own nature. To begin with it was only tentatively that I put forward the views I have developed here, but in the course of time they have gained such a hold upon me that I can no longer think in any other way. To my mind, they are far more serviceable from a theoretical standpoint than any other possible ones; they provide that simplification, without either ignoring or doing violence to the facts, for which we strive in scientific work. I know that in sadism and masochism we have always seen before us manifestations of the destructive instinct (directed outwards and inwards), strongly alloyed with erotism; but I can no longer understand how we can have overlooked the ubiquity of non-erotic aggressivity and destructiveness and can have failed to give it its due place in our interpretation of life. (The desire for destruction when it is directed inwards mostly eludes our perception, of course, unless it is tinged with erotism.) I remember my own defensive attitude when the idea of an instinct of destruction first emerged in psycho-analytic literature, and how long it took before I became receptive to it. That others should have shown, and still show, the same attitude of rejection surprises me less. For 'little children do not like it' when there is talk of the inborn human inclination to 'badness', to aggressiveness and destructiveness, and so to cruelty as well. God has made them in the image of His own perfection; nobody wants to be reminded how hard it is to reconcile the undeniable existence of evil - despite the protestations of Christian Science - with His all-powerfulness or His all-goodness. The Devil would be the best way out as an excuse for God; in that way he would be playing the same part as an agent of economic discharge as the Jew does in the world of the Aryan ideal. But even so, one can hold God responsible for the existence of the Devil just as well as for the existence of the wickedness which the Devil embodies. In view of these difficulties, each of us will be well advised, on some suitable occasion, to make a low bow to the deeply moral nature of mankind; it will help us to be generally popular and much will be forgiven us for it.¹

¹[1930a, 4510]
No other portion of the history of religion has become so clear to us as the introduction of monotheism into Judaism and its continuation in Christianity - if we leave on one side the development which we can trace no less uninterruptedly, from the animal totem to the human god with his regular companions. (Each of the four Christian evangelists still has his own favourite animal.) If we provisionally accept the world-empire of the Pharaohs as the determining cause of the emergence of the monotheist idea, we see that that idea, released from its native soil and transferred to another people was, after a long period of latency, taken hold of by them, preserved by them as a precious possession and, in turn, itself kept them alive by giving them pride in being a chosen people: it was the religion of their primal father to which were attached their hope of reward, of distinction and finally of world-dominion. This last wishful phantasy, long abandoned by the Jewish people, still survives among that people's enemies in a belief in a conspiracy by the 'Elders of Zion'. We reserve for discussion in later pages how the special peculiarities of the monotheist religion borrowed from Egypt affected the Jewish people and how it was bound to leave a permanent imprint on their character through its rejection of magic and mysticism, its invitation to advances in intellectuality and its encouragement of sublimations; how the people, enraptured by the possession of the truth, overwhelmed by the consciousness of being chosen, came to have a high opinion of what is intellectual and to lay stress on what is moral; and how their melancholy destinies and their disappointments in reality served only to intensify all these trends. For the moment we will follow their development in another direction.

The poor Jewish people, who with their habitual stubbornness continued to disavow the father's murder, atoned heavily for it in the course of time. They were constantly met with the reproach 'You killed our God!' And this reproach is true, if it is correctly translated. If it is brought into relation with the history of religions, it runs: 'You will not admit that you murdered God (the primal picture of God, the primal father, and his later reincarnations).' There should be an addition declaring: 'We did the same thing, to be sure, but we have admitted it and since then we have been absolved.' Not all the reproaches with which anti-semitism persecutes the descendants of the Jewish people can appeal to a similar justification. A phenomenon of such intensity and permanence as the people's hatred of the Jews must of course have more than one ground. It is possible to find a whole number of grounds, some of them clearly derived from reality, which call for no interpretation, and others, lying deeper and derived from hidden sources, which might be regarded as the specific reasons. Of the former, the reproach of being aliens is perhaps the weakest, since in many places dominated by anti-semitism to-day the Jews were among the oldest portions of the population or had even been there before the present inhabitants. This applies, for instance, to the city of Cologne, to which the Jews came with the Romans, before it was occupied by the Germans. Other grounds for hating the Jews are stronger - thus, the circumstances that they live for the most part as minorities among other peoples, for the communal feeling of groups requires, in order to complete it, hostility towards some extraneous minority, and the numerical weakness of this excluded minority encourages its suppression. There are, however, two other characteristics of the Jews which are quite unforgivable. First is the fact that in some respects they are different from their 'host' nations. They are not fundamentally different, for they are not Asiatics of a foreign race, as their enemies maintain, but composed for the most part of remnants of the Mediterranean peoples and heirs of the Mediterranean civilization. But they are none the less different, often in an indefinable way different, especially from the Nordic peoples, and the intolerance of groups is often, strangely enough, exhibited more strongly against small differences than against fundamental ones. The other point has a still greater effect: namely, that they defy all oppression, that the most cruel persecutions have not succeeded in exterminating them, and, indeed, that on the contrary they show a capacity for holding their own in commercial life and, where they are admitted, for making valuable contributions to every form of cultural activity.
The deeper motives for hatred of the Jews are rooted in the remotest past ages; they operate from the unconscious of the peoples, and I am prepared to find that at first they will not seem credible. I venture to assert that jealousy of the people which declared itself the first-born, favourite child of God the Father, has not yet been surmounted among other peoples even today: it is as though they had thought there was truth in the claim. Further, among the customs by which the Jews made themselves separate, that of circumcision has made a disagreeable, uncanny impression, which is to be explained, no doubt, by its recalling the dreaded castration and along with it a portion of the primeval past which is gladly forgotten. And finally, as the latest motive in this series, we must not forget that all those peoples who excel to-day in their hatred of Jews became Christians only in late historic times, often driven to it by bloody coercion. It might be said that they are all 'mis-baptized'. They have been left, under a thin veneer of Christianity, what their ancestors were, who worshipped a barbarous polytheism. They have not got over a grudge against the new religion which was imposed on them; but they have displaced the grudge on to the source from which Christianity reached them. The fact that the Gospels tell a story which is set among Jews, and in fact deals only with Jews, has made this displacement easy for them. Their hatred of Jews is at bottom a hatred of Christians, and we need not be surprised that in the German National-Socialist revolution this intimate relation between the two monotheist religions finds such a clear expression in the hostile treatment of both of them.

If we are clear in our mind that a procedure like ours of accepting what seems to us serviceable in the material presented to us and of rejecting what does not suit us and of putting the different pieces together in accordance with psychological probability - if we are clear that a technique of this kind can give no certainty that we shall arrive at the truth, then it may justly be asked why we are undertaking this work at all. The answer is an appeal to the work's outcome. If we greatly tone down the strictness of the requirements made upon a historico-psychological investigation, it will perhaps be possible to throw light on problems which have always seemed to deserve attention and which recent events have forced upon our observation anew. As we know, of all the peoples who lived round the basin of the Mediterranean in antiquity, the Jewish people is almost the only one which still exists in name and also in substance. It has met misfortunes and ill-treatment with an unexampled capacity for resistance; it has developed special character-traits and incidentally has earned the hearty dislike of every other people. We should be glad to understand more of the source of this viability of the Jews and of how their characteristics are connected with their history.

We may start from a character-trait of the Jews which dominates their relation to others. There is no doubt that they have a particularly high opinion of themselves, that they regard themselves as more distinguished, of higher standing, as superior to other peoples - from whom they are also distinguished by many of their customs.¹ At the same time they are inspired by a peculiar confidence in life, such as is derived from the secret ownership of some precious possession, a kind of optimism: pious people would call it trust in God.

¹ The aspersion, so common in antiquity, that the Jews were 'lepers' (cf. Manetho) no doubt has the sense of a projection: 'they keep as much apart from us as though we were lepers.'
We know the reason for this behaviour and what their secret treasure is. They really regard themselves as God's chosen people, they believe that they stand especially close to him; and this makes them proud and confident. Trustworthy reports tell us that they behaved in Hellenistic times just as they do to-day, so that the complete Jew was already there; and the Greeks, among whom and alongside of whom they lived, reacted to the Jewish characteristics in the same way as their 'hosts' do to-day. It might be thought that they reacted as though they too believed in the superiority which the people of Israel claimed for themselves. If one is the declared favourite of the dreaded father, one need not be surprised at the jealousy of one's brothers and sisters, and the Jewish legend of Joseph and his brethren shows very well where this jealousy can lead. The course of world-history seemed to justify the presumption of the Jews, since, when later on it pleased God to send mankind a Messiah and redeemer, he once again chose him from the Jewish people. The other peoples might have had occasion then to say to themselves: 'Indeed, they were right, they are God's chosen people.' But instead of this, what happened was that redemption by Jesus Christ only intensified their hatred of the Jews, while the Jews themselves gained no advantage from this second act of favouritism, since they did not recognize the redeemer.

On the basis of our earlier discussions, we may now assert that it was the man Moses who imprinted this trait - significant for all time - upon the Jewish people. He raised their self-esteem by assuring them that they were God's chosen people, he enjoined them to holiness and pledged them to be apart from others. Not that other peoples were lacking in self-esteem. Just as to-day, so in those days each nation thought itself better than any other. But the self-esteem of the Jews was given a religious anchorage by Moses: it became a part of their religious faith. Owing to their especially intimate relation to their God they acquired a share in his grandeur. And since we know that behind the God who had chosen the Jews and freed them from Egypt stands the figure of Moses, who had done precisely that, ostensibly at God's command, we venture to declare that it was this one man Moses who created the Jews. It is to him that this people owes its tenacity of life but also much of the hostility it has experienced and still experiences.

The pre-eminence given to intellectual labours throughout some two thousand years in the life of the Jewish people has, of course, had its effect. It has helped to check the brutality and the tendency to violence which are apt to appear where the development of muscular strength is the popular ideal. Harmony in the cultivation of intellectual and physical activity, such as was achieved by the Greek people, was denied to the Jews. In this dichotomy their decision was at least in favour of the worthier alternative.

Only a portion of the Jewish people accepted the new doctrine. Those who refused to are still called Jews to-day. Owing to this cleavage, they have become even more sharply divided from other peoples than before. They were obliged to hear the new religious community (which, besides Jews, included Egyptians, Greeks, Syrians, Romans and eventually Germans) reproach them with having murdered God. In full, this reproach would run as follows: 'They will not accept it as true that they murdered God, whereas we admit it and have been cleansed of that guilt.' It is easy therefore to see how much truth lies behind this reproach. A special enquiry would be called for to discover why it has been impossible for the Jews to join in this forward step which was implied, in spite of all its distortions, by the admission of having murdered God. In a certain sense they have in that way taken a tragic load of guilt on themselves; they have been made to pay heavy penance for it.
I came to Vienna as a child of 4 years from a small town in Moravia. After 78 years of assiduous work I had to leave my home, saw the Scientific Society I had founded, dissolved, our institutions destroyed, our Printing Press ('Verlag') taken over by the invaders, the books I had published confiscated or reduced to pulp, my children expelled from their professions. Don't you think you ought to reserve the columns of your special number for the utterances of non-Jewish people, less personally involved than myself?
[1938c, 5079]

I feel deeply affected by the passage in your letter acknowledging 'a certain growth of anti-Semitism even in this country'. Ought this present persecution not rather give rise to a wave of sympathy in this country?
[1938c, 5079]
No mention has yet been made of what is perhaps the most important item in the psychical inventory of a civilization. This consists in its religious ideas in the widest sense - in other words (which will be justified later) in its illusions.
[1927c, 4426]

The religious ideas that have been summarized above have of course passed through a long process of development and have been adhered to in various phases by various civilizations. I have singled out one such phase, which roughly corresponds to the final form taken by our present-day white Christian civilization. It is easy to see that not all the parts of this picture tally equally well with one another, that not all the questions that press for an answer receive one, and that it is difficult to dismiss the contradiction of daily experience. Nevertheless, such as they are, those ideas - ideas which are religious in the widest sense - are prized as the most precious possession of civilization, as the most precious thing it has to offer its participants. It is far more highly prized than all the devices for winning treasures from the earth or providing men with sustenance or preventing their illnesses, and so forth. People feel that life would not be tolerable if they did not attach to these ideas the value that is claimed for them. And now the question arises: what are these ideas in the light of psychology? Whence do they derive the esteem in which they are held? And, to take a further timid step, what is their real worth?
[1927c, 4432]

No feature, however, seems better to characterize civilization than its esteem and encouragement of man's higher mental activities - his intellectual, scientific and artistic achievements and the leading role that it assigns to ideas in human life. Foremost among those ideas are the religious systems, on whose complicated structure I have endeavoured to throw light elsewhere. Next come the speculations of philosophy; and finally what might be called man's 'ideals' - his ideas of a possible perfection of individuals, or of peoples or of the whole of humanity, and the demands he sets up on the basis of such ideas. The fact that these creations of his are not independent of one another, but are on the contrary closely interwoven, increases the difficulty not only of describing them but of tracing their psychological derivation. If we assume quite generally that the motive force of all human activities is a striving towards the two confluent goals of utility and a yield of pleasure, we must suppose that this is also true of the manifestations of civilization which we have been discussing here, although this is easily visible only in scientific and aesthetic activities. But it cannot be doubted that the other activities, too, correspond to strong needs in men - perhaps to needs which are only developed in a minority. Nor must we allow ourselves to be misled by judgements of value concerning any particular religion, or philosophic system, or ideal. Whether we think to find in them the highest achievements of the human spirit, or whether we deplore them as aberrations, we cannot but recognize that where they are present, and, in especial, where they are dominant, a high level of civilization is implied.
[1930a, 4491]
I have not always been a psychotherapist. Like other neuropathologists, I was trained to employ local diagnoses and electro-prognosis, and it still strikes me myself as strange that the case histories I write should read like short stories and that, as one might say, they lack the serious stamp of science. I must console myself with the reflection that the nature of the subject is evidently responsible for this, rather than any preference of my own. The fact is that local diagnosis and electrical reactions lead nowhere in the study of hysteria, whereas a detailed description of mental processes such as we are accustomed to find in the works of imaginative writers enables me, with the use of a few psychological formulas, to obtain at least some kind of insight into the course of that affection. Case histories of this kind are intended to be judged like psychiatric ones; they have, however, one advantage over the latter, namely an intimate connection between the story of the patient's sufferings and the symptoms of his illness - a connection for which we still search in vain in the biographies of other psychoses.

In response to many wishes that have reached me, I have decided to lay before my colleagues in collected form the minor works on the neuroses which I have published since 1893. They consist of fourteen short papers, mostly in the nature of preliminary communications, which have appeared in scientific proceedings or medical periodicals - three of them in French. The two last (XIII and XIV), which give a very succinct account of my present position as regards both the aetiology and the treatment of the neuroses, are taken from L. Löwefeld's well-known volumes, Die psychischen Zwangsercheinungen, 1904, and the fourth edition of Sexualleben und Nervenleiden, 1906, having been written by me at the request of their author, who is an acquaintance of mine.

(1) A girl suffered from obsessional self-reproaches. If she read something in the papers about coiners, the thought would occur to her that she, too, had made counterfeit money; if a murder had been committed by an unknown person, she would ask herself anxiously whether it was not she who had done the deed. At the same time she was perfectly conscious of the absurdity of these obsessional reproaches. For a time, this sense of guilt gained such an ascendancy over her that her powers of criticism were stifled and she accused herself to her relatives and her doctor of having really committed all these crimes. (This was an example of a psychosis through simple intensification - an 'Überwältigungspsychose'.) Close questioning then revealed the source from which her sense of guilt arose. Stimulated by a chance voluptuous sensation, she had allowed herself to be led astray by a woman friend into masturbating, and had practised it for years, fully conscious of her wrong-doing and to the accompaniment of the most violent, but, as usual, ineffective self-reproaches. An excessive indulgence after going to a ball had produced the intensification that led to the psychosis. After a few months of treatment and the strictest surveillance, the girl recovered.
I cannot say for certain what the upper age-limit is below which sexual injury plays a part in the aetiology of hysteria; but I doubt whether sexual passivity can bring on repression later than between the eighth and tenth years, unless it is enabled to do so by previous experiences. The lower limit extends as far back as memory itself - that is, therefore, to the tender age of one and a half or two years! (I have had two cases of this.) In a number of my cases the sexual trauma (or series of traumas) occurred in the third and fourth years of life. I should not lend credence to these extraordinary findings myself if their complete reliability were not proved by the development of the subsequent neurosis. In every case a number of pathological symptoms, habits and phobias are only to be accounted for by going back to these experiences in childhood, and the logical structure of the neurotic manifestations makes it impossible to reject these faithfully preserved memories which emerge from childhood life. True, it would be useless to try to elicit these childhood traumas from a hysteric by questioning him outside psycho-analysis; their traces are never present in conscious memory, only in the symptoms of the illness. [1896b, 386]

Moreover, Gentlemen, this first disappointment we meet with in following Breuer's method is immediately succeeded by another, and one that must be especially painful to us as physicians. When our procedure leads, as in the cases described above, to findings which are insufficient as an explanation both in respect to their suitability as determinants and to their traumatic effectiveness, we also fail to secure any therapeutic gain; the patient retains his symptoms unaltered, in spite of the initial result yielded by the analysis. You can understand how great the temptation is at this point to proceed no further with what is in any case a laborious piece of work. [1896c, 410]

Among these indications the reference to the possible employment of cocaine during withdrawal of morphine became of importance later. The expectation voiced at the end of the work that the property of cocaine for producing local anaesthesia would find further applications was soon afterwards fulfilled by K. Koller's experiments in anaesthetizing the cornea. [1897b, 438]

An eighteen-year-old man fell ill without fever but with general symptoms and dragging pains in his chest and legs. At first he showed symptoms of endocarditis, but later the pains increased and sensitiveness to pressure developed in the vertebral column and regionally in the skin, muscles and nerve trunks as the affection involved one extremity after the other: heightening of the reflexes, outbreaks of sweating, local wasting, and lastly diplopia, disturbances of swallowing, facial paresis, and hoarseness. Finally fever, extreme acceleration of the pulse and pulmonary affection. The diagnosis of acute multiple neuritis made during the course of the illness was confirmed by the post-mortem findings, which showed that all the spinal nerves in their sheaths were injected, greyish-red, and, as it were, bunched up. Similar changes in the cranial nerves. Endocarditis. - According to the pathologist, this was the first post-mortem finding of polyneuritis to be made in Vienna. [1897b, 440]

Since I had no access to any reference books on my journey, I had for several days to put up with this lapse of memory and with the inner torment associated with it which recurred at frequent intervals each day, until I fell in with a cultivated Italian who freed me from it by telling me the name: Signorelli. I was myself able to add the artist's first name, Luca. Soon my ultra-clear memory of the master's features, as depicted in his portrait, faded away. [1898b, 480]
In connection with the tendentious nature of our remembering and forgetting, I not long ago experienced an instructive example - instructive because of what it betrayed - of which I should like to add an account here. I was intending to pay a twenty-four-hour visit to a friend of mine who unfortunately lives very far away, and I was full of the things I was going to tell him. But before this I felt under an obligation to call on a family of my acquaintance in Vienna, one of whose members had moved to the town in question, so as to take their greetings and messages with me to the absent relative. They told me the name of the pension in which he lived, and also the name of the street and the number of the house, and, in view of my bad memory, wrote the address on a card, which I put in my wallet. The next day, when I had arrived at my friend's, I began: 'I've only one duty to carry out that may interfere with our being together; it's a call, and it shall be the first thing I do. The address is in my wallet.' To my astonishment, however, it was not to be found there. So now I had to fall back on my memory, after all. My memory for names is not particularly good, but it is incomparably better than for figures and numbers. I may have been paying medical visits at a certain house for a year on end, and yet, if I should have to be driven there by a cab driver, I should have difficulty in remembering the number of the house. But in this case I had taken special note of the house number; it was ultra-clear, as if to jeer at me - for no trace remained in my recollection of the name of the pension or the street. I had forgotten all the data in the address which might have served as a starting-point for discovering the pension; and, quite against my usual habit, I had retained the number of the house, which was useless for the purpose. In consequence, I was unable to make the call. I was consoled remarkably quickly, and I devoted myself entirely to my friend. When I was back again in Vienna and standing in front of my writing desk, I knew without a moment's hesitation where it was that, in my 'absent-mindedness', I had put the card with the address on it. In my unconscious hiding of the thing the same intention had been operative as in my curiously modified act of forgetting.

Further investigation of these indifferent childhood memories has taught me that they can originate in other ways as well and that an unsuspected wealth of meaning lies concealed behind their apparent innocence. But on this point I shall not content myself with a mere assertion but shall give a detailed report of one particular instance which seems to me the most instructive out of a considerable number of similar ones. Its value is certainly increased by the fact that it relates to someone who is not at all or only very slightly neurotic.
I have at my disposal a fair number of early memories of childhood which I can date with great certainty. For at the age of three I left the small place where I was born and moved to a large town; and all these memories of mine relate to my birth place and therefore date from my second and third years. They are mostly short scenes, but they are very well preserved and furnished with every detail of sense-perception, in complete contrast to my memories of adult years, which are entirely lacking in the visual element. From my third year onwards my recollections grow scantier and less clear; there are gaps in them which must cover more than a year; and it is not, I believe, until my sixth or seventh year that the stream of my memories becomes continuous. My memories up to the time of my leaving my first place of residence fall into three groups. The first group consists of scenes which my parents have repeatedly since described to me. As regards these, I feel uncertain whether I have had the mnemonic image from the beginning or whether I only construed it after hearing one of these descriptions. I may remark, however, that there are also events of which I have no mnemonic image in spite of their having been frequently retailed by my parents. I attach more importance to the second group. It comprises scenes which have not (so far as I know) been described to me and some of which, indeed, could not have been described to me, as I have not met the other participants in them (my nurse and playmates) since their occurrence. I shall come to the third group presently. As regards the content of these scenes and their consequent claim to being recollected, I should like to say that I am not entirely at sea. I cannot maintain, indeed, that what I have retained are memories of the most important events of the period, or what I should to-day judge to be the most important. I have no knowledge of the birth of a sister, who is two and a half years younger than I am; my departure, my first sight of the railway and the long carriage-drive before it - none of these has left a trace in my memory. On the other hand, I can remember two small occurrences during the railway-journey; these, as you will recollect, came up in the analysis of my phobia. But what should have made most impression on me was an injury to my face which caused a considerable loss of blood and for which I had to have some stitches put in by a surgeon. I can still feel the scar resulting from this accident, but I know of no recollection which points to it, either directly or indirectly. It is true that I may perhaps have been under two years old at the time.

[1899a, 492]
It follows from this that I feel no surprise at the pictures and scenes of these first two groups. No doubt they are displaced memories from which the essential element has for the most part been omitted. But in a few of them it is at least hinted at, and in others it is easy for me to complete them by following certain pointers. By doing so I can establish a sound connection between the separate fragments of memories and arrive at a clear understanding of what the childish interest was that recommended these particular occurrences to my memory. This does not apply, however, to the content of the third group, which I have not so far discussed. There I am met by material - one rather long scene and several smaller pictures - with which I can make no headway at all. The scene appears to me fairly indifferent and I cannot understand why it should have become fixed in my memory. Let me describe it to you. I see a rectangular, rather steeply sloping piece of meadow-land, green and thickly grown; in the green there are a great number of yellow flowers - evidently common dandelions. At the top end of the meadow there is a cottage and in front of the cottage door two women are standing chatting busily, a peasant-woman with a handkerchief on her head and a children's nurse. Three children are playing in the grass. One of them is myself (between the age of two and three); the two others are my boy cousin, who is a year older than me, and his sister, who is almost exactly the same age as I am. We are picking the yellow flowers and each of us is holding a bunch of flowers we have already picked. The little girl has the best bunch; and, as though by mutual agreement, we - the two boys - fall on her and snatch away her flowers. She runs up the meadow in tears and as a consolation the peasant-woman gives her a big piece of black bread. Hardly have we seen this than we throw the flowers away, hurry to the cottage and ask to be given some bread too. And we are in fact given some; the peasant-woman cuts the loaf with a long knife. In my memory the bread tastes quite delicious - and at that point the scene breaks off.

Now what is there in this occurrence to justify the expenditure of memory which it has occasioned me? I have racked my brains in vain over it. Does the emphasis lie on our disagreeable behaviour to the little girl? Did the yellow colour of the dandelions - a flower which I am, of course, far from admiring to-day - so greatly please me? Or, as a result of my careering round the grass, did the bread taste so much nicer than usual that it made an unforgettable impression on me? Nor can I find any connection between this scene and the interest which (as I was able to discover without any difficulty) bound together the other scenes from my childhood. Altogether, there seems to me something not quite right about this scene. The yellow of the flowers is a disproportionately prominent element in the situation as a whole, and the nice taste of the bread seems to me exaggerated in an almost hallucinatory fashion. I cannot help being reminded of some pictures that I once saw in a burlesque exhibition. Certain portions of these pictures, and of course the most inappropriate ones, instead of being painted, were built up in three dimensions - for instance, the ladies' bustles. Well, can you point out any way of finding an explanation or interpretation of this redundant memory of my childhood?
'I have not yet considered that point,' he replied. 'Now that you have raised the question, it seems to me almost a certainty that this childhood memory never occurred to me at all in my earlier years. But I can also recall the occasion which led to my recovering this and many other recollections of my earliest childhood. When I was seventeen and at my secondary school, I returned for the first time to my birthplace for the holidays, to stay with a family who had been our friends ever since that remote date. I know quite well what a wealth of impressions overwhelmed me at that time. But I see now that I shall have to tell you a whole big piece of my history: it belongs here, and you have brought it upon yourself by your question. So listen. I was the child of people who were originally well-to-do and who, I fancy, lived comfortably enough in that little corner of the provinces. When I was about three, the branch of industry in which my father was concerned met with a catastrophe. He lost all his means and we were forced to leave the place and move to a large town. Long and difficult years followed, of which, as it seems to me, nothing was worth remembering. I never felt really comfortable in the town. I believe now that I was never free from a longing for the beautiful woods near our home, in which (as one of my memories from those days tells me) I used to run off from my father, almost before I had learnt to walk. Those holidays, when I was seventeen, were my first holidays in the country, and, as I have said, I stayed with a family with whom we were friends and who had risen greatly in the world since our move. I could compare the comfort reigning there with our own style of living at home in the town. But it is no use evading the subject any longer: I must admit that there was something else that excited me powerfully. I was seventeen, and in the family where I was staying there was a daughter of fifteen, with whom I immediately fell in love. It was my first calf-love and sufficiently intense, but I kept it completely secret. After a few days the girl went off to her school (from which she too was home for the holidays) and it was this separation after such a short acquaintance that brought my longings to a really high pitch. I passed many hours in solitary walks through the lovely woods that I had found once more and spent my time building castles in the air. These, strangely enough, were not concerned with the future but sought to improve the past. If only the smash had not occurred! If only I had stopped at home and grown up in the country and grown as strong as the young men in the house, the brothers of my love! And then if only I had followed my father's profession and if I had finally married her - for I should have known her intimately all those years! I had not the slightest doubt, of course, that in the circumstances created by my imagination I should have loved her just as passionately as I really seemed to then. A strange thing. For when I see her now from time to time - she happens to have married someone here - she is quite exceptionally indifferent to me. Yet I can remember quite well for what a long time afterwards I was affected by the yellow colour of the dress she was wearing when we first met, whenever I saw the same colour anywhere else.'

[1899a, 494]

Then I am inclined to believe that the childhood scene we are considering emerged at this time, when you were struggling for your daily bread - provided, that is, that you can confirm my idea that it was during this same period that you first made the acquaintance of the Alps.

[1899a, 496]
There is in general no guarantee of the data produced by our memory. But I am ready to agree with you that the scene is genuine. If so, you selected it from innumerable others of a similar or another kind because, on account of its content (which in itself was indifferent) it was well adapted to represent the two phantasies, which were important enough to you. A recollection of this kind, whose value lies in the fact that it represents in the memory impressions and thoughts of a later date whose content is connected with its own by symbolic or similar links, may appropriately be called a 'screen memory'. In any case you will cease to feel any surprise that this scene should so often recur to your mind. It can no longer be regarded as an innocent one since, as we have discovered, it is calculated to illustrate the most momentous turning-points in your life, the influence of the two most powerful motive forces - hunger and love.

[1899a, 496]

And slips away into a childhood memory. You are quite right. It is precisely the coarsely sensual element in the phantasy which explains why it does not develop into a conscious phantasy but must be content to find its way allusively and under a flowery disguise into a childhood scene.

[1899a, 498]

'If that is so, I have lost all faith in the genuineness of the dandelion scene. This is how I look at it: On the two occasions in question, and with the support of very comprehensible realistic motives, the thought occurred to me: "If you had married this or that girl, your life would have become much pleasanter." The sensual current in my mind took hold of the thought which is contained in the protasis and repeated it in images of a kind capable of giving that same sensual current satisfaction. This second version of the thought remained unconscious on account of its incompatibility with the dominant sexual disposition; but this very fact of its remaining unconscious enabled it to persist in my mind long after changes in the real situation had quite got rid of the conscious version. In accordance, as you say, with a general law, the clause that had remained unconscious sought to transform itself into a childhood scene which, on account of its innocence, would be able to become conscious. With this end in view it had to undergo a fresh transformation, or rather two fresh transformations. One of these removed the objectionable element from the protasis by expressing it figuratively; the second forced the apodosis into a shape capable of visual representation - using for the purpose the intermediary ideas of "bread" and "bread-and-butter occupations". I see that by producing a phantasy like this I was providing, as it were, a fulfilment of the two suppressed wishes for deflowering a girl and for material comfort. But now that I have given such a complete account of the motives that led to my producing the dandelion phantasy, I cannot help concluding that what I am dealing with is something that never happened at all but has been unjustifiably smuggled in among my childhood memories.'

[1899a, 498]
I see that I must take up the defence of its genuineness. You are going too far. You have accepted my assertion that every suppressed phantasy of this kind tends to slip away into a childhood scene. But suppose now that this cannot occur unless there is a memory-trace the content of which offers the phantasy a point of contact - comes, as it were, half way to meet it. Once a point of contact of this kind has been found - in the present instance it was the deflowering, the taking away of the flowers - the remaining content of the phantasy is remodelled with the help of every legitimate intermediate idea - take the bread as an example - till it can find further points of contact with the content of the childhood scene. It is very possible that in the course of this process the childhood scene itself also undergoes changes; I regard it as certain that falsifications of memory may be brought about in this way too. In your case the childhood scene seems only to have had some of its lines engraved more deeply: think of the over-emphasis on the yellow and the exaggerated niceness of the bread. But the raw material was utilizable. If that had not been so, it would not have been possible for this particular memory, rather than any others, to make its way forward into consciousness. No such scene would have occurred to you as a childhood memory, or perhaps some other one would have - for you know how easily our ingenuity can build connecting bridges from any one point to any other. And apart from your own subjective feeling which I am not inclined to under-estimate, there is another thing that speaks in favour of the genuineness of your dandelion memory. It contains elements which have not been solved by what you have told me and which do not in fact fit in with the sense required by the phantasy. For instance, your boy cousin helping you to rob the little girl of her flowers - can you make any sense of the idea of being helped in deflowering someone? or of the peasant woman and the nurse in front of the cottage?

[1899a, 499]

FREUD, SIGM., Vienna. Born May 6, 1856, at Freiberg in Moravia. Studied in Vienna. Pupil of Brücke, the physiologist. Promotion, 1881. Pupil of Charcot in Paris 1885-6. Habilitation, 1885. Has worked as physician and Dozent at Vienna University since 1886. Proposed as Professor Extraordinarius, 1897. Earlier Freud produced writings on histology and cerebral anatomy and, subsequently, clinical works on neuropathology; translated writings by Charcot and Bernheim. In 1884 'Über Coca', a paper which introduced cocaine into medicine. In 1891 Zur Auffassung der Aphasien. In 1891 and 1893 monographs on the cerebral palsies of children, which culminated in 1897 in the volume on the subject in Nothnagel's Handbuch. In 1895 Studien über Hysterie (with Dr. J. Breuer). Since then Freud has turned to the study of the psychoneuroses and especially hysteria, and in a series of shorter works he has stressed the aetiological significance of sexual life for the neuroses. He has also developed a new psychotherapy of hysteria, on which only extremely little has been published. A book, Die Traumdeutung, is in the press.

[1900a, 506]
If within ten years of the publication of this book (which is very far from being an easy one to read) a second edition is called for, this is not due to the interest taken in it by the professional circles to whom my original preface was addressed. My psychiatric colleagues seem to have taken no trouble to overcome the initial bewilderment created by my new approach to dreams. The professional philosophers have become accustomed to polishing off the problems of dream-life (which they treat as a mere appendix to conscious states) in a few sentences - and usually in the same ones; and they have evidently failed to notice that we have something here from which a number of inferences can be drawn that are bound to transform our psychological theories. The attitude adopted by reviewers in the scientific periodicals could only lead one to suppose that my work was doomed to be sunk into complete silence; while the small group of gallant supporters, who practise medical psycho-analysis under my guidance and who follow my example in interpreting dreams and make use of their interpretations in treating neurotics, would never have exhausted the first edition of the book. Thus it is that I feel indebted to a wider circle of educated and curious-minded readers, whose interest has led me to take up once more after nine years this difficult, but in many respects fundamental, work.

[1900a, 509]

An equal durability and power to withstand any far-reaching alterations during the process of revision has been shown by the material of the book, consisting as it does of dreams of my own which have for the most part been overtaken or made valueless by the march of events and by which I illustrated the rules of dream-interpretation. For this book has a further subjective significance for me personally - a significance which I only grasped after I had completed it. It was, I found, a portion of my own self-analysis, my reaction to my father's death - that is to say, to the most important event, the most poignant loss, of a man's life. Having discovered that this was so, I felt unable to obliterate the traces of the experience. To my readers, however, it will be a matter of indifference upon what particular material they learn to appreciate the importance of dreams and how to interpret them.

[1900a, 509]

In 1909 G. Stanley Hall invited me to Clark University, in Worcester, to give the first lectures on psycho-analysis. In the same year Dr. Brill published the first of his translations of my writings, which were soon followed by further ones. If psycho-analysis now plays a role in American intellectual life, or if it does so in the future, a large part of this result will have to be attributed to this and other activities of Dr. Brill's.

[1900a, 515]

His first translation of *The Interpretation of Dreams* appeared in 1913. Since then much has taken place in the world, and much has been changed in our views about the neuroses. This book, with the new contribution to psychology which surprised the world when it was published (1900), remains essentially unaltered. It contains, even according to my present-day judgement, the most valuable of all the discoveries it has been my good fortune to make. Insight such as this falls to one's lot but once in a lifetime.

[1900a, 515]
My knowledge of that procedure was reached in the following manner. I have been engaged for many years (with a therapeutic aim in view) in unravelling certain psychopathological structures - hysterical phobias, obsessional ideas, and so on. I have been doing so, in fact, ever since I learnt from an important communication by Josef Breuer that as regards these structures (which are looked on as pathological symptoms) unravelling these coincides with removing them. (Cf. Breuer and Freud, 1895.) If a pathological idea of this sort can be traced back to the elements in the patient's mental life from which it originated, it simultaneously crumbles away and the patient is freed from it. Considering the impotence of our other therapeutic efforts and the puzzling nature of these disorders, I felt tempted to follow the path marked out by Breuer, in spite of every difficulty, till a complete explanation was reached. I shall have on another occasion to report at length upon the form finally taken by this procedure and the results of my labours. It was in the course of these psycho-analytic studies that I came upon dream-interpretation. My patients were pledged to communicate to me every idea or thought that occurred to them in connection with some particular subject; amongst other things they told me their dreams and so taught me that a dream can be inserted into the psychical chain that has to be traced backwards in the memory from a pathological idea. It was then only a short step to treating the dream itself as a symptom and to applying to dreams the method of interpretation that had been worked out for symptoms. [1900a, 603]
In the course of my psycho-analyses of neurotics I must already have analysed over a thousand dreams; but I do not propose to make use of this material in my present introduction to the technique and theory of dream-interpretation. Apart from the fact that such a course would be open to the objection that these are the dreams of neuropaths, from which no valid inferences could be made as to the dreams of normal people, there is quite another reason which forces this decision upon me. The subject to which these dreams of my patients lead up is always, of course, the case history which underlies their neurosis. Each dream would therefore necessitate a lengthy introduction and an investigation of the nature and aetiological determinants of the psychoneuroses. But these questions are in themselves novelties and highly bewildering and would distract attention from the problem of dreams. On the contrary, it is my intention to make use of my present elucidation of dreams as a preliminary step towards solving the more difficult problems of the psychology of the neuroses. If, however, I forego my principal material, the dreams of my neurotic patients, I must not be too particular about what is left to me. All that remains are such dreams as have been reported to me from time to time by normal persons of my acquaintance, and such others as have been quoted as instances in the literature dealing with dream-life. Unluckily, however, none of these dreams are accompanied by the analysis without which I cannot discover a dream's meaning. My procedure is not so convenient as the popular decoding method which translates any given piece of a dream's content by a fixed key. I, on the contrary, am prepared to find that the same piece of content may conceal a different meaning when it occurs in various people or in various contexts. Thus it comes about that I am led to my own dreams, which offer a copious and convenient material, derived from an approximately normal person and relating to multifarious occasions of daily life. No doubt I shall be met by doubts of the trustworthiness of 'self-analyses' of this kind; and I shall be told that they leave the door open to arbitrary conclusions. In my judgement the situation is in fact more favourable in the case of self-observation than in that of other people; at all events we may make the experiment and see how far self-analysis takes us with the interpretation of dreams. But I have other difficulties to overcome, which lie within myself. There is some natural hesitation about revealing so many intimate facts about one's mental life; nor can there be any guarantee against misinterpretation by strangers. But it must be possible to overcome such hesitations. 'Tout psychologue, writes Delboeuf, 'est obligé de faire l'aveu même de ses faiblesses s'il croit par là jeter du jour sur quelque problème obscur.'¹ And it is safe to assume that my readers too will very soon find their initial interest in the indiscretions which I am bound to make replaced by an absorbing immersion in the psychological problems upon which they throw light.²

¹[1900a, 606]
²[1900a, 610]

I was alarmed at the idea that I had missed an organic illness. This, as may well be believed, is a perpetual source of anxiety to a specialist whose practice is almost limited to neurotic patients and who is in the habit of attributing to hysteria a great number of symptoms which other physicians treat as organic. On the other hand, a faint doubt crept into my mind - from where, I could not tell - that my alarm was not entirely genuine. If Irma's pains had an organic basis, once again I could not be held responsible for curing them; my treatment only set out to get rid of hysterical pains. It occurred to me, in fact, that I was actually wishing that there had been a wrong diagnosis; for, if so, the blame for my lack of success would also have been got rid of.

[1900a, 610]
What I saw in her throat: a white patch and turbinal bones with scabs on them. The white patch reminded me of diphtheritis and so of Irma's friend, but also of a serious illness of my eldest daughter's almost two years earlier and of the fright I had had in those anxious days. The scabs on the turbinal bones recalled a worry about my own state of health. I was making frequent use of cocaine at that time to reduce some troublesome nasal swellings, and I had heard a few days earlier that one of my women patients who had followed my example had developed an extensive necrosis of the nasal mucous membrane. I had been the first to recommend the use of cocaine, in 1885, and this recommendation had brought serious reproaches down on me. The misuse of that drug had hastened the death of a dear friend of mine. This had been before 1895.

My friend Otto was now standing beside the patient and my friend Leopold was examining her and indicated that there was a dull area low down on the left. My friend Leopold was also a physician and a relative of Otto's. Since they both specialized in the same branch of medicine, it was their fate to be in competition with each other, and comparisons were constantly being drawn between them. Both of them acted as my assistants for years while I was still in charge of the neurological out-patients' department of a children's hospital. Scenes such as the one represented in the dream used often to occur there. While I was discussing the diagnosis of a case with Otto, Leopold would be examining the child once more and would make an unexpected contribution to our decision. The difference between their characters was like that between the bailiff Bräsig and his friend Karl: one was distinguished for his quickness, while the other was slow but sure. If in the dream I was contrasting Otto with the prudent Leopold, I was evidently doing so to the advantage of the latter. The comparison was similar to the one between my disobedient patient Irma and the friend whom I regarded as wiser than she was. I now perceived another of the lines along which the chain of thought in the dream branched off: from the sick child to the children's hospital. - The dull area low down on the left seemed to me to agree in every detail with one particular case in which Leopold had struck me by his thoroughness. I also had a vague notion of something in the nature of a metastatic affection; but this may also have been a reference to the patient whom I should have liked to have in the place of Irma. So far as I had been able to judge, she had produced an imitation of a tuberculosis.

A portion of the skin on the left shoulder was infiltrated. I saw at once that this was the rheumatism in my own shoulder, which I invariably notice if I sit up late into the night. Moreover the wording in the dream was most ambiguous: 'I noticed this, just as he did . . .' I noticed it in my own body, that is. I was struck, too, by the unusual phrasing: 'a portion of the skin was infiltrated.' We are in the habit of speaking of 'a left upper posterior infiltration', and this would refer to the lung and so once more to tuberculosis.

Injections of that sort ought not to be made so thoughtlessly. Here an accusation of thoughtlessness was being made directly against my friend Otto. I seemed to remember thinking something of the same kind that afternoon when his words and looks had appeared to show that he was siding against me. It had been some such notion as: 'How easily his thoughts are influenced! How thoughtlessly he jumps to conclusions!' - Apart from this, this sentence in the dream reminded me once more of my dead friend who had so hastily resorted to cocaine injections. As I have said, I had never contemplated the drug being given by injection. I noticed too that in accusing Otto of thoughtlessness in handling chemical substances I was once more touching upon the story of the unfortunate Mathilde, which gave grounds for the same accusation against myself. Here I was evidently collecting instances of my conscientiousness, but also of the reverse.

[1900a, 611, 612, 613]
It is easy to prove that dreams often reveal themselves without any disguise as fulfilments of wishes; so that it may seem surprising that the language of dreams was not understood long ago. For instance, there is a dream that I can produce in myself as often as I like - experimentally, as it were. If I eat anchovies or olives or any other highly salted food in the evening, I develop thirst during the night which wakes me up. But my waking is preceded by a dream; and this always has the same content, namely, that I am drinking. I dream I am swallowing down water in great gulps, and it has the delicious taste that nothing can equal but a cool drink when one is parched with thirst. Then I wake up and have to have a real drink. This simple dream is occasioned by the thirst which I become aware of when I wake. The thirst gives rise to a wish to drink, and the dream shows me that wish fulfilled. In doing so it is performing a function - which it was easy to divine. I am a good sleeper and not accustomed to be woken by any physical need. If I can succeed in appeasing my thirst by *dreaming* that I am drinking, then I need not wake up in order to quench it. This, then, is a dream of convenience. Dreaming has taken the place of action, as it often does elsewhere in life. Unluckily my need for water to quench my thirst cannot be satisfied by a dream in the same way as my thirst for revenge against my friend Otto and Dr. M.; but the good intention is there in both cases. Not long ago this same dream of mine showed some modification. I had felt thirsty even before I fell asleep, and I had emptied a glass of water that stood on the table beside my bed. A few hours later during the night I had a fresh attack of thirst, and this had inconvenient results. In order to provide myself with some water I should have had to get up and fetch the glass standing on the table by my wife's bed. I therefore had an appropriate dream that my wife was giving me a drink out of a vase; this vase was an Etruscan cinerary urn which I had brought back from a journey to Italy and had since given away. But the water in it tasted so salty (evidently because of the ashes in the urn) that I woke up. It will be noticed how conveniently everything was arranged in this dream. Since its only purpose was to fulfil a wish, it could be completely egoistical. A love of comfort and convenience is not really compatible with consideration for other people. The introduction of the cinerary urn was probably yet another wish-fulfilment. I was sorry that the vase was no longer in my possession - just as the glass of water on my wife's table was out of my reach. The urn with its ashes fitted in, too, with the salty taste in my mouth which had now grown stronger and which I knew was bound to wake me.¹

Dreams of convenience like these were very frequent in my youth. Having made it a practice as far back as I can remember to work late into the night, I always found it difficult to wake early. I used then to have a dream of being out of bed and standing by the washing-stand; after a while I was no longer able to disguise from myself the fact that I was really still in bed, but in the meantime I had had a little more sleep. A slothful dream of this kind, which was expressed in a particularly amusing and elegant form, has been reported to me by a young medical colleague who seems to share my liking for sleep. The landlady of his lodgings in the neighbourhood of the hospital had strict instructions to wake him in time every morning but found it no easy job to carry them out. One morning sleep seemed peculiarly sweet. The landlady called through the door: 'Wake up, Herr Pepi! It's time to go to the hospital!' In response to this he had a dream that he was lying in bed in a room in the hospital, and that there was a card over the bed on which was written: 'Pepi H., medical student, age 22.' While he was dreaming, he said to himself 'As I'm already *in* the hospital, there's no need for me to go there' - and turned over and went on sleeping. In this way he openly confessed the motive for his dream. [1900a, 624]
One evening I had a visit from a friend - one of the men whose example I had taken as a warning to me. For a considerable time he had been a candidate for promotion to a professorship, a rank which in our society turns its holder into a demi-god to his patients. Less resigned than I was, however, he was in the habit of paying his respects from time to time in the offices of the Ministry with a view to advancing his prospects. He had been paying one of these visits just before calling on me. He told me that on this occasion he had driven the exalted official into a corner and had asked straight out whether the delay over his appointment was not in fact due to denominational considerations. The reply had been that, in view of the present state of feeling, it was no doubt true that, for the moment, His Excellency was not in a position, etc. etc. 'At least I know where I am now', my friend had concluded. It was not news to me, though it was bound to strengthen my feeling of resignation; for the same denominational considerations applied to my own case.

¹ It is astonishing to observe the way in which my memory - my waking memory - was narrowed at this point, for the purposes of the analysis. Actually I have known five of my uncles and loved and honoured one of them. But at the moment at which I overcame my resistance to interpreting the dream I said to myself that I never had more than one uncle - the one that was intended in the dream.

I now made a fresh start. Once, I recalled, I really had written something in the nature of a monograph on a plant, namely a dissertation on the coca-plant, which had drawn Karl Koller's attention to the anaesthetic properties of cocaine. I had myself indicated this application of the alkaloid in my published paper, but I had not been thorough enough to pursue the matter further. This reminded me that on the morning of the day after the dream - I had not found time to interpret it till the evening - I had thought about cocaine in a kind of day-dream. If ever I got glaucoma, I had thought, I should travel to Berlin and get myself operated on, incognito, in my friend's house, by a surgeon recommended by him. The operating surgeon, who would have no idea of my identity, would boast once again of how easily such operations could be performed since the introduction of cocaine; and I should not give the slightest hint that I myself had had a share in the discovery. This phantasy had led on to reflections of how awkward it is, when all is said and done, for a physician to ask for medical treatment for himself from his professional colleagues. The Berlin eye-surgeon would not know me, and I should be able to pay his fees like anyone else. It was not until I had recalled this day-dream that I realized that the recollection of a specific event lay behind it. Shortly after Koller's discovery, my father had in fact been attacked by glaucoma; my friend Dr. Königstein, the ophthalmic surgeon, had operated on him; while Dr. Koller had been in charge of the cocaine anaesthesia and had commented on the fact that this case had brought together all of the three men who had had a share in the introduction of cocaine.
My thoughts then went on to the occasion when I had last been reminded of this business of the cocaine. It had been a few days earlier, when I had been looking at a copy of a Festschrift in which grateful pupils had celebrated the jubilee of their teacher and laboratory director. Among the laboratory's claims to distinction which were enumerated in this book I had seen a mention of the fact that Koller had made his discovery there of the anaesthetic properties of cocaine. I then suddenly perceived that my dream was connected with an event of the previous evening. I had walked home precisely with Dr. Königstein and had got into conversation with him about a matter which never fails to excite my feelings whenever it is raised. While I was talking to him in the entrance-hall, Professor Gärtner and his wife had joined us; and I could not help congratulating them both on their blooming looks. But Professor Gärtner was one of the authors of the Festschrift I have just mentioned, and may well have reminded me of it. Moreover, the Frau L., whose disappointment on her birthday I described earlier, was mentioned - though only, it is true, in another connection - in my conversation with Dr. Königstein.

I will make an attempt at interpreting the other determinants of the content of the dream as well. There was a dried specimen of the plant included in the monograph, as though it had been a herbarium. This led me to a memory from my secondary school. Our headmaster once called together the boys from the higher forms and handed over the school's herbarium to them to be looked through and cleaned. Some small worms - book worms - had found their way into it. He does not seem to have had much confidence in my helpfulness, for he handed me only a few sheets. These, as I could still recall, included some Crucifers. I never had a specially intimate contact with botany. In my preliminary examination in botany I was also given a Crucifer to identify - and failed to do so. My prospects would not have been too bright, if I had not been helped out by my theoretical knowledge. I went on from the Cruciferae to the Compositae. It occurred to me that artichokes were Compositae, and indeed I might fairly have called them my favourite flowers. Being more generous than I am, my wife often brought me back these favourite flowers of mine from the market.
The folded coloured plate. While I was a medical student I was the constant victim of an impulse only to learn things out of monographs. In spite of my limited means, I succeeded in getting hold of a number of volumes of the proceedings of medical societies and was enthralled by their coloured plates. I was proud of my hankering for thoroughness. When I myself had begun to publish papers, I had been obliged to make my own drawings to illustrate them and I remembered that one of them had been so wretched that a friendly colleague had jeered at me over it. There followed, I could not quite make out how, a recollection from very early youth. It had once amused my father to hand over a book with coloured plates (an account of a journey through Persia) for me and my eldest sister to destroy. Not easy to justify from the educational point of view! I had been five years old at the time and my sister not yet three; and the picture of the two of us blissfully pulling the book to pieces (leaf by leaf, like an artichoke, I found myself saying) was almost the only plastic memory that I retained from that period of my life. Then, when I became a student, I had developed a passion for collecting and owning books, which was analogous to my liking for learning out of monographs: a favourite hobby. (The idea of 'favourite' had already appeared in connection with cyclamens and artichokes.) I had become a book-worm. I had always, from the time I first began to think about myself, referred this first passion of mine back to the childhood memory I have mentioned. Or rather, I had recognized that the childhood scene was a 'screen memory' for my later bibliophile propensities.¹ And I had early discovered, of course, that passions often lead to sorrow. When I was seventeen I had run up a largish account at the bookseller's and had nothing to meet it with; and my father had scarcely taken it as an excuse that my inclinations might have chosen a worse outlet. The recollection of this experience from the later years of my youth at once brought back to my mind the conversation with my friend Dr. Königstein. For in the course of it we had discussed the same question of my being blamed for being too much absorbed in my favourite hobbies. [1900a, 660]

There was a similar instance of this when, in the course of my analysis of the dream of the monograph on the genus Cyclamen, I stumbled upon the childhood memory of my father, when I was a boy of five, giving me a book illustrated with coloured plates to destroy. It may perhaps be doubted whether this memory really had any share in determining the form taken by the content of the dream or whether it was not rather that the process of analysis built up the connection subsequently. But the copious and intertwined associative links warrant our accepting the former alternative: cyclamen - favourite flower - favourite food - artichokes; pulling to pieces like an artichoke, leaf by leaf (a phrase constantly ringing in our ears in relation to the piecemeal dismemberment of the Chinese Empire) - herbarium - book-worms, whose favourite food is books. Moreover I can assure my readers that the ultimate meaning of the dream, which I have not disclosed, is intimately related to the subject of the childhood scene. [1900a, 676]
At this point I shall once more take up the interpretation of a dream which we have already found instructive - the dream of my friend R. being my uncle. We have followed its interpretation to the point of recognizing clearly as one of its motives my wish to be appointed to a professorship; and we explained the affection I felt in the dream for my friend R. as a product of opposition and revolt against the slanders upon my two colleagues which were contained in the dream-thoughts. The dream was one of my own; I may therefore continue its analysis by saying that my feelings were not yet satisfied by the solution that had so far been reached. I knew that my waking judgement upon the colleagues who were so ill-used in the dream-thoughts would have been a very different one; and the force of my wish not to share their fate in the matter of the appointment struck me as insufficient to explain the contradiction between my waking and dreaming estimates of them. If it was indeed true that my craving to be addressed with a different title was as strong as all that, it showed a pathological ambition which I did not recognize in myself and which I believed was alien to me. I could not tell how other people who believed they knew me would judge me in this respect. It might be that I was really ambitious; but, if so, my ambition had long ago been transferred to objects quite other than the title and rank of professor extraordinarius.

[1900a, 677]

What, then, could have been the origin of the ambitiousness which produced the dream in me? At that point I recalled an anecdote I had often heard repeated in my childhood. At the time of my birth an old peasant-woman had prophesied to my proud mother that with her first-born child she had brought a great man into the world. Prophecies of this kind must be very common: there are so many mothers filled with happy expectations and so many old peasant-women and others of the kind who make up for the loss of their power to control things in the present world by concentrating it on the future. Nor can the prophetess have lost anything by her words. Could this have been the source of my thirst for grandeur? But that reminded me of another experience, dating from my later childhood, which provided a still better explanation. My parents had been in the habit, when I was a boy of eleven or twelve, of taking me with them to the Prater. One evening, while we were sitting in a restaurant there, our attention had been attracted by a man who was moving from one table to another and, for a small consideration, improvising a verse upon any topic presented to him. I was despatched to bring the poet to our table and he showed his gratitude to the messenger. Before enquiring what the chosen topic was to be, he had dedicated a few lines to myself; and he had been inspired to declare that I should probably grow up to be a Cabinet Minister. I still remembered quite well what an impression this second prophecy had made on me. Those were the days of the 'Bürger' Ministry. Shortly before, my father had brought home portraits of these middle-class professional men - Herbst, Giskra, Unger, Berger and the rest - and we had illuminated the house in their honour. There had even been some Jews among them. So henceforth every industrious Jewish schoolboy carried a Cabinet Minister's portfolio in his satchel. The events of that period no doubt had some bearing on the fact that up to a time shortly before I entered the University it had been my intention to study Law; it was only at the last moment that I changed my mind. A ministerial career is definitely barred to a medical man. But now to return to my dream. It began to dawn on me that my dream had carried me back from the dreary present to the cheerful hopes of the days of the 'Bürger' Ministry, and that the wish that it had done its best to fulfil was one dating back to those times. In mishandling my two learned and eminent colleagues because they were Jews, and in treating the one as a simpleton and the other as a criminal, I was behaving as though I were the Minister, I had put myself in the Minister's place. Turning the tables on His Excellency with a vengeance! He had refused to appoint me professor extraordinarius and I had retaliated in the dream by stepping into his shoes.

[1900a, 678]
In another instance it became apparent that, though the wish which instigated the dream was a present-day one, it had received a powerful reinforcement from memories that stretched far back into childhood. What I have in mind is a series of dreams which are based upon a longing to visit Rome. For a long time to come, no doubt, I shall have to continue to satisfy that longing in my dreams: for at the season of the year when it is possible for me to travel, residence in Rome must be avoided for reasons of health.¹ For instance, I dreamt once that I was looking out of a railway-carriage window at the Tiber and the Ponte Sant' Angelo. The train began to move off, and it occurred to me that I had not so much as set foot in the city. The view that I had seen in my dream was taken from a well-known engraving which I had caught sight of for a moment the day before in the sitting-room of one of my patients. Another time someone led me to the top of a hill and showed me Rome half-shrouded in mist; it was so far away that I was surprised at my view of it being so clear. There was more in the content of this dream than I feel prepared to detail; but the theme of 'the promised land seen from afar' was obvious in it. The town which I saw in this way for the first time, shrouded in mist, was - Lübeck, and the prototype of the hill was - at Gleichenberg. In a third dream I had at last got to Rome, as the dream itself informed me; but I was disappointed to find that the scenery was far from being of an urban character. There was a narrow stream of dark water; on one side of it were black cliffs and on the other meadows with big white flowers. I noticed a Herr Zucker whom I knew slightly and determined to ask him the way to the city. I was clearly making a vain attempt to see in my dream a city which I had never seen in my waking life. Breaking up the landscape in the dream into its elements, I found that the white flowers took me to Ravenna, which I have visited and which, for a time at least, superseded Rome as capital of Italy. In the marshes round Ravenna we found the loveliest water-lilies growing in black water. Because we had had such difficulty in picking them out of the water, the dream made them grow in meadows like the narcissi at our own Aussee. The dark cliff, so close to the water, reminded me vividly of the valley of the Tepl near Karlsbad. ‘Karlsbad’ enabled me to explain the curious detail of my having asked Herr Zucker the way. The material out of which the dream was woven included at this point two of those facetious Jewish anecdotes which contain so much profound and often bitter worldly wisdom and which we so greatly enjoy quoting in our talk and letters. Here is the first one: the 'constitution' story. An impecunious Jew had stowed himself away without a ticket in the fast train to Karlsbad. He was caught, and each time tickets were inspected he was taken out of the train and treated more and more severely. At one of the stations on his via dolorosa he met an acquaintance, who asked him where he was travelling to. ‘To Karlsbad’, was his reply, 'if my constitution can stand it.' My memory then passed on to another story: of a Jew who could not speak French and had been recommended when he was in Paris to ask the way to the rue Richelieu. Paris itself had for many long years been another goal of my longings; and the blissful feelings with which I first set foot on its pavement seemed to me a guarantee that others of my wishes would be fulfilled as well. 'Asking the way', moreover, was a direct allusion to Rome, since it is well known that all roads lead there. Again, the name Zucker was once more an allusion to Karlsbad; for we are in the habit of prescribing treatment there for anyone suffering from the constitutional complaint of diabetes. The instigation to this dream had been a proposal made by my friend in Berlin that we should meet in Prague at Easter. What we were going to discuss there would have included something with a further connection with 'sugar' and 'diabetes'.

¹ [Footnote added 1909:] I discovered long since that it only needs a little courage to fulfil wishes which till then have been regarded as unattainable; [added 1925:] and thereafter became a constant pilgrim to Rome.

[1900a, 679]
It was on my last journey to Italy, which, among other places, took me past Lake Trasimene, that finally - after having seen the Tiber and sadly turned back when I was only fifty miles from Rome - I discovered the way in which my longing for the eternal city had been reinforced by impressions from my youth. I was in the act of making a plan to by-pass Rome next year and travel to Naples, when a sentence occurred to me which I must have read in one of our classical authors: "Which of the two, it may be debated, walked up and down his study with the greater impatience after he had formed his plan of going to Rome - Winckelmann, the Vice-Principal, or Hannibal, the Commander-in-Chief" I had actually been following in Hannibal's footsteps. Like him, I had been fated not to see Rome; and he too had moved into the Campagna when everyone had expected him in Rome. But Hannibal, whom I had come to resemble in these respects, had been the favourite hero of my later school days. Like so many boys of that age, I had sympathized in the Punic Wars not with the Romans but with the Carthaginians. And when in the higher classes I began to understand for the first time what it meant to belong to an alien race, and anti-semitic feelings among the other boys warned me that I must take up a definite position, the figure of the semitic general rose still higher in my esteem. To my youthful mind Hannibal and Rome symbolized the conflict between the tenacity of Jewry and the organization of the Catholic church. And the increasing importance of the effects of the anti-semitic movement upon our emotional life helped to fix the thoughts and feelings of those early days. Thus the wish to go to Rome had become in my dream-life a cloak and symbol for a number of other passionate wishes. Their realization was to be pursued with all the perseverance and single-mindedness of the Carthaginian, though their fulfilment seemed at the moment just as little favoured by destiny as was Hannibal's lifelong wish to enter Rome.

At that point I was brought up against the event in my youth whose power was still being shown in all these emotions and dreams. I may have been ten or twelve years old, when my father began to take me with him on his walks and reveal to me in his talk his views upon things in the world we live in. Thus it was, on one such occasion, that he told me a story to show me how much better things were now than they had been in his days. 'When I was a young man', he said, 'I went for a walk one Saturday in the streets of your birthplace; I was well dressed, and had a new fur cap on my head. A Christian came up to me and with a single blow knocked off my cap into the mud and shouted: "Jew! get off the pavement!"' 'And what did you do?' I asked. 'I went into the roadway and picked up my cap', was his quiet reply. This struck me as unheroic conduct on the part of the big, strong man who was holding the little boy by the hand. I contrasted this situation with another which fitted my feelings better: the scene in which Hannibal's father, Hamilcar Barca,¹ made his boy swear before the household altar to take vengeance on the Romans. Ever since that time Hannibal had had a place in my phantasies.

I believe I can trace my enthusiasm for the Carthaginian general a step further back into my childhood; so that once more it would only have been a question of a transference of an already formed emotional relation on to a new object. One of the first books that I got hold of when I had learnt to read was Thiers' history of the Consulate and Empire. I can still remember sticking labels on the flat backs of my wooden soldiers with the names of Napoleon's marshals written on them. And at that time my declared favourite was already Massena (or to give the name its Jewish form, Manasseh).² (No doubt this preference was also partly to be explained by the fact that my birthday fell on the same day as his, exactly a hundred years later.) Napoleon himself lines up with Hannibal owing to their both having crossed the Alps. It may even be that the development of this martial ideal is traceable still further back into my childhood: to the times when, at the age of three, I was in a close relation, sometimes friendly but some times warlike, with a boy a year older than myself, and to the wishes which that relation must have stirred up in the weaker of us.
My records naturally include a large collection of patients’ dreams the analysis of which led to obscure or entirely forgotten impressions of childhood, often going back to the first three years of life. But it would be unsafe to apply any conclusions drawn from them to dreams in general. The persons concerned were in every instance neurotics and in particular hysterics; and it is possible that the part played by childhood scenes in their dreams might be determined by the nature of their neurosis and not by the nature of dreams. Nevertheless, in analysing my own dreams - and, after all, I am not doing so on account of any gross pathological symptoms - it happens no less frequently that in the latent content of a dream I come unexpectedly upon a scene from childhood, and that all at once a whole series of my dreams link up with the associations branching out from some experience of my childhood. I have already given some instances of this, and I shall have others to give in a variety of connections. I cannot, perhaps, bring this section to a better close than by reporting one or two dreams of mine in which recent occasions and long-forgotten experiences of childhood came together as sources of the dream. [1900a, 687]
When I began analysing this dream, I thought quite unexpectedly of the first novel I ever read (when I was thirteen, perhaps); as a matter of fact I began at the end of the first volume. I have never known the name of the novel or of its author; but I have a vivid memory of its ending. The hero went mad and kept calling out the names of the three women who had brought the greatest happiness and sorrow into his life. One of these names was Pélagie. I still had no notion what this recollection was going to lead to in the analysis. In connection with the three women I thought of the three Fates who spin the destiny of man, and I knew that one of the three women - the inn-hostess in the dream - was the mother who gives life, and furthermore (as in my own case) gives the living creature its first nourishment. Love and hunger, I reflected, meet at a woman's breast. A young man who was a great admirer of feminine beauty was talking once - so the story went - of the good-looking wet-nurse who had suckled him when he was a baby: 'I'm sorry', he remarked, 'that I didn't make a better use of my opportunity.' I was in the habit of quoting this anecdote to explain the factor of 'deferred action' in the mechanism of the psychoneuroses. - One of the Fates, then, was rubbing the palms of her hands together as though she was making dumplings: a queer occupation for a Fate, and one that cried out for an explanation. This was provided by another and earlier memory of my childhood. When I was six years old and was given my first lessons by my mother, I was expected to believe that we were all made of earth and must therefore return to earth. This did not suit me and I expressed doubts of the doctrine. My mother thereupon rubbed the palms of her hands together - just as she did in making dumplings, except that there was no dough between them - and showed me the blackish scales of epidermis produced by the friction as a proof that we were made of earth. My astonishment at this ocular demonstration knew no bounds and I acquiesced in the belief which I was later to hear expressed in the words: 'Du bist der Natur einen Tod schuldig.' ["Thou owest Nature a death."] So they really were Fates that I found in the kitchen when I went into it - as I had so often done in my childhood when I was hungry, while my mother, standing by the fire, had admonished me that I must wait till dinner was ready. - And now for the dumplings - the Knödel! One at least of my teachers at the University - and precisely the one to whom I owe my histological knowledge (for instance of the epidermis) - would infallibly be reminded by the name Knödl of a person against whom he had been obliged to take legal action for plagiarizing his writings. The idea of plagiarizing - of appropriating whatever one can, even though it belongs to someone else - clearly led on to the second part of the dream, in which I was treated as though I were the thief who had for some time carried on his business of stealing overcoats in the lecture-rooms. I had written down the word 'plagiarizing', without thinking about it, because it occurred to me; but now I noticed that it could form a bridge [Brücke] between different pieces of the dream's manifest content. A chain of associations (Pélagie - plagiarizing - plagiostomes² or sharks [Haifische] - a fish's swimming-bladder [Fischblase]) connected the old novel with the case of Knödl and with the overcoats, which clearly referred to implements used in sexual technique. (Cf. Maury's alliterative dreams.) No doubt it was a very far-fetched and senseless chain of thought; but I could never have constructed it in waking life unless it had already been constructed by the dream-work. And, as though the need to set up forced connections regarded nothing as sacred, the honoured name of Brücke (cf. the verbal bridge above) reminded me of the Institute in which I spent the happiest hours of my student life, free from all other desires - [1900a, 688]
The dream as a whole gives one the impression of being in the nature of a phantasy in which the dreamer was carried back to the Revolutionary year 1848. Memories of that year had been recalled to me by the Jubilee in 1898, as well as by a short trip which I had made to the Wachau, in the course of which I had visited Emmersdorf,² the place of retirement of the student-leader Fischhof, to whom certain elements in the manifest content of the dream may allude. My associations then led me to England and to my brother's house there. He used often to tease his wife with the words 'Fifty Years Ago' (from the title of one of Lord Tennyson's poems), which his children used then to correct to 'fifteen years ago'. This revolutionary phantasy, however, which was derived from ideas aroused in me by seeing Count Thun, was like the façade of an Italian church in having no organic relation with the structure lying behind it. But it differed from those façades in being disordered and full of gaps, and in the fact that portions of the interior construction had forced their way through into it at many points. [1900a, 692]

Here is the material relating to the two childhood scenes which I have promised my readers. I had bought a new trunk for the journey, of a brownish violet colour. This colour appears more than once in the dream: the violet-brown violets made of a stiffish material and beside them a thing known as a 'Mädchenfänger' ['girl-catcher'] - and the furniture in the ministerial apartments. It is commonly believed by children that people are struck by anything new. The following scene from my childhood has been described to me, and my memory of the description has taken the place of my memory of the scene itself. It appears that when I was two years old I still occasionally wetted the bed, and when I was reproached for this I consoled my father by promising to buy him a nice new red bed in N., the nearest town of any size. This was the origin of the parenthetical phrase in the dream to the effect that we bought or had to buy the urinal in town: one must keep one's promises. (Notice, too, the juxtaposition in symbolism of the male urinal and the female trunk or box.) This promise of mine exhibited all the megalomania of childhood. We have already come across the significant part played in dreams by children's difficulties in connection with micturition (cf. the dream reported on p. 685). We have also learned from the psycho-analysis of neurotic subjects the intimate connection between bed-wetting and the character trait of ambition. [1900a, 697]

When I was seven or eight years old there was another domestic scene, which I can remember very clearly. One evening before going to sleep I disregarded the rules which modesty lays down and obeyed the calls of nature in my parents' bedroom while they were present. In the course of his reprimand, my father let fall the words: 'The boy will come to nothing.' This must have been a frightful blow to my ambition, for references to this scene are still constantly recurring in my dreams and are always linked with an enumeration of my achievements and successes, as though I wanted to say: 'You see, I have come to something.' This scene, then, provided the material for the final episode of the dream, in which - in revenge, of course - the roles were interchanged. The older man (clearly my father, since his blindness in one eye referred to his unilateral glaucoma¹ ) was now micturating in front of me, just as I had in front of him in my childhood. In the reference to his glaucoma I was reminding him of the cocaine, which had helped him in the operation, as though I had in that way kept my promise. Moreover, I was making fun of him; I had to hand him the urinal because he was blind, and I revelled in allusions to my discoveries in connection with the theory of hysteria, of which I felt so proud.² [1900a, 697]
Here is some further interpretative material. Handing him the glass reminded me of the story of the peasant at the optician’s, trying glass after glass and still not being able to read. - (Peasant-catcher [Bauerfänger, ‘sharper’]; girl-catcher [Mädchenfänger] in the preceding episode of the dream.) - The way in which the father in Zola’s *La terre* was treated among the peasants after he had grown feeble-minded. - The tragic requital that lay in my father’s soiling his bed like a child during the last days of his life; hence my appearance in the dream as a sick-nurse. - ‘Here it was as though thinking and experiencing were one and the same thing.’ This recalled a strongly revolutionary literary play by Oskar Panizza, in which God the Father is ignominiously treated as a paralytic old man. In his case will and deed were represented as one and the same thing, and he had to be restrained from cursing and swearing by one of his archangels, a kind of Ganymede, because his imprecations would be promptly fulfilled. - My making plans was a reproach against my father dating from a later period. And indeed the whole rebellious content of the dream, with its lèse majesté and its derision of the higher authorities, went back to rebellion against my father. A Prince is known as the father of his country; the father is the oldest, first, and for children the only authority, and from his autocratic power the other social authorities have developed in the course of the history of human civilization—except in so far as the ‘matriarchy’ calls for a qualification of this assertion. - The phrase ‘thinking and experiencing were one and the same thing’ had a reference to the explanation of hysterical symptoms, and the ‘male urinal’ belonged in the same connection. I need not explain to a Viennese the principle of the ‘Gschnas’. It consists in constructing what appear to be rare, and precious objects out of trivial and preferably comic and worthless materials (for instance, in making armour out of saucepans, wisps of straw and dinner rolls) - a favourite pastime at bohemian parties here in Vienna. I had observed that this is precisely what hysterical subjects do: alongside what has really happened to them, they unconsciously build up frightful or perverse imaginary events which they construct out of the most innocent and everyday material of their experience. It is to these phantasies that their symptoms are in the first instance attached and not to their recollections of real events, whether serious or equally innocent. This revelation had helped me over a number of difficulties and had given me particular pleasure. What made it possible for me to refer to this by means of the dream-element of the ‘male urinal’ was as follows. I had been told that at the latest ‘Gschnas’-night a poisoned chalice belonging to Lucrezia Borgia had been exhibited; its central and principal constituent had been a *male urinal* of the type used in hospitals. [1900a, 697]
But the dream was not content with ‘suggesting away’ my boil by obstinately insisting upon an idea that was inconsistent with it and so behaving like the hallucinatory delusion of the mother who had lost her child or the merchant whose losses had robbed him of his fortune.¹ The details of the sensation which was being repudiated and of the picture which was employed in order to repress that sensation also served the dream as a means of connecting other material that was currently active in my mind with the situation in the dream and of giving that material representation. I was riding on a grey horse, whose colour corresponded precisely to the pepper-and-salt colour of the suit my colleague P. was wearing when I had last met him in the country. The cause of my boils had been ascribed to my eating highly-spiced food - an aetiology that was at least preferable to the sugar which might also occur to one in connection with boils. My friend P. liked to ride the high horse over me ever since he had taken over one of my women patients on whom I had pulled off some remarkable feats. (In the dream I began by riding tangentially - like the feat of a trick rider.) But in fact, like the horse in the anecdote of the Sunday horseman, this patient had taken me wherever she felt inclined. Thus the horse acquired the symbolic meaning of a woman patient. (It was highly intelligent in the dream.) 'I felt quite at home up there' referred to the position I had occupied in this patient's house before I was replaced by P. Not long before, one of my few patrons among the leading physicians in this city had remarked to me in connection with this same house: 'You struck me as being firmly in the saddle there.' It was a remarkable feat, too, to be able to carry on my psychotherapeutic work for eight or ten hours a day while I was having so much pain. But I knew that I could not go on long with my peculiarly difficult work unless I was in completely sound physical health; and my dream was full of gloomy allusions to the situation in which I should then find myself. (The note which neurasthenics bring with them to show the doctor; no work, no food.) In the course of further interpretation I saw that the dream-work had succeeded in finding a path from the wishful situation of riding to some scenes of quarrelling from my very early childhood which must have occurred between me and a nephew of mine, a year my senior, who was at present living in England. Furthermore, the dream had derived some of its elements from my travels in Italy: the street in the dream was composed of impressions of Verona and Siena. A still deeper interpretation led to sexual dream-thoughts, and I recalled the meaning which references to Italy seem to have had in the dreams of a woman patient who had never visited that lovely country: 'gen Italien [to Italy]' - 'Genitalien [genitals]'; and this was connected, too, with the house in which I had preceded my friend P. as physician, as well as with the situation of my boil.

[1900a, 710]

ANALYSIS. -The situation in the dream is taken from everyday reality. I occupy two flats in a house in Vienna, which are connected only by the public staircase. My consulting-room and study are on the upper ground floor and my living rooms are one storey higher. When, late in the evening, I have finished my work down below, I go up the stairs to my bedroom. On the evening before I had the dream, I had in fact made this short journey in rather disordered dress - that is to say, I had taken off my collar and tie and cuffs. In the dream this had been turned into a higher degree of undress, but, as usual, an indeterminate one. I usually go upstairs two or three steps at a time; and this was recognized in the dream itself as a wish-fulfilment: the ease with which I achieved it reassured me as to the functioning of my heart. Further, this method of going upstairs was an effective contrast to the inhibition in the second half of the dream. It showed me - what needed no proving - that dreams find no difficulty in representing motor acts carried out to perfection. (One need only recall dreams of flying.)

[1900a, 717]
Now how did this staircase and this female figure come to be in my dream? The feeling of shame at not being completely dressed is no doubt of a sexual nature; but the maid-servant whom I dreamt about was older than I am, surly and far from attractive. The only answer to the problem that occurred to me was this. When I paid my morning visits to this house I used as a rule to be seized with a desire to clear my throat as I went up the stairs and the product of my expectoration would fall on the staircase. For on neither of these floors was there a spittoon; and the view I took was that the cleanliness of the stairs should not be maintained at my expense but should be made possible by the provision of a spittoon. The concierge, an equally elderly and surly woman (but of cleanly instincts, as I was prepared to admit), looked at the matter in a different light. She would lie in wait for me to see whether I should again make free of the stairs, and, if she found that I did, I used to hear her grumbling audibly; and for several days afterwards she would omit the usual greeting when we met. The day before I had the dream the concierge's party had received a reinforcement in the shape of the maid-servant. I had, as usual, concluded my hurried visit to the patient, when the servant stopped me in the hall and remarked: 'You might have wiped your boots, doctor, before you came into the room today. You've made the red carpet all dirty again with your feet.' This was the only claim the staircase and the maid-servant had to appearing in my dream.

There was an internal connection between my running up the stairs and my spitting on the stairs. Pharyngitis as well as heart trouble are both regarded as punishments for the vice of smoking. And on account of that habit my reputation for tidiness was not of the highest with the authorities in my own house any more than in the other; so that the two were fused into one in the dream.

I dreamt one night that I saw in the window of a book-shop a new volume in one of the series of monographs for connoisseurs which I am in the habit of buying - monographs on great artists, on world history, on famous cities, etc. *The new series was called 'Famous Speakers' or 'Speeches' and its first volume bore the name of Dr. Lecher.*

But where was its wish-fulfilment to be found? Not in my avenging myself on my friend Otto, whose fate it seems to be to be ill-treated in my dreams; but in the following consideration. At the same time as I represented Otto in the dream as Baron L., I had identified myself with someone else, namely Professor R.; for just as in the anecdote R. had made a request to Baron L., so I had made a request to Otto. And that is the point. Professor R., with whom I should really not venture to compare myself in the ordinary way, resembled me in having followed an independent path outside the academic world and had only achieved his well-merited title late in life. So once again I was wanting to be a Professor! Indeed the words 'late in life' were themselves a wish-fulfilment; for they implied that I should live long enough to see my boys through the age of puberty myself.
Such tests as I have been able to make of this explanation on myself and on other people, though they have not been sufficiently numerous, have confirmed its validity. For instance, I myself failed in Forensic Medicine in my Finals; but I have never had to cope with this subject in dreams, whereas I have quite often been examined in Botany, Zoology or Chemistry. I went in for the examination in these subjects with well-founded anxiety; but, whether by the grace of destiny or of the examiners, I escaped punishment. In my dreams of school examinations, I am invariably examined in History, in which I did brilliantly - though only, it is true, because my kindly master (the one-eyed benefactor of another dream, see p. 531) did not fail to notice that on the paper of questions which I handed him back I had run my finger-nail through the middle one of the three questions included, to warn him not to insist upon that particular one. One of my patients, who decided not to sit for his Matriculation the first time but passed it later, and who subsequently failed in his army examination and never got a commission, has told me that he often dreams of the former of these examinations but never of the latter.

Not only the compound idea, 'botanical monograph', however, but each of its components, 'botanical' and 'monograph' separately, led by numerous connecting paths deeper and deeper into the tangle of dream-thoughts. 'Botanical' was related to the figure of Professor Gärtner [Gardener], the blooming looks of his wife, to my patient Flora and to the lady of whom I had told the story of the forgotten flowers. Gärtner led in turn to the laboratory and to my conversation with Königstein. My two patients had been mentioned in the course of this conversation. A train of thought joined the lady with the flowers to my wife's favourite flowers and thence to the title of the monograph which I had seen for a moment during the day. In addition to these, 'botanical' recalled an episode at my secondary school and an examination while I was at the University. A fresh topic touched upon in my conversation with Dr. Königstein - my favourite hobbies - was joined, through the intermediate link of what I jokingly called my favourite flower, the artichoke, with the train of thought proceeding from the forgotten flowers. Behind 'artichokes' lay, on the one hand, my thoughts about Italy and, on the other hand, a scene from my childhood which was the opening of what have since become my intimate relations with books. Thus 'botanical' was a regular nodal point in the dream. Numerous trains of thought converged upon it, which, as I can guarantee, had appropriately entered into the context of the conversation with Dr. Königstein. Here we find ourselves in a factory of thoughts where, as in the 'weaver's masterpiece' -

In this closely knit and, when it was carefully interpreted, very transparent dream, Professor N. played a part not only on account of this analogy and of my wish to be wrong, and on account of his incidental connections with Breslau and with the family of our friend who had settled there after her marriage but also on account of the following episode which occurred at the end of our consultation. When he had given his opinion and so concluded our medical discussion, he turned to more personal subjects: 'How many children have you got now?' - 'Six.' - He made a gesture of admiration and concern. - 'Girls or boys?' - 'Three and three: they are my pride and my treasure.' - 'Well, now, be on your guard! Girls are safe enough, but bringing up boys leads to difficulties later on.' - I protested that mine had been very well behaved so far. Evidently this second diagnosis, on the future of my boys, pleased me no more than the earlier one, according to which my patient was suffering from a neurosis. Thus these two impressions were bound up together by their contiguity, by the fact of their having been experienced both at once; and in taking the story of the neurosis into my dream, I was substituting it for the conversation about upbringing, which had more connection with the dream-thoughts, since it touched so closely upon the worries later expressed by my wife. So even my fear that N. might be right in what he said about the difficulty of bringing up boys had found a place in the dream, for it lay concealed behind the representation of my wish that I myself might be wrong in harbouring such fears. The same phantasy served unaltered to represent both of the opposing alternatives.

[1900a, 750]

[1900a, 756]

[1900a, 774]
Each of these two versions had a meaning of its own and led in a different direction when the dream was interpreted. I had chosen the simplest possible ritual for the funeral, for I knew my father's own views on such ceremonies. But some other members of the family were not sympathetic to such puritanical simplicity and thought we should be disgraced in the eyes of those who attended the funeral. Hence one of the versions: 'you are requested to close an eye', i.e. to 'wink at' or 'overlook.' Here it is particularly easy to see the meaning of the vagueness expressed by the 'either-or.' The dream-work failed to establish a unified wording for the dream-thoughts which could at the same time be ambiguous, and the two main lines of thought consequently began to diverge even in the manifest content of the dream.

[1900a, 788]

¹ In the complete analysis there was a reference to an event in my childhood, reached by the following chain of association. 'Der Mohr hat seine Schuldigkeit getan, der Mohr kann gehen.' ['The Moor has done his duty, the Moor can go.'] Then came a facetious conundrum: 'How old was the Moor when he had done his duty?' - 'One year old, because then he could go ['gehen' - both 'to go' and 'to walk']. (It appears that I came into the world with such a tangle of black hair that my young mother declared I was a little Moor.) - My not being able to find my hat was an occurrence from waking life which was used in more than one sense. Our housemaid, who was a genius at putting things away, had hidden it. - The end of this dream also concealed a rejection of some melancholy thoughts about death: 'I am far from having done my duty, so I must not go yet.' - Birth and death were dealt with in it, just as they had been in the dream of Goethe and the paralytic patient, which I had dreamt a short time before. (See pp. 797 ff.) [1900a, 806]

The central feature of the dream was a scene in which I annihilated P. with a look. His eyes changed to a strange and uncanny blue and he melted away. This scene was unmistakably copied from one which I had actually experienced. At the time I have in mind I had been a demonstrator at the Physiological Institute and was due to start work early in the morning. It came to Brücke's ears that I sometimes reached the students' laboratory late. One morning he turned up punctually at the hour of opening and awaited my arrival. His words were brief and to the point. But it was not they that mattered. What overwhelmed me were the terrible blue eyes with which he looked at me and by which I was reduced to nothing - just as P. was in the dream, where, to my relief, the roles were reversed. No one who can remember the great man's eyes, which retained their striking beauty even in his old age, and who has ever seen him in anger, will find it difficult to picture the young sinner's emotions. [1900a, 874]
Strange to say, I really did once play the part of Brutus. I once acted in the scene between Brutus and Caesar from Schiller before an audience of children. I was fourteen years old at the time and was acting with a nephew who was a year my senior. He had come to us on a visit from England; and he, too, was a revenant, for it was the playmate of my earliest years who had returned in him. Until the end of my third year we had been inseparable. We had loved each other and fought with each other; and this childhood relationship, as I have already hinted above, had a determining influence on all my subsequent relations with contemporaries. Since that time my nephew John has had many reincarnations which revived now one side and now another of his personality, unalterably fixed as it was in my unconscious memory. There must have been times when he treated me very badly and I must have shown courage in the face of my tyrant; for in my later years I have often been told of a short speech made by me in my own defence when my father, who was at the same time John's grandfather, had said to me accusingly: 'Why are you hitting John? My reply - I was not yet two years old at the time - was 'I hit him 'cos he hit me.' It must have been this scene from my childhood which diverted 'Non vivit' into 'Non vixit', for in the language of later childhood the word for to hit is 'wichsen'. The dream-work is not ashamed to make use of links such as this one. There was little basis in reality for my hostility to my friend P., who was very greatly my superior and for that reason was well fitted to appear as a new edition of my early playmate. This hostility must therefore certainly have gone back to my complicated childhood relations to John.

[1900a, 876]
In the example which I shall next bring forward I have been able to catch the dream-work in the very act of intentionally fabricating an absurdity for which there was absolutely no occasion in the material. It is taken from the dream which arose from my meeting with Count Thun as I was starting for my holidays. *I was driving in a cab and ordered the driver to drive me to a station.* 'Of course I can't drive with you along the railway line itself', I said, after he had raised some objection, as though I had overtired him. It was as if I had already driven with him for some of the distance one normally travels by train. The analysis produced the following explanations of this confused and senseless story. The day before, I had hired a cab to take me to an out-of-the-way street in Dornbach. The driver, however, had not known where the street was and, as these excellent people are apt to do, had driven on and on until at last I had noticed what was happening and had told him the right way, adding a few sarcastic comments. A train of thought, to which I was later in the analysis to return, led from this cab-driver to aristocrats. For the moment it was merely the passing notion that what strikes us bourgeois plebs about the aristocracy is the preference they have for taking the driver's seat. Count Thun, indeed, was the driver of the State Coach of Austria. The next sentence in the dream, however, referred to my brother, whom I was thus identifying with the cab-driver. That year I had called off a trip I was going to make with him to Italy. ('I can't drive with you along the railway line itself.') And this cancellation had been a kind of punishment for the complaints he used to make that I was in the habit of overtiring him on such trips (this appeared in the dream unaltered) by insisting upon moving too rapidly from place to place and seeing too many beautiful things in a single day. On the evening of the dream my brother had accompanied me to the station; but he had jumped out shortly before we got there, at the suburban railway station adjoining the main line terminus, in order to travel to Purkersdorf by the suburban line. I had remarked to him that he might have stayed with me a little longer by travelling to Purkersdorf by the main line instead of the suburban one. This led to the passage in the dream in which I drove in the cab *for some of the distance one normally travels by train*. This was an inversion of what had happened in reality - a kind of *tu quoque* argument. What I had said to my brother was: 'you can travel on the main line in my company for the distance you would travel by the suburban line.' I brought about the whole confusion in the dream by putting 'cab' instead of 'suburban line' (which, incidentally, was of great help in bringing together the figures of the cab-driver and my brother). In this way I succeeded in producing something senseless in the dream, which it seems scarcely possible to disentangle and which was almost a direct contradiction of an earlier remark of mine in the dream ('I can't drive with you along the railway line itself.') Since, however, there was no necessity whatever for me to confuse the suburban railway and a cab, I must have arranged the whole of this enigmatic business in the dream on purpose.
[1900a, 881]
A great part of the impression of absurdity in this dream was brought about by running together sentences from different parts of the dream-thoughts without any transition. Thus the sentence 'I went to him in the next room', etc., dropped the subject with which the preceding sentences had been dealing and correctly reproduced the circumstances in which I informed my father of my having become engaged to be married without consulting him. This sentence was therefore reminding me of the admirable unselfishness displayed by the old man on that occasion, and contrasting it with the behaviour of someone else - of yet another person. It is to be observed that the dream was allowed to ridicule my father because in the dream-thoughts he was held up in unqualified admiration as a model to other people. It lies in the very nature of every censorship that of forbidden things it allows those which are untrue to be said rather than those which are true. The next sentence, to the effect that he recollected 'having once got drunk and been locked up for it', was no longer concerned with anything that related to my father in reality. Here the figure for whom he stood was no less a person than the great Meynert, in whose footsteps I had trodden with such deep veneration and whose behaviour towards me, after a short period of favour, had turned to undisguised hostility. The dream reminded me that he himself had told me that at one time in his youth he had indulged in the habit of making himself intoxicated with chloroform and that on account of it he had had to go into a home. It also reminded me of another incident with him shortly before his death. I had carried on an embittered controversy with him in writing, on the subject of male hysteria, the existence of which he denied. When I visited him during his fatal illness and asked after his condition, he spoke at some length about his state and ended with these words: 'You know, I was always one of the clearest cases of male hysteria.' He was thus admitting, to my satisfaction and astonishment, what he had for so long obstinately contested. But the reason why I was able in this scene of the dream to use my father as a screen for Meynert did not lie in any analogy that I had discovered between the two figures. The scene was a concise but entirely adequate representation of a conditional sentence in the dream-thoughts, which ran in full: 'If only I had been the second generation, the son of a professor or Hofrat, I should certainly have got on faster.' In the dream I made my father into a Hofrat and professor. - The most blatant and disturbing absurdity in the dream resides in its treatment of the date 1851, which seemed to me not to differ from 1856, just as though a difference of five years was of no significance whatever. But this last was precisely what the dream-thoughts sought to express. *Four or five years* was the length of time during which I enjoyed the support of the colleague whom I mentioned earlier in this analysis; but it was also the length of time during which I made my fiancée wait for our marriage; and it was also, by a chance coincidence which was eagerly exploited by the dream-thoughts, the length of time during which I made my patient of longest standing wait for a complete recovery. 'What are five years?' asked the dream-thoughts; 'that's no time at all, so far as I am concerned; it doesn't count.' I have time enough in front of me. And just as I succeeded in the end in that, though you would not believe it, so I shall achieve this, too. Apart from this, however, the number 51 by itself, without the number of the century, was determined in another, and indeed, in an opposite sense; and this, too, is why it appeared in the dream several times. 51 is the age which seems to be a particularly dangerous one to men; I have known colleagues who have died suddenly at that age, and amongst them one who, after long delays, had been appointed to a professorship only a few days before his death.
But I have also undertaken to show that no dream is prompted by motives other than egoistic ones. So I must explain away the fact that in the present dream I made my friend's cause my own and put myself in his place. The strength of my critical conviction in waking life is not enough to account for this. The story of the eighteen-year-old patient, however, and the different interpretations of his exclaiming 'Nature!' were allusions to the opposition in which I found myself to most doctors on account of my belief in the sexual aetiology of the psychoneuroses. I could say to myself: 'The kind of criticism that has been applied to your friend will be applied to you - indeed, to some extent it already has been.' The 'he' in the dream can therefore be replaced by 'we': 'Yes, you're quite right, it's we who are the fools.' There was a very clear reminder in the dream that 'mea resagitur', in the allusion to Goethe's short but exquisitely written essay; for when at the end of my school-days I was hesitating in my choice of a career, it was hearing that essay read aloud at a public lecture that decided me to take up the study of natural science.

[1900a, 887]

This dream was constructed on a tangle of thoughts provoked by a play which I had seen, called Das neue Ghetto. The Jewish problem, concern about the future of one's children, to whom one cannot give a country of their own, concern about educating them in such a way that they can move freely across frontiers - all of this was easily recognizable among the relevant dream-thoughts.

[1900a, 889]

'By the waters of Babylon we sat down and wept.' Siena, like Rome, is famous for its beautiful fountains. If Rome occurred in one of my dreams, it was necessary for me to find a substitute for it from some locality known to me (see p. 679 f.). Near the Port Romana in Siena we had seen a large and brightly lighted building. We learned that it was the Manicomio, the insane asylum. Shortly before I had had the dream I had heard that a man of the same religious persuasion as myself had been obliged to resign the position which he had painfully achieved in a State asylum.

[1900a, 889]

When I woke up I had a feeling of great satisfaction, the reason for which I explained to myself as being that I was going to discover from this analysis the meaning of 'I've dreamt of that before.' In fact, however, the analysis taught me nothing of the kind; what it did show me was that the satisfaction belonged to the latent content of the dream and not to any judgement upon it. My satisfaction was with the fact that my marriage had brought me children. P. was a person whose course in life lay for some time alongside mine, who then out distanced me both socially and materially, but whose marriage was childless. The two events which occasioned the dream will serve, instead of a complete analysis, to indicate its meaning. The day before, I had read in a newspaper the announcement of the death of Frau Dona A----y (which I turned into 'Doni' in the dream), who had died in childbirth. My wife told me that the dead woman had been looked after by the same midwife who had attended her at the birth of our two youngest children. The name 'Dona' had struck me because I had met it for the first time a short while before in an English novel. The second occasion for the dream was provided by the date on which it occurred. It was on the night before the birthday of my eldest boy - who seems to have some poetic gifts.

[1900a, 893]
Here is a further instance of a process of judgement at work in a dream that I have already recorded. In the absurd dream of the communication from the town council I asked: 'Did you get married soon after that?' I calculated that, of course, I was born in 1856, which seemed to be the year which immediately followed the year in question. All of this was clothed in the form of a set of logical conclusions. My father had married in 1851, immediately after his attack; I, of course, was the eldest of the family and had been born in 1856; Q.E.D. As we know, this false conclusion was drawn in the interests of wish-fulfilment; and the predominant dream-thought ran: 'Four or five years; that's no time at all; it doesn't count.' Every step in this set of logical conclusions, however alike in their content and their form, could be explained in another way as having been determined by the dream-thoughts. It was the patient, of whose long analysis my colleague had fallen foul, who had decided to get married immediately the treatment was finished. The manner of my interview with my father in the dream was like an interrogation or examination, and reminded me too of a teacher at the University who used to take down exhaustive particulars from the students who were enrolling themselves for his lectures: 'Date of birth?' - '1856.' - 'Patre?' In reply to this, one gave one's father's first name with a Latin termination; and we students assumed that the Hofrat drew conclusions from the first name of the father which could not always be drawn from that of the student himself. Thus the drawing of the conclusion in the dream was no more than a repetition of the drawing of a conclusion which appeared as a piece of the material of the dream-thoughts. Something new emerges from this. If a conclusion appears in the content of the dream there is no question that it is derived from the dream-thoughts; but it may either be present in these as a piece of recollected material or it may link a series of dream-thoughts together in a logical chain. In any case, however, a conclusion in a dream represents a conclusion in the dream-thoughts.

At this point we may resume our analysis of the dream. The interrogation by the professor led to a recollection of the register of University Students (which in my time was drawn up in Latin). It led further to thoughts upon the course of my academic studies. The five years which are prescribed for medical studies were once again too few for me. I quietly went on with my work for several more years; and in my circle of acquaintances I was regarded as an idler and it was doubted whether I should ever get through. Thereupon I quickly decided to take my examinations and I got through them in spite of the delay. Here was a fresh reinforcement of the dream-thoughts with which I was defiantly confronting my critics: 'Even though you won't believe it because I've taken my time, I shall get through; I shall bring my medical training to a conclusion. Things have often turned out like that before.'

Anyone who has formed even the slightest idea of the extent of condensation in dreams will easily imagine what a number of pages would be filled by a full analysis of this dream. Fortunately, however, in the present context I need only take up one point in it, which provides an example of astonishment in dreams, as exhibited in the interpolation 'strangely enough'. The following was the occasion of the dream. Louise N., the lady who was assisting me in my job in the dream, had been calling on me. 'Lend me something to read', she had said. I offered her Rider Haggard's She. 'A strange book, but full of hidden meaning', I began to explain to her; 'the eternal feminine, the immortality of our emotions . . .' Here she interrupted me: 'I know it already. Have you nothing of your own?' - 'No, my own immortal works have not yet been written.' - 'Well, when are we to expect these so-called ultimate explanations of yours which you've promised even we shall find readable?' she asked, with a touch of sarcasm. At that point I saw that someone else was admonishing me through her mouth and I was silent. I reflected on the amount of self-discipline it was costing me to offer the public even my book upon dreams - I should have to give away so much of my own private character in it.
The task which was imposed on me in the dream of carrying out a dissection of my own body was thus my self-analysis which was linked up with my giving an account of my dreams. Old Brücke came in here appropriately; even in the first years of my scientific work it happened that I allowed a discovery of mine to lie fallow until an energetic remonstrance on his part drove me into publishing it. The further thoughts which were started up by my conversation with Louise N. went too deep to become conscious. They were diverted in the direction of the material that had been stirred up in me by the mention of Rider Haggard's She. The judgement 'strangely enough' went back to that book and to another one, Heart of the World, by the same author; and numerous elements of the dream were derived from these two imaginative novels. The boggy ground over which people had to be carried, and the chasm which they had to cross by means of boards brought along with them, were taken from She; the Red Indians, the girl and the wooden house were taken from Heart of the World. In both novels the guide is a woman; both are concerned with perilous journeys; while She describes an adventurous road that had scarcely ever been trodden before, leading into an undiscovered region. The tired feeling in my legs, according to a note which I find I made upon the dream, had been a real sensation during the day-time. It probably went along with a tired mood and a doubting thought: 'How much longer will my legs carry me?' The end of the adventure in She is that the guide, instead of finding immortality for herself and the others, perishes in the mysterious subterranean fire. A fear of that kind was unmistakably active in the dream-thoughts. The 'wooden house' was also, no doubt, a coffin, that is to say, the grave. But the dream-work achieved a masterpiece in its representation of this most unwished-for of all thoughts by a wish-fulfilment. For I had already been in a grave once, but it was an excavated Etruscan grave near Orvieto, a narrow chamber with two stone benches along its walls, on which the skeletons of two grown-up men were lying. The inside of the wooden house in the dream looked exactly like it, except that the stone was replaced by wood. The dream seems to have been saying: 'If you must rest in a grave, let it be the Etruscan one.' And, by making this replacement, it transformed the gloomiest of expectations into one that was highly desirable. Unluckily, as we are soon to hear, a dream can turn into its opposite the idea accompanying an affect but not always the affect itself. Accordingly, I woke up in a 'mental fright', even after the successful emergence of the idea that children may perhaps achieve what their father has failed to - a fresh allusion to the strange novel in which a person's identity is retained through a series of generations for over two thousand years.

This, then, was the origin of my attempted explanation to the effect that I had changed carriages while I was in an unconscious state; it had been carried over ready-made into the dream from the material of the dream-thoughts, and was evidently intended in the dream to serve the purpose of identifying me with the figure of this patient. My recollection of him had been aroused by an easy association. My last night-journey, a few weeks earlier, had been made in the company of this very man. He was cured, and was travelling with me into the provinces to visit his relatives, who had sent for me. We had a compartment to ourselves; we left all the windows open all through the night and had a most entertaining time for as long as I stayed awake. I knew that the root of his illness had been hostile impulses against his father, dating from his childhood and involving a sexual situation. In so far, therefore, as I was identifying myself with him, I was seeking to confess to something analogous. And in fact the second scene of the dream ended in a somewhat extravagant phantasy that my two elderly travelling companions had treated me in such a stand-offish way because my arrival had prevented the affectionate exchanges which they had planned for the night. This phantasy went back, however, to a scene of early childhood in which the child, probably driven by sexual curiosity, had forced his way into his parents' bedroom and been turned out of it by his father's orders.

[1900a, 899]

[1900a, 902]
The localities in the dream were brought together from several trips of mine to the Adriatic (to Miramare, Duino, Venice and Aquileia). A short but enjoyable Easter trip which I had made to Aquileia with my brother a few weeks before the dream was still fresh in my memory. The dream also contained allusions to the maritime war between America and Spain and to anxieties to which it had given rise about the fate of my relatives in America. At two points in the dream affects were in question. At one point an affect that was to be anticipated was absent: attention was expressly drawn to the fact that the Governor's death made no impression on me. At another point, when I thought I saw the warship, I was frightened and felt all the sensations of fright in my sleep. In this well-constructed dream the affects were distributed in such a way that any striking contradiction was avoided. There was no reason why I should be frightened at the death of the Governor and it was quite reasonable that as Commandant of the Castle I should be frightened at the sight of the warship. The analysis showed, however, that Herr P. was only a substitute for my own self. (In the dream I was the substitute for him.) I was the Governor who suddenly died. The dream-thoughts dealt with the future of my family after my premature death. This was the only distressing one among the dream-thoughts; and it must have been from it that the fright was detached and brought into connection in the dream with the sight of the warship. On the other hand, the analysis showed that the region of the dream-thoughts from which the warship was taken was filled with the most cheerful recollections. It was a year earlier, in Venice, and we were standing one magically beautiful day at the windows of our room on the Riva degli Schiavoni and were looking across the blue lagoon on which that day there was more movement than usual. English ships were expected and were to be given a ceremonial reception. Suddenly my wife cried out gaily as a child: 'Here comes the English warship!' In the dream I was frightened at these same words. (We see once again that speeches in a dream are derived from speeches in real life; I shall show shortly that the element 'English' in my wife's exclamation did not elude the dream-work either.) Here, then, in the process of changing the dream-thoughts into the manifest dream-content, I have transformed cheerfulness into fear, and I need only hint that this transformation was itself giving expression to a portion of the latent dream-content. This example proves, however, that the dream-work is at liberty to detach an affect from its connections in the dream-thoughts and introduce it at any other point it chooses in the manifest dream.

Because, as the analysis showed, the most agreeable and satisfying thoughts contributed to bringing the dream about. What at once occurred to me in the analysis were the Augean stables which were cleansed by Hercules. This Hercules was I. The hill and bushes came from Aussee, where my children were stopping at the time. I had discovered the infantile aetiology of the neuroses and had thus saved my own children from falling ill. The seat (except, of course, for the hole) was an exact copy of a piece of furniture which had been given to me as a present by a grateful woman patient. It thus reminded me of how much my patients honoured me. Indeed, even the museum of human excrement could be given an interpretation to rejoice my heart. However much I might be disgusted by it in reality, in the dream it was a reminiscence of the fair land of Italy where, as we all know, the W.C.s in the small towns are furnished in precisely this way. The stream of urine which washed everything clean was an unmistakable sign of greatness. It was in that way that Gulliver extinguished the great fire in Lilliput though incidentally this brought him into disfavour with its tiny queen. But Gargantua, too, Rabelais' superman, revenged himself in the same way on the Parisians by sitting astride on Notre Dame and turning his stream of urine upon the city. It was only on the previous evening before going to sleep that I had been turning over Garnier's illustrations to Rabelais. And, strangely enough, here was another piece of evidence that I was the superman. The platform of Notre Dame was my favourite resort in Paris; every free afternoon I used to clamber about there on the towers of the church between the monsters and the devils. The fact that all the faeces disappeared so quickly under the stream recalled the motto: 'Afflavit et dissipati sunt', which I intended one day to put at the head of a chapter upon the therapy of hysteria.
And now for the true exciting cause of the dream. It had been a hot summer afternoon; and during the evening I had delivered my lecture on the connection between hysteria and the perversions, and everything I had had to say displeased me intensely and seemed to me completely devoid of any value. I was tired and felt no trace of enjoyment in my difficult work; I longed to be away from all this grubbing about in human dirt and to be able to join my children and afterwards visit the beauties of Italy. In this mood I went from the lecture room to a café, where I had a modest snack in the open air, since I had no appetite for food. One of my audience, however, went with me and he begged leave to sit by me while I drank my coffee and choked over my crescent roll. He began to flatter me: telling me how much he had learnt from me, how he looked at everything now with fresh eyes, how I had cleansed the Augean stables of errors and prejudices in my theory of the neuroses. He told me, in short, that I was a very great man. My mood fitted ill with this paean of praise; I fought against my feeling of disgust, went home early to escape from him, and before going to sleep turned over the pages of Rabelais and read one of Conrad Ferdinand Meyer's short stories, ‘Die Leiden eines Knaben’ ['A Boy's Sorrows'].

[1900a, 913]

We have already come across an excellent example of a reversal of affect of this kind carried out in a dream on behalf of the dream-censorship. In the dream of 'my uncle with the yellow beard' I felt the greatest affection for my friend R., whereas and because the dream-thoughts called him a simpleton. It was from this example of reversal of affect that we derived our first hint of the existence of a dream-censorship. Nor is it necessary to assume, in such cases either, that the dream-work creates contrary affects of this kind out of nothing; it finds them as a rule lying ready to hand in the material of the dream-thoughts, and merely intensifies them with the psychical force arising from a motive of defence, till they can predominate for the purposes of dream-formation. In the dream of my uncle which I have just mentioned, the antithetical, affectionate affect probably arose from an infantile source (as was suggested by the later part of the dream), for the uncle-nephew relationship, owing to the peculiar nature of the earliest experiences of my childhood (cf. the analysis on p. 876 f.) had become the source of all my friendships and all my hatreds.

[1900a, 915]
In this series of dreams dreamt by an author who had been a journeyman tailor in his youth, it is hard to recognize the dominance of wish-fulfilment. All the dreamer's enjoyment lay in his day-time existence, whereas in his dreams he was still haunted by the shadow of an unhappy life from which he had at last escaped. Some dreams of my own of a similar kind have enabled me to throw a little light on the subject. As a young doctor I worked for a long time at the Chemical Institute without ever becoming proficient in the skills which that science demands; and for that reason in my waking life I have never liked thinking of this barren and indeed humiliating episode in my apprenticeship. On the other hand I have a regularly recurring dream of working in the laboratory, of carrying out analyses and of having various experiences there. These dreams are disagreeable in the same way as examination dreams and they are never very distinct. While I was interpreting one of them, my attention was eventually attracted by the word 'analysis', which gave me a key to their understanding. Since those days I have become an 'analyst', and I now carry out analyses which are very highly spoken of, though it is true that they are 'psycho-analyses'. It was now clear to me: if I have grown proud of carrying out analyses of that kind in my daytime life and feel inclined to boast to myself of how successful I have become, my dreams remind me during the night of those other, unsuccessful analyses of which I have no reason to feel proud. They are the punishment dreams of a parvenu, like the dreams of the journeyman tailor who had grown into a famous author. But how does it become possible for a dream, in the conflict between a parvenu's pride and his self-criticism, to side with the latter, and choose as its content a sensible warning instead of an unlawful wish-fulfilment? As I have already said, the answer to this question raises difficulties. We may conclude that the foundation of the dream was formed in the first instance by an exaggeratedly ambitious phantasy, but that humiliating thoughts that poured cold water on the phantasy found their way into the dream instead. It may be remembered that there are masochistic impulses in the mind, which may be responsible for a reversal such as this. I should have no objection to this class of dreams being distinguished from 'wish-fulfilment dreams' under the name of 'punishment dreams'. I should not regard this as implying any qualification of the theory of dreams which I have hitherto put forward; it would be no more than a linguistic expedient for meeting the difficulties of those who find it strange that opposites should converge. But a closer examination of some of these dreams brings something more to light. In an indistinct part of the background of one of my laboratory dreams I was of an age which placed me precisely in the gloomiest and most unsuccessful year of my medical career. I was still without a post and had no idea how I could earn my living; but at the same time I suddenly discovered that I had a choice open to me between several women whom I might marry! So I was once more young, and, more than everything, she was once more young - the woman who had shared all these difficult years with me. The unconscious instigator of the dream was thus revealed as one of the constantly gnawing wishes of a man who is growing older. The conflict raging in other levels of the mind between vanity and self-criticism had, it is true, determined the content of the dream; but it was only the more deeply-rooted wish for youth that had made it possible for that conflict to appear as a dream. Even when we are awake we sometimes say to ourselves: "Things are going very well to-day and times were hard in the old days; all the same, it was lovely then - I was still young."
I have not yet related the exciting cause of the dream. It was of great importance and led deep into an understanding of the dream. I had heard from my friend in Berlin, whom I have referred to as 'Fl.', that he was about to undergo an operation and that I should get further news of his condition from some of his relatives in Vienna. The first reports I received after the operation were not reassuring and made me feel anxious. I should have much preferred to go to him myself, but just at that time I was the victim of a painful complaint which made movement of any kind a torture to me. The dream-thoughts now informed me that I feared for my friend's life. His only sister, whom I had never known, had, as I was aware, died in early youth after a very brief illness. (In the dream Fl. spoke about his sister and said that in three quarters of an hour she was dead.) I must have imagined that his constitution was not much more resistant than his sister's and that, after getting some much worse news of him, I should make the journey after all - and arrive too late, for which I might never cease to reproach myself.¹ This reproach for coming too late became the central point of the dream but was represented by a scene in which Brücke, the honoured teacher of my student years, levelled this reproach at me with a terrible look from his blue eyes. It will soon appear what it was that caused the situation to be switched on to these lines. The scene itself could not be reproduced by the dream in the form in which I experienced it. The other figure in the dream was allowed to keep the blue eyes, but the annihilating role was allotted to me - a reversal which was obviously the work of wish-fulfilment. My anxiety about my friend's recovery, my self-reproaches for not going to see him, the shame I felt about this - he had come to Vienna (to see me) 'unobtrusively' - the need I felt to consider that I was excused by my illness - all of this combined to produce the emotional storm which was clearly perceived in my sleep and which raged in this region of the dream-thoughts. [1900a, 922]

But there was something else in the exciting cause of the dream, which had a quite opposite effect upon me. Along with the unfavourable reports during the first few days after the operation, I was given a warning not to discuss the matter with anyone. I had felt offended by this because it implied an unnecessary distrust of my discretion. I was quite aware that these instructions had not emanated from my friend but were due to tactlessness or over-anxiety on the part of the intermediary, but I was very disagreeably affected by the veiled reproach because it was - not wholly without justification. As we all know, it is only reproaches which have something in them that 'stick'; it is only they that upset us. What I have in mind does not relate, it is true, to this friend, but to a much earlier period of my life. On that occasion I caused trouble between two friends (both of whom had chosen to honour me, too, with that name) by quite unnecessarily telling one of them, in the course of conversation, what the other had said about him. At that time, too, reproaches had been levelled at me, and they were still in my memory. One of the two friends concerned was Professor Fleischl; I may describe the other by his first name of 'Josef' - which was also that of P., my friend and opponent in the dream. [1900a, 923]

The reproach of being unable to keep anything to myself was attested in the dream by the element 'unobtrusive' and by Fl.'s question as to how much I had told P. about his affairs. But it was the intervention of this memory that transported the reproach against me for coming too late from the present time to the period at which I had worked in Brücke's laboratory. And, by turning the second person in the scene of annihilation in the dream into a Josef, I made the scene represent not only the reproach against me for coming too late but also the far more strongly repressed reproach that I was unable to keep a secret. Here the processes of condensation and displacement at work in the dream, as well as the reasons for them, are strikingly visible. [1900a, 923]
My present-day anger, which was only slight, over the warning I had been given not to give anything away received reinforcements from sources in the depth of my mind and thus swelled into a current of hostile feelings against persons of whom I was in reality fond. The source of this reinforcement flowed from my childhood. I have already shown how my warm friendships as well as my enmities with contemporaries went back to my relations in childhood with a nephew who was a year my senior; how he was my superior, how I early learned to defend myself against him, how we were inseparable friends, and how, according to the testimony of our elders, we sometimes fought with each other and - made complaints to them about each other. All my friends have in a certain sense been re-incarnations of this first figure who ‘früh sich einst dem trüben Blick gezeigt’: they have been revenants. My nephew himself re-appeared in my boyhood, and at that time we acted the parts of Caesar and Brutus together. My emotional life has always insisted that I should have an intimate friend and a hated enemy. I have always been able to provide myself afresh with both, and it has not infrequently happened that the ideal situation of childhood has been so completely reproduced that friend and enemy have come together in a single individual - though not, of course, both at once or with constant oscillations, as may have been the case in my early childhood.

[1900a, 924]

I do not propose at this point to discuss how it is that in such circumstances as these a recent occasion for the generation of an affect can hark back to an infantile situation and be replaced by that situation as far as the production of affect is concerned. This question forms part of the psychology of unconscious thinking, and would find its proper place in a psychological elucidation of the neuroses. For the purposes of dream-interpretation let us assume that a childhood memory arose, or was constructed in phantasy, with some such content as the following. The two children had a dispute about some object. (What the object was may be left an open question, though the memory or pseudo-memory had a quite specific one in view.) Each of them claimed to have got there before the other and therefore to have a better right to it. They came to blows and might prevailed over right. On the evidence of the dream, I may myself have been aware that I was in the wrong (‘I myself noticed the mistake’). However, this time I was the stronger and remained in possession of the field. The vanquished party hurried to his grandfather - my father - and complained about me, and I defended myself in the words which I know from my father's account: ‘I hit him 'cos he hit me.’ This memory, or more probably phantasy, which came into my mind while I was analysing the dream - without further evidence I myself could not tell how - constituted an intermediate element in the dream-thoughts, which gathered up the emotions raging in them as a well collects the water that flows into it. From this point the dream-thoughts proceeded along some such lines as these: ‘It serves you right if you had to make way for me. Why did you try to push me out of the way? I don't need you, I can easily find someone else to play with', and so on. These thoughts now entered upon the paths which led to their representation in the dream. There had been a time when I had had to reproach my friend Josef for an attitude of this same kind: ‘Ôte-toi que je m'y mette!’ He had followed in my footsteps as demonstrator in Brücke's laboratory, but promotion there was slow and tedious. Neither of Brücke's two assistants was inclined to budge from his place, and youth was impatient. My friend, who knew that he could not expect to live long, and whom no bonds of intimacy attached to his immediate superior, sometimes gave loud expression to his impatience, and, since this superior was seriously ill, P.'s wish to have him out of the way might have an uglier meaning than the mere hope for the man's promotion. Not unnaturally, a few years earlier, I myself had nourished a still livelier wish to fill a vacancy. Wherever there is rank and promotion the way lies open for wishes that call for suppression. Shakespeare's Prince Hal could not, even at his father's sick-bed, resist the temptation of trying on the crown. But, as was to be expected, the dream punished my friend, and not me, for this callous wish.²

[1900a, 924]
It will be noticed that the name Josef plays a great part in my dreams (cf. the dream about my uncle). My own ego finds it very easy to hide itself behind people of that name, since Joseph was the name of a man famous in the Bible as an interpreter of dreams.

[1900a, 924]

It cannot be denied that to interpret and report one's dreams demands a high degree of self-discipline. One is bound to emerge as the only villain among the crowd of noble characters who share one's life. Thus it seemed to me quite natural that the revenants should only exist for just so long as one likes and should be removable at a wish. We have seen what my friend Josef was punished for. But the revenants were a series of reincarnations of the friend of my childhood. It was therefore also a source of satisfaction to me that I had always been able to find successive substitutes for that figure; and I felt I should be able to find a substitute for the friend whom I was now on the point of losing: no one was irreplaceable.

[1900a, 925]

Thus this group of thoughts was connected once again with the intermediate thought in the latent content of the dream from which the associative paths diverged in contrary directions: 'No one is irreplaceable!' 'There are nothing but revenants: all those we have lost come back!' And now the associative links between the contradictory components of the dream-thoughts were drawn closer by the chance fact that my friend's baby daughter had the same name as the little girl I used to play with as a child, who was of my age and the sister of my earliest friend and opponent. It gave me great satisfaction when I heard that the baby was to be called 'Pauline.' And as an allusion to this coincidence, I had replaced one Josef by another in the dream and found it impossible to suppress the similarity between the opening letters of the names 'Fleischl' and 'FI.' From here my thoughts went on to the subject of the names of my own children. I had insisted on their names being chosen, not according to the fashion of the moment, but in memory of people I have been fond of. Their names made the children into revenants. And after all, I reflected, was not having children our only path to immortality?

[1900a, 926]

¹ [Footnote added 1909:] In my 'Fragment of an Analysis of a Case of Hysteria' (1905e), I have analysed a good specimen of a dream of this sort, made up of a number of superimposed phantasies. Incidentally, I underestimated the importance of the part played by these phantasies in the formation of dreams so long as I was principally working on my own dreams, which are usually based on discussions and conflict of thought and comparatively rarely on day-dreams. In the case of other people it is often much easier to demonstrate the complete analogy between night-dreams and day-dreams. With hysterical patients, a hysterical attack can often be replaced by a dream; and it is then easy to convince oneself that the immediate forerunner of both these psychical structures was a day-dream phantasy.

[1900a, 933]
An observation which I have been able to make in the course of preparing this manuscript has shown me that dreams are no more forgotten than other mental acts and can be compared, by no means to their disadvantage, with other mental functions in respect of their retention in the memory. I had kept records of a large number of my own dreams which for one reason or another I had not been able to interpret completely at the time or had left entirely uninterpreted. And now, between one and two years later, I have attempted to interpret some of them for the purpose of obtaining more material in illustration of my views. These attempts have been successful in every instance; indeed the interpretation may be said to have proceeded more easily after this long interval than it did at the time when the dream was a recent experience. A possible explanation of this is that in the meantime I have overcome some of the internal resistances which previously obstructed me. When making these subsequent interpretations I have compared the dream-thoughts that I elicited at the time of the dream with the present, usually far more copious, yield, and I have always found that the old ones are included among the new. My astonishment at this was quickly halted by the reflection that I had long been in the habit of getting my patients, who sometimes tell me dreams dating from earlier years, to interpret them - by the same procedure and with the same success - as though they had dreamt them the night before. When I come to discuss anxiety-dreams I shall give two examples of postponed interpretations like these. I was led into making my first experiment of this kind by the justifiable expectation that in this as in other respects dreams would behave like neurotic symptoms. When I treat a psychoneurotic - a hysteric, let us say - by psycho-analysis, I am obliged to arrive at an explanation for the earliest and long since vanished symptoms of his illness no less than for the contemporary ones which brought him to me for treatment; and I actually find the earlier problem easier to solve than the immediate one. As long ago as in 1895 I was able to give an explanation in *Studies on Hysteria* of the first hysterical attack which a woman of over forty had had in her fifteenth year.¹

[1900a, 956]

This indication of the way in which infantile scenes (or their reproductions as phantasies) function in a sense as models for the content of dreams, removes the necessity for one of the hypotheses put forward by Scherner and his followers in regard to internal sources of stimulation. Scherner supposes that, when dreams exhibit particularly vivid or particularly copious visual elements, there is present a state of 'visual stimulation', that is, of internal excitation in the organ of vision. We need not dispute this hypothesis, but can content ourselves with assuming that this state of excitation applies merely to the *psychical* perceptual system of the visual organ; we may, however, further point out that the state of excitation has been set up by a *memory*, that it is a *revival* of a visual excitation which was originally an immediate one. I cannot produce any good example from my own experience of an *infantile* memory producing this kind of result. My dreams are in general less rich in sensory elements than I am led to suppose is the case in other people. But in the case of my most vivid and beautiful dream of the last few years I was easily able to trace back the hallucinatory clarity of the dream's content to the sensory qualities of recent or fairly recent impressions. On p. 907 ff. I recorded a dream in which the deep blue colour of the water, the brown of the smoke coming from the ship's funnels, and the dark brown and red of the buildings left behind a profound impression on me. This dream, if any, should be traceable, to a visual stimulus. What was it that had brought my visual organ into this state of stimulation? A recent impression, which attached itself to a number of earlier ones. The colours which I saw were in the first instance those of a box of toy bricks with which, on the day before the dream, my children had put up a fine building and shown it off for my admiration. The big bricks were of the same dark red and the small ones were of the same blue and brown. This was associated with colour impressions from my last travels in Italy: the beautiful blue of the Isonzo and the lagoons and the brown of the Carso. The beauty of the colours in the dream was only a repetition of something seen in my memory.

[1900a, 979]
Let us take one of the dreams I have already recorded - for instance, the one in which my friend Otto appeared with the signs of Graves' disease. (See p. 746 ff.) I had been worried during the previous day by Otto's looks; and, like everything else concerned with him, this worry affected me closely. And it pursued me, as I may assume, into my sleep. I was probably anxious to discover what could be wrong with him. This worry found expression during the night in the dream I have described, the content of which was in the first place nonsensical and in the second place was in no respect the fulfillment of a wish. I then began to investigate the origin of this inappropriate expression of the worry I had felt during the day, and by means of analysis I found a connection through the fact of my having identified my friend with a certain Baron L. and myself with Professor R. There was only one explanation of my having been obliged to choose this particular substitute for my daytime thought. I must have been prepared at all times in my Ucs. to identify myself with Professor R., since by means of that identification one of the immortal wishes of childhood - the megalomaniac wish - was fulfilled. Ugly thoughts hostile to my friend, which were certain to be repudiated during the day, had seized the opportunity of slipping through with the wish and getting themselves represented in the dream; but my daytime worry had also found some sort of expression in the content of the dream by means of a substitute. The daytime thought, which was not in itself a wish but on the contrary a worry, was obliged to find a connection in some way or other with an infantile wish which was now unconscious and suppressed, and which would enable it - suitably decocted, it is true - to 'originate' in consciousness. The more dominating was the worry, the more far-fetched a link could be established; there was no necessity for there being any connection whatever between the content of the wish and that of the worry, and in fact no such connection existed in our example.
[1900a, 988]
Once again it is impossible for me to present a complete analysis. I must restrict myself to bringing out a few salient points. Distressing anticipations from the previous day were what gave rise to the dream: we had once more been without news of our son at the front for over a week. It is easy to see that the content of the dream expressed a conviction that he had been wounded or killed. Energetic efforts were clearly being made at the beginning of the dream to replace the distressing thoughts by their contrary. I had some highly agreeable news to communicate - something about money being sent . . . distinction . . . distribution. (The sum of money was derived from an agreeable occurrence in my medical practice; it was an attempt at a complete diversion from the topic.) But these efforts failed. My wife suspected something dreadful and refused to listen to me. The disguises were too thin and references to what it was sought to repress pierced through them everywhere. If my son had been killed, his fellow-officers would send back his belongings and I should have to distribute what he left among his brothers and sisters and other people. A 'distinction' is often awarded to an officer who has fallen in battle. Thus the dream set about giving direct expression to what it had first sought to deny, though the inclination towards wish-fulfilment was still shown at work in the distortions. (The change of locality during the dream is no doubt to be understood as what Silberer has described as 'threshold symbolism'. We cannot tell, it is true, what it was that provided the dream with the motive force for thus giving expression to my distressing thoughts. My son did not appear as someone 'falling' but as someone 'climbing.' He had in fact been a keen mountaineer. He was not in uniform but in sports clothes; this meant that the place of the accident that I now feared had been taken by an earlier, sporting one; for he had had a fall during a skiing expedition and broken his thigh. The way in which he was dressed, on the other hand, which made him look like a seal, at once recalled someone younger - our funny little grandson; while the grey hair reminded me of the latter's father, our son-in-law, who had been hard hit by the war. What could this mean? . . . but I have said enough of it. - The locality in a store-closet and the cupboard from which he wanted to take something ('on which he wanted to put something' in the dream) - these allusions reminded me unmistakably of an accident of my own which I had brought on myself when I was between two and three years old. I had climbed up on to a stool in the store-closet to get something nice that was lying on a cupboard or table. The stool had tipped over and its corner had struck me behind my lower jaw; I might easily, I reflected, have knocked out all my teeth. The recollection was accompanied by an admonitory thought: 'that serves you right'; and this seemed as though it was a hostile impulse aimed at the gallant soldier. Deeper analysis at last enabled me to discover what the concealed impulse was which might have found satisfaction in the dreaded accident to my son: it was the envy which is felt for the young by those who have grown old, but which they believe they have completely stifled. And there can be no question that it was precisely the strength of the painful emotion which would have arisen if such a misfortune had really happened that caused that emotion to seek out a repressed wish-fulfilment of this kind in order to find some consolation. [1900a, 991]
It is dozens of years since I myself had a true anxiety-dream, but I remember one from my seventh or eighth year, which I submitted to interpretation some thirty years later. It was a very vivid one, and in it I saw my beloved mother, with a peculiarly peaceful, sleeping expression on her features, being carried into the room by two (or three) people with bird's beaks and laid upon the bed. I awoke in tears and screaming, and interrupted my parents' sleep. The strangely draped and unnaturally tall figures with birds' beaks were derived from the illustrations to Philippson's Bible. I fancy they must have been gods with falcons' heads from an ancient Egyptian funerary relief. Besides this, the analysis brought to mind an ill-mannered boy, a son of a concierge, who used to play with us on the grass in front of the house when we were children, and who I am inclined to think was called Philipp. It seems to me that it was from this boy that I first heard the vulgar term for sexual intercourse, instead of which educated people always use a Latin word, 'to copulate', and which was clearly enough indicated by the choice of the falcons' heads. I must have guessed the sexual significance of the word from the face of my young instructor, who was well acquainted with the facts of life. The expression on my mother's features in the dream was copied from the view I had had of any grandfather a few days before his death as he lay snoring in a coma. The interpretation carried out in the dream by the 'secondary revision' must therefore have been that my mother was dying; the funerary relief fitted in with this. I awoke in anxiety, which did not cease till I had woken my parents up. I remember that I suddenly grew calm when I saw my mother's face, as though I had needed to be reassured that she was not dead. But this 'secondary' interpretation of the dream had already been made under the influence of the anxiety which had developed. I was not anxious because I had dreamt that my mother was dying; but I interpreted the dream in that sense in my preconscious revision of it because I was already under the influence of the anxiety. The anxiety can be traced back, when repression is taken into account, to an obscure and evidently sexual craving that had found appropriate expression in the visual content of the dream.

And now a second association to 'table d'hôte.' A few weeks ago, while we were at table in a hotel at a mountain resort in the Tyrol, I was very much annoyed because I thought my wife was not being sufficiently reserved towards some people sitting near us whose acquaintance I had no desire at all to make. I asked her to concern herself more with me than with these strangers. This was again as though I were getting the worst of the bargain at the table. I was struck too by the contrast between my wife's behaviour at table and that of Frau E. L. in the dream, who 'turned her whole attention to me.'

To proceed. I now saw that the events in the dream were a reproduction of a small episode of a precisely similar kind which occurred between my wife and me at the time at which I was secretly courting her. The caress which she gave me under the table-cloth was her reply to a pressing love letter. In the dream, however, my wife was replaced by a comparative stranger - E. L.

Frau E. L. is the daughter of a man to whom I was once in debt. I could not help noticing that this revealed an unsuspected connection between parts of the content of the dream and my associations. If one follows the train of association starting out from one element of a dream's content, one is soon brought back to another of its elements. My associations to the dream were bringing to light connections which were not visible in the dream itself.
If a person expects one to keep an eye on his interests without any advantage to oneself, his artlessness is apt to provoke the scornful question: 'Do you suppose I'm going to do this or that for the sake of your beaux yeux [beautiful eyes]?' That being so, Frau E. L.'s speech in the dream, 'You've always had such beautiful eyes', can only have meant: 'People have always done everything for you for love; you have always had everything without paying for it.' The truth is, of course, just the contrary: I have always paid dearly for whatever advantage I have had from other people. The fact that my friend took me home yesterday in a cab without my paying for it must, after all, have made an impression on me.

As I now perceived, almost all the elements of the dream's content had been brought into the new context. For the sake of consistency, however, the further question might be asked of why spinach, of all things, was being served in the dream. The answer was that spinach reminded me of an episode which occurred not long ago at our family table, when one of the children - and precisely the one who really deserves to be admired for his beautiful eyes - refused to eat any spinach. I myself behaved in just the same way when I was a child; for a long time I detested spinach, till eventually my taste changed and promoted that vegetable into one of my favourite foods. My own early life and my child's were thus brought together by the mention of this dish. 'You ought to be glad to have spinach', the little gourmet's mother exclaimed; 'there are children who would be only too pleased to have spinach.' Thus I was reminded of the duties of parents to their children. Goethe's words

If we pursue the dream-thoughts further, we shall keep on finding ridicule and derision as correlates of the absurdities of the manifest dream. It is well known that it was the discovery of the split skull of a sheep on the Lido of Venice that gave Goethe the idea of the so-called 'vertebral' theory of the skull. My friend boasts that, when he was a student, he released a storm which led to the resignation of an old Professor who, though he had once been distinguished (among other things in connection precisely with the same branch of comparative anatomy), had become incapable of teaching owing to senile dementia. Thus the agitation which my friend promoted served to combat the mischievous system according to which there is no age limit for academic workers in German universities - for age is proverbially no defence against folly. - In the hospital here I had the honour of serving for years under a chief who had long been a fossil and had for decades been notoriously feeble minded, but who was allowed to continue carrying on his responsible duties. At this point I thought of a descriptive term based upon the discovery on the Lido.¹ Some of my young contemporaries at the hospital concocted, in connection with this man, a version of what was then a popular song: 'Das hat kein Goethe g'schrieben, das hat kein Schiller g'dicht . . .'²

¹ [1901a, 1056]
² [1901a, 1079]
I now return to the forgetting of names. So far we have not exhaustively considered either the case-material or the motives behind it. As this is exactly the kind of parapraxis that I can from time to time observe abundantly in myself, I am at no loss for examples. The mild attacks of migraine from which I still suffer usually announce themselves hours in advance by my forgetting names, and at the height of these attacks, during which I am not forced to abandon my work, it frequently happens that all proper names go out of my head. Now it is precisely cases like mine which could furnish the grounds for an objection on principle to our analytic efforts. Should it not necessarily be concluded from such observations that the cause of forgetfulness, and in particular of the forgetting of names, lies in circulatory and general functional disturbances of the cerebrum, and should we not therefore spare ourselves the search for psychological explanations of these phenomena? Not at all, in my view; that would be to confuse the mechanism of a process, which is of the same kind in all cases, with the factors favouring the process, which are variable and not necessarily essential. Instead of a discussion, however, I shall bring forward an analogy to deal with the objection.

[1901b, 1117]

(11) The next example, too, shows how a personal complex which is dominating someone at the time may cause a name to be forgotten in some very remote connection.

[1901b, 1125]

"Two men, an older and a younger one, who six months before had made a trip together in Sicily, were exchanging recollections of those pleasant and memorable days. "Let's see," said the younger, "what was the name of the place where we spent the night before making our trip to Selinunte? Wasn't it Calatafimi?" The older one rejected it: "No, it certainly wasn't, but I've forgotten the name too, though I recall most clearly all the details of our stay there. I only need to find someone else has forgotten a name, and it at once makes me forget it too. Let's look for the name. But the only thing that occurs to me is Caltanissetta, which certainly isn't right." "No," said the younger man, "the name begins with a 'w' or has a 'w' in it." "But there's no 'w' in Italian," objected the older. "I really meant a 'v', and I only said 'w' because I'm so used to it in my own language." The older man still opposed the "v". "As a matter of fact," he declared, "I believe I've forgotten a lot of the Sicilian names already; this would be a good time to make some experiments. For example, what was the name of the place on a hill that was called Enna in antiquity? Oh, I know - Castrogiovanni." The next moment the younger man had recalled the lost name as well. "Castelvetrano," he exclaimed, and was pleased at being able to point to the "v" he had insisted on. For a short while the older one had no sense of recognition; but after he had accepted the name it was for him to explain why he had forgotten it. "Obviously," he said, "because the second half, '-vetrano', sounds like 'veteran'. I know I don't much like to think about growing old, and I have strange reactions when I'm reminded of it. For instance, I recently charged a very dear friend of mine in the strangest terms with having 'left his youth far behind him', for the reason that once before, in the middle of the most flattering remarks about me, he had added that I was 'no longer a young man'. Another sign that my resistance was directed against the second half of the name Castelvetrano is that the initial sound recurred in the substitute name Caltanisetta." "What about the name Caltanisetta itself?" asked the younger man. "That," confessed the older one, "has always seemed to me like a pet name for a young woman."

[1901b, 1125]
When war broke out with Italy in 1915 I was able to make the observation upon myself that a whole quantity of Italian place-names which at ordinary times were readily available to me had suddenly been withdrawn from my memory. Like so many other Germans I had made it my habit to spend a part of my holidays on Italian soil, and I could not doubt that this large-scale forgetting of names was the expression of an understandable hostility to Italy which had now replaced my former partiality. In addition to this directly motivated forgetting of names, however, an indirect amnesia could also be detected, which it was possible to trace back to the same influence. I showed a tendency to forget non-Italian place-names as well; and on investigating the incidents I found that these names were in some way connected by means of remote similarities of sound with the proscribed enemy names. Thus I tormented myself one day in trying to recall the name of the Moravian town of Bisenz. When it finally came to my mind I at once recognized that this act of forgetting was to be laid to the charge of the Palazzo Bisenzi at Orvieto. The Hotel Belle Arti, where I had stayed on all my visits to Orvieto, is located in this palazzo. The most precious memories had naturally been the most severely damaged by the change in my emotional attitude.

Remembering in adults, as is well known, makes use of a variety of psychical material. Some people remember in visual images; their memories have a visual character. Other people can scarcely reproduce in their memory even the scantiest outlines of what they have experienced. Following Charcot's proposal, such people are called *auditifs* and *moteurs* in contrast to the *visuels*. In dreams these distinctions disappear: we all dream predominantly in visual images. But this development is similarly reversed in the case of childhood memories: they are plastically visual even in people whose later function of memory has to do without any visual element. Visual memory accordingly preserves the type of infantile memory. In my own case the earliest childhood memories are the only ones of a visual character: they are regular scenes worked out in plastic form, comparable only to representations on the stage. In these scenes of childhood, whether in fact they prove to be true or falsified, what one sees invariably includes oneself as a child, with a child's shape and clothes. This circumstance must cause surprise: in their recollections of later experiences adult *visuels* no longer see themselves. Furthermore it contradicts all that we have learnt to suppose that in his experiences a child's attention is directed to himself instead of exclusively to impressions from outside. One is thus forced by various considerations to suspect that in the so-called earliest childhood memories we possess not the genuine memory-trace but a later revision of it, a revision which may have been subjected to the influences of a variety of later psychical forces. Thus the 'childhood memories' of individuals come in general to acquire the significance of 'screen memories' and in doing so offer a remarkable analogy with the childhood memories that a nation preserves in its store of legends and myths.

A man of twenty-four has preserved the following picture from his fifth year. He is sitting in the garden of a summer villa, on a small chair beside his aunt, who is trying to teach him the letters of the alphabet. He is in difficulties over the difference between *m* and *n* and he asks his aunt to tell him how to know one from the other. His aunt points out to him that the *m* has a whole piece more than the *n* - the third stroke. There appeared to be no reason for challenging the trustworthiness of this childhood memory; it had, however, only acquired its meaning at a later date, when it showed itself suited to represent symbolically another of the boy's curiosities. For just as at that time he wanted to know the difference between *m* and *n*, so later he was anxious to find out the difference between boys and girls, and would have been very willing for this particular aunt to be the one to teach him. He also discovered then that the difference was a similar one - that a boy, too, has a whole piece more than a girl; and at the time when he acquired this piece of knowledge he called up the recollection of the parallel curiosity of his childhood.

[1901b, 1127]

[1901b, 1141]

[1901b, 1142]
I should like now to give a single example of the way in which a childhood memory, which previously appeared to have no meaning, can acquire one as a result of being worked over by analysis. When I began in my forty-third year to direct my interest to what was left of my memory of my own childhood there came to my mind a scene which had for a long while back (from the remotest past, as it seemed to me) come into consciousness from time to time, and which I had good evidence for assigning to a date before the end of my third year. I saw myself standing in front of a cupboard demanding something and screaming, while my half-brother, my senior by twenty years, held it open. Then suddenly my mother, looking beautiful and slim, walked into the room, as if she had come in from the street. These were the words in which I described the scene, of which I had a plastic picture, but I did not know what more I could make of it. Whether my brother wanted to open or shut the cupboard - in my first translation of the picture I called it a 'wardrobe' - why I was crying, and what the arrival of my mother had to do with it all this was obscure to me. The explanation I was tempted to give myself was that what was in question was a memory of being teased by my elder brother and of my mother putting a stop to it. Such misunderstandings of a childhood scene which is preserved in the memory are by no means rare: a situation is recalled, but it is not clear what its central point is, and one does not know on which of its elements the psychical accent is to be placed. Analytic effort led me to take a quite unexpected view of the picture. I had missed my mother, and had come to suspect that she was shut up in this wardrobe or cupboard; and it was for that reason that I was demanding that my brother should open the cupboard. When he did what I asked and I had made certain that my mother was not in the cupboard, I began to scream. This is the moment that my memory has held fast; and it was followed at once by the appearance of my mother, which allayed my anxiety or longing. But how did the child get the idea of looking for his absent mother in the cupboard? Dreams which I had at the same time contained obscure allusions to a nurse of whom I had other recollections, such as, for example, that she used to insist on my dutifully handing over to her the small coins I received as presents - a detail which can itself claim to have the value of a screen memory for later experiences. I accordingly resolved that this time I would make the problem of interpretation easier for myself and would ask my mother, who was by then grown old, about the nurse. I learned a variety of details, among them that this clever but dishonest person had carried out considerable thefts in the house during my mother's confinement and had been taken to court on a charge preferred by my half-brother. This information threw a flood of light on the childhood scene, and so enabled me to understand it. The sudden disappearance of the nurse had not been a matter of indifference to me: the reason why I had turned in particular to this brother, and had asked him where she was, was probably because I had noticed that he played a part in her disappearance; and he had answered in the elusive and punning fashion that was characteristic of him: 'She's "boxed up".' At the time, I understood this answer in a child's way, but I stopped asking any more questions as there was nothing more to learn. When my mother left me a short while later, I suspected that my naughty brother had done the same thing to her that he had done to the nurse and I forced him to open the cupboard for me. I now understand, too, why in the translation of this visual childhood scene my mother's slimness was emphasized: it must have struck me as having just been restored to her. I am two and a half years older than the sister who was born at that time, and when I was three years old my half-brother and I ceased living in the same place.
'If you want to buy carpets,' a lady said to me, 'you must go to Kaufmann [a proper name, also meaning 'merchant'] in the Matthäusgasse [Matthew Street]. I think I can give you recommendation there.' 'At Matthäus . . .' I repeated, 'I mean Kaufmann's.' My repeating one name in the other's place looks like a result of my thoughts being distracted. They really were distracted by what the woman said, for she diverted my attention to something much more important to me than carpets. As a matter of fact, the house in which my wife lived when she was my fiancée was in the Matthäusgasse. The entrance to the house was in another street, and I now noticed that I had forgotten its name and could only make it conscious in a round about way. The name Matthäus, which I was lingering over, was therefore a substitute name for the forgotten street-name. It was more suitable for this purpose than the name Kaufmann, for Matthäus is exclusively a personal name, while Kaufmann is not, and the forgotten street also bears the name of a person: Radetzky.
[1901b, 1156]
(2) How did I come to read in a newspaper one day: 'Im Fass across Europe', instead of 'Zu Fuss'? Solving this problem caused me prolonged difficulties. The first associations, it is true, indicated that it must have been the tub of Diogenes that I had in mind; and I had recently been reading about the art of the age of Alexander in a history of art. From there it was easy to recall Alexander's celebrated remark: 'If I were not Alexander I should like to be Diogenes.' I also had some dim recollection of a certain Hermann Zeitung¹ who had set out on his travels packed in a trunk. But the train of associations declined to run on further, and I did not succeed in rediscovering the page in the history of art on which the remark had caught my eye. It was not till months later that the problem, which I had meanwhile set aside, suddenly sprang to my mind once more; and this time it brought its solution with it. I recalled the comment of a newspaper article on the strange means of transport that people were then choosing in order to go to Paris for the International Exhibition; and the passage, I believe, went on with a joking account of now one gentleman intended to get himself rolled in a tub to Paris by another gentleman. Needless to say the only motive of these people would be to draw attention to themselves by such folly. Hermann Zeitung was in fact the name of the man who had provided the first instance of such extraordinary methods of transport. It then struck me that I once treated a patient whose pathological anxiety about reading newspapers was to be explained as a reaction against his pathological ambition to see himself in print and to read of his fame in the newspapers. Alexander of Macedon was undoubtedly one of the most ambitious men that ever lived. He even complained that he would find no Homer to sing of his exploits. But how could I possibly have failed to recall that there is another Alexander who is closer to me, that Alexander is the name of my younger brother? I now immediately found the objectionable thought about this other Alexander that had had to be repressed, and what it was that had given rise to it at the present time. My brother is an authority on matters connected with tariffs and transport, and at a certain date he was due to receive the title of professor for his work in teaching at a commercial college. Several years ago my own name had been suggested at the University for the same promotion, without my having obtained it. At the time, our mother expressed her surprise that her younger son was to become a professor before her elder. This had been the situation when I was unable to solve my mistake in reading. Subsequently my brother too met with difficulties; his prospects of becoming professor sank even lower than my own. But at that point the meaning of the misreading suddenly became clear to me; it was as though the fading of my brother's prospects had removed an obstacle. I had behaved as if I was reading of my brother's appointment in the newspaper and was saying to myself: 'How curious that a person can appear in the newspaper (i.e. can be appointed professor) on account of such stupidities (which is what his profession amounts to)!' Afterwards I had no difficulty in finding the passage about Hellenistic art in the age of Alexander, and to my astonishment convinced myself that in my previous search I had repeatedly read parts of the same page and had each time passed over the relevant sentence as if I was under the dominance of a negative hallucination. However, this sentence did not contain anything at all to enlighten me - anything that would have deserved to be forgotten. I suspect that the symptom consisting of my failure to find the passage in the book was only formed with the purpose of leading me astray. I was intended to search for a continuation of the train of thought in the place where my enquiries encountered an obstacle - that is, in some idea connected with Alexander of Macedon; in this way I was to be more effectively diverted from my brother of the same name. In fact the device was entirely successful; all my efforts were directed towards rediscovering the lost passage in the history of art.

[1901b, 1194]

(4) There is one misreading which I find irritating and laughable and to which I am prone whenever I walk through the streets of a strange town on my holidays. On these occasions I read every shop sign that resembles the word in any way as 'Antiquities'. This betrays the questing spirit of the collector.

[1901b, 1196]
With the aim of making a small contribution to our knowledge of the determinants of forgetting, I make it my practice to submit to a psychological analysis those cases in which I myself forget something. I am as a rule only concerned with a certain group of these cases, namely those in which the forgetting surprises me because I should have expected to know the thing in question. I may add that I am not in general inclined to forget things (things I have experienced, that is, not things I have learned!), and that for a short period of my youth some unusual feats of memory were not beyond me. When I was a schoolboy I took it as a matter of course that I could repeat by heart the page I had been reading; and shortly before I entered the University I could write down almost verbatim popular lectures on scientific subjects directly after hearing them. In the period of tension before my final medical examination I must have made use once more of what remained of this faculty, for in some subjects I gave the examiners, as though it were automatically, answers which faithfully followed the words of the textbook that I had skimmed through only once in the greatest haste.

[1901b, 1219]

Since then the command that I have over my store of memories has steadily deteriorated; yet right up to the most recent times I have convinced myself over and over again that with the aid of a certain device I can remember far more than I would otherwise have believed possible. When, for instance, a patient in my consulting hour claims that I have seen him before and I can recall neither the fact nor the time, I help myself by guessing: that is to say, I quickly think of a number of years, counting back from the present. In cases where records or more definite information from the patient enable me to check what has come to my mind, they show that I have rarely been more than half a year out in ten.¹ I have a similar experience when I meet a distant acquaintance and out of politeness enquire after his small children. If he describes their progress I try to think at random of the child’s present age. I afterwards check my estimate by what the father tells me; and at the most I am wrong by a month, or with older children by three months, although I am unable to say on what my estimate was based. I have latterly grown so bold that I always produce my estimate spontaneously without running any risk of offending the father by exposing my ignorance about his offspring. In this way I extend my conscious memory by invoking my unconscious memory, which is in any case far more extensive.

[1901b, 1219]

¹ One summer holiday my wife made me greatly annoyed though the cause was innocent enough. We were sitting at table d’hôte opposite a gentleman from Vienna whom I knew and who no doubt remembered me too. However, I had reasons of my own for not renewing the acquaintance. My wife, who had heard no more than his distinguished name, revealed too plainly that she was listening to his conversation with his neighbours, for from time to time she turned to me with questions that took up the thread of their discussion. I became impatient and finally irritated. Some weeks later I was complaining to a relative about this behaviour on my wife’s part but was unable to recall a single word of the gentleman’s conversation. I became impatient and finally irritated. Some weeks later I was complaining to a relative about this behaviour on my wife’s part but was unable to recall a single word of the gentleman’s conversation. As I am normally rather apt to harbour grievances and can forget no detail of an incident that has annoyed me, my amnesia in the present case was probably motivated by consideration for my wife. A short time ago I had a similar experience. I wished to have a good laugh with an intimate friend over a remark made by my wife only a few hours before, but was prevented from doing so by the singular fact that I had utterly forgotten what she had said. I had first to ask my wife to remind me what it was. It is easy to understand my forgetfulness here as being analogous to the typical disturbance of judgement to which we are subject where those nearest to us are concerned.

[1901b, 1220]
(4) Mislaying something is really the same as forgetting where it has been put. Like most people who are occupied with writing and books I know my way about on my writing-table and can lay my hands straight away on what I want. What appears to other people as disorder is for me order with a history behind it. Why, then, did I recently mislay a book-catalogue, which had been sent to me, so that it was impossible to find it? I had in fact intended to order a book, *Über die Sprache*, which was advertised in it, since it was by an author whose witty and lively style I like and whose insight in psychology and knowledge of the history of civilization I have learnt to value. I believe that this is precisely why I mislaid the catalogue. For it is my habit to lend books by this author to my acquaintances for their enlightenment, and a few days previously one of them had remarked as he returned a copy: 'His style reminds me very much of your own, and his way of thinking, too, is the same as yours.' The speaker did not know what he was touching on by that remark. Years before, when I was younger and in greater need of outside contacts, an elder colleague to whom I had praised the writings of a well-known medical author had made almost the same comment: 'It's just your style and your manner.' Prompted by this remark I had written a letter to the author seeking closer relations with him, but had been put in my place by a chilly answer. Perhaps still earlier discouraging experiences as well lie concealed behind this one, for I never found the mislaid catalogue and was in fact deterred by this omen from ordering the advertised book, although the disappearance of the catalogue formed no real hindrance since I could remember the names of both book and author.

[1901b, 1223]

(11) One day in the summer of 1901 I remarked to a friend with whom I used at that time to have a lively exchange of scientific ideas: 'These problems of the neuroses are only to be solved if we base ourselves wholly and completely on the assumption of the original bisexuality of the individual.' To which he replied: 'That's what I told you two and a half years ago at Br. when we went for that evening walk. But you wouldn't hear of it then.' It is painful to be requested in this way to surrender one's originality. I could not recall any such conversation or this pronouncement of my friend's. One of us must have been mistaken and on the *cui prodest?* principle¹ it must have been myself. Indeed, in the course of the next week I remembered the whole incident, which was just as my friend had tried to recall it to me; I even recollected the answer I had given him at the time: 'I've not accepted that yet; I'm not inclined to go into the question.' But since then I have grown a little more tolerant when, in reading medical literature, I come across one of the few ideas with which my name can be associated, and find that my name has not been mentioned.

[1901b, 1228]

Any inaccuracies in my own account of this phantasy could, I assured myself, easily be corrected at home when I had the book in front of me. But when I finally looked through *Le Nabab* to check this passage in my manuscript, which was ready to go to press, I found, to my very great shame and consternation, no mention of any such reverie on the part of Monsieur Jocelyn; in fact the poor book-keeper did not have this name at all but was called Monsieur Joyeuse. This second error quickly gave me the key to the solution of the first one - the paramnesia. 'Joyeux', of which 'Joyeuse' is the feminine form, is the only possible way in which I could translate my own name, Freud, into French. Where then could the phantasy, which I had remembered wrongly and ascribed to Daudet, have come from? It could only be a product of my own, a day-dream which I had formed myself and which had not become conscious or which had once been conscious and had since been totally forgotten. Perhaps I invented it myself in Paris where I frequently walked about the streets, lonely and full of longings, greatly in need of a helper and protector, until the great Charcot took me into his circle. Later I more than once met the author of *Le Nabab* in Charcot's house.¹

[1901b, 1231]
As with the functional disturbances described on earlier pages, I have made a collection of the cases of omitting to do something as a result of forgetting which I have observed in myself, and I have endeavoured to explain them. I have invariably found that they could be traced to interference by unknown and unavowed motives - or, as one may say, to a counter-will. In a number of these cases I found myself in a position which was similar to being under conditions of service; I was under a constraint, against which I had not entirely given up struggling, so that I made a demonstration against it by forgetting. This accounts for the fact that I am especially prone to forget to send congratulations on occasions such as birthdays, anniversaries, wedding celebrations and promotions. I keep on making new resolutions on the subject and become more and more convinced that I shall not succeed. I am now on the point of giving the effort up and of yielding consciously to the motives that oppose it. While I was in a transitional stage, a friend asked me to send a congratulatory telegram on a certain day on his behalf along with my own, but I warned him that I should forget both; and it was not surprising that the prophecy came true. It is due to painful experiences in the course of my life that I am unable to manifest sympathy on occasions where the expression of sympathy must necessarily he exaggerated, as an expression corresponding to the slight amount of my feeling would not be allowable. Since I have come to recognize that I have often mistaken other people's ostensible sympathy for their real feelings, I have been in revolt against these conventional expressions of sympathy, though on the other hand I recognize their social usefulness. Condolences in the case of death are excepted from this divided treatment: once I have decided to send them I do not fail to do so. Where my emotional activity no longer has anything to do with social duty, its expression is never inhibited by forgetting.

In other cases the motives for forgetting are less easy to discover, and when found arouse greater surprise. Thus, for instance, in former years I noticed that, out of a fairly large number of visits to patients, I only forgot those to non-paying patients or to colleagues. My shame at this discovery led me to adopt the habit of making a note beforehand in the morning of the visits I intended to make during the day. I do not know if other doctors have arrived at the same practice by the same road. But in this way we get some idea of what causes the so called neurasthenic patient to jot down, in his notorious 'notes', the various things he wants to tell the doctor. The ostensible reason is that he has no confidence in the reproductive capacity of his memory. That is perfectly correct, but the scene usually proceeds as follows. The patient has recounted his various complaints and enquiries in a very long-winded manner. After he has finished he pauses for a moment, then pulls out the jottings and adds apologetically: 'I've made some notes, as I can't remember things.' As a rule he finds that they contain nothing new. He repeats each point and answers it himself: 'Yes, I've asked about that already.' With the notes he is probably only demonstrating one of his symptoms: the frequency with which his intentions are disturbed through the interference of obscure motives.

I pass on to ailments that afflict the greater number of my healthy acquaintances as well as myself. I confess that - especially in former years - I was very apt to forget to return borrowed books, which I kept for long periods, and that it came about especially easily that I put off paying bills by forgetting them. One morning not long ago I left the tobacconist's where I had made my daily purchase of cigars without having paid for them. It was a most harmless omission, as I am well known there and could therefore expect to be reminded of my debt next day. But my trivial act of negligence, my attempt to contract a debt, was certainly not unconnected with budgetary thoughts which had occupied my mind during the preceding day. Among the majority even of what are called 'respectable' people traces of divided behaviour can easily be observed where money and property are concerned. It may perhaps be generally true that the primitive greed of the suckling, who wants to take possession of every object (in order to put it into his mouth), has only been incompletely overcome by civilization and upbringing.
Where intentions of some importance are concerned, we have found in general that they are forgotten when obscure motives rise against them. In the case of rather less important intentions we can recognize a second mechanism of forgetting: a counter-will is transferred to the intention from some other topic, after an external association has been formed between the other topic and the content of the intention. Here is an example. I set store by high-quality blotting paper and I decided one day to buy a fresh supply that afternoon in the course of my walk to the Inner Town. But I forgot for four days running, till I asked myself what reason I had for the omission. It was easy to find after I had recalled that though I normally write 'Löschpapier' I usually say 'Fliesspapier'. 'Fliess' is the name of a friend in Berlin who had on the days in question given me occasion for a worrying and anxious thought. I could not rid myself of this thought, but the defensive tendency (cf. above, p. 1230) manifested itself by transferring itself, by means of the verbal similarity, to the indifferent intention which on account of its indifference offered little resistance.

[1901b, 1239]

Direct counter-will and more remote motivation are found together in the following example of dilatoriness. I had written a short pamphlet On Dreams (1901a), summarizing the subject-matter of my Interpretation of Dreams, for the series Grenzfragen des Nerven- und Seelenlebens. Bergmann of Wiesbaden had sent me the proofs, and had asked for them back by return of post, as the book was to be issued before Christmas. I corrected the proofs the same night and placed them on my desk so as to take them with me next morning. In the morning I forgot about them, and only remembered them in the afternoon when I saw the wrapper on my desk. In the same way I forgot the proofs that afternoon, that evening and the following morning, till I pulled myself together and took them to a letter-box on the afternoon of the second day, wondering what could be the reason for my procrastination. It was obvious that I did not want to send them off, but I could not discover why. However, in the course of the same walk I called in at my publisher's in Vienna - the firm that had published my Interpretation of Dreams, I placed an order for something and then said, as if impelled by a sudden thought: 'I suppose you know I've written the dream-book over again?' - 'Oh, you can't mean that!' he said. 'Don't be alarmed', I replied; 'it's only a short essay for the Löwenfeld-Kurella series.' But he was still not satisfied; he was worried that the essay would interfere with the sales of the book. I disagreed with him and finally asked: 'If I'd come to you before, would you have forbidden my publishing it?' - 'No, I certainly wouldn't.' Personally I believe I acted quite within my rights and did nothing contrary to common practice; nevertheless it seems certain that a misgiving similar to that expressed by the publisher was the motive for my delay in sending back the proofs. This misgiving goes back to an earlier occasion, on which a different publisher raised difficulties when it seemed unavoidable for me to introduce unaltered a few pages from an earlier work of mine on children's palsies published by another firm, into my monograph on the same subject in Nothnagel's Handbuch. But in this case, as well, the reproach was not justified; this time, too, I had loyally informed my first publisher (the same one who published The Interpretation of Dreams) of my intention. However, if this chain of memories is followed back still further, it brings to light an even earlier occasion involving a translation from the French, in which I really did infringe the rights of property that apply to publications. I added notes to the text which I translated, without asking the author's permission, and some years later had reason to suspect that the author was displeased with my arbitrary action.

[1901b, 1240]
If slips in speaking - which is clearly a motor function - can be thought of in this way, it is a short step to extend the same expectation to mistakes in our other motor activities. I have here formed two groups of cases. I use the term 'bungled actions' ['Vergreifen'] to describe all the cases in which a wrong result - i.e. a deviation from what was intended - seems to be the essential element. The others, in which it is rather the whole action which seems to be inappropriate, I call 'symptomatic and chance actions'. But no sharp line can be drawn between them, and we are indeed forced to conclude that all the divisions made in this study have no significance other than a descriptive one and run counter to the inner unity in this field of phenomena. It is clear that the psychological understanding of 'bungled actions' will not be conspicuously helped if we class them under the heading of 'ataxia' or, in particular, of 'cortical ataxia'. Let us rather try to trace the individual examples back to their particular determinants. For this purpose I shall once more make use of self-observations, though in my case the occasions for these are not particularly frequent.

(a) In former years I visited patients in their homes more frequently than I do at present; and on numerous occasions when I was at the front door, instead of knocking or ringing the bell, I pulled my own latch key out of my pocket, only to thrust it back again in some confusion. When I consider the patients at whose houses this happened, I am forced to think that the parapraxis - taking out my key instead of ringing the bell - was in the nature of a tribute to the house where I made the mistake. It was equivalent to the thought 'Here I feel I am at home', for it only occurred at places where I had taken a liking to the patient. (Of course I never ring my own door bell.)

(d) Bungled actions can, of course, also serve a whole number of other obscure purposes. Here is a first example. It is very rare for me to break anything. I am not particularly dextrous but a result of the anatomical integrity of my nerve-muscle apparatus is that there are clearly no grounds for my making clumsy movements of this kind, with their unwelcome consequences. I cannot therefore recall any object in my house that I have ever broken. Shortage of space in my study has often forced me to handle a number of pottery and stone antiquities (of which I have a small collection) in the most uncomfortable positions, so that onlookers have expressed anxiety that I should knock something down and break it. That however has never happened. Why then did I once dash the marble cover of my plain inkpot to the ground so that it broke?

In the last few years, during which I have been collecting such observations, I have had a few more experiences of smashing or breaking objects of some value, but the investigation of these cases has convinced me that they were never the result of chance or of unintentional clumsiness on my part. One morning, for example, when I was passing through a room in my dressing-gown with straw slippers on my feet, I yielded to a sudden impulse and hurled one of my slippers from my foot at the wall, causing a beautiful little marble Venus to fall down from its bracket. As it broke into pieces, I quoted quite unmoved these lines from Busch:
This wild conduct and my calm acceptance of the damage are to be explained in terms of the situation at the time. One of my family was gravely ill, and secretly I had already given up hope of her recovery. That morning I had learned that there had been a great improvement, and I know I had said to myself: 'So she's going to live after all!' My attack of destructive fury served therefore to express a feeling of gratitude to fate and allowed me to perform a 'sacrificial act' — rather as if I had made a vow to sacrifice something or other as a thank-offering if she recovered her health! The choice of the Venus of Medici for this sacrifice was clearly only a gallant act of homage towards the convalescent; but even now it is a mystery to me how I made up my mind so quickly, aimed so accurately and avoided hitting anything else among the objects so close to it.

Another case of breaking something, for which I once again made use of a pen-holder that slipped from my hand, likewise had the significance of a sacrifice; but on this occasion it took the form of a propitiatory sacrifice to avert evil. I had once seen fit to reproach a loyal and deserving friend on no other grounds than the interpretation I placed on certain indications coming from his unconscious. He was offended and wrote me a letter asking me not to treat my friends psycho-analytically. I had to admit he was in the right, and wrote him a reply to pacify him. While I was writing this letter I had in front of me my latest acquisition, a handsome glazed Egyptian figure. I broke it in the way I have described, and then immediately realized that I had caused this mischief in order to avert a greater one. Luckily it was possible to cement both of them together - the friendship as well as the figure - so that the break would not be noticed.

Recently we passed through a period in my house during which an unusually large amount of glass and china crockery was broken; I myself was responsible for some of the damage. But the little psychical epidemic could easily be explained: these were the days before my eldest daughter's wedding. On such festive occasions it used to be the custom deliberately to break some utensil and at the same time utter a phrase to bring good luck. This custom may have the significance of a sacrifice and it may have another symbolic meaning as well.

As I very rarely find myself undertaking medical treatment, I can report only one example from my personal experience of a bungled action of a medical kind. There is a very old lady whom I have been visiting twice a day for some years. On my morning visit my medical services are limited to two actions. I put a few drops of eye-lotion into her eye and give her a morphine injection. Two bottles are always prepared for me: a blue one with the collyrium and a white one with the morphine solution. During the two operations my thoughts are no doubt usually busy with something else; by now I have performed them so often that my attention behaves as if it were at liberty. One morning I noticed that the automaton had worked wrong. I had put the dropper into the white bottle instead of the blue one and had put morphine into the eye instead of collyrium. I was greatly frightened and then reassured myself by reflecting that a few drops of a two per cent solution of morphine could not do any harm even in the conjunctival sac. The feeling of fright must obviously have come from another source.

As regards self-injuries of my own, there is little that I can report in uneventful times; but in extraordinary circumstances I find that I am not incapable of them. When a member of my family complains to me of having bitten his tongue, pinched a finger, or the like, he does not get the sympathy he hopes for, but instead the question: 'Why did you do that?' I myself once gave my thumb a most painful pinch when a youthful patient told me during the hour of treatment of his intention (not of course to be taken seriously) of marrying my eldest daughter. I knew that at the time she was lying critically ill in a sanatorium.
(2) On page 681 Hannibal's father is called Hasrubal. This error annoyed me especially, but it furnished me with the strongest corroboration of my view of such errors. There must be few readers of my book who are better acquainted with the history of the house of Barca than its author, who penned this error and who overlooked it in three sets of proofs. The name of Hannibal's father was Hamilcar Barca - Hasrubal was the name of Hannibal's brother, as well as of his brother-in-law and predecessor in command.

[1901b, 1293]

Goethe said of Lichtenberg: 'Where he makes a jest a problem lies concealed.' Similarly it can be said of the passages in my book that I have quoted here: where an error makes its appearance a repression lies behind it - or more correctly, an insincerity, a distortion, which is ultimately rooted in repressed material. In analysing the dreams reported there I was compelled, by the very nature of the themes to which the dream-thoughts related, on the one hand to break off the analysis at some point before it had been rounded off, and on the other hand to take the edge off some indiscreet detail by mild distortion. I could not do otherwise, and I had in fact no other choice if I wished to bring forward examples and evidence at all. My awkward position was a necessary result of the peculiar character of dreams, which consists in giving expression to repressed material - in other words, to material that is inadmissible to consciousness. (In spite of this it would seem that enough was still left to give offence to some sensitive souls.) I did not succeed, however, in carrying through the distortion or concealment of the thoughts, whose continuation was known to me, without leaving some trace of them behind. What I wanted to suppress often succeeded against my will in gaining access to what I had chosen to relate and appeared in it in the form of an error that I failed to notice. Moreover, the same theme is at the bottom of all the three examples I have given: the errors are derivatives of repressed thoughts connected with my dead father.

[1901b, 1293]

(1) Anyone who reads through the dream-analysed on p. 744 will in part find undisguisedly, and will in part be able to guess from hints, that I have broken off at thoughts which would have contained an unfriendly criticism of my father. In the continuation of this train of thoughts and memories there in fact lies an annoying story in which books play a part, and a business friend of my father's who bears the name of Marburg - the same name that woke me when it was called out at Marburg station on the Südbahn. In the analysis I tried to suppress this Herr Marburg from myself and from my readers; he took his revenge by intruding where he did not belong and changing the name of Schiller's birthplace from Marbach to Marburg.

[1901b, 1294]

(2) The error of putting Hasrubal instead of Hamilcar, the brother's name instead of the father's, occurred precisely in a context that concerned the Hannibal-phantasies of my school years and my dissatisfaction with my father's behaviour towards the 'enemies of our people'. I could have gone on to tell how my relationship with my father was changed by a visit to England, which resulted in my getting to know my half-brother, the child of my father's first marriage, who lived there. My brother's eldest son is the same age as I am. Thus the relations between our ages were no hindrance to my phantasies of how different things would have been if I had been born the son not of my father but of my brother. These suppressed phantasies falsified the text of my book at the place where I broke off the analysis, by forcing me to put the brother's name for the father's.

[1901b, 1294]
It may, in general, seem astonishing that the urge to tell the truth is so much stronger than is usually supposed. Perhaps, however, my being scarcely able to tell lies any more is a consequence of my occupation with psycho-analysis. As often as I try to distort something I succumb to an error or some other parapraxis that betrays my insincerity, as can be seen in this last example and in the previous ones.

(16) A trick very similar to the one in Example 14 was once brought off by me myself. I had promised my strict eldest brother that that summer I would make my long due visit to him at an English seaside resort, and had undertaken, as time was limited, to travel by the shortest route, without breaking my journey anywhere. I asked if I might stop for a day in Holland, but he thought I might postpone that till my journey back. So I travelled from Munich via Cologne to Rotterdam and the Hook of Holland from where the boat starts at midnight for Harwich. I had to change at Cologne; I left my train to change into the Rotterdam express, but it was nowhere to be found. I asked various railway officials, was sent from one platform to another, fell into a mood of exaggerated despair and soon realized that during this fruitless search I must have missed my connection. After this was confirmed I considered whether I should spend the night in Cologne. Among other considerations in favour of that plan was one of filial piety, since according to an old family tradition my ancestors had once fled from that city during a persecution of the Jews. However I decided against it, travelled by a later train to Rotterdam, which I reached late in the night, and was then obliged to spend a day in Holland. That day brought me the fulfilment of a long cherished wish; I was able to see Rembrandt's magnificent paintings at the Hague and in the Rijksmuseum at Amsterdam. It was only the next morning, when I was travelling in the train across England and could collect my impressions, that a clear memory emerged of my having seen a large notice in the station at Cologne - a few steps from the place where I had got off the train and on the same platform - which read 'Rotterdam-Hook of Holland'. There, waiting for me, had been the train in which I ought to have continued my journey. My action in hurrying away in spite of this clear direction, and my search for the train in another place, would have to be described as an incomprehensible 'blindness' unless one is prepared to assume that - contrary to my brother's instructions - I had really resolved to admire the Rembrandts on the journey out. Everything else - my well-acted perplexity, the emergence of the 'pious' intention to spend the night in Cologne - was merely a contrivance to keep my resolution hidden from myself till it had been completely carried out.
Moreover the choice of what have been called ‘favourite numbers’ is not unrelated to the life of the person concerned and is not without a certain psychological interest. A man who admitted having a special preference for the numbers 17 and 19 was able to specify after a little reflection that at the age of 17 he had gone to the university and so attained the academic freedom he had long desired, and that at 19 he had taken his first long journey and soon after had made his first scientific discovery. But the fixation of this preference occurred a decade later, when the same numbers took on a significance in his erotic life. - Indeed, even those numbers which a person uses especially often in a particular connection, in an apparently arbitrary way, can be traced by analysis to an unexpected meaning. Thus it struck a patient of mine one day that when annoyed he was especially fond of saying: 'I've told you that already from 17 to 36 times', and he asked himself whether there was any motive for it. It at once occurred to him that he was born on the 27th day of the month whereas his younger brother was born on the 26th, and that he had reason to complain that fate so often robbed him of the good things in life in order to bestow them on this younger brother. He therefore represented this partiality on the part of fate by deducting ten from the date of his own birthday and adding it to his brother's. 'I am the elder and yet I am cut short like this.'

In analyses of this kind which I conduct on myself I find two things particularly striking: firstly, the positively somnambulistic certainty with which I set off for my unknown goal and plunge into an arithmetical train of thought which arrives all at once at the desired number, and the speed with which the entire subsequent work is completed; and secondly, the fact that the numbers are so freely at the disposal of my unconscious thinking, whereas I am a bad reckoner and have the greatest difficulties in consciously noting dates, house numbers and such things. Moreover in these unconscious thought-operations with numbers I find I have a tendency to superstition, whose origin for long remained unknown to me.¹

On my return from my holidays my thoughts immediately turned to the patients who were to claim my attention in the year's work that was just beginning. My first visit was to a very old lady for whom I had for many years performed the same professional services twice every day (p. 1245). Owing to the uniformity of the circumstances, unconscious thoughts have very often managed to find expression while I was on my way to the patient and while I was treating her. She is over ninety years old; it is therefore natural to ask oneself at the beginning of each year's treatment how much longer she is likely to live. On the day I am speaking about I was in a hurry and called a cab to take me to her house. Every cabman on the rank in front of my house knew the old lady's address, as they had all often taken me there. But on this day it happened that the cabman did not draw up in front of her house but in front of a house with the same number in a nearby street which ran parallel and was in fact of a similar appearance. I noticed the error and reproached the cabman with it, and he apologized. Now is it of any significance that I was driven to a house where the old lady was not to be found? Certainly not to me, but if I were superstitious I should see an omen in the incident, the finger of fate announcing that this year would be the old lady's last. Very many omens recorded by history have been based on a symbolism no better than this. I of course explain the occurrence as an accident without any further meaning.

¹ [1901b, 1318]

² [1901b, 1322]
In the compass of these discussions the only answer I can give to the questions raised here is a subjective one - that is, one in accordance with my personal experience. To my regret I must confess that I am one of those unworthy people in whose presence spirits suspend their activity and the supernatural vanishes away, so that I have never been in a position to experience anything myself which might arouse a belief in the miraculous. Like every human being, I have had presentiments and experienced trouble, but the two failed to coincide with one another, so that nothing followed the presentiments, and the trouble came upon me unannounced. During the days when I was living alone in a foreign city - I was a young man at the time - I quite often heard my name suddenly called by an unmistakable and beloved voice; I then noted down the exact moment of the hallucination and made anxious enquiries of those at home about what had happened at that time. Nothing had happened. To balance this, there was a later occasion when I went on working with my patients without any disturbance or foreboding while one of my children was in danger of bleeding to death. Nor have I ever been able to regard any of the presentiments reported to me by patients as veridical. - I must however confess that in the last few years I have had a few remarkable experiences which might easily have been explained on the hypothesis of telepathic thought-transference.

The 'remarkable coincidence' of meeting a person we were at that very moment thinking about is a familiar one. I have observed a simple and easily explained example of it in myself, which is probably a good model for similar occurrences. A few days after I had been awarded the title of professor - which carries considerable authority with it in countries under monarchical rule - my thoughts, while I was walking through the Inner Town, suddenly turned to a childish phantasy of revenge directed against a particular married couple. Some months earlier they had called me in to see their little daughter, who had developed an interesting obsessional symptom following upon a dream. I took a great interest in the case, whose genesis I thought I understood. My offer of treatment was however declined by her parents and I was given to understand that they thought of changing over to a foreign authority who effected cures by hypnotism. My present phantasy was that after the total failure of that attempt the parents begged me to start my treatment, saying that now they had complete confidence in me, and so on. I however answered: 'Yes, now you have confidence in me - now that I too have become a professor. The title has done nothing to alter my capacities; if you could not make use of me as a university lecturer you can do without me as a professor as well.' - At this point my phantasy was interrupted by a loud 'Good day to you, Professor!' and I looked up and saw walking past me the very married couple on whom I had just taken my revenge by rejecting their offer. Immediate reflection destroyed the impression of something miraculous. I had been walking towards the couple along a wide, straight and almost deserted street; when I was about twenty paces from them I had glanced up for a moment and caught a glimpse of their impressive figures and recognized them, but had set the perception aside - on the pattern of a negative hallucination - for the emotional reasons which then took effect in the phantasy that arose with apparent spontaneity.
I will now describe the way in which I have overcome the technical difficulties of drawing up the report of this case history. The difficulties are very considerable when the physician has to conduct six or eight psychotherapeutic treatments of the sort in a day, and cannot make notes during the actual session with the patient for fear of shaking the patient's confidence and of disturbing his own view of the material under observation. Indeed, I have not yet succeeded in solving the problem of how to record for publication the history of a treatment of long duration. As regards the present case, two circumstances have come to my assistance. In the first place the treatment did not last for more than three months; and in the second place the material which elucidated the case was grouped around two dreams (one related in the middle of the treatment and one at the end). The wording of these dreams was recorded immediately after the session, and they thus afforded a secure point of attachment for the chain of interpretations and recollections which proceeded from them. The case history itself was only committed to writing from memory after the treatment was at an end, but while my recollection of the case was still fresh and was heightened by my interest in its publication. Thus the record is not absolutely phonographically exact, but it can claim to possess a high degree of trustworthiness. Nothing of any importance has been altered in it except in some places the order in which the explanations are given; and this has been done for the sake of presenting the case in a more connected form.

[1905e, 1352]

I remembered that long before, while I was working at Charcot's clinic, I had seen and heard how in cases of hysterical mutism writing operated vicariously in the place of speech. Such patients were able to write more fluently, quicker, and better than others did or than they themselves had done previously. The same thing had happened with Dora. In the first days of her attacks of aphonia 'writing had always come specially easy to her'. No psychological elucidation was really required for this peculiarity, which was the expression of a physiological substitutive function enforced by necessity; it was noticeable, however, that such an elucidation was easily to be found. Herr K. used to write to her at length while he was travelling and to send her picture post-cards. It used to happen that she alone was informed as to the date of his return, and that his arrival took his wife by surprise. Moreover, that a person will correspond with an absent friend whom he cannot talk to is scarcely less obvious than that if he has lost his voice he will try to make himself understood in writing. Dora's aphonia, then, allowed of the following symbolic interpretation. When the man she loved was away she gave up speaking; speech had lost its value since she could not speak to him. On the other hand, writing gained in importance, as being the only means of communication with him in his absence.

[1905e, 1377]
I must now turn to consider a further complication to which I should certainly give no space if I were a man of letters engaged upon the creation of a mental state like this for a short story, instead of being a medical man engaged upon its dissection. The element to which I must now allude can only serve to obscure and efface the outlines of the fine poetic conflict which we have been able to ascribe to Dora. This element would rightly fall a sacrifice to the censorship of a writer, for he, after all, simplifies and abstracts when he appears in the character of a psychologist. But in the world of reality, which I am trying to depict here, a complication of motives, an accumulation and conjunction of mental activities - in a word, overdetermination - is the rule. For behind Dora's supervalent train of thought which was concerned with her father's relations with Frau K. there lay concealed a feeling of jealousy which had that lady as its object - a feeling, that is, which could only be based upon an affection on Dora's part for one of her own sex. It has long been known and often been pointed out that at the age of puberty boys and girls show clear signs, even in normal cases, of the existence of an affection for people of their own sex. A romantic and sentimental friendship with one of her school friends, accompanied by vows, kisses, promises of eternal correspondence, and all the sensibility of jealousy, is the common precursor of a girl's first serious passion for a man. Thenceforward, in favourable circumstances, the homosexual current of feeling often runs completely dry. But if a girl is not happy in her love for a man, the current is often set flowing again by the libido in later years and is increased up to a greater or lesser degree of intensity. If this much can be established without difficulty of healthy persons, and if we take into account what has already been said about the fuller development in neurotics of the normal germs of perversion, we shall expect to find in these latter too a fairly strong homosexual predisposition. It must, indeed, be so; for I have never yet come through a single psycho-analysis of a man or a woman without having to take into account a very considerable current of homosexuality. When, in a hysterical woman or girl, the sexual libido which is directed towards men has been energetically suppressed, it will regularly be found that the libido which is directed towards women has become vicariously reinforced and even to some extent conscious.

[1905e, 1397]
The interpretation of the dream now seemed to me to be complete.¹ But Dora brought me an addendum to the dream on the very next day. She had forgotten to relate, she said, that each time after waking up she had smelt smoke. Smoke, of course, fitted in well with fire, but it also showed that the dream had a special relation to myself; for when she used to assert that there was nothing concealed behind this or that, I would often say by way of rejoinder: 'There can be no smoke without fire!' Dora objected, however, to such a purely personal interpretation, saying that Herr K. and her father were passionate smokers - as I am too, for the matter of that. She herself had smoked during her stay by the lake, and Herr K. had rolled a cigarette for her before he began his unlucky proposal. She thought, too, that she clearly remembered having noticed the smell of smoke on the three occasions of the dream's occurrence at L--, and not for the first time at its recent reappearance. As she would give me no further information, it was left to me to determine how this addendum was to be introduced into the texture of the dream-thoughts. One thing which I had to go upon was the fact that the smell of smoke had only come up as an addendum to the dream, and must therefore have had to overcome a particularly strong effort on the part of repression. Accordingly it was probably related to the thoughts which were the most obscurely presented and the most successfully repressed in the dream, to the thoughts, that is, concerned with the temptation to show herself willing to yield to the man. If that were so, the addendum to the dream could scarcely mean anything else than the longing for a kiss, which, with a smoker, would necessarily smell of smoke. But a kiss had passed between Herr K. and Dora some two years further back, and it would certainly have been repeated more than once if she had given way to him. So the thoughts of temptation seemed in this way to have harked back to the earlier scene, and to have revived the memory of the kiss against whose seductive influence the little 'thumb-sucker' had defended herself at the time, by the feeling of disgust. Taking into consideration, finally, the indications which seemed to point to there having been a transference on to me - since I am a smoker too - I came to the conclusion that the idea had probably occurred to her one day during a session that she would like to have a kiss from me. This would have been the exciting cause which led her to repeat the warning dream and to form her intention of stopping the treatment. Everything fits together very satisfactorily upon this view; but owing to the characteristics of 'transference' its validity is not susceptible of definite proof.

[1905e, 1410]
I may here add a few supplementary interpretations to those that have already been given: The 'Madonna' was obviously Dora herself; in the first place because of the 'adorer' who had sent her the pictures, in the second place because she had won Herr K.'s love chiefly by the motherliness she had shown towards his children, and lastly because she had had a child though she was still a girl (this being a direct allusion to the phantasy of childbirth). Moreover, the notion of the 'Madonna' is a favourite counter-idea in the mind of girls who feel themselves oppressed by imputations of sexual guilt, - which was the case with Dora. A first suspicion of this connection came to me while I was working as a physician at the Psychiatric Clinic of the University. I there came across a case of confusional insanity with hallucinations, in which the attack, which ran a rapid course, turned out to be a reaction to a reproach made against the patient by her fiancé. - If the analysis had been continued, Dora's maternal longing for a child would probably have been revealed as an obscure though powerful motive in her behaviour. The numerous questions which she had been raising latterly seem to have been belated derivatives of questions inspired by the sexual curiosity which she had tried to gratify with the encyclopaedia. The subjects which she read up in it were presumably pregnancy, childbirth, virginity, and so on. - In reproducing the dream Dora had forgotten one of the questions which need to be inserted into the course of the second situation in the dream. This question could only be: 'Does Herr -- live here?' or 'Where does Herr -- live?' There must have been some reason for her having forgotten this apparently innocent question, especially as she need not have brought it into the dream at all. This reason, it seems to me, lay in her surname itself, which also denoted an object and in fact more than one kind of object, and which could therefore be regarded as an 'ambiguous' word. Unluckily I cannot give the name and show how well designed it was to indicate something 'ambiguous' and 'improper'. This interpretation was supported by the discovery of a similar play upon words in another part of the dream, where the material was derived from Dora's recollections of her aunt's death ('they have already gone to the cemetery') and where there was similarly a play upon her aunt's name. These improper words seemed to point to a second and oral source of information, since the encyclopaedia would not cover them. I should not have been surprised to hear that this source had been Frau K. herself, Dora's calumniator. In that case she would have been the one person whom Dora generously spared, while she pursued the others with an almost malignant vindictiveness. Behind the almost limitless series of displacements which were thus brought to light, it was possible to divine the operation of a single simple factor - Dora's deep-rooted homosexual love for Frau K.

Dora had listened to me without any of her usual contradictions. She seemed to be moved; she said good-bye to me very warmly, with the heartiest wishes for the New Year, and - came no more. Her father, who called on me two or three times afterwards, assured me that she would come back again, and said it was easy to see that she was eager for the treatment to continue. But it must be confessed that Dora's father was never entirely straightforward. He had given his support to the treatment so long as he could hope that I should 'talk' Dora out of her belief that there was something more than a friendship between him and Frau K. His interest faded when he observed that it was not my intention to bring about that result. I knew Dora would not come back again. Her breaking off so unexpectedly, just when my hopes of a successful termination of the treatment were at their highest, and her thus bringing those hopes to nothing - this was an unmistakable act of vengeance on her part. Her purpose of self-injury also profited by this action. No one who, like me, conjures up the most evil of those half-tamed demons that inhabit the human breast, and seeks to wrestle with them, can expect to come through the struggle unscathed. Might I perhaps have kept the girl under my treatment if I myself had acted a part, if I had exaggerated the importance to me of her staying on, and had shown a warm personal interest in her - a course which, even after allowing for my position as her physician, would have been tantamount to providing her with a substitute for the affection she longed for? I do not know. Since in every case a portion of the factors that are encountered under the form of resistance remains unknown, I have always avoided acting a part, and have contented myself with practising the humbler arts of psychology. In spite of every theoretical interest and of every endeavour to be of assistance as a physician, I keep the fact in mind that there must be some limits set to the extent to which psychological influence may be used, and I respect as one of these limits the patient's own will and understanding.
She went on to tell me that she had come for help on account of a right-sided facial neuralgia, from which she was now suffering day and night. "How long has it been going on?" "Exactly a fortnight." I could not help smiling; for I was able to show her that exactly a fortnight earlier she had read a piece of news that concerned me in the newspaper. (This was in 1902.) And this she confirmed. [1905e, 1455]

The particular psychotherapeutic procedure which Freud practises and describes as 'psychoanalysis' is an outgrowth of what was known as the 'cathartic' method and was discussed by him in collaboration with Josef Breuer in their *Studies on Hysteria* (1895). This cathartic therapy was a discovery of Breuer's, and was first used by him some ten years earlier in the successful treatment of a hysterical woman patient, in the course of which he obtained an insight into the pathogenesis of her symptoms. As the result of a personal suggestion from Breuer, Freud revived this procedure and tested it on a considerable number of patients. [1904a, 1555]

At the time at which I was attributing to sexuality this important part in the production of the *simple neuroses*,¹ I was still faithful to a purely psychological theory in regard to the *psychoneuroses* - a theory in which the sexual factor was regarded as no more significant than any other emotional source of feeling. On the basis of some observations made by Josef Breuer on a hysterical patient more than ten years earlier, I collaborated with him in a study of the mechanism of the generation of hysterical symptoms, using the method of awakening the patient's memories in a state of hypnosis; and we reached conclusions which enabled us to bridge the gap between Charcot's traumatic hysteria and common non-traumatic hysteria (Breuer and Freud, 1895). We were led to the assumption that hysterical symptoms are the permanent results of psychical traumas, the sum of affect attaching to which has, for particular reasons, been prevented from being worked over consciously and has therefore found an abnormal path into somatic innervation. The terms 'strangulated affect', 'conversion' and 'abreaction' cover the distinctive features of this hypothesis. [1906a, 1576]

You ask me to name 'ten good books' for you, and refrain from adding to this any word of explanation. Thus you leave to me not only the choice of the books but also the interpretation of your request. Accustomed to paying attention to small signs, I must then trust the wording in which you couch your enigmatical demand. You did not say: 'the ten most magnificent works (of world literature)', in which case I should have been obliged to reply, with so many others: Homer, the tragedies of Sophocles, Goethe's *Faust*, Shakespeare's *Hamlet, Macbeth*, etc. Nor did you say the 'ten most significant books', among which scientific achievements like those of Copernicus, of the old physician Johann Weier on the belief in witches, Darwin's *Descent of Man*, and others, would then have found a place. You did not even ask for 'favourite books', among which I should not have forgotten Milton's *Paradise Lost* and Heine's *Lazarus*. I think, therefore, that a particular stress falls on the 'good' in your phrase, and that with this predicate you intend to designate books to which one stands in rather the same relationship as to 'good' friends, to whom one owes a part of one's knowledge of life and view of the world - books which one has enjoyed oneself and gladly commends to others, but in connection with which the element of timid reverence, the feeling of one's own smallness in the face of their greatness, is not particularly prominent. [1906f, 1991]

I will therefore name ten such 'good' books for you which have come to my mind without a great deal of reflection. [1906f, 1991]
My investigations into the aetiology and psychical mechanism of neurotic illnesses, which I have pursued since 1893, attracted little notice to begin with among my fellow specialists. At length, however, those investigations have met with recognition from a number of medical research workers and have also drawn attention to the psycho-analytic methods of examination and treatment to which I owe my findings. Dr. Wilhelm Stekel, who was one of the first of the colleagues to whom I was able to impart a knowledge of psycho-analysis, and who has himself become familiar with its technique through many years of practice in it, has now undertaken the task of working over one topic in the clinical aspect of these neuroses on the basis of my views and of presenting medical readers with the experiences he has obtained through the psycho-analytic method. If I am glad to take the responsibility for his work in the sense which I have just indicated, I think it is only right to declare explicitly that my direct influence upon the volume on nervous states of anxiety which lies before us has been a very slight one. The observations and all the detailed opinions and interpretations are the author's own. My share has been limited to proposing the use of the term 'anxiety hysteria'.

Here the patient broke off, got up from the sofa, and begged me to spare him the recital of the details. I assured him that I myself had no taste whatever for cruelty, and certainly had no desire to torment him, but that naturally I could not grant him something which was beyond my power. He might just as well ask me to give him the moon. The overcoming of resistances was a law of the treatment, and on no consideration could it be dispensed with. (I had explained the idea of 'resistance' to him at the beginning of the hour, when he told me there was much in himself which he would have to overcome if he was to relate this experience of his.) I went on to say that I would do all I could, nevertheless, to guess the full meaning of any hints he gave me. Was he perhaps thinking of impalement? - 'No, not that; . . . the criminal was tied up . . .' - he expressed himself so indistinctly that I could not immediately guess in what position - 'a pot was turned upside down on his buttocks . . . some rats were put into it . . . and they . . . ' - he had again got up, and was showing every sign of horror and resistance - ' . . . bored their way in . . .' - into his anus, I helped him out.

[1909d, 2136]

It would not surprise me to hear that at this point the reader had ceased to be able to follow. For even the detailed account which the patient gave me of the external events of these days and of his reactions to them was full of self-contradictions and sounded hopelessly confused. It was only when he told the story for the third time that I could get him to realize its obscurities and could lay bare the errors of memory and the displacements in which he had become involved. I shall spare myself the trouble of reproducing these details, the essentials of which we shall easily be able to pick up later on, and I will only add that at the end of this second session the patient behaved as though he were dazed and bewildered. He repeatedly addressed me as 'Captain', probably because at the beginning of the hour I had told him that I myself was not fond of cruelty like Captain N., and that I had no intention of tormenting him unnecessarily.

[1909d, 2139]

There can be no question that there was something in the sphere of sexuality that stood between the father and son, and that the father had come into some sort of opposition to the son's prematurely developed erotic life. Several years after his father's death, the first time he experienced the pleasurable sensations of copulation, an idea sprang into his mind: 'This is glorious! One might murder one's father for this!' This was at once an echo and an elucidation of the obsessional ideas of his childhood. Moreover, his father, shortly before his death, had directly opposed what later became our patient's dominating passion. He had noticed that his son was always in the lady's company, and had advised him to keep away from her, saying that it was imprudent of him and that he would only make a fool of himself.

[1909d, 2158]
If it is a merit to have brought psycho-analysis into being that merit is not mine.¹ I had no share in its earliest beginnings. I was a student and working for my final examinations at the time when another Viennese physician, Dr. Josef Breuer,² first (in 1880-2) made use of this procedure on a girl who was suffering from hysteria. Let us turn our attention straightaway to the history of this case and its treatment, which you will find set out in detail in the Studies on Hysteria³ which were published later by Breuer and myself.

[1910a, 2199]

The great French observer, whose pupil I became in 1885-6, was not himself inclined to adopt a psychological outlook. It was his pupil, Pierre Janet, who first attempted a deeper approach to the peculiar psychical processes present in hysteria, and we followed his example when we took the splitting of the mind and dissociation of the personality as the centre of our position. You will find in Janet a theory of hysteria which takes into account the prevailing views in France on the part played by heredity and degeneracy. According to him, hysteria is a form of degenerate modification of the nervous system, which shows itself in an innate weakness in the power of psychical synthesis. Hysterical patients, he believes, are inherently incapable of holding together the multiplicity of mental processes into a unity, and hence arises the tendency to mental dissociation. If I may be allowed to draw a homely but clear analogy, Janet's hysterical patient reminds one of a feeble woman who has gone out shopping and is now returning home laden with a multitude of parcels and boxes. She cannot contain the whole heap of them with her two arms and ten fingers. So first of all one object slips from her grasp; and when she stoops to pick it up, another one escapes her in its place, and so on. This supposed mental weakness of hysterical patients is not confirmed when we find that, alongside these phenomena of diminished capacity, examples are also to be observed of a partial increase in efficiency: as though by way of compensation. At the time when Breuer's patient had forgotten her mother tongue and every other language but English, her grasp of English reached such heights that, if she was handed a German book, she was able straight away to read out a correct and fluent translation of it.

[1910a, 2210]

Leonardo himself, with his love of truth and his thirst for knowledge, would not have discouraged an attempt to take the trivial peculiarities and riddles in his nature as a starting-point, for discovering what determined his mental and intellectual development. We do homage to him by learning from him. It does not detract from his greatness if we make a study of the sacrifices which his development from childhood must have entailed, and if we bring together the factors which have stamped him with the tragic mark of failure.

[1910c, 2299]

Since I neither fear the criticism of others nor shrink from criticizing myself, I have no motive for avoiding the mention of a similarity which may possibly damage our libido theory in the estimation of many of my readers. Schreber's 'rays of God', which are made up of a condensation of the sun's rays, of nerve fibres, and of spermatozoa, are in reality nothing else than a concrete representation and projection outwards of libidinal cathexes; and they thus lend his delusions a striking conformity with our theory. His belief that the world must come to an end because his ego was attracting all the rays to itself, his anxious concern at a later period, during the process of reconstruction, lest God should sever His ray-connection with him, - these and many other details of Schreber's delusional structure sound almost like endopsychic perceptions of the processes whose existence I have assumed in these pages as the basis of our explanation of paranoia. I can nevertheless call a friend and fellow-specialist to witness that I had developed my theory of paranoia before I became acquainted with the contents of Schreber's book. It remains for the future to decide whether there is more delusion in my theory than I should like to admit, or whether there is more truth in Schreber's delusion than other people are as yet prepared to believe.

[1911c, 2444]
Before I wind up these remarks on beginning analytic treatment, I must say a word about a
certain ceremonial which concerns the position in which the treatment is carried out. I hold to
the plan of getting the patient to lie on a sofa while I sit behind him out of his sight. This
arrangement has a historical basis; it is the remnant of the hypnotic method out of which
psycho-analysis was evolved. But it deserves to be maintained for many reasons. The first is a
personal motive, but one which others may share with me. I cannot put up with being stared at
by other people for eight hours a day (or more). Since, while I am listening to the patient, I, too,
give myself over to the current of my unconscious thoughts, I do not wish my expressions of
face to give the patient material for interpretations or to influence him in what he tells me. The
patient usually regards being made to adopt this position as a hardship and rebels against it,
especially if the instinct for looking (scopophilia) plays an important part in his neurosis. I insist
on this procedure, however, for its purpose and result are to prevent the transference from
mingling with the patient's associations imperceptibly, to isolate the transference and to allow it
to come forward in due course sharply defined as a resistance. I know that many analysts work
in a different way, but I do not know whether this deviation is due more to a craving for doing
things differently or to some advantage which they find they gain by it.

[1913c, 2487]

If in the end I am convicted of being in error over the theoretical problem of the 'actual
neuroses', I shall be able to console myself with the advance in our knowledge, which must
disregard the opinions of an individual. You may then ask why, since I have such a laudable
appreciation of the limitations of my own infallibility, I do not at once give in to these new
suggestions but prefer to re-enact the familiar comedy of an old man obstinately clinging to his
opinions. My reply is that I do not yet see any evidence to induce me to give in. In early days I
made a number of alterations in my views and did not conceal them from the public. I was
reproached on account of these changes, just as to-day I am reproached for my
conservativeness. Not that I should be intimidated by the one reproach or the other. But I know
that I have a destiny to fulfil. I cannot escape it and I need not move towards it. I shall await it,
and in the meantime I shall behave towards our science as earlier experience has taught me.
[1912f, 2571]

While I was living in Paris in 1885 as a pupil of Charcot, what chiefly attracted me, apart from
the great man's own lectures, were the demonstrations and addresses given by Brouardel. He
used to show us from post-mortem material at the morgue how much there was which deserved
to be known by doctors but of which science preferred to take no notice. On one occasion he
was discussing the indications which enabled one to judge the social rank, character and origin
of an unidentified body, and I heard him say: 'Les genoux sales sont le signe d'une fille
honnête.' He was using a girl's dirty knees as evidence of her virtue!
[1913k, 2639]

No reader of this book will find it easy to put himself in the emotional position of an author who
is ignorant of the language of holy writ, who is completely estranged from the religion of his
fathers - as well as from every other religion - and who cannot take a share in nationalist ideals,
but who has yet never repudiated his people, who feels that he is in his essential nature a Jew
and who has no desire to alter that nature. If the question were put to him: 'Since you have
abandoned all these common characteristics of your countrymen, what is there left to you that is
Jewish?' he would reply: 'A very great deal, and probably its very essence.' He could not now
express that essence clearly in words; but some day, no doubt, it will become accessible to the
scientific mind.
[1912-1913, 2649]
Why, it may be asked at this point, should we concern ourselves at all with this riddle of taboo? Not only, I think, because it is worth while while trying to solve any psychological problem for its own sake, but for other reasons as well. It may begin to dawn on us that the taboos of the savage Polynesians are after all not so remote from us as we were inclined to think at first, that the moral and conventional prohibitions by which we ourselves are governed may have some essential relationship with these primitive taboos and that an explanation of taboo might throw a light upon the obscure origin of our own 'categorical imperative'.

[1912-1913, 2670]

I may say at once that I am no connoisseur in art, but simply a layman. I have often observed that the subject-matter of works of art has a stronger attraction for me than their formal and technical qualities, though to the artist their value lies first and foremost in these latter. I am unable rightly to appreciate many of the methods used and the effects obtained in art. I state this so as to secure the reader's indulgence for the attempt I propose to make here.

[1914b, 2845]

Nevertheless, works of art do exercise a powerful effect on me, especially those of literature and sculpture, less often of painting. This has occasioned me, when I have been contemplating such things, to spend a long time before them trying to apprehend them in my own way, i.e. to explain to myself what their effect is due to. Wherever I cannot do this, as for instance with music, I am almost incapable of obtaining any pleasure. Some rationalistic, or perhaps analytic, turn of mind in me rebels against being moved by a thing without knowing why I am thus affected and what it is that affects me.

[1914b, 2845]

Another of these inscrutable and wonderful works of art is the marble statue of Moses, by Michelangelo, in the Church of S. Pietro in Vincoli in Rome. As we know, it was only a fragment of the gigantic tomb which the artist was to have erected for the powerful Pope Julius II.¹ It always delights me to read an appreciative sentence about this statue, such as that it is 'the crown of modern sculpture' (Grimm). For no piece of statuary has ever made a stronger impression on me than this. How often have I mounted the steep steps from the unlovely Corso Cavour to the lonely piazza where the deserted church stands, and have essayed to support the angry scorn of the hero's glance! Sometimes I have crept cautiously out of the half-gloom of the interior as though I myself belonged to the mob upon whom his eye is turned - the mob which can hold fast no conviction, which has neither faith nor patience, and which rejoices when it has regained its illusory idols.

[1914b, 2847]

More important than his infidelity to the text of the Scriptures is the alteration which Michelangelo has, in our supposition, made in the character of Moses. The Moses of legend and tradition had a hasty temper and was subject to fits of passion. It was in a transport of divine wrath of this kind that he slew an Egyptian who was maltreating an Israelite, and had to flee out of the land into the wilderness; and it was in a similar passion that he broke the Tables of the Law, inscribed by God Himself. Tradition, in recording such a characteristic, is unbiased, and preserves the impression of a great personality who once lived. But Michelangelo has placed a different Moses on the tomb of the Pope, one superior to the historical or traditional Moses. He has modified the theme of the broken Tables; he does not let Moses break them in his wrath, but makes him be influenced by the danger that they will be broken and makes him calm that wrath, or at any rate prevent it from becoming an act. In this way he has added something new and more than human to the figure of Moses; so that the giant frame with its tremendous physical power becomes only a concrete expression of the highest mental achievement that is possible in a man, that of struggling successfully against an inward passion for the sake of a cause to which he has devoted himself.

[1914b, 2864]
It gives you a queer feeling if, late in life, you are ordered once again to write a school essay. But you obey automatically, like the old soldier who, at the word 'Attention!', cannot help dropping whatever he may have in his hands and who finds his little fingers pressed along the seams of his trousers. It is strange how readily you obey the orders, as though nothing in particular had happened in the last half-century. But in fact you have grown old in the interval, you are on the eve of your sixtieth birthday, and your physical feelings, as well as your mirror, show unmistakably how far your life's candle is burnt down.

Later I became a physician - or a psychologist, rather - and was able to create a new psychological discipline, something that is known as 'psycho-analysis', which is followed to-day with excited interest, and is greeted with praise and blame, by physicians and enquirers in neighbouring, and in distant, foreign lands - but least of all, of course, in our own country.

In 1909, in the lecture-room of an American university, I had my first opportunity of speaking in public about psycho-analysis.¹ The occasion was a momentous one for my work, and moved by this thought I then declared that it was not I who had brought psycho-analysis into existence: the credit for this was due to someone else, to Josef Breuer, whose work had been done at a time when I was still a student engaged in passing my examinations (1880-2). Since I gave those lectures, however, some well-disposed friends have suggested to me a doubt whether my gratitude was not expressed too extravagantly on that occasion. In their view I ought to have done as I had previously been accustomed to do: treated Breuer's 'cathartic procedure' as a preliminary stage of psycho-analysis, and represented psycho-analysis itself as beginning with my discarding the hypnotic technique and introducing free associations. It is of no great importance in any case whether the history of psycho-analysis is reckoned as beginning with the cathartic method or with my modification of it; I refer to this uninteresting point merely because certain opponents of psycho-analysis have a habit of occasionally recollecting that after all the art of psycho-analysis was not invented by me, but by Breuer. This only happens, of course, if their views allow them to find something in it deserving attention; if they set no such limits to their rejection of it, psycho-analysis is always without question my work alone. I have never heard that Breuer's great share in psycho-analysis has earned him a proportionate measure of criticism and abuse. As I have long recognized that to stir up contradiction and arouse bitterness is the inevitable fate of psycho-analysis, I have come to the conclusion that I must be the true originator of all that is particularly characteristic in it. I am happy to be able to add that none of the efforts to minimize my part in creating this much-abused analysis have ever come from Breuer himself or could claim any support from him.

¹ In my 'Five Lectures' (1910a), delivered at Clark University.
It is well known, too, that after Breuer made his first discovery of the cathartic method he let it rest for a number of years, and only took it up again at my instigation, on my return from my studies under Charcot. He had a large consulting practice in medicine which made great claims on him; I myself had only unwillingly taken up the profession of medicine, but I had at that time a strong motive for helping people suffering from nervous affections or at least for wishing to understand something about their states. I had embarked upon physical therapy, and had felt absolutely helpless after the disappointing results from my study of Erb's *Elektrotherapie*, which put forward such a number of indications and recommendations. If I did not at the time arrive on my own account at the conclusion which Möbius established later, that the successes of electrical treatment in nervous patients are the effects of suggestion, there is no doubt that only the total absence of these promised successes was to blame. Treatment by suggestion during deep hypnosis, which I learned from Liébeault's and Bernheim's highly impressive demonstrations, then seemed to offer a satisfactory substitute for the failure of electrical treatment. But the practice of investigating patients in a state of hypnosis, with which Breuer made me acquainted - a practice which combined an automatic mode of operation with the satisfaction of scientific curiosity - was bound to be incomparably more attractive than the monotonous, forcible prohibitions used in treatment by suggestion, prohibitions which stood in the way of all research.

[1914d, 2879]

Some years later, at one of Charcot's evening receptions, I happened to be standing near the great teacher at a moment when he appeared to be telling Brouardel a very interesting story about something that had happened during his day's work. I hardly heard the beginning, but gradually my attention was seized by what he was talking of: a young married couple from a distant country in the East - the woman a severe sufferer, the man either impotent or exceedingly awkward. 'Tâchez donc,' I heard Charcot repeating, 'je vous assure, vous y arriverez.'¹ Brouardel, who spoke less loudly, must have expressed his astonishment that symptoms like the wife's could have been produced by such circumstances. For Charcot suddenly broke out with great animation: 'Mais, dans des cas pareils c'est toujours la chose génitale, toujours . . . toujours . . . toujours';² and he crossed his arms over his stomach, hugging himself and jumping up and down on his toes several times in his own characteristically lively way. I know that for a moment I was almost paralysed with amazement and said to myself: 'Well, but if he knows that, why does he never say so?' But the impression was soon forgotten; brain anatomy and the experimental induction of hysterical paralyses absorbed all my interest.

[1914d, 2883]
A year later, I had begun my medical career in Vienna as a lecturer in nervous diseases, and in everything relating to the aetiology of the neuroses I was still as ignorant and innocent as one could expect of a promising student trained at a university. One day I had a friendly message from Chrobak, asking me to take a woman patient of his to whom he could not give enough time, owing to his new appointment as a University teacher. I arrived at the patient's house before he did and found that she was suffering from attacks of meaningless anxiety, and could only be soothed by the most precise information about where her doctor was at every moment of the day. When Chrobak arrived he took me aside and told me that the patient's anxiety was due to the fact that although she had been married for eighteen years she was still *virgo intacta*. The husband was absolutely impotent. In such cases, he said, there was nothing for a medical man to do but to shield this domestic misfortune with his own reputation, and put up with it if people shrugged their shoulders and said of him: 'He's no good if he can't cure her after so many years.' The sole prescription for such a malady, he added, is familiar enough to us, but we cannot order it. It runs:

\[ \text{'Rx Penis normalis} \]
\[ \text{dosim} \]
\[ \text{repetatur!'} \]

I have not of course disclosed the illustrious parentage of this scandalous idea in order to saddle other people with the responsibility for it. I am well aware that it is one thing to give utterance to an idea once or twice in the form of a passing aperçu, and quite another to mean it seriously - to take it literally and pursue it in the face of every contradictory detail, and to win it a place among accepted truths. It is the difference between a casual flirtation and a legal marriage with all its duties and difficulties. ‘Épouser les idées de . . .’ is no uncommon figure of speech, at any rate in French.

The theory of repression quite certainly came to me independently of any other source; I know of no outside impression which might have suggested it to me, and for a long time I imagined it to be entirely original, until Otto Rank (1911) showed us a passage in Schopenhauer's *World as Will and Idea* in which the philosopher seeks to give an explanation of insanity. What he says there about the struggle against accepting a distressing piece of reality coincides with my concept of repression so completely that once again I owe the chance of making a discovery to my not being well-read. Yet others have read the passage and passed it by without making this discovery, and perhaps the same would have happened to me if in my young days I had had more taste for reading philosophical works. In later years I have denied myself the very great pleasure of reading the works of Nietzsche, with the deliberate object of not being hampered in working out the impressions received in psycho-analysis by any sort of anticipatory ideas. I had therefore to be prepared - and I am so, gladly - to forgo all claims to priority in the many instances in which laborious psycho-analytic investigation can merely confirm the truths which the philosopher recognized by intuition.
Another product of this sort was the hypothesis of infantile sexuality. This, however, was made at a much later date. In the early days of tentative investigation by analysis no such thing was thought of. At first it was merely observed that the effects of present-day experiences had to be traced back to something in the past. But enquirers often find more than they bargain for. One was drawn further and further back into the past; one hoped at last to be able to stop at puberty, the period in which the sexual impulses are traditionally supposed to awake. But in vain; the tracks led still further back into childhood and into its earlier years. On the way, a mistaken idea had to be overcome which might have been almost fatal to the young science. Influenced by Charcot’s view of the traumatic origin of hysteria, one was readily inclined to accept as true and aetologically significant the statements made by patients in which they ascribed their symptoms to passive sexual experiences in the first years of childhood - to put it bluntly, to seduction. When this aetiology broke down under the weight of its own improbability and contradiction in definitely ascertainable circumstances, the result at first was helpless bewilderment. Analysis had led back to these infantile sexual traumas by the right path, and yet they were not true. The firm ground of reality was gone. At that time I would gladly have given up the whole work, just as my esteemed predecessor, Breuer, had done when he made his unwelcome discovery. Perhaps I persevered only because I no longer had any choice and could not then begin again at anything else. At last came the reflection that, after all, one had no right to despair because one has been deceived in one’s expectations; one must revise those expectations. If hysterical subjects trace back their symptoms to traumas that are fictitious, then the new fact which emerges is precisely that they create such scenes in phantasy, and this psychical reality requires to be taken into account alongside practical reality. This reflection was soon followed by the discovery that these phantasies were intended to cover up the auto-erotic activity of the first years of childhood, to embellish it and raise it to a higher plane. And now, from behind the phantasies, the whole range of a child’s sexual life came to light.

I need say little about the interpretation of dreams. It came as the first fruits of the technical innovation I had adopted when, following a dim presentiment, I decided to replace hypnosis by free association. My desire for knowledge had not at the start been directed towards understanding dreams. I do not know of any outside influence which drew my interest to them or inspired me with any helpful expectations. Before Breuer and I ceased to meet I only just had time to tell him in a single sentence that I now understood how to translate dreams. Since this was how the discovery came about, it followed that the symbolism in the language of dreams was almost the last thing to become accessible to me, for the dreamer’s associations help very little towards understanding symbols. I have held fast to the habit of always studying things themselves before looking for information about them in books, and therefore I was able to establish the symbolism of dreams for myself before I was led to it by Scherner’s work on the subject. It was only later that I came to appreciate to its full extent this mode of expression of dreams. This was partly through the influence of the works of Stekel, who at first did such very creditable work but afterwards went totally astray. The close connection between psycho-analytic dream-interpretation and the art of interpreting dreams as practised and held in such high esteem in antiquity only became clear to me much later. Later on I found the essential characteristic and most important part of my dream theory - the derivation of dream-distortion from an internal conflict, a kind of inner dishonesty - in a writer who was ignorant, it is true, of medicine, though not of philosophy, the famous engineer J. Popper, who published his Phantasien eines Realisten under the name of Lynkeus.

[1914d, 2886]
It was only my success in this direction that enabled me to persevere. The result is that I have acquired a habit of gauging the measure of a psychologist's understanding by his attitude to dream-interpretation; and I have observed with satisfaction that most of the opponents of psycho-analysis avoid this field altogether or else display remarkable clumsiness if they attempt to deal with it. Moreover, I soon saw the necessity of carrying out a self-analysis, and this I did with the help of a series of my own dreams which led me back through all the events of my childhood; and I am still of the opinion to-day that this kind of analysis may suffice for anyone who is a good dreamer and not too abnormal.

I think that by thus unrolling the story of the development of psycho-analysis I have shown what it is, better than by a systematic description of it. I did not at first perceive the peculiar nature of what I had discovered. I unhesitatingly sacrificed my growing popularity as a doctor, and the increase in attendance during my consulting hours, by making a systematic enquiry into the sexual factors involved in the causation of my patients' neuroses; and this brought me a great many new facts which finally confirmed my conviction of the practical importance of the sexual factor. I innocently addressed a meeting of the Vienna Society for Psychiatry and Neurology with Krafft-Ebing in the chair, expecting that the material losses I had willingly undergone would be made up for by the interest and recognition of my colleagues. I treated my discoveries as ordinary contributions to science and hoped they would be received in the same spirit. But the silence which my communications met with, the void which formed itself about me, the hints that were conveyed to me, gradually made me realize that assertions on the part played by sexuality in the aetiology of the neuroses cannot count upon meeting with the same kind of treatment as other communications. I understood that from now onwards I was one of those who have 'disturbed the sleep of the world', as Hebbel says, and that I could not reckon upon objectivity and tolerance. Since, however, my conviction of the general accuracy of my observations and conclusions grew even stronger, and since neither my confidence in my own judgement nor my moral courage were precisely small, the outcome of the situation could not be in doubt. I made up my mind to believe that it had been my fortune to discover some particularly important facts and connections, and I was prepared to accept the fate that sometimes accompanies such discoveries.
I pictured the future as follows: I should probably succeed in maintaining myself by means of the therapeutic success of the new procedure, but science would ignore me entirely during my lifetime; some decades later, someone else would infallibly come upon the same things - for which the time was not now ripe - would achieve recognition for them and bring me honour as a forerunner whose failure had been inevitable. Meanwhile, like Robinson Crusoe, I settled down as comfortably as possible on my desert island. When I look back to those lonely years, away from the pressures and confusions of to-day, it seems like a glorious heroic age. My 'splendid isolation'¹ was not without its advantages and charms. I did not have to read any publications, nor listen to any ill-informed opponents; I was not subject to influence from any quarter; there was nothing to hustle me. I learnt to restrain speculative tendencies and to follow the unforgotten advice of my master, Charcot: to look at the same things again and again until they themselves begin to speak. My publications, which I was able to place with a little trouble, could always lag far behind my knowledge, and could be postponed as long as I pleased, since there was no doubtful ‘priority’ to be defended. *The Interpretation of Dreams*, for instance, was finished in all essentials at the beginning of 1896 but was not written out until the summer of 1899. The analysis of 'Dora' was over at the end of 1899; the case history was written in the next two weeks, but was not published until 1905. Meanwhile my writings were not reviewed in the medical journals, or, if as an exception they were reviewed, they were dismissed with expressions of scornful or pitying superiority. Occasionally a colleague would make some reference to me in one of his publications; it would be very short and not at all flattering - words such as 'eccentric', 'extreme', or 'very peculiar' would be used. It once happened that an assistant at the clinic in Vienna where I gave my University lectures asked me for permission to attend the course. He listened very attentively and said nothing; after the last lecture was over he offered to join me outside. As we walked away, he told me that with his chief's knowledge he had written a book combating my views; he regretted very much, however, that he had not first learnt more about them from my lectures, for in that case he would have written much of it differently. He had indeed enquired at the clinic whether he had not better first read *The Interpretation of Dreams*, but had been advised against doing so - it was not worth the trouble. He then himself compared the structure of my theory, so far as he now understood it, with that of the Catholic Church as regards its internal solidity. In the interests of the salvation of his soul, I shall assume that this remark implied a certain amount of appreciation. But he concluded by saying that it was too late to alter anything in his book, since it was already in print. Nor did my colleague think it necessary later to make any public avowal of his change of views on the subject of psycho-analysis; but preferred, in his capacity as a regular reviewer for a medical journal, to follow its development with flippant comments.

[1914d, 2890]
Whatever personal sensitiveness I possessed became blunted during those years, to my advantage. I was saved from becoming embittered, however, by a circumstance which is not always present to help lonely discoverers. Such people are as a rule tormented by the need to account for the lack of sympathy or the aversion of their contemporaries, and feel this attitude as a distressing contradiction of the security of their own sense of conviction. There was no need for me to feel so; for psycho-analytic theory enabled me to understand this attitude in my contemporaries and to see it as a necessary consequence of fundamental analytic premisses. If it was true that the set of facts I had discovered were kept from the knowledge of patients themselves by internal resistances of an affective kind, then these resistances would be bound to appear in healthy people too, as soon as some external source confronted them with what was repressed. It was not surprising that they should be able to justify this rejection of my ideas on intellectual grounds though it was actually affective in origin. The same thing happened equally often with patients; the arguments they advanced were the same and were not precisely brilliant. In Falstaff's words, reasons are 'as plenty as blackberries'. The only difference was that with patients one was in a position to bring pressure to bear on them so as to induce them to get insight into their resistances and overcome them, whereas one had to do without this advantage in dealing with people who were ostensibly healthy. How to compel these healthy people to examine the matter in a cool and scientifically objective spirit was an unsolved problem which was best left to time to clear up. In the history of science one can clearly see that often the very proposition which has at first called out nothing but contradiction has later come to be accepted, although no new proofs in support of it have been brought forward.

[1914d, 2891]

The introduction of psycho-analysis into North America was accompanied by very special marks of honour. In the autumn of 1909, Stanley Hall, the President of Clark University, Worcester, Massachusetts, invited Jung and myself to take part in the celebration of the twentieth anniversary of the foundation of the University by giving a number of lectures in German. To our great surprise, we found the members of that small but highly esteemed University for the study of education and philosophy so unprejudiced that they were acquainted with all the literature of psycho-analysis and had given it a place in their lectures to students. In prudish America it was possible, in academic circles at least, to discuss freely and scientifically everything that in ordinary life is regarded as objectionable. The five lectures which I improvised in Worcester appeared in an English translation in the American Journal of Psychology, and were shortly afterwards published in German under the title Über Psychoanalyse. Jung read a paper on diagnostic association experiments and another on conflicts in the mind of the child. We were rewarded with the honorary degree of Doctor of Laws. During that week of celebrations at Worcester, psycho-analysis was represented by five men: besides Jung and myself, there were Ferenczi, who had joined me for the journey, Ernest Jones, then at the University of Toronto (Canada) and now in London, and A. A. Brill, who was already practising psycho-analysis in New York.

[1914d, 2897]

In Italy, after several promising starts, no real interest was forthcoming. To Holland analysis found early access through personal connections: Van Emden, Van Ophuijsen, Van Renterghem (Freud en zijn School) and the two Stärckes are actively occupied with it both in practice and theory.¹ In scientific circles in England interest in analysis has developed very slowly, but there is reason to expect that the sense for the practical and the passionate love of justice in the English will ensure it a brilliant future there.

[1914d, 2899]
Perhaps in some respects it would have been better if I had given free rein to my own passions and to those of others round me. We have all heard of the interesting attempt to explain psycho-analysis as a product of the Vienna milieu. As recently as in 1913 Janet was not ashamed to use this argument, although he himself is no doubt proud of being a Parisian, and Paris can scarcely claim to be a city of stricter morals than Vienna. The suggestion is that psycho-analysis, and in particular its assertion that the neuroses are traceable to disturbances in sexual life, could only have originated in a town like Vienna - in an atmosphere of sensuality and immorality foreign to other cities - and that it is simply a reflection, a projection into theory, as it were, of these peculiar Viennese conditions. Now I am certainly no local patriot; but this theory about psycho-analysis always seems to me quite exceptionally senseless - so senseless, in fact, that I have sometimes been inclined to suppose that the reproach of being a citizen of Vienna is only a euphemistic substitute for another reproach which no one would care to put forward openly. If the premises on which the argument rests were the opposite of what they are, then it might be worth giving it a hearing. If there were a town in which the inhabitants imposed exceptional restrictions on themselves as regards sexual satisfaction, and if at the same time they exhibited a marked tendency to severe neurotic disorders, that town might certainly give rise in an observer's mind to the idea that the two circumstances had some connection with each other, and might suggest that one was contingent on the other. But neither of these assumptions is true of Vienna. The Viennese are no more abstinent and no more neurotic than the inhabitants of any other capital city. There is rather less embarrassment - less prudery - in regard to sexual relationships than in the cities of the West and North which are so proud of their chastity. These peculiar characteristics of Vienna would be more likely to mislead the observer on the causation of neurosis than to enlighten him on it.

It may be that my policy of avoiding wide publicity is to some extent responsible for this. If I had encouraged or allowed the medical societies of Vienna to occupy themselves with psycho-analysis in stormy debates which would have discharged all the passions and brought into the open all the reproaches and invectives that were on its opponents' tongues or in their hearts - then, perhaps, the ban on psycho-analysis would have been overcome by now and it would no longer be a stranger in its native city. As it is, the poet may be right when he makes his Wallenstein say:

> It is no easy or enviable task to write the history of these two secessions, partly because I am without any strong personal motive for doing so - I had not expected gratitude nor am I revengeful to any effective degree - and partly because I know that by doing so I shall lay myself open to the invectives of my not too scrupulous opponents and offer the enemies of analysis the spectacle they so heartily desire - of 'the psycho-analysts tearing one another limb from limb'. After exercising so much self-restraint in not coming to blows with opponents outside of analysis, I now see myself compelled to take up arms against its former followers or people who still like to call themselves its followers. I have no choice in the matter, however; only indolence or cowardice could lead one to keep silence, and silence would cause more harm than a frank revelation of the harms that already exist. Anyone who has followed the growth of other scientific movements will know that the same upheavals and dissensions commonly occur in them as well. It may be that elsewhere they are more carefully concealed; but psycho-analysis, which repudiates so many conventional ideals, is more honest in these matters too.
Readers of Hebrew and especially young people eager for knowledge are presented in this volume with psycho-analysis clothed in the ancient language which has been awakened to a new life by the will of the Jewish people. The author can well picture the problem which this has set its translator. Nor need he suppress his doubt whether Moses and the Prophets would have found these Hebrew lectures intelligible. But he begs their descendants (among whom he himself is numbered), for whom this book is designed, not to react too quickly to their first impulses of criticism and dislike by rejecting it. Psycho-analysis brings forward so much that is new, and among it so much that contradicts traditional opinions and wounds deeply rooted feelings, that it is bound at first to provoke denial. A reader who suspends his judgement and allows psycho-analysis as a whole to make its impression on him will perhaps become open to a conviction that even this undesired novelty is worth knowing and is indispensable for anyone who wishes to understand the mind and human life.

[1916-1917, 3127]

In psycho-analytic treatments we are invariably faced by the task of filling up these gaps in the memory of childhood; and in so far as the treatment is to any extent successful - that is to say, extremely frequently - we also succeed in bringing to light the content of these forgotten years of childhood. Those impressions had never been really forgotten, they were only inaccessible, latent, and had formed part of the unconscious. But it can come about that they emerge from the unconscious spontaneously, and this happens in connection with dreams. It appears that dream-life knows how to find access to these latent, infantile experiences. Excellent examples of this have been reported in the literature and I myself have been able to provide a contribution of the kind. I once dreamt in a certain connection of a person who must have done me a service and whom I saw clearly before me. He was a one-eyed man of small stature, stout, and with his head sunk deep in his shoulders. I concluded from the context that he was a doctor. Luckily I was able to enquire from my mother, who was still alive, what the doctor at my birth-place (which I had left when I was three) had looked like; and I learnt from her that he was one-eyed, short, stout and with his head sunk deep in his shoulders; and I also learnt what the accident was for which he had come to my help and which I myself had forgotten. This fact of dreams having at their disposal the forgotten material of the first years of childhood is thus a further archaic feature.

[1916-1917, 3290]
Let us look for some analogies to these processes in other fields of knowledge. When, as often happened at early periods of human history, a whole people left their place of domicile and sought a new one, we may be certain that the whole of them did not arrive at the new location. Apart from other losses, it must regularly have happened that small groups or bands of the migrants halted on the way and settled at these stopping places while the main body went further. Or, as you know, to turn to a nearer comparison, in the highest mammals the male sex-glands, which are originally situated deep in the abdominal cavity, start upon a migration at a particular stage of intra-uterine life, which brings them almost directly under the skin of the pelvic extremity. As a consequence of this migration, we find in a number of male individuals that one of these paired organs has remained behind in the pelvic cavity, or that it has become permanently lodged in what is known as the inguinal canal, through which both organs must pass in the course of their migration, or at least that this canal has remained open, though it should normally close up after the sex-glands have completed their change of situation. Or again, when as a young student I was engaged under von Brücke's direction on my first piece of scientific work, I was concerned with the origin of the posterior nerve-roots in the spinal cord of a small fish of very archaic structure; I found that the nerve-fibres of these roots have their origin in large cells in the posterior horn of the grey matter, which is no longer the case in other vertebrates. But I also discovered soon afterwards that nerve-cells of this kind are present outside the grey matter the whole way to what is known as the spinal ganglion of the posterior root; and from this I inferred that the cells of these masses of ganglia had migrated from the spinal cord along the roots of the nerves. This is also shown by their evolutionary history. But in this small fish the whole path of their migration was demonstrated by the cells that had remained behind.

However that may be, there is no question that the problem of anxiety is a nodal point at which the most various and important questions converge, a riddle whose solution would be found to throw a flood of light on our whole mental existence. I will not assert that I can give you this complete solution; but you will certainly expect psycho-analysis to approach this subject too in quite a different way from academic medicine. Interest there seems mainly to be centred on tracing the anatomical paths along which the state of anxiety is brought about. We are told that the medulla oblongata is stimulated, and the patient learns that he is suffering from a neurosis of the vagus nerve. The medulla oblongata is a very serious and lovely object. I remember quite clearly how much time and trouble I devoted to its study many years ago. To-day, however, I must remark that I know nothing that could be of less interest to me for the psychological understanding of anxiety than knowledge of the path of the nerves along which its excitations pass.

It may perhaps interest you to learn how anyone could have formed such an idea as that the act of birth is the source and prototype of the affect of anxiety. Speculation had a very small share in it; what I did, rather, was to borrow from the naïve popular mind. Long years ago, while I was sitting with a number of other young hospital doctors at our mid-day meal in an inn, a house physician from the midwifery department told us of a comic thing that had happened at the last examination for midwives. A candidate was asked what it meant if meconium (excreta) made its appearance at birth in the water coming away, and she promptly replied: 'it means the child's frightened.' She was laughed at and failed in the examination. But silently I took her side and began to suspect that this poor woman from the humbler classes had laid an unerring finger on an important correlation.
Let us begin with the former. I was a pupil of Bernheim's, whom I visited at Nancy in 1889 and whose book on suggestion I translated into German. I practised hypnotic treatment for many years, at first by prohibitory suggestion and later in combination with Breuer's method of questioning the patient. I can therefore speak of the results of hypnotic or suggestive therapy on the basis of a wide experience. If, in the words of the old medical aphorism, an ideal therapy should be rapid, reliable and not disagreeable for the patient, Bernheim's method fulfilled at least two of these requirements. It could be carried through much quicker - or, rather, infinitely quicker - than analytic treatment and it caused the patient neither trouble nor unpleasantness. For the doctor it became, in the long run, monotonous: in each case, in the same way, with the same ceremonial, forbidding the most variegated symptoms to exist, without being able to learn anything of their sense and meaning. It was hackwork and not a scientific activity, and it recalled magic, incantations and hocus-pocus. That could not weigh, however, against the patient's interest. But the third quality was lacking: the procedure was not reliable in any respect. It could be used with one patient, but not with another; it achieved a great deal with one and very little with another, and one never knew why. Worse than the capriciousness of the procedure was the lack of permanence in its successes. If, after a short time, one had news of the patient once more, the old ailment was back again or its place had been taken by a new one. One might hypnotize him again. But in the background there was the warning given by experienced workers against robbing the patient of his self-reliance by frequently repeated hypnosis and so making him an addict to this kind of therapy as though it were a narcotic. Admittedly sometimes things went entirely as one would wish: after a few efforts, success was complete and permanent. But the conditions determining such a favourable outcome remained unknown. On one occasion a severe condition in a woman, which I had entirely got rid of by a short hypnotic treatment, returned unchanged after the patient had, through no action on my part, got annoyed with me; after a reconciliation, I removed the trouble again and far more thoroughly; yet it returned once more after she had fallen foul of me a second time. On another occasion a woman patient, whom I had repeatedly helped out of neurotic states by hypnosis, suddenly, during the treatment of a specially obstinate situation, threw her arms round my neck. After this one could scarcely avoid, whether one wanted to or not, investigating the question of the nature and origin of one's authority in suggestive treatment.

The factor of the repetition of the same thing will perhaps not appeal to everyone as a source of uncanny feeling. From what I have observed, this phenomenon does undoubtedly, subject to certain conditions and combined with certain circumstances, arouse an uncanny feeling, which, furthermore, recalls the sense of helplessness experienced in some dream states. As I was walking, one hot summer afternoon, through the deserted streets of a provincial town in Italy which was unknown to me, I found myself in a quarter of whose character I could not long remain in doubt. Nothing but painted women were to be seen at the windows of the small houses, and I hastened to leave the narrow street at the next turning. But after having wandered about for a time without enquiring my way, I suddenly found myself back in the same street, where my presence was now beginning to excite attention. I hurried away once more, only to arrive by another détour at the same place yet a third time. Now, however, a feeling overcame me which I can only describe as uncanny, and I was glad enough to find myself back at the piazza I had left a short while before, without any further voyages of discovery. Other situations which have in common with my adventure an unintended recurrence of the same situation, but which differ radically from it in other respects, also result in the same feeling of helplessness and of uncanniness. So, for instance, when, caught in a mist perhaps, one has lost one's way in a mountain forest, every attempt to find the marked or familiar path may bring one back again and again to one and the same spot, which one can identify by some particular landmark. Or one may wander about in a dark, strange room, looking for the door or the electric switch, and collide time after time with the same piece of furniture - though it is true that Mark Twain succeeded by wild exaggeration in turning this latter situation into something irresistibly comic.
We shall therefore be prepared for the statement that suggestion (or more correctly suggestibility) is actually an irreducible, primitive phenomenon, a fundamental fact in the mental life of man. Such, too, was the opinion of Bernheim, of whose astonishing arts I was a witness in the year 1889. But I can remember even then feeling a muffled hostility to this tyranny of suggestion. When a patient who showed himself unamenable was met with the shout: 'What are you doing? Vous vous contre-suggestionnez!', I said to myself that this was an evident injustice and an act of violence. For the man certainly had a right to counter-suggestions if people were trying to subdue him with suggestions. Later on my resistance took the direction of protesting against the view that suggestion, which explained everything, was itself to be exempt from explanation. Thinking of it, I repeated the old conundrum:¹

As you will observe, the part played by analytic interpretation is even more important in this example than in the last one. Analysis may actually be said to have created the occult fact. Accordingly, this example, too, would seem to offer positively conclusive evidence of its being possible to transfer an unconscious wish and the thoughts and knowledge relating to it. I can see only one way of evading the conclusiveness of this last case and you may be sure that I shall not conceal it. It is possible that in the course of the twelve or thirteen years that elapsed between the prophecy and the account of it given during the treatment the patient may have formed a paramnesia: the Professor may have uttered some general and colourless consolation - which would be nothing to wonder at - and the patient may have gradually inserted the significant numbers out of her unconscious. If so, we should have avoided the fact which threatened us with such momentous consequences. We will gladly identify ourselves with the sceptics who will only attach value to a report of this kind if it is made immediately after the event - and even then, perhaps, not without hesitation. I remember that after I was appointed to a professorship I had an audience with the Minister to express my thanks. As I was on my way home from this audience I caught myself in the act of trying to falsify the words that had passed between us and I was never able to recapture correctly the actual conversation. I must leave it to you to decide whether the explanation I have suggested is tenable. I can neither prove nor disprove it. Thus, this second observation, though in itself more impressive than the first, is not equally free from doubt.

I will instead add a few remarks about someone who is very well known in Vienna, a graphologist, Rafael Schermann, who has a reputation for the most astonishing performances. He is said to be able not merely to read a person's character from a specimen of his handwriting, but also to describe his appearance and to add predictions about him which later come true. Incidentally, many of these remarkable achievements are based on his own stories. A friend of mine once, without my previous knowledge, made the experiment of getting him to allow his imagination to play over a specimen of my writing. All that he produced was that the writing was that of an old gentleman (which it was easy to guess), with whom it was hard to live since he was an intolerable tyrant in his home. Those who share my house would hardly confirm this. But, as we know, the field of the occult is subject to the convenient principle that negative cases prove nothing. I have made no direct observations on Schermann, but through a patient of mine I have been in contact with him without his knowing it. I will tell you about it.
You will have grasped the sense in which I am inclined to interpret these experiences of mine with Schermann. You will see that all my material touches only on the single point of thought-transference. I have nothing to say about all the other miracles that are claimed by occultism. My own life, as I have already openly admitted, has been particularly poor in an occult sense. Perhaps the problem of thought-transference may seem very trivial to you in comparison with the great magical world of the occult. But consider what a momentous step beyond what we have hitherto believed would be involved in this hypothesis alone. What the custodian of Saint-Denis used to add to his account of the saint's martyrdom remains true. Saint-Denis is said, after his head was cut off, to have picked it up and to have walked quite a distance with it under his arm. But the custodian used to remark: 'Dans des cas pareils, ce n'est que le premier pas qui coûte.' The rest is easy.

The material on which the present communication is based is very slight. In the first place, I must express my regret that I could make no use of my own dreams, as I did when I wrote my *Interpretation of Dreams* (1900a). But I have never had a 'telepathic' dream. Not that I have been without dreams of the kind that convey an impression that a certain definite event is happening at some distant place, leaving it to the dreamer to decide whether the event is happening at that moment or will do so at some later time. In waking life, too, I have often become aware of presentiments of distant events. But these hints, foretellings and premonitions have none of them 'come true', as we say; there proved to be no external reality corresponding to them, and they had therefore to be regarded as purely subjective anticipations.

For example, I once dreamt during the war that one of my sons then serving at the front had been killed. This was not directly stated in the dream, but was expressed in an unmistakable manner, by means of the well-known death-symbolism of which an account was first given by Stekel. (We must not omit to fulfil the duty, often felt to be inconvenient, of making literary acknowledgements.) I saw the young soldier standing on a landing-stage, between land and water, as it were; he looked to me very pale. I spoke to him but he did not answer. There were other unmistakable indications. He was not wearing military uniform, but a ski-ing costume that he had worn when a serious ski-ing accident had happened to him several years before the war. He stood on something like a footstool with a cupboard in front of him; a situation always closely associated in my mind with the idea of 'falling', through a memory of my own childhood. As a child of little more than two years old I had myself climbed on a footstool like this to get something off the top of a cupboard - probably something good to eat - and I fell down and gave myself an injury, of which I can even now show the scar. My son, however, whom the dream pronounced to be dead, came home from the war unscathed.
Psycho-analysis grew up in a narrowly-restricted field. At the outset, it had only a single aim - that of understanding something of the nature of what were known as the 'functional' nervous diseases, with a view to overcoming the impotence which had so far characterized their medical treatment. The neurologists of that period had been brought up to have a high respect for chemico-physical and pathologico-anatomical facts; and they were latterly under the influence of the findings of Hitzig and Fritsch, of Ferrier, Goltz and others, who seemed to have established an intimate and possibly exclusive connection between certain functions and particular parts of the brain. They did not know what to make of the psychical factor and could not understand it. They left it to the philosophers, the mystics and - the quacks; and they considered it unscientific to have anything to do with it. Accordingly they could find no approach to the secrets of the neuroses, and in particular of the enigmatic 'hysteria', which was, indeed, the prototype of the whole species. As late as in 1885, when I was studying at the Salpêtrière, I found that people were content to account for hysterical paralyses by a formula which asserted that they were founded on slight functional disturbances of the same parts of the brain which, when they were severely damaged, led to the corresponding organic paralyses.

The general hostility, however, did not succeed in preventing psycho-analysis from continuous expansion during the next decade in two directions: on the map, for interest in it was constantly cropping up in new countries, and in the field of the mental sciences, for it was constantly finding applications in new branches of knowledge. In 1909 President G. Stanley Hall invited Freud and Jung to give a series of lectures at Clark University in Worcester, Mass., of which he was the head and where they were given a friendly reception. Since then psycho-analysis has remained popular in America, although precisely in that country its name has been coupled with much superficiality and some abuses. As early as in 1911, Havelock Ellis was able to report that analysis was studied and practised, not only in Austria and Switzerland, but also in the United States, in England, India, Canada, and, no doubt, in Australia too.

Finally, with all reserve, the question may be raised whether the personality of the present writer as a Jew who has never sought to disguise the fact that he is a Jew may not have had a share in provoking the antipathy of his environment to psycho-analysis. An argument of this kind is not often uttered aloud. But we have unfortunately grown so suspicious that we cannot avoid thinking that this factor may not have been quite without its effect. Nor is it perhaps entirely a matter of chance that the first advocate of psycho-analysis was a Jew. To profess belief in this new theory called for a certain degree of readiness to accept a situation of solitary opposition - a situation with which no one is more familiar than a Jew.

I believe that what enabled me to discover the cause of dream-distortion was my moral courage. In the case of Popper it was the purity, love of truth and moral serenity of his nature.

. . . I can say that I stand as far apart from the Jewish religion as from all other religions: that is to say, they are of great significance to me as a subject of scientific interest, but I have no part in them emotionally. On the other hand I have always had a strong feeling of solidarity with my fellow-people, and have always encouraged it in my children as well. We have all remained in the Jewish denomination.

In the time of my youth our free-thinking religious instructors set no store by their pupils' acquiring a knowledge of the Hebrew language and literature. My education in this field was therefore extremely behindhand, as I have since often regretted.
I find it painful that my ill-health prevents me from being present at the opening festivities of the Jewish University in Jerusalem.
[1925c, 4181]

Several of the contributors to this series of 'Autobiographical Studies' have begun by expressing their misgivings at the unusual difficulties of the task they have undertaken. The difficulties in my case are, I think, even greater; for I have already more than once published papers upon the same line as the present one, papers which, from the nature of the subject have dealt more with personal considerations than is usual or than would otherwise have been necessary.
[1925d, 4185]

I gave my first account of the development and subject matter of psycho-analysis in five lectures which I delivered in 1909 before Clark University at Worcester, Mass., where I had been invited to attend the celebration of the twentieth anniversary of the foundation of that body.¹ Only recently I gave way to the temptation of making a contribution of a similar kind to an American collective publication dealing with the opening years of the twentieth century, since its editors had shown their recognition of the importance of psycho-analysis by allotting a special chapter to it.² Between these two dates appeared a paper, 'On the History of the Psycho-Analytic Movement', which, in fact, contains the essence of all that I can say on the present occasion. Since I must not contradict myself and since I have no wish to repeat myself exactly, I must endeavour to construct a narrative in which subjective and objective attitudes, biographical and historical interests, are combined in a new proportion.
[1925d, 4185]

I was born on May 6th, 1856, at Freiberg in Moravia, a small town in what is now Czechoslovakia. My parents were Jews, and I have remained a Jew myself. I have reason to believe that my father's family were settled for a long time on the Rhine (at Cologne), that, as a result of a persecution of the Jews during the fourteenth or fifteenth century, they fled eastwards, and that, in the course of the nineteenth century, they migrated back from Lithuania through Galicia into German Austria. When I was a child of four I came to Vienna, and I went through the whole of my education there. At the 'Gymnasium' I was at the top of my class for seven years; I enjoyed special privileges there, and had scarcely ever to be examined in class. Although we lived in very limited circumstances, my father insisted that, in my choice of a profession, I should follow my own inclinations alone. Neither at that time, nor indeed in my later life, did I feel any particular predilection for the career of a doctor. I was moved, rather, by a sort of curiosity, which was, however, directed more towards human concerns than towards natural objects; nor had I grasped the importance of observation as one of the best means of gratifying it. My deep engrossment in the Bible story (almost as soon as I had learnt the art of reading) had, as I recognized much later, an enduring effect upon the direction of my interest. Under the powerful influence of a school friendship with a boy rather my senior who grew up to be a well-known politician, I developed a wish to study law like him and to engage in social activities. At the same time, the theories of Darwin, which were then of topical interest, strongly attracted me, for they held out hopes of an extraordinary advance in our understanding of the world; and it was hearing Goethe's beautiful essay on Nature read aloud at a popular lecture by Professor Carl Brühl just before I left school that decided me to become a medical student.
[1925d, 4186]
When, in 1873, I first joined the University, I experienced some appreciable disappointments. Above all, I found that I was expected to feel myself inferior and an alien because I was a Jew. I refused absolutely to do the first of these things. I have never been able to see why I should feel ashamed of my descent or, as people were beginning to say, of my ‘race’. I put up, without much regret, with my non-acceptance into the community; for it seemed to me that in spite of this exclusion an active fellow-worker could not fail to find some nook or cranny in the framework of humanity. These first impressions at the University, however, had one consequence which was afterwards to prove important; for at an early age I was made familiar with the fate of being in the Opposition and of being put under the ban of the ‘compact majority’. The foundations were thus laid for a certain degree of independence of judgement.

I was compelled, moreover, during my first years at the University, to make the discovery that the peculiarities and limitations of my gifts denied me all success in many of the departments of science into which my youthful eagerness had plunged me. Thus I learned the truth of Mephistopheles’ warning:

At length, in Ernst Brücke’s physiological laboratory, I found rest and full satisfaction - and men, too, whom I could respect and take as my models: the great Brücke himself, and his assistants, Sigmund Exner and Ernst Fleischl von Marxow. With the last of these, a brilliant man, I was privileged to be upon terms of friendship. Brücke gave me a problem to work out in the histology of the nervous system; I succeeded in solving it to his satisfaction and in carrying the work further on my own account. I worked at this Institute, with short interruptions, from 1876 to 1882, and it was generally thought that I was marked out to fill the next post of Assistant that might fall vacant there. The various branches of medicine proper, apart from psychiatry, had no attraction for me. I was decidedly negligent in pursuing my medical studies, and it was not until 1881 that I took my somewhat belated degree as a Doctor of Medicine.

The turning-point came in 1882, when my teacher, for whom I felt the highest possible esteem, corrected my father’s generous improvidence by strongly advising me, in view of my bad financial position, to abandon my theoretical career. I followed his advice, left the physiological laboratory and entered the General Hospital as an Aspirant. I was soon afterwards promoted to being a Sekundararzt, and worked in various departments of the hospital, among others for more than six months under Meynert, by whose work and personality I had been greatly struck while I was still a student.

In a certain sense I nevertheless remained faithful to the line of work upon which I had originally started. The subject which Brücke had proposed for my investigations had been the spinal cord of one of the lowest of the fishes (*Ammocoetes Petromyzon*); and I now passed on to the human central nervous system. Just at this time Flechsig's discoveries of the non-simultaneity of the formation of the medullary sheaths were throwing a revealing light upon the intricate course of its tracts. The fact that I began by choosing the medulla oblongata as the one and only subject of my work was another sign of the continuity of my development. In complete contrast to the diffuse character of my studies during my earlier years at the University, I was now developing an inclination to concentrate my work exclusively upon a single subject or problem. This inclination has persisted and has since led to my being accused of one-sidedness.
I now became as active a worker in the Institute of Cerebral Anatomy as I had previously been in the physiological one. Some short papers upon the course of the tracts and the nuclear origins in the medulla oblongata date from these hospital years, and some notice was taken of my findings by Edinger. One day Meynert, who had given me access to the laboratory even during the times when I was not actually working under him, proposed that I should definitely devote myself to the anatomy of the brain, and promised to hand over his lecturing work to me, as he felt he was too old to manage the newer methods. This I declined, in alarm at the magnitude of the task; it is possible, too, that I had guessed already that this great man was by no means kindly disposed towards me.

From the material point of view, brain anatomy was certainly no better than physiology, and, with an eye to pecuniary considerations, I began to study nervous diseases. There were, at that time, few specialists in that branch of medicine in Vienna, the material for its study was distributed over a number of different departments of the hospital, there was no satisfactory opportunity of learning the subject, and one was forced to be one’s own teacher. Even Nothnagel, who had been appointed a short time before, on account of his book upon cerebral localization, did not single out neuropathology from among the other subdivisions of medicine. In the distance shone the great name of Charcot; so I formed a plan of first obtaining an appointment as University Lecturer on Nervous Diseases in Vienna and of then going to Paris to continue my studies.

In the course of the following years, while I continued to work as a junior physician, I published a number of clinical observations on organic diseases of the nervous system. I gradually became familiar with the ground; I was able to localize the site of a lesion in the medulla oblongata so accurately that the pathological anatomist had no further information to add; I was the first person in Vienna to send a case for autopsy with a diagnosis of polyneuritis acuta.

The fame of my diagnoses and of their post-mortem confirmation brought me an influx of American physicians, to whom I lectured upon the patients in my department in a sort of pidgin English. About the neuroses I understood nothing. On one occasion I introduced to my audience a neurotic suffering from a persistent headache as a case of chronic localized meningitis; they all quite rightly rose in revolt and deserted me, and my premature activities as a teacher came to an end. By way of excuse I may add that this happened at a time when greater authorities than myself in Vienna were in the habit of diagnosing neurasthenia as cerebral tumour.

In the spring of 1885 I was appointed Lecturer in Neuropathology on the ground of my histological and clinical publications. Soon afterwards, as the result of a warm testimonial from Brücke, I was awarded a Travelling Bursary of considerable value. In the autumn of the same year I made the journey to Paris.
I became a student at the Salpêtrière, but, as one of the crowd of foreign visitors, I had little attention paid me to begin with. One day in my hearing Charcot expressed his regret that since the war he had heard nothing from the German translator of his lectures; he went on to say that he would be glad if someone would undertake to translate the new volume of his lectures into German. I wrote to him and offered to do so; I can still remember a phrase in the letter, to the effect that I suffered only from 'l'aphasie motrice' and not from 'l'aphasie sensorielle du français'. Charcot accepted the offer, I was admitted to the circle of his personal acquaintances, and from that time forward I took a full part in all that went on at the Clinic.

As I write these lines, a number of papers and newspaper articles have reached me from France, which give evidence of a violent objection to the acceptance of psycho-analysis, and which often make the most inaccurate assertions in regard to my relations with the French school. I read, for instance, that I made use of my visit to Paris to familiarize myself with the theories of Pierre Janet and then made off with my booty. I should therefore like to say explicitly that during the whole of my visit to the Salpêtrière Janet's name was never so much as mentioned.

Before I returned to Vienna I stopped for a few weeks in Berlin, in order to gain a little knowledge of the general disorders of childhood. Kassowitz, who was at the head of a public institute in Vienna for the treatment of children's diseases, had promised to put me in charge of a department for the nervous diseases of children. In Berlin I was given assistance and a friendly reception by Baginsky. In the course of the next few years I published, from the Kassowitz Institute, several monographs of considerable size on unilateral and bilateral cerebral palsies in children. And for that reason, at a later date (in 1897), Nothnagel made me responsible for dealing with the same subject in his great Handbuch der allgemeinen und speziellen Therapie.

In the autumn of 1886 I settled down in Vienna as a physician, and married the girl who had been waiting for me in a distant city for more than four years. I may here go back a little and explain how it was the fault of my fiancée that I was not already famous at that youthful age. A side interest, though it was a deep one, had led me in 1884 to obtain from Merck some of what was then the little-known alkaloid cocaine and to study its physiological action. While I was in the middle of this work, an opportunity arose for making a journey to visit my fiancée, from whom I had been parted for two years. I hastily wound up my investigation of cocaine and contented myself in my monograph on the subject with prophesying that further uses for it would soon be found. I suggested, however, to my friend Königstein, the ophthalmologist, that he should investigate the question of how far the anaesthetizing properties of cocaine were applicable in diseases of the eye. When I returned from my holiday I found that not he, but another of my friends, Carl Koller (now in New York), whom I had also spoken to about cocaine, had made the decisive experiments upon animals' eyes and had demonstrated them at the Ophthalmological Congress at Heidelberg. Koller is therefore rightly regarded as the discoverer of local anaesthesia by cocaine, which has become so important in minor surgery; but I bore my fiancée no grudge for the interruption.
I will now return to the year 1886, the time of my settling down in Vienna as a specialist in nervous diseases. The duty devolved upon me of giving a report before the 'Gesellschaft der Aerzte' upon what I had seen and learnt with Charcot. But I met with a bad reception. Persons of authority, such as the chairman (Bamberger, the physician), declared that what I said was incredible. Meynert challenged me to find some cases in Vienna similar to those which I had described and to present them before the Society. I tried to do so; but the senior physicians in whose departments I found any such cases refused to allow me to observe them or to work at them. One of them, an old surgeon, actually broke out with the exclamation: 'But, my dear sir, how can you talk such nonsense? Hysteron (sic) means the uterus. So how can a man be hysterical?' I objected in vain that what I wanted was not to have my diagnosis approved, but to have the case put at my disposal. At length, outside the hospital, I came upon a case of classical hysterical hemi-anaesthesia in a man, and demonstrated it before the 'Gesellschaft der Aerzte'. This time I was applauded, but no further interest was taken in me. The impression that the high authorities had rejected my innovations remained unshaken; and, with my hysteria in men and my production of hysterical paralyses by suggestion, I found myself forced into the Opposition. As I was soon afterwards excluded from the laboratory of cerebral anatomy and for terms on end had nowhere to deliver my lectures, I withdrew from academic life and ceased to attend the learned societies. It is a whole generation since I have visited the 'Gesellschaft der Aerzte'.

[1925d, 4193]

Anyone who wants to make a living from the treatment of nervous patients must clearly be able to do something to help them. My therapeutic arsenal contained only two weapons, electrotherapy and hypnotism, for prescribing a visit to a hydropathic establishment after a single consultation was an inadequate source of income. My knowledge of electrotherapy was derived from W. Erb's text-book, which provided detailed instructions for the treatment of all the symptoms of nervous diseases. Unluckily I was soon driven to see that following these instructions was of no help whatever and that what I had taken for an epitome of exact observations was merely the construction of phantasy. The realization that the work of the greatest name in German neuropathology had no more relation to reality than some 'Egyptian' dream-book, such as is sold in cheap book-shops, was painful, but it helped to rid me of another shred of the innocent faith in authority from which I was not yet free. So I put my electrical apparatus aside, even before Moebius had saved the situation by explaining that the successes of electric treatment in nervous disorders (in so far as there were any) were the effect of suggestion on the part of the physician.

[1925d, 4194]
This implied, of course, that I abandoned the treatment of organic nervous diseases; but that was of little importance. For on the one hand the prospects in the treatment of such disorders were in any case never promising, while, on the other hand, in the private practice of a physician working in a large town, the quantity of such patients was nothing compared to the crowds of neurotics, whose number seemed further multiplied by the way in which they hurried, with their troubles unsolved, from one physician to another. And, apart from this, there was something positively seductive in working with hypnotism. For the first time there was a sense of having overcome one's helplessness; and it was highly flattering to enjoy the reputation of being a miracle-worker. It was not until later that I was to discover the drawbacks of the procedure. At the moment there were only two points to complain of: first, that I could not succeed in hypnotizing every patient, and secondly, that I was unable to put individual patients into as deep a state of hypnosis as I should have wished. With the idea of perfecting my hypnotic technique, I made a journey to Nancy in the summer of 1889 and spent several weeks there. I witnessed the moving spectacle of old Liébeault working among the poor women and children of the labouring classes. I was a spectator of Bernheim's astonishing experiments upon his hospital patients, and I received the profoundest impression of the possibility that there could be powerful mental processes which nevertheless remained hidden from the consciousness of men. Thinking it would be instructive, I had persuaded one of my patients to follow me to Nancy. This patient was a very highly gifted hysteric, a woman of good birth, who had been handed over to me because no one knew what to do with her. By hypnotic influence I had made it possible for her to lead a tolerable existence and I was always able to take her out of the misery of her condition. But she always relapsed again after a short time, and in my ignorance I attributed this to the fact that her hypnosis had never reached the stage of somnambulism with amnesia. Bernheim now attempted several times to bring this about, but he too failed. He frankly admitted to me that his great therapeutic successes by means of suggestion were only achieved in his hospital practice and not with his private patients. I had many stimulating conversations with him, and undertook to translate into German his two works upon suggestion and its therapeutic effects.

During the period from 1886 to 1891 I did little scientific work, and published scarcely anything. I was occupied with establishing myself in my new profession and with assuring my own material existence as well as that of a rapidly increasing family. In 1891 there appeared the first of my studies on the cerebral palsies of children, which was written in collaboration with my friend and assistant, Dr. Oskar Rie. An invitation which I received in the same year to contribute to an encyclopaedia of medicine led me to investigate the theory of aphasia. This was at the time dominated by the views of Wernicke and Lichtheim, which laid stress exclusively upon localization. The fruit of this enquiry was a small critical and speculative book, Zur Auffassung der Aphasien

The manner in which I arrived at this other procedure was as follows. While I was still working in Brücke's laboratory I had made the acquaintance of Dr. Josef Breuer, who was one of the most respected family physicians in Vienna, but who also had a scientific past, since he had produced several works of permanent value upon the physiology of respiration and upon the organ of equilibrium. He was a man of striking intelligence and fourteen years older than myself. Our relations soon became more intimate and he became my friend and helper in my difficult circumstances. We grew accustomed to share all our scientific interests with each other. In this relationship the gain was naturally mine. The development of psycho-analysis afterwards cost me his friendship. It was not easy for me to pay such a price, but I could not escape it.
Even before I went to Paris, Breuer had told me about a case of hysteria which, between 1880 and 1882, he had treated in a peculiar manner which had allowed him to penetrate deeply into the causation and significance of hysterical symptoms. This was at a time, therefore, when Janet's works still belonged to the future. He repeatedly read me pieces of the case history, and I had an impression that it accomplished more towards an understanding of neuroses than any previous observation. I determined to inform Charcot of these discoveries when I reached Paris, and I actually did so. But the great man showed no interest in my first outline of the subject, so that I never returned to it and allowed it to pass from my mind.

When I was back in Vienna I turned once more to Breuer's observation and made him tell me more about it. The patient had been a young girl of unusual education and gifts, who had fallen ill while she was nursing her father, of whom she was devotedly fond. When Breuer took over her case it presented a variegated picture of paralyses with contractures, inhibitions and states of mental confusion. A chance observation showed her physician that she could be relieved of these clouded states of consciousness if she was induced to express in words the affective phantasy by which she was at the moment dominated. From this discovery, Breuer arrived at a new method of treatment. He put her into deep hypnosis and made her tell him each time what it was that was oppressing her mind. After the attacks of depressive confusion had been overcome in this way, he employed the same procedure for removing her inhibitions and physical disorders. In her waking state the girl could no more describe than other patients how her symptoms had arisen, and she could discover no link between them and any experiences of her life. In hypnosis she immediately discovered the missing connection. It turned out that all her symptoms went back to moving events which she had experienced while nursing her father; that is to say, her symptoms had a meaning and were residues or reminiscences of those emotional situations. It was found in most instances that there had been some thought or impulse which she had had to suppress while she was by her father's sick-bed, and that, in place of it, as a substitute for it, the symptom had afterwards appeared. But as a rule the symptom was not the precipitate of a single such 'traumatic' scene, but the result of a summation of a number of similar situations. When the patient recalled a situation of this kind in a hallucinatory way under hypnosis and carried through to its conclusion, with a free expression of emotion, the mental act which she had originally suppressed, the symptom was abolished and did not return. By this procedure Breuer succeeded, after long and painful efforts, in relieving his patient of all her symptoms.
Official disapproval could not hinder the spread of psycho-analysis either in Germany or in other countries. I have elsewhere followed the stages of its growth and given the names of those who were its first representatives. In 1909 G. Stanley Hall invited Jung and me to America to go to Clark University, Worcester, Mass., of which he was President, and to spend a week giving lectures (in German) at the celebration of the twentieth anniversary of that body's foundation. Hall was justly esteemed as a psychologist and educationalist, and had introduced psycho-analysis into his courses several years earlier; there was a touch of the 'king-maker' about him, a pleasure in setting up authorities and in then deposing them. We also met James J. Putnam there, the Harvard neurologist, who in spite of his age was an enthusiastic supporter of psycho-analysis and threw the whole weight of a personality that was universally respected into the defence of the cultural value of analysis and the purity of its aims. He was an estimable man, in whom, as a reaction against a predisposition to obsessional neurosis, an ethical bias predominated; and the only thing in him that was disquieting was his inclination to attach psycho-analysis to a particular philosophical system and to make it the servant of moral aims. Another event of this time which made a lasting impression on me was a meeting with William James the philosopher. I shall never forget one little scene that occurred as we were on a walk together. He stopped suddenly, handed me a bag he was carrying and asked me to walk on, saying that he would catch me up as soon as he had got through an attack of angina pectoris which was just coming on. He died of that disease a year later; and I have always wished that I might be as fearless as he was in the face of approaching death.

At that time I was only fifty-three. I felt young and healthy, and my short visit to the new world encouraged my self-respect in every way. In Europe I felt as though I were despised; but over there I found myself received by the foremost men as an equal. As I stepped on to the platform at Worcester to deliver my Five Lectures on Psycho-Analysis it seemed like the realization of some incredible day-dream: psycho-analysis was no longer a product of delusion, it had become a valuable part of reality. It has not lost ground in America since our visit; it is extremely popular among the lay public and is recognized by a number of official psychiatrists as an important element in medical training. Unfortunately, however, it has suffered a great deal from being watered down. Moreover, many abuses which have no relation to it find a cover under its name, and there are few opportunities for any thorough training in technique or theory. In America, too, it has come in conflict with Behaviourism, a theory which is naïve enough to boast that it has put the whole problem of psychology completely out of court.

If a community is based on agreement upon a few cardinal points, it is obvious that people who have abandoned that common ground will cease to belong to it. Yet the secession of former pupils has often been brought up against me as a sign of my intolerance or has been regarded as evidence of some special fatality that hangs over me. It is a sufficient answer to point out that in contrast to those who have left me, like Jung, Adler, Stekel, and a few besides, there are a great number of men, like Abraham, Eitingon, Ferenczi, Rank, Jones, Brill, Sachs, Pfister, van Emden, Reik, and others, who have worked with me for some fifteen years in loyal collaboration and for the most part in uninterrupted friendship. I have only mentioned the oldest of my pupils, who have already made a distinguished name for themselves in the literature of psycho-analysis; if I have passed over others, that is not to be taken as a slight, and indeed among those who are young and have joined me lately talents are to be found on which great hopes may be set. But I think I can say in my defence that an intolerant man, dominated by an arrogant belief in his own infallibility, would never have been able to maintain his hold upon so large a number of intellectually eminent people, especially if he had at his command as few practical attractions as I had.
If the preliminary cathartic period is left on one side, the history of psycho-analysis falls from my point of view into two phases. In the first of these I stood alone and had to do all the work myself: this was from 1895-6 until 1906 or 1907. In the second phase, lasting from then until the present time, the contributions of my pupils and collaborators have been growing more and more in importance, so that to-day, when a grave illness warns me of the approaching end, I can think with a quiet mind of the cessation of my own labours. For that very reason, however, it is impossible for me in this Autobiographical Study to deal as fully with the progress of psycho-analysis during the second phase as I did with its gradual rise during the first phase, which was concerned with my own activity alone. I feel that I should only be justified in mentioning here those new discoveries in which I still played a prominent part, in particular, therefore, those made in the sphere of narcissism, of the theory of the instincts, and of the application of psycho-analysis to the psychoses.

[1925d, 4230]

I should not like to create an impression that during this last period of my work I have turned my back upon patient observation and have abandoned myself entirely to speculation. I have on the contrary always remained in the closest touch with the analytic material and have never ceased working at detailed points of clinical or technical importance. Even when I have moved away from observation, I have carefully avoided any contact with philosophy proper. This avoidance has been greatly facilitated by constitutional incapacity. I was always open to the ideas of G. T. Fechner and have followed that thinker upon many important points. The large extent to which psycho-analysis coincides with the philosophy of Schopenhauer - not only did he assert the dominance of the emotions and the supreme importance of sexuality but he was even aware of the mechanism of repression - is not to be traced to my acquaintance with his teaching. I read Schopenhauer very late in my life. Nietzsche, another philosopher whose guesses and intuitions often agree in the most astonishing way with the laborious findings of psycho-analysis, was for a long time avoided by me on that very account; I was less concerned with the question of priority than with keeping my mind unembarrassed.

[1925d, 4234]

Looking back, then, over the patchwork of my life's labours, I can say that I have made many beginnings and thrown out many suggestions. Something will come of them in the future, though I cannot myself tell whether it will be much or little. I can, however, express a hope that I have opened up a pathway for an important advance in our knowledge.

[1925d, 4243]

Two themes run through these pages: the story of my life and the history of psycho-analysis. They are intimately interwoven. This Autobiographical Study shows how psycho-analysis came to be the whole content of my life and rightly assumes that no personal experiences of mine are of any interest in comparison to my relations with that science.

[1925d, 4244]
Shortly before I wrote this study it seemed as though my life would soon be brought to an end by the recurrence of a malignant disease; but surgical skill saved me in 1923 and I was able to continue my life and my work, though no longer in freedom from pain. In the period of more than ten years that has passed since then, I have never ceased my analytic work nor my writing - as is proved by the completion of the twelfth volume of the German edition of my collected works. But I myself find that a significant change has come about. Threads which in the course of my development had become intertangled have now begun to separate; interests which I had acquired in the later part of my life have receded, while the older and original ones become prominent once more. It is true that in this last decade I have carried out some important pieces of analytic work, such as the revision of the problem of anxiety in my book *Inhibitions, Symptoms and Anxiety* (1926d) or the simple explanation of sexual 'fetishism' which I was able to make a year later (1927e). Nevertheless it would be true to say that, since I put forward my hypothesis of the existence of two classes of instinct (Eros and the death instinct) and since I proposed a division of the mental personality into an ego, a super-ego, and an id (1923b), I have made no further decisive contributions to psycho-analysis: what I have written on the subject since then has been either unessential or would soon have been supplied by someone else. This circumstance is connected with an alteration in myself, with what might be described as a phase of regressive development. My interest, after making a lifelong *détour* through the natural sciences, medicine and psychotherapy, returned to the cultural problems which had fascinated me long before, when I was a youth scarcely old enough for thinking. At the very climax of my psycho-analytic work, in 1912, I had already attempted in *Totem and Taboo* to make use of the newly discovered findings of analysis in order to investigate the origins of religion and morality. I now carried this work a stage further in two later essays, *The Future of an Illusion* (1927c) and *Civilization and its Discontents* (1930a). I perceived ever more clearly that the events of human history, the interactions between human nature, cultural development and the precipitates of praeval experiences (the most prominent example of which is religion) are no more than a reflection of the dynamic conflicts between the ego, the id and the super-ego, which psycho-analysis studies in the individual - are the very same processes repeated upon a wider stage. In *The Future of an Illusion* I expressed an essentially negative valuation of religion. Later, I found a formula which did better justice to it: while granting that its power lies in the truth which it contains, I showed that that truth was not a material but a historical truth.

These studies, which, though they originate in psycho-analysis, stretch far beyond it, have perhaps awakened more public sympathy than psycho-analysis itself. They may have played a part in creating the short-lived illusion that I was among the writers to whom a great nation like Germany was ready to listen. It was in 1929 that, with words no less pregnant than friendly, Thomas Mann, one of the acknowledged spokesmen of the German people, found a place for me in the history of modern thought. A little later my daughter Anna, acting as my proxy, was given a civic reception in the Rathaus at Frankfort-on-Main on the occasion of my being awarded the Goethe Prize for 1930. This was the climax of my life as a citizen. Soon afterwards the boundaries of our country narrowed and the nation would know no more of us.

And here I may be allowed to break off these autobiographical notes. The public has no claim to learn any more of my personal affairs - of my struggles, my disappointments, and my successes. I have in any case been more open and frank in some of my writings (such as *The Interpretation of Dreams* and *The Psychopathology of Everyday Life*) than people usually are who describe their lives for their contemporaries or for posterity. I have had small thanks for it, and from my experience I cannot recommend anyone to follow my example.
I cannot say that I am an admirer of these measures. The second one is a quite undisguised encroachment of police supervision to the detriment of intellectual freedom. I am beyond suspicion of having much belief in what are known as ‘occult phenomena’ or of feeling any desire that they should be recognized. But prohibitions like these will not stifle people’s interest in that supposedly mysterious world. They may on the contrary have done much harm and have closed the door to an impartial curiosity which might have arrived at a judgement that would have set us free from these harassing possibilities. But once again this only applies to Austria. In other countries ‘para-psychical’ researches are not met by any legal obstacles. The case of hypnotism is somewhat different from that of analysis. Hypnotism is the evoking of an abnormal mental state and is used by laymen to-day only for the purpose of public shows. If hypnotic therapy had maintained its very promising beginnings, a position would have been arrived at similar to that of analysis. And incidentally the history of hypnotism provides a precedent for that of analysis in another direction. When I was a young lecturer in neuropathology, the doctors inveighed passionately against hypnotism, declared that it was a swindle, a deception of the Devil’s and a highly dangerous procedure. To-day they have monopolized this same hypnotism and they make use of it unhesitatingly as a method of examination; for some nerve specialists it is still their chief therapeutic instrument.

[1926e, 4378]

It will not have escaped my readers that in what I have said I have assumed as axiomatic something that is still violently disputed in the discussion. I have assumed, that is to say, that psycho-analysis is not a specialized branch of medicine. I cannot see how it is possible to dispute this. Psycho-analysis is a part of psychology; not of medical psychology in the old sense, not of the psychology of morbid processes, but simply of psychology. It is certainly not the whole of psychology, but its sub-structure and perhaps even its entire foundation. The possibility of its application to medical purposes must not lead us astray. Electricity and radiology also have their medical application, but the science to which they both belong is none the less physics. Nor can their situation be affected by historical arguments. The whole theory of electricity had its origin in an observation of a nerve-muscle preparation; yet no one would dream to-day of regarding it as a part of physiology. It is argued that psycho-analysis was after all discovered by a physician in the course of his efforts to assist his patients. But that is clearly neither here nor there. Moreover, the historical argument is double-edged. We might pursue the story and recall the unfriendliness and indeed the animosity with which the medical profession treated analysis from the very first. That would seem to imply that it can have no claims over analysis to-day. And though I do not accept that implication, I still feel some doubts as to whether the present wooing of psycho-analysis by the doctors is based, from the point of view of the libido theory, upon the first or upon the second of Abraham’s sub-stages - whether they wish to take possession of their object for the purpose of destroying or of preserving it.

[1926e, 4393]
I should like to consider the historical argument a moment longer. Since it is with me personally that we are concerned, I can throw a little light, for anyone who may be interested, on my own motives. After forty-one years of medical activity, my self-knowledge tells me that I have never really been a doctor in the proper sense. I became a doctor through being compelled to deviate from my original purpose; and the triumph of my life lies in my having, after a long and roundabout journey, found my way back to my earliest path. I have no knowledge of having had any craving in my early childhood to help suffering humanity. My innate sadistic disposition was not a very strong one, so that I had no need to develop this one of its derivatives. Nor did I ever play the 'doctor game'; my infantile curiosity evidently chose other paths. In my youth I felt an overpowering need to understand something of the riddles of the world in which we live and perhaps even to contribute something to their solution. The most hopeful means of achieving this end seemed to be to enrol myself in the medical faculty; but even after that I experimented - unsuccessfully - with zoology and chemistry, till at last, under the influence of Brücke, who carried more weight with me than any one else in my whole life, I settled down to physiology, though in those days it was too narrowly restricted to histology. By that time I had already passed all my medical examinations; but I took no interest in anything to do with medicine till the teacher whom I so deeply respected warned me that in view of my impoverished material circumstances I could not possibly take up a theoretical career. Thus I passed from the histology of the nervous system to neuropathology and then, prompted by fresh influences, I began to be concerned with the neuroses. I scarcely think, however, that my lack of a genuine medical temperament has done much damage to my patients. For it is not greatly to the advantage of patients if their doctor's therapeutic interest has too marked an emotional emphasis. They are best helped if he carries out his task coolly and keeping as closely as possible to the rules.

[1926e, 4394]

It happened that in the years from 1895 onwards I was subjected to two powerful impressions which combined to produce the same effect on me. On the one hand, I had gained my first insight into the depths of the life of the human instincts; I had seen some things that were sobering and even, at first, frightening. On the other hand, the announcement of my unpleasing discoveries had as its result the severance of the greater part of my human contacts; I felt as though I were despised and universally shunned. In my loneliness I was seized with a longing to find a circle of picked men of high character who would receive me in a friendly spirit in spite of my temerity. Your society was pointed out to me as the place where such men were to be found.

[1941e [1926], 4410]

That you were Jews could only be agreeable to me; for I was myself a Jew, and it had always seemed to me not only unworthy but positively senseless to deny the fact. What bound me to Jewry was (I am ashamed to admit) neither faith nor national pride, for I have always been an unbeliever and was brought up without any religion though not without a respect for what are called the 'ethical' standards of human civilization. Whenever I felt an inclination to national enthusiasm I strove to suppress it as being harmful and wrong, alarmed by the warning examples of the peoples among whom we Jews live. But plenty of other things remained over to make the attraction of Jewry and Jews irresistible - many obscure emotional forces, which were the more powerful the less they could be expressed in words, as well as a clear consciousness of inner identity, the safe privacy of a common mental construction. And beyond this there was a perception that it was to my Jewish nature alone that I owed two characteristics that had become indispensable to me in the difficult course of my life. Because I was a Jew I found myself free from many prejudices which restricted others in the use of their intellect; and as a Jew I was prepared to join the Opposition and to do without agreement with the 'compact majority'.

[1941e [1926], 4410]
So it was that I became one of you, took my share in your humanitarian and national interests, gained friends among you and persuaded my own few remaining friends to join our society. There was no question whatever of my convincing you of my new theories; but at a time when no one in Europe listened to me and I still had no disciples even in Vienna, you gave me your kindly attention. You were my first audience.

For some two thirds of the long period that has elapsed since my entry I persisted with you conscientiously, and found refreshment and stimulation in my relations with you. You have been kind enough to-day not to hold it up against me that during the last third of the time I have kept away from you. I was overwhelmed with work, and demands connected with it forced themselves on me; the day ceased to be long enough for me to attend your meetings, and soon my body began to rebel against a late evening meal. Finally came the years of my illness, which prevents me from being with you even to-day.

I cannot tell whether I have been a genuine B.B. in your sense. I am almost inclined to doubt it; so many exceptional circumstances have arisen in my case. But of this I can assure you - that you meant much to me and did much for me during the years in which I belonged to you. I ask you therefore to accept my warmest thanks both for those years and for to-day.

Long years before I saw you, I had honoured you as an artist and as an apostle of the love of mankind. I was myself a disciple of the love of mankind, not from sentimental motives or in pursuit of an ideal, but for sober, economic reasons, because, our inborn instincts and the world around us being what they are, I could not but regard that love as no less essential for the survival of the human race than such things as technology.

The author of this paper is known to me as a man of strong and independent intelligence. Probably through being somewhat self-willed he failed to get on to good terms with two analysts with whom he made the attempt. He thereupon proceeded to make a systematic application of the procedure of self-analysis which I myself employed in the past for the analysis of my own dreams. His findings deserve attention precisely on account of the peculiar character of his personality and of his technique.

For this situation is nothing new. It has an infantile prototype, of which it is in fact only the continuation. For once before one has found oneself in a similar state of helplessness: as a small child, in relation to one's parents. One had reason to fear them, and especially one's father; and yet one was sure of his protection against the dangers one knew. Thus it was natural to assimilate the two situations. Here, too, wishing played its part, as it does in dream-life. The sleeper may be seized with a presentiment of death, which threatens to place him in the grave. But the dream-work knows how to select a condition that will turn even that dreaded event into a wish-fulfilment: the dreamer sees himself in an ancient Etruscan grave which he has climbed down into, happy to find his archaeological interests satisfied. In the same way, a man makes the forces of nature not simply into persons with whom he can associate as he would with his equals - that would not do justice to the overpowering impression which those forces make on him - but he gives them the character of a father. He turns them into gods, following in this, as I have tried to show, not only an infantile prototype but a phylogenetic one.
There are, of course, many such teachings about the most various things in the world. Every school lesson is full of them. Let us take geography. We are told that the town of Constance lies on the Bodensee. A student song adds: 'if you don't believe it, go and see.' I happen to have been there and can confirm the fact that that lovely town lies on the shore of a wide stretch of water which all those who live round it call the Bodensee; and I am now completely convinced of the correctness of this geographical assertion. In this connection I am reminded of another, very remarkable, experience. I was already a man of mature years when I stood for the first time on the hill of the Acropolis in Athens, between the temple ruins, looking out over the blue sea. A feeling of astonishment mingled with my joy. It seemed to say: 'So it really is true, just as we learnt at school!' How shallow and weak must have been the belief I then acquired in the real truth of what I heard, if I could be so astonished now! But I will not lay too much stress on the significance of this experience; for my astonishment could have had another explanation, which did not occur to me at the time and which is of a wholly subjective nature and has to do with the special character of the place.

[1927c, 4437]

You will not find me inaccessible to your criticism. I know how difficult it is to avoid illusions; perhaps the hopes I have confessed to are of an illusory nature, too. But I hold fast to one distinction. Apart from the fact that no penalty is imposed for not sharing them, my illusions are not, like religious ones, incapable of correction. They have not the character of a delusion. If experience should show - not to me, but to others after me, who think as I do - that we have been mistaken, we will give up our expectations. Take my attempt for what it is. A psychologist who does not deceive himself about the difficulty of finding one's bearings in this world, makes an endeavour to assess the development of man, in the light of the small portion of knowledge he has gained through a study of the mental processes of individuals during their development from child to adult. In so doing, the idea forces itself upon him that religion is comparable to a childhood neurosis, and he is optimistic enough to suppose that mankind will surmount this neurotic phase, just as so many children grow out of their similar neurosis. These discoveries derived from individual psychology may be insufficient, their application to the human race unjustified, and his optimism unfounded. I grant you all these uncertainties. But often one cannot refrain from saying what one thinks, and one excuses oneself on the ground that one is not giving it out for more than it is worth.

[1927c, 4459]

¹ Anyone who has tasted the miseries of poverty in his own youth and has experienced the indifference and arrogance of the well-to-do, should be safe from the suspicion of having no understanding or good will towards endeavours to fight against the inequality of wealth among men and all that it leads to. To be sure, if an attempt is made to base this fight upon an abstract demand, in the name of justice, for equality for all men, there is a very obvious objection to be made - that nature, by endowing individuals with extremely unequal physical attributes and mental capacities, has introduced injustices against which there is no remedy.

[1930a, 4505]

In the autumn of 1927, G. S. Viereck, a German-American journalist who had paid me a welcome visit, published an account of a conversation with me, in the course of which he mentioned my lack of religious faith and my indifference on the subject of survival after death. This 'interview, as it was called, was widely read and brought me, among others, the following letter from an American physician:

[1928a, 4548]

I sent a polite answer, saying that I was glad to hear that this experience had enabled him to retain his faith. As for myself, God had not done so much for me. He had never allowed me to hear an inner voice; and if, in view of my age, he did not make haste, it would not be my fault if I remained to the end of my life what I now was - 'an infidel Jew'.

[1928a, 4549]
In the course of a friendly reply, my colleague gave me an assurance that being a Jew was not an obstacle in the pathway to true faith and proved this by several instances. His letter culminated in the information that prayers were being earnestly addressed to God that he might grant me 'faith to believe'.
[1928a, 4549]

I am still awaiting the outcome of this intercession. In the meantime, my colleague's religious experience provides food for thought. It seems to me to demand some attempt at an interpretation based upon emotional motives; for his experience is puzzling in itself and is based on particularly bad logic. God, as we know, allows horrors to take place of a kind very different from the removal to a dissecting-room of the dead body of a pleasant-looking old woman. This has been true at all times, and it must have been so while my American colleague was pursuing his studies. Nor, as a medical student, can he have been so sheltered from the world as to have known nothing of such evils. Why was it, then, that his indignation against God broke out precisely when he received this particular impression in the dissecting-room?
[1928a, 4549]

For anyone who is accustomed to regard men's internal experiences and actions analytically the explanation is very obvious - so obvious that it actually crept into my recollections of the facts themselves. Once, when I was referring to my pious colleague's letter in the course of a discussion, I spoke of his having written that the dead woman's face had reminded him of his own mother. In fact these words were not in his letter, and a moment's reflection will show that they could not possibly have been. But that is the explanation irresistibly forced on us by his affectionately phrased description of the 'sweet-faced dear old woman'. Thus the weakness of judgement displayed by the young doctor is to be accounted for by the emotion roused in him by the memory of his mother. It is difficult to escape from the bad psycho-analytic habit of bringing forward as evidence details which also allow of more superficial explanations - and I am tempted to recall the fact that my colleague addressed me later as a 'brother physician'.
[1928a, 4549]

As you suggest, I included Dostoevsky the psychologist under the creative artist. Another objection I might have raised against him was that his insight was so much restricted to abnormal mental life. Consider his astonishing helplessness in face of the phenomena of love. All he really knew were crude, instinctual desire, masochistic subjection and loving out of pity. You are right, too, in suspecting that, in spite of all my admiration for Dostoevsky's intensity and pre-eminence, I do not really like him. That is because my patience with pathological natures is exhausted in analysis. In art and life I am intolerant of them. Those are character traits personal to me and not binding on others.
[1928b, 4570]

I have not been spoilt by public marks of honour and I have so adapted myself to this state of things that I have been able to do without them. I should not like to deny, however, that the award of the Goethe Prize of the City of Frankfurt has given me great pleasure. There is something about it that especially fires the imagination and one of its stipulations dispels the feeling of humiliation which in other cases is a concomitant of such distinctions.
[1930, 4577]
Unfortunately I shall not be able to attend the ceremony in Frankfurt; I am too frail for such an undertaking. The company there will lose nothing by that: my daughter Anna is certainly pleasanter to look at and to listen to than I am. We propose that she shall read out a few sentences of mine which deal with Goethe’s connections with psycho-analysis and defend the analysts themselves against the reproach of having offended against the respect due to the great man by the analytic attempts they have made on him. I hope it will be acceptable if I thus adapt the theme that has been proposed to me - my ‘inner relations as a man and a scientist to Goethe’ - or else that you will be kind enough to let me know.

My life’s work has been directed to a single aim. I have observed the more subtle disturbances of mental function in healthy and sick people and have sought to infer - or, if you prefer it, to guess - from signs of this kind how the apparatus which serves these functions is constructed and what concurrent and mutually opposing forces are at work in it. What we - I, my friends and collaborators - have managed to learn in following this path has seemed to us of importance for the construction of a mental science which makes it possible to understand both normal and pathological processes as parts of the same natural course of events.

I offer my thanks to the Burgomaster of the town of Príbor-Freiberg, to the organizers of this celebration and to all those who are attending it, for the honour they have done me in marking the house of my birth with this commemorative tablet from an artist’s hand - and this during my lifetime and while the world around us is not yet agreed in its estimate of my work.

I left Freiberg at the age of three and visited it when I was sixteen, during my school holidays, as a guest of the Fluss family, and I have never returned to it again. Since that time much has befallen me; my labours have been many, I have experienced some suffering and happiness as well, and I have had a share of success - the common medley of human life. At seventy-five it is not easy for me to put myself back into those early times; of their rich experiences but few relics remain in my memory. But of one thing I can feel sure: deeply buried within me there still lives the happy child of Freiberg, the first-born son of a youthful mother, who received his first indelible impressions from this air, from this soil. Thus I may be allowed to end my words of thanks with a heartfelt wish for the happiness of this place and of those who live in it.

My Introductory Lectures on Psycho-Analysis were delivered during the two Winter Terms of 1915-16 and 1916-17 in a lecture room of the Vienna Psychiatric Clinic before an audience gathered from all the Faculties of the University. The first half of the lectures were improvised, and written out immediately afterwards; drafts of the second half were made during the intervening summer vacation at Salzburg, and delivered word for word in the following winter. At that time I still possessed the gift of a phonographic memory.

These new lectures, unlike the former ones, have never been delivered. My age had in the meantime absolved me from the obligation of giving expression to my membership of the University (which was in any case a peripheral one) by delivering lectures; and a surgical operation had made speaking in public impossible for me. If, therefore, I once more take my place in the lecture room during the remarks that follow, it is only by an artifice of the imagination; it may help me not to forget to bear the reader in mind as I enter more deeply into my subject.
Firstly: One day of the previous week I had waited in vain for Herr P. at eleven o'clock, and had then gone out to visit Dr. Anton von Freund in his pension. I was surprised to find that Herr P. lived on another floor of the same building in which the pension was located. In connection with this I had later told P. that I had in a sense paid him a visit in his house; but I know definitely that I did not tell him the name of the person I visited in the pension. And now, shortly after mentioning 'Herr von Vorsicht' he asked me whether perhaps the Freud-Ottorego who was giving a course of lectures on English at the Volks universität was my daughter. And for the first time during our long period of intercourse he gave my name the distorted form to which I have indeed become habituated by functionaries, officials and compositors: instead of 'Freud' he said 'Freund'.

[1933a, 4660]

I am sure you will not feel very well satisfied with my attitude to this problem - with my not being entirely convinced but prepared to be convinced. You may perhaps say to yourselves: 'Here's another case of a man who has done honest work as a scientist all through his life and has grown feeble-minded, pious and credulous in his old age.' I am aware that a few great names must be included in this class, but you should not reckon me among them. At least I have not become pious, and I hope not credulous. It is only that, if one has gone about all one's life bending in order to avoid a painful collision with the facts, so too in one's old age one still keeps one's back ready to bow before new realities. No doubt you would like me to hold fast to a moderate theism and show myself relentless in my rejection of everything occult. But I am incapable of currying favour and I must urge you to have kindlier thoughts on the objective possibility of thought-transference and at the same time of telepathy as well.

[1933a, 4664]

In the neighbourhood of the little Moravian town in which I was born, and which I left when I was a three-year-old child, there is a modest health-resort, prettily situated in the woods. During my schooldays I went there several times in the holidays. Some twenty years later the illness of a near relative was the occasion for my visiting the place again. In the course of a conversation with the physician attached to the spa, who had attended my relative, I enquired among other things about his relations with the peasants - Slovaks, I believe - who constituted his whole clientèle during the winter. He told me that his medical practice proceeded as follows. In his consulting hours the patients came into his room and stood in a row. One after another stepped forward and described his complaint: he had backache or pains in his stomach or had tired legs, and so on. The doctor then examined him and, after satisfying himself as to what was the matter, called out the diagnosis, which was the same in every case. He translated the word to me; it meant approximately 'bewitched'. I asked in astonishment whether the peasants made no objection to his verdict being the same with every patient. 'Oh, no!' he replied, 'they are very pleased with it: it is what they expected. Each of them, as he went back to his place in the row, showed the others by looks and gestures that I was a fellow who understood things.' Little did I guess at the time in what circumstances I should come across an analogous situation once again.

[1933a, 4742]

But there is one topic which I cannot pass over so easily - not, however, because I understand particularly much about it or have contributed very much to it. Quite the contrary: I have scarcely concerned myself with it at all. I must mention it because it is so exceedingly important, so rich in hopes for the future, perhaps the most important of all the activities of analysis. What I am thinking of is the application of psycho-analysis to education, to the upbringing of the next generation. I am glad that I am at least able to say that my daughter, Anna Freud, has made this study her life-work and has in that way compensated for my neglect.

[1933a, 4746]
It was in the winter of 1899 that my book on *The Interpretation of Dreams* (though its title-page was post-dated into the new century) at length lay before me. This work was the product of the labours of four or five years and its origin was unusual. Holding a lectureship in Nervous Diseases at the University, I had attempted to support myself and my rapidly increasing family by a medical practice among the so-called 'neurotics' of whom there were only too many in our society. But the task proved harder than I had expected. The ordinary methods of treatment clearly offered little or no help: other paths must be followed. And how was it by any means possible to give patients help when one understood nothing of their illness, nothing of the causes of their sufferings or of the meaning of their complaints? So I eagerly sought direction and instruction from the great Charcot in Paris and from Bernheim at Nancy; finally, an observation made by my teacher and friend, Josef Breuer of Vienna, seemed to open a new prospect for understanding and therapeutic success.

To begin with, I naturally understood no more about my patients' dreams than the dreamers did themselves. But by applying to these dreams, and more particularly to my own dreams, the procedure which I had already used for the study of other abnormal psychological structures, I succeeded in answering most of the questions which could be raised by an interpretation of dreams. There were many such questions: What do we dream about? Why do we dream at all? What is the origin of all the strange characteristics which distinguish dreams from waking life? - and many more such questions besides. Some of the answers were easily given and turned out to confirm views that had already been put forward; but others involved completely new hypotheses with regard to the structure and functioning of the apparatus of the mind. People dream about the things that have engaged their minds during the waking day. People dream in order to allay impulses that seek to disturb sleep, and in order to be able to sleep on. But why was it possible for dreams to present such a strange appearance, so confusedly senseless, so obviously contrasted with the content of waking thought, in spite of being concerned with the same material? There could be no doubt that dreams were only a substitute for a rational process of thought and could be interpreted - that is to say, translated into a rational process. But what needed explaining was the fact of the *distortion* which the dream-work had carried out upon the rational and intelligible material.

Overwhelmed by meeting with such wisdom, I began to read all his works - his books on Voltaire, on Religion, on War, on the Universal Provision of Subsistence, etc. - till there was built up clearly before my eyes a picture of this simple-minded, great man, who was a thinker and a critic and at the same time a kindly humanitarian and reformer. I reflected much over the rights of the individual which he advocated and to which I should gladly have added my support had I not been restrained by the thought that neither the processes of Nature nor the aims of human society quite justified such claims. A special feeling of sympathy drew me to him, since he too had clearly had painful experience of the bitterness of the life of a Jew and of the hollowness of the ideals of present-day civilization. Yet I never saw him in the flesh. He knew of me through common acquaintances, and I once had occasion to answer a letter from him in which he asked for some piece of information. But I never sought him out. My innovations in psychology had estranged me from my contemporaries, and especially from the older among them: often enough when I approached some man whom I had honoured from a distance, I found myself repelled, as it were, by his lack of understanding for what had become my whole life to me. And after all Josef Popper had been a physicist: he had been a friend of Ernst Mach. I was anxious that the happy impression of our agreement upon the problem of dream-distortion should not be spoilt. So it came about that I put off calling upon him till it was too late and I could now only salute his bust in the gardens in front of our Rathaus.
I have been urgently pressed to make some written contribution to the celebration of your seventieth birthday and I have made long efforts to find something that might in any way be worthy of you and might give expression to my admiration for your love of the truth, for your courage in your beliefs and for your affection and good will towards humanity; or, again, something that might bear witness to my gratitude to you as a writer who has afforded me so many moments of exaltation and pleasure. But it was in vain. I am ten years older than you and my powers of production are at an end. All that I can find to offer you is the gift of an impoverished creature, who has 'seen better days'.

[1936a, 4823]

You know that the aim of my scientific work was to throw light upon unusual, abnormal or pathological manifestations of the mind - that is to say, to trace them back to the psychical forces operating behind them and to indicate the mechanisms at work. I began by attempting this upon myself and then went on to apply it to other people and finally, by a bold extension, to the human race as a whole. During the last few years, a phenomenon of this sort, which I myself had experienced a generation ago, in 1904, and which I had never understood, has kept on recurring to my mind. I did not at first see why; but at last I determined to analyse the incident - and I now present you with the results of that enquiry. In the process, I shall have, of course, to ask you to give more attention to some events in my private life than they would otherwise deserve.

[1936a, 4823]

Every year, at that time, towards the end of August or the beginning of September, I used to set out with my younger brother on a holiday trip, which would last for some weeks and would take us to Rome or to some other region of Italy or to some part of the Mediterranean seaboard. My brother is ten years younger than I am, so he is the same age as you - a coincidence which has only now occurred to me. In that particular year my brother told me that his business affairs would not allow him to be away for long: a week would be the most that he could manage and we should have to shorten our trip. So we decided to travel by way of Trieste to the island of Corfu and there spend the few days of our holiday. At Trieste he called upon a business acquaintance who lived there, and I went with him. Our host enquired in a friendly way about our plans and, hearing that it was our intention to go to Corfu, advised us strongly against it: 'What makes you think of going there at this time of year? It would be too hot for you to do anything. You had far better go to Athens instead. The Lloyd boat sails this afternoon; it will give you three days there to see the town and will pick you up on its return voyage. That would be more agreeable and more worth while.'

[1936a, 4824]

This, I think, explains our behaviour in Trieste. We could not believe that we were to be given the joy of seeing Athens. The fact that the piece of reality that we were trying to repudiate was to begin with only a possibility determined the character of our immediate reactions. But when we were standing on the Acropolis the possibility had become an actuality, and the same disbelief found a different but far clearer expression. In an undistorted form this should have been: 'I could really not have imagined it possible that I should ever be granted the sight of Athens with my own eyes - as is now indubitably the case!' When I recall the passionate desire to travel and see the world by which I was dominated at school and later, and how long it was before that desire began to find its fulfilment, I am not surprised at its after-effect on the Acropolis; I was then forty-eight years old. I did not ask my younger brother whether he felt anything of the same sort. A certain amount of reserve surrounded the whole episode; and it was this which had already interfered with our exchanging thoughts at Trieste.

[1936a, 4827]
It will be enough for my purposes if I return to two general characteristics of the phenomena of derealization. The first is that they all serve the purpose of defence; they aim at keeping something away from the ego, at disavowing it. Now, new elements, which may give occasion for defensive measures, approach the ego from two directions - from the real external world and from the internal world of thoughts and impulses that emerge in the ego. It is possible that this alternative coincides with the choice between derealizations proper and depersonalizations. There are an extraordinarily large number of methods (or mechanisms, as we say) used by our ego in the discharge of its defensive functions. An investigation is at this moment being carried on close at hand which is devoted to the study of these methods of defence: my daughter, the child analyst, is writing a book upon them. The most primitive and thorough-going of these methods, 'repression', was the starting point of the whole of our deeper understanding of psychopathology. Between repression and what may be termed the normal method of fending off what is distressing or unbearable, by means of recognizing it, considering it, making a judgement upon it and taking appropriate action about it, there lie a whole series of more or less clearly pathological methods of behaviour on the part of the ego. May I stop for a moment to remind you of a marginal case of this kind of defence? You remember the famous lament of the Spanish Moors 'Ay de mi Alhama', which tells how King Boabdil received the news of the fall of his city of Alhama. He feels that this loss means the end of his rule. But he will not 'let it be true', he determines to treat the news as 'non arrivé'. The verse runs:

The second general characteristic of the derealizations - their dependence upon the past, upon the ego's store of memories and upon earlier distressing experiences which have since perhaps fallen victim to repression - is not accepted without dispute. But precisely my own experience on the Acropolis, which actually culminated in a disturbance of memory and a falsification of the past, helps us to demonstrate this connection. It is not true that in my schooldays I ever doubted the real existence of Athens. I only doubted whether I should ever see Athens. It seemed to me beyond the realms of possibility that I should travel so far - that I should 'go such a long way'. This was linked up with the limitations and poverty of our conditions of life in my youth. My longing to travel was no doubt also the expression of a wish to escape from that pressure, like the force which drives so many adolescent children to run away from home. I had long seen clearly that a great part of the pleasure of travel lies in the fulfilment of these early wishes - that it is rooted, that is, in dissatisfaction with home and family. When first one catches sight of the sea, crosses the ocean and experiences as realities cities and lands which for so long had been distant, unattainable things of desire - one feels oneself like a hero who has performed deeds of improbable greatness. I might that day on the Acropolis have said to my brother: 'Do you still remember how, when we were young, we used day after day to walk along the same streets on our way to school, and how every Sunday we used to go to the Prater or on some excursion we knew so well? And now, here we are in Athens, and standing on the Acropolis! We really have gone a long way!' So too, if I may compare such a small event with a greater one, Napoleon, during his coronation as Emperor in Notre Dame, turned to one of his brothers - it must no doubt have been the eldest one, Joseph - and remarked: 'What would Monsieur notre Père have said to this, if he could have been here to-day?'

But here we come upon the solution of the little problem of why it was that already at Trieste we interfered with our enjoyment of the voyage to Athens. It must be that a sense of guilt was attached to the satisfaction in having gone such a long way: there was something about it that was wrong, that from earliest times had been forbidden. It was something to do with a child's criticism of his father, with the undervaluation which took the place of the overvaluation of earlier childhood. It seems as though the essence of success was to have got further than one's father, and as though to excel one's father was still something forbidden.
As an addition to this generally valid motive there was a special factor present in our particular case. The very theme of Athens and the Acropolis in itself contained evidence of the son's superiority. Our father had been in business, he had had no secondary education, and Athens could not have meant much to him. Thus what interfered with our enjoyment of the journey to Athens was a feeling *filial piety*. And now you will no longer wonder that the recollection of this incident on the Acropolis should have troubled me so often since I myself have grown old and stand in need of forbearance and can travel no more.

[1936a, 4831]

In an earlier contribution to this periodical,¹ I attempted to bring up a fresh argument in support of the hypothesis that the man Moses, the liberator and law-giver of the Jewish people, was not a Jew but an Egyptian. It had long been observed that his name was derived from the Egyptian vocabulary, though the fact had not been properly appreciated. What I added was that the interpretation of the myth of exposure which was linked with Moses necessarily led to the inference that he was an Egyptian whom the needs of a people sought to make into a Jew. I remarked at the end of my paper that important and far-reaching implications followed from the hypothesis that Moses was an Egyptian, but that I was not prepared to argue publicly in favour of these implications, since they were based only on psychological probabilities and lacked any objective proof. The greater the importance of the views arrived at in this way, the more strongly one feels the need to beware of exposing them without a secure basis to the critical assaults of the world around one - like a bronze statue with feet of clay. Not even the most tempting probability is a protection against error; even if all the parts of a problem seem to fit together like the pieces of a jigsaw puzzle, one must reflect that what is probable is not necessarily the truth and that the truth is not always probable. And lastly, it did not seem attractive to find oneself classed with the schoolmen and Talmudists who delight in exhibiting their ingenuity without regard to how remote from reality their thesis may be.

[1939a, 4848]

We are living here in a Catholic country under the protection of that Church, uncertain how long that protection will hold out. But so long as it lasts, we naturally hesitate to do anything that would be bound to arouse the Church's hostility. This is not cowardice, but prudence. The new enemy, to whom we want to avoid being of service, is more dangerous than the old one with whom we have already learnt to come to terms. The psycho-analytic researches which we carry on are in any case viewed with suspicious attention by Catholicism. I will not maintain that this is unjustly so. If our work leads us to a conclusion which reduces religion to a neurosis of humanity and explains its enormous power in the same way as a neurotic compulsion in our individual patients, we may be sure of drawing the resentment of our ruling powers down upon us. Not that I should have anything to say that would be new or that I did not say clearly a quarter of a century ago: but it has been forgotten in the meantime and it could not be without effect if I repeated it to-day and illustrated it from an example which offers a standard for all religious foundations. It would probably lead to our being prohibited from practising psycho-analysis. Such violent methods of suppression are, indeed, by no means alien to the Church; the fact is rather that it feels it as an invasion of its privileges if someone else makes use of those methods. But psycho-analysis, which in the course of my long life has gone everywhere, still possesses no home that could be more valuable for it than the city in which it was born and grew up.

[1939a, 4883]

¹ In an earlier contribution to this periodical, I attempted to bring up a fresh argument in support of the hypothesis that the man Moses, the liberator and law-giver of the Jewish people, was not a Jew but an Egyptian. It had long been observed that his name was derived from the Egyptian vocabulary, though the fact had not been properly appreciated. What I added was that the interpretation of the myth of exposure which was linked with Moses necessarily led to the inference that he was an Egyptian whom the needs of a people sought to make into a Jew. I remarked at the end of my paper that important and far-reaching implications followed from the hypothesis that Moses was an Egyptian, but that I was not prepared to argue publicly in favour of these implications, since they were based only on psychological probabilities and lacked any objective proof. The greater the importance of the views arrived at in this way, the more strongly one feels the need to beware of exposing them without a secure basis to the critical assaults of the world around one - like a bronze statue with feet of clay. Not even the most tempting probability is a protection against error; even if all the parts of a problem seem to fit together like the pieces of a jigsaw puzzle, one must reflect that what is probable is not necessarily the truth and that the truth is not always probable. And lastly, it did not seem attractive to find oneself classed with the schoolmen and Talmudists who delight in exhibiting their ingenuity without regard to how remote from reality their thesis may be.
I do not only think but I know that I shall let myself be deterred by this second obstacle, by the external danger, from publishing the last portion of my study on Moses. I have made yet another attempt to get the difficulty out of the way, by telling myself that my fears are based on an over-estimation of my own personal importance: that it will probably be a matter of complete indifference to the authorities what I choose to write about Moses and the origin of monotheist religions. But I feel uncertain in my judgement of this. It seems to me much more possible that malice and sensationalism will counter-balance any lack of recognition of me in the contemporary world's judgement. So I shall not give this work to the public. But that need not prevent my writing it. Especially as I have written it down already once, two years ago, so that I have only to revise it and attach it to the two essays that have preceded it. It may then be preserved in concealment till some day the time arrives when it may venture without danger into the light, or till someone who has reached the same conclusions and opinions can be told: 'there was someone in darker times who thought the same as you!'

[1939a, 4883]

The quite special difficulties which have weighed on me during my composition of this study relating to the figure of Moses - internal doubts as well as external obstacles - have resulted in this third and concluding essay being introduced by two different prefaces, which contradict each other and indeed cancel each other out. For in the short space of time between the two there has been a fundamental change in the author's circumstances. At the earlier date I was living under the protection of the Catholic Church, and was afraid that the publication of my work would result in the loss of that protection and would conjure up a prohibition upon the work of the adherents and students of psycho-analysis in Austria. Then, suddenly, came the German invasion and Catholicism proved, to use the words of the Bible, 'a broken reed'. In the certainty that I should now be persecuted not only for my line of thought but also for my 'race' - accompanied by many of my friends, I left the city which, from my early childhood, had been my home for seventy-eight years.

[1939a, 4884]

I met with the friendliest reception in lovely, free, magnanimous England. Here I now live, a welcome guest; I can breathe a sigh of relief now that the weight has been taken off me and that I am once more able to speak and write - I had almost said 'and think' - as I wish or as I must. I venture to bring the last portion of my work before the public.

[1939a, 4884]

There are no external obstacles remaining, or at least none to be frightened of. In the few weeks of my stay here I have received countless greetings from friends who were pleased at my arrival, and from unknown and indeed uninvolved strangers who only wanted to give expression to their satisfaction at my having found freedom and safety here. And in addition there arrived, with a frequency surprising to a foreigner, communications of another sort, which were concerned with the state of my soul, which pointed out to me the way of Christ and sought to enlighten me on the future of Israel. The good people who wrote in this way cannot have known much about me; but I expect that when this work about Moses becomes known, in a translation, among my new compatriots, I shall forfeit enough of the sympathy which a number of other people as well now feel for me.

[1939a, 4884]
As regards internal difficulties, a political revolution and a change of domicile could alter nothing. No less than before, I feel uncertain in the face of my own work; I lack the consciousness of unity and of belonging together which should exist between an author and his work. It is not as though there were an absence of conviction in the correctness of my conclusion. I acquired that a quarter of a century ago when in 1912 I wrote my book about *Totem and Taboo*, and it has only grown firmer since. From that time I have never doubted that religious phenomena are only to be understood on the pattern of the individual neurotic symptoms familiar to us - as the return of long since forgotten, important events in the primaeval history of the human family - and that they have to thank precisely this origin for their compulsive character and that, accordingly, they are effective on human beings by force of the historical truth of their content. My uncertainty sets in only when I ask myself whether I have succeeded in proving these theses in the example which I have chosen here of Jewish monotheism. To my critical sense this book, which takes its start from the man Moses, appears like a dancer balancing on the tip of one toe. If I could not find support in an analytic interpretation of the exposure myth and could not pass from there to Sellin's suspicion about the end of Moses, the whole thing would have had to remain unwritten. In any case, let us now take the plunge.

[1939a, 4885]

Actually it has been written twice: for the first time a few years ago in Vienna, where I did not think it would be possible to publish it. I determined to give it up; but it tormented me like an un laid ghost, and I found a way out by making two pieces of it independent and publishing them in our periodical *Imago*: the psycho-analytic starting-point of the whole thing 'Moses an Egyptian', and the historical construction erected on this 'If Moses was an Egyptian . . .'. The remainder, which included what was really open to objection and dangerous - the application to the genesis of monotheism and the view of religion in general - I held back, as I thought, forever. When, in March 1938, came the unexpected German invasion, which forced me to leave my home but also freed me from my anxiety lest my publication might conjure up a prohibition of psycho-analysis in a place where it was still tolerated. I had scarcely arrived in England before I found the temptation irresistible to make the knowledge I had held back accessible to the world, and I began to revise the third part of my study to fit it on to the two parts that had already been published. This naturally involved a partial re-arrangement of the material. I did not succeed, however, in including the whole of this material in my second version; on the other hand I could not make up my mind to give up the earlier versions entirely. And so it has come about that I have adopted the expedient of attaching a whole piece of the first presentation to the second unchanged - which has brought with it the disadvantage of involving extensive repetition.

[1939a, 4924]

I might, however, console myself with the reflection that the things I am treating are in any case so new and so important, apart from how far my account of them is correct, that it can be no misfortune if the public is obliged to read the same thing about them twice over. There are things which should be said more than once and which cannot be said often enough. But the reader must decide of his own free will whether to linger over the subject or to come back to it. He must not be surreptitiously led into having the same thing put before him twice in one book. It is a piece of clumsiness for which the author must take the blame. Unluckily an author's creative power does not always obey his will: the work proceeds as it can, and often presents itself to the author as something independent or even alien.

[1939a, 4925]
How enviable, to those of us who are poor in faith, do those enquirers seem who are convinced of the existence of a Supreme Being! To that great Spirit the world offers no problems, for he himself created all its institutions. How comprehensive, how exhaustive and how definitive are the doctrines of believers compared with the laborious, paltry and fragmentary attempts at explanation which are the most we are able to achieve! The divine Spirit, which is itself the ideal of ethical perfection, has planted in men the knowledge of that ideal and, at the same time, the urge to assimilate their own nature to it. They perceive directly what is higher and nobler and what is lower and more base. Their affective life is regulated in accordance with their distance from the ideal at any moment. When they approach to it - at their perihelion, as it were - they are brought high satisfaction; when, at their aphelion, they have become remote from it, the punishment is severe unpleasure. All of this is laid down so simply and so unshakeably. We can only regret that certain experiences in life and observations in the world make it impossible for us to accept the premise of the existence of such a Supreme Being. As though the world had not riddles enough, we are set the new problem of understanding how these other people have been able to acquire their belief in the Divine Being and whence that belief obtained its immense power, which overwhelms 'reason and science'.

If we recognize the case we are discussing as an expression of the destructive or aggressive instinct, the question at once arises whether this view should not be extended to other instances of conflict, and, indeed, whether all that we know about psychical conflict should not be revised from this new angle. After all, we assume that in the course of man's development from a primitive state to a civilized one his aggressiveness undergoes a very considerable degree of internalization or turning inwards; if so, his internal conflicts would certainly be the proper equivalent for the external struggles which have then ceased. I am well aware that the dualistic theory according to which an instinct of death or of destruction or aggression claims equal rights as a partner with Eros as manifested in the libido, has found little sympathy and has not really been accepted even among psycho-analysts. This made me all the more pleased when not long ago I came upon this theory of mine in the writings of one of the great thinkers of ancient Greece. I am very ready to give up the prestige of originality for the sake of such a confirmation, especially as I can never be certain, in view of the wide extent of my reading in early years, whether what I took for a new creation might not be an effect of cryptomnesia.

I came to Vienna as a child of 4 years from a small town in Moravia. After 78 years of assiduous work I had to leave my home, saw the Scientific Society I had founded, dissolved, our institutions destroyed, our Printing Press (‘Verlag’) taken over by the invaders, the books I had published confiscated or reduced to pulp, my children expelled from their professions. Don't you think you ought to reserve the columns of your special number for the utterances of non-Jewish people, less personally involved than myself?

I came to Vienna as a child of 4 years from a small town in Moravia. After 78 years of assiduous work I had to leave my home, saw the Scientific Society I had founded, dissolved, our institutions destroyed, our Printing Press (‘Verlag’) taken over by the invaders, the books I had published confiscated or reduced to pulp, my children expelled from their professions. Don't you think you ought to reserve the columns of your special number for the utterances of non-Jewish people, less personally involved than myself?
The sequence of events had accordingly been as follows: when she woke up in the morning she found herself in an anxious mood, and to account for it she grasped at the first anxious idea that came to mind. On the previous afternoon she had had a conversation about the lift at the Pension. Over-careful of her children as usual, she had asked their governess whether her elder daughter, who could not walk much on account of ovarian neuralgia on the right side and pains in the right leg, used the lift for going down as well as up. A paramnesia then enabled her to link the anxiety she was conscious of with the idea of the lift. Her consciousness did not present her with the real cause of her anxiety; that only emerged - but now it did so without any hesitation - when I questioned her about it in hypnosis. The process was the same as that studied by Bernheim and others after him in persons who carry out in a post-hypnotic condition instructions given them during hypnosis. For instance, Bernheim (1886, 29) suggested to a patient that after he woke up he should put both his thumbs in his mouth. He did so, and excused his action by saying that his tongue had been giving him pain since the previous day when he had bitten it in an epileptiform attack. Again, in obedience to a suggestion, a girl made an attempt to murder a law-court officer who was totally unknown to her. When she was seized and questioned as to the motives of her act, she invented a story of a wrong done to her which called for revenge. There seems to be a necessity for bringing psychical phenomena of which one becomes conscious into causal connection with other conscious material. In cases in which the true causation evades conscious perception one does not hesitate to attempt to make another connection, which one believes, although it is false. It is clear that a split in the content of consciousness must greatly facilitate the occurrence of ‘false connections’ of this kind.

The delirium which I have last described was also the last considerable disturbance in Frau Emmy von N.’s condition. Since I did not take the initiative in looking for the symptoms and their basis, but waited for something to come up in the patient or for her to tell me some thought that was causing her anxiety, her hypnoses soon ceased to produce material. I therefore made use of them principally for the purpose of giving her maxims which were to remain constantly present in her mind and to protect her from relapsing into similar conditions when she had got home. At that time I was completely under the sway of Bernheim’s book on suggestion and I anticipated more results from such didactic measures than I should to-day. My patient's condition improved so rapidly, that she soon assured me she had not felt so well since her husband’s death. After a treatment lasting in all for seven weeks I allowed her to return to her home on the Baltic.

I shall have to go into this point of my technical procedure in greater detail. When, in 1889, I visited the Nancy clinics, I heard Dr. Liébeault, the doyen of hypnotism, say: 'If only we had the means of putting every patient into a state of somnambulism, hypnotic therapy would be the most powerful of all.' In Bernheim’s clinic it almost seemed as though such an art really existed and as though it might be possible to learn it from Bernheim. But as soon as I tried to practise this art on my own patients, I discovered that my powers at least were subject to severe limits, and that if somnambulism were not brought about in a patient at the first three attempts I had no means of inducing it. The percentage of cases amenable to somnambulism was very much lower in my experience than what Bernheim reported.
The present collection serves as an introduction and supplement to my larger publications dealing with the same topics - *Studies on Hysteria* (with Dr. J. Breuer), 1895; *The Interpretation of Dreams*, 1900; *The Psychopathology of Everyday Life*, 1901 and 1904; *Jokes and their Relation to the Unconscious*, 1905; *Three Essays on the Theory of Sexuality*, 1905; *Fragment of an Analysis of a Case of Hysteria*, 1905. The fact that I have put my Obituary of J.-M. Charcot at the head of this collection of my short papers should be regarded not only as the repayment of a debt of gratitude, but also as an indication of the point at which my own work branches off from the master's.

[1906b, 272]

On the 16th of August of this year, J.M. Charcot died suddenly, without pain or illness, after a life of happiness and fame. In him, all too soon, the young science of neurology has lost its greatest leader, neurologists of every country have lost their master teacher and France has lost one of her foremost men. He was only sixty-eight years old; his physical strength and mental vigour, together with the hopes he so frankly expressed, seemed to promise him the long life which has been granted to not a few mental workers of this century. The nine imposing volumes of his *Oeuvres complètes*, in which his pupils had collected his contributions to medicine and neuropathology, his *Leçons du mardi*, the yearly reports of his clinic at the Salpêtrière, and other works besides - all these publications will remain precious to science and to his pupils; but they cannot take the place of the man, who had still much more to give and to teach and whose person or whose writings no one has yet approached without learning something from them.

[1893f, 275]

He took an honest, human delight in his own great success and used to enjoy talking of his beginnings and the road he had travelled. His scientific curiosity, he said, had been aroused early, when he was still a young *interne*, by the mass of material presented by the facts of neuropathology, material which was not in the least understood at the time. In those days, whenever he went the rounds with his senior in one of the departments of the Salpêtrière (the institution for the care of women) amid all the wilderness of paralyses, spasms and convulsions for which forty years ago there was neither name nor understanding, he would say: 'Faudrait y retourner et y rester', and he kept his word. When he became *médecin des hôpitaux*, he at once took steps to enter the Salpêtrière in one of the departments for nervous patients. Having got there, he stayed where he was instead of doing what French senior physicians are entitled to do - transferring in regular succession from one department to another and from hospital to hospital, and at the same time changing their speciality as well.

[1893f, 275]
Thus his first impression and the resolution it led him to were decisive for the whole of his further development. His having a great number of chronic nervous patients at his disposal enabled him to make use of his own special gifts. He was not a reflective man, not a thinker: he had the nature of an artist - he was, as he himself said, a ‘visuel’, a man who sees. Here is what he himself told us about his method of working. He used to look again and again at the things he did not understand, to deepen his impression of them day by day, till suddenly an understanding of them dawned on him. In his mind's eye the apparent chaos presented by the continual repetition of the same symptoms then gave way to order: the new nosological pictures emerged, characterized by the constant combination of certain groups of symptoms. The complete and extreme cases, the 'types', could be brought into prominence with the help of a certain sort of schematic planning, and, with these types as a point of departure, the eye could travel over the long series of ill-defined cases - the 'formes frustes' - which, branching off from one or other characteristic feature of the type, melt away into indistinctness. He called this kind of intellectual work, in which he had no equal, 'practising nosography', and he took pride in it. He might be heard to say that the greatest satisfaction a man could have was to see something new - that is, to recognize it as new; and he remarked again and again on the difficulty and value of this kind of 'seeing'. He would ask why it was that in medicine people only see what they have already learned to see. He would say that it was wonderful how one was suddenly able to see new things - new states of illness - which must probably be as old as the human race; and that he had to confess to himself that he now saw a number of things which he had overlooked for thirty years in his hospital wards. No physician needs to be told what a wealth of forms were acquired by neuropathology through him, and what increased precision and sureness of diagnosis were made possible by his observations. But the pupil who spent many hours with him going round the wards of the Salpêtrière - that museum of clinical facts, the names and peculiar characteristics of which were for the most part derived from him would be reminded of Cuvier, whose statue, standing in front of the Jardin des Plantes, shows that great comprehender and describer of the animal world surrounded by a multitude of animal forms; or else he would recall the myth of Adam, who, when God brought the creatures of Paradise before him to be distinguished and named, may have experienced to the fullest degree that intellectual enjoyment which Charcot praised so highly.

For a whole number of years Charcot occupied the Chair of Pathological Anatomy in Paris, and he carried on his neuropathological studies and lectures, which quickly made him famous abroad as well as in France, on a voluntary basis and as a secondary occupation. It was a piece of good fortune for neuropathology that the same man could undertake the discharge of two functions: on the one hand he created the nosological picture through clinical observation, and on the other he demonstrated that the same anatomical changes underlay the disease whether it appeared as a type or as a forme fruste. It is very generally recognized how successful this anatomical clinical method of Charcot's was in the field of organic nervous diseases - in tabes, multiple sclerosis, amyotrophic lateral sclerosis, and so on. Years of patient waiting were often necessary before the presence of organic change could be proved in those chronic illnesses which are not directly fatal; and only in a hospital for incurables like the Salpêtrière was it possible to keep the patients under observation for such long periods of time. Charcot made his first demonstration of this kind before he had charge of a department. While he was still a student he happened to engage a maid-servant who suffered from a peculiar tremor and could not find a situation on account of her clumsiness. Charcot recognized her condition as a paralysie choréiforme, a disease which had already been described by Duchenne, but whose basis was unknown. Charcot kept this interesting servant, although in the course of the years she cost him a small fortune in dishes and plates. When at last she died he was able to demonstrate from her case that paralysie choréiforme was the clinical expression of multiple cerebro-spinal sclerosis.
Pathological anatomy has to serve neuropathology in two ways. Besides demonstrating the presence of a morbid change, it must establish the localization of that change; and we all know that during the last two decades the second part of this task has aroused the greater interest of the two and has been more actively pursued. Charcot played a most distinguished part in this work, too, although the pioneer discoveries were not made by him. To begin with he followed in the footsteps of our fellow-countryman, Türck, who is said to have lived and carried on his researches in comparative isolation among us. When the two great innovations came - the Hitzig-Fritsch stimulation experiments and Flechsig's findings on the development of the spinal cord - which ushered in a new epoch in our knowledge of the 'localization of nervous diseases', Charcot's lectures on localization played the largest and best part towards bringing the new theories into touch with the clinical work and making them fruitful for it. As regards in especial the relationship of the somatic muscular apparatus to the motor area of the human cerebrum, I may remind the reader of the long time during which the more exact nature and topography of this relationship was in question. (Was there a common representation of both extremities in the same areas? or was there a representation of the upper extremity in the anterior central convolution and if the lower extremity in the posterior one - that is, a vertical disposition?) At last, continued clinical observations and experiments in stimulation and extirpation on living subjects during surgical operations decided the question in favour of the view of Charcot and Pitres that the middle third of the central convolutions mainly serves the representation of the arm, while the upper third and the mesial portion serve that of the leg - that is to say, that in the motor area the disposition is a horizontal one.

An enumeration of Charcot's separate contributions would not enable us to establish his significance for neuropathology. For during the last two decades there have not been many themes of any importance in whose formulation and discussion the school of the Salpêtrière has not had an outstanding share; and the 'school of the Salpêtrière' was, of course, Charcot himself, who, with the wealth of his experience, the transparent clarity of his diction and the plasticity of his descriptions, could easily be recognized in every publication of the school. Among the circle of young men whom he thus gathered round him and made into participants in his researches, a few eventually rose to a consciousness of their own individuality and made a brilliant name for themselves. Now and then, even, it happened that one of them would come forward with an assertion which seemed to the master to be more clever than correct; and this he would argue against with plenty of sarcasm in his conversation and lectures, but without doing any damage to his affectionate relationship with his pupil. And in fact Charcot leaves behind him a host of pupils whose intellectual quality and whose achievements up to now are a guarantee that the study and practice of neuropathology in Paris will not so quickly slip down from the height to which Charcot has brought them.
In Vienna we have repeatedly had occasion to realize that the intellectual significance of an academic teacher is not necessarily combined with a direct personal influence on younger men which leads to the creation of a large and important school. If Charcot was so much more fortunate in this respect we must put it down to the personal qualities of the man - to the magic that emanated from his looks and from his voice, to the kindly openness which characterized his manner as soon as his relations with someone had overcome the stage of initial strangeness, to the willingness with which he put everything at the disposal of his pupils, and to his life-long loyalty to them. The hours he spent in his wards were hours of companionship and of an exchange of ideas with the whole of his medical staff. He never shut himself away from them there. The youngest newly-qualified physician walking the wards had a chance of seeing him at his work and might interrupt him at it; and the same freedom was enjoyed by students from abroad, who, in later years, were never lacking at his rounds. And, lastly, on the evenings when Madame Charcot was at home to a distinguished company, assisted by a highly-gifted daughter who was growing up in the likeness of her father, the pupils and medical assistants who were always present met the guests as part of the family.

Charcot was in the very prime of life when this abundance of facilities for teaching and research were placed at his disposal. He was a tireless worker, and always, I believe, the busiest in the whole institute. His private consultations, to which patients flocked 'from Samarkand and the Antilles', could not keep him from his teaching activities or his researches. There is no doubt that this throng of people did not turn to him solely because he was a famous discoverer but quite as much because he was a great physician and friend of man, who could always find an answer to a problem and who, when the present state of science did not allow him to know, was able to make a good guess. He has often been blamed for his therapeutic method which, with its multiplicity of prescriptions, could not but offend a rationalistic conscience. But he was simply continuing the procedures which were customary at that time and place, without deceiving himself much about their efficacy. He was, however, not pessimistic in his therapeutic expectations, and repeatedly showed readiness to try new methods of treatment in his clinic: their short-lived success was to find its explanation elsewhere.
At about the time at which the clinic was established and at which he gave up the Chair of Pathological Anatomy, a change occurred in the direction of Charcot's scientific pursuits, and to this we owe the finest of his work. He now pronounced that the theory of organic nervous illnesses was for the time being fairly complete, and he began to turn his attention almost exclusively to hysteria, which thus all at once became the focus of general interest. This, the most enigmatic of all nervous diseases, for the evaluation of which medicine had not yet found a serviceable angle of approach, had just then fallen into thorough discredit; and this discredit extended not only to the patients but to the physicians who concerned themselves with the neurosis. It was held that in hysteria anything was possible, and no credence was given to a hysterical about anything. The first thing that Charcot's work did was to restore its dignity to the topic. Little by little, people gave up the scornful smile with which the patient could at that time feel certain of being met. She was no longer necessarily a malingerer, for Charcot had thrown the whole weight of his authority on the side of the genuineness and objectivity of hysterical phenomena. Charcot had repeated on a small scale the act of liberation in memory of which Pinel's portrait hung in the lecture hall of the Salpêtrière. Once the blind fear of being made a fool of by the unfortunate patient had been given up - a fear which till then had stood in the way of a serious study of the neurosis - the question could arise as to what method of approach would lead most quickly to a solution of the problem. A quite unbiased observer might have arrived at this conclusion: if I find someone in a state which bears all the signs of a painful affect - weeping, screaming and raging - the conclusion seems probable that a mental process is going on in him of which those physical phenomena are the appropriate expression. A healthy person, if he were asked, would be in a position to say what impression it was that was tormenting him; but the hysterical would answer that he did not know. The problem would at once arise of how it is that a hysterical patient is overcome by an affect about whose cause he asserts that he knows nothing. If we keep to our conclusion that a corresponding psychical process must be present, and if nevertheless we believe the patient when he denies it; if we bring together the many indications that the patient is behaving as though he does know about it; and if we enter into the history of the patient's life and find some occasion, some trauma, which would appropriately evoke precisely those expressions of feeling - then everything points to one solution: the patient is in a special state of mind in which all his impressions or his recollections of them are no longer held together by an associative chain, a state of mind in which it is possible for a recollection to express its affect by means of somatic phenomena without the group of the other mental processes, the ego, knowing about it or being able to intervene to prevent it. If we had called to mind the familiar psychological difference between sleep and waking, the strangeness of our hypothesis might have seemed less. No one should object that the theory of a splitting of consciousness as a solution to the riddle of hysteria is much too remote to impress an unbiased and untrained observer. For, by pronouncing possession by a demon to be the cause of hysterical phenomena, the Middle Ages in fact chose this solution; it would only have been a matter of exchanging the religious terminology of that dark and superstitious age for the scientific language of to-day.

[1893f, 281]
Charcot, however, did not follow this path towards an explanation of hysteria, although he drew copiously upon the surviving reports of witch trials and of possession, in order to show that the manifestations of the neurosis were the same in those days as they are now. He treated hysteria as just another topic in neuropathology; he gave a complete description of its phenomena, demonstrated that these had their own laws and uniformities, and showed how to recognize the symptoms which enable a diagnosis of hysteria to be made. The most painstaking investigations, initiated by himself and his pupils, extended over hysterical disturbances of sensibility in the skin and deeper tissues, over the behaviour of the sense organs, and over the peculiarities of hysterical contractures and paralyses, and of trophic disturbances and changes in metabolism. The many different forms of hysterical attack were described, and a schematic plan was drawn up by depicting the typical configuration of the major hysterical attack as occurring in four stages, which made it possible to trace the commonly observed ‘minor’ attacks back to this same typical configuration. The localization and frequency of occurrence of the so-called ‘hysterogenic zones’ and their relationship to the attacks were also studied, and so on. Once all this information about the manifestations of hysteria had been arrived at, a number of surprising discoveries were made. Hysteria in males, and especially in men of the working class was found far more often than had been expected; it was convincingly shown that certain conditions which had been put down to alcoholic intoxication or lead-poisoning were of a hysterical nature; it was possible to subsume under hysteria a whole number of affections which had hitherto not been understood and which had remained unclassified; and where the neurosis had become joined with other disorders to form complex pictures, it was possible to separate out the part played by hysteria. Most far-reaching of all were the investigations into nervous illnesses which followed upon severe traumas - the ‘traumatic neuroses’ - views about which are still under discussion and in connection with which Charcot has successfully put forward the arguments in favour of hysteria.

[1893f, 282]

At one point in his work Charcot rose to a level higher even than that of his usual treatment of hysteria. The step he took assured him for all time, too, the fame of having been the first to explain hysteria. While he was engaged in the study of hysterical paralyses arising after traumas, he had the idea of artificially reproducing those paralyses, which he had earlier differentiated with care from organic ones. For this purpose he made use of hysterical patients whom he put into a state of somnambulism by hypnotizing them. He succeeded in proving, by an unbroken chain of argument, that these paralyses were the result of ideas which had dominated the patient's brain at moments of a special disposition. In this way, the mechanism of a hysterical phenomenon was explained for the first time. This incomparably fine piece of clinical research was afterwards taken up by his own pupil, Pierre Janet, as well as by Breuer and others, who developed from it a theory of neurosis which coincided with the mediaeval view - when once they had replaced the ‘demon’ of clerical phantasy by a psychological formula.

[1893f, 283]
Charcot's concern with hypnotic phenomena in hysterical patients led to very great advances in this important field of hitherto neglected and despised facts, for the weight of his name put an end once and for all to any doubt about the reality of hypnotic manifestations. But the exclusively nosographical approach adopted at the School of the Salpêtrière was not suitable for a purely psychological subject. The restriction of the study of hypnosis to hysterical patients, the differentiation between major and minor hypnotism, the hypothesis of three stages of 'major hypnosis', and their characterization by somatic phenomena - all this sank in the estimation of Charcot's contemporaries when Liébeault's pupil, Bernheim, set about constructing the theory of hypnosis on a more comprehensive psychological foundation and making suggestion the central point of hypnosis. It is only the opponents of hypnosis who, content to conceal their lack of personal experience behind an appeal to authority, still cling to Charcot's assertions and who like to take advantage of a pronouncement made by him in his last years, in which he denied to hypnosis any value as a therapeutic method.

Furthermore, the aetiological theories supported by Charcot in his doctrine of the 'famille névropathique', which he made the basis of his whole concept of nervous disorders, will no doubt soon require sifting and emending. So greatly did Charcot over-estimate heredity as a causative agent that he left no room for the acquisition of nervous illness. To syphilis he merely allotted a modest place among the 'agents provocateurs'; nor did he make a sufficiently sharp distinction between organic nervous affections and neuroses, either as regards their aetiology or in other respects. It is inevitable that the advance of our science, as it increases our knowledge, must at the same time lessen the value of a number of things that Charcot taught us; but neither changing times nor changing views can diminish the fame of the man whom - in France and elsewhere - we are mourning to-day.

As you know, Gentlemen, all the modern advances made in the understanding and knowledge of hysteria are derived from the work of Charcot. In the first half of the eighties, Charcot began to turn his attention to the 'major neurosis', as the French call hysteria. In a series of researches he has succeeded in proving the presence of regularity and law where the inadequate or half-hearted clinical observations of other people saw only malingering or a puzzling lack of conformity to rule. It may safely be said that everything new that has been learnt about hysteria in recent times goes back directly or indirectly to his suggestions. But among Charcot's numerous works, none, in my estimate, is of higher value than the one in which he taught us to understand the traumatic paralyses which appear in hysteria; and since it is precisely this work of which ours appears as a continuation, I hope you will allow me to lay this subject before you once again in some detail.

Since the fine work done by Pierre Janet, Josef Breuer and others, it may be taken as generally recognized that the syndrome of hysteria, so far as it is as yet intelligible, justifies the assumption of there being a splitting of consciousness, accompanied by the formation of separate psychical groups. Opinions are less settled, however, about the origin of this splitting of consciousness and about the part played by this characteristic in the structure of the hysterical neurosis.
From previous experience I can foresee that it is precisely against this assertion or against its universal validity that your contradiction, Gentlemen, will be directed. Perhaps it would be better to say, your inclination to contradict; for none of you, no doubt, have as yet any investigations at your disposal which, based upon the same procedure, might have yielded a different result. As regards the controversial matter itself, I will only remark that the singling out of the sexual factor in the aetiology of hysteria springs at least from no preconceived opinion of my part. The two investigators as whose pupil I began my studies of hysteria, Charcot and Breuer, were far from having any such presupposition; in fact they had a personal disinclination to it which I originally shared. Only the most laborious and detailed investigations have converted me, and that slowly enough, to the view I hold to-day. If you submit my assertion that the aetiology of hysteria lies in sexual life to the strictest examination, you will find that it is supported by the fact that in some eighteen cases of hysteria I have been able to discover this connection in every single symptom, and, where the circumstances allowed, to confirm it by therapeutic success. No doubt you may raise the objection that the nineteenth or the twentieth analysis will perhaps show that hysterical symptoms are derived from other sources as well, and thus reduce the universal validity of the sexual aetiology to one of eighty percent. By all means let us wait and see; but, since these eighteen cases are at the same time all the cases on which I have been able to carry out the work of analysis and since they were not picked out by anyone for my convenience, you will find it understandable that I do not share such an expectation but am prepared to let my belief run ahead of the evidential force of the observations I have so far made. Besides, I am influenced by another motive as well, which for the moment is of merely subjective value. In the sole attempt to explain the physiological and psychical mechanism of hysteria which I have been able to make in order to correlate my observations, I have come to regard the participation of sexual motive forces as an indispensable premiss.

An obituary of the master of neuropathology who died in 1893 and among whose pupils the present writer numbers himself.

'Some points for a comparative study of organic and hysterical motor paralyses.'

This explanation struck me as unconvincing. Inadequate reasons like this usually conceal unconfessed motives. They remind one of Bernheim's hypnotized patients. When one of these carries out a post-hypnotic suggestion and is asked why he is acting in this way, instead of saying that he has no idea he feels compelled to invent some obviously unsatisfactory reason. The same was no doubt true of my patient and the caviare. I saw that she was obliged to create an unfulfilled wish for herself in her actual life; and the dream represented this renunciation as having been put into effect. But why was it that she stood in need of an unfulfilled wish?
I have not yet related the exciting cause of the dream. It was of great importance and led deep into an understanding of the dream. I had heard from my friend in Berlin, whom I have referred to as 'Fl.', that he was about to undergo an operation and that I should get further news of his condition from some of his relatives in Vienna. The first reports I received after the operation were not reassuring and made me feel anxious. I should have much preferred to go to him myself, but just at that time I was the victim of a painful complaint which made movement of any kind a torture to me. The dream-thoughts now informed me that I feared for my friend's life. His only sister, whom I had never known, had, as I was aware, died in early youth after a very brief illness. (In the dream Fl. spoke about his sister and said that in three quarters of an hour she was dead.) I must have imagined that his constitution was not much more resistant than his sister's and that, after getting some much worse news of him, I should make the journey after all - and arrive too late, for which I might never cease to reproach myself.¹ This reproach for coming too late became the central point of the dream but was represented by a scene in which Brücke, the honoured teacher of my student years, levelled this reproach at me with a terrible look from his blue eyes. It will soon appear what it was that caused the situation to be switched on to these lines. The scene itself could not be reproduced by the dream in the form in which I experienced it. The other figure in the dream was allowed to keep the blue eyes, but the annihilating role was allotted to me - a reversal which was obviously the work of wish-fulfilment. My anxiety about my friend's recovery, my self-reproaches for not going to see him, the shame I felt about this - he had come to Vienna (to see me) 'unobtrusively' - the need I felt to consider that I was excused by my illness - all of this combined to produce the emotional storm which was clearly perceived in my sleep and which raged in this region of the dream-thoughts.

[1900a, 922]

Remembering in adults, as is well known, makes use of a variety of psychical material. Some people remember in visual images; their memories have a visual character. Other people can scarcely reproduce in their memory even the scantiest outlines of what they have experienced. Following Charcot's proposal, such people are called auditifs and moteurs in contrast to the visuels. In dreams these distinctions disappear: we all dream predominantly in visual images. But this development is similarly reversed in the case of childhood memories: they are plastically visual even in people whose later function of memory has to do without any visual element. Visual memory accordingly preserves the type of infantile memory. In my own case the earliest childhood memories are the only ones of a visual character: they are regular scenes worked out in plastic form, comparable only to representations on the stage. In these scenes of childhood, whether in fact they prove to be true or falsified, what one sees invariably includes oneself as a child, with a child's shape and clothes. This circumstance must cause surprise: in their recollections of later experiences adult visuels no longer see themselves.¹ Furthermore it contradicts all that we have learnt to suppose that in his experiences a child's attention is directed to himself instead of exclusively to impressions from outside. One is thus forced by various considerations to suspect that in the so-called earliest childhood memories we possess not the genuine memory-trace but a later revision of it, a revision which may have been subjected to the influences of a variety of later psychical forces. Thus the 'childhood memories' of individuals come in general to acquire the significance of 'screen memories' and in doing so offer a remarkable analogy with the childhood memories that a nation preserves in its store of legends and myths.

[1901b, 1141]
I remembered that long before, while I was working at Charcot's clinic, I had seen and heard how in cases of hysterical mutism writing operated vicariously in the place of speech. Such patients were able to write more fluently, quicker, and better than others did or than they themselves had done previously. The same thing had happened with Dora. In the first days of her attacks of aphonia 'writing had always come specially easy to her'. No psychological elucidation was really required for this peculiarity, which was the expression of a physiological substitutive function enforced by necessity; it was noticeable, however, that such an elucidation was easily to be found. Herr K. used to write to her at length while he was travelling and to send her picture post-cards. It used to happen that she alone was informed as to the date of his return, and that his arrival took his wife by surprise. Moreover, that a person will correspond with an absent friend whom he cannot talk to is scarcely less obvious than that if he has lost his voice he will try to make himself understood in writing. Dora's aphonia, then, allowed of the following symbolic interpretation. When the man she loved was away she gave up speaking; speech had lost its value since she could not speak to him. On the other hand, writing gained in importance, as being the only means of communication with him in his absence.

I was further anxious to show that sexuality does not simply intervene, like a deus ex machina, on one single occasion, at some point in the working of the processes which characterize hysteria, but that it provides the motive power for every single symptom, and for every single manifestation of a symptom. The symptoms of the disease are nothing else than the patient's sexual activity. A single case can never be capable of proving a theorem so general as this one; but I can only repeat over and over again - for I never find it otherwise - that sexuality is the key to the problem of the psychoneuroses and of the neuroses in general. No one who disdains the key will ever be able to unlock the door. I still await news of the investigations which are to make it possible to contradict this theorem or to limit its scope. What I have hitherto heard against it have been expressions of personal dislike or disbelief. To these it is enough to reply in the words of Charcot: 'Ça n'empêche pas d'exister.'

Secondly, let me draw your attention to the fact that we physicians cannot discard psychotherapy, if only because another person intimately concerned in the process of recovery - the patient - has no intention of discarding it. You will know of the increase in knowledge on this subject that we owe to the Nancy school, to Liébeault and Bernheim. A factor dependent on the psychical disposition of the patient contributes, without any intention on our part, to the effect of every therapeutic process initiated by a physician; most frequently it is favourable to recovery, but often it acts as an inhibition. We have learned to use the word 'suggestion' for this phenomenon, and Möbius has taught us that the unreliability which we deplore in so many of our therapeutic measures may be traced back to the disturbing influence of this very powerful factor. All physicians, therefore, yourselves included, are continually practising psychotherapy, even when you have no intention of doing so and are not aware of it; it is a disadvantage, however, to leave the mental factor in your treatment so completely in the patient's hands. Thus it is impossible to keep a check on it, to administer it in doses or to intensify it. Is it not then a justifiable endeavour on the part of a physician to seek to obtain command of this factor, to use it with a purpose, and to direct and strengthen it? This and nothing else is what scientific psychotherapy proposes.
A singular thing. I can remember, when I first began to meddle in the conflict of scientific opinions twenty-two years ago, with what derision the older generation of neurologists and psychiatrists of those days received assertions about suggestion and its effects. Since then the situation has fundamentally changed. The former aversion has been converted into an only too ready acceptance; and this has happened not only as a consequence of the impression which the work of Liébeault and Bernheim and their pupils could not fail to create in the course of these two decades, but also because it has since been discovered how great an economy of thought can be effected by the use of the catchword 'suggestion'. Nobody knows and nobody cares what suggestion is, where it comes from, or when it arises, - it is enough that everything awkward in the region of psychology can be labelled 'suggestion'. I do not share the view which is at present fashionable that assertions made by children are invariably arbitrary and untrustworthy. The arbitrary has no existence in mental life. The untrustworthiness of the assertions of children is due to the predominance of their imagination, just as the untrustworthiness of the assertions of grown-up people is due to the predominance of their prejudices. For the rest, even children do not lie without a reason, and on the whole they are more inclined to a love of truth than are their elders. If we were to reject little Hans's statements root and branch we should certainly be doing him a grave injustice. On the contrary, we can quite clearly distinguish from one another the occasions on which he was falsifying the facts or keeping them back under the compelling force of a resistance, the occasions on which, being undecided himself, he agreed with his father (so that what he said must not be taken as evidence), and the occasions on which, freed from every pressure, he burst into a flood of information about what was really going on inside him and about things which until then no one but himself had known. Statements made by adults offer no greater certainty. It is a regrettable fact that no account of a psycho-analysis can reproduce the impressions received by the analyst as he conducts it, and that a final sense of conviction can never be obtained from reading about it but only from directly experiencing it. But this disability attaches in an equal degree to analyses of adults.

LADIES AND GENTLEMEN, - At about the same time at which Breuer was carrying on the 'talking cure' with his patient, the great Charcot in Paris had begun the researches into hysterical patients at the Salpêtrière which were to lead to a new understanding of the disease. There was no possibility of his findings being known in Vienna at that time. But when, some ten years later, Breuer and I published our 'Preliminary Communication' on the psychical mechanism of hysterical phenomena, we were completely under the spell of Charcot's researches. We regarded the pathogenic experiences of our patients as psychical traumas, and equated them with the somatic traumas whose influence on hysterical paralyses had been established by Charcot; and Breuer's hypothesis of hypnoid states was itself nothing but a reflection of the fact that Charcot had reproduced those traumatic paralyses artificially under hypnosis.
